1

2 ¹All genes are tabulated which have a “translational repression factor” of ≤0.5 or ≥2.0 in exponential
 3 phase and in stationary phase. The translational repression factor is the quotient of free RNA to
 4 polysome-bound RNA (normalized to the average of all genes). The identifier is the clone designation
 5 in the onefold coverage genome library used to generate the shotgun DNA microarray (Zraigler et al.
 6 2003). The “putative functions” are derived from blast searches against public databases. The “length”
 7 is the partial or total length of the gene which is present in the respective clone. The columns Ø, SD
 8 and n list average value, standard deviation and number of biological replicates included in the
 9 analysis.
