The CFS Working Paper Series

presents ongoing research on selected topics in the fields of money, banking and finance. The papers are circulated to encourage discussion and comment. Any opinions expressed in CFS Working Papers are those of the author(s) and not of the CFS.

The Center for Financial Studies, located in Goethe University Frankfurt's House of Finance, conducts independent and internationally oriented research in important areas of Finance. It serves as a forum for dialogue between academia, policy-making institutions and the financial industry. It offers a platform for top-level fundamental research as well as applied research relevant for the financial sector in Europe. CFS is funded by the non-profit-organization Gesellschaft für Kapitalmarktforschung e.V. (GfK). Established in 1967 and closely affiliated with the University of Frankfurt, it provides a strong link between the financial community and academia. GfK members comprise major players in Germany's financial industry. The funding institutions do not give prior review to CFS publications, nor do they necessarily share the views expressed therein.

THE BROKEN BUCK STOPS HERE: EMBRACING SPONSOR SUPPORT IN MONEY MARKET FUND REFORM

Jill E. Fisch[*]

Abstract

Since the 2008 financial crisis, in which the Reserve Primary Fund "broke the buck," money market funds (MMFs) have been the subject of ongoing policy debate. Many commentators view MMFs as a key contributor to the crisis because widespread redemption demands during the days following the Lehman bankruptcy contributed to a freeze in the credit markets. In response, MMFs were deemed a component of the nefarious shadow banking industry and targeted for regulatory reform. The Securities and Exchange Commission's (SEC) misguided 2014 reforms responded by potentially exacerbating MMF fragility while potentially crippling large segments of the MMF industry.

Determining the appropriate approach to MMF reform has been difficult. Banks regulators supported requiring MMFs to trade at a floating net asset value (NAV) rather than a stable $1 share price. By definition, a floating NAV prevents MMFs from breaking the buck but is unlikely to eliminate the risk of large redemptions in a time of crisis. Other reform proposals have similar shortcomings. More fundamentally, the SEC's reforms may substantially reduce the utility of MMFs for many investors, which could, in turn, affect the availability of short term credit.

The shape of MMF reform has been influenced by a turf war among regulators as the SEC has battled with bank regulators both about the need for additional reforms and about the structure and timing of those reforms. Bank regulators have been influential in shaping the

terms of the debate by using banking rhetoric to frame the narrative of MMF fragility. This rhetoric masks a critical difference between banks and MMFs – asset segregation. Unlike banks, MMF sponsors have assets and operations that are separate from the assets of the MMF itself. This difference has caused the SEC to mistake sponsor support as a weakness rather than a key stability-enhancing feature. As a result, the SEC mistakenly adopted reforms that burden sponsor support instead of encouraging it.

As this article explains, required sponsor support offers a novel and simple regulatory solution to MMF fragility. Accordingly this article proposes that the SEC require MMF sponsors explicitly to guarantee the $1 share price. Taking sponsor support out of the shadows embraces rather than ignores the advantage that MMFs offer over banks through asset partitioning. At the same time, sponsor support harnesses market discipline as a constraint against MMF risk-taking and moral hazard.

Introduction

On September 16, 2008, the Reserve Primary Fund (the "Reserve Fund") broke the buck. The Reserve Fund, which held $785 million in Lehman Brothers debt, reduced its NAV[1] to 97 cents per share after the announcement of Lehman's bankruptcy filing caused the board to write down the value of the Lehman debt to zero.[2]

By September 16, 2008, the financial markets had already experienced substantial turbulence. Contributing to this turbulence were the bailout of Bear Stearns, the federal government's decision to put Fannie Mae and Freddie Mac into conservatorship, the Federal Reserve Bank's announcement of its decision to support AIG financially,[3] and the Lehman bankruptcy. Many MMF sponsors provided support to their MMFs to maintain the stable $1 share price by taking actions like buying

[1] NAV is the net asset value of a share of an MMF. See Jill Fisch & Eric Roiter, A Floating NAV for Money Market Funds: Fix or Fantasy?, 2012 U. Ill. L. Rev. 1003, 1008 (2012) (explaining calculation of NAV).

[2] Diya Gullapalli, Shefali Anand & Daisy Maxey, Money Fund, Hurt by Debt Tied to Lehman, Breaks the Buck, Wall St. J., Sept. 17, 2008, http://online.wsj.com/article/SB122160102128644897.html.

[3] The Federal Reserve issued a press release announcing this support at 9:00 pm on September 16th. Federal Reserve Press Release dated Sept. 16, 2008, http://www.federalreserve.gov/newsevents/press/other/20080916a.htm

debt holdings that had declined in market value.[4] Nonetheless, over the next several days, investors redeemed substantial amounts of money from MMFs.[5] According to the SEC, during the week of September 15, 2008 ("Lehman week"), investors withdrew $300 billion from prime MMFs.[6]

Widespread redemptions put more MMFs at risk of breaking the buck, but they also had a broader effect. Fund managers began to retain increased quantities of cash in their portfolios rather than continuing to invest, to provide a liquidity cushion to meet the demands of further redemptions.[7] Because MMFs form a substantial proportion of the buyers of commercial paper, repurchase agreements and other types of short term debt instruments, the withdrawal of capital reduced the availability of short term credit.[8] Tightening credit conditions caused businesses to reduce capital expenditures and lay off workers.[9]

Although the story of the Reserve Fund is over in that its assets have been liquidated and distributed to investors,[10] the effect lingered on. Policymakers viewed the fragility of MMFs as a substantial cause of the financial crisis.[11] Deemed a component of the nefarious shadow banking

industry,[12] MMFs were targeted for regulatory reform.[13] The central goal of reform proposals was to prevent MMFs from breaking the buck in the future,[14] because of the concern that breaking the buck would generate "runs." Regulators warned that these runs would produce contagion across MMFs generally and lead to systemic effects on the economy.[15] As Treasury Secretary Timothy Geithner explained:

> The financial crisis of 2007-2008 demonstrated that MMFs are subject to runs and can be a source of financial instability with serious implications for broader financial markets and the economy.[16]

The dominant reform proposal was to require that MMFs move to a floating NAV rather than a stable $1 share price, which, by definition, would prevent funds from breaking the buck.[17] Although bank regulators favored a floating NAV, members of the SEC were skeptical.

"funds were at the heart of the 2008 financial crisis."). Arthur Levitt was Chair of the SEC from 1993 to 2000.

[17] See 2013 Rule Proposal, supra note __ at 47 (describing proposal to require floating NAV).

In 2012, then-Chair Mary Schapiro attempted to adopt a rule requiring a floating NAV for all MMFs but was unable to persuade fellow Commissioners to support the reform.[18] Bank regulators increased their pressure subsequent to Schapiro's announcement and, on July 23, 2014, the SEC adopted a compromise rule, requiring a floating NAV only for institutional prime MMFs and implementing a variety of additional regulatory requirements for other MMFs, including a complex structure of fees and gates for retail MMFs. [19]

Throughout the six year debate, proposals for MMF reform have been widely unsatisfactory, and the SEC's new rule is no exception.[20] The required floating NAV may eliminate the viability of prime MMFs as an investment option and reduce the size of the short term credit markets in the future.[21] At the same time, there are compelling reasons to question whether retail funds could ever employ fees and gates without signing their own death warrants. Neither aspect of the reform responds in a meaningful manner to the problem of large redemptions in a time of financial distress.

The debate over money market reform goes further than the issue of how best to regulate a particular financial product. Situated at the crossroads of two powerful interest groups – banks and the mutual fund industry, MMF regulation illustrates a fault line in financial market regulation.[22] The battle over MMF reform pitted the banking industry

[22] The conflict also highlighted the ambiguous role of the newest financial regulator, the Financial Services Oversight Commission (the "FSOC"), in overseeing policy decisions by other financial regulators. See Daniel M Gallagher, Commissioner, U.S. Securities & Exchange Commission, Remarks at "The SEC Speaks in 2013", Feb. 22, 2013,

and its regulators against the SEC and the powerful Investment Company Institute.[23] Both sides were cognizant of the stakes involved in the future of a $3 trillion industry.[24] In the end, reform was possible only by the SEC's vast concession to allow the operation of retail MMFs to proceed largely unchanged, a concession that divided the mutual fund industry and won the SEC the support of the large retail-oriented sponsors including Schwab, Fidelity and Vanguard.[25]

Politics has pressured the SEC to take a flawed approach to MMF reform and to overlook a simple and superior regulatory solution. The rhetoric that describes MMFs as shadow banks and analogizes MMF redemptions to bank runs has obscured a critical structural difference between MMFs and bank accounts -- the separation of MMF assets from the finances and operations of the MMF's sponsor.[26] The MMF sponsor is not a parent or affiliate of the fund but a separate legal entity that provides services to the MMF pursuant to an advisory contract. Unlike banks, MMF sponsors are legally independent from MMFs, and their assets are separate from the securities in the MMF's portfolio.[27]

This separation between the MMF and its sponsor allows sponsor support to mitigate fluctuations in the value of an MMF's holdings and reduce the demand for redemption. Historically, sponsors have regularly provided financial support to prevent MMFs from breaking the buck,

[23] See, e.g., Levitt, supra note __ (stating that the SEC would have adopted structural reforms, but for industry interference).

[24] See 2014 Final Rule, supra note __ at 7 (reporting that, as of Feb. 28, 2014, MMFs collectively held over $3 trillion in assets).

[25] See Trevor Hunnicutt, SEC passes money fund rules – but wait, the buck could still break, Investment News, July 23, 2014, http://www.investmentnews.com/article/20140723/FREE/140729961/sec-passes-money-fund-rules-but-wait-the-buck-could-still-break (explaining that retail funds sold by firms such as Schwab, Fidelity and Vanguard will be exempt from the "main thrust" of the MMF reforms). The big loser in the compromise was Federated, the third largest MMF sponsor, which offers primarily institutional prime MMFs. Christopher Condon, Federated Most Vulnerable to SEC Money Fund Proposals, Bloomberg, Apr. 29, 2014, http://www.bloomberg.com/news/2014-04-29/federated-most-vulnerable-to-sec-money-fund-proposals.html.

[26] See, e.g., John Morley, The Separation of Funds and Managers: A Theory of Investment Fund Structure and Regulation, 123 Yale L.J. 1228 (2014) (explaining that the separation of investment assets and management assets is a distinctive feature of investment funds).

[27] Id.

despite the fact that they have no legal obligation to do so. Ironically, although regulators have viewed sponsor support with suspicion, a suspicion that is reflected in elements of the SEC's 2014 rule, it is an unexplored mechanism for enhancing MMF stability.

This Article argues for a dramatic shift in the regulation of MMFs. Rather than trying to make them operate more like banks by requiring capital buffers or sacrificing their viability by mandating a floating NAV, reform should formalize the role of sponsor support. Specifically, this Article proposes that regulators require MMF sponsors to stand behind their MMFs by committing to maintain the stable $1 net asset value. In a time of crisis, sponsors could provide such support by buying distressed assets from the fund, reducing management fees or subsidizing the fund with other business revenues. Sponsors could also privately insure their obligation.

Mandatory sponsor support offers several advantages over the 2014 rule and other reform proposals. It would both prevent MMFs from breaking the buck and harness market discipline to provide fund sponsors with appropriate incentives to limit risk-taking. Required sponsor support would eliminate market uncertainty about the extent to which a sponsor would voluntarily support its fund in a time of crisis – uncertainty that contributed to the turmoil surrounding the events at the Reserve Primary Fund. Sponsor support would substitute sponsor financial stability for the need for investors to monitor the quality of MMF assets directly, a task that the SEC has highlighted with its new and unworkable disclosure requirements. Most importantly, sponsor support would address MMF fragility while allowing MMFs to continue to meet investor demand for a liquid stable value cash management option.

The Article begins in Part I by briefly outlining the core attributes of MMFs, the events leading up to the Reserve Fund's breaking the buck, and the SEC's initial response – the 2010 MMF reforms. Part II describes the case for further regulatory reform and the flawed and controversial reform effort. Part III evaluates the SEC's 2014 rule. Part IV briefly explains two other regulatory approaches – a liquidity facility and required capital buffers. In Part V, the Article introduces its proposed alternative – mandatory sponsor support for a $1 NAV. Part VI identifies and responds to possible objections to the proposal.

I. Background

A. The Structure of MMFs

MMFs are a type of mutual fund and are regulated by the SEC under the Investment Company Act of 1940.[28] MMFs offer investors access to a pool of short term debt securities, often called money market securities.[29] Money market securities include government securities, repurchase agreements, certificates of deposit and commercial paper.[30] The critical feature that distinguishes MMFs from other short term investment funds is that, while the price of most mutual funds fluctuates on a daily basis in accordance with the funds' net asset value,[31] MMF shares are bought and sold at a stable $1/share price.[32] The $1 share price facilitates the role of MMFs as a cash management tool because the frequent investment and redemption of MMF shares does not result in a gain or loss for tax or accounting purposes.[33] As a result, MMFs offer investors both liquidity and stability. Importantly, unlike bank deposits, MMFs are not protected by federal insurance.[34]

Several types of MMFs exist, including those that invest in government securities (government MMFs), those that invest in municipal securities in order to generate tax-exempt income (tax exempt MMFs), and those that invest primarily in commercial paper and other

[30] Id.
[31] Mutual funds are priced as of the 4:00 close of their trading day; orders to sell or purchase fund shares must be submitted prior to the 4:00 close. Fisch & Roiter, supra note __ at 1009.
[32] The price that MMFs pay for authorization to trade at $1 per share is compliance with SEC rule 2a-7 which imposes a variety of constraints on the safety and liquidity of the assets in which MMFs are permitted to invest. 2013 Rule Proposal, supra note __ at 8-9. See also Fisch, supra note __ at 1975 (describing Rule 2a-7); 2014 Final Rule at 133 (explaining that the decision to allow MMFs to trade at a stable share price was a regulatory concession that the SEC is now, in the case of prime institutional MMFs, eliminating).
[33] See 2013 Rule Proposal at 12 (describing "tax and administrative convenience" of stable $1 share price).
[34] See Rule 2a-7(c)(2)(i) (requiring MMFs explicitly to disclose that investments are not protected by FDIC insurance).

non-government securities (prime MMMs). Some MMFs are held by institutional investors; others are largely retail funds.

Because MMFs provide same day liquidity, investors use MMFs primarily for cash management.[35] Retail investors use MMFs as an alternative to traditional bank deposit and checking accounts and as a sweep investment to facilitate trades in brokerage accounts.[36] Institutional investors use MMFs as a holding vehicle for cash and to manage operating expenditures such as payroll.[37] MMFs have traditionally offered investors higher returns and greater diversification than traditional bank accounts, as well as features like check-writing and debit card access.[38]

MMFs are mutual funds, not bank accounts. Each MMF is organized as a discrete legal entity – a corporation or business trust.[39] The fund's sponsor manages the fund's assets pursuant to an advisory contract.[40] When investors purchase shares in an MMF, the sponsor uses those funds to purchase short term debt securities. As with other mutual fund investors, an MMF shareholder has an equity interest, he or she owns a pro rata percentage of the securities held by the MMF. As with other mutual funds, shares in an MMF are redeemable on a daily basis.[41] In addition, MMF assets are segregated from the assets of other funds sold by the sponsor as well as from the sponsor's own assets.[42] MMF sponsors vary – approximately half are traditional mutual fund companies such as Vanguard and Fidelity; approximately half are bank affiliates.[43]

MMFs are able to maintain a stable $1 share price for two reasons. First, SEC rules allow MMFs to engage in "penny rounding," meaning that so long as the NAV does not fall below .995 or above 1.0049, the fund's shares may trade at $1 per share.[44] Second, MMFs are managed in a manner that limits the difference between the funds' NAV and $1 per share. The investments of MMFs, unlike most mutual funds, are conservative securities that are typically held to maturity. MMFs rarely sell their portfolio holdings unless compelled to do so by redemption requests.[45] Indeed, the money market instruments in which MMFs invest are themselves rarely traded. As a result, while the value of the MMFs portfolio may fluctuate on a daily basis, the value of any particular asset will approach its face amount as the instrument nears maturity. Since 1982, SEC rules have reflected this fact by allowing MMFs to value their portfolio assets using amortized cost accounting rather than market price.[46]

If an MMF's share price drops below .995, it is required to price its shares at 99 cents (or less). This is described as "breaking the buck."[47] MMFs rarely break the buck because MMF sponsors have traditionally been willing to support the $1 share price.[48] Sponsor support is discretionary – indeed, current SEC rules do not permit sponsors to commit in advance to support a fund's share price.[49] Sponsor support may take the form of capital support agreements, letters

---

working paper dated April 2012, at 17, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1769025 ("How Safe?") (describing characteristics and extent of sponsors' non-MMF business)

[44] See 2014 Final Rule at 7-8 (explaining amortized cost valuation and penny rounding). In contrast, other mutual fund must calculate their price to the nearest 1/10 of 1%. Id.

[45] The infrequency with which MMFs trade is reflected in the fact that MMFs, unlike other mutual funds, are not required to disclose their turnover rate to investors. See Form N-1A ("A Fund that is a Money Market Fund may omit the portfolio turnover information required by this Item.").

[46] See Fisch & Roiter, supra note _, at 1014-15 (describing SEC acceptance of amortized cost accounting).

[47] In the course of history, two MMFs have broken the buck, the Reserve Primary Fund, in 2008, and the Community Bankers U.S. Government Fund, a small institutional fund, in 1994. See Fisch & Roiter, supra note __.

[48] See 2013 Rule Proposal at 23 (detailing frequency of sponsor support from 1994 to 2011).

[49] See tan infra. Rule 17a-9 permits discretionary sponsor support. 2013 Rule Proposal at 20, n. 41.

of credit, waiving management fees, or purchasing distressed assets from the MMF at amortized cost.[50] Sponsor support can prevent a fund's NAV from departing too far below $1 per share or provide a fund with sufficient liquidity to meet redemption requests without being forced to sell assets at distressed prices.

On the supply side, MMFs provide a major part of the market for short term debt securities. Historically, prime MMFs' assets have consisted largely of short term debt instruments issued by financial institutions, although their holdings of such assets have declined since 2008.[51] Before the financial crisis, MMFs were the primary buyers of commercial paper.[52] Although after the financial crisis, MMFs decreased their holdings of commercial paper in favor of safer assets such as Treasuries,[53] as of June 2012, MMFs held 43% of nonfinancial commercial paper and 33% of repurchase agreements.[54]

MMFs are also an important source of financing for state and local governments and government entities. In 2008 MMFs were the largest institutional holding of municipal bonds, second only to retail investors.[55] Since 2008, MMFs have reduced their holdings of municipal bonds dramatically, a shift that is largely due to a decline in interest rates.[56]

SEC Rule 2a-7 regulates both the quality and the maturity of MMF portfolio assets. The rule requires MMFs' investment portfolios to have a weighted average maturity of sixty days.[57] An MMF is required to invest at least 97% of its assets in first tier securities.[58] At least 10% of an MMF's assets must be in cash, US Treasury securities or securities that mature within one day (daily liquid assets)[59] and at least 30% must be in securities that mature within a week (weekly liquid assets).[60] Since the financial crisis, most MMFs have invested more conservatively than required by the rule. The average maturity for instruments held by prime MMFs in October 2012, for example, was 42 days.[61] As of June 2012, prime MMFs held 31% of their assets in daily liquid assets, and 46% in weekly liquid assets.[62]

B. The Reserve Primary Fund

In the early morning of September 15, 2008, Lehman Brothers filed for bankruptcy.[63] The Reserve Primary Fund held approximately 1.2% of its portfolio in short term Lehman debt, debt that, as of the date

[57] This requirement, which reflects a reduction from the prior WAM requirement of 90 days, was a component of the 2010 MMF reforms. See Money Market Fund Reform, Inv. Co. Act Rel. No. 29,132 (Feb. 23, 2010), http://www.sec.gov/rules/final/2010/ic-29132.pdf (2010 MMF Reforms).

[58] First tier securities are securities that have received the highest short-term debt rating from the NRSROs or have been determined by the fund's board to be of comparable quality. The rules further provide that an MMF cannot invest more than ½ of 1% of its assets in second tier securities issued by any single issuer and may not buy second tier securities that mature in more than 45 days (rather than the previous limit of 397 days). *See* rule 2a-7(c)(3)(ii) and (c)(4)(i)(C). Second tier securities are eligible securities that, if rated, have received other than the highest short-term term debt rating from the requisite NRSROs or, if unrated, have been determined by the fund's board of directors to be of comparable quality. *See* rule 2a-7(a)(24) (defining "second tier security");

[59] Rule 2a-7(c)(5)(ii).

[63] Lehman filed its bankruptcy petition at 1:45 am Monday morning. See Peg Brickley, Lehman Makes It Official in Overnight Chapter 11 Filing, Wall St. J., Sept. 15, 2008, http://blogs.wsj.com/wallstreetcrisis/2008/09/15/lehman-makes-it-official/

that Lehman filed for bankruptcy, was rated prime-1 by Moody's[64] – Moody's highest short term debt rating.[65] Moody's downgraded the Lehman debt on September 15, 2008, at which time the Reserve Fund received redemption requests of $25 billion, reflecting more than 40% of the fund's value. The next day the fund broke the buck and, following the announcement, suspended redemptions.[66] Investors eventually recovered more than 99 cents on the dollar but were required to wait 16 months to recover all their money.[67]

The Reserve Fund was not the only MMF to receive substantial redemption requests during Lehman week.[68] Moreover, the broader instability of financial institutions offered the prospect of a problem that extended well beyond the Lehman bonds. A widespread failure of financial firms would greatly increase the pressure on MMFs by multiplying the extent of their losses on financial firm debt instruments. As then-executive vice president of the Markets Group at the New York Office of the Federal Reserve William Dudley observed in the meeting of the Federal Reserve Board on Sept. 16, 2008, "The risk here, of course, is that, if AIG were to fail, money funds have even a broader exposure to them than to Lehman, and so breaking the buck on the money market funds is a real risk."[69]

[69] Statement of William Dudley, Manager, System Open Market Account, Transcript of Federal Reserve Meeting, Sept. 16, 2008, at 5. http://www.federalreserve.gov/monetarypolicy/files/FOMC20080916meeting.pdf.

The government responded to this concern by establishing a Treasury Department Temporary Guarantee Program for Money Market Funds and the Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility, created by the Federal Reserve Board. The Temporary Guarantee Program was designed to reduce redemption requests by assuring investors that they would not lose the value of money invested in MMFs.[70] Under the terms of the program, MMFs paid a premium in exchange for the federal government agreeing to guarantee the amortized cost value of their portfolios as of Sept. 19, 2008.[71] The guarantee only extended to money invested in the MMFs as of that date – new deposits into MMFs were not covered by the guarantee.[72] Federal Reserve Chairman Ben Bernanke explained that this limit was designed to prevent the guarantee from causing money to "run" from bank deposits into MMFs.[73] Participation in the program was voluntary, but virtually all MMFs chose to participate.[74] The federal

[70] See Press Release, Treasury Department, Treasury Announces Guaranty Program for Money Market Funds (Sept. 19, 2008), available at http://www.treas.gov/press/releases/hp1147.htm. The guaranty was funded by the $50 billion Exchange Stabilization Fund, but no MMF drew upon the Stabilization Fund, and the program expired on September 18, 2009. See Press Release, U.S. Department of the Treasury, Treasury Announces Expiration of Guarantee Program for Money Market Funds (Sept. 18, 2009), available at http://www.treas.gov/press/releases/tg293.htm. .

[71] The program required "money market funds with a net asset value per share greater than or equal to $0.9975 as of the close of business on September 19, 2008, to pay an upfront fee of 0.01 percent, 1 basis point, based on the number of shares outstanding on that date. Funds with net asset value per share of greater than or equal to $0.995 and below $0.9975 [were required] to pay an upfront fee of 0.015 percent." US Dept. of the Treasury, Press Release, Treasury Announces Temporary Guarantee Program for Money Market Funds, Sept. 29, 2008, http://www.treasury.gov/press-center/press-releases/Pages/hp1161.aspx.

[72] Id. The guarantee was originally scheduled to last for three months but was extended to just over a year in duration. See FINRA, Treasury's Guarantee Program for Money Market Mutual Funds: What You Should Know, http://www.finra.org/investors/protectyourself/investoralerts/mutualfunds/p117136.

[73] Transcript of Conference Call of the Federal Open Market Committee on September 29, 2008, at 8 (statement of Chairman Bernanke) http://www.federalreserve.gov/monetarypolicy/files/FOMC20080929confcall.pdf

government did not pay out any funds pursuant to the guarantee but received $1.2 billion in premiums.[75]

The Federal Reserve Board also created the Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility (AMLF) to provide a market for asset backed commercial paper.[76] The AMLF created this market indirectly by providing financing to US banks that purchased commercial paper from MMFs.[77] To facilitate these purchases, the Federal Reserve extended non-recourse credit to the purchasing banks at its primary credit rate.[78] Importantly, in order to obtain these terms, the banks had to purchase the commercial paper at amortized cost rather than market value.[79]

The AMLF had two distinct objectives.[80] First, it provided a source of liquidity for MMFs that were subject to redemption requests. Second, it provided price support to the commercial paper market by propping up the price at which commercial paper was traded. This avoided the need for MMFs to engage in distressed sales that would have reduced the value of the underlying short term credit instruments.[81]

The AMLF was quite successful. At its peak, it provided financing for approximately 22% of the asset backed commercial paper market in the United States.[82] The facility was used by 105 MMFs, which represented 42% of eligible prime MMFs.[83] Importantly, empirical research found that the AMLF reduced redemption requests

and outflows from MMFs, thus addressing the liquidity concern.[84] It also found that use of the AMLF helped reduce ABCP yields, meaning that that it was effective in preventing commercial paper from trading at distressed prices.[85]

An additional factor that limited the scope of the outflow is that redemption requests during Lehman week were concentrated primarily among institutional investors. As the SEC noted, fewer than 5% of retail funds experienced redemption requests of greater than 5% on each of September 17-19, 2008, compared to 22-30% of institutional funds.[86]

C. The SEC's 2010 MMF Reforms

The SEC responded to the Reserve Primary Fund situation and the broader turmoil in the MMF industry in January 2010 by amending Rule 2a-7 in an effort to make MMFs more resistant to the effects of adverse economic events in the future.[87] The reforms included requirements that MMF portfolios have higher investment quality, shorter maturities and greater liquidity.[88] There is little dispute that these reforms enhanced MMF stability.[89]

MMFs were also required by the rule to engage in periodic stress testing so as to determine how likely the fund was to break the buck in the event of adverse economic developments and/or heavy redemption requests.[90] As a component of this stress testing, MMFs were required to incorporate "know your customer" evaluations in their stress testing procedures, based on an understanding of their customers' liquidity needs.[91] Finally, MMFs were subjected to increased disclosure

[90] 2010 MMF Reforms, supra note __.
[91] See id. at n.261 ("As discussed above, amended rule 2a-7's new liquidity requirements require money market funds to evaluate their liquidity needs based on their shareholder base. . . . Money market funds should also incorporate this element in their stress testing procedures as appropriate.").

requirements,[92] including a requirement that MMFs disclose their portfolio holdings both publicly and to the SEC.[93]

A subtle[94] but potentially significant component of the 2010 reforms was the addition of a requirement that MMFs periodically calculate a "shadow NAV" reflecting the value of the MMF portfolio using a market-based valuation approach rather than amortized cost.[95] As a result of the 2010 amendments, MMF boards of directors must establish written procedures for the calculation of the shadow NAV, periodically review deviations between the shadow NAV and the amortized cost valuation and, promptly consider whether any action should be taken if the deviation exceeds ½ of 1 percent – the amount of deviation that could potentially require a fund to break the buck.[96] As we will see, the concept of a shadow NAV is a critical component of further policy reforms, including the 2014 rule.

II. The Case for Further Regulatory Reform

A. Concern that the 2010 Reforms were not Enough

When it adopted the 2010 rule changes, the SEC noted that more fundamental changes to MMFs might be needed. Chair Mary Schapiro identified several possible regulatory alternatives, including most prominently a requirement that MMFs shift to a floating NAV rather than trading at a stable $1 share price.[97] Schapiro stated that, although the various alternatives remained under consideration and further study,

---

[92] See ICI Research Perspective, supra note __, at 4 (explaining how this increased transparency enabled the market to monitor MMF's exposures during 2011).

[93] 2010 MMF Reforms, supra note __. The 2010 reforms contained several additional components, including a formalized procedure permitting fund affiliates to purchase distressed assets from the fund – a key mechanism for sponsor support – and a rule permitting MMFs to suspend redemptions in order to conduct an orderly liquidation. See Fisch & Roiter, supra note __ at 1024.

[94] For example, in its 2013 rule proposal, the SEC summarizes the 2010 regulatory reforms, but does not describe the shadow pricing requirements. See 2013 Rule Proposal at 35-36.

[95] Rule 2a-7(c)(8)(ii)(A).

[96] See 2010 MMF Reforms, supra note __.

[97] Speech by SEC Chairman: Statement on Money Market Funds Before the Open Commission Meeting, Jan. 27, 2010, https://www.sec.gov/news/speech/2010/spch012710mls-mmf.htm.

she was "committed to continuing to move forward with reforming the money market fund industry."[98]

At the same time that the SEC was adopting the 2010 MMF reforms, the Treasury Department was developing a package of financial regulatory reforms designed to address the conditions that, in its view, contributed to the financial crisis.[99] In June 2009, the Treasury Department released Financial Regulatory Reform: A New Foundation Report (the "Treasury Department Report").[100] The Treasury Department Report contained reforms aimed at meeting five main objectives, one of which was promoting the "Robust Supervision and Regulation of Financial Firms."[101] In achieving that objective, the Treasury proposed the creation of the Financial Stability Oversight Council (FSOC).[102] Congress responded to this suggestion, creating the FSOC as part of the Dodd-Frank Consumer Protection Act in 2010.[103]

Treasury also stated that the SEC should move forward with its plans to strengthen the regulation of MMFs[104] and that the "President's Working Group on Financial Markets should prepare a report assessing

[103] See Dodd-Frank Wall Street Reform and Consumer Protection Act, Pub. L. No. 111-203, § 111- 12, 124 Stat. 1376 (2010) (codified as amended in scattered sections of 12 U.S.C.). The FSOC consists of 10 voting members including the Secretary of the Treasury, the Chairman of the Board of Governors of the Federal Reserve, the Comptroller of the Currency and the heads of various federal agencies including the SEC and CFTC, as well as 5 non-voting members including an independent insurance expert, and representatives of state regulators. U.S. Dept. of the Treasury, Financial Stability Oversight Council, Who is on the Council?, http://www.treasury.gov/initiatives/fsoc/about/council/Pages/default.aspx.

[104] The Treasury Department Report was fairly specific about the reforms that the Treasury Department recommended the SEC adopt. See Treasury Department Report, supra note __ at 38. These reforms had already been described in the SEC's proposed rulemaking, which had been released for public comment at the time of the Report's release. See Money Market Fund Reform, Investment Company Act Release No. 28,807, 74 Fed. Reg. 32,688, 32,692 (proposed July 9, 2009) [hereinafter MMF Proposing Release] (to be codified at 17 C.F.R. pts. 271, 274).

whether more fundamental changes are necessary to further reduce the MMF industry's susceptibility to runs, such as eliminating the ability of a MMF to use a stable net asset value or requiring MMFs to obtain access to reliable emergency liquidity facilities from private sources"[105]

Following Treasury's direction,[106] the President's Working Group on Financial Markets (the "PWG")[107] undertook a study of possible additional MMF reforms and published a report on reform options in October 2010 (the "PWG Report).[108] The PWG Report identified and discussed eight policy options ranging from the elimination of a stable NAV to regulating MMFs as special purpose banks and subjecting them to bank regulation and oversight.[109] The Report devoted considerable attention to justifying the need for additional reform efforts, primary by reiterating the fact that, despite the SEC's rule changes, MMFs remained vulnerable to runs and by highlighting the destabilizing effort of runs on the economy.[110]

The SEC then began to develop an additional rulemaking proposal.[111] According to Chairman Schapiro, the two alternatives under

---

[106] Report of the President's Working Group on Financial Markets, Money Market Fund Reform Options, 1 (Oct. 2010) ("PWG Report"), available at http://www.treasury.gov/press-center/press-releases/Documents/10.21%20PWG%20Report%20Final.pdf ("This report by the PWG responds to Treasury's call").

[107] The members of the PWG included the Secretary of the Treasury Department (as chairman of the PWG), the Chairman of the Board of Governors of the Federal Reserve System, the Chairman of the SEC, and the Chairman of the Commodity Futures Trading Commission. Id. at 1, n.1.

[108] Id..

[109] See id. at 4-6 (describing eight policy options).

[110] Id. at 8-12. The Report also discussed possible means of implementing the reform alternatives, but it did not recommend any specific reform. Id. at 18-35.

[111] Toward this end, the SEC issued a request for comment on the PWG Report. President's Working Group Report on Money Market Fund Reform, Investment Company Act Release No. 29497 (Nov. 3, 2010) [75 FR 68636 (Nov. 8, 2010)] , http://www.sec.gov/rules/other/2010/ic-29497.pdf It also hosted a Roundtable on Money Market Funds and Systematic Risk (the 2011 Roundtable). See U.S. Securities and Exchange Commission, *Roundtable on Money Market Funds and Systemic Risk*, unofficial transcript (May 10, 2011), *available at* http://www.sec.gov/spotlight/mmf-risk/mmf-risk-transcript-051011.htm ("Roundtable Transcript") The main regulatory alternatives discussed at the Roundtable were requiring that MMFs convert to a floating NAV, subjecting MMFs to bank-like regulation in exchange for the provision of outside liquidity support, or mandating that MMFs maintain some type of capital buffer. See Joan Ohlbaum Swirsky, Fund Alert, June 2011, SEC Roundtable Discussion Highlights Different Views of Money Market Fund Reform ,

consideration were a floating NAV or requiring capital buffers.[112] Commissioner Schapiro indicated that she supported one or both of these reforms,[113] and that she "consider[ed] the structural reform of money markets one of the pieces of unfinished business from the financial crisis."[114]

At the time, other members of the Commission disagreed about the desirability of going forward with the staff's proposal. Commissioner Aguilar issued a public statement raising concern about the accuracy of the information upon which the staff proposal had relied.[115] He also argued that the SEC should not regulate MMFs further without more broadly studying the cash management industry.[116] Commissioners Gallagher and Paredes stated that they were not convinced that the Commission's alternatives would "achieve the goal of stemming a run on money market funds, particularly during a period of widespread financial crisis"[117] The dissenting Commissioners also argued that the case had not been made for reform. They noted that the 2010 reforms had not been shown to be ineffective.[118] Furthermore, the Chairman's proposal would, in their view, compromise the functioning of MMFs, inflicting harm both on investors and on those who obtain short term funding from

[117]. See Statement of Commissioners Gallagher and Paredes, supra note __.

[118] See id. (noting that "the empirical evidence we have so far, such as the performance of money market funds during the ongoing Eurozone crisis and the U.S. debt ceiling impasse and downgrade in 2011, suggests just the opposite — that money market funds can meet substantial redemption requests, in large part, we have heard, because of the 2010 reforms").

MMFs.[119] In light of the lack of agreement among the Commissioners, on Aug. 22, 2012, Chairman Schapiro announced that the Commission would not, at that time, go forward with the staff proposal.[120]

To address the concerns expressed by Commissioners Aguilar, Gallagher and Paredes, the SEC Division of Risk, Strategy, and Financial Innovation undertook to study and report on three questions - the causes of the high level of MMF redemptions in September 2008, the efficacy of the 2010 MMF reforms, and the potential impact of additional reforms on investor demand for money market funds and alternative investment vehicles.[121] The SEC Staff Report, which was released on Nov. 30, 2012, presented a variety of data responsive to all three questions.[122] The staff concluded that the 2010 reforms had made MMFs "more resilient now to both portfolio losses and investor redemptions than they were in 2008."[123] Nonetheless, the Report concluded, through a series of simulations, that the reforms would not have been sufficient to prevent the Reserve Primary Fund from breaking the buck in 2008.[124]

The key empirical finding of the Report was largely a foregone conclusion because the empirical methodology sought to determine whether a fund could avoid breaking the buck if it sustained losses, as the Reserve Fund did, of more than 1%. Unsurprisingly then, the report concluded that "The rate at which funds break the buck approaches 100 percent for capital losses that exceed 1 percent regardless of whether there are either redemption requests or WLA requirements."[125] By definition, a fund that suffers a 1% loss will have an NAV of 99 cents and will break the buck in the absence of an outside source of funding such as sponsor support. The staff's complex simulations were

---

[119] See id. ("we are concerned that the Chairman's proposal would, at a minimum, severely compromise the utility and functioning of money market funds, which would inflict harm on retail and institutional investors who have come to rely on money market funds for investing and as a means of cash management and on states, municipalities, and businesses that borrow from money market funds").

[120] Schapiro, supra note __.

[121] See SEC Staff Report, supra note __.

[125] Id.

unnecessary to establish this point.[126] The SEC subsequently concluded from these findings that the 2010 reforms were not "sufficient."[127]

When the SEC announced that a majority of the Commissioners did not support further MMF reforms,[128] Treasury Secretary Timothy Geithner urged the FSOC (which he chaired) to become involved.[129] At his prompting, the FSOC took the unprecedented step of releasing for public comment its own MMF reform recommendations.[130] The FSOC described its proposal as pursuant to its authority under section 120 of Dodd-Frank,[131] to "provide for more stringent regulation of such financial activity or practice by issuing recommendations to a primary financial regulatory agency to apply new or heightened standards or safeguards."[132] Significantly, this was the first time the FSOC was using its authority under Dodd-Frank to issue recommendations to another regulatory agency.[133]

The FSOC proposal consisted of three options, which it recommended the SEC implement individually or in combination.[134] The options, which bore a strong resemblance to those that the SEC had

considered and tabled, were 1) requiring MMFs to switch from a fixed to a floating NAV, 2) providing for a NAV capital buffer of up to 1%, supplied by a MMF sponsor together with a required minimum balance at risk for MMF investors, or 3) requiring a risk-based capital buffer of up to 3%, which could be combined with other risk-reducing measures.[135] Although commentators criticized the FSOC's actions for several reasons,[136] the recommendations had the intended effect of pressuring the SEC, in 2013, to release a rule proposing substantial structural reforms to MMFs.[137] The SEC subsequently adopted a modified version of this proposed rule, which will be discussed in Part III.

B. The Case for MMF Vulnerability

The case for MMF reform was based on a simple logic. The structural characteristics of MMFs make them vulnerable to runs.[138] Runs have a destabilizing effect on the economy.[139] Reform is therefore necessary to reduce or eliminate the risk of future runs.[140] As the PWG

---

[135] The FSOC proposal also requested the SEC to increase the minimum weekly liquidity requirements for MMFs from 30% to 40%.

[136] See, e.g., Keen, supra note __; Gallagher, "The SEC Speaks", supra note __ (describing FSOC's involvement in the effort to regulate MMFs as a threat to the political independence of the Commission); Sean Foley, Money Market Fund Reform & The Financial Stability Oversight Council, 32 Rev. Banking & Fin. L. 308 (2012-13) (questioning FSOC's use of its power under section 120).

[137] 2013 Rule Proposal, supra note _. See Sarah N. [138] See, e.g., FSOC Report at 2-3 (describing vulnerability of MMFs to runs); 2013 Rule Proposal, supra note __ at 14-31 (discussing five characteristics of MMFs that make them vulnerable to runs).

[139] See, e.g., Douglas W. Diamond & Philip H. Dybvig, Banking Theory, Deposit Insurance, and Bank Regulation, 59 J. BUS. 55, 64 (1986) (noting the social cost of bank runs and the resulting social value of preventing such runs).

[140] It is noteworthy that reform advocates justify regulation in terms of the need to eliminate the risk of runs, yet regulated banks experience runs with some frequency despite the use of capital buffers and federal insurance. In the days before IndyMac's failure, for example, depositors withdrew approximately $1.3 billion of the bank's deposits. Ari Levy & David Mildenberg, IndyMac Seized by U.S. Regulators; Schumer

Report explained, the primary objective of reform efforts should be "to materially reduce MMFs' susceptibility to runs."[141]

The term "run" is typically associated with banks, not mutual funds.[142] Banks hold money that depositors are entitled to withdraw on demand. Banks in turn lend that depositor money to borrowers. If many depositors demand their money at the same time, the bank will not be able to meet those demands and will experience a run.[143] In the classic bank run, those depositors who withdraw their funds the fastest are typically able to receive payment in full.[144] Those who "run slowest" will likely not receive full payment.[145] This is the so-called first mover advantage. The classic bank run presents an interesting causal question –

Blamed for Failure, Bloomberg, July 12, 2008, http://www.bloomberg.com/apps/news?pid=newsarchive&sid=aAYLeK3YAie4 On September 25, 2008, regulators shut down Washington Mutual, the largest savings and loan in the United States after customers had withdrawn over $16.7 billion in deposits in 10 days. The Downfall of Washington Mutual, Case Study, IBS Center for Management Research, http://www.icmrindia.org/casestudies/catalogue/Business%20Strategy/The%20Downfall%20of%20Washington%20Mutual.htm (last visited June 12, 2014). At the peak of the financial crisis, Wachovia was losing $1 billion in deposits per day, according to Federal Reserve Transcripts. See Rick Rothhacker, New transcripts: Teetering Wachovia was losing $1 billion in deposits a day, Charlotteobserver.com, Feb. 21, 2014, http://www.charlotteobserver.com/2014/02/21/4713938/new-transcripts-wachovia-was-losing.html. These large-scale redemptions are not limited to the financial crisis. When the government announced the expiration of the expanded government guarantee on bank deposits, in January 2013, depositors withdraw more than $114 billion from the twenty-five largest US banks. Nick Summers, Withdrawn: $114 Billion From Big U.S. Banks, Bloomberg Businessweek, Jan. 23, 2013, http://www.businessweek.com/articles/2013-01-23/missing-114-billion-from-u-dot-s-dot-banks.

[141] PWG Report, supra note __, at 2.

[142] Scholars generally agree that a key component of banks' susceptibility to runs is the maturity mismatch – the bank's assets are tied up in long term investments but the bank offers immediate liquidity to depositors. See, e.g., Diamond & Dybvig, supra note __ at 63; Zachary J. Gubler, Regulating in the Shadows: Systemic Moral Hazard and the Problem of the Twenty-First Century Bank Run, 63 Ala. L. Rev. 221, 232 (2014). Although MMFs technically present a maturity mismatch, it is far more limited because of the liquidity requirements imposed on MMF assets.

does the bank's financial distress trigger the run, or does the run cause the bank to fail?[146]

It is somewhat misleading to characterize heavy investor withdrawals from MMFs as a "run" warranting regulatory intervention.[147] Large and rapid movement of assets in the financial markets is common.[148] Rather, it seems that two attributes distinguish a run: panic trading and a first mover advantage. As Mary Schapiro put it, the redemptions from the Reserve Primary Fund and other MMFs during Lehman week were made by "panicked investors."[149] Panic trading implies a degree of irrationality – redemptions that are motivated by fear rather than genuine financial weakness.[150] In contrast, few commentators would characterize the widespread selling of Enron stock following the revelation of fraud as "panic selling."[151] Moreover, panic selling is not enough. When the stock market fell more than 1000 points in a single day, the result of a combination of the Greek debt crisis and technical problems, there was clearly widespread panic, but no one

---

[146] See id. at 568 (noting the issue and stating that "few bank failures appear to have been directly attributed to runs"). The article further notes that, in the pre-FDIC era, bank runs appeared to exert market discipline on bank management to minimize the risk associated with the bank's loan portfolio.

[147] Cf. Jeffrey N. Gordon & Christopher M. Gandia, Money Market Funds Run Risk: Will Floating Net Asset Value Fix the Problem?, 2014 Colum. Bus. L. Rev. 313, 315 (2014) (explaining that "withdrawals [during Lehman week] -- call it a run – amount[ing] to approximately $300 billion, approximately 15 percent of prime money market fund assets"). See also SEC Staff Report at 7 (noting that, although many individual MMFs experienced large net redemptions during "the Crisis Month", other funds gained assets during that period).

[150] See, e.g., Gillian Wee, Credit Swaps Show Fear, Not Reality, Executives Say, Bloomberg News, Oct. 3, 2008, http://www.bloomberg.com/apps/news?pid=20601109&sid=a.o1tHRJoe.k&refer=home (describing widening spreads in credit default swaps as based on a "a disconnect between the health of [issuer] balance sheets and investor behavior.").

[151] See, e.g., 401(k) investors sue Enron, CNN Money, Nov. 26, 2011, http://money.cnn.com/2001/11/26/401k/q_retire_enron_re/ (explaining how Enron employees lost money when they were prevented from selling Enron stock in their 401(k) plans after the company revealed damaging financial information).

described the sales of stock at free-falling prices as a run.[152] Runs are also characterized by a first mover advantage meaning that investor behavior itself causes a shortage or diminution in value of the remainder. This leads investors who would not otherwise have traded take action in order to avoid losing out entirely.[153] As a result, a run can induce scarcity by creating an abnormal level of investor demand.[154]

Importantly, the mechanics of a run operate differently for an MMF than a bank. A bank holds long term illiquid assets that cannot readily be converted to cash. As a result, if a substantial number of a bank's depositors all demand their money, it is impossible for the bank to repay them all. In contrast, MMFs hold high quality short term assets that typically can be liquidated at or near par value. As a result, under normal market conditions, heavy redemption requests would not create a first mover problem at an MMF; because the MMF could satisfy those redemption requests by liquidating assets.

The situation in 2008 was distinctive for three reasons. First, the bankruptcy of Lehman generated substantial losses in the value of MMF assets – the Reserve Fund held 1.2% of its assets in Lehman short term debt,[155] which it wrote down to zero on Sept. 16, 2008.[156] A loss of this

size in money market assets was highly unusual. Second, the economic climate during the fall of 2008 put many MMF investors under economic pressure and, in particular, liquidity pressure, because of the freeze-up in the short term credit markets.[157] This led MMF investors to withdraw funds to meet their cash flow needs. Third, non-Lehman events, including the bailout of Bear Stearns, the trouble at a number of other financial institutions including AIG, Wachovia and Citigroup, created widespread concern about the quality (and possible default) of money market debt from other issuers.[158] As a result, the MMFs that experienced a high volume of redemptions could not readily find buyers for their assets.

Both attributes of a run – panic trading and the first mover advantage – are relevant to the causal relationship between breaking the buck and a run on MMFs. First, the act of breaking the buck may increase the salience to the market of the fact that MMFs do not guarantee the $1 share price.[159] Once the risk of losing money becomes salient, investors may panic and withdraw their funds even from financially-stable MMFs. These withdrawals tax the MMF's liquidity, so that those who run slowly may be unable to withdraw their money.

In the case of an MMF, the situation is aggravated by a stable $1 NAV. So long as the MMF's NAV is sufficiently high, investors can redeem at the $1 share price. But as the MMF's NAV falls below $1/share, investors can continue to redeem at $1 even if their share of the fund's assets is somewhat less, as long as the NAV is above .995. These redemptions deplete the fund's assets because redeeming investors are receiving more than their entitlement – the difference between the fund's actual NAV and $1 -- and leaving even less for subsequent investors.

[157] See University of Mary Washington Blog, 2008 Financial Crisis and Global Recession, http://2008financialcrisis.umwblogs.org/analysis/the-credit-crisis/ (last visited June 2, 2014) (explaining that, as the "lending markets dried up . . . businesses found it difficult or impossible to obtain the credit required to function normally"

[158] See Investment Company Institute, Money Market Funds in 2012 Money Market Funds: What Really Happened in the 2008 Financial Crisis, Feb. 14, 2012, at 3, www.ici.org/pdf/12_mmf_2008.pdf, (describing factors contributing MMF redemptions).

[159] See, e.g., Patrick E. McCabe, The Cross Section of Money Market Fund Risks and Financial Crises, Fed. Reserve Bd. Working paper dated Sept. 12, 2010, at 1-2, avail. at http://www.federalreserve.gov/pubs/feds/2010/201051/201051pap.pdf (describing how the Reserve Fund's breaking the buck "underlined the importance of money fund risks for MMF investors").

These redemptions reflect the so-called arbitrage opportunity created by the $1 share price.[160] Importantly, absent heavy redemption pressure, these small deviations between $1 and the fund's actual NAV do not deplete fund assets because the effect is offset by simultaneous purchases that also take place at $1/share. As a result, the gap has a meaningful effect on fund value only in situations in which redemption demand significantly outpaces purchases. The Reserve case exemplified this effect; early redeemers got out at $1/share, and other investors received only 99 cents.[161]

The third problem with MMFs is contagion effect. On one reading, the fact that a single MMF breaks the buck alerts the market to the fact that MMFs do not guarantee the $1 share price and may lead investors in other MMFs to redeem even if the MMFs are independent financially.[162] In reality, the situation is more complex. MMFs all hold similar assets – a collection of short term debt instruments that include repurchase agreements, government securities, certificates of deposit (often from non-US banks) and commercial paper.[163] In recent years, a substantial percentage of these instruments have been issued by financial firms. If one MMF experiences financial distress, that distress may signal to the market a weakness in the assets held by many other MMFs. This correlation among portfolios, with a likely correlation in portfolio losses as well, produces a contagion effect.[164]

Because an investor has the right to redeem his or her MMF shares on demand, a heavy volume of redemptions places liquidity demands on MMFs which must be met by a sale of assets. The assets that are sold may present little or no default risk and were likely purchased with the expectation that they would be held until maturity. Nonetheless, the need to generate cash may generate fire sale prices even

---

[162] See, e.g., Gordon & Gandia, supra note __ at 327 n. 35.

[163] See id.

[164] Id. at 8, n. 32 ("The default of a money market security may led investors at other funds to run not because they are trying to arbitrage a gap but because want to avoid the realization of loss.").

for non-distressed assets because active secondary markets do not exist for money market securities. Correlated distress among many MMFs may also lead to market imbalances because the redemption requests create a large number of sellers amid a limited supply of buyers.

Once MMFs begin to sell assets at fire sale prices -- meaning prices less than par value -- the prices themselves generate a feedback effect in that they reduce the market price of the assets. When an MMF calculates its shadow NAV, it is required to mark its assets to market, and therefore incorporate the fire sale prices into its own NAV, even if it is not itself experiencing heavy redemptions. In turn, this decline in the shadow NAV may, once disclosed to investors, generate further redemptions.

The 2010 changes to Rule 2a-7 increased the risk of contagion by reducing the pool for permitted investments for MMFs – both increasing quality requirements and reducing the permitted maturity for MMF assets.[165] These changes caused each MMF's portfolio to become more like those of other MMFs. This in turn increases the correlation among MMF values, which magnifies the potential for contagion if one MMF experiences financial distress.

A run on MMFs may affect the overall economy, as was illustrated by the events that occurred during Lehman week. MMFs reduced their purchases of short term money market assets and, in an effort to meet potential redemption requests, increased their holdings of cash.[166] This reduced the availability of short term credit to businesses.[167]

III. The 2014 Reform

A. The SEC's 2014 MMF Rule

---

[165] See Fisch & Roiter, supra note __ (describing 2010 rule changes).

[166] See Mary Schapiro, Chairman US Securities & Change Commission, Testimony on "Perspectives on Money Market Mutual Fund Reforms", Before the Senate Committee on Banking, Housing, and Urban Affairs, June 21, 2012, avail. at http://www.sec.gov/News/Testimony/Detail/Testimony/1365171489510 (stating As that "During the last two weeks in September 2008, companies that issued short-term debt were largely shut out of the credit markets").

[167] Id.

On July 23, 2014, the SEC approved a final rule reforming MMF regulation by a divided 3-2 vote.[168] According to Chair Mary Jo White the new rule "will fundamentally change the way most money market funds operate."[169] Chair White explained that the reforms were intended to "significantly mitigate[] the risks of a run in money markets funds and [to] limit further contagion should a run occur."[170] The other commissioners were less sanguine.[171] Commissioner Aguilar, who voted in favor of the reform, described the rulemaking process as "one of the most flawed and controversial" ever undertaken by the SEC.[172]

The new rule requires prime institutional MMFs to implement a floating NAV, but it exempts retail and government funds from this requirement.[173] The rule authorizes boards of retail funds to implement fees and gates to discourage redemptions and provides that the power to use these tools is triggered by declines in fund liquidity.[174] Finally, the

---

[168] 2014 Final Rule, supra note __. See Sarah Lynch, Split SEC Adopts long-awaited money market fund reforms , Reuters, July 23, 2014, http://www.reuters.com/article/2014/07/23/sec-moneyfunds-vote-idUSL2N0PY1HP20140723. The rule reflected, in substantial part, reforms proposed in the SEC's rulemaking release issued on June 5, 2013. The 2013 release proposed a required floating NAV and fees and gates, stating that it might adopt either alternative or combination of the two. See 2013 Rule Proposal, supra note __ at 45.

[169] Chair Mary Jo White, Statement at SEC Open Meeting on Money Market Fund Reform, July 23, 2014, http://www.sec.gov/News/Speech/Detail/Speech/1370542343041

[170] Id.

[171] See Statement of Commissioner Kara M. Piwowar, at Open Meeting Regarding Money Market Fund Reform, July 23, 2014, http://www.sec.gov/News/Speech/Detail/Speech/1370542346300#.U9Zf4sJ0yiN (same).

[172] Jayne O'Donnell, SEC ends $1 a share for some money funds, USA Today, July 23, 2014, http://www.usatoday.com/story/money/markets/2014/07/23/sec-money-funds-rules/13033749/

[173] Retail funds are defined as funds that have "policies and procedures reasonably designed to limit all beneficial owners of the fund to natural persons." 2014 Final Rule at 208-09. This was a change from the proposed rule, which would have defined retail funds as those that did not allow shareholders to redeem more than $1 million in a single business day. 2013 Rule Proposal, supra note __ at 80.

[174] Unlike the proposed rule, in the final rule the fee and gate provisions are explicitly discretionary. A fund may impose such provisions, however, only when a fund's weekly liquid assets drop below 30% of its total assets. See 2014 Final Rule, supra

rule adopts a new and narrow definition of government MMFs,[175] and exempts such MMFs from both the floating NAV and fees and gates provisions.[176]

In addition to these structural changes,[177] the new rule includes important new disclosure requirements. MMFs are required to provide extensive additional information on their websites.[178] These requirements are supplemented by additional disclosures in the MMF prospectus and marketing materials,[179] in Form N-CR and in the statement of additional information (SAI).[180] The requirements include disclosure of the fund's current and historical market-based NAV calculated on a daily basis and rounded to four decimal points – the nearest one ten-thousandth of a cent.[181] Funds are required to disclose any past use of fees and gates[182] and historical sponsor support.[183] Funds must disclose current and historical information about the percentage of daily and weekly liquid assets in their portfolios as well as current and historical information about net shareholder inflows and outflows.[184]

---

note __ at 75-59. The 2010 amendments already required MMFs to maintain 30% of their portfolios in weekly liquid assets. See 2014 Final Rule at 10.

[175] See 2014 Final Rule at 206 ("We therefore are revising the definition of a government fund to require that such a fund invest at least 99.5% (up from 80% in the proposal) of its assets in cash, government securities, and/or repurchase agreements that are collateralized by cash or government securities.").

[176] Id. at 197-99 (explaining rationale for this exemption). The exemption for government MMFs preserves such funds as a cash management option for institutional investors. At the same time, it expands the number of funds that remain potentially vulnerable. As the SEC noted in the adopting release, government MMFs experienced substantial outflows in connection with the 2013 debt ceiling impasse. See 2014 Final Rule, supra note __ at 35. In addition, the capacity of government MMFs to absorb the quantity of assets that will potentially migrate from institutional prime funds is unclear. See Letter from Wells Fargo Advantage Funds to Elizabeth Murphy dated Apr. 23, 2014 at 5, http://www.sec.gov/comments/s7-03-13/s70313-340.pdf.

[177] The rule contained several additional features including heighted diversification requirements and stress testing. See 2014 Final Rule, supra note __ at 474-479.

[178] 2014 Final Rule at 327.

[179] Id. at 281.

[180] Id. at 365.

[181] Id. at 333. The requirement that funds calculate and disclose a current market-valued NAV is not limited to floating NAV funds. Id. at 338.

[182] Id. at 342.

[183] Id. at 347.

[184] Id. at 331.

An important but little-mentioned effect of the retail exemption from the floating NAV is increased market segmentation. In order to obtain the exemption for the floating NAV requirement, funds must limit their investors to individual persons. Retail investors currently benefit from the market discipline imposed by more sophisticated institutions.[185] This discipline includes limitations on risk-taking as well as competitive pressure on advisory fees.[186] Retail investors will lose this benefit if the funds in which they invest are limited to individual investors.

Cognizant of the potentially substantial effect that its rule would have on the viability of MMFs and the secondary effect on the short term credit markets, the SEC provided that compliance dates for both the fees and gates provision and the floating NAV would not occur until two years after the effective date of the rule,[187] although individual MMFs are permitted to implement them sooner.[188] In addition, the new disclosure requirements for historical data are prospective only.

B. Evaluating the Reforms

The 2014 rule adopts a combination of liquidity gates and fees and a floating NAV, the two regulatory approaches that had been the subject of the 2013 rule proposal. As indicated above, numerous commentators have weighed in on the feasibility and effectiveness of the SEC's 2013 proposals, and this article will not reexamine those comments in detail. Instead, the article will highlight several reasons

[185] See, e.g., Mark Perlow, Money Market Funds - Preserving Systemic Benefits, Minimizing Systemic Risks, 8 Berkeley Bus. L.J. 74. 88 (2011) (explaining that retail investors benefit from the due diligence of institutions even if those institutions invest in different share classes); but see Donald C. Langevoort, Private Litigation to Enforce Fiduciary Duties in Mutual Funds: Derivative Suits, Disinterested Directors and the Ideology of Investor Sovereignty, 83 Wash. U. L.Q. 1017, 1034 (2005) (noting that segmentation of the mutual fund market already limits market discipline over funds sold primarily to retail investors).

[186] Perlow, supra.

[187] The SEC itself acknowledged the concern that the regulatory change could itself trigger a run on MMFs. See id. at 195 ("We acknowledge, as discussed in the Proposing Release and as noted by some commenters, that a transition to a new regulatory regime could itself cause the type of heavy redemptions that the amendments, including the floating NAV reform, are designed to prevent").

[188] See 2014 Final Rule at 695-96. Various disclosure requirements are to be implemented sooner. See id.

why the rule is likely to ineffective in addressing the SEC's identified concerns about MMF fragility. In addition, the article will identify key problems with the new disclosure requirements that commentators have largely overlooked.

1. The Floating NAV

The central component of MMF reform proposals since the financial crisis has been requiring MMFs to float their NAV.[189] Under the new rule, the floating NAV requirement will only apply to a portion of existing MMFs, MMFs estimated by the SEC to hold almost $1.3 trillion in assets.[190] The costs of moving to a floating NAV are substantial.[191] The SEC's rule was predicated on accounting and tax concessions to simplify compliance issues created by a floating NAV[192] but it is nonetheless likely that many if not most institutional investors will be unwilling or unable to use a floating NAV product.[193] Because

News, Sept. 5, 2013, http://www.investmentnews.com/article/20130905/FREE/130909961# (identifying a floating NAV as a "victory" for the Fed and the Treasury); Letter from Sheila Bair to Elizabeth Murphy, Secretary US Securities & Exchange Commission dated Sept. 16, 2013, at 1 (stating that "The Stable NAV is the Cause of Money Market Funds' Structural Weakness").

[190] 2014 Final Rule at 582.

[191] See, e.g., Letter of Association for Financial Professionals, et al., to Mary Jo White dated July 2, 2013, avail. at http://www.sec.gov/comments/s7-03-13/s70313.shtml (describing accounting, tax and operational difficulties associated with a floating NAV and questioning whether the IRS can address these difficulties adequately).; Letter from F. William McNabb III to the Financial Stability Oversight Council on proposed recommendations regarding money market mutual fund reform dated Jan. 15, 2013, at 4, n. 12, https://institutional.vanguard.com/# (citing comment letters to the SEC and other regulators opposing a floating NAV); Institutional Cash Distributors, ICD Commentary, Operational and Accounting Issues with the Floating NAV and the Impact on Money Market Funds, July 2013, http://www.google.com/url?sa=t&rct=j&q=&esrc=s&frm=1&source=web&cd=2&cad=rja&uact=8&ved=0CCQQFjAB&url=http%3A%2F%2Fwww.sec.gov%2Fcomments%2Fs7-03-13%2Fs70313-40.pdf&ei=TD2XU4XCEemysAS1_IDQCQ&usg=AFQjCNFw_xKiypqySgEK0t1WZ2Yr5eKldQ&sig2=Vicciwi13V2NKi3dy7lKPQ (reviewing the complexities associated with a floating NAV MMF).

[192] Id. at 167-74.

[193] See, e.g., ICI 2011 letter at 5

each purchase and redemption in such a fund will occur at a different price, investors will face the prospect of negative yields on a regular basis, making funds unsuitable for many types of investors.[194] The SEC itself observes that it is impossible to estimate the extent to which the new rule will cause redemptions from institutional prime MMFs.[195] These redemptions may greatly reduce the availability of short term credit. In addition, institutional investors may shift their money into unregistered and potentially less stable investment alternatives.[196]

Thus the floating NAV requirement is likely to impose substantial costs. The question, for regulators, is whether a floating NAV generates corresponding benefits in terms of improving MMF stability.[197] As described above, advocates of a floating NAV argue that a stable NAV creates an incentive for early redemption. They argue that a floating NAV addresses this problem because redemptions always take place at the fund's true NAV.[198]

Even defenders of a floating NAV recognize, however, that a floating NAV reduces the first mover problem only to a limited degree. The SEC itself has noted the questionable efficacy of a floating NAV in reducing redemptions. As the SEC stated in the proposing release, "we expect that if a floating NAV had been in place, it could have mitigated some of the heavy redemptions that occurred due to the stable share price. Many factors, however, contributed to these heavy redemptions, and we recognize that a floating NAV requirement is a targeted reform that may not ameliorate all of those factors."[199]

First, on a theoretical level, it is important to recognize that the arbitrage opportunity created by a fixed NAV only exists during the period in which the fund's NAV has fallen below $1 but remains above 99.5 cents. Once the fund must, by virtue of penny rounding, reduce its trading price to 99 cents, the arbitrage opportunity is reversed because purchasing shareholders can obtain, at a cost of 99 cents per share, assets valued at more than that. Of course this effect is purely theoretical in that

only two MMFs in history have ever broken the buck, and no MMF has broken the buck but continued to operate as a going concern.

Second, existing empirical evidence does not support the claim that a floating NAV reduces redemption pressure in a time of crisis. In 2008, ultra short bond funds – the floating NAV alternative to MMFs – experienced comparable levels of redemptions to MMFs.[200] Indeed, the total assets invested in ultra-short bond funds declined by more than 60% from their peak in 2007 to the end of 2008.[201] Similarly Jeffrey Gordon and Christopher Gandia studied the difference in run rates in European MMFs during the financial crisis and found that none of the difference is explained by whether the NAV is fixed or floating.[202] A likely explanation for these findings is that the same economic factors that cause investors to redeem from an MMF cause them to redeem from a floating NAV fund. Critically, redemption requests create an analogous first mover advantage at floating rate funds as early redemptions can be satisfied through sales of the funds' most liquid assets.

The key factor contributing to redemption pressure is the stale pricing of mutual fund assets. When an investor redeems mutual fund shares, that redemption request must be honored on the basis of the current value of the MMF's portfolio, calculated as of the 4:00 close.[203] As noted above, however, the very fact of redemption may require a fund to sell assets at distressed prices, prices that will reduce the fund's NAV. Because the typical fund will maintain a certain liquidity level in order to meet redemption requests, the sale of those assets will generally not take place until after the redemption, and will therefore not be reflected in the

---

[200] See Comment Letter from Samuel Hanson et al. to Elizabeth Murphy, Secretary, US Securities & Exchange Commission dated Sept. 16, 2013 at 2 ("the recent financial crisis witnessed widespread runs on MMF-like cash management products with floating NAVs, including ultra-short bond funds in the US and variable NAV MMFs in Europe"). See also Fisch & Roiter, supra note __ at 1036.

[201] Paul Schott Stevens, ICI, ICI Testimony on Perspectives on Money Market Mutual Fund Reforms, June 21, 2012, at 28, http://www.google.com/url?sa=t&rct=j&q=&esrc=s&frm=1&source=web&cd=3&cad=rja&uact=8&ved=0CDcQFjAC&url=http%3A%2F%2Fwww.ici.org%2Fpdf%2F12_senate_pss_mmf_written.pdf&ei=WDorU-u5D_G80QGurIGgCA&usg=AFQjCNGN04t5iGHX1gxycgQ79Z_9jBa2oQ&sig2=M6Hivgj9JcoHf7lbcwjotQ

[203] See Rule 22c-1.

price at which the redemption occurs.[204] Thus, the claim that the investor in a floating rate fund exits at the fund's true value is misstated – in times of heavy redemption, all funds face a first mover advantage.

Floating the NAV is likely to increase this redemption pressure because investors will then, on a regular basis, expect share prices to decline in response to various economic factors.[205] In a stable value fund, MMF managers face pressure to maintain the $1 NAV, and, anticipating that, investors do not expect an arbitrage opportunity to materialize. That this pressure is effective is reflected in the empirical evidence demonstrating that the NAVs of MMFs fluctuated very little even in periods of substantial economic turmoil.[206] The historical stability of MMF's NAVs belies the claim that a stable NAV is misleading or the result of a regulatory dispensation.[207] MMFs trade at a $1 share price because their sponsors manage the portfolios in a way that minimizes any discrepancy between the underlying share value and a dollar.

To eliminate the first mover advantage, MMFs must do more than float their NAVs, they must satisfy redemption requests at fair value. For reasons described in further detail below, it is difficult to price MMF assets accurately.[208] As a result, the floating NAV will require MMFs to sell and redeem shares based on "noisy guesstimates of

---

[204] Moreover, in a time of crisis, the inability to value distressed assets makes the fund's calculation of NAV inherently unreliable. The court observed as much in the case of the Reserve Fund, finding that the Fund's calculation of NAV on Sept. 15 and 16, 2008 was unreliable, even after the Fund broke the buck. See SEC v. Reserve Management Co. et al., 09 Civ. 4346 (PGG), Memorandum Opinion at 24-25 (Nov. 25, 2009).

[205] See Piwowar Statement, supra note __ ("even if the NAV floats, sophisticated investors with significant money at stake that have a lower risk tolerance, the very investors at which the floating NAV is aimed, will still have incentive to redeem ahead of other investors").

[206] See, e.g., Investment Company Institute, Frequently Asked Questions about the Pricing of U.S. Money Market Funds, http://www.ici.org/mmfs/basics/faqs_pricing_mmfs (reporting that "Average per-share market values for prime money market funds . . . varied between $1.0020 and $0.9980 during the decade from 2000 to 2010."

[207] See, e.g., William A Birdthistle, Breaking Bucks in Money Market Funds, 2010 Wisc. L. Rev. 1155, 1161 (2010) (arguing that SEC has granted MMFs a regulatory subsidy that allows them to obfuscate their true value from investors).

[208] See infra Part III(A)(3).

true value."[209] These transactions have the potential to generate far greater unfairness between shareholders than the arbitrage opportunity to which the floating NAV is addressed.

2. Gates and Fees

As with the floating NAV, the SEC's Gates/Fees alternative appears poorly suited to address the central problem identified by regulators as justifying further reform – run risk. Indeed, as I have argued elsewhere, fees and gates potentially present a greater threat to MMF investors than a loss in principal because they jeopardize the investors' immediate access to their funds – a key factor motivating the use of MMFs.[210]

One problem with the Gates/Fees alternative is its complexity. Cognizant of the fact that a mandatory fee or gate would likely be a strong negative for many investors, the SEC modified its Gates/Fees alternative from the proposing release to make the use of fees and gates discretionary rather than mandatory. The final rule empowers fund boards to impose liquidity fees of up to 2% or suspend redemptions (impose gates) for up to ten business days if a fund's weekly liquid assets fall below 30% of its total assets.[211] At the same time, boards are required to impose a 1% liquidity fee if the fund's weekly liquid assets fall below 10% of its total assets unless the fund board decides that such as fee is not in the best interests of the fund.[212] Thus the rule provides an opt-in for 2% fees and gates, and an opt-out for 1% fees. The SEC failed to provide meaningful guidance on the "best interests" standard,[213] and in fact cited the fact that investors would not be able to predict the

[212] Id.

[213] 2014 Final Rule, supra note __ at 88.

manner in which fund boards would exercise this discretion as a benefit.[214] Without a clear indication as to the factors that a particular board will consider in imposing a fee or gate, it will be impossible for investors to price this risk in deciding whether to invest in an MMF.

In addition, as Commissioner Kara Stein has noted, fees and gates are likely to be counterproductive both in addressing run risk and the greater problem of systemic contagion.[215] Superficially, of course, fees and gates can reduce redemption pressure by making redemption more costly. If investors must pay a 1 or 2% fee to redeem their shares, they will be less willing to redeem. Similarly, imposing a gate could completely prevent redemptions. Nonetheless, both fees and gates exacerbate run risk near the point of the trigger. Specifically, if investors are aware of the prospect of draconian fee or complete bar on withdrawals, they may seek to redeem as the fund approached the trigger point for the imposition of the fee or gate.[216] The result would be precisely the type of first mover advantage that this Article has identified as a critical component of a run.[217]

The incentive to run under the SEC's proposal would be more powerful than the arbitrage opportunity associated with penny-rounding because the liquidity fees authorized under the rule are far greater than the ½% differential that the SEC identified as a concern under the status quo. Importantly as well, the fund board's discretion as to whether to impose a fee or gate would generate uncertainty about any particular board's willingness to do so.[218] Under the final rule, the board's power to impose fees and gates is triggered if a fund's liquidity drops to twice the limit legally required by Rule 2a-7, suggesting that boards will potentially be able to exercise this power with some frequency. This

[215] See Stein Statement, supra note __ (explaining why gates are "the wrong tool" to address run risk).
[216] See also Goldman letter, supra note __ at 2 ("To avoid payment of a fee or loss of liquidity of their investment as a result of a gate, investors can be expected to redeem shares of a money fund at the first sign of loss of liquidity").
[217] See, e.g., Letter from Eric Rosengren, Federal Reserve Bank of Boston to Elizabeth Murphy dated Sept. 12, 2013, at 7, www.bostonfed.org/news/press/2013/pr091213-letter.pdf (explaining that "investors could have an incentive to redeem before their fund breaches the WLA threshold" and terming this shortcoming "substantial").
[218] See, e.g., Gordon & Gandia, supra note __ at 367 (explaining that the fees and gates alternative "disserves systemic stability because it does not establish clear expectations about loss realizations and loss absorption").

uncertainty could lead investors to redeem well in advance of any fund distress, in which case the investor redemptions, rather than economic developments could cause the fund to fail.

In addition, because the fund's power to impose both gates and fees would be triggered by an abrupt decline in liquidity, they could be triggered by events that have nothing to do with the soundness of the fund or the quality of its assets.[219] As Eric S. Rosengren, the president of the Federal Reserve Bank of Boston wrote in a comment letter to the SEC, fees and gates could be triggered simply by a few large investors in a fund withdrawing their money at the same time.[220] Rather than simply monitoring the quality of an MMF's portfolio assets or the degree of risk undertaken by the MMF's sponsor, investors would now have to worry about the behavior of their fellow investors and any significant demands that such behavior might impose on the fund's liquidity.

Moreover, a single fund's imposition of a fee or gate could scare investors in other funds into redeeming to avoid the prospect of facing a similar restriction. This would cause one MMF to generate a spillover contagion effect on the industry.[221] Given that the risk of panic may be highest among individual investors (who would also be least able to evaluate the fund's disclosures in an effort to ascertain the likelihood that a fee or gate will actually be imposed, the use of fees and gates for retail MMFs is particularly problematic. Rosengren's letter warns, "As this represents a new run mechanism that does not exist under the status quo, the fees-and-gates alternative may actually increase run risk relative to not enacting further reform,"[222] Put differently, Sheila Bair, former FDIC chair, observed that fees and gates create a new source of uncertainty – the type of uncertainty that generates a run – uncertainty by investors about their ability to withdraw their money.[223]

---

[219] Although to be fair, rapid redemptions should not be a triggering event in the context of a strong market for money market assets, because the MMF could restore its liquidity through sales. Such sales would, of course, be constrained by the limited trading that occurs in some money market assets such as repos.
[220] Rosengren comment letter, supra note __ at 7.
[221] See Goldman letter, supra note __ at 3 (explaining that fees and gates may lead to the very type of contagion the reform seeks to prevent).
[222] Id.
[223] Sheila C. Bair, Chair, Systemic Risk Council, Examining the SEC's Money Market Fund Rule Proposal, Testimony Before the House Committee on Financial Services

The biggest problem with fees and gates, however, is that mutual fund boards face powerful disincentives to use them. Although the circumstances under which the imposition of a fee or gate is warranted are likely to be extremely rare, imposing a fee or gate would irreparably damage the reputation not just of the MMF itself but its sponsor. Investors who have been subjected to a fee or gate are unlikely to continue to invest with that fund family in the future. Prospective investors will be wary of investing in a fund that has implemented such restrictions in the past and, under the new rule, MMFs will have to disclose any use of a fee or gate for the next ten years. In a highly competitive industry, there are reasons to believe that the use of fees or gates will limit a fund sponsor's ability to attract investments to a degree that makes the survival of the sponsor questionable. This will be a major concern for a board considering the exercise of these powers. Although fees and gates may facilitate the liquidation of an irreparably damaged MMF,[224] they are unlikely to be implemented for funds that are not terminal. As such, their value in enhancing MMF stability is questionable.

3. The New Disclosure Requirements

True to the disclosure-orientation of the federal securities laws,[225] the new rule adopts an extensive menu of additional required disclosures that offer independent reasons for concern.[226] First, voluminous disclosure requirements may overwhelm investors and limit their ability

---

Capital Markets & Government Sponsored Enterprises Subcommittee, Sept. 18, 2013, at 3-4, http://www.systemicriskcouncil.org/wp-content/uploads/2013/09/Sheila-Bair-Testimony-House-Financial-Services-Sep-18-13.pdf.

[224] I have argued elsewhere that a partial gate would be a useful tool for boards to use in circumstances in which it must break the buck. See Fisch & Roiter, supra note __. Our proposal differs from the rule in that it would only impose a gate as a last resort and would limit the size of the gate so as to allow investors to redeem the majority of their funds without delay.

[225] See, e.g., Thomas Hazen, Social Networks and the Securities Laws, 90 N.C.L. Rev. 1735, 1741 (2012) ("The federal securities laws do not focus on the merits of investments but rather are based on disclosure to allow sufficiently informed investors to fend for themselves").

[226] The new disclosure and reporting requirements take up almost 200 pages of the adopting release, from page 281 to 473.

to ascertain useful information about their investments.[227] The problem of information overload is particularly apparent in mutual fund disclosure; commentators have observed for years that mutual fund regulation mandates too many disclosures that are of questionable value to investors.[228] Most investors already complain that mutual fund disclosures are confusing and contain too much information,[229] so much so that research conducted in 2006 found that more than half mutual fund investors read the fund prospectus very little or not at all, and only 8% read the prospectus in full.[230] Moreover, because of the forced market segmentation between institutional and retail funds, retail investors will not benefit from the market discipline imposed by more sophisticated institutions that might use these disclosures more effectively.[231]

Second, and perhaps more problematically, the disclosure is designed to make MMF portfolios, redemption requests and liquidity levels more transparent, ostensibly to enable more effective investor monitoring. Yet active investor monitoring of MMFs is of uncertain value. Apart from the question of whether MMF investors have the necessary skill set to evaluate MMF risk on the basis of the required disclosures, the private money aspect of MMF is arguably in tension with a high level of information sensitivity. As Dang and others have argued in the context of bank secrecy, it may be desirable to maintain a level of information opacity for financial institutions that produce private money or money equivalents.[232]

Two disclosure requirements are of particular concern. The first is the requirement that all MMFs calculate and disclose a market-based NAV on a daily basis. For floating value MMFs, this is the price at

---

[227] See, e.g., Troy A. Paredes, Blinded by the Light: Information Overload and Its Consequences for Securities Regulation, 81 Wash. U. L.Q. 417 (2003) (identifying the problem of information overload and explaining how too much disclosure can be counterproductive).

[231] See note __ supra and accompanying text (explaining how retail exemption will increase market segmentation).
[232] See Tri Vi Dang, Gary Gorton, Bengt Holmstrom & Gulliermo Ordonez, Banks as Secret Keepers (working paper dated June 2014) (defending bank opacity as efficient).

which the fund issues and redeems shares; for stable value MMFs, it is a shadow NAV. Importantly, the rule requires that, in both cases, the calculation be made to four decimal places or to the nearest ten thousandth of a cent. This high level of precision is explicitly designed to create an artificial appearance of volatility in a fund's NAV. The SEC rejected imposing a precision requirement analogous to that used by other mutual funds, an NAV rounded to three decimal places,[233] on the basis of empirical data showing that, only with this requirement would MMF prices appear to fluctuate.[234]

As a result, the disclosure conveys a false degree of price fluctuation. The Investment Company Institute describes the SEC's proposal as "an artificially sensitive pricing scheme to force "movement" in the NAVs of the funds."[235] More troubling is the fact that the use of four decimal places suggests a scientific degree of accuracy to the valuation process that simply is not present.[236] In fact, the opposite is true. As noted above, many of the assets held by MMFs rarely trade – they are held to maturity and rolled over.[237] This means that when a fund calculates its NAV, current market prices for the securities may not be readily be available.[238]

---

[233] 2014 Final Rule, supra note __ at 154 (acknowledging that the requirement is "a more precise standard than other mutual funds use today").

[234] Id. at 155 (reporting that, according to staff data, less than 5% of MMFs would have fluctuated in price during the three years between Nov. 2010 and Nov. 2013 under the standard applicable to other mutual funds).

[235] Comment Letter of the Investment Company Institute to the Securities and Exchange Commission dated Sept. 17, 2013, at 41.

[236] Cf. Comment Letter from Presidents of the Fed. Reserve Banks, to the Fin. Stability Oversight Council 1 (Feb. 12, 2013), available at http://www.bostonfed.org/news/press/2013/pr021213-letter.pdf. (arguing that accurate market-based NAVs are a critical part of any reform option).

[237] See notes __ through __, supra.

[238] See Letter from Catherine T. Dixon, Chair ABA Federal Regulation of Securities Committee to Elizabeth M. Murphy, Secretary, US Sec. & Exch. Comm'n, dated Sept. 30, 2013 ("Dixon letter"), at 26 (explaining that, for most money market securities, there can be no secondary market prices because "there is no, or virtually no secondary market"). In addition, MMF boards may be faced with reflecting economic developments that affect liquidity but not default risk into MMF pricing, despite the absence of principles for making these judgments. An example is the pricing of money market assets, such as repos, during the time that they are subject to the two-day stay applicable to qualified financial contracts of a SIFI that is subject to a resolution proceeding under Dodd-Frank. See, e.g., Darrell Duffie & David A. Skeel, A Dialogue on the Costs and Benefits of Automatic Stays for Derivatives and Repurchase

In the absence of an available market price, funds are required to determine the "fair value" of the assets they hold.[239] Fair value determinations are required for all investment funds, but the valuation methodology has a greater impact on funds that hold a large proportion of assets that do not have readily available market prices.[240] Fair valuation methodology incorporates models, predictions and multi-factor tests.[241] As a result, although MMF prices will be calculated to four decimal places, they will incorporate valuations that are not scientific but subjective and imprecise.[242]

Concededly, the new rule reflects an important modification from the 2013 rule proposal – it authorizes stable NAV funds to continue to use amortized cost valuation.[243] Both fixed and floating NAV funds can also continue to use amortized cost valuation for portfolio securities with a remaining maturity of 60 days or less.[244] Importantly, however, the adopting release warns that funds can only use amortized cost valuation if the "board determines that the amortized cost of the security is fair value."[245] For the reasons noted above, this determination may prove challenging. A substantial proportion of Lehman's borrowing, for

---

Agreements (March 1, 2012), at 4, avail. at http://ssrn.com/abstract=1982095 (describing the two-day stay). While it is unclear how these assets should be priced during the stay, it is clear that the constraint on their liquidity cannot be ignored from a fair value perspective.

[239] See Investment Company Act Release No. 26299 (Dec. 17, 2003) [68 FR 74713, 74718 (Dec. 24, 2003)] (describing process of determining fair value).

[240] See, e.g., Disclosure Regarding Market Timing and Selective Disclosure of Portfolio Holdings, Investment Company Act Release No. 26418 (Apr. 19, 2004). http://www.sec.gov/rules/final/33-8408.htm (adopting amendments to Form N-1A and other registration forms) (explaining that "that funds are required to use fair value prices any time that market quotations for their portfolio securities are not readily available (including when they are not reliable)." The release noted that MMFs were then subject to different pricing requirements under Rule 2a-7.

[241] See Dixon letter, supra note __, at 26 (explaining that techniques for valuing MMF assets include "mark to model" pricing and "matrix" pricing. Both techniques provide relatively imprecise "estimates" of value, rather than true market value.").

[242] See, e.g., Ian McDonald & Tom Lauricella, Mutual Funds' Pricing Flaw, Wall St. J., Mar. 24, 2004, http://online.wsj.com/news/articles/SB108007959483063307 (explaining that fair value pricing techniques "are only estimates and therefore can easily produce varying numbers.").

[243] See 2014 Final Rule at 166 (explaining importance of amortized cost valuation for intraday liquidity).

[244] Id. at 270.

[245] 2014 Final Rule, supra note __, at 272.

example, was in the repo market, and it is not clear when boards would have been required to value this debt at less than amortized cost as Lehman's financial condition declined in 2008.[246] An additional consequence of this concession is that it may drive MMFs to concentrate their portfolios to an even greater degree in the very shortest term assets,[247] with potentially significant affects for the distribution of demand for short term credit.

In addition, as noted above, mutual fund pricing is inevitably stale because it does not account for the effect of pending economic developments and redemption requests that will affect the value of securities that must be sold to meet pending redemption requests.[248] Given that floating NAV funds will need to trade at these prices, the valuation methodology creates the potential for substantial intra-shareholder disparities.

The difficulty of accurately computing fair value[249] and the potential liability exposure associated with a failure to do so were recently

---

[246] See, e.g., Peter Eavis, Lessons of Lehman's Flighty Funding, Wall St. J., Sept. 7. 2010, http://online.wsj.com/news/articles/SB10001424052748703713504575475532391301148 (citing Financial Crisis Inquiry Commission's findings about Lehman's repo exposure). It is also unclear how a fund board could have made this determination given the expectation by many market participants that the government would rescue Lehman.

[247] MMF holdings are already concentrated in very short term debt. For example, the SEC stated that, as of Feb. 2014, approximately 56% of the assets of prime MMFs had maturities of 60 days or less. Id. at 272 n. 874.

[248] See notes __ through __, supra.

[249] The SEC recognized the challenges of determining a market-based NAV in its adopting release; indeed, it devoted an entire section of the release to providing additional guidance on the topic of fair valuation. 2014 Final Rule at 270. Unfortunately, the guidance left much to be desired. The guidance reminded fund boards that their duty to determine whether prices constituted fair value is nondelegable, but highlighted the potential value of third party pricing services in assisting the board in this determination. Id. In light of the controversy associated with reliance on third parties in the context of credit rating agencies and proxy advisors, the SEC's suggestion of regulatory approval for this reliance is surprising. See, e.g., Proxy Voting: Proxy Voting Responsibilities of Investment Advisers and Availability of Exemptions from the Proxy Rules for Proxy Advisory Firms, Staff Legal Bulletin No. 20 (IM/CF) , June 30, 2014, http://www.sec.gov/interps/legal/cfslb20.htm (providing guidance on when institutional investors may reasonably rely on voting recommendations supplied by third party proxy advisors).

demonstrated in the Morgan Keegan case.[250] The five Morgan Keegan bond funds at issue, like MMFs, held fixed income securities that were rarely traded. As a result, the funds had to determine fair value for securities that constituted more than 60% of the funds' assets.[251] The SEC brought proceedings against the funds, their employees and their board of directors for failing to apply appropriate procedures to calculate the funds' NAV.[252] Although Morgan Keegan is an extreme case in that, according to the SEC, the funds' valuations were fraudulently manipulated,[253] the litigation illustrates the complexity of the fair value determination.[254]

The SEC's new rule also imposes troubling requirements with respect to the disclosure of sponsor support, reflecting the SEC's view that sponsor support contributes to the fragility of MMFs.[255] The provisions seek both to reduce investor reliance on the possibility of sponsor support and to increase the disincentive for sponsors to provide

See also Sean Collins, Is SEC Data Misleading the Public on Sponsor Support of Money Market Funds?, ICI Viewpoints, June 21, 2012, http://www.ici.org/viewpoints/view_12_mmfs_fund_support (explaining that the provision of sponsor support "does not mean a money market fund is in danger").

such support. These objectives are troubling in that sponsor support has historically been a key factor enhancing MMF stability.

To achieve the first objective, the rule requires MMFs to inform prospective investors that "The Fund's sponsor has no legal obligation to provide financial support to the Fund, and you should not expect that the sponsor will provide financial support to the Fund at any time."[256] The SEC explains that this language is designed to "emphasize to investors that they should not expect a fund sponsor to provide financial support."[257] Although, under current law, the statement is certainly factually accurate, given the historical willingness of sponsors to provide such support, it is not clear what message investors are to take from this emphasis.

The message is particularly confusing in the context of the additional new requirement that sponsors disclose all prior instances in which they have provided support over the past ten years.[258] One possible reading of the disclosures is that investors should ignore the statement about legal obligation because this sponsor has historically gone beyond its obligations and voluntarily provided support. Another possibility implication is that, despite the sponsor's past practice of providing support when necessary, this support is not to be trusted.

Beyond these mixed messages is the question of how investors should interpret a sponsor's prior practice of providing support. On the one hand, the disclosure might mean that the sponsor has stood behind its fund and has the financial wherewithal to do so. Alternatively, the fact that a fund required prior sponsor support might signal that it is poorly managed or takes excessive risks. Absent some meaningful indication of what sponsor support means, it is difficult to understand how investors can use this information to make informed investment choices.[259]

Regardless of the effect of the signal, requiring sponsors to disclaim financial responsibility for a fund's NAV may reduce their willingness to

---

[256] 2014 Final Rule at 284. The statement also adds language warning investors of the possibility that the fund will impose fees and gates. Id.

[257] Id. at 290.

[258] Id. at 315.

[259] The SEC itself indicated some confusion as to this point. See 2014 Final Rule at 320 (explaining that: "the disclosure of affiliate sponsor support could have additional effects on capital formation, depending on whether investors interpret financial support as a sign of money market fund strength or weakness").

assume such responsibility. Once a sponsor is forced to tell investors that it need not provide support, it may be unwilling to provide such support voluntarily. Similarly, in the face of a detailed disclosure requirement that will extend for the next ten years, sponsors may be less willing to provide support in the face of weakness, or may delay providing support in hopes that it will prove unnecessary rather than acting promptly before investors become concerned. Either way, MMF stability will be reduced.

IV. Other Reform Proposals

Commentators and policymakers have suggested a variety of other reform proposals in too extensive to detail here.[260] A common theme to these proposals, including several of those favored by bank regulators, is their similarity to bank regulation.[261] This article briefly considers two such alternatives.

A. A Private Liquidity Facility

One alternative is a private emergency liquidity facility.[262] As noted above, high redemption demand can strain the liquidity reserves of MMFs and force them to sell assets. A liquidity facility supplies temporary liquidity in times of economic stress. The mutual fund industry initially developed a detailed proposal for such a facility that would have set up the facility as a bank or trust company capitalized

---

[260] See also 2013 Rule Proposal, supra note __ at 250 (describing and rejecting various alternative reform proposals).

[261] Bank-like regulation is the preferred approach of bank regulators, who categorize MMFs within the nefarious "shadow banking" industry. See, e.g., Statement of Paul Volcker at SEC Roundtable, supra note __ ("Paul A. Volcker: I happened to be there at the birth of money market funds. It was pure regulatory arbitrage. …. It is a shadow bank. And do we need shadow banks, or are we making real banks?"). Indeed, some commentators have suggested that MMFs be regulated directly as private banks and subjected to the oversight of bank regulators as well as other bank regulatory requirements. See 2013 Rule Proposal at 276 (describing and rejecting this proposal).

[262] See id. at 269 describing this proposal. A detailed description of how such a proposal could be structured is set out in the Investment Company Institute's 2011 comment letter to the SEC. See Letter from Paul Schott Stevens, CEO, Inv. Co. Inst., to Elizabeth M. Murphy, Sec'y, SEC (Jan. 10, 2011), 23-31, avail. at http://www.ici.org/pdf/11_sec_pwg_com.pdf .

with private funds – contributions from the sponsors of prime MMFs.[263] Based on its status as a bank, the liquidity facility would have access to time deposits and recourse to the Federal Reserve discount window if necessary.[264] In effect, the liquidity facility interpose interposing a bank-like structure as a backstop for MMF liquidity as alternative to treating MMFs themselves as banks.

The PWG Report noted several weaknesses in the proposal including possible conflicts between MMFs, the difficulty in ensuring that the facility would have adequate capacity in a time of crisis and the risk of moral hazard.[265] The SEC observed that it lacked the authority to grant the facility access to the discount window without authorizing legislation.[266] This legislation seemed improbable in that commentators questioned the propriety of allowing MMFs access to the discount window without imposing full bank regulation.[267] Commentators raised

[267] See, e.g., SEC Roundtable, supra note __, Statement of Paul Tucker, Bank of England, ("As I understand it, this is a bank whose sole purpose is to stand between the Federal Reserve and the money market mutual fund industry. If I think about that as a central banker, I think 'So, I'm lending to the money market mutual fund industry.' What do I think about the regulation of the money market mutual fund industry? ...And the other thought I think I would have is...'If the money market mutual fund industry can do this, what's to stop other parts of our economy doing this and tapping into the special ability of the central bank to create liquidity'...It's almost to bring out the enormity of the idea that you have floated...it's posing very big questions indeed, about who should have direct access and to the nature of the monetary economy."); Barbara Novick, et al., BlackRock, Money Market Funds: Potential Capital Solutions, Viewpoint, Aug. 2011, avail. at http://www.google.com/url?sa=t&rct=j&q=&esrc=s&frm=1&source=web&cd=4&cad=rja&uact=8&ved=0CEwQFjAD&url=http%3A%2F%2Fwww.blackrock.com%2Fcorporate%2Fen-ch%2Fliterature%2Fwhitepaper%2Fviewpoint-money-market-funds-potential-capital-solutions.pdf&ei=SHuYU9LNA4fgsAT3poDQCA&usg=AFQjCNE9VxzRFV0qrvsP7sCiR_SxQoZ-Og&sig2=u-Tm8H2XNdA3JT80eY67nw (observing that the opposition

similar objections to addressing MMF fragility by establishing a permanent government guarantee along the lines of the Treasury's Guaranty Program. In particular, commentators noted that such a program would encourage excessive risk-taking among fund sponsors and externalize the costs of such risk-taking onto taxpayers.[268]

The factual predicate for this concern over excessive risk-taking is unclear. As noted earlier, MMFs have historically been highly stable and even in times of stress have demonstrated limited volatility in their NAVs.[269] Moreover, only two MMFs have ever broken the buck. These numbers stand in marked contrast to the evidence of risk-taking by banks. The FDIC reports lists 487 failed banks between 2008 and October 2013.[270] This number does not include more than 800 additional banks that were merged into other banks due to financial weakness.[271]

Moreover, although critics argue that the Reserve Fund's failure was based on its excessive risk-taking,[272] it is worth noting that the Lehman debt instruments that triggered its failure were rated were prime-1, Moody's highest credit rating, up until Lehman filed for bankruptcy.[273] Moreover, in light of the government's prior bailout of

---

by the Federal Reserve to allowing access to the discount window effectively eliminates the feasibility of the liquidity facility proposal).

Bear Stearns, the market's apparent expectation that Lehman would be rescued does not appear unrealistic.[274]

B. Capital Buffers

A second alternative would require that MMFs maintain capital buffers – cushions of capital that they could draw upon to avoid breaking the buck if their portfolio assets decline in value. Advocates proposed capital buffers either standing alone or in combination with a requirement that individual MMF investors maintain a minimum balance at risk (MBR).[275] Funding for capital buffers could come directly from the MMF sponsor[276] or by setting aside MMF income that would otherwise be distributed to investors.[277] Capital buffers would allow

Issue Brief, Sept. 12, 2013, http://www.heritage.org/research/reports/2013/09/lehman-brothers-bankruptcy-and-the-financial-crisis-lessons-learned ("The Bear Stearns bailout set the expectation that Lehman would also be bailed out, setting up investors and creditors for a fall").

[275] The concept of requiring MMF investors to maintain an MBR was developed in a paper drafted by staff members of the Federal Reserve Bank of New York. See Patrick E. McCabe et al., The Minimum Balance at Risk: A Proposal to Mitigate the Systemic Risks Posed by Money Market Funds, Federal Reserve Bank of New York Staff Reports, no. 564, July 2012, http://www.federalreserve.gov/pubs/feds/2012/201247/201247pap.pdf. The paper explicitly analyzed the use of MBRs in conjunction with capital buffers. See id. at 10 ("The MBR rules that we propose would work particularly well in tandem with a capital buffer."). Using a series of models of investors' expected losses, the paper concluded that an MBR of 3-4% coupled with a capital buffer of 50 basis points "would probably be adequate to create disincentives for redemptions." Id. at 60.

[276] BlackRock proposed the use of capital buffers through a special purpose entity created by the sponsor to address accounting rules that limit the sponsor's ability to set aside capital directly. David Messman, Fidelity, Charles Schwab, and Wells Fargo to the Securities and Exchange Commission re: File No. 4-619; Release No. IC- 29497 President's Working Group Report on Money Market Fund Reform, dated May 3, 2011, available at http://www.google.com/url?sa=t&rct=j&q=&esrc=s&frm=1&source=web&cd=1&cad=rja&uact=8&ved=0CB0QFjAA&url=http%3A%2F%2Fwww.sec.gov%2Fcomments

MMFs to absorb a level of portfolio losses without breaking the buck and would have the added advantage of distributing those losses across investors, reducing the first mover advantage, because losses up to the level of the capital buffer would not impact the value of fund shares directly.

Chairman Schapiro identified capital buffers as an attractive regulatory reform in her August 2012 press release, stating that such a buffer would be valuable in that it would allow the fund "to absorb the day-to-day variations in the value of a money market fund's holdings."[278] The FSOC also viewed capital buffers as attractive. Required capital buffers, either with or without an MBR, were the two alternative reform proposals to a floating NAV recommended by the FSOC report.[279]

Capital buffers are a standard component of bank regulation. A bank's capital is simply the value of its assets minus its liabilities or its equity.[280] By requiring a minimum amount of capital, regulators limit the extent to which a bank can finance its operations through leverage, thereby increasing its financial stability.[281] The amount of capital reserves that banks should be required to hold has been an ongoing debate among academics, regulators and international policy-makers[282] and is perhaps most apparent in the recent adoption of Basel III capital requirements which are designed to increase both the quality and quantity of capital held by banks.

Pfleiderer, Fallacies, Irrelevant Facts, and Myths in the Discussion of Capital Regulation: Why Bank Equity is Not Socially Expensive (October 22, 2013). http://ssrn.com/abstract=2349739, at 1 (explaining capital requirement).

[281] Id. at 6-7.

[282] See id. at 5 (noting that "[t]here have been hundreds of papers on capital regulation in the last decade").

The challenge to borrowing the idea of capital buffers from bank regulation is that the legal status of capital for MMFs is unclear. MMFs are simply a pool of assets owned pro rata by the MMF's investors. Unlike banks, MMFs do not finance their operations through leverage. Although MMFs hold debt instruments, those instruments are assets, not liabilities. Consequently, from a traditional accounting perspective, MMFs currently operate with 100% capital.

Unlike bank capital, which provided by the bank's investors – a group that is distinct from the bank's depositors -- the MMF's capital buffer would either have to come from its investors, as a type of extra fee or payment, or from the fund's sponsor. Requiring investors to fund a capital buffer, particularly in an environment of low interest rates, is impractical. At present, the average seven day yield on MMFs is a single basis point, meaning that funds have no ability to withhold a portion of the interest payable to fund a buffer.[283] As a result, for capital buffers to be a realistic near-term reform, they would have to be financed by MMF sponsors.

A sponsor-funded capital buffer is, in function, similar to a sponsor guarantee. Capital buffers offer a way to structure contingent sponsor support by creating both a mandate and a mechanism for sponsors to designate funding to cover potential MMF losses without reflecting this funding as a contingent liability or requiring consolidation of the sponsor and its MMF. At the same time, capital buffers would only require the sponsor to commit to a limited guarantee – the amount of the required buffer.

As with bank capital requirements, the inherent limitation to capital buffers is the tension between the cost of maintaining the buffer and the limited utility of a buffer that is too small. The ICI estimates that, under current market conditions, a capital buffer of 1.5 to 3% would absorb every dollar of advisors' net earnings for 18 to 45 years.[284] Faced with such a requirement, it is unlikely that sponsors would continue to

[284] Investment Company Institute, The Implications of Capital Buffer Proposals for Money Market Funds, May 2012, at 3, http://www.ici.org/pdf/ppr_12_mmfs_capital_buffer.pdf.

offer MMFs.[285] On the other hand, small capital buffers are likely to fail.[286] A recent study by Craig Lewis, Chief Economist at the SEC, shows that although a small buffer would be sufficient to absorb price variation under normal market conditions, a much larger buffer would be necessary to protect shareholders from losses associated with an event like the Lehman bankruptcy.[287] More problematically, a capital buffer requirement might be counterproductive in that it could increase the incentive of the sponsor to reach for yield by investing in riskier assets.[288]

Notably, however, the debate overlooks the fact that MMF sponsors are already providing capital buffers indirectly, in the form of fee waivers. Although the MMF advisory fee is set by contract, fund managers' have the discretion to waive the fee in whole or in part, and fund managers regularly do so.[289] Fee waivers do not require approval from the fund's board or the SEC,[290] and such waivers have the effect of shifting capital, in the amount of the waiver, from the investment advisor to the fund itself. Fee waivers have been common for many years; the practice long predates the financial crisis.[291] Susan Christoffersen found

---

[285] The SEC noted as much when assessing the capital buffer proposal in its 2013 release. See 2013 Rule Proposal 259 ("The cost of diverting funds for this purpose represents a significant incremental cost of doing business for those providing the buffer funding.").

[291] See id. at 1119 (stating that "Fund managers have used fee waivers since the late 1970s").

that, for example, between 1991 and 1995, over half of retail MMFs and nearly 80 percent of institutional MMFs waived all or part of their fees.[292]

The extent to which MMFs have used fee waivers has increased dramatically since the financial crisis. Since 2008, MMFs have waived a total of $24 billion in fees.[293] In 2013 alone MMF fee waivers totaled $5.8 billion.[294] A key reason for the fee waivers is the low interest rates that are currently available on money market assets – absent fee waivers, the funds would generate negative returns.[295]

The widespread use of fee waivers demonstrates the willingness of fund sponsors to forego profits and to absorb virtually all the expenses of operating the funds.[296] By waiving their fees, managers are transferring the waived amount to the funds to support their NAVs, and absorbing the funds' losses on behalf of the funds' investors.[297] Importantly, by structuring sponsor support as a fee waiver, in which the fund manager has a contractual entitlement to a payment and then voluntarily and discretionarily waives that payment, MMFs are able to avoid the accounting and regulatory complications that would accompany an explicit guarantee or ex ante commitment.

The downside of relying on fee waivers is that the practice is informal, discretionary and largely clandestine. Sponsors are not legally obligated to provide support through fee waivers, and investors do not learn about such waivers until after the fact. Despite MMFs' extensive

use of fee waivers, regulators do not even appear to recognize their economic significance as a form of sponsor support. In fact, the new disclosure requirement for sponsor support does not include fee waivers.[298] Nonetheless, fee waivers demonstrate that sponsor support is a viable mechanism for enhancing MMF stability. Accordingly, in the next Part, this Article proposes an extension of this practice into an explicit mandate.

V. Mandatory Sponsor Support – A New Approach to MMF Reform

As noted above, the SEC's long-awaited reforms are unlikely to increase MMF stability and may, in fact, be counterproductive. Fee waivers and capital buffers demonstrate that direct sponsor support offers greater potential. At the same time, both fee waivers and capital buffers have important limitations. These limitations can be overcome by embracing sponsor support directly. Accordingly, this Article offers a new approach to MMF reform – mandated sponsor support of the $1 share price.

This Article proposes that the SEC amend Rule 2a-7 to require sponsors of stable value MMFs to support the $1 share price. Sponsors would be required to commit to support as a condition for offering a stable value NAV MMF. Put differently, the proposal would provide MMF sponsors with a choice. Sponsors could continue to offer a stable NAV MMF, but if they did so, they would be required to commit to maintain the $1 share price. Alternatively, sponsors could offer a floating NAV MMF, which could be regulated in accordance with the 2014 rule.[299]

The Article's rationale for embracing sponsor support is the critical structural difference between MMFs and banks. MMFs, like other investment funds, are a pool of assets that are segregated from the assets of their sponsors. Redemptions from an MMF are made from the MMF's assets, not from the sponsor's assets. Although the MMF sponsor oversees the fund's operations, its financial operations are linked

[298] 2014 Final Rule at 308 n. 990. Technically the exclusion is for "routine" fee waivers, but the release does not define the term routine.

[299] Although this article does not favor a floating NAV, it retains the floating NAV to broaden the pool of potential MMF sponsors beyond those who could commit credibly to provide adequate support.

to the MMF only to the extent that it receives fees for the services provided to the MMF.

John Morley has explained that this separation of investments and management is an important and efficient feature of mutual funds, in part, because it critically changes the risk exposure of mutual fund investors, who are not exposed to the general operational risks of the mutual fund sponsor.[300] The separation also means that, as a general rule, sponsor assets are not available to MMF investors. Sponsor support is an exception to this traditional separation because it makes sponsor assets available to MMF investors in the event of MMF distress. Critically, sponsor support is conceptually possible only because the assets of the sponsor are an independent resource rather than part of the MMF's portfolio value.

Banks, in contrast, lack this separation of investments and management. Bank deposits are a loan from the depositor to the bank, and depositors look to the general assets of the bank to satisfy this obligation. The bank's financial fragility therefore poses a risk to depositors, and this risk is the source of bank runs. Banks lack an analogous option of sponsor support because the bank's resources already stand behind its obligations, and there is no additional pool of assets to supplement those resources.

Experience has demonstrated the effectiveness of sponsor support for MMFs that faced substantial redemptions or other forms of financial distress. The SEC staff reported that, during the critical 2007-2008 time frame, almost 20% of all money market funds received sponsor support or SEC no-action approval of such support.[301] According to Moody's, at least 145 MMFs received sponsor support prior to 2007.[302] Brady, Anadu and Cooper documented 78 funds that received direct sponsor support during the 2007-2011 time frame.[303]

Importantly, sponsor support increases price stability.[304] The prevalence of sponsor support explains why MMFs so rarely break the

[304] Patrick E. McCabe, The Cross Section of Money Market Fund Risks and Financial Crises, Finance and Economics Discussion Series, Divisions of Research & Statistics

buck. As McCabe demonstrates, for example, sponsor support was highly effective in stabilizing MMFs during the asset backed commercial paper crisis of 2007, and no MMF broke the buck.[305] McCabe also demonstrates that, after the Reserve Fund broke the buck, MMFs with weaker sponsors experienced higher levels of redemptions.[306] Sponsors have provided support to their MMFs in multiple ways. In addition to the fee waivers discussed above, sponsors purchase distressed assets from a fund at amortized cost, provide direct injections of capital or liquidity, or provide letters of indemnity or other types of guarantees.[307]

Sponsors have a strong incentive to support their MMFs. Breaking the buck could irreparably damage a sponsor's reputation and make it unable to continue to operate.[308] Importantly, for the vast majority of sponsors, MMFs represent only a small proportion of their overall business, and the spillover effect could destroy the sponsors other operations as well.[309]

In addition, sponsor support is not costly in the context of most sponsors' overall operations. MMFs generally constitute a small percentage of the sponsor's assets under management,[310] and the potential cost of furnishing support to the funds is a tiny portion of the sponsor's independent value. BlackRock, for example, manages approximately $300 billion in MMF products, out of a total of more than

[307] See Moody's Investors Service, Sponsor Support Key to Money Market Funds, Aug. 9, 2010 at 3 (describing various types of sponsor support).

[308] See, e.g., Kacperczyk & Schnabl, How Safe, supra note __ ("fund sponsors with more non-money market fund business expect to incur large costs if their money market funds fail. Such costs …could be outflows from other mutual funds managed by the same sponsor or a loss of business in the sponsor's commercial banking, investment banking, or insurance operations"); Patrick E. McCabe, Cross Section, supra note __ ("because allowing a fund to break the buck would have been destructive to a sponsor's reputation and franchise, sponsors backstopped their funds voluntarily.").

[309] Comment Letter of James J. Angel (Feb. 6, 2013) (available in File No. FSOC-2012-0003) ("Angel FSOC Comment Letter") ("Sponsors have a strong commercial incentive to stand behind their funds. Breaking the buck means the immediate and catastrophic end of the sponsor's entire asset management business.").

[310] For the Reserve Primary Fund, of course, the proportion was much higher, as it is for sponsors like Federated. See Federated 2013 Annual Report at 2, http://corp.federatedinvestors.com/FII/daf/pdf/annual_report/2013_Annual_Report.pdf.

$ 4 trillion in assets under management.[311] BlackRock has an independent value of $51 billion, meaning that $51 billion of value from the sponsor's shareholders is available to meet the potential demands of its MMFs.[312] In essence BlackRock's market capitalization provides a capital buffer of 17%. In addition, MMF sponsors receive regular and highly liquid fee income from their funds, income that constitutes a percentage of the total assets under management.[313] These fees provide a ready source of liquidity upon which the sponsor could draw to meet its support obligations.[314] Indeed, even in an era in which MMF yields have plummeted, MMF sponsors have continued to receive substantial fee income from the funds.[315]

Under current law, sponsor support is always discretionary. Rule 17a-9 permits but does not require sponsors to provide voluntary support to MMFs.[316] Indeed various legal rules affirmatively prevent sponsors from guaranteeing fund value in advance, including limitations on affiliate transactions, requirements for reporting contingent liabilities, consolidation requirements and, for regulated entities, a concern about extending the federal safety net to a non-bank entity.[317] Similarly

Indeed, in September 2008, the SEC staff issued guidance to clarify that banks were not required to consolidate the fund on balance sheet if they provided discretionary support in connection with the financial crisis. Sec. & Exch. Comm'n, SEC Issues Clarification on Accounting Issues Relating to Bank Support for

accounting rules limit the ability to segregate assets to cover potential losses in the form of a reserve because the sponsor has no obligation to cover those losses. Although accounting rules would allow reserves if the sponsor guaranteed its MMF losses in advance, such a guarantee would subject to the sponsor to disclosure obligations and possible consolidation.[318] In addition, an explicit guarantee could arguably be treated as an asset of the fund, with the resulting requirement that it be reflected in the fund's NAV.[319]

Sponsor support is widely characterized as a weakness of MMFs, precisely because it is voluntary.[320] The fear is that the sponsor may fail to provide support in time of crisis and allow the MMF to fail.[321] The instability and panic in the MMF market in connection with the Reserve Fund's breaking the buck may have been affected, in part, by uncertainty about the likelihood of future support from other MMF sponsors. Importantly, sponsors were limited in their ability to reassure their customers because the Bents initially promised to support their funds through credit support agreements and then failed to do so.[322] The uncertainty about support from other sponsors both increased the contagion effect and made the federal guarantee an effective solution.

Money Market Mutual Funds , Sept. 17, 2008, http://www.sec.gov/news/press/2008/2008-205.htm

[318] See PWG Report, supra note __ at 10,

[319] See generally Technical Revisions to the Rules and Forms Regulating Money Market Funds, Sec. Act Rel. No 7479, Dec. 2, 1997, 1997 SEC LEXIS 2475 (discussing the regulatory treatment of guarantees of securities held by MMFs).

[320] See Duygan-Bump, supra note __ at 735 (attributing weakness of MMFs, in part to "discretionary sponsor support instead of formal capital buffers or insurance"); Cecilia Parlatore Siritto, Fragility in Money Market Funds: Sponsor Support and Regulation (July 12, 2013), http://ssrn.com/abstract=2295145 (describing voluntary sponsor support as both instrumental to maintaining a stable NAV and, at the same time, a source of MMF "fragility").

[321] The failure of the Reserve Fund followed this fact pattern. As one paper observes: "it was the lack of sponsor support . . . that was more unusual than the underlying losses suffered." Brady et al., supra note __ at 2. It is unclear whether the Reserve Management Company ("RMCI") was unable or unwilling to provide support for the Reserve Fund, but, as detailed in the SEC's enforcement action against the RMCI, the defendants issued a number of public statements indicated that they intended to provide sponsor support – support that never materialized. See SEC v. Reserve Management Co. Inc., 09 CV 4346 (S.D.N.Y. May 5, 2009), at 2-3. The SEC's fraud case was based on the claim that, at the time the Bents made these promises, they had no intention of providing such support. Id.

[322] Id. at 2-3.

Although historically sponsors (other than the Reserve Management Company) have supported their funds' NAVs voluntarily, doubts remain about the willingness of sponsors to provide voluntary support going forward. In describing why additional regulatory reforms were necessary, former Chairman Mary Schapiro explained that sponsor "support may be there, or it may not. And there certainly is no current legal requirement that sponsor support or any other back-up exist."[323] Moody's has warned that the increasing size of MMFs coupled with changes in the credit markets increase the risk that, in the future, sponsors may be less willing to provide support than they have in the past.[324] In addition, commentators have criticized voluntary sponsor support for concealing risks in MMF portfolios and for leading investors, mistakenly to misperceive the risk associated with MMFs.[325]

Mandatory sponsor support offers a more flexible and lower cost solution than capital buffers because sponsors could provide the support in a variety of different ways.[326] As they have done in the past, sponsors could waive advisory fees, in whole or in part, to prevent the fund from experiencing a negative yield. Sponsors could commit up front to provide support through an explicit guarantee or letter of credit or could purchase private insurance to cover any potential liability. Alternatively, a sponsor could, if a fund experiences financial weakness, provide liquidity by purchasing MMF assets at par, exchanging assets or injecting capital into the MMF.

Critically, in order to allow a sponsor to commit to these forms of support up front, the SEC would need to modify the rules on affiliate transactions, calculation of NAV and consolidation, where necessary. Because, under this proposal, sponsor support would be a contingent liability, the mandate would regularize the accounting treatment of measures taken by a sponsor to provide for such support in advance, such as through the creation of reserves.

---

[323] SEC Chairman Mary Schapiro, Remarks at SIFMA's 2011 Annual Meeting, Nov. 7, 2011, http://www.sec.gov/news/speech/2011/spch110711mls.htm.
[324] Moody's, supra note __.
[325] See 2013 Rule Proposal at 20 n. 42.
[326] Capital buffers are costly both because the sponsor must designate and segregate the capital in advance and because, in order to serve as an effective buffer, the capital cannot be invested in a manner that involves significant risk, so the return on the buffer will be limited. Similarly, capital buffers only ensure financial stability up to the amount of the buffer. In contrast, this Article proposes an unlimited support obligation.

Mandating sponsor support would address former Chairman Schapiro's concern about the unreliability of sponsor support in a time of crisis. To address the related concern about transparency, this Article proposes several complementary disclosure requirements. MMFs would be required, on a real time basis, to disclose the extent and form of support provided.[327] MMFs would also be required to disclose any conditional forms of support including insurance coverage, contingent purchases and third party guarantees. Importantly, these disclosures would not have the potential adverse consequences of the requirements included in the 2014 Rule because, in a regulatory environment in which sponsor support is mandated, disclosure that the sponsor has provided such support would not be a confusing signal about the need for support or the sponsor's willingness to provide support in the future.

In addition to this disclosure, MMF sponsors would have to provide disclosures about their financial condition. For sponsors that regularly provide current financial information to the public, either through capital markets disclosures or publicly available filings with regulators, such information would be sufficient. Private sponsors that are not otherwise subject to mandated financial disclosure, like the Reserve Management Company or Fidelity, would be required to provide analogous periodic disclosures to allow investors to evaluate their capacity to meet the support requirement.

Mandatory sponsor support is a better approach than the 2014 rule for three reasons. First, experience shows that sponsor support has been remarkably successful in preventing MMFs from breaking the buck (thereby preventing investor losses) and avoiding the contagion effect associated with a run.[328] As the SEC and others have documented, sponsors have supported the NAV of their MMFs for years.[329] Sponsor support has enabled hundreds of MMFs to weather the turmoil of the financial crisis of 2008, the European Debt crisis, uncertainty about the US debt ceiling, the SIV issue and more, without breaking the buck.

---

[327] MMFs would be required to disclose all forms of support, including fee waivers. Unlike the current rule, the proposal would not require sponsors to disclose the reason for providing support, as the reason – supporting the fund's NAV and supplying liquidity—are implicit in the regulatory mandate.

[328] See Brady, et al., supra note __ (documenting effectiveness of sponsor support in preventing MMFs from breaking the buck despite economic stress).

[329] See TAN, supra.

Notably, a commitment to sponsor support reduces run risk because it eliminates the pressure for investors to redeem. As a result, in most circumstances the guarantee alone will be sufficient to provide stability without requiring the sponsor incur substantial cost. The effectiveness of a guarantee is illustrated by the federal government's temporary guarantee during the 2008 financial crisis. Although the government provided nominal insurance of MMF assets, it never paid out any money – sponsor support enabled all the funds other than the Reserve Fund to weather the Lehman default without breaking the buck.[330]

Second sponsor support requires the sponsor, which controls the MMF's investment decisions, to internalize the costs of those decisions. Unlike a government bailout, sponsor support means that the sponsor pays, not the taxpayer. As a result, required sponsor support eliminates the moral hazard problem and instead provides optimal incentives for sponsors to minimize portfolio risk.[331] One of the ongoing concerns about MMFs is the potential that sponsors will take excessive risk in an effort to increase yield and obtain a competitive advantage.[332] Although the SEC's 2010 MMF reforms reduce the degree of permissible risk-taking, so long as the sponsor does not bear the full costs of its risk-taking, it will have an incentive to take excessive risk. Moreover, this appetite for risk is likely to be concentrated in those MMF sponsors that are themselves financially fragile or those that lack independent business

---

[330] See Paul Scott Stevens, Letter to the Editor, Money Market Funds' U.S. Guarantee Was Limited and Temporary, American Banker, Oct. 18, 2012, http://www.americanbanker.com/bankthink/money-market-funds-US-guarantee-was-limited-and-temporary-1053607-1.html (explaining that the Temporary Guarantee Program did not pay out a single claim but generated $1.2 billion in fee revenue from participating MMFs).

[331] Importantly, unlike capital buffers, sponsor guarantees would not provide a discontinuity with respect to sponsor incentives. With required capital buffers, a sponsor's incentive to take risk increases as potential losses approach the size of the buffer because the sponsor will not bear the cost of losses beyond the amount of the buffer. Thus capital buffers create a distortion analogous to that created by low capital requirements for banks.

[332] For example, commentators described the Reserve Fund's risk-taking as excessive, noting that in September 2008, the Reserve Fund's 12 month yield was "the highest among more than 2,100 money funds tracked, according to Morningstar." Steve Stecklow & Diya Gullapalli, A Money-Fund Manager's Fateful Shift, Wall St. J., Dec. 8, 2008, http://online.wsj.com/news/articles/SB122869788400386907. This yield made the Fund an attractive investment –"the fund's assets tripled in two years to $62.6 billion." Id.

reasons for maintaining a sound MMF. Both these concerns about the sponsor's incentives for risk-taking, however, which arguably affect the value of the sponsor's commitment, are highly transparent to MMF investors. Thus, to the extent that sponsor support reduces the independence of an MMF's portfolio from the financial stability of its sponsor, market forces should lead investors to prefer MMFs offered by those sponsors that most credibly can stand behind the MMF's share price.[333]

Third, sponsor support does not create the moral hazard problem associated with external financial support such as a private liquidity facility or an industry-wide insurance or guarantee system because each sponsor is individually responsible for the stability of its own funds. Sponsors that take excessive risk with their MMF portfolios cannot draw upon resources contributed by more conservative sponsors. Similarly, because MMFs would be looking to their individual sponsors for support rather than a common pool, the contagion effect of individual MMF fragility would be contained. Even if a particular sponsor experienced financial distress, that distress would have a limited effect on investors' expectations about the stability of other funds.

VI. Objections to Mandatory Sponsor Support and Responses

The most likely objection to this Article's proposal might be, if mandatory sponsor support is such a good idea, why hasn't someone proposed it?[334] In light of the extensive debate over on MMF reform, it would seem that regulators and commentators have already identified and debated all viable options. The answer to this question is that the viability of sponsor guarantees has been masked by the political dynamic

---

[333] Indeed, Patrick McCabe finds that investors are capable of distinguishing among MMF sponsors; he shows that the MMFs associated with risky sponsors increased a higher level of institutional redemptions during recent economic crises. See McCabe, Cross Section, supra note __ at 34.

[334] Twenty years ago, Howell Jackson proposed a conceptually similar alternative to increased regulation of financial holding companies. Howell E. Jackson, The Expanding Obligations of Financial Holding Companies, 107 Harv. L. Rev. 507 (1994). Jackson argued, analogously to the arguments raised in this article, that "Particularly, in the depository institution field, where illiquid assets and severe informational asymmetries complicate traditional forms of risk-regulation by government agencies, holding company guarantees are a promising innovation in regulatory structure." Id. at 513. Much of Jackson's reasoning can be applied to the context of MMFs.

in which MMF reform has been debated. Commentators have described MMFs as shadow banks, termed the 2008 redemptions a "run" akin to bank runs, and proposed reforms designed to make MMFs more like banks such as capital buffers. As noted above, mandatory sponsor support is only possible because of the unique separation of management and investments in MMFs, a separation that does not exist in a traditional bank.

Politically, sponsor guarantees are also an unattractive option for both key interest groups – banks and mutual fund sponsors. From the perspective of banks, sponsor guarantees highlight the difference between banks and MMFs by tapping a source of financial stability that banks cannot replicate. To the extent that MMFs offer an attractive competitive product, explicit sponsor guarantees would allow them to continue to offer that product without facing the regulatory burdens of banks.

Mutual fund companies, which sponsor roughly half of MMFs, would likely also find explicit sponsor guarantees unattractive for several reasons. First, although sponsors have historically provided support, the voluntary nature of this support provides sponsors with an exit option if that support should prove too costly, as it might, for example, in a situation such as the US government defaulting on its debt. Second, many of the most powerful mutual funds have been successful in avoiding a substantial regulatory burden by persuading the SEC to exempt retail funds. Subjecting themselves to a support commitment would obviously be less attractive. Third, to the extent that they must face additional regulation, sponsors would likely prefer fees and gates, which allow them to transfer the costs of excessive risk-taking to their MMF investors rather than bearing those costs themselves, as they would through a sponsor support requirement.

A second objection might be that, as with capital buffers, explicit sponsor guarantees are too costly. As noted above, one advantage of this Article's proposal is that, because it offers sponsors a variety of mechanisms for meeting their obligation and does not mandate an explicit set-aside of capital, it will be less expensive to implement than a capital buffer. Nonetheless, the contingent liability associated with a guarantee, standby letter of credit or the purchase of illiquid assets (even if those assets will trade at par on maturity) becomes more costly as the size of an MMF grows. As a result, sponsor support may require a sponsor to limit the size of its MMFs to reduce its liability exposure.

This article does not view the prospect that sponsor support might impose a limit on MMF size as problematic; indeed, this might be viewed as an additional advantage of the proposal. If required sponsor support causes sponsors voluntarily to reduce MMF size, that action would reduce the systemic importance of any single MMF. Part of the contagion effect generated by the Reserve Fund's failure was due to its size -- $62.6 billion in assets.[335] The resulting redemption requests created a need for the Reserve Fund to seek billions of dollars' worth of liquidity and to attempt to sell a substantial quantity of securities into a weak credit market. If it is problematic for banks and other financial institutions to get too big, regulation that indirectly places a practical limit on MMF size seems at worst benign.[336] Concededly, MMFs, like other mutual funds, do enjoy economies of size and scale, and funds would sacrifice those economies if they were limited in size.

In addition, although financially-sound sponsors with other substantial business operations, such as large mutual fund companies, could likely fund any support obligation through operating capital or other assets, sponsor support may be particularly burdensome for smaller sponsors or those that lack other businesses. Thus explicit guarantees might have the effect of precluding certain types of sponsors from offering MMFs, either because they would lack the assets to guarantee fund value or that because the market would be skeptical of their ability to meet the support obligation. In retrospect, investors might be more skeptical that the Reserve Management Company, "a stand-alone fund company with almost no other funds under management,"[337] would provide support than a company like Fidelity, which, in 2006 "sponsored 252 non-money market mutual funds with $814 billion in assets under management."[338] Sponsors with other businesses face the most spillover risk if their MMF is fragile and, accordingly, are likely to take steps to reduce prevent that by reducing the riskiness of their MMF assets.[339]

---

[335] See Stecklow & Gullapalli, supra note __, http://online.wsj.com/news/articles/SB122869788400386907.
[336] In particular some administrative expenses are more or less fixed regardless of fund size. See Investment Company Institute, 2014 Investment Company Fact Book, Chapter Five, http://www.icifactbook.org/fb_ch5.html (describing mutual fund fees and expenses and noting economies of scale and size).
[337] See Kacperczyk & Schnabl, Risk-Taking Incentives, supra note __ at 10.
[338] Id. at 11.
[339] See id. at 28 (finding that "funds sponsored by companies with more money fund business took on more risk").

Similarly funds with substantial non-MMF assets are in a better position to provide support.

Again, to the extent this reform has the effect of reducing the ability of financially compromised sponsors to offer MMFs, this Article views that effect as an advantage, not a weakness. Notably, explicit sponsor support changes the focus of market discipline by properly focusing investors on sponsor financial stability in evaluating MMFs rather than on the MMF portfolio. As this Article argued earlier, the structure of MMFs makes direct investor monitoring of portfolio assets problematic. The portfolio's assets are extremely short term, meaning that the quality of the portfolio can change rapidly. Portfolio assets are, in many cases, thinly traded and difficult to price. Finally, the MMF's shadow prices tend to be stale and to incorporate future economic developments incompletely. In contrast, investors can readily monitor the financial condition of MMF sponsors and identify the business practices that provide economic incentives for sponsors to meet their support obligations. This more efficient investor monitoring is a distinctive advantage of this Article's proposal.

At the same time, this Article's proposal would not preclude smaller and less stable sponsors from offering MMFs. Sponsors could address investors' concerns about incentives and solvency through a variety of mechanisms including explicit guarantees, standby letters of credit or purchasing insurance to cover their support obligations.[340] In particular, insurance offers yet another mechanism for monitoring MMF risk, as insurance providers have an economic incentive to understand an MMF sponsor's risk profile and tailor the cost and scope of coverage

---

[340] Some MMFs purchased insurance from the ICI Mutual Insurance Company from 1993 to 2003. See 2013 Rule Proposal, supra note __ at 252 n. 491 (describing cost and coverage of mutual fund portfolio insurance). The ICI has expressed concern that, in today's market, such insurance would either not be available or would be prohibitively expensive. See Investment Company Institute, Report of the Money Market Working Group, March 17, 2009, at 113, avail. at http://www.ici.org/pdf/ppr_09_mmwg.pdf. It should be noted that insurance is available and currently used to ensure the stability of a comparable product – stable value funds. See Robert Steyer, Wrap market returns — but with changes, Pensions & Investments, Dec. 13, 2010, http://www.pionline.com/article/20101213/PRINT/101219979/wrap-market-returns-8212-but-with-changes# (describing use of stable value funds, in which price is maintained through insurance wraps in retirement accounts).

accordingly.[341] Importantly, insurance for an individual sponsor's MMF obligations would be quite different from industry-wide mandated insurance, and would not create the same concerns about cost and moral hazard.[342] On the other hand, the sponsor support requirement could operate as a barrier to entry for smaller potential sponsors, reducing competition in the industry.

Critics may also question whether sponsor support is sufficiently reliable. What happens, under this approach, if a sponsor defaults, as the Bents did? While mandatory sponsor support cannot eliminate the possibility, such a default would be no different from the failure of any financial institution to meet its obligations. Unlike the current system, however, investors would not face unpredictability about whether a sponsor would provide support because such support would be required rather than voluntary. In addition, an MMF sponsor that failed to meet its obligations would face the prospect of an enforcement action, not just the uncertain penalty of market discipline. As a result, solvent and financially responsible sponsors are unlikely to default, and, as described above, investors should have adequate information to identify and avoid sponsors that cannot credibly commit to support their funds.

Finally, this Article proposal can be criticized on the basis that it would undermine the efficient asset partitioning that is a key component of the MMF structure.[343] Sponsor support would make sponsor assets available to meet MMF shortfalls. Importantly, the interference with asset partitioning would be both limited and operate only in one direction. Sponsor assets would only be available to the extent necessary for the MMF to maintain a stable $1 NAV. Concededly, the added liability exposure of fund sponsors could be viewed as another justification for classifying investment managers as systemically important financial institutions or SIFIs.[344] Whether it is appropriate for

---

[341] See Investment Company Institute, Insurance in the US Market for Investment Companies and Related Entities, http://www.ici.org/pubs/white_papers/03_eu_insurance_paper (explaining that "The insurance obtained by investment companies tends to be closely matched to their risk profiles. The insurance company's interest in the process fosters greater accuracy of insurance coverage.").

[342] Cf. 2013 Rule Proposal at 274-75 (describing and rejecting proposal that MMFs be required to obtain some type of insurance)

[343] See Morley, supra note __.

[344] In September 2013, the Office of Financial Research released a report produced at the request of the FSOC to enable the FSOC to consider whether asset managers should

the FSOC to designate asset managers as SIFIs[345] is a controversial topic and beyond the scope of this Article,[346] although it is worth noting that for the vast majority of asset managers, MMFs constitute a small percentage of their total assets under management.[347]

In addition, MMF assets would not be available to meet the needs of a financially distressed sponsor. This segregation of MMF assets from sponsor assets provides the key value of asset partitioning in the mutual fund structure.[348] The segregation is illustrated by the failure of Lehman. Notably, although Lehman's bankruptcy brought down the Reserve Fund, it did not bankrupt Lehman's own mutual funds. The assets of those funds were segregated by law and out of the reach of Lehman's creditors.[349]

Conclusion

Since 2008, MMFs have been targeted for broad-based regulatory reform. Six years later, the SEC has adopted a rule that may have draconian consequences for some types of MMFs while failing to address core concerns about MMF stability. The limitations of the rule can largely be attributed to the flawed process by which it was produced

---

be considered for enhanced regulation as SIFIs. See Office of Financial Research, Asset Management and Financial Stability, Sept. 2013, at 1, avail. at http://www.treasury.gov/initiatives/ofr/research/Pages/AssetManagementFinancialStability.aspx. The OFR concluded that asset managers can "introduce vulnerabilities that could pose, amplify, or transmit threats to financial stability." Id.

[345] It is also conceivable that the FSOC could designate MMFs themselves as SIFIs. For a detailed analysis of why such a designation would not be appropriate see Eric D. Roiter, Should Money Market Funds be Designated as "SIFIs"?, 31 Rev. Banking & Fin. L. 749 (2011-2012).

[346] Both the report and the prospect that the FSOC could designate certain asset managers as SIFIs have generated considerable controversy. See, e.g., Emily Stephenson & Sarah N. Lynch, U.S. senators slam study on systemic risks posed by asset managers, Reuters, Jan. 24, 2014, http://www.reuters.com/article/2014/01/24/us-financial-regulation-asset-idUSBREA0N1LG20140124 (noting claims that the study was flawed and could damage the Treasury Department's reputation).

[347] See Office of Financial Research, supra note __ at 20 (providing data for seven large asset managers). Note, Federated Investors is an exception; its business consists primarily of institutional money market funds. Id.

[348] See also id.

[349] See Anne Kates Smith, What Happens to Lehman's Customers? , Kiplinger, Sept. 15, 2008, http://www.kiplinger.com/article/investing/T023-C000-S001-what-happens-to-lehman-s-customers.html.

and, in particular, the politics of MMF reform. In particular, by analogizing MMF redemptions to bank runs and debating proposed reforms on the basis of whether they will reduce a run risk to zero, policymakers have set an unrealistic objective for MMF reform and imposed a risk reduction requirement far beyond that applicable to the banking industry.

In addition by painting MMFs as part of the shadow banking system, critics have overlooked the critical attribute that distinguishes MMFs from bank deposits – the structural separation of MMFs from their sponsors. This attribute provides the key to increased MMF stability. The solution for reducing MMF fragility lies within MMFs themselves in the form of explicit sponsor support. Although existing law prevents sponsors from committing to maintain a $1 share price, this Article argues that such a commitment is desirable and should be required.

Importantly, however, sponsor support should not be mandated through a rigid and costly vehicle such as capital buffers or mandatory insurance. MMF sponsors come in a variety of different shapes and sizes, and this variety offers a range of possible support mechanisms that take advantage of the sponsors' reputations, outside assets and overall business plans. As a result, sponsor support should be permitted through the range of mechanisms that have been used successfully throughout the history of the MMF. By mandating sponsor support, regulators can formalize existing support practices that have proved valuable in maintaining MMF stability while increasing the transparency of sponsor support to the market.
