Data Processing [?](#)

Figure S1. View of the dialog box to search ontologies for controlled terms to describe aspects of an experiment or sample during submission. If the terms currently in the CEDAR database are not adequate, this dialog can be used to search through relevant ontologies associated with this specific field. CEDAR interacts with the ontology lookup service web service to search the relevant ontologies. The figure shows an example search of the NCBITaxon ontology for a specific species. If neither the database nor the relevant ontology contains a suitable term, a custom term can be added instead.
