

Figure S1. Alignment of *Synechocystis hsp17* 5'-UTR (thermometer element) with the 5'-UTRs of *T. elongates* and *T. vulcanus*. Identical nucleotides are indicated by bold letters.

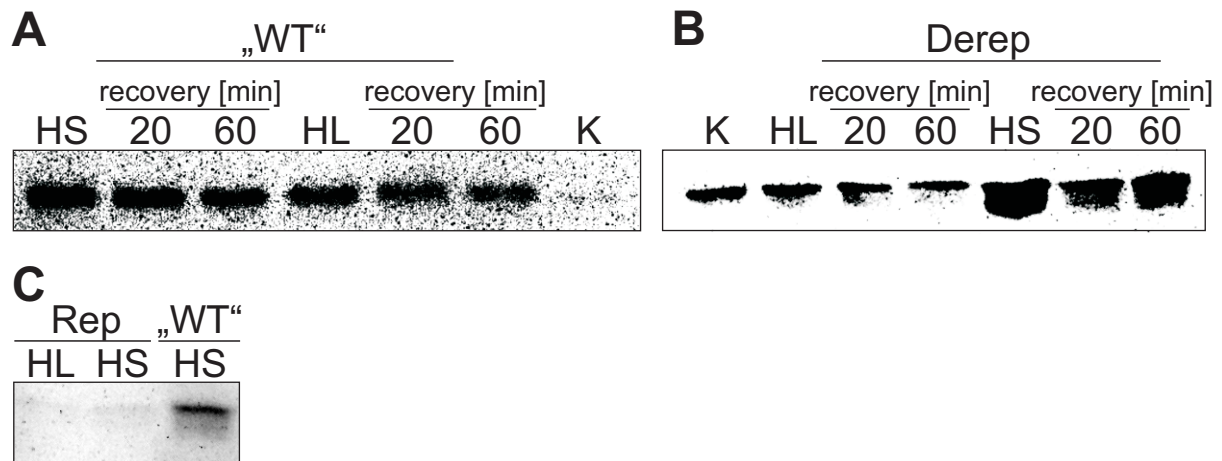

Figure S2. Comparative Western blot analysis of Hsp17 protein levels after heat shock (HS) and high light stress (HL) and in the recovery phase. (A) *Synechocystis* „WT“ and (B) Derep cells were incubated at 42°C (for 60 min) or stressed with high light (for 30 min). Following the different stress conditions, the cultures were transferred to 28°C and LL conditions (recovery phase). Total protein was extracted directly after stress (HS or HL) and at time points during recovery phase as indicated. K, control (total protein extracted from cells grown at 28°C and low light). (C) Total protein was extracted from *Synechocystis* Rep cells incubated at 42°C or under high light conditions and blotted beside total protein originating from heat shocked „WT“ cells. Hsp17 protein was detected via monoclonal α -Hsp17 antibody. Equal amounts of total protein were checked by Coomassie-stained SDS-PAGE gels (data not shown).
