### Abstract

A list of 60 Odonata species and their distribution across 109 localities on the Crimean Peninsula is provided. The study is based on a literature review and a field survey between 1999 and 2008. *Erythromma lindenii* and *Epitheca bimaculata* are here recorded for the first time from Crimea. Diagnostic morphological characters of *Calopteryx splendens taurica* and *Orthetrum coerulescens aniceps* are briefly described. Descriptions of typical Crimean habitats of dragonflies are also presented. The necessity of the protection of Crimean freshwater habitats is discussed.

### Introduction

The investigation of Odonata on the Crimea peninsula has a long history. The first species recorded, *Lestes barbarus*, was mentioned in the review paper by H. Hagen (1856). Later, on 25.02.1895 the flight of *Sympetrum fusca* was observed by S. Mokrzhetsky in Simpheropol' (Mokrzhetsky 1899). The first checklists (Brauner 1902, 1903) contain 14 species for the submontane and steppe areas of Crimea and 8 species for the South coast and the Kerch peninsula. Further records are provided by A. Bartenev (1912a, 1912b, 1915), G. Pliginsky (1913) and A. Shorygin (1926). This first stage of Odonata investigation on Crimea, the "faunistic" period, was concluded by Artobolevsky's (1929) fundamental publication. He summarised all previous data and presented the checklist of Crimean Odonata which consisted of 37 species including 6 new ones. He also described the new subspecies *Lestes viridis parvidens* (now: *Chalcolestes parvidens* Art.).

The second stage of Odonata investigation continued with faunistics but placed the main attention to ecological peculiarities and zoogeographical characteristics of Crimean dragonflies. Ya. Tseeb (1947) reported four new species, *Aeshna*

*grandis*, *Ae. juncea*, *Ae. mixta* and *Sympetrum depressiusculum*, and I. Mal'tsev (1953) recorded 12 species in the forest-belts of the steppe area. A series of hydrobiological papers described the role of dragonfly larvae in freshwater ecosystems (Mel'nikov & Lubyanov, 1958, Kiseleva et al., 1984, 1985, 1998; Temirova et al., 1980, 1984; Prokopov, 2001, 2003). In a faunistic review of Ukrainian dragonflies (Gorb et al., 2000) 30 species were reported for Crimea from a literature review.

In a third stage of Crimean odonatalogical research the issue of conservation of rare and endangered species occupied a central role. Mal'tsev (1999) proposed a Red list of Crimean Odonata consisting of 23 species. An attempt of the systematisation of biodiversity and zoogeographical data on Crimea Odonata has also been made (Pyshkin et al., 2004). During more systematic inventarisation of Odonata, faunistics, of course, remained an important pillar. New species have been found during the last three years: *Anax ephippiger*, *Sympetrum danae* (Khrokalo & Prokopov, 2005), *Leucorrhinia albifrons* (Matuskina, 2006), *Selysiosthemis nigra* (Matuskina, 2007).

The present paper reviews the checklist of Crimean Odonata. We report and comment on all 60 species found in the literature and our original records in 1999-2008.

## General characteristics of the Crimean peninsula

A general overview of the Crimean geology and landscapes is given by M. Pistun and Ye. Shipovich (1982). Briefly, the Crimea Peninsula is located in the south of Ukraine, on the northern coast of the Black Sea and on the western coast of the Sea of Azov (Fig. 1). Crimea's total land area is 26,100 km<sup>2</sup>. The peninsula is connected to the mainland by the 5–7 km wide isthmus of Perekop. The Crimean Peninsula is distinguished by its variety of landscapes. Seventy-five percent of Crimea consists of semiarid prairie-like landscape. This is a southward continuation of the Pontic steppes which slope gently to the northwest from the foot of the Crimean Mountains. In the steppe and agricultural regions a number of plantations were created as wind shelters to the arable land. These are referred to as shelter belts in the text. The Crimean mountains are geologically young and consist of three subranges: the main, the internal, represented by separate rocky massifs which heights are 700-1300 meters, and the much less elevated external subrange. The main range is subdivided into several massifs, known as yaylas or mountain plateaus ("yayla" is name after Crimean Tatar for "alpine meadow"). The highest peak is mt. Roman-Kosh (1545 m above sea level). The south coast is flanked by parallel ranges of mountains at a distance of 8–12 km from the sea.

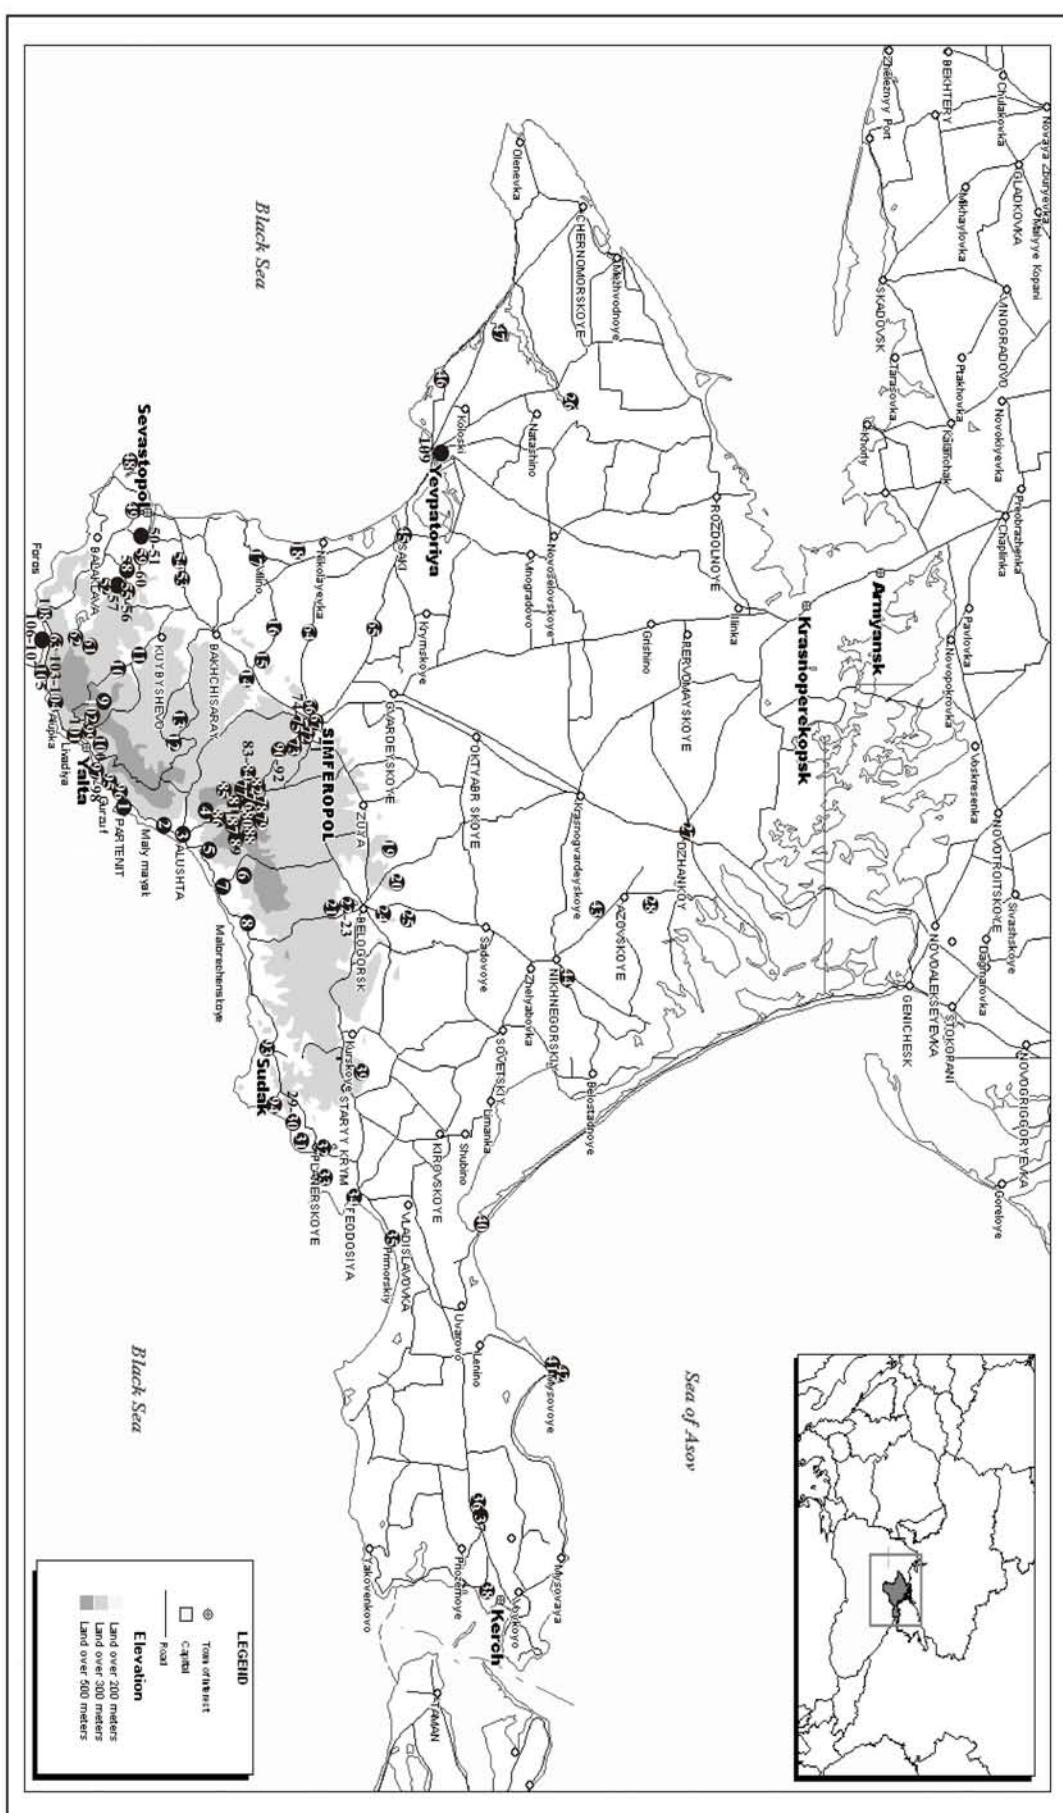

Fig. 1: Map of Crimea with localities of Odonata records (numbers according table 1).

Most of Crimea has a temperate continental climate, except for the south coast where it experiences a humid subtropical climate because of the warm influences from the Black Sea. Summers can be hot (28 °C July average) and winters cool (-0.3 °C January average) in the interior. On the south coast winters are milder (4 °C January average) and temperatures much below freezing are exceptional. Precipitation in the interior is low with only 400 mm a year. On the south coast precipitation is more than double of that.

Montane forests on the northern flank of Crimea Mountains follow a distinct altitudinal pattern. The forest-steppe extends up to 150-300 m above sea level, between 300-350 m oak forests with areas of pine are found whereas between 750-1000 (1300) m there are beech and hornbeam forests. Above 1000 m, up to 1300 m karst plateaus with alpine meadows are found (yaylas). These are often used as a pasture. At the southern flank up to 350-400 m from the sea juniper and oak forests and bushes are found. From 350-400 m to 900-1000 m there is a belt of oak and pine forests while the zone of beech and pine is much narrower than on the north, between 900-1000 m.

The main rivers of the Crimean Mountains include the Al'ma, Chorna and Salhir rivers on the northern slope. The Uchan-Su river on the southern slope forms the Uchan-Su waterfall, the highest one in the Ukraine.

The recent economic development and state of the environment on Crimea is summarised by Gluschenko et al. (2007) and 'Crimea in measures of sustainable development' (2008). Briefly, the largest part of Crimea (above 65 %) is used for agriculture, 63 % of which for cereal and oil-bearing crops, 22.9 % for pastures and the remainder for horticulture and vineyards. Cattle and poultry breeding is found in the steppe, submontane and mountain regions. Heavy industry is represented by big metallurgy plants on the Kerch peninsula, tanneries in the surroundings of Simferopol', and numerous chemical factories. Natural gas reserves are exploited on the Kerch peninsula and the shelves of the Black and Azov seas. Crimea is also a popular recreation place mainly for Ukrainian and Russian citizens. One finds sanatoria and holiday resorts at the south and west coasts as well as in the mountains and the submontane areas.

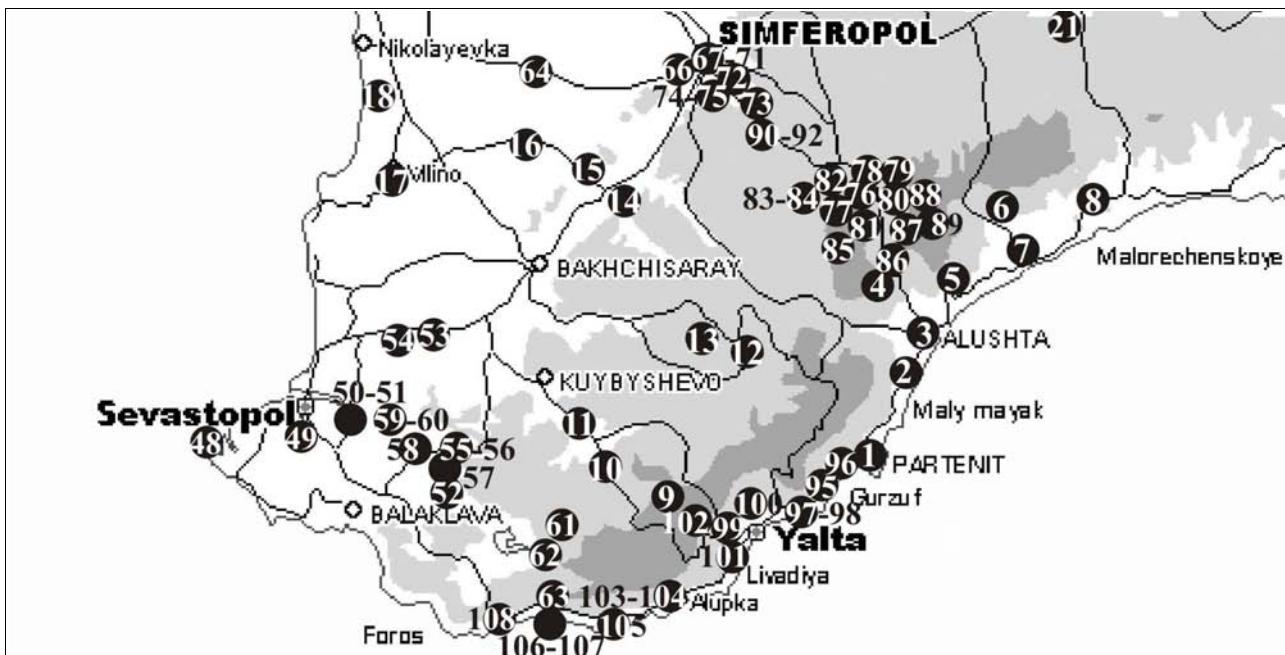

The lack of water resources is one of the largest problems in Crimea. The Sevoro-Krymskij canal, constructed in 1963, provides drinking water to the greater cities with industrial development. Reservoirs and dams provide water to agriculture and the increasing tourism infrastructure with several billions of over-night stays of tourists. Despite of some reduction of agricultural and industrial activities during last decade, environmental issues are an increasing concern because of the increasing of tourism and recreation. Disposal of industrial sewage into the rivers remains huge problem as well as pollution of various waterbodies by agricultural chemicals. Environmental issues of Crimea are discussed on numer-

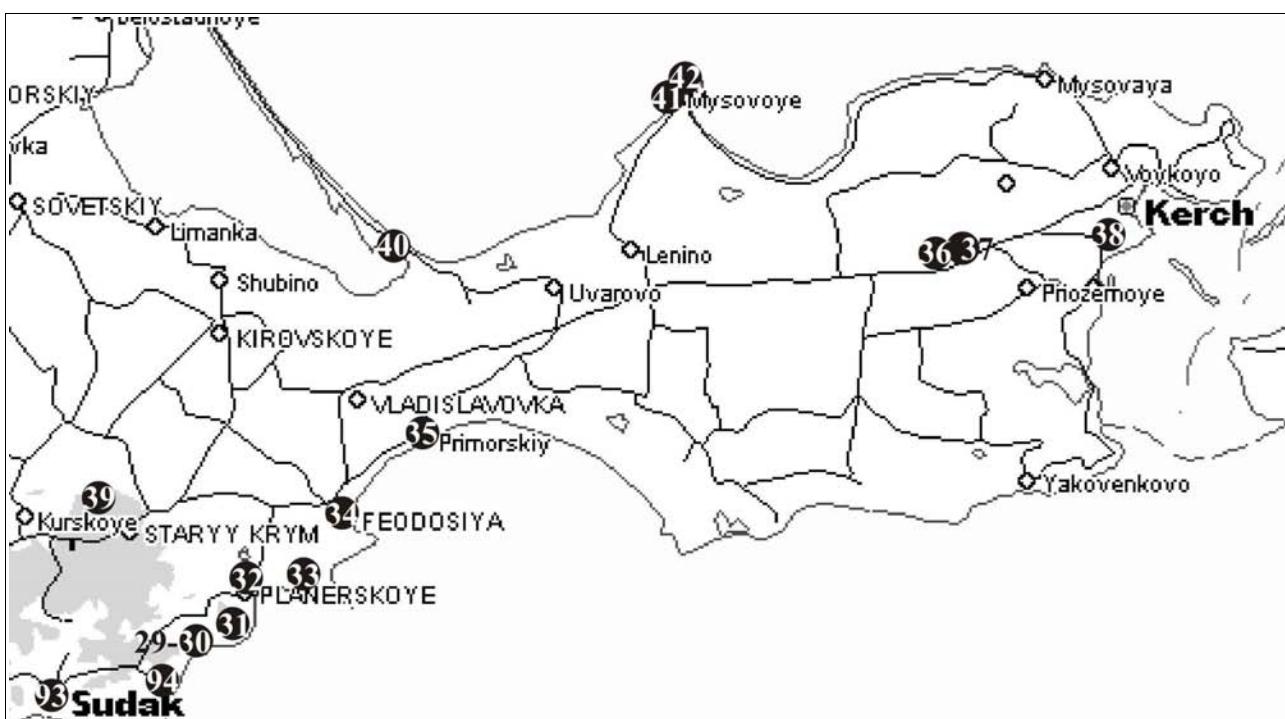

ous conferences, symposia and special government committee meetings in order to balance the state budget, investments and international organization funds.

## List of localities

Data from 109 localities were available. These are given in Table 1 and are shown in Fig. 1 and more in detail in figures 1a-c.

1a: Southern part of Crimean Peninsula with localities.

1b: Eastern part of Crimean Peninsula with localities.

## **1c: North-western part of Crimean Peninsula with localities**

**Table 1.** List of localities of literature and original records of Odonata on Crimea.

Locality #	Administrative area (district)	Localities	Coordinates
1.	Alushta	Ayu-Dag mountain, surroundings of Frunsenskoye (Partenit)	44°34'N 34°20'E
2.	Alushta	Kastel mountain	44°38'10"N 34°23'10"E

### Annotated list of species

The localities given in brackets refer to those listed in Table 1.

1. ***Calopteryx virgo* (Linnaeus, 1758)**

Literature: (103): 1 ♂ (Bartenev, 1912a). - (73, 74, 78, 80, 83): larvae (Kiseleva, Ezernytsky, 1985). - (27,73) larvae (Kiseleva, Vershytsky, 1998).- in Crimea: (Mal'tsev, 1999)

- Original data: none

2. ***Calopteryx splendens* (Harris, 1782)**

Literature: (67): (22.05.1894, 13.07.1894) (Brauner, 1902). - (74, 82, 84): larvae (Kiseleva, Ezernytsky, 1985). - (73): larvae (Kiseleva, Vershytsky, 1998). - (100): (Prokopov, 2001).

- Original data: (24): (05.06.2008) 1 ♂.

***Calopteryx splendens taurica* Selys, 1853**

According to Bartenev (1912a) the diagnostic feature of adults are the size and shape of the blue band on the wings of the male: the blue colour spreads to 1-10 cells behind node, the band is narrow, its proximal margin

is sharply cut-off. Body size is smaller than *C. s. splendens* (*C. s. splendens* abdomen – 38-42 mm, wings – 27-36 mm; *Calopteryx splendens taurica* abdomen – 36-38 mm, wings – 27-31 mm;). The larvae of *C. s. splendens* and *C. s. taurica* are not distinguishable. The abundance of all larval *Calopteryx* in Crimea refers to *C. s.taurica* if no adults were caught at the same locality.

**Literature:** Records on Crimea by Selys-Longchamps (1853, 1854, 1887) (cited after Artobolevsky 1915). - (54): (18.05.1897) 2 ♂; (30.05.1897) 2 ♀; - (67): (25.05.1899) 1 ♀; - (71): (19.05.1899) 1 ♂, 1 ♀; - (103): (12.08.1902) 1 ♂ (Bartenev, 1912a). - (50, 52, 54, 55, 67): (11.05.-30.06) (Pliginsky, 1913). - (15): (5.07.1898) 2 ♂; (10.05.1899) 1 ♂; - (49): (17.06.1907) 1 ♀; - (50): (11.05.1908), 1 ♀, 1 ♂; (18.05.1908) 2 ♂, 2 ♀; (08.06.1908) 3 ♂, 1 ♀; - (54): (06.06.1913) - (67): (1898) 2 ♂, 2 ♀; (26.06.1898) 1 ♂, 1 ♀; (07.1898) 1 ♂; (02.07.1898) 1 ♂; (10.05.1899) 1 ♀ Common in montane and submontane Crimea (Artobolevsky, 1929). - in Crimea: (Mal'tsev, 1999). - (57, 60): larvae (Prokopov, 2003). - (30): 26-27.07.2005 (Matuskina, 2006).

- **Original data:** (10): (20.08.2000), larvae 4 ♂, 2 ♀; - (11): (21.08.2000) larvae 2 ♂, 1 ♀; - (12): (25.06.07); - (14): (21.05.2005), larvae 2 ♀; - (17): (21.08.2008) 2 ♂; - (25): (26.07.2007) 1 ♂; - (53): (1.06.1999) larva 1 ♂; (10.04.2005) larva 1 ♀; - (56): larva 1 ♀; - (57): (17.08.2002) 1 ♂; - (17.08.2001) larva 1 ♂; (8.06.2003) 6 ♂, 3 ♀; - (58): (25.11.2003) larvae 2 ♂, 1 ♀, - (60): (25.11.2003) larva 1 ♂; - (64): (06.08.2008) 1 ♂; - (68): (7.08.2002) 11 ♂, 8 ♀, larvae 1 ♂, 1 ♀; (10.06.2005) 6 ♂, 1 ♀; - (69): (9.05.2005) larvae 2 ♀; - (91): (11.10.2001), larvae 2 juv; - (90, 92): (22.09.2002) larvae 1 ♂, 3 ♀, 2 juv; - (99): (12.11.2000), larva 1 ♂.

### 3. *Sympetrum fusca* (Vander Linden, 1823)

**Literature:** (66): (25. 02. 1895) (Mokrzhetsky, 1999). - (67): (25.02.1894), (22.04.1894) (Brauner, 1902). - Crimea, 2 ♀ (Shorygin, 1926). - (15): (05.07.1998) 1 ♀; (10.05.1899) 4 ♂ - (67): (25.05.1898) 1 ♀; (Artobolevsky, 1929). - (73, 74) larvae (Kiseleva, Ezernytsky, 1985). - (74, mountain Crimea): larvae (Kiseleva, Vershytsky, 1998)

- **Original data:** (4): (11-20.06.2005) 1 ♂; - (6): (12.07.2006); - (7): (11.03.2007) 2 ♂; - (8): (6.05.2005) 7 ♂, 4 ♀; (8.05.2005) 3 ♂; - (16): 11.08.2008, 1 ♀; - (31): (4.07.2006) 1 ♂, 1 ♀; - (33): (11.09.2005) 1 ♀; - (47): (25.08.2008) 1 ♂; - (51): (20.08.2008) 1 ♂. - (64): (02.10.2006) 1 ♂; - (70): (03.07.2006); - (72): (03.08.2008) 1 ♂. - (77): (19.07.2008) 1 ♂, 1 ♀; - (98): (08-10.07.2008) larvae 2 ♀.

### 4. *Sympetrum paedisca* (Brauer, 1877)

**Literature:** - in Crimea: (Mal'tsev, 1999). The record of this species in Crimea needs confirmation.

5. *Lestes virens* (Charpentier, 1825)

Literature: (3): (10-15.08.1900) 1 ♂ (Bartenev, 1912b). - in Crimea: (Mal'tsev, 1999).

- Original data: none

6. *Lestes barbarus* (Fabricius, 1798)

Literature: (48): (Hagen, 1856). - (2): (19.05.1900) 2 ♂; (26.05.1900) 5 ♂, 6 ♀; (08.07.1900) 1 ♂; - (106): (11.07.1902), 1 ♂; (22.07.1902) 2 ♂; - (3): (02.06.1900) 11 ♂, 4 ♀; (5-10.08.1900) 1 ♀, (10-20.08.1900) 2 ♂; (Bartenev, 1912b). - (28): (24.06.1894) (Brauner, 1902). - (101): (summer 1902) 1 ♀ (Brauner, 1903). - (3): 02.06.1898, 1 ♀; - (15): (05.06.1898) 1 ♀; (05.07.1898) 5 ♂, 5 ♀; (30.07.1899) 1 ♂; (08.06.1914) 2 ♂; (29.06.1914) 2 ♂; - (45): (08.07.1906) 1 ♀; - (49): (11.06.1907) 1 ♂; (17.06.1907) 2 ♂, 2 ♀; (29.06.1907) 1 ♀; (01.07.1907) 1 ♂; (19.07.1907) 1 ♂; (95): (15.08.1917) 1 ♂; (96): (13.08.1917) 1 ♂; - (105): (10.07.1926) 1 ♀; (12.07.1926) 1 ♂; (14.09.1928) 1 ♂; - (109) 1 ♂; (16.07.1902) 1 ♂; (30.06.1914) 5 ♂, 2 ♀; Most abundant of all Lestidae in the steppe area and the south coast (Artobolevsky, 1929). - Widespread between May-August in the shelter belts (Mal'tsev, 1953). - (74, 83): larvae (Kiseleva, Ezer-nytsky, 1985). - (74): (Kiseleva, Vershytsky, 1998)

- Original data: (4): (17.06.2004) 1 ♂; (11-20.06.2005) 1 ♀, larvae 1 ♂, 1 ♀; - (6): (12.07.2006); - (18): (05.08.2004) 4 ♂, 5 ♀; - (41): (12.05.2005) 2 ♀, larvae 6 ♂, 8 ♀. (72): (18.06.2003) 2 ♀; - (88): (19.07.2008) 2 ♂; (7.08.2004) 1 ♀; (10.08.2004) 1 ♀; (21.08.2001) 1 ♂; (19.08.2001) 2 ♂, 2 ♀; (26.08.2001) 1 ♂. (94): (15.06.2005) 2 ♂; - (98): (08.07.2008) 4 ♂, 4 ♀.

7. *Lestes parvidens* (Artobolevsky, 1929)

Literature: - (24): larvae (Temirova et al., 1984). - Mountain and steppe areas of Crimea, larvae (Kiseleva, Vershytsky, 1998). - (65): (19.10.2002) 4 ♂ (Martynov, Martynov, 2004). - in Crimea: (Mal'tsev, 1999). - (105): (14.09.1928, 2 ♂ mountain lake (altitude about 400 m) (Artobolevsky, 1929).

- Original data: (29): (20.08.2008), 2 ♂, 1 ♀; - (62): (16.08.2006) larvae 1 ♂, 1 ♀.

8. *Lestes macrostigma* (Eversmann, 1836)

Literature: (28): (16.06.1894) (Brauner, 1902). - (109): (07.06.1906) (Artobolevsky, 1929). - In shelter belts in June and beginning of July (Mal'tsev, 1953). - in Crimea: (Mal'tsev, 1999).

- Original data: none

9. *Lestes dryas* Kirby, 1890

Literature: (3): (02.06.1900) 1 ♂ (Bartenev, 1912b). - (3): (02.06.1898) 1

♀; (109): (30.07.1914) 2 ♂, classified as rare species in Crimea (Artobolevsky, 1929). - (74, 82) larvae (Kiseleva, Ezernytsky, 1985). - in Crimea: (Mal'tsev, 1999).

- Original data: (4):(11-20.06.2005) 3 ♂, 3 ♀, larvae 3 ♂, 1 ♀; (25.06.2008) 12 ♂, 1 ♀, larvae 3 ♂, 9 ♀.

10. ***Lestes sponsa* (Hansemann, 1823)**

Literature: (109): (12.06.1894) (Brauner, 1902). - (67): (30.05.1911) 1 ♀ classified as rare species in Crimea (Artobolevsky, 1929). - Steppe area, in shelter-belts far from water (Mal'tsev, 1953). - (Steppe and South coast, 73) larvae (Kiseleva, Vershytsky, 1998)

- Original data: none

11. ***Platycnemis pennipes* (Pallas, 1771)**

Literature: (54): (19.05.1897) 1 ♀; (14.05.1897) 1 ♀; (18.05.1897) 2 ♀; (30.05.1897) 1 ♂ (Bartenev, 1912b). - (67): (22.05.1894, 13.07.1894) (Brauner, 1902). - (15): (10.05.1899) 1 ♂, 1 ♀ - (49): (17.06.1907) 3 ♀; (23.06.1906) 1 ♀; (50): (11.05.1898) 2 ♂, 7 ♀; (18.05.1908) 2 ♀; (8.06.1908) 2 ♀; (12.07.1908) 1 ♀; - (54): (14.06.1909) 2 ♀; - (67): (30.05.1911) 2 ♂, 1 ♀; (26.06.1898) 1 ♂, 2 ♀; (20-25.07.1898) 1 ♂, 2 ♀; abundant, mostly in submontane regions (Artobolevsky, 1929). - (73, 74, 78, 82, 83, 84): larvae (Kiseleva, Ezernytsky, 1985). - (73), mountain Crimea, larvae (Kiseleva, Vershytsky, 1998). - in Crimea (Mal'tsev, 1999)

- Original data: (7): (19.05.2001) larva 2 ♂; (5): (26.06.2006); - (8): (06.05.2005), larvae 1 ♂; - (12): (25.06.2007) ♂♂, ♀♀; (20.06.2008) 2 ♂; - (13): (25.07.2008) 4 ♂; - (14): (02.03.2007) 3 ♂, 2 ♀; - (18): (14-17.08.2001) 1 ♂; (01.08.2004) 1 ♀; (06.08.2004) 1 ♀; (07.08.2004) 1 ♀; (08.08.2004) 1 ♀; (10.08.2004) 1 ♀; (07-12.08.2008) 3 ♂; (24): (05.06.2008) 4 ♂, 2 ♀; (15.07.2008) 3 ♂, 1 ♀. - (25): (26.07.2007) 1 ♂; - (60): (25.11.2003) larva 1 ♀; - (61): (01.05.2002) larva 2 ♂, 3 ♀; - (64): (06.08.2008) 4 ♂, 2 ♀; - (68): (07.08.2002) 3 ♂, 3 ♀; (10.06.2005) 7 ♂, 9 ♀; (25.07.2007); - (70): (03.07.2006) 1 ♂; - (72): (03.08.2008) 2 ♂, 1 ♂; - (75): (06.07.2008) - 3 ♂, 2 ♀; - (90): (15.06.2002) larva 6 ♂, 7 ♀; - (90, 92): (17.06.2002) larvae 3 ♂; (22.09.2002) larva 1 ♂, 1 ♀; - (95): (03.07.2008) 2 ♂, 3 ♀; - (98): (08-10.07.2008) 3 ♂, 4 ♀.

12. ***Nehalennia speciosa* (Charpentier, 1840)**

Literature: (109): (30.06.1913) 1 ♀ Very rare (Artobolevsky, 1915). - in Crimea: (Mal'tsev, 1999).

- Original data: none

13. ***Ischnura elegans* (Vander Linden, 1820)**

Literature: (2): (19.05.1900) 3 ♂; (26.05.1900) 1 ♂; - (3): (02.06.1900) 1 ♂ (Bartenev, 1912b). - South coast, summer 1902, 1 ♂; - (36, 37, 38):

(15.06.1902) (Brauner, 1903). - (15): (05.07.1898) 1 ♂; - (45): (24.07.1902) 2 ♀; - (49): (02.06.1902) 1 ♀; (18.07.1906) 1 ♀; - (50): 1 ♂; - (109): (30.06.1914) 1 ♂ Not abundant (Artobolevsky, 1929). - In Crimea widespread May-September (Mal'tsev, 1953). - (73, 74): larvae (Kiseleva, Vasyuta, 1984). - (73, 74, 83): larvae (Kiseleva, Ezernytsky, 1985). - (45): larvae, abundant; - mountain and steppe Crimea, everywhere, larvae (Kiseleva, Vershytsky, 1998)

- Original data: (7): (19.05.2001) larva 1 ♀; - (8): (6-8.05.2005) abundant adults, larvae; - (16): (07-12.08.2008) 1 ♂, 3 ♀; - (17): (21.08.2008) 1 ♂; - (18): (14-17.08.2001) 10 ♂, 8 ♀; (23-26.08.2001) 26 ♂, 5 ♀; (23.08.2001) larvae 1 ♂, 1 ♀ juv; (1.08.2004) 11 ♂, 1 ♀; (3.08.2004) 1 ♂, 1 ♀; (04-10.08.2004) abundant; - (20): (26.07.07) 2 ♂, 1 ♀; - (32): (08.09.2002) 2 ♂; - (40): (10.09.2007) 1 ♂; - (41): (12.05.2005), 1 ♂; - (42): (10-11.05.2005) 9 ♂, 13 ♀; (47): (21.07.2007). - (61): (01.05.2002) larvae 4 ♂, 1 ♀; - (64): (06.08.2008) 2 ♂, larvae 4 ♂, 2 ♀; - (68): (25.07.2007) 4 ♂, 7 ♀; - (69): (09.05.2005) 2 ♂; (72): (09.06.2005) 3 ♂, 2 ♀; (03.08.2008) 2 ♂, 1 ♀, larvae 2 ♀; (04.08.2007) 3 ♂, 3 ♀; (76): (13.06.2005) 1 ♀; - (94): (15.06.2005) 1 ♀; - (98): (08-10.07.2008) 4 ♂, 1 ♀; - (102): (23.05.2000), larvae 2 ♂, 4 ♀.

#### 14. *Ischnura pumilio* (Charpentier, 1825)

Literature: (2): (19.05.1900) 5 ♂; (26.05.1900) 1 ♂; - (54): (10.07.1897) 1 ♀; - (104): (09.07.1899) 1 ♀; - (106): (10.07.1902) 2 ♀; (Bartenev, 1912b). - South coast, summer 1902, 2 ♂, 1 ♀ (Brauner, 1903). - (2): (19.05.1900) 2 ♀; - (15): (30.07.1899) 1 ♂, 1 ♀; (34): (1922) 1 ♂, 3 ♀; - (49): (02.06.1902) 1 ♀; (01.07.1907) 1 ♂; - (54): (09.06.1913) 1 ♀; - (86): (07.06.1907) 9 ♂, 2 ♀; - (105): (08-11.06.1926) 1 ♂, 1 ♀; - (106): (09.07.1900) 1 ♂; (13.07.1900) 1 ♂; - (109): (21.06.1914) 1 ♂; (30.06.1914) 2 ♂; (04.07.1914) 3 ♂. Everywhere common and abundant (Artobolevsky, 1929). - (73, 74, 78, 82, 83): larvae (Kiseleva, Ezernytsky, 1985). - Mountain and steppe Crimea, larvae (Kiseleva, Vershytsky, 1998)

Fig. 2: River Salgir (Simferopol' district).

## Species composition in the investigated biotopes

The six main groups of biotopes that were classified according to peculiarities of relief, climate and hydrology harbour a characteristic fauna of dragonflies (tab. 2).

The first group of nine species is found in the spring and upstream habitats of Crimean rivers and streams of the mountainous part. The water flows fast and is clear. The river bed consists of stones and there is a general lack of submerged and water macrophyts. One typical example is the upper river Salhir (fig. 2).

Table 2: Distribution of Odonata species among the types of biotopes (after original records only)

№	Species (subspecies)	Type of biotope					
		Lotic		Lentic			
		Springs and river upstream	River downstream	Mountain water bodies		Big reservoirs	Ponds, lakes and puddles at the steppe part
				Lakes at the yayla	Lakes, ponds and puddles at forest zone

A second group of 14 species is found in the downstream parts of rivers and streams located mainly in submontane areas. The water flow is less rapid and submerged vegetation is well developed. The river bed consists of stone, clay and silt (e.g. river Biyuk Karasu near Bilogirs'k - fig. 3).

Fig. 3: River Biyuk Karasu near Bilogirs'k.

Fig. 4: River Al'ma at the village Viline (Bakhchysaray district).

Another example is the river Al'ma (fig. 4) near the village Viline, which is under permanent anthropogenic impact. The river is regulated, silted, and the water level is low because it was dammed to use it as watering place for cattle. Plants as *Phragmites communis*, *Potamogeton* sp. are abundant, the ground is covered by filamentous algae.

Fig. 5: Lake at the Dolgorukov yayla (Simperepol' district).

A third group occurs in the lakes in the yayla. Lakes on the Gurzuph and Dolgorukov yaylas belong to this group. The latter (fig. 5) were created for watering the cattle. They are small and have a silty floor and well developed macrophyte vegetation such as *Sparganium erectum*, *Phragmites communis*, *Typha angustifolia* L., *Potamogeton* sp. Only five species were recorded in this biotope type.

Fig. 6: Ponds at the north of Mys Mart'yan Reservation.

The fourth group consists of the lentic water bodies in the mountain forest zones. They include lakes, pools, ponds, and areas of dammed rivers. Well developed macrophyte vegetation can be found. One example, are the ponds in the surroundings of Mys Mart'yan Reservation (fig. 6.) where *Potamogeton pectinatus*, *P. natans*, *Phragmites communis*, *Scirpus sylvaticus* and *Eleocharis palustris* grow. Usually in August the pond dries up.

Another example is the lake in the surroundings of the village Kutusovka (fig. 7). This is a eutrophic lake with a rich macrophyte vegetation and very low water level in the middle of summer (in some years drying up). In or at all of the water bodies belonging to this group 29 species were recorded. The highest densities of larvae and the highest species diversity were observed in the shallow, thoroughly warmed pools, where most of Odonata predators such as fish were absent.

Fig. 7: *Lake at the village Kutuzovka.*

The fifth habitat group, the big reservoirs such as the Simferopol' reservoir (fig 8), is the best studied one. It is one of the largest reservoirs in Crimea, created on the river Salhir. In some part of the Simferopol' reservoir mass occurrences of cyanobacteria and algal blooms regularly happened during the last decade. In addition, the water level in these reservoirs changes by several meters two times per day. Such continuous changes of water level negatively impact several biota of the reservoir. At Crimean reservoirs 13 Odonata species were recorded.

Fig. 8: *Simferopol' reservoir.*

The last group comprises the lakes, ponds and small lentic waterbodies in the steppe zone of Crimea. One example is the lake Donuzlav (fig. 9) which is connected with Black sea and is brackish in its western part. The freshwater part fed by springs is separated from the brackish one by a dam. It is divided into several ponds used for cattle and sheep watering. Submerged and water macrophytes are well developed.

Fig. 9: Lake Donuzlav (freshwater part is main location of dragonflies breeding) Chornomorske district.

An additional example is the pond in the surroundings of the village of Pozharske (fig. 10) created on the river Bulganak. This pond is used as a range for poultry as well as for fishing. Crayfish also occur here. In total 26 species were recorded in this landscape (tab. 2).

Fig. 10: Pond on the river Bulganak at env. of vill. Pozharske (Simpheropol' district).

## Conclusions

The Crimea peninsula includes semiarid steppes, mountain forests and meadows as well as subtropical sea coast landscapes. One can, therefore, expect a number of different dragonfly assemblages. However, agriculture and tourism have a strong impact on the environment. There is also a high pressure on water resources and the water quality of the rivers is quite poor. Climate change with increasing air temperatures may additionally exacerbate the situation of water-bodies and their fauna. These general observations on the environmental impact were supported by observations made during field work on the following specific threats for Odonata habitats on the Crimea peninsula:

- Eutrophication and water pollution by fertilizers and pesticides from agriculture (e.g. locality 11, 17, 24, 44, 64, 72, 73, 74)
- Contamination and dangerous waste disposal from industrial activities (e.g. locality 37, 38, 68)
- Recreation activities by tourists (e.g. locality 3, 29, 32, 47, 79, 93, 95, 102, 109).

As a result of these habitat threats the following Odonata species on Crimea are likely to be under particular threat from the following activities:

- Land use intensification because of tourism: *Lestes virens*, *L. macrostigma*, *L. parvidens*, *Aeshna grandis*, *A. viridis*.
- Eutrophication by agriculture: *Erythromma lindenii*, *Coenagrion ornatum*, *Onychogomphus forcipatus*.
- Changing/decreasing water tables: *Sympetrum danae*, *S. depressiusculum*, *S. pedemontanum*.
- Changing climate: all species with a more northern and eurosiberian distribution such as *Calopteryx virgo*, *Nehalennia speciosa*, *Coenagrion lunulatum*, *C. armatum*, *Epitheca bimaculata*.

## Acknowledgements

Authors are deeply grateful to international dragonfly fund for financial support of project.
