Insecta Mundi is a journal primarily devoted to insect systematics, but articles can be published on any non-marine arthropod. Topics considered for publication include systematics, taxonomy, nomenclature, checklists, faunal works, and natural history. **Insecta Mundi** will not consider works in the applied sciences (i.e. medical entomology, pest control research, etc.), and no longer publishes book reviews or editorials. Insecta Mundi publishes original research or discoveries in an inexpensive and timely manner, distributing them free via open access on the internet on the date of publication.

Insecta Mundi is referenced or abstracted by several sources including the Zoological Record, CAB Abstracts, etc. **Insecta Mundi** is published irregularly throughout the year, with completed manuscripts assigned an individual number. Manuscripts must be peer reviewed prior to submission, after which they are reviewed by the editorial board to ensure quality. One author of each submitted manuscript must be a current member of the Center for Systematic Entomology.

Abstract. *Megapsyrassa xestiooides* (Bates, 1872) (Coleoptera: Cerambycidae: Cerambycinae: Elaphidiini) is reported from Colombia for the first time. Ecological information is also provided.

Key Words: Longhorn beetles, Neotropical, new records, South America.

Introduction

Megapsyrassa Linsley, 1961 presently includes seven described species from western Mexico to Panama (Bates 1880; Giesbert 1993; Lingafelter 1998; Maes et al. 2010; Swift et al. 2010; Monné 2015). The Colombian Elaphidiini fauna is poorly studied, as indicated by the mere 25 species recorded in cerambycid checklists (Swift et al. 2010) and catalogues (Monné 2015), and *Megapsyrassa* species have not been recorded for Colombia. We present a record of *Megapsyrassa* from Colombia, extending its known range into South America.

Materials and Methods

An individual of *M. xestiooides* (Fig. 1) was collected on the Caribbean side of Colombia: Departamento de Sucre, Municipio de Toluviejo, Parque Aventura Roca Madre, 09°30'50.18"N / 075°23'40.254"W, 29 April 2015, C. Taboada col. The specimen has been deposited in the colección Familia Pardo-Locarno, Colombia (CFPL-COL). To confirm the identification of our specimen we consulted several cerambycid collections in Colombia, but unfortunately found no other specimens. Comparisons with specimens in the Museo de Invertebrados G.B. Fairchild, Universidad de Panamá (MIUP) revealed two specimens with identical collection data: Panama, Colon, Fort Sherman, 8 May 1999, Wappes and Morris col.

Results

The specimen reported here is the first record of *M. xestiooides* outside of the Central American region. It was collected in an area dominated by primary lowland tropical dry forest, a habitat that generally matches that of *M. xestiooides* localities in previously reported countries, all of which are in comparable lowland super-humid rainforest, tropical dry forest, and tropical rainforest of the Holdridge life zone (Maes et al. 2010).

Acknowledgments

The authors thank the late Ubirajara R. Martins de Souza (Museu de Zoologia, Universidade de São Paulo, Brazil) for confirmation of the species determination. We also appreciate the assistance of Julian Salazar (Museo de Historia Natural, Universidad de Caldas), Jhon Alveiro Quiroz Gamboa (Museo Entomológico Francisco Luis Gallego, Universidad Nacional), Alonso Santos Murgas and Roberto Cambra (MIUP) for their support in our search for specimens of *M. xestiooides* in their insect collections. We also thank Antonio Santos-Silva (Museu de Zoologia, Universidade de São Paulo, Brazil) and Annette Aiello (Smithsonian Tropical Research Institution) for their useful comments and reviews of the manuscript.
