Abstract: This is a comprehensive list of all recorded species (866), including 11 subspecies, and genera (113) of Alticinae from Mexico to Panama, but also includes complete distributional data (with references) for each species. It includes all generic and specific synonymies published since the 1939-1940 Coleopterorum Catalogus. There are three new combinations and a new synonym. This checklist basically follows and, for the first time comprehensively synthesizes, the taxon arrangement of the late Jan Bechyné.

Introduction

The first comprehensive study of Neotropical Alticinae was included in the *Biologia Centrali-Americana* (Jacoby, 1884, 1885, 1886, 1888, 1891, 1892)(47-52). George Horn (1889) (46) primarily treated what is now the United States; however, he included Lower California, now Baja California (Mexico). Doris H. Blake (1934-1955)(28-37) also studied some Alticinae genera in the Neotropics, especially in the Caribbean. However, the last (only) comprehensive list of Alticinae species was the Coleopterorum Catalogus (Heikertinger and Csiki, 1939-1940)(44, 45). However, since that time there has been considerable systematic and faunistic work on the flea beetles which has generated many new genera and species. Part 4 of "The Checklist of the Coleopterous Insects of Mexico, Central America, the West Indies, and South America", compiled by R. E. Blackwelder, in 1946 (27), is basically taken directly from Heikertinger and Csiki, 1939-1940, and is not used in the present paper as a primary reference. With the increasing interest on the Neotropical fauna for studies of biodiversity, systematics, biological control of weeds, chemical prospecting, etc., there is also an increasing need to be able to use and understand the proper nomenclature. The late Dr. Jan Bechyné and his

wife Bohumila Springlova Bechyné studied Neotropical Chrysomelidae more extensively than most previous workers and described many taxa, including Alticinae (3-26). There are more than 230 named genera of Alticinae in the Neotropics and the Bechynés described over 90 of these as well as hundreds of species. All publications by the Bechynés were after the Coleopterorum Catalogus. A recent checklist of the world chrysomelid genera exists (Seeno and Wilcox, 1982)(65), and a preliminary list of species for North and Central America was compiled by Wilcox (1975)(66). However, the Wilcox list is incomplete for the species names, synonymies, distributional data and references, and does not reflect the Bechyné system of nomenclature; therefore, there is no comprehensive checklist of the species. Because there is no reference which lists the species that the Bechynés considered to belong to the many Neotropical genera, the checklist contained here will allow the user to understand the majority of the Bechyné system of Neotropical Alticinae genera.

There are several generic names used in the Neotropical Region which are basically names from Old World genera and actually do not exist in the New World, or at least not in the Neotropics. *Hermaphaga* Foudras (1860) is improperly used in the New World for species of *Syphrea* Baly

(1876). *Sphaeroderma* Stephens (1831) is also apparently incorrectly applied in the New World (Furth, 1989 [41], Flowers, et al. 1994 [40]) and, therefore, is listed below as "Sphaeroderma". *Asiorestia* Jacobson, 1925 and *Crepidodera* Chevrolat (1836) has been misused in the Neotropics for *Stegnea* Baly (1879), (Scherer 1983 [64], Furth 1989 [41]). Neotropical *Aphthona* Chevrolat (1836) was mostly divided into other genera (*Brasilaphthona* Bechyné (1956), *Centralaphthona* Bechyné (1960), *Genaphthona* Bechyné (1956) and does not exist in the Neotropics in the sense of this genus from the Old World. However, a number of species (see below) are still in need of detailed study in order to place them into the proper Neotropical genera and, therefore, are provisionally listed below as in "Aphthona".

We have changed the status of 4 species which are established in the checklist below. There are new combinations: *Omophoita aequatorialis variabilis* Jacoby (1879) as indicated by Jacoby [48] is only a variation of *O. aequatorialis* (Harold 1876); *Rhinotmetus jacobyi* Scherer (1962) (= *canescens* Jacoby 1886) cannot be used because this species epithet existed previously as *R. jacobyi* Bowditch (1915), but also because Jacoby (1886) (49) actually referred to it as *R. canescens* Clark (1860); *Strabala intermedia* J. du Val (1856), as partially used by Jacoby, 1884 (the Costa Rica record) is placed under *S. acuminata costaricensis* Blake (1953), because the true *intermedia* is apparently endemic to Cuba (Blake 1934). There is one new synonym: *Lactica inornata* was described by Jacoby (1891: 258) and as *Nephrica inornata*, in the same publication (page 277 and with a figure), it belongs in *Pedilia* Clark (1865) (Bechyné 1959) (13).

Table

The checklist below lists 866 taxa, including 11 subspecies, in 113 genera. The generic and specific synonymy given is primarily that published after the Coleopterorum Catalogus (44, 45) and a reference is provided for the establishment of the synonymies or new combinations. For each species, the author name and year of publication are given. If a species was originally described in a different genus, that genus name follows the species name and is in parentheses, unless the original genus name is given as a generic synonym. A former genus name for a species has no author indication if that genus name is listed as a primary name elsewhere in the checklist. If the distributional

data (countries) has been published after the Coleopterorum Catalogus, the numbered references in the righthand column provide the sources for that data and include the complete known distribution for each species listed. The abbreviations used for countries in the distributional data are as follows: Can. = Canada; USA = United States; Mex. = Mexico; Bel. = Belize (formerly British Honduras); Hond. = Honduras; Guat. = Guatemala; Nic. = Nicaragua; CR = Costa Rica; ES = El Salvador; Pan. = Panama; Ven. = Venezuela; Col. = Colombia; Ecuad. = Ecuador; Bol. = Bolivia; Guyana = British Guiana; Br. = Brazil; Par. = Paraguay; Arg. = Argentina; PR = Puerto Rico; DR = Dominican Republic; Jam. = Jamaica; BWI = British West Indies. A? before a species name denotes some level of uncertainty by the authors of the present paper about the determination and/or the distribution record of that taxon.

Generic Synonyms Used in Checklist

There have been many changes in generic concepts in the Neotropical Alticinae, therefore species have been placed in several different genera. In order to facilitate finding the correct placement (= valid genus) for specific names in this checklist, the following is a list of generic names which are, at least in part, used in synonymy (= old names) with species names in the checklist below. Thus, some current (valid) genera may contain species formerly placed in several other genera. The names listed under Synonym (Old Name) are still valid names used for other species.

Synonym (Old Name) Valid Genus (Current Name)

<i>Allochroma</i>	<i>Exartematus</i>
<i>Altica</i>	<i>Sparnus</i>
	<i>Deuteraltica</i>
	<i>Disonycha</i>
	<i>Macrohaltica</i>
	<i>Syphrea</i>
<i>Aphthona</i>	<i>Brasilaphthona</i>
	<i>Centralaphthona</i>
	<i>Gioia</i>
<i>Asiorestia</i>	<i>Margaridisa</i>
	<i>Stegnea</i>
<i>Asphaera</i>	<i>Omophoita</i>
<i>Cacoscelis</i>	<i>Disonycha</i>
	<i>Prasona</i>
<i>Centralaphthona</i>	<i>Aphthona</i>

<i>Chalcoides</i>	<i>Stegnea</i>	<i>Disonycha</i>
<i>Chloëphaga</i>	<i>Capraita</i>	<i>Kuschelina</i>
<i>Chrysogramma</i>	<i>Acrocyum</i>	<i>Omophoita</i>
<i>Chrysomela</i>	<i>Alagoasa</i>	<i>Paranaita</i>
