Table S2: Excluded Pan Assay Interference Compounds (PAINS).

| Structure | Reason for exclusion |
| :--- | :--- |
| Shift higher than the threshold on all five proteins. |  |
| Shift higher than the threshold for sEH-H, LTA4H, and RXR. |  |
| Contains reactive hydrazine functional group |  |

## General

The Prestwick Drug-Fragment Library and all compounds tested in the orthogonal assay systems were purchased from Prestwick Chemical Librarys (lllkirch, France). The compounds measured in the ITC experiments were purchased from TCI Deutschland GmbH (compound 1), Fluorochem Ltd (compound 4,5 and 8) and BLD Pharmatech GmbH (compound 9 and 10). The restriction enzymes BamHI and Xhol were purchased from New England Biolabs GmbH. LB Broth and SYPRO® Orange Protein Gel Stain were purchased from Invitrogen ${ }^{\mathrm{TM}}$. If not otherwise declared the used chemicals were either purchased from AppliChem GmbH, Thermo Fisher (Kandel) GmbH, Merck KGaA or Carl Roth GmbH + Co. KG.

Purity of all active compounds was determined with a LCMS 2020 and a coupled UV detector module SPD-20A from Shimadzu. The columns Luna 10u C18(2) 100A ( $250 \times 4.60 \mathrm{~mm}$ ) and Luna 10u CN 100A ( $250 \times 4.60 \mathrm{~mm}$ ) from Phenomenex were used with a flow rate of $1 \mathrm{~mL} / \mathrm{min}$. The eluents were $0.1 \%$ formic acid and acetonitrile and the detection occurred via UV absorption at two wavelengths (254 and 280 nm ). All final compounds exhibit a purity over $95 \%$ at 254 nm and 280 nm . The methods were as followed:

Method A: linear gradient from $40 \%$ to $90 \%$ acetonitrile within $10 \mathrm{~min}, 90 \%$ acetonitrile were hold for another 6 min, linear gradient from $90 \%$ to $40 \%$ within $2 \mathrm{~min}, 40 \%$ acetonitrile were hold for 2 min

Method B: hold $5 \%$ acetonitrile for 2 min, linear gradient from 5\% to $90 \%$ acetonitrile within $12 \mathrm{~min}, 90 \%$ acetonitrile for further 4 min , linear gradient from $90 \%$ to $5 \%$ within $1 \mathrm{~min}, 90 \%$ acetonitrile were hold for 1 min

Method C: linear gradient from $30 \%$ to $90 \%$ acetonitrile within $10 \mathrm{~min}, 90 \%$ acetonitrile were hold for another 5 min, linear gradient from $90 \%$ to $30 \%$ within $1 \mathrm{~min}, 30 \%$ acetonitrile were hold for 4 min

## SOM training

The Kohonen network was used only for visualization of the chemical space. Overall, 16,791 compounds (1,280 approved drugs, 2,630 sEH inhibitors, 5,1635 -LO inhibitors, 1,118 LTA4H inhibitors, 2,831 RXR ligands, 3,769 FXR ligands) were used for training. Approved drugs were retrieved from the Prestwick Drug Library, while the other compounds were downloaded from ChembIDB v24 using the human target name as search item via the DataWarrior "Search Chembl Database" interface. FragFP fingerprints were calculated and a $50 \times 50$ Kohonen network was trained using default settings.

Cloning of FXR and RXR constructs

FXR cloning:
The FXR LBD construct (aa244-472) was cloned using the pFA-CMV-hFXR-LBD ${ }^{2}$ as PCR template (forward primer 5'-CCCCGGATCCGAACTGACCCCAGATCAACAG-3' and reverse primer 5'-CCCCCTCGAGTCATTATCACTGCACGTCCCAGATTTC-3). The PCR product as well as a modified pET29-vector were linearized with the restriction enzymes BamHI and Xhol and purified using NucleoSpin® Gel and PCR Clean-up (MACHERYNAGEL) according to supplier protocol. The purified products were ligated using T4-ligase for 1 h at $37^{\circ} \mathrm{C}$. The mixture was then used to transform E. coli (DH5a) by standard heat shock transformation protocol. Single clones were selected from agarose plates, containing a final concentration of $100 \mu \mathrm{~g} / \mathrm{ml}$ Kanamycin and multiplied plasmids were extracted using NucleoSpin $®$ Plasmid EasyPure (MACHERY-NAGEL) according to supplier protocol. The sequence of the insert was verified by Sanger sequencing. (Microsynth Seqlab) .The final construct carried an N -terminal $\mathrm{His}_{6}$-tag and a TEV site followed by the FXR LBD.

(TGCTAGTTATTGCTCAGCGG) from Microsynth Seqlab) using the standard settings of "map to reference" with the software Geneious 11.0.5.

RXRa cloning:
The wildtype RXRa LBD construct (aa225-462) was first amplified via PCR (forward primer 5'-CCGAAAACCTGTACTTCCAGGGATCCACCTCTTCCGCCAATGAAGATATGCCGG-3' and reverse primer 5'-CTGCAGGTCGACCTCGAGTCATTAGGTCATCTGATGCGGAGCTTCC-3') from a tag free RXRa LBD construct and carried an N-terminal TEV recognition and cleavage side. The PCR product was again cloned into a pMAL vector with an ampicillin resistance using PCR (forward primer 5'-ATGACTCGAGGTCGACCTGCAGGCAAGCTTGG-3' and reverse primer 5'-CTGCAGGTCGACCTCGAGTCATTAGGTCATCTGATGCGGAGCTTCC-3'). The final construct carried an N-terminal maltose binding protein (MBP) tag followed by a poly-N-tag, a His $\mathbf{8}_{8}$-tag and a TEV site.

Protein expression and purification

FXR, LTA4H, sEH-H and sEH-FI:
The LTA4H was purified as previously described ${ }^{3}$ and FXR was purified adapted from Merk et. al. ${ }^{4}$. In brief, for the expression of LTA4H and FXR transformed E.coli BL21 (DE3) cells were grown in LB Broth supplemented with $100 \mu \mathrm{~g} / \mathrm{ml}$ Kanamycin at a temperature of $37^{\circ} \mathrm{C}$ and shaking speed of 180 rpm until an $\mathrm{OD}_{600}$ of 0.8 was reached. Then the cultures were induced by the addition of isopropyl $\beta$-D-thiogalactopyranosid (IPTG), with a final concentration of $400 \mu \mathrm{M}$ in case of the LTA4H and $100 \mu \mathrm{M}$ for FXR. After induction the incubation temperature was lowered to $21^{\circ} \mathrm{C}$ for LTA4H and $18{ }^{\circ} \mathrm{C}$ in case of FXR. Cultures were harvested after $\sim 18 \mathrm{~h}$ by centrifugation at $4^{\circ} \mathrm{C}$ with 5500 xg for 20 min (centrifuge: Sorvall LYNX 4000 super speed centrifuge; rotor: F12-6X500-LEX fiberlite). For the expression of sEH-H and sEH-FI transformed E.coli BL21 (DE3) cells were grown in 5052 media supplemented with $100 \mu \mathrm{~g} / \mathrm{ml}$ kanamycin at $37^{\circ} \mathrm{C}$ and 180 rpm as described by Hahn et al. ${ }^{5}$ and Lukin et al. ${ }^{6}$. Temperature was reduced to $16^{\circ} \mathrm{C}$ after 3 h and cells were harvested by centrifugation after additional 42 h of incubation. The cell pellets were either stored at $-20^{\circ} \mathrm{C}$ or directly suspended in buffer A supplemented with DNAse I and protease inhibitor mix (cOmplete ${ }^{\mathrm{TM}}$, EDTA-free Protease Inhibitor Cocktail, Roche). Cell suspension was lysed by a cell homogenizer (Invensys APV-1000 Homogenizer, Denmark). The lysed cells were centrifuged with $43992 \times \mathrm{g}$ at $4^{\circ} \mathrm{C}$ for 1 h (centrifuge: Sorval RC 5B Plus; rotor: HFA22.50). The supernatant was filtrated using a 0.45 mm syringe filter, before the filtrate was further purified by using an ÄKTA purifier (GE Healthcare) with a 5 ml HisTrap HP (GE Healthcare) equilibrated and run in buffer A. The HisTrap was eluted using buffer B and the protein concentration of the elution fractions was measured. The fractions containing protein were pooled and if necessary the volume was reduced to 5 ml by using an Amicon® Ultra-15 Centrifugal Filter Unit with a 3 kDa cutoff and centrifuging at $4^{\circ} \mathrm{C}$ with $2500 \times \mathrm{g}$ (centrifuge: 5810R; rotor: $\mathrm{F}-34-6-38$ ). In case of FXR, LTA4H and $\mathrm{sEH}-\mathrm{H}$ the protein was filtrated through a 0.22 mm filter and the 5 ml were further purified by using the ÄKTA purifier (GE Healthcare) running in buffer C and a HiLoad 16/600 Superdex 75 pg $^{\top \mathrm{M}}$ (GE Healthcare) for FXR and a HiLoad 16/600 Superdex $200 \mathrm{pg}^{\mathrm{TM}}$ (GE Healthcare) in case of LTA4H and sEH-H. sEH-FI was instead dialyzed two times against $\sim 100 x$ volume of buffer C for about 8 h each. The purity of the protein was evaluated by SDS page using a $14 \%$ polyacrylamide gel followed by Coomassi staining. The amount of protein was determined by measuring the sample with a NanoDrop ${ }^{T M} 2000$ c. The fractions containing pure protein were pooled. They were either used for ITC experiments or in case of sEH-H and sEH-FI the pooled fractions were supplemented with glycerol to a final concentration of $20 \%$. The pooled fractions were then frozen in liquid nitrogen and then stored at $-80^{\circ} \mathrm{C}$.

For the ITC experiments FXR was expressed as described above but after the purification using a 5 ml HisTrap HP (GE Healthcare) the fractions containing the protein were pooled and a self-produced TEV protease containing a 6xHis tag was added with a molar ratio of $1: 10$. The mixture was dialyzed overnight using buffer A and a dialysis membrane with a 3 kDa MWCO. Then a second run using a 5 ml HisTrap HP (GE Healthcare) was performed. Proteins without His-tag were in the flow through. These fractions were concentrated using an Amicon $®$ Ultra-15 Centrifugal Filter Unit with a 10 kDa cutoff centrifuged at $4^{\circ} \mathrm{C}$ with $2500 \times \mathrm{g}$ (centrifuge: 5810R; rotor: F-34-6-38) until a final volume of 5 ml was reached. Concentrated sample was further purified by gel filtration in an analog fashion to the normal FXR purification. From the fractions containing the highest amount of protein an SDS page was performed and the purest fractions were pooled and dialyzed two times for 12 h in 1 L buffer C . The protein was frozen in liquid nitrogen and stored at $-80^{\circ} \mathrm{C}$. The dialysis buffer was stored at $-20^{\circ} \mathrm{C}$.

## 5-LOX:

The 5-LOX protein was expressed and purified as previously published ${ }^{7,8}$. In short the transformed E.coli BL21 (DE3) cells were grown in LB Broth supplemented with $50 \mu \mathrm{~g} / \mathrm{ml}$ ampicillin at a temperature of $37^{\circ} \mathrm{C}$ and shaking speed of 180 rpm for 5 h . Then the temperature was reduced to $21^{\circ} \mathrm{C}$ and the cultures were induced by adding IPTG to a final concentration of $200 \mu \mathrm{M}$. After growing overnight, the cells were harvested by centrifugation (centrifuge: Sorval RC 5B Plus; rotor: HFA12.500). The cells were
suspended using 20 ml buffer A per Liter of expression culture and chilled for 20 min on ice. The suspended cells were lysed by sonification (Bandolin MS73) $3 \times 1 \mathrm{~min}$ with $90 \%$ intensity. Cell homogenate was centrifuged (centrifuge: Sorval® RC-5B Refrigerated Superspeed Centrifuge; rotor: 5534) for 15 min at $4^{\circ} \mathrm{C}$ with $10,000 \times \mathrm{g}$, before the supernatant was further centrifuged for 70 min at $4^{\circ} \mathrm{C}$ with $100,000 \times \mathrm{g}$ (centrifuge: Optima ${ }^{\text {TM }}$ LE-80K Ultracentrifuge; rotor: Beckman fixed angle rotor 55.2 Ti ). The supernatant was applied on a custom-made ATP-column with a column volume of $\sim 3.5 \mathrm{ml}$ followed by a ResourceQ 1 ml column. Purification steps were performed by means of an ÄKTA Xpress system (GE Healthcare) using buffer B. The 5-LOX was eluted using buffer B supplemented with 500 mM NaCl and then a gradient from $0 \%$ up to $100 \%$ of buffer B supplemented with 20 mM ATP. For the DSF experiments the buffer was changed to buffer B using an ÄKTA purifier (GE Healthcare) with three subsequentially arranged 5 ml HiTrap® Desalting Columns (GE Healtcare). The concentration was determined by performing a Bradford assay according to the Bio-Rad instruction manual.

## RXRa:

For the RXRa protein expression the pMal plasmid coding for the wildtype RXRa LBD construct was transformed into competent E.coli T7-express cells which already held a pGro7 co-plasmid, coding for the GroEL/ES chaperone, with a chloramphenicol resistance (from the Chaperone Plasmid Set Cat. \#3340, TAKARA Bio Inc. (Japan)). Positive clones were selected on LB -plates supplemented with $100 \mu \mathrm{~g} / \mathrm{ml}$ ampicillin and $34 \mathrm{mg} / \mathrm{ml}$ chloramphenicol. These clones where then used to inoculate a pre-culture of 250 ml LB-medium supplemented with $100 \mu \mathrm{~g} / \mathrm{ml}$ ampicillin and $34 \mathrm{mg} / \mathrm{ml}$ chloramphenicol. After incubation of $1 \mathrm{~h}\left(37^{\circ} \mathrm{C}, 180\right.$ $\mathrm{rpm}), 40 \mathrm{ml}$ of the pre-culture were used to inoculate the expression culture of 1 ILB -medium without antibiotics. The expression culture was incubated at $37^{\circ} \mathrm{C}$ with 180 rpm . At an $\mathrm{OD}_{600}$ of approximately $0.6-0.7$ the GroEL/ES expression was induced using 1 mg Arabinose. The flasks were then moved into a shaker at $20^{\circ} \mathrm{C}$ and 120 rpm .30 minutes later at an $\mathrm{OD}_{600}$ of 0.9-1.0 the target protein expression was induced using 0.5 mM IPTG. The expression cultures were incubated overnight and then harvested at 6000 rpm at $4^{\circ} \mathrm{C}$ for 15 min (centrifuge: Sorval $®$ Lynx 6000 ; rotor: $\mathrm{F} 10-4 \times 1000$ ). For the purification a pellet of 2 I E. coli culture was suspended in 50 ml lysis buffer A supplemented with protease inhibitor, DNAse, RNAse and lysozyme. Incubation was performed for at least 30 min and the mechanically lysis was done with a cell homogenizer (Invensys APV-1000 Homogenizer, Denmark). In order to force the ATP dependent GroEL/ES release the lysate was then incubated with 1 mM ATP for at least 30 min on ice. The cell debris were removed via centrifugation ( $16500 \mathrm{xg}, 20 \mathrm{~min}, 4^{\circ} \mathrm{C}$, centrifuge: Eppendorf 5810 R ; rotor: F-34-6-38) and the supernatant was applied onto a 15 ml Ni-IDA Sepharose 6 fast-flow column. The target protein eluted at 300 mM imidazole. The N-terminal MBP used as a solubility-tag was removed with the help of a recombinant MBP-TEV protease during dialysis in 3 I buffer B. The TEV protease was applied with a $1: 50$ molar ratio. In order to remove the MBP-TEV protease, the cleaved N -Terminal MBP-tag and undigested target protein from the protein solution an amylose affinity chromatography (AAC) step was performed. An Amylose High Flow resin (NEB) on a gravity flow column was used. The MBP-TEV digest was applied onto the column and the flow through containing the cleaved protein was collected. The flow through of the AAC was then concentrated and purified in a final step with a $26 / 60$ Superdex 75 column on an ÄKTA purifier system in assay buffer C. The elution fractions were pooled, shock frozen with liquid nitrogen and stored at $-80^{\circ} \mathrm{C}$.

For the ITC measurements RXRa was dialyzed, using a dialysis membrane with a 3 kDa MWCO and placed in 2 I fresh buffer C, overnight. Then concentrated using an Amicon® Ultra-15 Centrifugal Filter Unit with a 3 kDa cutoff and centrifuging at $4^{\circ} \mathrm{C}$ with 1500 xg (centrifuge: Eppendorf 5810R; rotor: $\mathrm{F}-34-6-38$ ) until a concentration higher than $50.5 \mu \mathrm{M}$ was reached.

Table S3: All buffers used for the protein purification:

| Protein | buffer A | buffer B | buffer C |
| :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { sEH-H/ } \\ & \text { sEH-FI } \end{aligned}$ | 50 mM Tris, $500 \mathrm{mM} \mathrm{NaCl}, 70 \mathrm{mM}$ imidazole, $\mathrm{pH}=8$ | $\begin{array}{ll} 50 \mathrm{mM} & \text { Tris, } \quad 500 \mathrm{mM} \\ 400 \mathrm{mM} & \mathrm{NaCl}, \\ \text { imidazole, } & 10 \mathrm{mM} \\ \mathrm{MgCl}_{2}, \mathrm{pH}=8 \end{array}$ | 50 mM Tris, 50 mM NaCl , $\mathrm{pH}=8$ |

| 5-LO | 50 mM Triethanolamine, 5 mM EDTA, $1 \mathrm{mg} / \mathrm{ml}$ Lysozym, 0.4 mM PMSF, 2 mM DTT, $60 \mu \mathrm{~g} / \mathrm{ml}$ Soybean Trypsin Inhibitor, $\mathrm{pH}=8$ | 1X DPBS, 1 mM EDTA, pH = 7.5 | $1 \mathrm{XPB}, 1 \mathrm{mM} \mathrm{EDTA}, \mathrm{pH}=7.5$ |
| RXRa | $400 \mathrm{mM} \mathrm{NaCl}, 20 \mathrm{mM} \mathrm{NaP}$ i pH 7.8, $10 \% ~(\mathrm{w} / \mathrm{v})$ Glycerol, 20 mM Bmercaptoethanol, 20 mM imidazole, 20 mM MgSO 4 | $400 \mathrm{mM} \mathrm{NaCl}, 20 \mathrm{mM} \mathrm{NaP} i \mathrm{pH}$ 7.8, 10\% (w/v) Glycerol, 20 mM B-mercaptoethanol | 150 mM potassium fluoride, 25 mM HEPES, 5 mM DTT, $10 \%$ glycerol, $\mathrm{pH}=7.5$ |

Figure S3: SDS page of the purified proteins (proteins RXRa and FXR after TEV cleavage) using a $14 \%$ polyacrylamide gel, which was stained with coomassi. Precision Plus Protein ${ }^{T M}$ Unstained Protein Standards (Bio-Rad Laboratories, Inc.) was used as protein standard.

## DSF screening

All experiments were performed as duplicates using MicroAmp fast 96 -well plates. Each plate contained 80 different compound wells and 16 DMSO control wells. First $0.8 \mu \mathrm{l}$ of a 25 mM Preswick Library Fragment dilution in DMSO or pure DMSO were placed in each of the well (final concentration $500 \mu \mathrm{M}$ ). Then $39.2 \mu \mathrm{l}$ of the master mix (containing protein, Triton x-100, SYPRO® Orange Protein Gel Stain and buffer that corresponds to the tested protein) were added.

Table S4: Final concentrations in DSF experiments:

| Protein | Final concentrations under screening conditions |
| :---: | :---: |
| sEH-H | $500 \mu \mathrm{M}$ compound, $5 \mu \mathrm{M}$ protein, 19.625 mM Bis-tris, 3.6125 mM Tris, $3.6125 \mathrm{mM} \mathrm{NaCl}, 1.7 \%$ (V/V) glycerol, $0.01 \%$ (W/V) Triton X-100, 2.05 \% DMSO and $2.5 x$ SYPRO® with a pH = 7 |
| LTA4H | $500 \mu \mathrm{M}$ compound, $5 \mu \mathrm{M}$ protein, 43.5 mM Tris, $43.5 \mathrm{mM} \mathrm{NaCl}, 0.01 \%$ (W/V) Triton X-100, 2.05\% DMSO and 2.5 x SYPRO® with a $\mathrm{pH}=8$ |
| 5-LOX | $500 \mu \mathrm{M}$ compound, $3.5 \mu \mathrm{M}$ protein, 0.87 x DPBS, 0.87 mM EDTA, $0.01 \%$ (W/V) Triton X-100, 2.1\% DMSO and $5 x$ SYPRO® with a $\mathrm{pH}=7.5$ |
| RXRa | $500 \mu \mathrm{M}$ compound, $5 \mu \mathrm{M}$ protein, 130.5 mM potassium fluoride, 21.75 mM HEPES, 4.35 mM DTT, 8.7 \% (V/V) glycerol, $0.01 \%(\mathrm{~W} / \mathrm{V})$ Triton X-100, $2.1 \%$ DMSO and 5 x SYPRO® with a pH $=7.5$ |
| FXR | $500 \mu \mathrm{M}$ compound, $5 \mu \mathrm{M}$ protein, 1.16 mM TRIS, $11.6 \mathrm{mM} \mathrm{NaCl}, 0.58 \mathrm{mM}$ DTT, 100 mM sodium citrate , $0.01 \%$ (W/V) Triton X-100, 2.1\% DMSO and 5x SYPRO® with a pH = 5.5 |

The measurements were performed using a iCycler iQ ${ }^{\text {TM }}$ Single-Color Real Time PCR device with a heat rate of $1^{\circ} \mathrm{C}$ per min, an excitation wavelength of 490 nm and an emission wavelength of 570 nm . The first derivation calculated by MyiQ Optical Software 1.0 was analyzed using Microsoft Office Excel 2013 by comparing the maxima. A shift of $1^{\circ} \mathrm{C}$ (in case of $5-\mathrm{LOX} 0.9^{\circ} \mathrm{C}$ ) or more compared to the DMSO control were assumed as potentially binding of the fragment.

Fragments:
The 10 fragments showing dual activity in the DSF experiments were validated by functional assay screening with a fixed concentration of $500 \mu \mathrm{M}$ in case of sEH-H and LTA4H, $100 \mu \mathrm{M}$ in case of $5-\mathrm{LOX}$ and $30 \mu \mathrm{M}, 10 \mu \mathrm{M}$ and $5 \mu \mathrm{M}$ in case of FXR and RXRa. The FXR and RXRa activity assays didn't show any results, because the concentration of used fragments was toxic for the cells or didn't show any activity. The compounds showing an inhibition greater than $50 \%$ (sEH and LTA4H), greater than 70 $\% ~(5-L O X)$ as well as the hits determined in the DSF experiments were further measured with concentrations between $1000 \mu \mathrm{M}$ and $0.1 \mu \mathrm{M}$ (sEH-H and LTA4H) and between $300 \mu \mathrm{M}$ and $1 \mu \mathrm{M}$ (5-LOX). The sEH and LTA4H activity assays were performed as triplicate and repeated 3 times. The 5-LOX activity assay was performed with one point per concentration and repeated 3 times Raw data was first analyzed in Microsoft Office Excel (2013), before $I C_{50}$ curves were plotted and further analyzed using GraphPad Prism 7 and GraphPad Prism 8 for the shown graphs.

Approved drugs:
The eight approved drugs were measured in the orthogonal assay systems analogous to the fragments. The approved drugs were tested on the targets, where the fragment structure they contain, showed activity. For the sEH-H and LTA4H, they were measured as triplicate in concentrations between $1000 \mu \mathrm{M}$ and $1 \mu \mathrm{M}$ and each measurement was repeated three times. For the 5-LOX they were measured as single point measurement in three different experiments with concentrations between $300 \mu \mathrm{M}$ and $1 \mu \mathrm{M}$. For FXR and RXRa a single hybrid reporter gene measurement with three concentrations between $30 \mu \mathrm{M}$ and $3 \mu \mathrm{M}$ was performed. Raw data was processed according to the fragments.
sEH-H activity assay:
The sEH-H activity assay was performed adapted from Hahn et al. ${ }^{5}$ and Lukin et al. ${ }^{6}$. In short $1 \mu$ l of compound dilution in DMSO or pure DMSO (for the positive and negative control) was placed in a black 96 -well plate (Thermo Scientific ${ }^{\text {TM }}$ Nunc ${ }^{\text {TM }}$ F96 MicroWell ${ }^{\text {TM }}$ Black Polystyrene Plate) and then $89 \mu$ of protein-mix or buffer mix (without protein as negative control) were added and the mixture was incubated for 30 min at room temperature. $10 \mu \mathrm{l}$ of 0.6 mM 3-phenyl-cyano(6-methoxy-2-naphthalenyl)methylester-2-oxiraneacetic acid (PHOME) were added to every well. The Plate was measured every minute for 45 min. Final concentration per well was $3 \mathrm{nM} \mathrm{sEH}-\mathrm{FI}, 0.001 \%$ Triton X-100, 25 mM Bis-tris, $0.1 \mathrm{mg} / \mathrm{ml} \mathrm{BSA}, \mathrm{pH}=7.0,1.6 \%$ DMSO and $60 \mu \mathrm{M}$ PHOME.

## LTA4H activity assay:

The LTA4H activity assay was performed adapted from Hiesinger et al. ${ }^{3}$.As in the sEH-H measurement $1 \mu \mathrm{l}$ of compound dilution in DMSO or pure DMSO (for the positive and negative control) was placed in a black 96 -well plate (Thermo Scientific ${ }^{\text {TM }}$ Nunc ${ }^{\text {TM }}$ F96 MicroWell ${ }^{\text {TM }}$ Black Polystyrene Plate) and then $89 \mu \mathrm{l}$ of protein-mix or buffer mix (without protein as negative control) were added and incubated for 30 min at room temperature. Then the reaction was started by the addition of $10 \mu \mathrm{l} 1.82 \mathrm{mM} \mathrm{L}$-arginin7 -amido-4-methylcumarine (Arg-AMC) to every well. After the addition the plate was measured every minute for 45 min . The final concentration per well was 100 nM LTA4H, $0.001 \%$ Triton X-100, 48.7 mM Tris, $48.7 \mathrm{mM} \mathrm{NaCl}, \mathrm{pH}=8,1.4 \% \mathrm{DMSO}$ and $182 \mu \mathrm{M}$ Arg-AMC.

## 5-LOX activity assay:

The 5-LOX-activity assay was performed adapted from Wertz et al. ${ }^{9}$ and Kretschmer et al. ${ }^{7}$. In short, the purified 5-LOX protein was used in a final concentration of $3 \mu \mathrm{~g} / \mathrm{ml}$ in assay buffer ( $1 \times \mathrm{PBS}, 1 \mathrm{mM}$ EDTA, $\mathrm{pH}=7.4$ ) and preincubated with $10 \mu \mathrm{l}$ compound in DMSO or pure DMSO as positive control. Then 1 mM ATP (Roth) was added. The mixture was preincubated for 15 min on ice and then for 30 s at $37^{\circ} \mathrm{C}$ using a water bath. The reaction was started by addition of $2 \mathrm{mM} \mathrm{CaCl}{ }_{2}$ and $20 \mu \mathrm{M}$ arachidonic acid (Cayman). After 10 min of incubation at $37^{\circ} \mathrm{C}$ the reaction was stopped by adding 1 ml of chilled methanol and the reaction vessel was placed on ice. $30 \mu \mathrm{l} 1 \mathrm{~N} \mathrm{HCl}, 200 \mathrm{ng}$ of Prostaglandin B1 (as internal standard) and $500 \mu \mathrm{~L}$ PBS were added. The Clean-UP C-18 solid phase extraction columns (UCT) were conditioned using 1 ml of methanol and 1 ml of water. Then the samples were given on the columns and washed with 1 ml water and $1 \mathrm{ml} 25 \%$ methanol. The extraction was performed by the addition of $300 \mu \mathrm{l}$ $100 \%$ methanol. The extract was diluted by adding $120 \mu \mathrm{l}$ water and $100 \mu \mathrm{l}$ of this dilution were analyzed by HPLC using the method and setup as described from Steinhilber et al. ${ }^{10}$.

Hybrid reporter gene assay FXR and RXRa:
The assay was performed as described by Pollinger et al..$^{2}$. In brief HEK293T cells were cultured at $37^{\circ} \mathrm{C}$ and $5 \% \mathrm{CO}_{2}$ using a mixture of DMEM high glucose, $10 \%$ FCS, 1 mM sodium pyruvate, $100 \mathrm{U} / \mathrm{ml}$ penicillin and $100 \mu \mathrm{~g} / \mathrm{ml}$ streptomycin. The cells were seeded in a 96 -well plate with a density of $3^{*} 10^{4}$ cells/well and after a growth time of 24 h the medium was changed to Opti-MEM. For the transfection Lipofectamin LTX reagent (Invitrogen ${ }^{T M}$ ) with the respective plasmids was used as described in the manufacturer's protocol. For FXR testing the plasmids pFR-Luc (Stratagene), pRL-SV40 (Promega) and pFA-CMV-hFXR-LBD were used. For RXRa the plasmids pFR-Luc (Stratagene), pRL-SV40 (Promega) and pFA-CMV-hRXRa-LBD. 5 h after transfection the medium was changed to a mixture of Opti-MEM, $100 \mathrm{U} / \mathrm{ml}$ penicillin, $100 \mu \mathrm{~g} / \mathrm{ml}$ streptomycin and $0.1 \%$ DMSO with or without compound (untreated control). After incubation for 14-16 h the Dual-Glo ${ }^{\text {TM }}$ Luciferase Assay System (Promega) was performed as described by the manufacturer. The luminescence was measured using a Spark 10M luminometer (Tecan Deutschland GmbH ) device. The measured firefly luciferase data were divided by the associated renilla luciferase data and multiplied by 1000 leading to a normalized result as relative light unit (RLU). The fold activation was then obtained by dividing the RLUs of the compound by the mean of the untreated control. Every plate also contained reference compounds (GW4064 for FXR and bexarotene for RXRa) as positive control.

ITC measurements for sEH-H, LTA4H, FXR, and RXRa:
ITC experiments were performed in normal mode using an "Affinity ITC" (TA-Instruments) at $25^{\circ} \mathrm{C}$. FXR was used with a concentration of $50 \mu \mathrm{M}$ in Tris buffer ( 10 mM Tris, $100 \mathrm{mM} \mathrm{NaCl}, 5 \mathrm{mM} \mathrm{DTT}, \mathrm{pH}=8.3$ ), supplemented with $1 \%$ DMSO and $0.5 \%$ CHAPS. RXRa was also used in a concentration of $50 \mu \mathrm{M}$ in a HEPES buffer (containing 150 mM potassium fluoride, 25 mM HEPES, 5 mM DTT, $10 \%$ Glycerol, $\mathrm{pH}=7.5$ ) supplemented with $1 \%$ DMSO and $0.5 \%$ CHAPS. LTA4H was used with a
concentration of $20 \mu \mathrm{M}$ (for compound 10) and $40 \mu \mathrm{M}$ (for compound 9) in a Tris buffer ( 50 mM Tris, $50 \mathrm{mM} \mathrm{NaCl}, \mathrm{pH}=8$ ) supplemented with $1 \%$ of DMSO. sEH-H was used with a concentration of $20 \mu \mathrm{M}$ (for compound 10) and $40 \mu \mathrm{M}$ (for compound 9) in a Tris buffer ( 50 mM Tris, $500 \mathrm{mM} \mathrm{NaCl}, \mathrm{pH}=8$ ) supplemented with $1 \%$ of DMSO. $300 \mu \mathrm{~L}$ of the protein solution were placed in the cell. For blank experiments the dialysis buffer supplemented with $1 \%$ DMSO and $0.5 \%$ CHAPS was used. A $250 \mu \mathrm{M}$ or a $100 \mu \mathrm{M}$ dilution of compound in buffer containing final concentrations of $1 \%$ DMSO (as well as $0.5 \%$ CHAPS, in case of FXR and RXRa) was placed in the syringe. The titrations were performed with 1 injection of $0.5 \mu \mathrm{~L}$ and 30 injections with $2 \mu \mathrm{~L}$ or 35 injections with $1.5 \mu \mathrm{~L}$ as well as a spacing time between the injections of 240 or 300 seconds. One measurement with protein in the cell and blank buffer (respective buffer supplemented with $1 \%$ DMSO (as well as $0.5 \%$ CHAPS, in case of FXR and RXRa)) in the syringe was performed as well as two times for every compound measurement. A second blank experiment was performed where compound was titrated in the respective blank buffer. The results were analyzed using the program "NanoAnalyze Data Analysis" (Version 3.10.0 from TA Instruments) by subtracting a fix heat, determined by the blank experiments and using the independent option for modeling.

$\mathrm{IC}_{50}$ measurement results:
sEH-H activity:

 triplicate in three different measurements with concentrations between $1 \mu \mathrm{M}$ and $1000 \mu \mathrm{M}$.

LTA4H activity:

Figure S10: $\mathrm{IC}_{50}$ determination of compounds $\mathbf{3}(\mathrm{A}), \mathbf{4}(\mathrm{B}), \mathbf{5}(\mathrm{C}), \mathbf{7}(\mathrm{D}), \mathbf{9}(\mathrm{E})$, and $\mathbf{1 0}(\mathrm{F})$ towards LTA4H activity. Measured as triplicate in three different measurements with concentrations between $1 \mu \mathrm{M}$ and $1000 \mu \mathrm{M}$.

Figure S11: $\mathrm{IC}_{50}$ determination of compound $\mathbf{2}(\mathrm{A}), \mathbf{5}(\mathrm{B}), \mathbf{7}(\mathrm{C}), \mathbf{8}(\mathrm{D}), \mathbf{9}(\mathrm{E})$ and $\mathbf{1 0}(\mathrm{F})$ towards 5 -LOX activity. Measured as single point in three different measurements with concentrations between $1 \mu \mathrm{M}$ and $300 \mu \mathrm{M}$.

ITC Measurements results:
sEH-H measurement:

## Compound 9

Graph S1: ITC titration of $40 \mu \mathrm{M}$ sEH-H in cell with $250 \mu \mathrm{M}$ compound 9 in syringe. One initial step with $0.5 \mu \mathrm{~L}$ followed by 35 steps with $1.5 \mu \mathrm{l}$ volume. The measurement was performed at $25^{\circ} \mathrm{C}$ and between every step there was a spacing of 240 s .

## Compound 10

Graph S2: ITC titration of $20 \mu \mathrm{M}$ LTA4H in cell with $100 \mu \mathrm{M}$ compound 10 in syringe. One initial step with $0.5 \mu \mathrm{~L}$ followed by 30 steps with $2 \mu \mathrm{l}$ volume. The measurement was performed at $25^{\circ} \mathrm{C}$ and between every step there was a spacing of 300 s .

## Compound 9

Graph S3: ITC titration of $40 \mu \mathrm{M}$ LTA4H in cell with $250 \mu \mathrm{M}$ compound 9 in syringe. One initial step with $0.5 \mu \mathrm{~L}$ followed by 30 steps with $1.5 \mu \mathrm{l}$ volume. The measurement was performed at $25^{\circ} \mathrm{C}$ and between every step there was a spacing of 240 s .

Graph S4: ITC titration of $20 \mu \mathrm{M}$ LTA4H in cell with $100 \mu \mathrm{M}$ compound 10 in syringe. One initial step with $0.5 \mu \mathrm{~L}$ followed by 30 steps with $2 \mu \mathrm{l}$ volume. The measurement was performed at $25^{\circ} \mathrm{C}$ and between every step there was a spacing of 240 s .

Graph S5: ITC titration of $50 \mu \mathrm{M} \mathrm{FXR}$ in cell with $250 \mu \mathrm{M}$ compound $\mathbf{4}$ in syringe. One initial step with $0.5 \mu \mathrm{~L}$ followed by 30 steps with $2 \mu \mathrm{l}$ volume. The measurement was performed at $25^{\circ} \mathrm{C}$ and between every step there was a spacing of 240 s .

## Compound 8

Time (s)

Graph S6: ITC titration of $50 \mu \mathrm{M} \mathrm{FXR}$ in cell with $250 \mu \mathrm{M}$ compound 8 in syringe. One initial step with $0.5 \mu \mathrm{~L}$ followed by 30 steps with $2 \mu \mathrm{l}$ volume. The measurement was performed at $25^{\circ} \mathrm{C}$ and between every step there was a spacing of 240 s .

Graph S7: ITC titration of $50 \mu \mathrm{M}$ FXR in cell with $250 \mu \mathrm{M}$ compound 9 in syringe. One initial step with $0.5 \mu \mathrm{~L}$ followed by 30 steps with $2 \mu \mathrm{l}$ volume. The measurement was performed at $25^{\circ} \mathrm{C}$ and between every step there was a spacing of 240 s .

Results of the tested approved drugs

## sEH-H activity:

Figure S9: $\mathrm{IC}_{50}$ determination of compound 14 (tolvaptam, left) and $\mathbf{1 7}$ (diflunisal, right) towards $\mathrm{sEH}-\mathrm{H}$ activity. Measured as triplicate in three different measurements with concentrations between $1 \mu \mathrm{M}$ and $1000 \mu \mathrm{M}$.

## LTA4H activity:

Figure S13: $\mathrm{IC}_{50}$ determination of compound 11 (benoxinate, left) and 18 (fluvastatin, right) towards LTA4H activity. Measured as triplicate in three different measurements with concentrations between $1 \mu \mathrm{M}$ and $1000 \mu \mathrm{M}$.

5-LOX activity:

$\log _{10}(\mathbf{c}($ Inhibitor $)[\mathrm{M}])$
Figure S14: $\mathrm{IC}_{50}$ determination of compound 15 (beperidil) towards 5-LO activity. Measured as single point in three different measurements with concentrations between $1 \mu \mathrm{M}$ and $300 \mu \mathrm{M}$.
