Received 5 March 2009; accepted 5 March 2009

Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(\text{C}-\text{C}) = 0.001$  Å;  $R$  factor = 0.043;  $wR$  factor = 0.120; data-to-parameter ratio = 20.7.

In the title compound,  $\text{C}_{11}\text{H}_{14}\text{O}_4$ , an intermediate for the synthesis of a new kind of estrogen receptor modulator, all non-H atoms lie on a common plane (r.m.s. deviation = 0.0472 Å). All C—C bonds in the side chain are in a *trans* conformation, and the hydroxyl group is also *trans* to the methylene chain. In the crystal structure, molecules form centrosymmetric dimers showing a head-to-head arrangement which is stabilized by O—H...O hydrogen bonds. A weak C—H...O contact is also present.

## 4-(3-Methoxyphenoxy)butyric acid

J. Heilmann-Brohl, G. Jaouen and M. Bolte

### Comment

4-(3-Methoxyphenoxy)butyric acid is an intermediate for the synthesis of a new kind of estrogen receptor modulators (Lloyd *et al.*, 2004). All non-H atoms of the title compound (Fig. 1) lie in a common plane (r.m.s. deviation 0.0472 Å). All C—C bonds in the side chain are in a *trans* conformation, and the hydroxyl group is also *trans* to the methylene chain. In the crystal, the molecules form centrosymmetric dimers showing a head-to-head arrangement which is stabilized by O—H···O hydrogen bonds (Fig. 2). In addition to this classical hydrogen bond, there is weak C—H···O contact (Table 1).

Two comparable structures, 4-(4-chlorophenoxy)butanoic acid and 4-(2,4-dichlorophenoxy)butanoic acid, (Smith *et al.*, 1989) adopt a very similar conformation as the title compound. However, the carboxyl group in these structures is slightly twisted out of the molecular plane. The HO—C(O)—CH<sub>2</sub>—CH<sub>2</sub> torsion angle is 161.6° and 170.1° in 4-(4-chlorophenoxy)butanoic acid and 4-(2,4-dichlorophenoxy)butanoic acid, respectively, whereas this torsion angle amounts to 174.73 (9)° in the title compound.

### Experimental

Synthesis of 4-(3-methoxy-phenoxy)-butyric acid ethyl ester (scheme 2):

Cs<sub>3</sub>CO<sub>3</sub> (9.666 mmol, 3.149 g) was added to a solution of 3-methoxyphenol (8.055 mmol, 1.000 g) in acetone (20 ml) and the mixture was stirred for 5 min at r.t.. Ethyl-4-bromobutyrate (8.055 mmol, 1.571 g) was added and the reaction mixture was heated under reflux for 28 h. After cooling to r.t. the slurry was poured onto H<sub>2</sub>O/ice/HCl and the aqueous phase was extracted with CH<sub>2</sub>Cl<sub>2</sub> (4 x 25 ml). The combined organic layers were washed with H<sub>2</sub>O (3 x 25 ml), dried over MgSO<sub>4</sub> and the solvent was removed under reduced pressure to yield the crude product as a slightly yellow oil. The crude product was subjected to a column chromatography (eluent 100% CH<sub>2</sub>Cl<sub>2</sub>), to obtain the pure product as a slightly yellow oil (1.486 g, 77%). **<sup>1</sup>H-NMR (CDCl<sub>3</sub>, 300 MHz):** δ = 7.165 (tr, *J* = 8.1 Hz, 1H, C<sub>6</sub>H<sub>4</sub>), 6.519 – 6.447 (m, 3H, C<sub>6</sub>H<sub>4</sub>), 4.146 (q, *J* = 7.2 Hz, 2H, H<sub>12</sub>), 3.987 (tr, *J* = 6.2 Hz, 2H, H<sup>8</sup>), 3.780 (s, 3H, O—CH<sub>3</sub>), 2.509 (tr, *J* = 7.2 Hz, 2H H<sup>10</sup>), 2.145 – 2.055 (m, 2H H<sup>9</sup>), 1.259 (tr, *J* = 7.2 Hz, 3H, H<sup>13</sup>).

Synthesis of 4-(3-methoxy-phenoxy)-butyric acid (scheme 3):

4-(3-methoxy-phenoxy)-butyric acid ethyl ester (2.938 mmol, 0.700 g) is dissolved in acetone (10 ml) and H<sub>2</sub>O (5 ml) and 1 M NaOH (20 ml) is added. The reaction mixture is stirred at r.t. for 1 h and is then poured into H<sub>2</sub>O/HCl (50 ml). The aqueous phase is extracted with CH<sub>2</sub>Cl<sub>2</sub> (4 x 25 ml), and the combined organic layers are washed with H<sub>2</sub>O (2 x 30 ml), dried over MgSO<sub>4</sub> and the solvent is evaporated. The crude product is obtained as light yellow oil from which colourless crystals – suitable for X-Ray analysis - start to grow within 30 min. Purification of the crude product is conducted by column chromatography. The by-products are removed by elution with CH<sub>2</sub>Cl<sub>2</sub>. The desired product is then eluted with MeOH.

## supplementary materials

After evaporation of MeOH, the pure product is obtained as an off-white crystalline solid (0.352 g, 58%).  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ , 300 MHz):  $\delta = 7.171$  (tr,  $J = 8.3$  Hz, 1H,  $\text{C}_6\text{H}_4$ ), 6.526 - 6.447 (m, 3H,  $\text{C}_6\text{H}_4$ ), 4.010 (tr,  $J = 6.0$  Hz, 2H,  $\text{H}^8$ ), 3.787 (s, 3H,  $\text{O}-\text{CH}_3$ ), 2.592 (tr,  $J = 7.4$  Hz, 2H,  $\text{H}^{10}$ ), 2.174 - 2.073 (m, 2H,  $\text{H}^9$ ), n.o. ( $\text{COOH}$ ).

### Refinement

H atoms bonded to C were refined with fixed individual displacement parameters [ $U(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$  or  $U(\text{H}) = 1.5 U_{\text{eq}}(\text{C}_{\text{methyl}})$ ] using a riding model with  $\text{C}_{\text{aromatic}}-\text{H} = 0.95$  Å,  $\text{C}_{\text{methyl}}-\text{H} = 0.98$  Å, and  $\text{C}_{\text{methylene}}-\text{H} = 0.99$  Å. The methyl group was allowed to rotate but not to tip. the hydroxy H atom was freely refined.

 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\text{max}} = 0.001$   
 $\Delta\rho_{\text{max}} = 0.31 \text{ e \AA}^{-3}$   
 $\Delta\rho_{\text{min}} = -0.20 \text{ e \AA}^{-3}$   
 Extinction correction: SHELXL97 (Sheldrick, 2008),  
 $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$   
 Extinction coefficient: 0.048 (5)

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
