Im Herbst 1994 wurde durch den Freistaat Thüringen in Zusammenarbeit mit der Stadt Erfurt ein europaweiter städtebaulicher Ideenwettbewerb, kombiniert mit einem Realisierungswettbewerb, für die Universität Erfurt ausgeschrieben. Als erste Preisträger des Wettbewerbs wurde Koch + Partner mit der Planung des Bibliotheksgebäudes und dem Umbau eines bestehenden Wohnheims der Pädagogischen Hochschule beauftragt. Für die städtebauliche Entwicklung der gesamten Universität wurde dazu ein Entwicklungsgutachten erstellt. Die Universitätsbibliothek ist Kristallisationspunkt der Entwicklung der neuen Universität Erfurt. Ein wichtiges Gestaltungsziel der Universitätsbibliothek war die flexible Großraumkonzeption der Freihandbereiche und eine spannungsvolle Schnittführung im Gebäude. Dies wird vor allem in den drei zentralen Lichthöfen mit Oberlicht erreicht. Die Lichthöfe sind auf einer Seite von einer differenziert gestalteten Wandscheibe mit einer großzügigen Treppenanlage flankiert. Über Brücken und Öffnungen gibt es Sicht- und Wegebeziehungen zur angelagerten Verwaltungsspanne. Entlang der Lufträume, wo die meisten Publikumsbewegungen stattfinden, sind die Freihandbereiche mit ihren Regalzonen trapezförmig aufgefächert. Durch die klare Zonierung und durch die innere Lichtführung über die drei Lufträume ist eine leichte Orientierung innerhalb des Gebäudes gewährleistet. Es gibt ruhig gelegene Leseplätze - abgeschirmt durch die Regalzonen - entlang der Fassade mit kleinen Ausguckfenstern und Lesezonen mit geschosshohen Glasfassaden und Blickbeziehung zur Stadt, zum Campus und zur Landschaft. (Koch)

Das Gebäude ist klar gegliedert in einen Publikumsbereich, der im Wesentlichen von Buchaufstellung und Benutzerarbeitsplätzen bestimmt wird, und einen dahinter liegenden Verwaltungstrakt, der die internen Funktionsbereiche aufnimmt. Durch die drei Lichthöfe (mit Oberlicht) wird der gesamte Publikumsbereich schon vom EG her sichtbar. Die in jeder Etage wiederkehrende Gliederung in Buch-, Arbeits- und Informationsbereiche ermöglicht dem Benutzer eine schnelle Orientierung innerhalb des Gebäudes. Der Ein- und Ausgang des Lese- und Freihandbereiches ist auf einen einzigen Punkt (mit Buchsicherungsanlage) konzentriert- und ermöglicht so die Benutzung bis in die späten Abendstunden mit wenig Personal. Die Transparenz des Gebäudes auch zwischen Verwaltungs- und Öffentlichkeitsbereichen wird auch vom Personal positiv empfunden. Die Ästhetik des Gebäudes hat auch eine funktionale Qualität: das angenehm gebrochene Tageslicht, das durch das Prismenglas der Oberlichter in den Raum fällt; die Großzügigkeit und Klarheit der Linienführung in den Freihand- und Leseschichten, die trotz der Masse und Vielfalt der aufgestellten Medien wirklich als eine Bibliothek erlebbar sind. Das Birkenholz der Wandvertäfelungen und Arbeitstische schafft einen hellen, freundlichen Raum, der zum Verweilen und Studieren einlädt. (<http://www.bibliothekportal.de>)

**Libraries:**

### **Universitätsbibliothek Duisburg-Essen, Essen – Germany Wettbewerb 2009, 1. Preis**

The library building – the book tower – forms the heart of the new buildings on the Essen campus. “Stacked books” are the formal idea behind the building’s design, as an image of the knowledge stored there. The library cube has space for a reference library as

well as storage facilities, with adjoining, for the most part two-storey reading rooms facing the city and/or the campus. The book tower is embedded in an ensemble comprising a pedestal, housing the repository, and two additional buildings that will be put to various uses. In terms of urban planning the "book tower" is located on a city axis, such that the heavily frequented exterior with its overarching connecting function can remain open space. The new, urban library plaza also upgrades the location. The cube's sculptural interior shape, which is created by the stacked sealed volumes, is embraced by a transparent printed sheath. By day this appears calm and even. In the twilight and at night the lighted from inside makes individual facilities and work areas recognizable and the "book core" of the library is highlighted. The roof area is open to the public, attracting additional people from the surrounding plaza into the building. In addition to the library hall for prestigious occasions and the training room, the "reading garden" with a view over the city is outside public space of extraordinary quality. (KSP)

Site: 18.770 m<sup>2</sup>, Floor Area: 50.009 m<sup>2</sup>, Cubage: 216.321 m<sup>3</sup>

#### **ELSI Legal Studies Institute, Universität Osnabrück – Germany 2008**

The European Legal Studies Institute at the University of Osnabrück has moved into a former furniture store, which was converted, renovate, and extended. The building was turned into two separate structures for the Institute and the library, which are connected via a glass foyer. In line with what it now houses, the building has been given a new urban identity, with its fabric transformed into a place for communication. Above and beyond the requisite renovations and conversion work the aim behind the design concept was to give the building a new identity and an interior quality befitting in the international importance of the Institute. As well as meeting the functional demands the building was intended to boast spatial quality as a place for communication. To the end the uniform ceiling layers had to be opened up to create new views and inspiring interiors. The existing building fabric was altered only to the extent that design and function dictated and that was financially acceptable. The building mass was divided into two structures for the institute and the library. The connecting building on Kommenderiestrasse was removed. The edifices are on the same scale as the urban fabric, blend in with it, and break up the long, unstructured line of buildings. (KSP)

Floor Area: 5.101 m<sup>2</sup>, Cubage: 20.492 m<sup>3</sup>

#### **Zentralbibliothek mit Musikbibliothek der Stadtbücherei Frankfurt – Germany 2007**

The property is located downtown on Hasengasse, close to the Frankfurt street known as Zeil. The building was erected in 1965, as part of reconstruction work in the old town, to house the HQ of Frankfurter Sparkasse and remained in business as a fully operational branch until 2005. In the seven story main building along Hasengasse, the large teller's hall, part of which extends over two floors, occupies almost the entire groundfloor. Along with the main building, a four-story east wing demarcates the forecourt up to the main entrance. The main building's single-depth stories were designed around an inner atrium. The building's facades clearly reveal its reinforced concrete skeleton construction. For the building's new function, the roof over the atrium is to be raised a story and parts of the ceiling to the basement opened up, thus creating spacious areas for the library, spread over four floors. A "reading tower" with a sculptural design is being erected on the side of the hall opposite the entrance. A staircase located here links all the library's public floors. Recesses for working and reading are being created. A café is being installed on the ground floor of the eastwing, looking out on the forecourt. The entire ground-floor façade facing the forecourt is being renewed and provided with generous glazing. A large colorful porch just out in front, accentuating the entrance to the library. (KSP)

Floor Area: 12.000 m<sup>2</sup>, Cubage: 44.500 m<sup>3</sup>

#### **Bibliothek der Hochschule für Bildende Künste, Braunschweig – Germany 2002**

Through the glass cube of the new library, the college for Visual Arts in Braunschweig got a new emblem. The basic idea was the re-usage of the Mexican pavillon (Architect: Legoretta) at the EXPO in Hannover. Although changes to the interior due to the different functional requirements had to be made, the basic character of the cube should as much as possible be preserved. This was possible due to the newly realized concept. During the integration of the cube into the existing structure of the HBK a redesigning of the neighboring buildings and the forecourt took place. The glass construction with an approximate edge length of 18 meters consists of an undirected quadratic steel grid. In the center of the glass cube a bookshelf of 11 x 11 meters with a square outline ( 12 meters height ) was placed. The tower stands as a free, recognizable and colorfully designed building structure within the transparent shell. The book collection of the library is stored here on four levels. The tower is twisted, with respect to the outer shell, forming narrowing gaps between the two building constructions. The technological concept for the building had to be adjusted to meet the demands of the enormous amount of solar radiation. Working intensely together with construction physicists and building engineers, a solution was developed to cool or heat the inner room, depending on the outside temperature, with stored energy from construction-component activation of the book-tower. (KSP)

Floor Area: 2.200 m<sup>2</sup>

#### **Erweiterung Universitätsbibliothek TU Braunschweig – Germany 1996**

A new entrance situation to the central university area will be created with an extension construction of the university library on the exposed city planned site, at the corner of Pockelmannstrasse/Konstantin-Uhde-Strasse. The cubical appearance of the new construction picks up the formal language of the old structure. The building height and facade design are oriented to the old building, the facades of which are made of fair-faced concrete. The design of the new building is dependant on the grid of the old building facade. The two main buildings are connected by a transparent construction with a glassed courtyard as clarification of the seam. The facades of the new building will be determined by glass bands on the ground and first floor. On the third floor the facade is set back as far as the terrace is deep. The east-facing facade is designed as a hole-facade corresponding to the building directly opposite. In addition to the walls of the ground and first floor, plastered in light colors, a facade covering of whitish gray stone manufactured from natural materials dominates the appearance of the new building. In the course of extension a new order of the rooms and functions is being made. The book collections, which were stored in other parts of the TU, are now accessible for everybody in the stack located in the first, second and third underground levels. Next to these are reading halls, work places for staff and rooms for the head of the library. (KSP)

#### **National Library of China, Beijing – China 2008**

Alongside Purple Bamboo Park in Beijing's Haidian District stands the main National Library of China (NLC), its architecture perfectly blending a splendid facade with a graceful solemnity. As the third largest national library in the world, covering 250,000 square meters, it embraces three components: the first phase of construction (1987), the second phase (2008), and the NLC Library of Ancient Books, west of Beihai Park. Phase I, completed in 1987, covers 7.42 hectares, with a built area of 140,000 sq.m, ranking first among "Beijing's Top 10 Buildings of the 1980s." Phase II covers a built area of 80,538 square meters. The National Library of China serves as the repository of the nation's publications, a national bibliographic center, as well as a national center for the preservation and conservation for ancient books. The major mission of the NLC includes: the collection and preservation of domestic and foreign publications; national coordination of document preservation and conservation work; provision of information and reference services to the central government, other governmental organizations, social organizations, and the general public; research in library sciences, and development of library services and programs, and guidance to other libraries in China with its expertise; the fulfillment of its role in international cultural exchanges through participation in the activities of the International

Federation of Library Associations and Institutions (IFLA) and other related organizations worldwide, as well as the promotion of exchanges and cooperation with other libraries in China and abroad. (<http://www.nlc.gov>) KSP Jürgen Engel Architekten was awarded the bid among contestants taking part in the bidding competition in 2003. The task to be fulfilled was to expand the existing library by adding a second tract to the building with a total space of 77.000 m<sup>2</sup> that was to house 12 million books. The existing old building that is protected as a historic monument is to stay intact and will only be attached to the new tract using light bridges. An import trend setting component included in the expansion in the "digital library". The "Si Ku Quan Shu" collection is of historic significance and culturally not to be surpassed, and will also be housed in the new building. By means of a contemporary interpretation, the design for the National Library of China takes up traditional Chinese architectural components. Building foundations the placement of pillars and a floating ceiling are style elements used in Chinese building history, which were typically reserved for the most part public buildings. The new construction will tie into the past, present and future not only by its architectural design, but also in terms of its content. The concept reverts back to the historic "Si Ku Quan Shu" scrolls written by Emperor Quianlong (1736-1795). The collection is visible from every direction and is housed in a glass shrine in the base of the building. Surrounding these is the contemporary library built up over several levels encompassing a reading room that is flooded by large amounts of light & nbsp; One enters the library located in the gap between the base and the ceiling by climbing a wide flight of steps. From here, one has an overview of the entire library below the wide stretching steel construction that makes up the roof, in which the digital library is housed. In October 2006, as a part of a ceremonious event, the steel construction weighting 10.388 tons of the National Library of China in Beijing was hoisted. This amount of weight is approximately equal to the weight of the Eifel Tower in Paris. In order to optimise construction for the upper floor, which was built at ground level. Once mounting was completed, the building pit below the steel construction was excavated and the basement floors and the cores of the building extending up the fifth floor were built. At this cores, the steel construction was hoisted to its final height of 16.25 metres using 24 computer-controlled access points. The steel structure with dimensions from 120 to 105 m and a height of 10 m takes up two library floors today now that it has been completed. After the steel construction was hoisted, the above-ground base storeys of the library were built as raw brickwork and the entire building was completed in the fitting out phase. (KSP)

**Institut für Ostseeforschung, Warnemünde – Germany 2007**

Auftraggeber Land Mecklenburg-Vorpommern, 1. Preis Wettbewerb 2004, Realisierung 2005-2007, BGF 1.445 m<sup>2</sup>, BRI 4.960 m<sup>3</sup>

Am 13. September 2006 wurde das Richtfest für den Erweiterungsbau des Instituts für Ostseeforschung im Ostseebad Warnemünde gefeiert. Architekten sind KSV Krüger Schuberth Vandreike (Berlin), die im Jahr 2004 das entsprechende VOF-Verfahren für sich entscheiden konnten. Für die Nutzung des Erweiterungsbaus des Leibniz-Instituts auf 1.200 Quadratmeter Hauptnutzfläche sind Labore, Büros und die Bibliothek des Forschungsinstituts vorgesehen. Das neue Institutsgebäude positioniert sich am Kurpark im Ostseebad Warnemünde. Es bildet eine klare Kante zur bestehenden Villenstruktur der Uferpromenade und schafft mit dieser räumlichen Ordnung den nördlichen Abschluss des Kurparks. Ziel des Konzeptes ist die Verknüpfung vorhandener Kubaturen zu einem neuen, eigenständigen architektonischen Thema. Gegenwärtig besteht das Ensemble des Instituts aus einer Addition unterschiedlicher Gebäudeteile. Durch die Konzentration der Baumaßnahmen in einem quadratischen Kubus wurde ein hohes Maß an Flexibilität für die Bebauung gewonnen. Alt- und Neubau sind ab dem 1. Obergeschoss miteinander verbunden. Die materialbündige Ausbildung der Fassade in dunklem Putz, hellem Naturstein und Glas soll die kompakte Form des Kubus' unterstützen, unterschiedliche Fensterbandlängen lassen einzelne Laborbereiche und Raummassen ablesen. Der Forschungsbereich des IOW umfasst die marine Ökosystemforschung in Küsten- und Randmeeren sowie das Monitoring für die Bundesrepublik Deutschland im Auftrag des Bundesamtes für Seeschifffahrt und Hydrographie. **Libraries:**

**Lauder Business School, Wien – Austria 2004**

**Bauherr: Ronald S. Lauder Foundation**

Das Schlösschen wurde 1745 als Lustschloss für die kaiserliche Regentin Maria Theresia im Rokostil errichtet, und ist seit 1939 im Eigentum der Stadt Wien. 1912–14 wurde das Maria-Theresien-Schlössel von der Nathaniel Freiherr von Rothschild'sche Stiftung für Nervenranke zu einer Heilanstalt mit 66 Betten für Nervenranke ausgebaut. geführt. Nach dem Krieg führte man wieder den Normalbetrieb fort, bis die Rothschildstiftung im Zuge des Anschlusses aufgelöst wurde. 1956 wurde die Stiftung zwar wiederhergestellt, das Schlössel blieb aber in Stadtbesitz. Im Jahr 2003 übersiedelte das neurologische Krankenhaus als Neurologisches Zentrum - Rothschildstiftung - Maria-Theresien-Schlössel des Wiener Krankenanstaltenverbands (KAV) in das Otto-Wagner-Spital.[1] Die Stadt Wien übergab das Gebäude an die damals neu gegründete Lauder Business School, außerdem wird es als sommerliches Studentenwohnheim des Vienna International College betrieben

Die Errichtung einer internationalen Wirtschaftsakademie mit integriertem College um das barocke Wiener Maria-Theresien-Schlössel basiert auf der Grundidee des Campus: Die bestehende Parkanlage wird zum verbindenden Raum, um den sich unterschiedliche Pavillons gruppieren. Alt und Neu werden in der Konstellation am Campus zu einem räumlichen Ensemble: das barocke Palais nimmt durch denkmalgerechte Adaptierung Festsäle und Verwaltung auf, der zweite Baukörper an der Hofzeile wird zum Bibliotheks- und Seminargebäude umgebaut, der bestehende Baukörper an der Südseite des Parks wird als Studentenwohnheim des Colleges adaptiert. Ein neuer Auditoriums- und Mensapavillon im Park bildet den Mittelpunkt der Akademie. Er wird geprägt von einem zentralen Einbaukörper aus Holz, einem Hörsaal und Mensa verbindenden Element, das alle technischen Funktionen beider Ebenen enthält. Verbindende Themen verschränken Um- und Neubau: Als Raum im Raum werden die Einbauten im Seminar- und Verwaltungsteil durch Eichenholzverkleidungen und -schränke vom Bestand differenziert und setzen sich im neuen Auditoriumspavillon in

Akustikwänden fort. Bibliothek, Medienräume, Seminarräume und Hörsaal werden durch ihre Materialität sowie den Blick auf den Park vereint. Im Kontrast zu den Räumen der Akademie ist das College durchgängig in Teakholz ausgestattet. Der Pavillon als Mittelpunkt der Anlage verfügt über eine gebäudebreite Campustreppe aus dunkelgrauem Naturstein, deren hohe Stufen eine Sitzbank am Park bilden. Das hallenartige Auditorium besitzt großformatige Fensterverglasungen in zwei Ebenen. Eine vom College zugängliche Terrasse auf dem Pavillondach fügt sich auf halber Höhe in die Parkanlage und erweitert deren Freiraumtypologien. (<http://www.oegfa.at>)

### **Libraries:**

#### **Kulturzentrum Ismaning (Bibliothek, Kulturhaus, Volkshochschule), Ismaning – Germany 2009**

Bauherr Gemeinde Ismaning, Bauzeit März 2007 – Juli 2009, Bauplanung Architekturbüro Landbrecht, München  
Baukosten 3.730.000 Euro

Am 1. August 2007 fand der erste Spatenstich für das neue Kultur- und Bildungszentrum der Gemeinde Ismaning bei München statt. Das Projekt wird nach den Plänen des Münchner Architekten Bernhard Landbrecht realisiert, dessen Entwurf in einem eingeladenen VOF-Verfahren unter drei weiteren Teilnehmern ausgewählt wurde. Mit einer Bausumme von 22,9 Millionen Euro ist es bisher das teuerste Bauvorhaben der Gemeindegeschichte. 2009, zur 1200-Jahrfeier Ismanings, soll der Gebäudekomplex fertig gestellt sein. Das neue Kulturforum wird künftig Volkshochschule, Gemeindebibliothek und Musikschule beherbergen. Zwei dominante Altbauten bestimmen das Gebäudeensemble: die denkmalgeschützte Villa Seidl und der langgestreckte Bau einer alten Sägemühle auf einer Insel im Seebach. Die Villa wird zur Volkshochschule die Sägemühle zum Museum umfunktioniert. Als Neubau schlägt der Architekt ein offenes U als dreiseitige Hofanlage vor, die mit sich mit zwei Geschossen und Satteldach sehr zurückhaltend in die historische Bebauung einfügt. Hier werden Bibliothek, Musikschule und die Probenräume des örtlichen Blasorchesters untergebracht. „Die zweigeschossige Anlage entwickelt das gestalterische Vokabular der um 1900 entstandenen Villa in einer zeitgemäßen Formensprache weiter, so dass die unterschiedlichen Entstehungszeiten und Nutzungszusammenhänge als konzeptionelle Einheit klar abzulesen sind,“ so Bernhard Landbrecht. (<http://www.baunetz.de>)

Über 27 Jahre war die „Schloßbücherei“ auf einer Fläche von 400 m<sup>2</sup> im ehemaligen Gärtnerhaus des Schloßparks der Gemeinde Ismaning untergebracht. Der enorme Benutzeranstieg in den letzten Jahren und fehlende räumliche Erweiterungsmöglichkeiten erforderten einen Bibliotheksneubau an einem anderen Standort. Um Synergieeffekte auch mit weiteren Kultur und Bildungseinrichtungen zu ermöglichen, plante die Gemeinde Ismaning, die künftige Gemeindebibliothek in einem neuen Gebäudekomplex zusammen mit Volkshochschule, Musikschule und Blasorchester unterzubringen. Ausgangspunkt aller Überlegungen für das neue Kultur- und Bildungszentrum war die denkmalgeschützte Villa des ehemaligen Anwesens Seidl-Mühle. Sie steht als Merkzeichen an markanter Stelle im Ortsgefüge und ist Teil einer ehemaligen Hofanlage mit Mahl- und Sägemühle in naturräumlich herausgehobener Lage am Zusammenfluss von Seebach und Kernbach. Bereits das Ortskatasterblatt von 1858 zeigt an dieser Stelle einen dem Ortsbereich damals noch vorgelagerten Ökonomiehof, der von drei mächtigen Satteldachbaukörpern gebildet wurde. Um 1910 ist diese Anlage – In der Seidl-Mühle pulsiert das Leben. Nach zweijährigen Bauarbeiten erhielt die Gemeindebibliothek Ismaning (Landkreis München) mit dem Einzug in das Kultur- und Bildungszentrum Seidl-Mühle einen neuen und sehr attraktiven Standort. Von Christian Mörtel und Bernhard Landbrecht in Verlängerung des nördlichen Flügels – mit einem neuen Wohngebäude, der „Villa Seidl“, ergänzt worden. Die Idee des zentralen Ökonomiehofes, um den sich nun die Kultur- und Bildungseinrichtungen in Form einer Dreiflügelanlage gruppieren, wird für die neuen, gemeinschaftlichen Nutzungen übernommen. Die zweigeschossige Gebäudegruppe nimmt auch den Maßstab der ursprünglich vorhandenen Bebauung auf, entwickelt jedoch für die Neubauten das gestalterische Vokabular der um 1910 entstandenen denkmalgeschützten Villa in einer zeitgemäßen Formensprache weiter. So bleiben in der konzeptionellen Einheit die unterschiedlichen Entstehungszeiten und Nutzungszusammenhänge trotzdem klar ablesbar. Der einfache, hoch wärmedämmte und verputzte Massivbau kontrastiert mit aufgelösten, holzverkleideten Skelettstrukturen im Bereich der Bibliothek und weiterer herausgehobener Nutzungen. Besonders in den dauernd genutzten Arbeitsräumen entstehen dadurch Speichermassen, die nicht zuletzt auch im Hinblick auf den sommerlichen Wärmeschutz klimaregulierend wirken. Die Holzfassade der Bibliothek und der darüberliegenden Veranstaltungszone – alternierend gefügt aus geschlossenen, hoch wärmedämmten und verglasten Elementen – wurde zur optimalen Belichtung auch tiefer Zonen weitgehend raumhoch ausgeführt. Die Funktionen der natürlichen Lüftung und der Belichtung sind dabei differenziert entwickelt. Dies erleichtert die sommerliche Nachtabkühlung mit eigenen Lüftungskappen bei geschlossenen Fensterflügeln ohne zusätzlichen Wetter- bzw. Einbruchschutz. Für den Sonnenschutz ergänzen in diesen meist unmittelbar zugänglichen Bereichen robuste Schiebeläden die Holzfassaden und geben ihnen mit ihren je nach Gebäudeseite horizontalen bzw. vertikalen Lamellen zudem einen besonderen Rhythmus. Christian Mörtel, in: Bibliotheksforum Bayern 4, 2010. (<http://www.bibliotheksform-bayern.de>)

## **Landesbauamt Schwerin – Germany**

<http://www.bbl-mv.de>

#### **Bibliothek Hochschule Wismar – Germany 2000**

Der Bibliotheksneubau liegt zentral im Campus des Hochschulgeländes und stellt einen Anbau an das vorhandene Bibliotheksgebäude dar. In dem Neubau sind Freihandbibliothek, Lesesaal, Magazin, Haupteingang mit Garderobenbereich sowie Buchannahme und Buchausgabe untergebracht. Der Neubau ist ein zweigeschossiger Stahlbetonskelettbau mit nach Süden und Osten ausgerichteten Glasfassaden mit vorgesetzten festen Sonnenschutzlamellen und verschiebbarem inneren Blendschutz aus graublau satinierten Gläsern. Die West- und Nordseite wurde aus energetischen Gründen massiv ausgeführt und stellt mit den vorgehängten roten bzw. grauen Platten aus Mehrschichtholz und Faserzement sowie den außen liegenden Fluchttreppen einen bewussten Kontrast zu den übrigen verglasten Fassaden dar. Im Innenbereich dominieren Materialien wie Beton, Holz, Glas und ein über zwei Etagen verlegter rotbrauner Teppichboden. Alt- und Neubau sind über einen verglasten Verbindungsgang miteinander verbunden. (<http://www.architektenkammer-mv.de>)

## [Straßenbahndepot Sachsenhausen, Bibliothek, Frankfurt am Main – Germany 2009](#)

Architekt Michael A. Landes - Landes & Wentz GmbH

Bauherr Depot Sachsenhausen GmbH, BGF 14.500m<sup>2</sup>

Eine kleine Stadt mit Wohnungen, Markt, Bibliothek und einem Bouleplatz unter Platanen. Die denkmalgeschützten Hallen sind zum Teil erhalten und als architektonischer Raum wieder hergestellt worden. (Landes)

Seit Sonntag wird die Frankfurter Rundschau in ihren neuen Redaktionsräumen im ehemaligen Straßenbahndepot Sachsenhausen in Frankfurt am Main produziert, nachdem auch die meisten anderen Nutzer in den Wochen zuvor schon in dem umgebauten Gebäudekomplex eingezogen sind. Realisiert wurde das Projekt von dem Frankfurter Architekturbüro Landes & Partner. Das Straßenbahndepot war 1899 als erster eigener Betriebshof errichtet worden, in unmittelbarer Nähe zum damals schon bedeutenden Verkehrsknotenpunkt Südbahnhof. Das Gebäudeensemble liegt auf einem rund 8.300 Quadratmeter großen Grundstück in einem Gebiet, das vornehmlich von Wohnnutzungen geprägt wird. An dem Standort wird nun ein recht breites Nutzungsspektrum angeboten. Neben dem „Bibliothekszentrum Sachsenhausen“, das in der mittleren Depothalle mit einem Gastronomie-Betrieb untergebracht ist, steht die gesamte östliche Halle für den Lebensmittelhandel zur Verfügung, so dass im Hinblick auf den Denkmalschutz die Halle und der ursprüngliche Raumeindruck des historischen Gebäudes erhalten werden konnte. Das Projekt umfasst neben dem Ausbau der Hallen auch einen Neubauteil, etwa für Wohnnutzungen. Um das Gebiet zu einem „lebendigen, urbanen Stadtquartier“ mit gemischter Nutzung zu entwickeln sind neben den Wohnbereichen darüber hinaus auch Büroflächen – wie eben die Redaktionsräume der FR – auf dem Gelände untergebracht. (<http://www.baunetz.de>)

## [Landesbetrieb Liegenschafts- und Baubetreuung \(vorm. Staatsbauamt\)](#)

<http://www.lbbnet.de>

**Libraries:**

#### [Universitätsbibliothek Koblenz – Germany 2001](#)

Fläche: 2.800 qm (HNF), Art der Baumaßnahme: Neubau des Benutzungsbereichs und Umbau eines Altgebäudes für Dienstbereich  
Gesamtkosten: in den Gesamtkosten für den Campus-Neubau der Universität Koblenz enthalten

Der Bibliotheksbau vereint - über Brücken und Lichthöfe angebunden, einen Alt- und einen Neubau zu einem neuen Ganzen. Leitendes Prinzip der bibliotheksbaulichen Planung ist eine flexible Bauweise mit multifunktionaler Nutzungsmöglichkeit. Dies wird durch einen rechteckigen, zweigeschossigen Neubau aus Glas und Stahl im Konstruktionsraster 7,50 x 7,50 m (Außenmaß 53 x 34 m) erreicht, der den Benutzungsbereich aufnimmt und mit dem im Altbau untergebrachten Verwaltungsbereich über drei Brücken mit dazwischen liegenden begehbaren Atrien verbunden ist. (<http://www.bibliothekportal.de>)

## [Landesbetrieb Liegenschafts- und Baubetreuung \(vorm. Staatsbauamt\)](#)

### [Niederlassung Landau, Architekt Thomas Seyler – Germany](#)

<http://www.lbbnet.de>

**Libraries:**

#### [Universitätsbibliothek Landau – Germany 2001](#)

Fläche: 3.708 m<sup>2</sup>, Art der Baumaßnahme: Um- und Erweiterungsbau, Gesamtkosten: 9,6 Mio. Euro, Baukosten: 8,85 Mio. Euro, Einrichtungskosten: 750.000 Euro (Einrichtung und Geräteausstattung)

Planung: Architekt Thomas Seyler, Landesbetrieb Liegenschafts- und Baubetreuung, Niederlassung Landau

Das vorhandene Bibliotheksgebäude (Erd- und Untergeschoss) muss in den Neubau integriert werden: Im Süden wurde das bestehende Gebäude durch einen Verwaltungstrakt im Untergeschoss und Lese- und Arbeitsbereiche im Erdgeschoss, im Westen und Osten um jeweils dreigeschossige Freihandbereiche erweitert. Die Kapazität der Bibliothek kann durch Aufstockung der Regalanlage in der nördlichen Zone des Obergeschosses erweitert werden. Der Brandschutz formt wesentlich die Innenfigur mit einer mittigen Brandwand und dem Konzept des alleinsichtigen Großraums, in den die neuen Stockwerke, von der Außenwand abgerückt, eingestellt werden. Die Fluchttreppen gliedern den kompakten Baukörper von außen. Das Schrägdach aus Sperrholz und Glas überspannt diese Räume. Diese ruhige Anordnung wird unterbrochen durch ein großes Oberlicht mit dem darunter befindlichen, frei im Raum stehenden Aufzug. Schalldämmende, weiße Deckensegel sowie das formgleiche Oberlicht spiegeln die darunter liegenden Grundrisszuschnitte. Es handelt sich daher bei dem Landauer Neubau nicht um einen reinen Neubau, sondern um einen Um- bzw. Erweiterungsbau des alten Bibliotheksgebäudes aus den 60er Jahren.

## [Lederer + Ragnarsdóttir + Oei, Stuttgart – Germany](#)

<http://www.archlro.de>

**Libraries:**

#### [Erweiterungsbau Landesbibliothek Stuttgart – Germany on design \(2015\)](#)

Am 27. Mai 2011 empfiehlt das Preisgericht des Planungswettbewerbs das Stuttgarter Architekturbüro „Lederer Ragnarsdóttir Oei“ für den ersten Preis. Der Entwurf sieht einen eigenständigen Erweiterungsbau im nordwestlichen Bereich der Landesbibliothek vor, der nur über einen Steg mit dem Altbau verbunden ist. Dieser ist nicht von massiven baulichen Eingriffen betroffen und kann daher auch während der ganzen Bauzeit ohne Störung genutzt werden. Auch auf kostspielige Auslagerungen der Bestände kann somit verzichtet werden. Der Lesesaal rückt klar ins Zentrum des Gesamtensembles. Deutlich ist die Achse zum Neuen Schloss erkennbar. Der Entwurf geht von der Boulevardidee der Konrad-Adenauer-Straße aus. Gefallen hat den Experten gerade diese "hervorragende städtebauliche Einbindung entlang der Kulturmeile", wie der Frankfurter Architekt und Vorsitzende der Jury, Prof. Christoph Mäckler, betont. Das Konzept beziehe den angedachten Rückbau der Konrad-Adenauer-Straße zur Allee mit ein und sei daher zukunftsweisend. Eine wichtige Frage stellt sich mit dem vorgesehenen Abbruch und Neubau der vorhandenen Tiefgarage. Eine Wirtschaftlichkeitsuntersuchung hat ergeben, dass ein Neubau gegenüber einer Überbauung und Sanierung der alten Tiefgarage vorzuziehen sei und zudem Raumvolumen für eine Erdgeschossnutzung auf dem Niveau der Konrad-Adenauer-Straße böte. Der helle sandfarbene Werkstein, der die Fassade auszeichnet, gibt dem Bau einen freundlichen, einladenden

Charakter. Zusammen mit dem vorgelagerten Bibliotheksplatz und der großen Treppenanlage ergibt sich ein optisch ansprechender Gesamteindruck. (<http://www.wlb-stuttgart.de>)

Schwäbisches Tagblatt 30.05.2011 - 08:30 Uhr

Der zweite Anlauf hat sich gelohnt. Drei Büros, die im letzten Dezember "gleichrangig gute Arbeiten" für den Neubau an der Konrad-Adenauer-Straße vorgestellt hatten, wurden um Überarbeitung gebeten. Gestern fiel dann die Entscheidung - für die Stuttgarter Architektengemeinschaft. Ihr Entwurf überzeuge insbesondere durch seine hervorragende städtebauliche Einbindung entlang der Kulturmeile, erklärt der Jury-Vorsitzende Christoph Mäckeler. Der Anbau versperre nicht den Blick auf das Bestandsgebäude. Es stehe komplett frei und werde nur über eine Brücke mit diesem verbunden. Die Fassade soll wie die Nachbargebäude aus hellem Naturstein bestehen und im Erdgeschoss große Fensterflächen erhalten. Mäckeler lobt diese Transparenz: "Das ist zukunftsweisend. Hier wird bereits berücksichtigt, dass die Kulturmeile mal zu einem Boulevard umgestaltet wird."

Für WLB-Direktor Hannsjörg Kowark, der seit Jahren für eine Erweiterung kämpft, ist die Wettbewerbsentscheidung "ein wichtiges Etappenziel". Er hofft nun auf eine schnelle Realisierung, "weil wir einfach keinen Platz mehr haben". Im Neubau soll die 5,6 Millionen Medien umfassende Bibliothek um eine Fläche von 6500 Quadratmeter erweitert werden. Dort sollen vor allem neue Ausleihflächen und Benutzerarbeitsplätze entstehen.

Ministerialdirektor Thomas Knödler vom Finanzministerium und sein Kollege vom Wissenschaftsministerium, Hans Georg Koch, betonen, der Erweiterungsbau sei "eine wichtige Investition in eine zentrale Bildungseinrichtung des Landes". Doch die Mittel müssten im Landeshaushalt aber erst noch eingeplant werden. (<http://www.tagblatt.de>)

### Salem International College (Bibliothek), Überlingen – Germany 2000

Bauherr: Schule Schloss Salem Vertreten durch Dr. Bernhard Bueb, Baukosten: 35 Mio Euro (Gesamtbudget 1. Bauabschnitt)

Baugrundstück: 100.000 qm (10 ha)

#### **Literature:**

Wettbewerbe aktuell, Heft 05 / 1996

Auf einem herrlichen Grundstück, das teilweise den Blick auf den Bodensee freigibt, konnten wir die Anlage für ein neues Internat der Schule Schloss Salem entwickeln. Es handelt sich dabei in einer ersten Stufe um ein Zentrumsgebäude, das Aula, Speisesaal, Bibliothek und Verwaltung beherbergt, ein Unterrichtsgebäude, sowie einer für die Schüler und Lehrer konzipierten Wohnanlage aus Reihenhäusern, die eine gemeinsame Gasse bilden. (Die Schüler des Colleges sind zwischen 16 und 19 Jahre alt.). Der städtebauliche Entwurf orientiert sich an dem Gedanken der "Polis". Wichtig war uns die Gestaltung der Zwischenräume, Wege und Plätze, die die wesentlichen Orte von Begegnung und sozialem Austausch darstellen. Das Zentrum liegt im Schwerpunkt des Grundstückes und ist sehr plastisch und geschlossen geplant. Die ansteigenden Sitzreihen der Aula folgen dem natürlichen Verlauf des Geländes. Zwischen dem Zuschauerraum mit Bühne und dem talseitigen Hof im Freien befindet sich die Theaterwerkstatt. Die Mensa, die sich mit ihrer großflächigen Verglasung zum Tobel öffnet, spannt sich wie eine Brücke über diesen Bereich. Wie die Mensa bietet auch die darüberliegende Bibliothek den Schülern den Ausblick auf den See. Bei warmer Witterung kann das Auladach zusätzlich als Leschhof genutzt werden. Auch die Wohnhäuser sind monolithisch gestaltet. Zwischen Wohngebäuden und Zentrum liegt die lange "Schlange" des Unterrichtsgebäudes. Dieses ist im Gegensatz zu den anderen Häusern sehr leicht gebaut. Die gesamte Anlage hat einen hohen ökologischen Standard, der Teil des pädagogischen Lehrplanes ist. Deshalb war das Internat im Rahmen der EXPO 2000 als Projekt zu besichtigen. Der Ort verlangt, ähnlich wie unsere Schule in Ostfildern, eine prägende Architektur. Deshalb haben wir auch hier, beim Zentrum und den Wohngebäuden einen Ziegelstein mit grober Verfassung verarbeitet. Dagegen wirkt das Unterrichtsgebäude, der Ort des Lernens und der Wissensvermittlung, wegen der weiß lackierten Holzkonstruktion hell, leicht und transparent - fast wie im Urlaub. (Lederer)

### Medienschiff Weiterstadt – Germany 2009

Standort: Marktplatz Weiterstadt, Bauherr: Stadt Weiterstadt, Realisation: 2008 – 2010, BGF: 1.500 m<sup>2</sup>

Bücherei, Stadtbüro, Polizeistation.

Der Marktplatz, das Bürgerhaus, die Schule, der Platz Verneuil-sûr-Seine, die Parkanlage bilden zusammen mit dem Neubau eine öffentliche Spange an der Darmstädter Straße, das Zentrum in Weiterstadt gestärkt. Durch das Medienschiff wird die Südseite des Marktplatzes gefasst. Auf dem Platz wird Parken auf das erforderliche Maß reduziert, die gewonnene Fläche wird durch ein Café belebt. (Lengfeld)

Das Stahlbeton-Tragwerk besteht aus Flachdecken und Wandscheiben. Geschosshöhe und als Überzug gerechnete Außenwandscheiben dominieren die markante Erscheinung des Baukörpers. Die Lasten aus den Decken als Scheibentragwerk ruhen unterstützungsfrei auf lediglich zwei punktuellen V-Stützen in der Erdgeschosszone. (<http://www.beton.org>)

### NRW – Gesundheitscampus, Bibliothek, Bochum – Germany on design

Am 12. März 2010 wurde der Wettbewerb für den NRW-Gesundheitscampus in Bochum entschieden. Gewonnen haben Léon Wohlhage Wernik (Berlin). Beim zukünftigen Standort des Gesundheitscampus' handelt es sich um ein Grundstück mit einer Fläche von 48.000 Quadratmetern. Insgesamt sollen 53.000 Quadratmeter Bruttogeschossfläche realisiert werden. Es werden rund 200 Millionen Euro investiert, dafür entstehen hier rund 1.000 Studien- und ebenso viele Arbeitsplätze. 19 Teams hatten an dem Wettbewerb teilgenommen, die Jury unter dem Vorsitz von Manfred Hegger (TU Darmstadt) vergab folgende Preise:

1. Preis (70.000 Euro): Léon Wohlhage Wernik (Berlin) mit Bauer und Partner Landschaftsarchitekten

3. Preis (35.000 Euro): Gerber Architekten mit WES & Partner Landschaftsarchitekten

3. Preis (35.000 Euro): Auer+Weber+Assoziierte mit LATZ+Partner Landschaftsarchitekten

Anerkennung (17.500 Euro): Heinle, Wischer und Partner (Berlin) mit Heinz W. Hallmann

Anerkennung (17.500 Euro): Gatermann + Schossig mit FSWLA Landschaftsarchitektur

Die ersten Preisträger beschreiben ihren Entwurf wie folgt: „Der neue Gesundheitscampus Nordrhein-Westfalen setzt ein architektonisches Zeichen im gewachsenen Landschaftsraum. Um die umliegenden landschaftlichen Ressourcen zu schonen, bleiben die begrünte Hangkante und der Baumbestand erhalten, die Bebauung konzentriert sich auf das rechteckige Baufeld. Eine breite, langgestreckte Terrasse bildet das Rückgrat der neuen Bebauung und öffnet sich nach Süden mit einer weiten Sicht über den Landschaftsraum. Die Campusterrasse ist das zentrale Element im neuen Gebäudekomplex. Hier befinden sich die Hauptzugänge der einzelnen Einrichtungen. Die Terrasse ist sowohl Verbindungselement als auch dezentrale Anlaufstelle mit Bezug zur Umgebung. Am südwestlichen Ende des Baufeldes steht bereits ein Hochhaus, das den Eckpfeiler für den Gesundheitscampus bildet. Ein weiteres Hochhaus als Pendant wird in der zweiten Erweiterungsstufe ergänzt. Alle Häuser auf dem Campus sind in Weiß gehalten mit großen Fensteröffnungen. Eine Differenzierung der Oberflächen und Variationen im Rhythmus der Fassaden sind wünschenswert, allerdings hält das Weiß als Grundfarbe den gesamten Komplex als eine Art „White City“ zusammen und vermittelt darüber hinaus das Thema Gesundheit. Mensa, Bibliothek und zentrales Veranstaltungszentrum sind in einem Baukörper im Zentrum der Anlage zusammengefasst. In der ersten Bauphase ist diese zentrale Einrichtung das Auftaktprojekt für den neuen Gesundheitscampus. In seiner großzügigen Struktur und Bedeutung unterscheidet es sich erheblich von den übrigen Instituts- und Verwaltungsbauten mit Büros, Seminar- und Hörsälen. Große, markante Glasflächen im Kontrast zur geschlossenen Fläche, stellen das Haus als Solitär heraus und unterstreichen seinen besonderen Charakter. Die Mensa öffnet sich ebenerdig nach Süden und kann so die Terrasse im Sommer miteinbeziehen. Zwei wichtige Serviceangebote, Information und Mensa, rahmen das Hochschulgebäude und vernetzen als Anlaufpunkte Hochhaus, Hochschule, Bibliothek und Terrasse zu einem Campus.“ (<http://www.baunetz.de>)

### University Library & Media Centre HTWK Leipzig, Leipzig – Germany 2009

Client: Staatsbetrieb Sächsisches Immobilien- u. Baumanagement, NL Leipzig II, Competition 1st prize 2004, Construction 2007-2009, GFA 8.000 m<sup>2</sup>

University Library and Media Centre create a new prominent building cluster on the Campus of the HTWK Leipzig. Both buildings which had very different briefs form a harmonious and powerful composition at the corner of Karl-Liebknecht-Straße and Gustav-Freytag-Straße. Three upper floors of the library cantilever 11 meter in total into the street providing a canopy to the entrance. The reflecting mosaic glass tiles of the facade turn the building into an abstract, white glistening sculpture. Large format windows provide insights into the colourful reading rooms and working spaces and enliven the outdoor space. (Léon)

#### Centre International du Design, St. Etienne (Loire) – France 2009

Surface net: 21.140m<sup>2</sup>, competition march to june 2004, realisation 2006 to 2009, Costs: 41,5 Mio €

The „Centre International du Design“ is a new institution for communication, research and education in design. The project is situated on the historic site of the National Arms Manufacture in St. Etienne. It involves the renovation of several historic buildings, as well as the integration of a new building the ‘platine’ (200 x32 m), an observation tower (31m high), two gardens and the Place d’Armes, a public esplanade. The ‘platine’ is an interclimatic laboratory whose adaptive skin is enveloping several programs as an exhibition spaces, an auditorium, the ‘agora’, a greenhouse and a media- and material library. It is reacting on their different needs in terms of light and climate. It is also an expression of the different activities in the Cité du Design. Project status: International competition, 1st prize, opening 1st october 2009

#### Bibliothek für das Institut für Weltwirtschaft, Kiel – Germany 2001

Gesamtkosten: 46.300.000 DM, Baukosten: 44.800.000 DM, Einrichtungskosten: 1.500.000 DM, Art der Baumaßnahme: Erweiterungsbau

Das Haus wird durch den Altbau des Krupp'schen Gästehauses bestimmt, der um die Jahrhundertwende im Stile des Historismus entstanden ist und ein Konglomerat unterschiedlicher Baustile zu einem imponierenden Ensemble des 19. Jahrhunderts zusammenschweißte. Städtebaulich fügt sich die neue Bibliothek harmonisch in die Lage zwischen Kieler Förde und Düsternbrooker Gehölz ein. Die zur Förde hin geschwungene Glasfassade setzt einen architektonischen Akzent an der Kiellinie. Dadurch gelang eine harmonische Verbindung von Altbau und neuem Baukörper, der Transparenz, Licht und Luft zum Ausdruck bringt.

#### Stadtbibliothek Essen, Gildehof Center, Essen – Germany 1999

Das in unmittelbarer Nähe zum Hauptbahnhof gelegene Gildehof Center ist ein Gebäudekomplex aus den späten 80er Jahren, bestehend aus vierzehn Hochhausetagen und zwei ausgedehnten Basementgeschossen, mit u. a. einem seit Jahren brachliegenden Spaßbad. Die Stadtbibliothek, ursprünglich in sechs Etagen des Hochhauses auf 6000 qm verteilt, wurde in diese Basementgeschosse verlagert, erweitert und mit eigener Identität versehen. Die im Hochhaus frei gewordenen Flächen werden in einem zweiten Bauabschnitt für städtische Verwaltungsaufgaben hergerichtet. (Lom)

#### **Universität Hamburg, Fachbereich Erziehungswissenschaft, Martha-Muchow Bibliothek, Hamburg – Germany 2006**

Grundinstandsetzung Fachbereich Erziehungswissenschaft, Universität Hamburg, Bauherr: Freie und Hansestadt Hamburg, Hochschulamt, Baubeginn: September 2003

Die überwiegende Zahl der in den 60iger Jahren entstandenen Hochschulbauten auf dem Campus der Universität Hamburg werden gegenwärtig renoviert oder grundinstandgesetzt. Neben dem Audimax (Architekt B. Hermkes) gehören auch die Bauten von Paul Seitz, darunter der Fachbereich Erziehungswissenschaft, zu den architektonisch wichtigsten „Erbstücken“ aus dieser Zeit.

Die Grundinstandsetzung umfasst die Erneuerung sämtlicher Fassaden, die komplette Renovierung des Hörsaales einschließlich Einbau neuer Medientechnik, überhaupt den Ersatz der gesamten Haustechnik, darüber hinaus Umbau und Renovierung aller Innenräume. Übergeordnetes Entwurfsziel ist es, die vorgefundene relative Vielgestaltigkeit der Baukörper und Fassaden im Grundsatz zu belassen, ja, im Gegenteil durch kraftvolle Reduktion auf das Wesentliche und prägnante Ausgestaltung im Detail im Ausdruck zu steigern. Zum Campus selbst entsteht eine zweite Fassadenschicht in Form eines großen Gitterwerkes aus Aluminium. Das Innere des Gebäudes wird durch klare und mutige Farben an den Wänden bestimmt. Der Bodenbelag besteht aus Quarzitstein und rotem Linoleum. Das ehemalige Werkstattgebäude wird in einem 2. Bauabschnitt nahezu komplett entkernt und zu einem Bibliothekshaus auf fünf Ebenen umgebaut. (Mansberg)

#### **Universität Lüneburg, Bibliothek, Lüneburg – Germany 1999**

Bauherr: Land Niedersachsen, Projektsteuerung: NILEG Hannover, BGF: 12000 m<sup>2</sup> / BRI: 42000 m<sup>3</sup>

Der Neubau der Bibliothek ist Teil einer Gesamtplanung für die Konversion der ehemaligen Scharnhorst-Kaserne. Die in Baustufen geplanten und realisierten Neubauten auf dem Campus umfassen insgesamt vier Hörsäle an einer zentralen Magistrale, die Mensa und die Zentralbibliothek am Endpunkt der Magistrale. Die Bibliothek umfasst insgesamt 600.000 Bände, die mit wenigen Ausnahmen sämtlich als Freihandbestand den Benutzern zur Verfügung stehen. Eine zweigeschossige Eingangshalle mit Cafeteria auf der Galerie bildet den Auftakt. Von dort aus bewegt man sich in den Freihandbereich, der auf zwei Ebenen den eingestellten „Tisch“ aus Stahl als großen Lesesaal in der Tradition klassischer Bibliotheksbauten umgreift. Insgesamt gibt es 350 Leseplätze. Eine Besonderheit stellt eine in den Bibliotheksbau integrierte ehemalige Wartungshalle für Fahrzeuge dar. Diese tritt als ablesbarer Baukörper mit originalen, übergroßen Toren in Erscheinung und beherbergt einen Teil des Freihandbereiches in einer Kompaktaufstellung. Die Fassaden aus rotem Backstein nehmen Bezug auf die ehemaligen Kasernengebäude auf dem Campus. Sie bilden eine bewusst spärlich befensterte Mauer im Erdgeschoss, während die obere Bibliotheksebene mit umlaufendem Fensterband einen „Blick über die Mauer“ wirft. Die Dachränder kragen sehr weit über die Fassade aus und geben der Bibliothek einen weiterhin sichtbaren, eigenständigen Ausdruck. (Mansberg)

#### **Stadthaus, Scharnhäuser Park und Marktplatz, Ostfildern – Germany 2002**

Bauherr: Stadt Ostfildern, 1. Preis, Int. Wettbewerb 1998, Fertigstellung 4/2002, Collection of MoMA New York, USA,

Im Zentrum des Scharnhäuser Parks liegt der Marktplatz mit dem Stadthaus. Es ist ein multifunktionales öffentliches Gebäude, das Stadtverwaltung, Bürgerservice, Stadtteilbibliothek, Städtische Galerie, Musikschule, Trauzimmer, Volkshochschule, Büroräume und einen Festsaal unter einem Dach zusammenfasst. Durch die intensive Durchdringung der einzelnen städtischen Angebote entsteht ein programmatischer Synergieeffekt, der funktionale und optische Transparenzen provoziert. Das gesamte Haus ist als ein großer öffentlicher Raum konzipiert, in den einzelne Funktionen für bestimmte Anforderungen als Kernräume eingelegt sind. Um sie herum legt sich ein fließender Kommunikationsraum für zufällige oder geplante Begegnungen. Vom Marktplatz bis zum begehbaren Panoramadach verbindet sich das Stadthaus durch Einschnitte und Terrassen mit dem Außenraum. Diese Einschnitte bleiben als strategische Erweiterung des Raumprogramms über die üblichen Öffnungszeiten hinaus aktiver öffentlicher Raum. Sie werden durch Licht- und Wasserelemente animiert und setzen Natur und Technologie in ein wechselseitiges Abhängigkeitsverhältnis. Von der leuchtenden Unterseite des Vordachs tropft ein computergesteuerter künstlicher Regen, durch den man zum Eingang gelangt. Beim Windlicht auf dem Marktplatz bewegen sich, angeregt durch die Luftbewegung, die hängenden Lichtstränge und das auf den Boden projizierte Punkteraster. Über Webcams, die in die Masten eingebaut sind, wird dieses bewegte Lichtbild als Projektion zurück in das Stadthaus und auf die Website der Stadt Ostfildern übertragen. Mit Stadthaus und Marktplatz wurde ein Prototyp entwickelt, der exemplarisch die Gleichzeitigkeit des städtischen Lebens im realen, medialen und virtuellen öffentlichen Raum umsetzt. (Mayer)

 NEU BAU LAND 1990 - 2007 , Architektur und Stadtumbau in den neuen Bundesländern, Hrsg.: Ernst A. Busche u. a., E.A. Seemann Verlag, Deutsches Architekturmuseum 2007, S. 161

Für einen im Zweiten Weltkrieg teilweise zerstörten und später durch Fabrikgebäude ergänzten Häuserblock mitten in der Altstadt von Weimar ergab sich nach der Wiedervereinigung die Chance einer Neuordnung. Bereits in dem 1991 ausgelobten städtebaulichen Ideenwettbewerb schlugen die Architekten vor, den Block teilweise zu entkernern und durch Bebauung neu zu strukturieren. Obwohl die Planung wegen unterschiedlicher Nutzungskonzepte mehrfach modifiziert werden musste, blieb die grundlegende Idee erhalten. Das zweiflügelige Gebäude beherbergt nun die Bibliothek und einen Hörsaal der Bauhaus-Universität. Es fügt sich geschickt in den von vier Straßen eingefassten Häuserblock ein und gliedert den Innenhof in verschiedene Bereiche. So ist eine Folge von kleinen Plätzen entstanden, die über Fußwege und Treppen mit dem Stadtraum verknüpft sind und das von Norden nach Süden ansteigende Gefälle überwinden. Der von drei Seiten zugängliche Gebäude-komplex bildet dabei die Schnittstelle. Er gliedert sich in das Hauptgebäude und einen einhöftigen Verwaltungstrakt; der Zwischenbau verzahnt beide Bereiche und verbindet die Eingangsebenen über eine Freitreppe. Mit seiner modernen Formsprache grenzt sich das Gebäude deutlich von der historischen Blockrandbebauung ab. Gleichzeitig nimmt die Fassade Bezug auf die lokale Bautradition: Analog zu den Putzflächen der alten Fachwerkhäuser, bei denen die konstruktive Schichtung spürbar ist, erhielt der Beton eine bewusst ungleichmäßige, von Hand nachbearbeitete Oberfläche. Die Lasur trägt außerdem die für Weimar typische Farbe Dunkelgrau. Die Farbtöne im Inneren – Weiß, Beige, Grau und Rotbraun – erinnern wiederum an die Bauhaus-Architektur. Sie werden vor allem im Verwaltungstrakt und im Foyer verwendet. Die Bibliothek dagegen ist komplett mit Eichenholz ausgekleidet. Sie ist das Herzstück des Gebäudes und erstreckt sich über alle fünf Geschosse. Heide Wessely (<http://www.arcguide.de>)

### **Umbau der wirtschaftswissenschaftlichen Bibliothek der Universität Hamburg, Hamburg – Germany 2010**

BGF 3.700 qm

Die Bibliothek für die Wirtschaftswissenschaften befindet sich im 1. OG eines 70-iger Jahre-Gebäudes auf dem Campus der Universität Hamburg. Bei der Umgestaltung der Bibliothek stand eine klare Zonierung der einzelnen Bibliotheksbereiche im Mittelpunkt der Entwurfsüberlegungen. Ziel dabei war, den Nutzern eine eindeutige und übersichtliche Orientierung zu bieten. Um eine raumakustisch ruhige und konzentrierte Arbeitsatmosphäre zu schaffen wurden die "lauten" Gruppenarbeitsplätze räumlich von den "ruhigen" Einzelarbeitsplätzen getrennt. Entlang der Außenfassaden zum Campus sind an langen Lesetischen die Einzelarbeitsplätze mit AP-Leuchten und Internet-Anschlüssen aufgereiht. Der Bereich der Gruppenarbeitsplätze befindet sich auf der gegenüberliegenden Gebäudeseite entlang der Fassade zum Innenhof. Dazwischen sind als "Schalldämpfer" die Bücherregale platziert. Lernkabinette, OPAC-Rechercheplätze und Diskussionsräume gliedern die große Bibliotheksfläche. Dreh- und Angelpunkt der Bibliothek ist der Informations- und Ausleihresen. Seine markante Form und die Lichtdecke mit integrierten Schallabsorbieren sind weithin sichtbar. Zwei kleinere Informationsresen bilden dezentrale Anlaufpunkte in den besucherintensiven Bereichen. Die Zone der Zeitschriftenleseplätze unterscheidet sich in ihrem Charakter deutlich von den übrigen Arbeitsplätzen. In der Leselounge sitzt man in ausladenden, bequemen Sesseln und kann sich in entspannter Atmosphäre seiner Lektüre widmen. (medium)

### **Rechtshaus. Zentralbibliothek Recht, Erweiterung. Universität Hamburg, Hamburg – Germany 1999 – 2004**

Wettbewerb 1999 - 1. Preis, Fertigstellung 2004, BGF 6.000 m<sup>2</sup>

Städtebauliche Leitidee ist die Ausbildung eines Vorplatzes. Selbstbewußt steht der Bücherturm neben dem bestehenden Rechtshaus und formuliert durch sein Vorspringen in die Straßenflucht eine neue Vorzone, den Eingangsplatz zum Campus. Parallele, lineare Bänder und Flächen charakterisieren den Außenbereich der neuen Zentralbibliothek Recht. Gebäude, Wege-, Platz- und Pflanzflächen bewegen sich streifenförmig von der Rothenbaumchaussee zum Universitätscampus. Das bestehende Rechtshaus bleibt in seiner Funktion als Haupteingang erhalten, den neuen Bücherturm betritt man durch das Foyer des Altbaus. Beide Gebäude werden über ein gläsernes Atrium miteinander verbunden. Es entsteht ein Gesamtensemble, das sowohl kompositorisch, als auch funktional eine Einheit bildet. Das stilisierte Baummotiv der Südfassade bildet die „Kulisse“ für die denkmalgeschützte Villa und stellt diese in einen imaginären Park. Das Grün des Innenhofs zieht sich als grüne Mischwaldkulisse über die Fassade der Bibliothek bis zur Allee der Rothenbaumchaussee. Der Erweiterungsbau der Bibliothek ist als „kompakter Bücherturm“ konzipiert, der über ein Atrium mit dem bestehenden Rechtshaus verbunden ist. Umhüllt von einer Glasfassade präsentiert sich ein schwebender Körper. Die mit verschiedenfarbigen Gläsern bestückte Fassade ändert, je nach Lichteinfall, Tages- und Jahreszeit ihre Erscheinung. Ein Bücherkubus der am Tage seine Farbigkeit im Innenraum erlebbar macht, verwandelt sich in der Nacht zum gelb strahlenden Lichtobjekt. Die Erschließung von Alt- und Neubau erfolgt über Aufzug und Treppenanlage im Atrium. Im Basisgeschoss befinden sich die öffentlichen Seminar- und Garderobenbereiche, in den Obergeschossen die Bibliothek. Brücken- und Treppenverbindungen queren das Atrium, lassen den 5 m breiten und 25 m hohen, fast sakralen Raum, zum Erlebnis werden. Tief unten schimmert die türkisfarbene Wasserfläche, die neben der atmosphärischen auch raumklimatische Aufgaben zu erfüllen hat. Die kontrollierten Bereiche der Bibliothek beginnen im Hochparterre des Neubaus. Ab hier ist die Nutzungsverteilung über alle Geschosse identisch. Informations- und Recherchesysteme findet man auf den zum Atrium hin offenen Galerien. Entlang der Fassaden reihen sich die natürlich belichteten Leseplätze. Im Innenbereich, vor der Brandwand gelegen, werden kompakt die Buchstellflächen angeordnet. Im Endausbau wird die Zentralbibliothek mit 700.000 Bänden, einer Fachbodenlänge von ca. 27 km

und rund 1.200 Leseplätzen im 24 Stunden Betrieb geöffnet sein. Wesentliches Element des passiven Energiekonzepts ist das Atrium. Es verbindet räumlich Neu- und Altbau und fungiert als Pufferraum und Verzögerer für Wärmeverluste. Dieser Klimapuffer eröffnet den Nutzern die Möglichkeit, an einer offenen Galerie zu sitzen und den Zwischenraum zu erleben. Die thermische Hülle wird durch die Atrienverglasung gebildet. Auf beiden Giebelseiten sorgen Lüftungsklappen für die natürlich Be- und Entlüftung. Der thermische Kamineffekt des Atriums wird als Antrieb genutzt für die Abströmung der natürlichen Luftdurchspülung der Bibliotheksgeschosse. Positiv auf die Energiebilanz wirkt sich auch die minimierte Außenumschließungsfläche des Bücherturms aus. Die massiven Betondecken der Geschoßebenen wirken als thermische Speichermasse, nehmen Energie auf und geben diese phasenverzögert wieder ab. Unter das Glasdach montierte Lichtlenklammeln lenken das einfallende Tageslicht in die Tiefe des Atriums und sorgen so, auch auf der Nordseite, für ausreichend Tageslicht. (medium)

**Hochschule für Film und Fernsehen Konrad Wolf (HFF), Potsdam-Babelsberg – Germany 1996 – 2000**  
Wettbewerb 1996 - 1.Preis, Fertigstellung 2000, BGF 20.000 qm

Bibliothek mit Hochschuleinrichtungen, Café Fläche: 1.500 qm, Gesamtkosten: 70.000.000 DM, Einrichtungskosten: 475.000 DM Die Hochschule für Film und Fernsehen wird aus 5 Einzelhäusern gebildet, die über Glasatrien verbunden, ein Gebäude darstellen. Die konzipierten Glashäuser mit der außenliegenden thermischen Hülle verringern den Außenflächenanteil des Gesamtgebäudes erheblich. Der Energieaufwand wird durch die passiven Solargewinne drastisch gesenkt. Durch eine hochwertige Atrienverglasung können die Innenfassaden deutlich vereinfacht werden: Temperaturschwankungen sind vermindert, weder Wind noch Regen erreichen die Fassade, Frost kann praktisch ausgeschlossen werden. Da von einer Umgebungstemperatur von 15°C die angrenzenden Räume nicht beheizt werden müssen, ergibt sich in diesen Räumen ein minimierter Heizenergieverbrauch. Durch großflächige Verglasung der "Wintergärten" ist eine ausreichende Lichtstärke sowohl in den Bürogeschossen als auch für die Bepflanzung in den Erdgeschosszonen gegeben. Die Belüftung der Halle erfolgt durch Lüftungsklappen, die ohne großen technischen Aufwand für ein optimales Innenklima sorgen. Der im Grundwasser liegende Massespeicher, unter der Tiefgarage, ermöglicht die Vorheizung bzw. die Abkühlung der Außenluft, bevor diese in die zu belüftenden Räume oder in die große Halle eingelassen wird. Der verbrauchten Raumluft wird über einen Wärmetauscher die Wärmeenergie entzogen, bevor sie das Gebäude verlässt. Das anfallende Regenwasser versickert über eine Rigolen-Versickerung auf dem Grundstück.

Die Konfiguration der 5 parallelen Baukörper der Filmhochschule ermöglicht die klare funktionale Gliederung des Gesamtgebäudes und erlaubt, dass Bibliothek, Hörsäle, Studios und Ateliers klar gegliedert sind. Die Überdachung der Gebäudezwischenräume der 5 Teilhäuser bietet neben den ökologischen Vorteilen eine optimale Anbindung der einzelnen Funktionsbereiche. Haupterschließungs- und Verteilerpunkt des Gebäudes ist der zentrale "Stadtplatz", von dem aus direkt die Bibliothek/Mediathek, die Filmausleihe, sowie die öffentlichen Bereiche der Verwaltung zu erreichen sind. Die Theke im Eingangsbereich ist das Herzstück der Bibliothek und Schnittstelle zwischen Außen- und Innenbereich. Sechs Arbeitsplätze sind in einem besonderen Glaskubus untergebracht. (medium)

**Germanisches Nationalmuseum, Nürnberg – Germany 1993**

Wettbewerb 1983 - 1.Preis, Fertigstellung 1993, BGF 4.300 qm

Mit der 1993 fertiggestellten Erweiterung erhielt der Komplex des Germanischen Nationalmuseums einen weiteren, zeitgenössischen Baustein hinzu. Die Geschichte seiner Architektur spannt sich damit vom Mittelalter bis in die Gegenwart. Von der bei seiner Gründung 1857 vorhandenen Klosterarchitektur des 14. Jahrhunderts, über die Um-, An- und Neubauten des späten 19. und frühen 20. Jahrhunderts, die Nachkriegsbauten von Sep Ruf (Franz Joseph Ruf \*09.03.08 München - + 29.07.82 München, Kanzlerbungalow Bonn, Erweiterungsbau/Ostbau Bayerische Staatsbibliothek München) bis hin zu der seit 1988 in vier Abschnitten von me di um Architekten realisierten Maßnahmen. Diese umfassten nicht nur die Errichtung des Kartäuserbaus und die in den Bestand integrierte neue Eingangshalle, sondern auch das beide Teile verbindende Museumsforum. Außerdem wurde die Bibliothek umgebaut und aufgestockt, der Theodor-Heuss-Bau saniert, sowie neue Arbeits- und Unterrichtsräume für das kunstpädagogische Zentrum geschaffen. Die zentrale Entwurfsidee beruht auf dem Erhalt der durch das Museum laufenden Kartäusergasse und ihrer Ausbildung als „Brücke“, die als öffentlicher Raum durch das Museum führt und dadurch eine unterirdische, zusammenhängende Erschließung ermöglicht. Um den stadträumlichen und funktionellen Anforderungen zu entsprechen, erfolgte die Verlegung des Haupteingangs vom Kornmarkt in die Kartäusergasse. Diese wurde nach einem Entwurf des Künstlers Dani Karavan als „Strasse der Menschenrechte“ gestaltet. Ein Torbau und 27 Rundpfeiler, zwei Bodenplatten und ein Baum, aneinandergereiht aufgestellt, stehen für die 30 Artikel der Menschenrechtskonvention der Vereinten Nationen. Die Toranlage am Kornmarkt markiert den Eintritt in den Museumsbereich und bildet zugleich das Gegenstück zum Kartäuserort. Das kommunikative Zentrum des Erweiterungsbaus ist das Museumsforum. Unter der Kartäusergasse liegend, die sich einer Brücke gleich darüberspannt, verbindet es den Kartäuserbau mit der neuen Eingangshalle. Ein großzügiges Glas-Tonnen-Gewölbe erlaubt eine weitestgehend natürliche Belichtung und bietet darüber hinaus die angestrebte Beziehung zwischen öffentlichem (Strassen-) Raum und Ausstellungskomplex. Die Situierung des Forums lässt aber auch eine museumsunabhängige Nutzung zu. (medium)

**Hochschule für Jüdische Studien, Bibliothek, Heidelberg – Germany 2009**

Als „geglückte Integration“ bezeichnet die FAZ den Neubau der Hochschule für Jüdische Studien in Heidelberg, der gestern in der Landfriedstraße 12 eingeweiht wurde. Der Neubau wurde von dem Heidelberger Architekturbüro Hansjörg Maier + Partner entworfen (siehe BauNetz-Meldung zum Baubeginn vom 13. Dezember 2007) und schließt sich an das Gründerzeitgebäude, das 1903 als ein Bau der Reichsbank eröffnet wurde, an. Das nun neu entstandene Gebäudeensemble aus historischer Bausubstanz und modernem Anbau ist für 250 Studenten ausgelegt und soll die vier bisherigen Standorte der Hochschule unter einem Dach vereinen. Die Nutzfläche wurde von ca. 1.000 auf knapp 3.000 Quadratmeter erweitert. Der zwei- bis dreigeschossige Neubau setzt sich als selbstbewusstes, eigenständiges Gebäude gestalterisch und konstruktiv von der umgebenden historischen Bebauung ab. Als einfaches Stahlbetonskelett mit aussteifendem Kern und gläserner Vorhangsfassade konzipiert, ist der Neubau über eine Glasfuge mit dem Altbau verbunden. Man betritt das Gebäude durch die zweigeschossige Eingangshalle mit Foyer und Empfang. Eine breite Treppe führt hinab zum Eingang, der ein paar Stufen unterhalb der Zufahrt liegt. Im Querriegel befinden sich im 1. Obergeschoss Seminarräume und ein großer Hörsaal; im 2. Obergeschoss sind Gästewohnungen und Büroflächen angeordnet. Die über drei Etagen untergebrachte Bibliothek fungiert als Verbindungsglied zum Altbau. Hier sind die Verwaltungsbereiche, die Archive und die Büroräume der Professoren und wissenschaftlichen Mitarbeiter untergebracht. Die Innenräume sind in den Farben des Hochschulembles gestaltet worden – Wände und Decken sind weiß, die Fußböden aus Basalt oder blauem Teppich und auch

einzelne Fensterscheiben sind blau gefärbt. Glastrennwände sollen die transparente und großzügige Raumwirkung des Neubaus unterstützen. (<http://www.baunetz.de>)

Architekt der Alten Staatsbibliothek gibt auf

Die Antwort des Bundesamts für Bauwesen und Raumordnung (BBR) auf eine detaillierte Anfrage der Berliner Zeitung ist knapp: Die "vertrauensvolle Zusammenarbeit" mit dem Architekten HG Merz sei "mit Wirkung zum 31. Mai 2011" beendet worden. Merz selbst habe aus "wichtigen persönlichen Gründen" den Vertrag für die Gesamtsanierung und den Neubau des Hauptlesesaals mit seiner spektakulären Glashaube gekündigt, die renommierte Berliner Firma BAL Planungs- und Steuerungs-GMBH nach einer Ausschreibung seine Aufgaben übernommen. Sie arbeitet schon jetzt an der Sanierung des Linden-Flügels der Alten Staatsbibliothek mit. Entschädigungsgelder oder Terminverschiebungen werde der "Planerwechsel" nicht haben. Nikolaus Bernau: Berliner Zeitung, 11.06.11 (<http://www.berlinonline.de>)

## **Moersch + Würfel Architekten, Köln – Germany**

**Kultur- und Medienzentrum Pulheim – Germany 2006**

Bauherr: Stadt Pulheim, 1.052 m<sup>2</sup> Nutzfläche, 940 m<sup>2</sup> Bibliotheksfläche, Baukosten € 2.313.000, Einrichtung: € 421.000

Eine Stadt erhält eine neue Mitte. Ein städtebaulicher Ideenworkshop unter dem Titel » Vision Pulheim 2010 « entwickelte mit Hilfe vier namhafter Planungsbüros einen Rahmen- und Masterplan für den Innenbereich von Pulheim. Kernaussage der Stadtplaner war, daß urbanes Leben nur in einem Ambiente entstehen kann, das zum Verweilen einlädt. Die Architekten Professor Nikolaus Fritschi und Knut Würfel entwickelten eine Konzeption, in der Straßen mit neuen Platzelementen verflochten werden. Rathaus, Rathauscenter und der 1987 fertiggestellte Dr.-Hans-Köster-Saal sollten nicht um einen weiteren Solitär ergänzt werden, sondern es sollte eine Platzmitte geschaffen und mit zwei Bauten gefaßt werden. Im Februar 2006 war es dann soweit: Das neue Kultur- und Medienzentrum der Stadt Pulheim konnte eröffnet werden. Architekt Knut Würfel setzte die städtebauliche Idee überzeugend um: das westlich vom Dr.-Hans- Köster-Saal gelegene Gebäude beherbergt nun auf einer Fläche von 1.200 m<sup>2</sup> die Stadtbücherei, in der mehr als 40.000 Medien zur Verfügung stehen. Gegenüber, östlich gelegen, läßt der neue Veranstaltungssaal mit Foyer und integriertem Café zu städtischen Die schlicht-moderne Architektursprache öffnet sich kommunikativ mit großen Fensteranlagen in alle Himmelsrichtungen. Schmale Sichtbetonbänder gliedern die Gebäude horizontal. Die Ausfachungen wurden anspruchsvoll in regionaltypischem Mauerwerksverband mit Natursteinen realisiert. Vertikale Betonstelen öffnen die repräsentative Loggia vor dem Veranstaltungssaal. Die beiden neuen Gebäude überwinden mit ihrer verbindenden großen Treppenanlage die Höhendifferenz der bestehenden Bebauung. Es ist ein stimmiges Gebäudeensemble entstanden mit einer dreiteiligen Platzanlage. Die obere Ebene vor dem Dr.-Hans- Köster-Saal erlaubt einen hervorragenden Blick auf die verbindende Treppenanlage und die untere Platzebene vor Rathaus und Rathauscenter mit seinen Geschäften und gastronomischen Einrichtungen. Eine Baumreihe grenzt die Außengastronomie im Abstand von 6 Metern von der restlichen Platzfläche durchlässig ab. Auf ca. 1.500 m<sup>2</sup> sind hier unterschiedlichste Aktivitäten möglich. Das Kultur- und Medienzentrum in Pulheim ist mehr als eine neue Stadtbibliothek und ein Veranstaltungssaal. Die Stadt hat eine urbane Mitte bekommen. Städtebaulich gelungen, muten Formen und Materialien hell und freundlich an und laden ein zum Flanieren und Verweilen. Die gezielt eingesetzten Beleuchtungselemente garantieren diese Wohlfühlatmosphäre auch in der Dämmerung. Mehr noch, die Höhenstaffelung und der neue Zusammenhalt des Gebäude- und Platzensembles werden durch die Lichtinszenierung wirkungsvoll gesteigert. (<http://www.bega.com>)

#### **Bibliotheksgebäude Bucerius Law School, Hamburg 2006 - 2007**

Als Ergebnis eines beschränkten Wettbewerbes, wurde das Konzept der Fortführung der straßenbegleitenden Volumina zur städtebaulichen Definition des neuen Campus der Universität, mit dem 1. Preis gekürt und anschließend realisiert. Das Gebäude beherbergt neben der Bibliothek auch einen weiteren Hörsaal sowie die Mensa der Universität und integriert diese, zusammen mit verschiedenen Wintergärten in Anlehnung der in direkter Nachbarschaft befindlichen Baugewächshäuser vom Architekten Hermkes, zu einem Gesamtkonzept. (mpp)

The new library building of Bucerius Law School is in continuation of the old stock at the corner of Jungiusstraße / Marseiller Straße and gives the park behind it an urban edge. The architects understood their design as a symbolic continuation of 'traditional glass greenhouses' at this location, which also includes the historical review by Bernhard Greenhouse Hermkes from 1963. In the upper storeys of the new building, there is a library for the 650 students of the college. The use of coloured glass panels on the façade was inspired by books on the back of a shelf. On the ground floor, a lecture hall with hundreds of seats and a new cafeteria are located. (<http://www.mimoo.eu>)

#### **Internationales Maritimes Museum, Bibliothek, Hamburg – Germany 2008**

Am 12.05.06 feierte die Peter Tamm sen. Stiftung Richtfest, am 21.12.06 wurde der fertige Bau abgenommen und am 25.06.08 eröffneten Bundespräsident Horst Köhler, Hamburgs Erster Bürgermeister Ole von Beust und Professor Peter Tamm das neue und "International Maritime Museum Hamburg" denkmalgeschützten "Kaispeicher B" in der HafenCity. Prof. Peter Tamm sen. ist sowohl Ideengeber als auch Hauptstifter des Gesamtprojektes mit u.a. über 27.000 Schiffsmodellen, 50.000 Konstruktionsplänen von Schiffen, rund 5.000 Gemälden von anerkannten Marinemalern sowie rund 1.500.000 Fotografien (!). Dies alles machte er den Bürgern und Gästen der Stadt Hamburg zum Geschenk unter der Maßgabe, dass die Stadt ihrerseits ein geeignetes Gebäude einbringt. Das ist Hamburg mit dem für 99 Jahre in Erbpacht bereitgestellten 1879 gebauten "Kaispeicher B" in angemessener Weise gelungen. Diese neue und spannende Nutzungsmöglichkeit hat das älteste Lagergebäude der unmittelbar angrenzenden Speicherstadt an der damaligen Magdeburger Straße 1 - heute Koreastr. 1 - zu neuem Leben erweckt. Natürlich bedurfte es vorher erheblicher Renovierungsarbeiten, damit letztlich rund 15.000 m<sup>2</sup> Nutzfläche auf 10 Decks mit interessanten Themenbereichen gefüllt werden und sich das Museum zu einem weiteren Highlight von internationalem Rang inmitten der HafenCity entwickeln konnte. Das Museum beherbergt darüber hinaus eine Bibliothek und ein Archiv mit über 100.000 Büchern; zusätzlich sind dort ein Museumsshop und ein Cafe mit Außenterrasse eingezogen. Ein für die Öffentlichkeit nutzbarer Durchgang durch das Gebäude verbindet zusätzlich die HafenCity mit der Speicherstadt und gestattet damit auch rund um die Uhr einen kleinen Einblick in das Hafensemuseum. Doch Mittelpunkt sind die bereits erwähnten Sammlungsgegenstände, die Prof. Tamm über die Peter Tamm sen. Stiftung dem Museum mit Vertrag aus 2005 dauerhaft zur Verfügung gestellt hat. Durch sie wird ermöglicht, dass über 10 Böden (lagerhausspezifischer Name für Etagen, die hier schiffahrtsbezogenen Decks genannt werden) interessante Themen wie "Entdecker", "Navigation", "Schiffe unter Segel" und "Schiffsbau", aber auch "Sportmedium Wasser" oder "Marinemalerei" informativ und umfassend behandelt werden. Und natürlich wird auch die Geschichte der Hanse nicht vergessen, ein für die Freie und Hansestadt Hamburg wesentlicher Baustein ihrer Entwicklungsgeschichte.

(<http://www.kulturkarte.de/hamburg/32037/schifffahrt>)

#### **Zentrum für Marine und Atmosphärische Wissenschaften, Bibliothek, Hamburg – Germany 2003**

Die Universität Hamburg und das ZMAW erhielten 2007 den Zuschlag für ein Exzellenzcluster in der Klimaforschung. Durch Vernetzung der beteiligten Institute und Partner entsteht der KlimaCampus Hamburg, ein Kompetenz- und Ausbildungszentrum für Klimaforschung und Erdsystemwissenschaften - [www.KlimaCampus.de](http://www.KlimaCampus.de)

Der Bibliotheks- und Informationsservice (BIS-ZMAW) entstand Anfang 2004 als gemeinsame Einrichtung der am ZMAW beteiligten Institute. Beim Einzug in das neue Gebäude wurden bestehende Institutsbibliotheken und Buchbestände zu einer Serviceeinheit zusammengefasst: •Bibliothek des Instituts für Hydrobiologie und Fischereiwissenschaft, •Bibliothek Meteorologie + Geophysik des MPI für Meteorologie, des Meteorologischen Instituts und des Instituts für Geophysik, •Bibliothek des Instituts für Meereskunde, •Buchbestände des Instituts für Biogeochemie und Meereschemie, •Buchbestände der Forschungsstelle für Nachhaltige Umweltentwicklungen. (<http://www.zmaw.de>)

Ein Jahr nach der Grundsteinlegung wurde am 28. Mai 2001 in Hamburg das Richtfest für den Neubau des Zentrums für Marine und Atmosphärische Wissenschaften (ZMAW) gefeiert. Der von den Hamburger Architekten Markovic, Ronai, Lütjen und Voss (MRL) geplante und realisierte Komplex wird das Institut für Meereskunde, das Max-Planck-Institut für Meteorologie, eine Bibliothek und die Verwaltung des Zentrums für Marine und Atmosphärische Wissenschaften unter einem Dach zusammen führen. Der z-förmige, viergeschossige Neubau folgt in seiner Ausrichtung den diagonal auf dem Grundstück platzierten Universitätsbauten und reagiert gleichzeitig auf die parallel zur Straße verlaufenden Gründerzeitbauten. Außerdem übernimmt das Gebäude die Höhe der Nachbargebäude im Laufgraben und vermittelt zwischen dem Bau des Pharmazeutischen Instituts und den Hochhausbauten des Geomatikums. Das Gebäude setzt sich aus zwei Teilen zusammen, die über eine gemeinsame Erschließungszone miteinander verbunden werden. Der Haupteingang befindet sich an der Bundesstraße, ein weiterer „interner“ Eingang orientiert sich zum angrenzenden Geomatikum. Während die gemeinschaftlich genutzten Bereiche, wie Bibliothek, Seminarräume und Verwaltung im Erdgeschoss Platz finden sollen, nehmen die Obergeschosse die jeweils um ein kleines Atrium gruppierten Arbeits- und Besprechungsräume der Institute auf. Das über die zenital belichteten Atrien einströmende Tageslicht wird über Lichtlenkelemente bis in das Erdgeschoss geleitet. Auf diese Weise kann auch die Bibliothek noch natürlich belichtet werden. Insgesamt entstehen circa 5.200 Quadratmeter Nutzfläche. Die Eröffnung des 32 Millionen Mark teuren Gebäudes ist für Frühjahr 2003 geplant. (<http://www.baunetz.de>)

#### **Stadtfenster Duisburg, Duisburg – Germany 2012**

Auftraggeber: Multi-Development Germany GmbH, 13.000 m<sup>2</sup> BGF, € 24.000.000

Ein Komplex als Dreiklang aus Bibliothek, VHS und Handel in mitten der Duisburger Innenstadt – Elemente der Reihung, die stetig wechselnde Rhythmisierung der Fassadenelemente als metaphorische Geste, die Stadtfenster aus Cortenstahl als geschichtlicher Zeitrahmen mit Ausblick auf die sich stetig verändernde Stadt. Das Sichtbarmachen der kulturellen Werte und der gestattete Einblick als Einladung an den Bürger prägen die Fassade dieser Bibliothek. (MSP)

In addition to the Forum Duisburg and Königsgalerie retail projects, Multi's third large project in the inner city area of Duisburg is the Stadtfenster development. Multi Development plans the Stadtfenster to be built on a site situated on the Steinsche Gasse at the corner of the Münzstraße. The site, currently occupied by the old Boecker department store, will, by the beginning of 2012, become home to the new city library and adult education centre, covering around 11,000 m<sup>2</sup>. The project will include around 1,200 m<sup>2</sup> of retail space. The site forms part of Lord Norman Foster's master plan for Duisburg's inner city area. The planning of the building takes up Foster's ideas for the design of the public spaces in the Münzstrasse and Königstrasse area and represents the first implementation of a component from the framework of the master plan. Multi Development is investor and project developer. (<http://www.multi.eu>)

#### **Fakultät für Gesellschafts- und Erziehungswissenschaften und des Präsidiums der Goethe Universität - Frankfurt am Main 2013**

Wettbewerb 2007, 1. Preis, Realisierung 2007 – 2013, Kosten (netto): ca. € 130.000.000, BGF: 71.800 m<sup>2</sup>

Auftraggeber: Land Hessen, vertreten durch das Hessische Baumanagement, Regionalniederlassung Rhein-Main

Zwei eigenständige Gebäude bilden zusammen mit dem Max-Planck-Institut einen Komplex, der sich selbstverständlich in das Gesamtensemble einfügt. Wie die Bauten des ersten Bauabschnitts orientieren sich die Neubauten in ihrer Materialität an dem IG Farben Haus Hans Poelzigs, das das neue Hochschulareal dominiert. Das große Volumen des Fakultätsgebäudes wird durch zwei gegeneinander verschobene sechsgeschossige Gebäudeteile gegliedert. Es beherbergt verschiedene Institute, eine gemeinsame Bibliothek sowie ergänzende infrastrukturelle Einrichtungen. Der Verwaltungsbau ist ein fünfgeschossiger Baukörper für die universitäre Zentralverwaltung. Beide Bauten sind um jeweils großzügige zentrale Foyers mit anliegenden Gemeinschaftsräumen organisiert.

#### **Neubau einer Fakultät und Bibliothek für Rechts- und Wirtschaftswissenschaften der Goethe Universität - Frankfurt am Main 2008**

Wettbewerb 2004, 1. Preis, Realisierung 2004 – 2008, Kosten (netto): ca. € 43.000.000, BGF: 30.000 m<sup>2</sup>, Auftraggeber:

Land Hessen, vertreten durch das Hessische Baumanagement

Das Fakultätsgebäude der Recht- und Wirtschaftswissenschaften ist eines von mehreren Neubauten am Campus Westend in Frankfurt am Main. Alle, von verschiedenen Architekten errichteten Gebäude des neuen Campus, orientieren sich in ihrer Materialität und Architektursprache an das historische IG-Farben Haus von Hans Poelzig, das das weitläufige Campusareal dominiert. Neben den verschiedenen Fachbereichen der beiden Fakultäten beherbergt das Gebäude gemeinsame Einrichtungen wie eine Fachbereichsbibliothek mit nahezu 1000 Arbeitsplätzen, einem Café sowie einer großen Anzahl an Seminarräumen. Das Gebäude kann entsprechend dem Programm als Einheit aber auch als Komposition aus einzelnen Teilen gelesen werden. Die Bibliothek bildet einen zweigeschossigen Sockel, aus dem die beiden Baukörper der Fakultäten herauswachsen. Zentrale Gartenhöfe optimieren die Belichtungsverhältnisse, bieten Orientierung und unterstützen in der Bibliothek eine konzentrierte Stimmung an den Leseplätzen.

#### **Auswärtiges Amt, Bibliothek, Berlin - Germany 1999**

Im Neubauteil sollen auf etwa 20.000 Quadratmetern 770 der insgesamt 2.000 Arbeitsplätze untergebracht sein. Weniger als 20 Prozent der Mitarbeiter des Auswärtigen Amtes verbleiben in Bonn, womit das Ministerium als größtes der nach Berlin ziehenden Ressorts gilt. Im Bewußtsein des Erbes, den das Reichsbankgebäude in sich trägt, betonte Minister Müntefering, man werde nicht vergessen, daß die Nationalsozialisten diesen Bau errichtet haben. Doch demokratische Strukturen hätten schließlich gesiegt und mit den neuen Erweiterungsbau und der neuen Nutzung wäre heute ein positives Kapitel aufgeschlagen worden. Der Neubauteil des Amtes, der durch die Berliner Architekten Thomas Müller und Ivan Reimann errichtet wird, ergänzt den bestehenden Baublock von 1934 (1934-1940 Reichsbankbaudirektor Heinrich Wolff \* 1880 - + 1944, 1959 – 1990 Sitz des Zentralkomitees der SED), der von den Architekten Kollhoff und Timmermann revitalisiert wird. Der geschlossenen Baumasse des Altbaus setzen Müller und Reimann ein von Lichthöfen durchsetztes Gebäude entgegen. Am Werderschen Markt wird der Haupteingang von der Stadtmitte her erfolgen; ein überdachter, städtischer Platz empfängt dort den Besucher. Zur Spreeinsel hin steht den Nutzern des Hauses eine Stadtlloggia zur Verfügung, im Empfangshof - der Kontaktstelle zum Altbau - werden die Gäste des Bundesaußenministers ankommen. Für die Bibliothek entwarfen die Architekten eine „offene Leselandschaft, die sich um einen zentralen, von oben belichteten Lesehof“ entwickelt. Die Innen- und Außenräume des Gebäudes nehmen zu den umgebenden „Stadtfragmenten“, den Geistern des verschwundenen Stadtschlusses und der Bauakademie, ganz unterschiedliche Beziehungen auf.

Das Auswärtige Amt kann voraussichtlich Mitte November 1999 seinen Berliner Sitz vollständig beziehen, doch bereits in Kürze nach diesem Richtfest werden die ersten 70 Räume im ehemaligen Reichsbankgebäude ihren Nutzern übergeben. Für die Gesamtmaßnahme wird mit einer Bausumme von 545 Millionen Mark gerechnet, wovon ca. 170 Millionen Mark auf den Erweiterungsbau entfallen. (<http://www.baunetz.de>)

## **Nattler Architekten, Essen - Germany**

### **Libraries:**

#### **Folkwang Library, Essen – Germany 2010 – 2012**

see <http://maxdudler.de>

Der geplante Neubau des Architekten Max Dudler befindet sich im Bereich der ehemaligen Abtei Essen-Werden. Er ersetzt das durch einen Brand zerstörte alte Gebäude, schließt städtebaulich die offene südliche Flanke des Ehrenhofs und vervollständigt somit das bauliche Ensemble der ehemaligen Abtei Essen-Werden, in der die Folkwang Universität der Künste ihren Hauptsitz hat. Die Fassade aus transluzenten Stein-Glas-Verbundelementen, bislang einzigartig in Deutschland, verleiht dem kubischen Baukörper ein kristallines Aussehen. Nattler Architekten begleiten als Generalplaner die Ausführungsphase. Zur Zeit erfolgen archäologische Untersuchungen auf dem Grundstück. Der Neubau soll bereits Mitte 2011 fertig gestellt sein. In der neuen Bibliothek, die vom Innovationsministerium und der Altfried Krupp von Bohlen und Halbach-Stiftung gesponsert wurde, werden erstmalig drei wertvolle Bestände zusammengefasst: die bedeutende musikwissenschaftliche Bibliothek der Ruhr-Universität Bochum, die musikpädagogischen Bestände der Universität Duisburg-Essen und die Bestände der Folkwang Hochschule. Damit verfügt die neue Bibliothek über eine der größten musikwissenschaftlichen Bestände in Nordrhein-Westfalen. (Nattler)

A new library building is being built on the Werden Campus that will equip the Folkwang University of the Arts with "the music library of the Ruhr region" from 2010. It will combine the Folkwang collections with the former music library of the RUB and the earlier music pedagogy holdings of the University of Duisburg Essen. Expected completion of the building: March 2012. A budget of 6 million euros has been made available for construction of the new building, of which the Altfried Krupp von Bohlen and Halbach Foundation has generously pledged 2.5 million euros. The State of NRW (Bau- und Liegenschaftsbetrieb NRW) will finance the rest. The design of the architectural firm of Max Dudler, Berlin, emerged as the winner of the competition, which was lauded by the Bau- und Liegenschaftsbetrieb NRW (Duisburg branch). In the jury's opinion, this firm put forward the most convincing design for developing the new building within the framework of the heritage-listed building ensemble of the Old Abbey. The facade has been designed out of transparent stone. (Nattler)

## **Nickl & Partner, München – Berlin, Germany**

<http://www.nickl-partner.com>

### **Libraries:**

#### **Fachhochschule Düsseldorf, Campus Derendorf – Germany 2011 – 2013**

Bauherr: BLB Bau- und Liegenschaftsbetrieb Nordrhein-Westfalen, € 169.000.000 BFG 109.600 m<sup>2</sup>, BRI 470.500 m<sup>3</sup>

Ziel des Entwurfs für die FH Düsseldorf – Campus Derendorf ist es, einen zentralen Campus zu bilden, von dem alle Bereiche der FH erschlossen werden, und dabei bei voller Funktionsfähigkeit eine kleinteilige Stadtstruktur zu entwickeln. Das Konzept sieht sieben Fachhochschulgebäude vor, die alle direkt vom Campus, dem zentralen Kommunikationsbereich der Fachhochschule, zugänglich sind. Die beiden Bestandsgebäude Großviehalle und Pferdeschlachthaus werden in das Konzept integriert und bilden die Endpunkte einer Ost-West-Grünachse, die den Campus bildet. Bibliothek und ITM werden gemeinsam in die bestehende Großviehalle integriert. Die Mensa wird im Zusammenhang mit AstA und Studentenservice als eigener Baukörper ausgebildet. Das Hörsaalzentrum nimmt eine besondere Stellung ein. Es verbindet durch seine Lage die Öffentlichkeit und Lehre und Forschung und markiert die „Adresse Fachhochschule“. Die übrigen Fachbereiche sind in drei weiteren Baukörpern verortet. Jeweils zwei Fachbereiche teilen sich gemeinsame Funktionen. Das Prinzip der Ablesbarkeit der Fachhochschule als eine Einheit ist nicht nur städtebaulich vordringliches Ziel, sondern zeigt sich auch in der Fassadengestaltung. Durch die Entwicklung einer flexiblen Grundstruktur, die auf dem Prinzip einer Bandfassade beruht, können alle Gebäude trotz unterschiedlicher Nutzungen ein einheitliches Erscheinungsbild erhalten. (Nickl)

### **Libraries:**

#### **Volkswagen Universitätsbibliothek der TU (Technischen Universität) und UDK (Universität der Künste) Berlin – Germany 2000 - 2004**

Auftraggeber: Senatsverwaltung für Stadtentwicklung, Gesamtfläche (BGF): ca. 29.000 m<sup>2</sup>. Baukosten: ca. 44.000.000 Euro  
Optimierung einer vorliegenden Planung

Das ca. 56,3 Millionen Euro teure, vierstöckige Gebäude ist Ergebnis eines Jahrzehnte langen Anlaufs, dessen Ausführung mehrfach an den Kosten zu scheitern drohte. Nach den allgemeinen Regeln des Hochschulbauförderungsgesetzes sollten Bund und Land Berlin die Kosten zunächst je zur Hälfte tragen. Nachdem das Land 1999 seine Finanzierungszusage zurückzog, bot die TU an, diesen Anteil über einen Kredit selbst zu übernehmen. Dadurch kommen zu den Kosten noch zusätzliche 15,8 Millionen Euro an Zinsen hinzu, die ebenfalls von der TU zu tragen sind. Eine in den letzten Planungsphasen existierende Finanzierungslücke in Höhe von 5,1 Millionen Euro wurden durch Gelder der Volkswagen AG geschlossen. Zusammen mit den Kosten für den Umzug der bisherigen Bibliotheksstandorte in Höhe von knapp 1,5 Millionen Euro müssen die beiden Universitäten 39,4 Millionen Euro aufbringen. Diese Mittel will die TU vor allem durch Aufgabe bisher angemieteter Gebäude erbringen. Schwierigkeiten im Vergabeverfahren verzögerten den Baubeginn nochmals. Als Generalunternehmer begann die beauftragte Firma Epple, Stuttgart, im Sommer 2002 mit der Errichtung. Die feierliche Eröffnung fand am 9. Dezember 2004 statt. Der ursprünglich „verspielte“ und preisgekrönte Entwurf des Architektenehepaars Jeromin aus dem Jahr 1988 wurde im Laufe der langen Planung vom Architekten Walter A. Noebel stark überarbeitet bzw. „optimiert“. Als Kritik handelte sich das Gebäude häufiger den Vergleich mit einem „Parkhaus für Bücher“ ein. Die Bibliothek ist in ihrer Gestaltung und durch ihre technische Ausstattung zweckdienlich auf die Lagerung der Bücher im Magazin und eine teilweise Freihandaufstellung des Bestandes ausgerichtet. (<http://www.wikipedia.org>)

Die Technische Universität und die Universität der Künste haben den schwierigen und langjährigen Prozess des Planens und Bauens ihrer Bibliothek mit all den genannten Aspekten vor kurzem erfolgreich abgeschlossen. Der Prozess begann Mitte der 80er Jahre, also lange vor dem Fall der Mauer, mit den Vorbereitungen für einen schließlich 1988 durchgeführten Architektenwettbewerb für den jetzt fertig gestellten Neubau der Universitätsbibliothek auf dem Grundstück Fasanenstraße/Ecke Hertzallee. Gewonnen wurde der Wettbewerb von dem Braunschweiger Architekten Lothar Jeromin, der ein lang gestrecktes Gebäude an der Fasanenstraße

entworfen hat. Lothar Jeromin erhielt auch den Auftrag und begann zusammen mit den Nutzern und der Senatsverwaltung für Bau- und Wohnungswesen das Projekt baureif zu planen. Allein die Schilderung der Planungs- und Baugeschichte wäre ein eigenes Kapitel der Baukultur der öffentlichen Hand, für das hier nicht der ausreichende Platz vorhanden ist. Die Schwierigkeiten begannen mit dem Grundstück, das es als Baugrundstück in der vorgesehenen Form gar nicht gab. Vielmehr handelt es sich bei diesem Grundstück um die Fragmente einer autobahnähnlichen Straßentrasse der autoorientierten West-Berliner Verkehrsplanung der 60er Jahre. Das Gelände war zudem interimistisch von der Berliner BVG mit einem Sozialgebäude besetzt, für das erst auf den benachbarten Flächen ein Ersatzbau errichtet werden musste. Als endlich alle Probleme gelöst schienen, sollte Mitte der 90er Jahre, also nach dem Fall der Mauer, endlich mit dem Bau begonnen werden. Nun sprachen allerdings Haushaltsprobleme dagegen. Es wurde ein Baustopp verhängt und das Projekt ruhte fast sieben Jahre lang. Erst als auf Betreiben der Technischen Universität 1999 eine größere Spende der Volkswagen AG eingeworben wurde, konnte der Bau der Hauptbibliothek für zwei Universitäten, nun unter dem Sponsorennamen VOLKSWAGEN Universitätsbibliothek, fortgesetzt werden. Die inzwischen notwendig gewordenen Umplanungen wurden durch den Wettbewerbsgewinner Lothar Jeromin wieder aufgenommen, damit mit dem Bau durch einen Generalunternehmer im Jahr 2001 endlich begonnen werden konnte. Und als hätte es nicht schon genug Probleme um dieses Gebäude gegeben, trat ein neues Problem in Form einer Vergabebeschwerde auf. Um diesem neuen Hindernis nicht noch weitere folgen zu lassen, entschied sich die Verwaltung für eine Überarbeitung des Grundrisses und der Architektur des in den 80er Jahren des vorigen Jahrhunderts geplanten Projektes. Die Überarbeitung wurde dem Berliner Architekten Walter A. Noebel übertragen, der vor allem dafür sorgen sollte (und gesorgt hat), dass das Projekt innerhalb des festgesetzten Kostenrahmens errichtet werden konnte. Den Prozess der Optimierung beschreibt Prof. Noebel in einem eigenen Text. Nun da die Bibliothek zwölf Jahre nach dem Wettbewerb endlich realisiert wurde, lohnt nicht nur der Blick auf das eindrucksvolle Gebäude, sondern auch auf den Standort an der Peripherie des Hochschulgeländes zwischen der Straße des 17. Juni - der Adresse der Technischen Universität Berlin - und der Hardenbergstraße, dem Sitz der Universität der Künste. Was auf den ersten Blick disfunktional wirkt, liegt - nimmt man die beiden Hochschulen zusammen - genau an der richtigen und zudem zukunftssträchtigen Stelle an der Fasanenstraße/Ecke Hertzallee. Der Bau der Universitätsbibliothek an diesem Standort leitet den Neubeginn eines vergessenen und von Verkehrsplanungen, provisorischen Bauten und Abstellplätzen überlagerten Bereichs des alten Westens ein. Das beginnt mit der Reaktivierung der Hertzallee, einst die verbindende Straße zwischen dem Bahnhof Zoologischer Garten und dem Knie am heutigen Ernst-Reuter-Platz. Das 1999 vom Berliner Senat beschlossene Planwerk Innenstadt sieht diese Reaktivierung, wenn auch nicht als Fahrstraße, vor. Sie gibt der Adresse der neuen Bibliothek im Gelände der beiden Universitäten an der gleichermaßen trennenden wie verbindenden Hertzallee eine ganz neue Position. Dass diese Adresse so lange vergessen werden konnte, liegt, wie erwähnt, an der autoorientierten Verkehrsplanung, die beginnend von der Spichernstraße eine teilweise als Hochstraße ausgeführte Straße vorsah. Die Realisierung dieser Planung, die die Fasanenstraße in ihrem schönsten Teil zwischen der Meierotto-Straße und dem Kurfürstendamm unter sich begraben hätte, blieb Gott sei Dank auf dem Papier. Die auf diese Planung ausgerichteten Eigentumsverhältnisse auf dem Gelände der jetzigen Universitätsbibliothek blockierten gleichwohl jahrzehntelang jegliche vernünftige Entwicklung. Die Bibliothek setzt hier nun einen neuen Anfang, der den Beginn für ein neues Universitätsquartier östlich der Fasanenstraße einläuten könnte. So gesehen, markiert der glückliche Neubau der Bibliothek nicht nur das Ende eines allzu langen Planungs-, Finanzierungs- und Realisierungsprozesses, sondern auch den Beginn der Wiedergewinnung eines vergessenen Stadtraums für die Lehre und Forschung von Kunst und Technik. Hans Stimmann, in: Ein Baustein für ein neues Stadtquartier. ([http://opus.kobv.de/tuberlin/volltexte/2005/1108/pdf/Festschrift\\_Nebau\\_UB\\_TU.pdf](http://opus.kobv.de/tuberlin/volltexte/2005/1108/pdf/Festschrift_Nebau_UB_TU.pdf))

## **Numrich Albrecht Klumpp Gesellschaft von Architekten mbH, Berlin – Germany**

<http://www.numrich-albrecht.de>

### **Bildungszentrum der Finanzverwaltung des Landes Brandenburg in Königs Wusterhausen, Bibliothek – Germany 2008**

Bauherr: Ministerium der Finanzen des Landes Brandenburg, Ansprechpartner: Brandenburgischer Landesbetrieb für Liegenschaften und Bauen Baubereich Frankfurt (Oder), BGF: 1.842 m<sup>2</sup>, Bausumme: KGR 200–700 5.374.000 €

Am 7. Dezember 2006 werden auf dem Akademie-Campus in Königs-Wusterhausen auf zwei Baustellen gefeiert: Richtfest für das „Lehrsaalgebäude Ausbildung“ und die Grundsteinlegung für das „Seminargebäude Fortbildung“. Beide Gebäude werden vom Berliner Büro Numrich Albrecht Klumpp geplant. Bauherr ist der Brandenburgische Landesbetrieb für Liegenschaften und Bauen, Niederlassung Frankfurt (Oder). Die Neubauten gehören zu dem Bildungszentrum der Finanzverwaltung, der Justizakademie und der Landesakademie für öffentliche Verwaltung des Landes Brandenburg. Durch Um- und Neubaumaßnahmen auf dem elf Hektar großen Gelände wird eine gemeinsame Aus- und Fortbildungseinrichtung für die entsprechenden Ministerien entstehen. Lehrgangsteilnehmer aus den Ländern Brandenburg, Sachsen-Anhalt und Berlin werden hier für den mittleren und gehobenen Dienst ausgebildet. Das „Lehrsaalgebäude Ausbildung“, für das das Richtfest gefeiert wird, stellt das zentrale Gebäude der Liegenschaft dar und beherbergt neben den Einrichtungen für den Lehrbetrieb auch einen Mehrzwecksaal, eine Bibliothek und eine Druckerei. Die verschiedenen Funktionsbereiche gruppieren sich um einen Innenhof, der als offenes Foyer den Mittelpunkt der Liegenschaft ausbildet. Der ansteigende Hörsaal und die über dem Eingang schwebende Bibliothek leiten den Besucher von der Straße in den Innenhof. Es wird ein Ort geschaffen, der von dem spannungsreichen Kontrast zwischen dem extensiven, bewaldeten Außenraum und der intensiven Gestaltung des Innenhofes lebt. Für das „Seminargebäude Fortbildung“ wird der Grundstein gelegt. Der rechteckige Baukörper reagiert mittels Einschnitten auf die unterschiedlichen städtebaulichen und landschaftsräumlichen Situationen. Das Gebäude beinhaltet Seminar- und Computerräume, einen Hörsaal und eine Bibliothek. Der offene Erschließungsbereich, der die drei Geschosse räumlich miteinander verbindet, steht sinnbildlich für die Zusammenlegung der drei Fortbildungseinrichtungen an diesem Standort. Die Fassaden beider Gebäuden sind von den umlaufenden Fensterbändern und den geschlossenen Flächen aus eingefärbten Fertigtelementen geprägt. (<http://www.baunetz.de>)

### **Libraries:**

### **Bundesministerium für Gesundheit BMG, Bibliothek, Bonn – Germany 2007**

In einem feierlichen Akt wird am 11. Januar 2007 zum Richtfest in Bonn über dem Neubau des Bundesgesundheitsministeriums die Richtkrone aufgezogen. Die Grundsteinlegung fand im April 2006 statt. Noch in diesem Jahr eröffnet das BMG seinen 400 Mitarbeiter umfassenden, neuen Dienstsitz. Die Architekten

Das dreiteilige Gebäudeensemble entsteht nach den Plänen des renommierten und vielfach ausgezeichneten deutschen Architekturbüros Petzinka Pink Technologische Architektur mit Sitz in Düsseldorf. Bekannt durch die Architektur des Düsseldorfer Stadttore – Staatskanzlei und somit Dienstsitz des Ministerpräsidenten von Nordrhein-Westfalen -, der Landesvertretung NRW in Berlin, der Bundesgeschäftsstelle der CDU, ebenfalls in Berlin und der preisgekrönten Revitalisierung des Industriedenkmal „Jahrhunderthalle Bochum“. Der neue Dienstsitz des Bundesministeriums für Gesundheit Der neue Dienstsitz des BMG bietet auf über 17.000 m<sup>2</sup> Bruttogrundrissfläche für 400 Beschäftigten ein zukunftsfähiges Bürogebäude von hoher gestalterischer und architektonischer Qualität. Das Hochhaus bildet ein attraktives Vis-à-vis zu dem Hochhaus des Bundesministerium für Ernährung, Landwirtschaft und Verbraucherschutz (BMELV). Der Baukomplex besteht aus einem Hochhaus mit 13 Obergeschossen, einem zweistöckigem Verbindungsbauwerk mit repräsentativer, überdachter Vorfahrt und einem sechsgeschossigem Gebäudeband, welches parallel zur Grünachse des Quartiers verläuft. Im Zusammenwirken der neuen Architektur mit den städtebaulichen Gegebenheiten und den vorhandenen Grünflächen und Kunstachsen erfährt das Quartier eine Stärkung und das BMG eine ausdrucksvolle und stimmige Visitenkarte. (Petzinka)

In Anwesenheit zahlreicher politischer Amtsträger wurde am 19. Oktober 2007 der Schlüssel des neuen Gesundheitsministeriums in Bonn übergeben. Den Schlüssel überreichte der Architekt des Gebäudeensembles, Thomas Pink von Petzinka Pink Technologische Architektur (Düsseldorf). Der Entwurf des Büros ist als 1. Preis aus einem Wettbewerbsverfahren im Jahr 2004 hervorgegangen. Der Neubau liegt an der Rochusstraße 1 in der früheren Bundeshauptstadt und wird in Zukunft rund 400 Mitarbeitern des Bundesministeriums für Gesundheit einen Arbeitsplatz bieten. Das dreiteilige Gebäudeensemble hat als Höhendominante einen 13-geschossigen Turm und erstreckt sich auf 17.000 Quadratmetern Bruttogeschossfläche. Die Architekten verstehen das Gebäude als städtebauliches Pendant zum Hochhaus des Bundesministeriums für Ernährung, Landwirtschaft und Verbraucherschutz. In der Fassade kommen sandfarbener Werkstein, Glas und Metall zum Einsatz. Das Gebäude ist vielleicht aufgrund seines Standortes als politischer Anachronismus zu bewerten, architektonisch positioniert es sich jedoch durchaus aktuell. Der 28 Millionen Euro teure Neubau ersetzt die bisher angemieteten Räumlichkeiten des Ministeriums, für die jährlich rund vier Millionen Euro Miete gezahlt werden mussten. (<http://www.baunetz.de>)

#### **Universitäts- u. Landesbibliothek Münster, Torhaus, Erweiterung und Sanierung – Germany 2009**

Das "Torhaus" soll architektonisch den Anspruch des Hauptzugangs zum Areal der ULB vermitteln. Es leitet direkt in die dahinterliegende "Gasse des Buches", die durch den neuen Lesesaaltrakt und den Altbau gebildet wird. Mit mehr als 40 Meter Länge und einer Breite von etwas über sieben Meter bildet der neue Lesesaaltrakt die wichtigste Erweiterung für die Nutzer. Der zweigeschossige Baukörper wird im ersten Stock über eine Brücke vom alten Lesesaal erschlossen. Die Lesesaal ist mit fest montierten Wandregalen und eingebauten Lesesaaltischen, die individuelle Beleuchtung und Strom- sowie LAN-Versorgung bereitstellen, ausgestattet. Helles Holz und Lesesaaltische mit Linoleumaufgabe bieten eine hohe Raumqualität bei zugleich optimaler Raumnutzung. Niedrig und eng war bislang der bestimmende Raumeindruck beim Betreten der ULB. Seit Inbetriebnahme des neuen Foyers im Juni 2008 ist das anders: Nun betritt man die ULB durch einen hellen transparenten zweigeschossigen Glasvorbau, der das Foyer nach Osten und Süden jeweils um mehr als fünf Meter erweitert. Hochwertiger Naturstein (Juramarmor) und die offene, transparente und lichte Atmosphäre werten den Eingangsbereich gegenüber der früheren Situation auf, in der der Waschbetonboden der siebziger Jahre bestimmend war. (<http://www.uni-muenster.de>)

Die Bedeutung der Universitäts- u. Landesbibliothek Münster (ULB) als Lern- und Arbeitsort für die Studierenden ist in den letzten Jahren stetig gewachsen. Die ULB ist nicht allein Bibliothek, sie ist auch zentraler Treffpunkt für das gemeinsame Lernen und den Austausch von Informationen auf dem Campus. Weil die Zahl ihrer Besucher auf täglich mehr als 5.000 gestiegen war und auch die Anzahl der dort lagernden Medien ständig zunahm, wurde zwei Jahre lang bei laufendem Betrieb eine Sanierung und Erweiterung durchgeführt. Seit August 2007 mussten Nutzer und Mitarbeiter auf einer Baustelle leben. Als im Frühjahr 2009 der Abschluss der Sanierungsmaßnahmen gefeiert werden konnte, erkannten die Gäste auf den ersten Blick nicht mehr viel vom Gebäude der ULB am Krümmen Timpen, das 1973 eröffnet wurde. Wo vorher allzu schlichte Funktionalität wenig Raum und Licht zum angenehmen Lernen und Arbeiten bot, präsentiert sich jetzt ein transparenter Gebäudekomplex - hell, freundlich und modern. Dazu hat auch die Farbgestaltung der unterschiedlichen Bibliotheksbereiche mit einem Remmers-System für die Böden einen wichtigen Beitrag geleistet. Die Erweiterung um 3500 Quadratmeter ermöglichte ein drittes Stockwerk, das erweiterte Foyer und den neu gestalteten Lesesaal. (<http://www.hartmann-bautenschutz.de>)

#### **Fachbereich Geowissenschaften, Bibliothek, Martin - Luther - Universität Halle – Wittenberg – Germany 2003**

Bauherr: Staatshochbauamt Halle

Umbau und Sanierung des denkmalgeschützten Ensembles der ehemaligen Heerschule (1936/1937) von Ernst Sagebiel (\*1892 - + 1970, Reichsluftfahrtministerium 1934/35, Flughafen Tempelhof 1935/41 prov. fertiggestellt) aus den 30-er Jahren. Institutsgebäude mit hohem Anteil an Labornutzung, einer Bibliothek, Hörsälen und Büros. Fachbereichsbibliothek der Universitäts- und Landesbibliothek Sachsen-Anhalt und Geologische Sammlung des Fachbereichs Geowissenschaften sowie Geiseltalmuseums. (Pfeifer)

## **PPS-Planungsbüro Prof. Peter Schuck GmbH, München – Germany**

#### **Max-Planck-Institut für Chemische Physik fester Stoffe, Bibliothek, Dresden – Germany 1996 – 2003**

In Verbindung mit: Dr. Heinekamp Labor- und Institutsplanung, Karlsfeld <http://www.heinekamp.de>

Bauherr: Bauabteilung Max-Planck-Gesellschaft zur Förderung der Wissenschaften e.V., 8.750 m<sup>2</sup>, 89.150 m<sup>3</sup>

Die über 100m lange Fassade zur Nöhnitzer Straße nimmt die Flucht des Nachbarinstitutes auf. Stellt sich die Anlage von der Straßenseite aus geschlossen dar, bietet der Blick aus der südlichen Hanglage eine offene Form.

Vier Gliederstränge, die Laborflügel und ein Flügel mit Bibliothek, Wohnen und Seminar und Werkstattfunktionen verweben sich mit der Umgebung. Die Drehung und Kopfbetonung des östlichen Kamms in Anlehnung an die gegenüberliegende Bebauungsstruktur bewirkt auch die Öffnung des Bauraumes zu einer Grün- u. Freiluftschneise. Um den interdisziplinären Austausch an Erfahrungen und Ideen zu fördern, Anstöße freizusetzen und spontane Begegnungen zu fördern wurde für dieses wichtige Moment der Arbeit eine Plattform geschaffen. Der überdachte Freiraum als zentraler Wintergarten zwischen den beiden

Laborflügeln ist eine Art „Mall der Begegnung“. Ein zentraler Turm verbindet alle Laborebenen miteinander und ist Knotenpunkt kurzer, interner Wege. Die funktions- und betriebstechnisch bedingte straffe Grundrißorganisation vermittelt den Ausdruck von Funktionalität und technischer Perfektion. Erst die extensive Verwendung von Farbe bringt diese scheinbar einseitige Ausrichtung in ein humanes Gleichgewicht. Darüber hinaus erlaubt die Verwendung von Farbe die Ablesbarkeit der Funktionen und Bereiche, sowohl durch einfach optisch-intellektuelle Wahrnehmung, als auch unbewußt durch das spontane Aufnehmen der Licht- und Farbschwingungen. (PPS)

Das Max-Planck-Institut (MPI) für Chemische Physik fester Stoffe feierte am 2. November 2001 die offizielle Einweihung eines Institutsneubaus in Dresden. Das Projekt in der Nöthnitzer Straße entstand in rund dreijähriger Bauzeit nach den Plänen des Architekten Peter Schuck (Hallbergmoos). Die Architektur, die geprägt ist durch eine enge räumliche Verzahnung der Fachbereiche, lasse „die Grenze zwischen den beiden Bereichen fallen und ermögliche eine enge Zusammenarbeit der Chemiker und Physiker des Instituts“, heißt es in einer Erklärung des MPI. Das Gebäude ist als eine kammartige Struktur angelegt: Während im Hauptflügel die Verwaltung, eine Bibliothek sowie die Funktionen Wohnen, Seminar und Werkstatt untergebracht sind, belegen die physikalischen und chemischen Laboratorien die Querriegel des Neubaus. Entlang der Nöthnitzer Straße ist das Institut als straßenbegleitende Bebauung angelegt, nach Süden hin öffnen sich die Gebäudeteile zu begrünten Innenhöfen, die die Labortrakte verbinden. Einer der Höfe, in den ein sogenannter „Begegnungsturm“ eingestellt ist, wird von einem 17 x 31 Meter messenden Dach überspannt. Der so entstandene Wintergarten soll von den 150 Mitarbeitern des Institutes als Kommunikations- und Pausenraum genutzt werden. Insgesamt stehen rund 8.700 Quadratmeter Nutzfläche zur Verfügung. (<http://www.baunetz.de>)

## **Raubewegung Architektur, Berlin – Germany**

<http://www.raubewegung.de>

### **Libraries:**

#### **Bibliothek im Bahnhof, Luckenwalde – Germany 2005 – 2008**

Bauherr: Stadt Luckenwalde, Fläche: 959 qm NF (nach DIN 277), Umnutzung, Erweiterung, Sanierung, denkmalgeschütztes Altbauobjekt (Bahnhof), Baukosten: 3,4 Mio Euro, Einrichtungskosten: 0,5 Mio Euro

### **Awards:**

**2010 Sonderpreis des Deutschen Städtebaupreises 2010 für das Projekt Bibliothek im Bahnhof Luckenwalde**

**2009 Brandenburgischer Baukulturpreis 2009 für die Bibliothek Luckenwalde**

Seit der Teilprivatisierung der Deutschen Bahn werden viele regionale Gleisanlagen teils oder ganz wegrationalisiert. Viele Bahnhofsgelände sind von Leerstand oder Verfall betroffen. In der brandenburgischen Kreisstadt Luckenwalde halten zwar noch Züge, jedoch sorgte die Abtrennung des Post- und Güterbahnhofs und die damit zu ändernde Erschließung der Bahnsteige für Leerstand im denkmalgeschützten Empfangsgebäude des Bahnhofs. Der alte Ort des Wartens, an dem man früher nur billige Bahnfiktur erstein konnte, wurde jüngst durch einen Um- und Anbau sprichwörtlich „vergoldet“: Am 19. Juni 2008 eröffnete die Stadtbibliothek Luckenwalde hier ihre Türen. Die Berliner Architektenteam Wronna/Fleckenstein/Feldhusen (letztere zwei firmieren als FF-Architekten), hatten 2004 den entsprechenden Wettbewerb gewonnen. Das Projekt wurde von 2005 bis 2008 für 3,4 Millionen Euro umgesetzt. Die Idee einer Stadtbibliothek im leerstehenden Bahnhofsgelände bot die Chance, dem Bahnhof einen neuen Platz im Stadtgefüge zu geben. Als Knotenpunkt des öffentlichen Nahverkehrs ist der Ort hochfrequentiert und gut erreichbar. Um einen unabhängigen Zugang zu den Gleisen zu schaffen und das Gebäude völlig eigenständig nutzen zu können, wurden zunächst die vorhandenen eingeschossigen Anbauten zurückgebaut. Der zweite wesentliche Baustein des Entwurfs ist der Anbau der Kinder- und Jugendbibliothek. Mit seiner goldenen, schuppenartigen Fassadenhaut hebt sich der dynamisch-windschiefe Kubus deutlich vom alten Gebäudetrakt ab und soll damit die besondere Stellung der Kinder- und Jugendbibliothek hervorheben. Ein Blickfang ist der goldene Kubus in einer Kleinstadt allemal. Das Bestandsgebäude bot großzügige Wartesäle bis hin zu kleinteilig strukturierten Wohnbereichen. Der Umbau verbindet nun die verschiedenen Bereiche und sorgt für fließende Räume, in denen sich die Bibliotheksbesucher gut orientieren können. Das neue Farbkonzept passt alle Farben und Einbauten denen der bestehenden Räume an und bindet über verschiedene Rottöne alles zu einer zusammenhängenden Sequenz zusammen. (<http://www.baunetz.de>)

Die ehemalige Bahnhofshalle bildet heute das Zentrum der Bibliothek. Die Halle ist der Informations- und Treffpunkt der Bibliotheksbesucher. Die Kernbereiche der Bibliothek (Sachbuch und Belletristik) sind in den ehemaligen Wartesälen untergebracht, die sich unmittelbar an die Halle anschließen. Im Kaiserzimmer wird die Hörbuchsammlung präsentiert. Im Wartesaal befindet sich eine Galerie, die mit einer Treppe das Obergeschoss erschließt. Für die Kinder- und Jugendbibliothek wurde ein Neubau geschaffen. Der neue Kubus hebt sich optisch deutlich vom alten Gebäudetrakt ab. Die markante, Gold schimmernde, schuppenartige Fassadengestaltung unterstreicht die stadträumliche Akzentuierung. Die Kinderbibliothek im Erdgeschoss ist als offene Lese- und Spiellandschaft konzipiert. Mit der großzügigen Verglasung zum Bahnhofsplatz wird die Kinderbibliothek zum öffentlichen Raum. Die im Obergeschoss des Anbaus organisierte Jugendbibliothek ist ein introvertierter Ort, der sich als Freiraum für die Jugendlichen bewusst von der Bibliothek absetzt. #### **Kinderliteraturhaus – Germany Projekt – Erste Ausführung 2010**

Kinderliteraturhaus ein Entwurf von raumlaborberlin 2009 für Kinderliteraturhaus/Ute von Sydow, Esther Kimmel

Benjamin Foerster-Baldenius, Axel Timm, Matthias Rick, María García Pérez

Diese Idee soll auf verschiedene Städte appliziert werden. Nachdem anfänglich davon ausgegangen wurde, dass man dafür bestehende Gebäude herrichtet, hat sich bei den Initiatoren die Überzeugung durchgesetzt, dass diese neue Vision auch eine eigene architektonische Form braucht. Eine Architektur, die das Konzept unterstützt und die Leselust der Kinder herausfordert. Das raumlaborberlin hat dafür eine räumliche Umsetzung entwickelt. Ein modulares, transportables, zeichnerisches, praktisches Raumsystem, das vor allem für seine zukünftigen Nutzer, die Kinder, als Gebäude ein Ansporn sein kann, sich mit Literatur auseinanderzusetzen. Dabei haben wir systematisch die verschiedenen Möglichkeiten untersucht nach Ihren Möglichkeiten, Vor- und Nachteilen. Wir haben für die verschiedenen Räume die jeweils möglichen Raumvarianten miteinander kombiniert und daraus drei Entwurfsskizzen entwickelt. (Raumlabor)

#### **Neubau und Generalsanierung Universität Mozarteum, Bibliothek, Salzburg, – Austria 2006**

##### **Awards:**

**Österreichischer Bauherrenpreis 2009**

Bauherr: Bundesimmobiliengesellschaft ([www.big.at](http://www.big.at)), Nutzer: Universität Mozarteum Salzburg ([www.moz.ac.at](http://www.moz.ac.at)), NF\_ca. 11.250 m<sup>2</sup>, BGF\_ca. 25.350 m<sup>2</sup>, BRI\_ca. 112.500 m<sup>3</sup>, Bibliothek 1.200 m<sup>2</sup>, Baukosten € 37.000.000, Baubeginn\_Juni 2004, Eröffnung\_12.10.2006

Im Oktober 2006 ist die Universität Mozarteum an ihren angestammten Ort am Mirabellplatz zurückgekehrt. Sie präsentiert sich in neuem Gewand. Ein steinerner Solitär steht am Eingang. Ihm gegenüber flankiert der ehemalige Primogenituralast den zur Stadt geöffneten Vorplatz und begleitet ins Gebäude. Die Universität empfängt ihre Besucher in einer großzügig gestalteten gläsernen Halle. Eine Freitreppe führt zu den Institutsbereichen, offene Laubengänge dienen als attraktive Aufenthaltsfläche und sorgen für eine gute Orientierung. Das Haus bietet adäquaten Raum für Musikunterricht, Veranstaltungen und Wissenschaft. Ausserdem ist es gelungen ein Tonstudio, die Universitätsbibliothek und das Rektorat zu integrieren. Besucher können sich in einem Bistro aufhalten und hauseigener Musikaufnahmen in einem Laden erwerben. Städtebaulich konnte durch den Rückbau ganzer Gebäudeteile der bestehende Komplex zum Mirabellplatz geöffnet werden. Es entstand ein Entree, das den Ansprüchen einer Universität entspricht. Gliederung und Kubaturen nehmen den Maßstab der Umgebung auf. Der Stadtraum Mirabellplatz wird in das Gebäude hineingeführt. Im Gegenzug öffnet sich das neue Haus zur Stadt. Öffentlicher, halb-öffentlicher und universitärer Raum kommunizieren miteinander. Neu- und Umbau erfolgten auf den konstruktiven Spuren des Bestandes. Das gesamte Gebäude wurde bis auf den Rohbau entkernt. Zwei Untergeschosse wurden adaptiert, denkmalgeschützte Bauteile fachgerecht saniert. Die lichte gläserne Architektur der Eingangshalle steht im Kontrast zum steinernen, in sich ruhenden Solitär. Seine Präsenz in der Stadt macht ihn zum neuen Markenzeichen der Universität Mozarteum. Innen gelangt man über seitliche Aufgänge vom Foyer in den neuen Kammermusiksaal, der über eine Loggia zum Mirabellgarten und damit zur Stadt geöffnet ist. Stelen lösen die Wände auf, Licht tritt gefiltert ein, Aufgang und Konzertsaal wirken räumlich und akustisch zusammen. Stein und Holz definieren den Raum und bieten einen besonderen Rahmen für musikalische Erlebnisse. Zwei weitere wichtige Veranstaltungsstätten sind das Große und Kleine Studio. Modernste Bühnentechnik bietet variable Szenarien für Oper und Orchester. Insgesamt entstanden fünf verschiedene Veranstaltungssäle unterschiedlicher Größe für ca. 1.000 Besucher. Klare Grundrisse, durchgängige Detailausbildung und der Einsatz weniger Materialien prägen auch hier die Innenraumgestaltung. Natürliche Stein- und Holzoberflächen setzen sich gegen weiss geputzte Wänden ab. Es wurden ausschließlich natürliche, ökologisch nachhaltige Produkte verwendet, die zudem durch ihre haptischen Qualitäten überzeugen. Das Gebäude wirkt in seiner räumlichen Vielfalt ruhig und zurückhaltend. Es will inspirieren und seinen Nutzern Raum für das eigene Gestalten geben. (Rechenauer)

Gross Building Content: 3.890 m<sup>3</sup>, Net Building Area: 750 m<sup>2</sup>

##### **Awards:**

**Beispielhaftes Bauen: Landkreis Tübingen 2004-2011**

Der eingeschossige, langgestreckte Bau zwischen Straße und Bahntrasse im modernen Ortszentrum fällt durch seine Fassade von breiten vertikalen Lamellen aus eloxiertem Aluminium auf. Mit abgestuften Beige- und Brauntönen nehmen sie die Naturfarben der Schwäbischen Alb auf. Die Lamellen, die sich der Sonneneinstrahlung anpassen, können auch als Buchseiten gelesen werden. Von außen erwecken sie Neugier, ohne direkten Einblick zu gewähren, von innen sind sie „durchsichtig“. Die Gebäudekante folgt einem Knick der Straße. An dieser breiten Stelle öffnet sich der gläserne Bibliotheks-Großraum zu einem aparten, nicht überdachten Lesehof. Die Schulmediothek am Ende des Gebäudes kann als Veranstaltungsraum der Bibliothek zugeschaltet werden. Technik und Büro sind in einem Sichtbetonbaukörper, der unter das Vordach über dem Eingang ragt. Innenverkleidung in hellem Holz und Sitzmöbel in frischen Gelb- und Grüntönen machen die Bücherei einladend; eine Flucht weißer, von der Decke hängender Platten wirken schalldämpfend und dekorativ. Dank Erdwärme, Fußbodenheizung und einem Lüftungssystem mit Wärmerückgewinnung wurden Heizkörper überflüssig. (<http://www.competitionline.com>)

#### **Stadtbibliothek Hanau – Germany on design (2016)**

In dem geplanten Einkaufszentrum auf dem Freiheitsplatz sind 6500 Quadratmeter Fläche für Bibliothek, Stadtarchiv und Medienzentrum vorgesehen. Gegen die künftige Stadtbibliothek im zweiten Obergeschoss des neuen Zentrums auf dem Freiheitsplatz wird die heutige Bücherei im historischen Kanzleigebäude sicher kuschelig, aber auch winzig erscheinen: Mit rund 4200 Quadratmetern Geschossfläche wird das neue Literaturdomizil gut dreimal so groß ausfallen wie sein Vorgänger am Schlossplatz. Gesellschaft bekommt die neue Bibliothek zudem auf weiteren 2300 Quadratmetern vom Stadtarchiv, dem Medienzentrum, der Wetterausichen Gesellschaft und der Schriftenabteilung des Hanauer Geschichtsvereins; gedacht ist auch daran, eine Dependence der Volkshochschule im neuen Zentrum unterzubringen. Der gesamte Komplex erhält den Namen „Kulturforum hoch fünf“ – und soll jährlich rund 300000 Besucher anlocken, wie Kulturmanager Klaus-Dieter Stork gestern den Mitgliedern mehrerer Ausschüsse erläuterte. Wolfram Henning, von der Stadt als Berater engagierter Professor für Bibliothekswesen und Kulturmanagement, geht davon aus, dass diese Zahl leicht zu erreichen sein wird. Insbesondere die Lage des Kulturforums im Herzen der Innenstadt, über Geschäften und Gastronomie, sieht er als großen Vorteil an. Überdies wird der Eingang zur Bibliothek an exponierter Stelle liegen: in der Mitte des Wegekreuzes, das die vier Gebäude des künftigen Einkaufszentrums durchzieht und 24 Stunden lang offen sein soll. Rund um die Uhr soll auch der Windfang vor dem – ebenerdigen – Foyer der Bücherei zugänglich sein, erklärte der mit dem Innenausbau beauftragte Architekt Stefan Schrammel aus Augsburg:

Ausleiher können Bücher dort künftig an einer automatischen Station zu jeder Tages- und Nachtzeit zurückgeben. Auch das Foyer soll nicht nur Eingangshalle zur Bücherei sein, sondern Platz für die Präsentation von Neuerscheinungen und Ausstellungen bieten, so Schrammel, dessen Büro für den Neubau der Augsburger Bibliothek mit einem Preis ausgezeichnet wurde. Vom Foyer führen eine große Freitreppe und Aufzüge in die Bücherei im zweiten Stock, in die möglichst viel Tageslicht fallen und keine Klimaanlage Luft pusten soll. Wie die äußere Hülle der Bibliothek und des gesamten Zentrums aussehen wird, steht indes noch nicht im Detail fest. Architekt Matthias Pfeifer, dessen Düsseldorfer Büro RKW vom Investor HBB mit der Planung des Centers beauftragt wurde, stellte gestern mehrere Varianten vor: So sei es denkbar, bei den Fassaden mit regionalen Materialien wie Buntsandstein oder Basalt zu arbeiten, ebenso könnten einzelne historisierende Elemente integriert werden. Die vorherrschende Architektursprache soll allerdings modern sein – ob eher kantig mit einem „Stadtfenster“ genannten Kubus Richtung Hammerstraße oder abgerundeten Ecken, ist noch nicht geklärt. Auf jeden Fall aber soll das Dach des Zentrums begrünt und die dort untergebrachte Technik besser versteckt werden als auf dem ebenfalls von HBB realisierten „Postcarré“. Und noch etwas steht mittlerweile fest: Die große Platane an der südwestlichen Ecke darf an ihrem Platz bleiben. (Pamela Dörhöfer, in: Frankfurter Rundschau 01.02.2011, (<http://www.fr-online.de>))

### **Hochschule Hamm-Lippstadt, Lippstadt – Germany 1. Preis 2010**

Neubau der Hochschule Hamm-Lippstadt: Insgesamt gruppieren sich vier Gebäude Mensa- und Verwaltungsbau, Bibliotheks- und Hörsaalzentrum sowie zwei Institutsgebäude inklusive der Labore und Werkstätten um diesen zentralen Platz und bilden eine Mitte – den Campus. Alle Gebäude öffnen sich über großzügige Foyers zum Campusplatz und erzeugen einen beziehungsreichen Ort mit fließenden Übergängen zwischen den Nutzungen und zwischen Innen und Außen. Das Areal für den neuen Hochschulcampus in Lippstadt liegt zwischen historischem Stadtkern und Lippeauen. Zielsetzung des Entwurfs ist eine eindeutige Ablesbarkeit des Hochschulareals. Gleichzeitig wird auf eine kompakte und klare Anordnung der Funktionsbereiche geachtet, um die Wiesenlandschaften entlang der Lippe möglichst tief in das Hochschulgrundstück holen zu können. Das entstehende Ensemble fügt sich durch seine Orientierung und Maßstäblichkeit in seine Umgebung ein und schont durch seine Dichte die Naturflächen. Wegen der Fixierung der Gebäude um den zentralen Campusplatz wird das Hochschulareal als besonderer Ort in Lippstadt deutlich hervorgehoben. Durch die strategische Verteilung aller Hochschulnutzungen um den Platz ergibt sich ein belebter Ort des Flanierens und des Austausches. Als offenes Foyer des Campus definiert der Platz in besonderer Weise den Charakter der Hochschule. Zentrum der neuen Fachhochschule ist der Campus. Alle Gebäude gruppieren sich um diesen zentralen Platz und bilden eine Mitte – den Campus. Langgestreckte Sitzbänke und Solitäräume rhythmisieren diesen Raum, bieten Platz für Kommunikation und Reflexion. Alle Dachflächen werden extensiv begrünt. (RKW)

### **Stadtbibliothek Flensburg (Neubau, Umbau, Einbau) – Germany 2007**

2.100 m<sup>2</sup>, Bauherr: Credit Suisse Asset Management Immobilien, Frankfurt a.M., Bauleitung: Trigon Invest, Berlin

In historischen Städten eine geeignete Lage für ein Einkaufszentrum mit Anbindung an die Fußgängerzone zu finden, ist bereits eine große Herausforderung an sich. Am „Südermarkt“, dem südlichen Ende der Haupteinkaufsstraße Flensburgs, bot sich die Konzeption eines dreigeschossigen Einkaufszentrums mit 15.000 m<sup>2</sup> Verkaufsfläche dennoch an. Rückwärtig zum Straßenbesatz führt dieses Areal bis zu den „Süderhofenden“. Dabei stellte die Anbindung an die Laufzonen, die einen Durchstoß durch die historische Substanz erforderte, erhebliche Anforderungen an alle Beteiligten. Das Thema Denkmalschutz und Fragen zu den schmalen Grundstücken zur Stadtseite wurden in langen Diskussionen zwischen Planern, Politik und Investor erörtert. Die zahlreichen, kontrovers besprochenen Planungen führten letztlich zu Lösungen, die zum einen äußerst sensibel mit der denkmalgeschützten Bausubstanz umgehen und zum anderen durch moderne Architekturkomponenten das Neue signalisieren. Glas und Sandstein in drei verschiedenen Farbgebungen wurden in einer der Altstadtbebauung angemessenen Maßstäblichkeit verwendet. Die zu den „Süderhofenden“ größer werdenden architektonischen Strukturen beherbergen in einem Dachgeschoss mit Lesegarten auch die Stadtbücherei, die ehemals als Solitär auf dem Grundstück stand. Ein Zeichen, dass Kultur und Kommerz durchaus koexistieren und voneinander profitieren können!

### **Stadtteilbibliothek Bremen-Gröpelingen – Germany 1995**

Bauherr: Georg Geils-Lindemann, Ritterhude, Fläche: 1.000qm, Baukosten: 5.500.000 DM, Einrichtungskosten: 360.000 DM

Hier wurde unter Verwendung zahlreicher maritimer Metaphern eine "Bücherarche" realisiert. Von außen eher verschlossen, allerdings mit transparentem Sockelgeschoß, entwickelt sich im Innern, ähnlich eines Schiffsladeraums, eine Bücher- und Veranstaltungslandschaft. Das Tageslicht wird über ein großes gewölbtes Lichtsegel im Staffelgeschoß, das in seiner Geometrie an ein geöffnetes Buch erinnert, ins Innere des Gebäudes gelenkt. Das Raumklima der Gesamtanlage wird ohne Powerklimattechnik genutzt; Belüftung und Klima werden durch passive Systeme gesteuert. Die ovale Form mit ihrer "Endlosfassade" ist eine Reaktion auf die freistehende Platzsituation. 1995 brannte hier eines der letzten Bauernhäuser in Gröpelingen ab. Eingeschrieben in die rechteckige Form des 1750 erbauten Hofes steht nun der Neubau und unterstreicht durch seine Form und Nutzung die öffentliche Bedeutung des Ortes. (Rosengart)

#### **The British Council Headquarter, Library, Berlin – Germany 1999 – 2000**

Size: 2.100 sqm, Building Costs: € 1.600.000

An existing seven-storey building in central Berlin was converted to accommodate the headquarters of the British Council in Germany. Apart from the central administration, this branch of the British Council offers a mediatheque, an Information Centre and an English Language School. While the upper floors have been fitted out for offices, the lower public floors offer the visitor a generous architectural promenade that elevates everyday situations into special moments through differentiated and stimulating spaces. The ground floor acts as a large stage to be viewed from the street, from where one can see the activities of the central reception desk and a series of internet stations for visitor. A quiet reading area is situated to the rear. A generous curved stairway guides the visitor up to the first floor. Lined with sinuous shelving, it is here that the various activities of the Information Centre take place. In contrast to the lightness and openness of the floor below, here the enclosing materials and colours were deliberately kept to dark tones. – recalling the atmosphere of an English club. The ceiling painting by Michael Craig-Martin presents a lively contrast and supports the intention of the design to enclose the space, while at the same time dissolving its boundaries. A smaller staircase tucked behind the shelving leads up to the lobby of the Teaching Centre, where an undulating wall guides the way into the various classrooms. (Sauerbruch)

#### **Hochschule Furtwangen Neubau Instituts- und Bibliotheksgebäude in Schweningen –Germany 2011**

Nutzfläche: 1.450 qm, Bruttorauminhalt: 9.645 cbm, Gesamtbaukosten: 5,3 Mio. Euro, Bauzeit: März 2010 bis September 2011

Im Neubau werden auf dem arrondierten Areal der Hochschule auf 900 qm Seminarräume und Bürobereiche für die Fakultät Wirtschaft eingerichtet. Die Bibliothek ist mit 26.000 Bänden als Freihandbibliothek mit Flächen für Zeitschriften, Lese- und Rechercheplätzen sowie Arbeitsplätzen für Bibliothekare mit 480 qm konzipiert. Das dreigeschossige Gebäude repräsentiert die Hochschule zur Erzberger- und Uhlandstraße. Es bildet, zusammen mit der städtischen Galerie, zum einen den südlichen Zugang zum Campus und zum anderen eine Verbindung zum Bahnhof und den Stellplätzen auf dem Bahnareal. Der Haupteingang wird durch die schräg gestellte Wandscheibe im Innenhof markiert und führt in eine zentrale Treppenhalle. Der zweigeschossige Luftraum erstreckt sich vom Foyer bis in die Bibliothek. Im EG befinden sich Ausleihe, Leselounge und Arbeitsplätze. Im 1. OG sind Buchstellflächen und weitere Arbeitsbereiche angeordnet. Im 2. OG befinden sich Büroflächen der Fakultät Wirtschaft und der Besprechungsraum mit großzügiger Aussicht. Im Seminarriegel an der Uhlandstraße werden pro Geschoss zwei Unterrichtsräume angeboten, deren Größe durch eine mobile Trennwand variiert werden kann. Als Beitrag für umweltbewusste Wärmeerzeugung und Verteilung wurde ergänzend zur Gasbrennwert-Wärmeerzeugungsanlage ein kleines Blockheizkraftwerk eingebaut. Dadurch wird ein Teil des Strombedarfs für Beleuchtung und elektrische Einrichtungen des Gebäudes selbst produziert. Weiter wurden für die Wärmeverteilung energieeffiziente Heizkreispumpen vorgesehen. Die Beleuchtungskörper werden zum großen Teil über Präsenz-Melder energieeffizient gesteuert. Im Foyer, direkt im Bereich des Haupteinganges, befindet sich die Kunst am Bau mit dem Titel „TONDO“, ein Rundbild, welches sich aus der Architektur selbst herauschält, die Architektur sichtbar verrückt und unabhängig mit dem Ort verbindet. Die Betonsägearbeit mit einem Durchmesser von 2.50 m und einer Drehung im Uhrzeigersinn ist zum einen eine Hommage an die Zeit der einstigen Uhrenindustrie und zum anderen soll sie den immerwährenden Fortschritt der Lehre symbolisieren. (Schädler)

#### **Planung und Errichtung eines Erweiterungsbaus der Bibliothek des ZMF Mannheim für die medizinische Fakultät Mannheim der Universität Heidelberg – Germany 2008**

Bruttorauminhalt: 2.622 m<sup>3</sup>, Nutzfläche: 380 m<sup>2</sup>, Baukosten: 1.515.000 EUR, Gesamtkosten: 2.186.000 EUR (ohne KG 100)

### **Awards:**

Hugo-Häring-Auszeichnung des BDA Mannheim 2011

"Vor dem Hintergrund der Bebauung des Klinikgeländes ist die Bibliothekserweiterung eine städtebaulich und architektonisch wohlthuend ruhige und unprätentiöse Lösung. Zwischen dem baulichen Bestand und dem Bibliotheksanbau entsteht ein harmonischer Gartenraum, der über die weit aufgeglaste Fassade in den Lesesaal hineinwirkt. Die Aufgabenstellung "Anbau" wird mit einer sehr eigenen und vom Klinikkontext unabhängigen Haltung gelöst: die Sichtbetonfassaden geben dem Anbau einen nach innen gewandten Charakter, Lesebereich und Seminarraum öffnen sich dem Grün."

### **ERLÄUTERUNG**

Städtebau: Im Bereich des Klinikums Mannheim wurde 2001 das Forschungszentrum mit Bibliothek, Verwaltungs- und Seminarräumen für die Universität Heidelberg in Betrieb genommen. Als Erweiterung für die Bibliothek entstand in nur 8 Monaten Bauzeit an der Nordostseite ein 2-geschossiger Kubus, der über einen eingeschossigen Verbindungsgang an den 1. Bauabschnitt anschließt. Nach Wegfall der Apotheke nimmt der Erweiterungsbauteil eine repräsentative Stelle im Gesamtensemble des

Forschungskomplexes ein und reagiert mit seiner Raumorganisation und Fassadengestaltung bereits darauf. Baukörper und Funktion: Die Reduktion auf wenige aber prägende und gut alternde Materialien orientiert sich am 1. BA, unterstreicht die klare Baukörperkonzeption und vermittelt die typologische Gliederung der Nutzungen nach außen. Die ca. 40 Arbeitsplätze an der Westseite werden durch raumhohe Pfosten-Riegel-Verglasungen belichtet. Sichtbetonsandwichelemente mit flächenbündig integrierten Fassadenelementen für Erschließung, Belichtung und Belüftung sind an den 3 weiteren Außenwandseiten eingebaut und sorgen für einen eher introvertierten Charakter. Im Inneren ist das Gebäude stringent organisiert. Die interne Erschließung der Bibliothek (183 m<sup>2</sup>) im Erdgeschoss erfolgt über den einseitig verglasten Verbindungsgang. An der Südseite erfolgt die äußere Erschließung, die in den 2-geschossigen Treppenraum führt. Im Obergeschoss befinden sich 2 PC-Schulungsräume (120 + 60 m<sup>2</sup>), sowie weitere Technikflächen. (Schädler)

### **Berufsakademie Villingen-Schwenningen, 1. Bauabschnitt (Bibliothek), Schwenningen – Germany 1997**

Bruttorauminhalt: 23.851 m<sup>3</sup>, Bruttogrundfläche: 6.400 m<sup>2</sup>, Nettogrundfläche: 5.560 m<sup>2</sup>, Nutzfläche: 3.511 m<sup>2</sup>, Gesamtkosten: 9.500.000 EUR

#### **Awards:**

**Beispielhaftes Bauen Schwarzwald-Baar-Kreis 1994-2004**

#### **Literature:**

**Deutsches Architektenblatt 12/2004**

"Der langgestreckte gut proportionierte Baukörper schafft eine klare städtebauliche Situation. Es entstehen eindeutige stadträumliche Bereiche, wie der gefasste Straßenraum zum einen und der offene Park zum anderen. Die Fassadengestaltung und deren Materialwahl unterstützen diese Haltung. Auch im Inneren ist der Baukörper klar gegliedert. Eine großzügige, lichtdurchflutete Erschließungshalle in Gebäudelängsrichtung sorgt für eine gute Orientierung und eine hohe Aufenthaltsqualität. Über die Halle werden alle wesentlichen Bereiche des Gebäudes erschlossen. Helle freundliche Materialien und Farben bestimmen die Innenräume. Dieses Gebäude stellt ein überzeugendes Beispiel dar für den Umgang und die Angemessenheit, mit der eine solche Bauaufgabe bearbeitet werden kann."

#### **ERLÄUTERUNG**

Bei dem Grundstück handelt es sich um das ehemalige Uhren-Kienzle Areal am Rande der Innenstadt von Schwenningen, welches durch das Land Baden-Württemberg erworben und 1993 über einen Architektenwettbewerb zur Unterbringung verschiedener Einrichtungen der Berufsakademie einer neuen städtebaulichen Entwicklung zugeführt wurde. Bei dem Realisierungswettbewerb konnte sich das Architekturbüro Schädler & Zwerger mit einem 1. Preis und eindeutigem Preisgerichtsvotum durchsetzen, sodass bis 1997 anstelle eines nicht erhaltungswürdigen Industriebaus der 1. Bauabschnitt der insgesamt 3 Bauabschnitte umfassenden Gesamtkonzeption als Investorenmodell realisiert werden konnte. Dieser beherbergt Lehrsäle, Bibliothek, Große Hörsäle, Verwaltungs- und Seminarräume sowie Musik- und Gymnastikräume für das Wirtschafts- und Sozialwesen der Berufsakademie. Die Fassadengestaltung reagiert mit vorgehängter Tonziegelfassade mit Fensterbändern zur Straße hin und mit großzügig verglaster Multiplex/Alu-Pfosten-Riegel-Konstruktion zum Park auf die unterschiedlichen städtebaulichen Gegebenheiten. Die zweigeschossige Foyerzone zu den Großen Hörsälen vermittelt Großzügigkeit und kommunikative Transparenz. Die Großen Hörsäle, die sich als Tiefenhörsäle in den Park schieben, erhalten durch ein Oberlichtband zusätzlich natürliche Belichtung, die auch die Sichtbetonwand mit abgestuften Graulasurttönen als Wandscheibe akzentuiert. Durch die Licht- und Farbgebung wirkt der Große Hörsaal introvertiert. Im Gegensatz dazu öffnen sich die Lehrsäle maximal zum Park. Im Kopfbau ist u.a. der Raum für Musikerziehung untergebracht. Mit Holzvertäfelung und -parkett sowie großem Schiebefenster zum Postplatz hin erhält der Raum eine eigenständige Qualität. Die Bibliothek mit 47.000 Fachbüchern und vielen Fachzeitschriften ist von der Eingangshalle mit teilweise bedrucktem Glas abgeteilt, so dass die Blickbeziehung zum Park erhalten bleibt und die Auffindbarkeit günstig ist. Öffnungen im Dach und in den Erschließungszonen belichten die Flure und lockern den Zweibund auf. Verbindungsstege aus begehbarem Glas, Glasaufzug und die über drei Geschosse durchgehende Lehrsalaalwand in gelber Maltechnik mit unterschiedlich pastellfarbigen Türen unterstreichen den Eindruck einer lichtdurchfluteten Eingangshalle. (Schädler)

#### **Blauer Turm, Einweihung eines Hochschulbaus in Hamburg**

Am 31. Oktober 2002 wurde in Hamburg der Neubau der Hochschule für Angewandte Wissenschaften (HAW) am Berliner Tor offiziell eingeweiht. Hamburgs Bürgermeister Ole von Beust sagte bei seiner Festrede, der 14-geschossige Neubau der Architekten Coop Himmelb(l)au (Wien) sei eine „große Bereicherung für den Stadtteil St. Georg“. In den markanten, blau verglasten Turm sind 1.500 Studierende und 48 Professoren der Fachbereiche Wirtschaft, Bibliothek und Informatik eingezogen, ebenso die Hochschulleitung, die Unibibliothek sowie Labore und Werkstätten. Der 35 Millionen Euro teure Neubau wurde zu gleichen Teilen von der Stadt Hamburg und dem Bund finanziert. Er ist Teil eines neu entstehenden Ensembles am Berliner Tor, zu dem auch ein Wohnheim für Studierende, ein Gerichtsgebäude und ein Hotel mit Geschäften gehören (lesen Sie dazu die BauNetz-Meldung vom 2.9.2002). ### **Libraries:**

#### **Hochschulbibliothek, Fachhochschule Westküste, Heide – Germany 2002**

Schleswig Holsteins Ministerpräsidentin Heide Simonis weihte am 16. Mai 2001 die neue Fachhochschule Westküste (FHW) in Heide/Holstein ein. Für den Entwurf zeichnet das Kölner Architekturbüro Ruby und Scheuring verantwortlich, das 1994 den dafür europaweit ausgeschriebenen Wettbewerb für sich entscheiden konnte. Insgesamt wurden rund 100 Millionen in den Neubau der Fachhochschule vom Land Schleswig Holstein investiert. Nach fünfjähriger Bauzeit wurden schon zum Wintersemester die neuen Gebäude am Fritz-Thiedemann-Ring bezogen, die nun anlässlich eines Tages der Offenen Tür offiziell eingeweiht wurden. Für den zwei- und dreigeschossigen Neubau wurde ein klar gegliederter, quadratischer Baukörper miteinander verbundenen Gebäuden gewählt, die mehrere Innenhöfe bilden. Riegel und pavillonartige Gebäude sind durch überdachte Gänge und Pausenhallen miteinander verbunden und vermitteln den Eindruck eines zwar in sich geschlossenen, aber zur Stadt und Landschaft geöffneten Campusgebäudes. Die Anlage grenzt sich ähnlich den norddeutschen Landhöfen des 18. und 19. Jahrhunderts markant gegen die freie Landschaft mit ihren Baumreihen und Knicks ab. Der Campus mit einem großen Baum im Zentrum ist ein städtischer Platz. Im Gegensatz dazu stehen die Seminarräume als kontemplative Inseln in dem abgesenkten Innenhofbereich, der mit Findlingen der Ostseeküste gefüllt ist. Die Mehrschichtigkeit der Umfassungswand, die traditionelle Klinkermauerwerk in Bezug zu Stahl, Glas und Beton setzt, wird die Wirkung als Großform wieder relativiert. (<http://www.baunetz.de>)

#### **Bibliothek Westsächsische Hochschule, Zwickau – Germany 1994 – 1998**

### **Literature:**

**Andreas Scheuring: Hochschulbibliothek Zwickau 1994 – 1998**, in: Junge Deutsche Architekten und Architektinnen, Berlin 1 (1998) pp. 106-107.

**Matthias Bauer: Hochschulbibliothek Zwickau**, in: Baumeister 3 (1999) pp. 30-35.

Das von den Architekten Scheuring und Partner (Köln) entworfene und realisierte Bibliotheksgebäude, übrigens der 1. Preis im Wettbewerb, passt in den Trend heutiger Bibliotheksbauten, indem der Ästhetik des Gebäudes bis hin zur detaillierten Innenausstattung der Vorrang vor der Funktionalität gegeben wird. Die freie, offene Gebäudeform und die Transparenz bis ins Innere des Hauses ermöglichen aber auch Identifikation und Selbstdarstellung der Bibliothek bezüglich Hochschule und Stadt. Die Abkehr der Architekten vom festen Planungsraaster bot die Chance für interessante gestalterische Lösungen u. a. in Freihand- und Lesezonen, bei der Treppengestaltung und Schaffung von Licht- und Lufträumen teilweise über alle Geschosse sich ausbreitend. Funktionalität für Bibliothekare und Bibliotheksnutzer zu schaffen, gelang deshalb nur in enger, Diskussion nicht ausschließender Zusammenarbeit zwischen Architekten, Staatshochbauamt und Nutzer. Von Anfang an in Konzeption, Planung und Baudurchführung einbezogen, konnten wichtige Anregungen und Forderungen der Bibliothek eingebracht und realisiert werden. So gelang es, bibliothekarische Arbeitsabläufe optimal in die Raumsituation einzupassen z. B. bei der Umsetzung des Postweges über Poststelle und Aufzug, der Thekengestaltung, dem Leitsystem, der Inneneinrichtung u. a. Die Orientierung im klar gegliederten, freundlich und hell bis in den letzten Winkel wirkenden Gebäude fällt auch dem Bibliotheksnutzer leicht. Alle Nutzungsbereiche gruppieren sich um den bis in das Untergeschoss reichenden, mit einer Robinie beplanten Atriumhof. Der Nutzer kann wählen zwischen Leseplätzen rund um die gläserne Innenfassade des Atriums, den ruhigen Carrels im 2. Obergeschoss mit Blick auf den Innenhof, interessant gestalteten Leseplätzen an der massiven Gebäuderückwand oder im zweigeschossigen offenen Lesesaal. Wirkt das gesamte Bibliotheksgebäude mit dem weitauskragenden Dach, das die einzelnen Baukörper wie z. B. den viergeschossigen Betonwinkel und den parallel zur Straße auf runde Baustützen gesetzten Verwaltungsriegel vereint, selbstbewusst zwischen benachbarter Altbausubstanz in die Stadt, so kennzeichnen kräftige Farben besondere Nutzungen im Inneren. Im Untergeschoss befindet sich orange gekennzeichnet die Mediothek sowie die durch eine grüne Glaswand abgeschlossene Normenauslegestelle. Im Erdgeschoss findet man direkt neben dem Eingangsbereich mit seinen gläsernen Garderobenschränken Ausleihtheke und zentrale Auskunft, an die sich, über eine Rampe erreichbar, der gelb gekennzeichnete Zeitschriftenlesesaal direkt anschließt. Während die Sondernutzungen farblich mit Signalfarben auf sich aufmerksam machen, sind alle anderen Bibliotheksbereiche durch Zurückhaltung und Harmonie in Farbe und Material gekennzeichnet. Der naturbelassene Sisal-Fußbodenbelag korrespondiert mit Einbaumöbeln, Zwischenwänden, Bibliotheksregalen, Tischen und Stühlen in Ahorn ergänzt durch einheitliche hellgraue Farbgebung von Leselampen, Regalprofilen, Zeitschriftenklappen u. a. und führt damit zu einer angenehmen, ruhigen Atmosphäre im ganzen Haus. (<http://141.32.44.95/hsb/neubau-abi.htm>)

Am 30. Juni 1998 wurde der Neubau der Hochschulbibliothek der Westsächsischen Hochschule Zwickau feierlich übergeben. Die Bibliothek, die nach dem Entwurf der Kölner Architekten Scheuring und Partner (Wettbewerb 1. Preis) gebaut wurde, beherbergt auf einer Nutzfläche von rund 2.100 Quadratmetern 150.000 Medien, wie Lehrbücher, Zeitschriften, Normen, Patente und CD-ROM. Sie wurde in einer Bauzeit von zwei Jahren mit Gesamtbaukosten von fast 13 Millionen Mark errichtet. Der Neubau ist durch seine direkte Anbindung in die Altbausubstanz integriert.

Im Erdgeschoß des drei- bzw. viergeschossigen Baukörpers befindet sich die Bücherausleihe und der Zeitschriftenlesesaal. Die zwei darüberliegenden Ebenen nehmen Leseplätze, Computer-Arbeitsplätze und Einzelarbeitskabinen auf. Im vierten Geschoß ist die Verwaltung untergebracht. Das Magazin und die Normenauslegestelle sind im Untergeschoß eingerichtet. Ein Lichthof ermöglicht die natürliche Beleuchtung aller Arbeits- und Leseplätze; großzügige, offene Treppenanlagen und Lufträume schaffen interessante Sichtbeziehungen. (<http://www.baunetz.de>)

### **Libraries:**

#### **Bezirkszentralbibliothek Friedrichshain-Kreuzberg, Berlin – Germany 2010**

Bauherr: Land Berlin, Wettbewerb 1. Preis

Um das serielle Erscheinungsbild des Typenbaus "SK 66 Berlin" mit seinen Bandfenstern zu brechen, bedurfte es einer radikalen Umdeutung der Fassade. Gleichzeitig sollten die Eingriffe im Inneren weiterhin die Lesbarkeit des Ursprungbaus zulassen. Das Gebäude impliziert durch die einheitliche Fassadenbekleidung einen monolithischen Charakter. Das Volumen wird als homogene Einheit gelesen und behauptet sich selbstverständlich im Stadtraum. Die Hülle aus geschosshohen Zedernholzlamellen

lässt das Gebäude von der Frankfurter Allee her als prägnanten Solitär erscheinen. Zwischen den Bäumen der Stichstraße erhebt sich ein Haus, welches mit seiner Materialwahl auf den Standort in einem begrünten Blockinnenbereich reagiert. Die neue Gebäudehülle wird durch großzügige, raumhohe Öffnungen durchbrochen. Sie sind kompositorisch angeordnet, die Beziehung von Innen nach Außen wird für die Besucher wahrnehmbar. Durch die großen Öffnungen entsteht eine Dramaturgie von Aus- und Einblicken und eine besondere Belichtungssituation. Die Lamellen dienen gewissermaßen als Filter zwischen der Innen- und Außenwelt. Betrachtet man das Gebäude von außen, wird der Blick auf die wie Schaufenster wirkenden Verglasungen gelenkt hinter denen sich Bücherregale ausmachen lassen. Im Innern offenbart sich ein spannungsvolles Wechselspiel aus Öffnungen mit und ohne Lamellenvorhang. Indem die Lamellen einen Teil des Blicks nach Außen verstellen, erzeugen sie eine kontemplative Atmosphäre. Gleichzeitig lässt sich durch den gerichteten Blick die Welt bisweilen neu entdecken. Im Kontrast zum gefilterten Blick stehen dann an bewusst gewählten Orten, der freie und großzügige Blick auf die Frankfurter Allee oder den weiten Hof mit seinen üppigen Platanen. Unterschiedliche Lamellenstellungen lassen das Licht in abwechselnder Intensität einfallen. Bei nächtlicher Innenbeleuchtung wirkt der scheinbar schwere Monolith an vielen Stellen transluzent, leicht und fragil. Die Unterkonstruktion der neuen Fassade besteht aus einem Holzrahmen, die über Stahlkonsolen mit dem Gebäude kraftschlüssig verbunden sind. Dieses "Fachwerk" ist mit mineralischer Wärmedämmung ausgefüllt und mit schwarzen Fassadenbahnen kaschiert, es tritt vollständig in den Hintergrund. Die vorfabrizierten Lamellenelemente aus Zedernholz sind an diese Unterkonstruktion montiert. Die vertikal angeordneten Lamellen sind in unterschiedlicher Schrägstellung ausgeführt, so dass ein changierendes Fassadenbild entsteht. Besonders in der Bewegung ergibt sich ein lebendiges Spiel. Gerade so, als bliese der Wind durch ein Gerstenfeld. (Schmidt)

Bauwelt Nr. 9, 2005

Baumeister, 2005

DAM Jahrbuch 2005

Am Weimarer Schlossplatz wird am 4. Februar 2005 der Erweiterungsbau der Anna-Amalia-Bibliothek eingeweiht. Der Bau für eine Million Bücher stammt von den Architekten Hilde Barz-Malfatti und Karl-Heinz Schmitz (siehe BauNetz-Meldung). Bauherr war die „Stiftung Weimarer Klassik“. Der Neubau mit 6.300 Quadratmetern Fläche grenzt an das historische Gebäude mit Rokosoaal. Dort war am 2. September 2004 ein Feuer ausgebrochen, bei dem über 30.000 Bände durch Feuer oder Löschwasser beschädigt worden sind. Der 24 Millionen Euro teure, von einem Glasdach gedeckte, rundum mit Bücherwänden ausgestattete Kubus des Neubaus spielt auf den runden Bücherturm des Altbaus der Bibliothek an. Die Leseplätze reichen in den angrenzenden Ilm-Park. Die zweigeschossigen Tiefmagazine unter dem Platz der Demokratie sind klimatisiert, wasser- und feuersicher und verbinden das Stammhaus und den Erweiterungsbau unterirdisch. Das Studienzentrum hat 180 Leseplätze, eine Freihandbibliothek sowie eine Foto- und Mediathek. (<http://www.baunetz.de>)

Für das Studienzentrum wurde ein historischer Gebäudekomplex (Rotes und Gelbes Schloss) nutzbar gemacht. Der Schlösserkomplex ist ein Gefüge verschiedenartiger Baukörper aus unterschiedlichen Bauepochen (Renaissance, Barock bis zu Überformungen nach den Kriegszerstörungen). Die Baukörper sind auch unterirdisch miteinander verbunden. Der im Stadtraum sichtbare Teil des Ensembles wurde ergänzt durch einen Eingangsneubau und einen unterirdischen Lesebereich mit Tageslicht. Ein in den alten Innenhof eingesetzter Bücherkubus mit 16 verglasten Oberlichtern bildet das Kernstück der neuen Anlage. Mit seinem Kontrast zwischen "rauer" Außenseite aus Sichtbeton und "feiner Holzschale" im Inneren ist dieser geometrische Innenraum ein modernes Pendant zum Rokosoaal des Stammgeländes der Bibliothek. Architekturpreis des Landes Sachsen-Anhalt 1995, Bauen im Bestand

Im Rahmen der seit Anfang der 1990er Jahre bewusst verfolgten Altstadtsanierung Ascherslebens schließt die Kreisbibliothek eine innerstädtische Baulücke zwischen zwei unter Denkmalschutz stehenden Gebäuden. Als schmaler, länglicher Baukörper verbindet sie ein in der Badstubenstraße erhaltenes Gebäude des ehemaligen Krankenhauses mit der dazugehörigen neugotischen Kapelle und komplettiert die einst vorhandene städtebauliche Blockstruktur. An der Straßenseite erinnert die Bibliothek an ein transparentes,

begehbare Regal, während der dahinterliegende Hof durch eine massive Wandscheibe, die lediglich im Bereich der Anschlüsse von Alt und Neu Durchblicke erlaubt, geschützt wird. Eine äußere, entlang der vollverglaste Bibliotheksfassade angeordnete Rampe führt den Besucher zu einem Eingangskubus aus Stahlbeton, der aus der Straßenfront herausgedreht ist. Im Innern setzt sich die Rampe fort und erschließt die Kapelle, die nach ihrer Sanierung in die Bibliotheksnutzung integriert wurde sowie eine zweite Leseebene.

Bauherr: Stadt Frankfurt am Main

Vom geradezu legendären Amerika Haus konnte sich der American way of life in die sich neu findende bundesdeutsche Gesellschaft ausbreiten. Die Architekten des kurz nach Ende des Zweiten Weltkriegs eröffneten Kultur- und Informationszentrums waren Skidmore, Owings & Merrill SOM (1957) in Zusammenarbeit mit dem Frankfurter Otto Apel. Bei der behutsamen Sanierung durch schneider+schumacher ging es darum, die Geschichte des Hauses fortleben zu lassen. Im Jahr 2008 wurde das Gebäude dem spanischen Kulturinstitut Cervantes übergeben. Die dafür neu entwickelte, das Gebäude abschirmende und dabei sehr prägnante "Spanische Wand" vereint Funktionalität und Bildhaftigkeit. (Schneider)

Die Bibliothek Antonio Gamoneda im Instituto Cervantes Frankfurt

Das Instituto Cervantes verfügt über eine großzügige Bibliothek mit direkter Verbindung zum Institutsgarten. Sie steht allen Besuchern offen, die sich für Spanien und Lateinamerika interessieren. Der Bestand umfasst mehr als 6800 Medieneinheiten, darunter Bücher, Fachzeitschriften, Tageszeitungen, CDs, Videos und DVDs. Das Medienangebot deckt ein breites Themenspektrum ab: von Philologie, Literatur und spanischer Didaktik bis zu Bildender Kunst, Wirtschaft, Geschichte und Recht, und vielem mehr. Ein spezieller Bereich ist Unterrichtsmaterialien zu Spanisch als Fremdsprache gewidmet. Neben der Möglichkeit Medien auszuleihen, lädt ein ansprechend gestalteter Lesebereich die Bibliotheksbesucher zur Lektüre und zum Durchblättern der aktuellen spanischen Tages- und Fachpresse ein. Eine besondere Aufmerksamkeit ist dem Film und der Musik gewidmet, von den klassischen Werken bis zu aktuellsten Entwicklungen. Diese Themen erhalten in der Bibliothek einen herausgehobenen Platz. (<http://frankfurt.cervantes.es>)

#### **Teda High School (Library), Tianjin – China 2014 -**

In Zusammenarbeit mit Tianjin architecture and design institute, Tianjin (CN), Landschaftsarchitekten GTL Gnüchtel Triebswetter Landschaftsarchitekten, Kassel (DE), Düsseldorf (DE), Beijing (CN)

Die Architekten ersetzten den Schulcampus durch einen einzigen, fünfgeschossigen Baukörper. Auf einer Fläche von etwa 63.000 Quadratmetern sind hier Klassenräume für 2.700 Schüler, eine Mensa, die Bibliothek, ein Veranstaltungssaal für 600 Personen und eine Sporthalle untergebracht. Ein 180 Meter langer Korridor verbindet als „Rückgrat“ die – auch baulich gegeneinander abgesetzten – Funktionsbereiche miteinander. Über seine Verkehrsfunktion hinaus soll dieses zentrale Gestaltungselement als Aufenthaltsraum für den zwanglosen Austausch dienen.

Während solch ein informeller Begegnungsraum ein Novum ist, das traditionellen chinesischen Schulen fehlt, bindet die Gestaltung der Obergeschosse die Tradition bewusst mit ein: In Anlehnung an „Liu Shang Qu Shui“, eine Erzählung „um das gemeinsame Erdenken, Austauschen und Weitergeben von Wissen“, mäandrieren die Verbindungsbrücken durch die roten Treppenwände hindurch. Die klare Glas- und Steinfassade aus stehenden und liegenden Elementen setzt sich ebenfalls gegen das übliche Erscheinungsbild chinesischer Schulen ab, und soll den herausragenden Ruf der Schule auch gestalterisch unterstreichen. Der Bau für die Lehrgebäude der Klassen 6 bis 12 soll Anfang 2013 beginnen, die erste Bauphase bis Mitte 2014 abgeschlossen sein.

Design competition 4/01, 1<sup>st</sup> Prize, usable floorspace: 15.250 m<sup>2</sup>, gross volume: 134.210 m<sup>3</sup>

The extension intertwines into the existing orthogonal structure only marked by a gap. A trench with water ties the building together with the city's green belt leading the way from the campus to the main entrance hall. The floor levels are structured into five zones. Flexible laboratories and office spaces are divided according to the needs of the various study groups. Green zones form circulation spaces enhancing interaction. Public areas such as lecture theatres and library are located at entrance level. Vertical voids link the public areas to the departments and the greenhouse roof thus creating green spaces within the building. (Schneider)

#### **Fachhochschule Deggendorf (Bibliothek) – Germany 1998**

€ 3.200.000, 13.285 m<sup>2</sup>

The design concept follows the paradigm of the ancient Gymnasium of Olympia. Two long parallel buildings containing the departments of engineering, electrical engineering, structural engineering, business administration as well as offices shape a central campus together with the library, the data centre and the cafeteria as separate buildings set in between. Located in the heterogeneous environment of an industrial park the campus develops its own identity though still linking the adjacent park and the bank of the river Danube by large scale openings. A portico is forming the main entrance whose rows of columns continue alongside the campus. A small grove and two ponds in front of the special purpose buildings enrich the pedestrianised campus. A wooden deck defines the outside area in front of the cafeteria. Small trenches filled with water create paths and increase the permeability of the campus. (Schneider)

### **Libraries:**

**Stadtbibliothek Hanau** see: RKW Rhode Kellermann Wawrosky

### **Stadtbücherei Augsburg – Germany 2009**

Die Pläne rekurren zu Teilen auf den prämierten Wettbewerbsbeitrag für die Neuorganisation des Reuterplatzes: In der nördlichen Platzhälfte soll das neue Büchereigebäude über viertelkreisförmiger Grundfläche entstehen, dem im Westen ein Bürotrakt angegliedert ist. Hierdurch wird ein neuer, L-förmiger Platzraum zwischen Bücherei, Parkhaus, Anna-Passage und Kaufhaus entstehen, der im Süden leicht trapezförmig auf den Zugang des Stadtmarktes zuläuft und das Potential für eine spätere Neuordnung des Marktzugangs bietet. Büro- und Büchereitrakt sind gestalterisch deutlich voneinander geschieden. Hierdurch wird besonders an der Südseite ein reizvoller Kontrast erzielt: Die mit Metalltafeln verkleidete Ostfassade, deren Fenster mit perforierten und damit halbtransparenten Elementen begleitet sind, steht dabei im Kontrast zum Büchereitrakt, dessen architektonische Kennzeichen Leichtigkeit, Transparenz und Helligkeit sind. Hier lassen Glasfassaden im Süden und Osten Tageslicht in das dreigeschossige Gebäude strömen und öffnen es zugleich visuell nach außen, wodurch Innen- und Platzraum zur Einheit werden. Ergänzend sollen sensorgesteuerte Rollos die Räume vor zu starker Sonneneinwirkung schützen. Die konvexe Ostfassade besteht aus schmalen Glassegmenten, die wie die Seiten eines leicht geöffneten Buches nebeneinander angeordnet sind; durch dezente Einfärbung, bzw. differenzierte Transparenz, der verwendeten Scheiben wird dieser Eindruck noch verstärkt. Zudem wird die Front auf diese Weise gestalterisch gegliedert und erhält, im Vergleich zur 'entmaterialisierten' Südfassade, eine stärkere materielle Substanz. Dies wird insbesondere in sonnenlichtarmen Zeiten wahrnehmbar sein, wenn das Kunstlicht die Glassegmente von Innen zum Leuchten bringt. Im Inneren öffnen sich alle Etagen auf ein Atrium, in dem sich auch das Haupttreppenhaus befindet. Die Transparenz des Gebäudes nach Außen wird so im Inneren in einer offenen, großzügigen Raumwirkung fortgesetzt. Das seitlich einfallende Tageslicht wird durch Oberlicht-Sheds ergänzt. Darüber hinaus sollen mehrere "Lichttrompeten" – hierbei handelt es sich um polygonale, annähernd prismenförmige Hohlkörper, die an den Innenseiten mit einem System aus Spiegeln versehen sind – Sonnenstrahlen gezielt in den Innenraum leiten. Neben der funktionalen Dimension besitzen diese Lichttrompeten eine skulpturale Qualität, durch die der Innenraum eine zusätzliche Akzentuierung erfährt. Besonders evident wird die Plastizität der 'Sonnenrichter' jedoch auf dem begehbaren Flachdach der Bücherei. Hier entsteht durch die in Höhe und Dimensionen differierenden, unregelmäßig gruppierten Prismen eine plastisch gestaltete Dachlandschaft. Die Dachlandschaft wird zur Erweiterung des Gebäudes, zur Verbindung von Innen- und Außenraum, zum skulpturalen Garten. Der einladende, kommunikative Charakter des Neubaus wird durch ein Café mit Außenbestuhlung im südlichen Bereich des Erdgeschosses ergänzt. (Schrammel) (<http://www.stadtbuecherei.augsburg.de>)

### **Neubau einer Gemeinde- und Schulbibliothek, eines Schulverwaltungstrakts und einer Mensa, Lohfelden – Germany 2009**

Auftraggeber: Gemeinde Lohfelden + Landkreis Kassel, Kosten, BRI, BGF: 5,8 Mio. € einschl. Einrichtung, 12.252 m<sup>3</sup>, 3.131 m<sup>2</sup>

Umgesetzt wird voraussichtlich ab Ende 2006 der Entwurf des Architekturbüros Schultze & Schulze. Professor Wolfgang Schulze erläuterte seine Entwurfs-Schwerpunkte. Wichtig sei ihm aus städtebaulicher Sicht, dass man das Gebäude gut sehen könne. So wird es in voller Länge – vom Ortszentrum aus gesehen – vor die Gesamtschule gesetzt. Die festen, bunten Lamellen erinnern an Bücher in einem Regal. Sie sollen sich mit der Sonne drehen und für Beschattung sorgen. Die Nutzungsmöglichkeiten seien sehr variabel, so Professor Schulze weiter. Die Mensa mit 90 Plätzen und die Bücherei, die zunächst für 30.000 Bücher, Tonträger und andere Medien ausgelegt ist, liegen ebenerdig nebeneinander. So kann die Mensa auch zum Catering bei Veranstaltungen genutzt werden. Ein Klassenzimmer in der Bibliothek ermöglicht es, den Schülern und auch den Kindergarten-Kindern den Umgang mit den Medien näher zu bringen. Optional angedacht ist der Bau einer Solarthermischen- oder Photovoltaikanlage auf dem Dach. Dort befindet sich auch ein Freiluftlabor, in dem die Kinder mit Sonnenenergie experimentieren können. Der Verwaltungstrakt für die Schule ist im Obergeschoss über der Bücherei vorgesehen und kann somit ebenfalls von der „alten“ Söhre-Schule aus auf sehr kurzem Wege erreicht und von der Schulverwaltung optimal genutzt werden. NEU IN...HALLE, in: db 5/99, p.16

DAS JURIDICUM IM SPANNUNGSFELD VON MODERNE UND KLASSIZISMUS, in: architektur & wirtschaft, 1/98 pp. 18-19

JURIDICUM DER UNIVERSITÄT HALLE (1998), Andreas Denk, Centrum. Jahrbuch Architektur und Stadt 1998/1999, pp. 38-39

JURIDICUM IN HALLE AN DER SAALE, Wolfgang Stock, Baumeister, 11/98, pp. 48-55

TEMPEL DES WISSENS, AIT, 8/94, p. 13

Die Idee eines terrassierten Baukörpers fasst die beiden Funktionen Bibliothek und Lehrstuhlbereich zusammen. Die den Lehrstuhlbüros vorgelagerten, begrünten Terrassenflächen werden in der großen Halle der Bibliothek zu den Lesebereichen. Innen- und Außenraum sind somit wie ein Vexierbild lesbar. Die abgestufte Kubatur integriert die Baumasse des Juridicums selbstverständlich in die heterogene Struktur der direkt angrenzenden altstädtischen Bebauung. Den Terrassen, welche nach Westen zur Spiegelstraße als schmalparzellige Einzelgebäude in Erscheinung treten, wird im Osten, zur Platzseite, ein dreieckiger Baukörper vor gestellt, welcher zu der Architektur und Ausrichtung der klassizistischen Gebäude vis-à-vis vermittelt. Das Juridicum wird somit als "Solitär im Block" lesbar und unterstreicht die besondere Stellung des freistehenden Löwengebäudes als Hauptgebäude der Universität. Mit dem Bau der neuen Bibliothek des Juridicums und des Auditorium Maximum wurde das Campusgelände in das gewachsene urbane Geflecht und die Topographie Halles eingewoben. Die Gestaltung des Platzes reagiert mit großzügigen Rasenflächen auf die ehrwürdigen historischen Universitätsgebäude, um deren Solitärwirkung zu steigern. Gleichzeitig verwebt sich die steinerne Platzfläche mit der neuen Architektur. Es entsteht eine innere Verwandtschaft zwischen Platz und Gebäuden. Der Platzraum wird über zwei neue Treppenanlagen terrassiert, wodurch ein neuer oberer Platzzugang etabliert wird und der Straßenraum vor dem Juridicum in das Platzgefüge eingebunden wird. Die Treppe wird als zentrales Kommunikationsprinzip der Universität interpretiert: die Treppenanlage als Ort des Ausruhens oder der angeregten Diskussion zwischen zwei Lehrveranstaltungen. Eine breite und lange Bank, aus durchgefärbtem, schwarzem Beton dient als Ort zum Liegen, Sitzen, als Tisch und Plattform. (Schulz)

Der Neubau des Juridicums fügt sich städtebaulich gekonnt in die Struktur der Altstadt ein und schließt die westliche Seite des Campus. Zum Universitätsplatz entstand mit der stringenten Lochfassade eine klar definierte Platzwand. Aus der gleichen Formensprache wurden zur Spiegelgasse kleinteilig gegliederte Kuben mit Terrassen entwickelt. An den bestehenden Altbau der juristischen Fakultät schließt sich der Lesesaal an und vermittelt geschickt mit seiner Glasfassade zwischen Bestehendem und Neuem. Die logische funktionelle Struktur im Inneren bleibt so im äußeren Erscheinungsbild ablesbar. Der Besucher ist überrascht von der Großzügigkeit des Innenraumes. Nicht nur beim Betreten des Hauses in der Eingangshalle, sondern auch in den folgenden Räumen spürt man Offenheit und Freizügigkeit durch klare Gliederungen, geschickte Staffelungen der Funktionen und Transparenz in den Materialien. #### **Büchermagazin, Badische Landesbibliothek, Karlsruhe – Germany 2013**

Die Badische Landesbibliothek erhält ein neues Büchermagazin. Der Neubau soll in der Zeit vom 1.9.2010 bis zum 31.3.2013 errichtet werden. Ein Auszug aus der Ausschreibung im Bekanntmachungstext des EU-Amtsblattes lautet:

"Die Badische Landesbibliothek ist auf dem Grundstück Erbprinzenstraße 15 in der Karlsruher Innenstadt untergebracht. Da dort die Aufnahmekapazität erschöpft ist, soll am Stadtrand ein neues Büchermagazin errichtet werden. Hierfür steht im Industriegebiet Grötzingen, nahe der Autobahn A5, das Grundstück "Am Heegwald" mit 5 750 qm zur Verfügung. Vorgesehen ist ein 4-geschossiges Gebäude mit 3 000 qm Nutzfläche, davon 2 750 qm Magazinfläche für die Unterbringung von Rollregalanlagen. Das Gebäude soll in schwerer Bauweise errichtet werden, um die klimatischen Anforderungen mit möglichst geringem Energieaufwand erfüllen zu können (träges Klima). Für die Maßnahme werden derzeit Gesamtkosten in Höhe von ca. 9 000 000 EUR veranschlagt." (<http://www.baunetz.de>)

#### **Collegium Hungaricum Berlin – Germany 2011**

Bauherr: Ministerium Nationales Kulturerbe Ungarn, Bauzeit: 2006–2011, Bauvolumen 7.700 m<sup>2</sup>, Entwurf Peter P. Schweger, Jens-Peter Frahm

Das Collegium Hungaricum Berlin kehrt zurück an seinen historischen Standort hinter die Humboldt-Universität und das Maxim Gorki Theater in der Dorotheenstraße 12 in Berlin-Mitte. Für das Collegium Hungaricum wurde ein Konzept entwickelt, das sowohl den historischen Traditionen als auch den heutigen Anforderungen entspricht. In dem Bau wurden neben den funktionalen Qualitäten und der kompakten Klarheit der Baukörper insbesondere die integrative Komplettierung der unterschiedlichen Epochen des Standortes wie auch die symbolhafte Aussage für das Collegium Hungaricum hervorgehoben. Die Architektur des Gebäudes bezieht sich insbesondere auf die klassische Moderne und die damaligen Verbindungen zwischen Ungarn und Bauhaus Deutschland durch Laszlo Moholy-Nagy und Marcel Breuer. Das Gebäude wird von der Dorotheenstraße aus betreten, ist aber schon von der Straße Unter den Linden sichtbar – das große Fenster des Festsaaes bzw. Multifunktionsraumes überträgt die kulturellen Aktivitäten des Instituts direkt in den Stadtraum. Das moderne Ensemble mit den zwei Wohnhäusern bildet einen signifikanten Ort in der historischen Mitte Berlins. Das Gebäude des CHB wird fünf Obergeschosse haben, verbunden durch einen großzügigen Foyer- und Freitreppenbereich auf jeder Etage. (Schweger)

Mit der Überschrift „Klassische Moderne am historischen Ort“ kündigt Peter P. Schweger die Einweihung seines Neubaus für das „Collegium Hungaricum Berlin“ (CHB) am 30. November 2007 an (siehe BauNetz-Meldung vom 4. Mai 2007 zum Richtfest). Der Neubau in der Dorotheenstraße 12 in Berlin-Mitte befindet sich hinter der Humboldt-Universität und dem Maxim-Gorki-Theater. Schweger, der in den fünfziger Jahren in Budapest studierte, sagte über seinen Entwurf für das CHB: „In seinem Ausdruck ist das Gebäude eine Referenz auf die Tradition der Baukultur der klassischen Moderne, die zwischen dem Bauhaus in Deutschland und Ungarn durch seine Protagonisten bestand. Die ungarischen Bauhausmeister wie Marcel Breuer oder László Moholy-Nagy sowie deren Schüler haben in den 30er Jahren in Budapest einige bemerkenswerte Bauten der Bauhausphilosophie realisiert.“ Das Collegium Hungaricum Berlin ist von der Straße Unter den Linden sichtbar, das große Fenster des Festsaaes überträgt die kulturellen Aktivitäten des CHB in den Stadtraum. Der CHB-Neubau hat sechs Geschosse, verbunden durch einen Foyer- und Freitreppenbereich. Der Haupteingang liegt zur Dorotheenstraße, das Erdgeschoss wird ein Café/Restaurant beherbergen. Mit dem Ausstellungsraum, den Seminarräumen, der Bibliothek und dem multifunktionalen, großen Saal bieten sich vielfältige Nutzungsmöglichkeiten für das Kulturprogramm des CHB und seiner Partner. Im obersten Geschoss liegen die Büros des Instituts sowie Gästewohnungen. (<http://www.baunetz.de>)

#### **Umbau und Erweiterung Bundesschulzentrum Tulln (Bibliothek) – Austria 2011**

Bauherr: Bundesimmobiliengesellschaft – BIG, Baukosten: € 14.600.000, HNF 11.600 m<sup>2</sup>, BGF 19.380 m<sup>2</sup>, BRI 90.000 m<sup>3</sup>  
Fertigstellung: 2011, Das Preisgericht fand am 30. August 2005 statt, als Sieger ging das Projekt der Arbeitsgemeinschaft Schwinde - Ebert Ingenieure aus München, hervor. I. Rang, Arbeitsgemeinschaft Schwinde - Ebert Ingenieure, Architekt DI Peter Schwinde, DI Dieter Leipoldt

Die Qualität in der baukünstlerischen Grundhaltung wird bei diesem Entwurf im gekonnten Umgang mit den funktionellen Erfordernissen im zentralen Nutzungsbereich Allgemeinbildender Höherer Schulen, im Bemühen um Gestaltgebung der neuen, für die Erweiterung erforderlichen baulichen Gruppierungen in Verbindung mit der Großform des bestehenden Schulgebäudes, und in der Fähigkeit, den vorgegebenen Kostenrahmen für ein optimales Raumangebot in den zentralen Einrichtungen und den Sonderunterrichtsräumen zu nutzen, gezeigt. Die Stärke des Entwurfs in funktioneller Hinsicht liegt in der durchdachten Zuordnung von Mehrzwecksaal, Bibliothek, Speisesaal zur Aula im zentralen Bereich des Schulgebäudes, die den Erfordernissen des Schulbetriebs bestmöglich entspricht, auch in der Schaffung von Möglichkeiten, einzelne Raumabgrenzungen veränderbar einzurichten, um die verfügbaren Flächen variabel nutzbar zu machen. Gut nutzbar ist auch das Raumangebot für die Klassen der Erweiterung in einem 2-geschoßigen Zubau, die einen um einen Innenhof gruppierten attraktiven Schulbereich bilden. Die zeitgemäße Ausformung der neuen Baukörper, die sich von der Bestandes deutlich abhebt, zeigt in der gestalterischen Haltung Anspruch an Qualität. (Schwinde)

### **Libraries:**

#### **ZMB Zentrum für molekulare Biowissenschaften, Bibliothek, Graz – Austria 2007**

Planung: 2004 – 2006, Fertigstellung: 2006 – 2007, BGF: 20.430m<sup>2</sup>

Drei biomorphe, kompakte, unterschiedlich große Volumen lassen differenzierte Außenräume zwischen Neubau und Bestand entstehen. Entspannt fügt sich das Ensemble in die umgebende städtebauliche Situation ein. Es zitiert den Campusgedanken als Ausdruck der Eigenständigkeit der Fakultät, bzw. des Zentrums in der Universitätsstruktur. Die drei Gebäudevolumen beinhalten technisch hochausgestattete Forschungslaboratorien, Isotopenlaboratorien, Tierhaltung, OPs Büro- und Seminarräume, die Fachbereichsbibliothek, den Hörsaal und als zentralen Treffpunkt die Cafeteria, sowie die Tiefgarage mit 100 Stellplätzen. Prägnant ist das äussere Erscheinungsbild: drehbare Sonnenschutzlamellen aus Glas sind geschosshoch auf der kompletten Fassade montiert. (Seidel)

Die Anordnung der Neu- und Bestandsbauten um den zentralen Körper „EX\_USU“ (aus der Erfahrung, durch Übung) soll die Imagination einer Ideenzelle als Knotenpunkt interner wie externer wissenschaftlicher Arbeit erzeugen. Der viergeschossig ausgebildete Körper passt sich in der Höhenentwicklung den umliegenden Gebäuden an und ergänzt das Straßenbild der Humboldtstraße in angepasster Maßstäblichkeit. Im mittleren Bereich des Grundstücks lagert der größte Baukörper mit der universitären Nutzung. Die beiden Baukörper sind auf Erdgeschossniveau miteinander verbunden. Der Verbindungsteil markiert den Hauptzugang zu den beiden Gebäudeteilen für alle Nutzer und Besucher und versteht sich als zentraler Verteiler zu den beiden Forschungsbereichen. Der dritte und kleinste Gebäudekörper (EX\_USU) beinhaltet den Hörsaal, die Seminarräume, die gemeinschaftlich genutzte Bibliothek sowie das öffentlich zugängliche Café. Der Körper schafft eine Schnittstelle zwischen Öffentlichkeit, Lehre und Forschung. Alle drei Volumina sind auf den Untergeschossenebenen miteinander verbunden. Das äußere Erscheinungsbild des Gebäudekomplexes prägen geschosshohe Sonnenschutzlamellen aus Glas, die im Sommer die darunterliegende Fassade vor zu starker Sonneneinstrahlung schützen. Sie ändern ihren Öffnungswinkel im Tagesverlauf je nach Sonnenstand. Zusätzlich kann der Nutzer individuellen Einfluss auf „seine“ Sonnenschutzlamellen nehmen und diese je nach persönlichen Anforderungen öffnen oder schließen, woraus sich ein variantenreiches Spiel von geöffneten, halbgeöffneten und geschlossenen Lamellen ergibt. Auf der Außenseite sind die Lamellen mit semitransparenten Punkten bedruckt. Dadurch behalten sie ihre glasspezifische Durchsichtigkeit in

abgeschwächter Form, die darunterliegende farbenfrohe Fassade ist je nach Öffnungswinkel der Lamelle und Reflexion des Sonnenlichtes vielfältig erlebbar. Die gesamte Fassade unterliegt einem Maßsystem: Die Achsen der Fassadenbleche und der Lamellen sind dem Vielfachen des optimalen Laborgrundrisses entlehnt. Die Konstruktion besteht aus einem Stahlbetonskelettbau mit Lochfassade. Die Decken sind mit Betonkernaktivierung ausgestattet, die die hohen inneren Wärmelasten kontinuierlich abführt. Nachträglich lassen sich in dieses System nur schwerlich Deckendurchbrüche setzen, deshalb wurden bereits in der Planung Regeldurchbrüche gesetzt, die auch eine spätere Änderung der Raumgrößen zulassen. Die benötigten Dunkelräume wurden allesamt im Gebäudekern angeordnet, was eine hohe Gebäudetiefe zulässt und somit das Verhältnis Volumen zu Fassadenfläche positiv prägt. Besonders viel Wert wurde auf die Vermeidung von umweltbelastenden Materialien gelegt. Beitrag von GAT (<http://www.nextroom.at>)

### **Libraries:**

**Neubau Mensa / Bibliothek Görlitz – FH Zittau/Görlitz –Germany 2003 – 2006**

Client: SIB (Sächsisches Immobilien- und Baumanagement)

Der Auftrag ging an das Architekturbüro Koop + Singer. Der Neubau Mensa/Bibliothek ist ein zweigeschossiges Gebäude, das in der Mitte des Campus gelegen ist. Bestimmende Materialien sind neben den Verglasungen mit grauen und silbernen Rahmen vor allem die Fassadenbekleidungen aus dunkelroten Faserzementplatten. Dieser farbliche Akzent setzt den Neubau von den umgebenden Gebäuden ab und unterstreicht die Zentralität der Lage. Für die „Kunst am Bau“ entwarf der bekannte Maler und Graphiker Veit Hofmann im Haupttreppenhaus des neuen Gebäudes eine „Spray-Kunst auf Beton“. Diese „Spray-Kunst auf Beton“ operiert mit bekannten, aber nur noch erahnbaren Schrift- und Bildelementen. Das Zeichen als Element der Schrift findet hier wieder seinen bildmäßigen Ursprung. Die standorttypische Gefährdung durch das Hochwasser wurde bei der Konstruktion des Gebäudes berücksichtigt. Alle sensiblen Anlagen wurden deshalb in einer Dachzentrale untergebracht. Im Havariefall melden auf Fußboden installierte Sensoren einen Wasseraustritt. (<http://www.medienservice.sachsen.de>)

**Zentrale Universitätsbibliothek, Philipps-Universität, Marburg – Germany Groundbreaking 2012**

Der Realisierungswettbewerb für den Neubau der Zentralen Universitätsbibliothek der Philipps-Universität Marburg auf dem Campus Firmanei ist entschieden: Die Jury des städtebaulichen Ideen- und Realisierungswettbewerbs unter Vorsitz des Architekten Ferdinand Heide würdigte mit großer Mehrheit das mit dem ersten Preis ausgezeichnete Vorhaben des Darmstädter Architekturbüros von Norbert Sinning in Kooperation mit der Landschaftsarchitektin Angela Bezenberger. 1. Preis: sinning architekten; Landschaftsarchitekten Angela Bezenberger Der Campus Firmanei entsteht in Nachbarschaft der Elisabethkirche, im Areal der ehemaligen Universitätsklinik. Die zum überwiegenden Teil unter Schutz stehenden Baudenkmäler werden für die Nutzung durch die Institute saniert. Die 108,4 Millionen Euro teure neue Zentrale Universitätsbibliothek wird das Herzstück des neuen innenstädtischen Campus Firmanei bilden und das Gartendenkmal des Alten Botanischen Gartens begrenzen. Vorgesehen ist ein langgestreckter, gut proportionierter Baukörper, der den Übergang zwischen dem eng bebauten Viertel an der Deutschhausstraße und dem historischen Freiraum des Botanischen Gartens markiert. Die im Grundriss abgewinkelte Baufigur mit ihrem gläsernen Atrium fügt sich nach Auffassung der Jury gut in die historische Bebauung ein und wird den Studierenden und Wissenschaftlern einen angenehmen Zugang zu einer Bibliothek mit hoher Aufenthaltsqualität bieten. Staatsministerin Eva Kühne-Hörmann hob hervor, dass die Wahl auf einen sehr guten Entwurf gefallen sei. „Die städtebaulichen Ideen und der Siegerentwurf für die Bibliothek lassen erwarten, dass die hohen Anforderungen erfüllt werden. Die Wettbewerbsteilnehmer mussten in einem sensiblen städtebaulichen Umfeld zwischen dem Kulturdenkmal der Elisabethkirche und dem Naturdenkmal des Alten Botanischen Gartens Funktionalität und Ästhetik einer modernen Bibliothek mit der Harmonie eines historischen Stadtbilds aus allen Perspektiven in Einklang bringen. Ganz besonders freue ich mich darüber, dass durch das Sonderinvestitionsprogramm des Landes Hessen die sofortige Realisierung des Neubaus gesichert ist“, sagte die Ministerin. Der Präsident der Philipps-Universität Marburg, Prof. Dr. Volker Nienhaus, der selbst Preisrichter war, zeigte sich beeindruckt, wie die preisgekrönten Entwürfe die Herausforderungen gemeistert haben. „Zusammen mit dem Neubau auf dem Brauereigelände und dem Lückenschluss in der Kinderklinik wird ein äußerst attraktiver Campus in zentraler Innenstadtlage entstehen, der einen Gewinn nicht nur für die Universität, sondern auch für die Universitätsstadt Marburg darstellen wird.“ Der Hessischen Landesregierung gebühre Dank, dass sie im Rahmen des HEUREKA-Programms die notwendigen Finanzmittel bereitstelle, um die Philipps-Universität im Standortwettbewerb der Forschungsuniversitäten nachhaltig zu stärken. „Die Gliederung des Baukörpers, die Orientierung zum Botanischen Garten und die Umsetzung des Raumprogramms sind vorbildlich gelungen“, urteilte der Vorsitzende des Preisgerichts, Ferdinand Heide. Oberbürgermeister Egon Vaupel, der ebenfalls dem Preisgericht angehörte, zeigt sich sehr erfreut über das Wettbewerbsergebnis. „Die neue Bibliothek wird das Nordviertel beleben und aufwerten“, sagte er. Der Wettbewerb wurde in zwei Phasen durchgeführt. Der städtebauliche Ideenteil in der ersten Phase stellte die Aufgabe, die vorgesehenen Neubauten des Campus Firmanei in eine an der städtebaulichen und architektonischen Qualität des Standorts orientierte Gesamtplanung einzubetten. Als Neubauten sind künftig neben der zentralen Universitätsbibliothek ein Institutsgebäude auf dem Gelände der ehemaligen Brauerei sowie die Lückenschließung in der ehemaligen Kinderklinik vorgesehen. Die Teilnehmer waren aufgefordert, Ideen für die Gliederung der Baukörper sowie die städtebauliche Einbindung über stringente Wegeverbindungen zwischen dem Campus Firmanei und weiteren Standorten der Universität in der Innenstadt zu entwickeln. In einem vorgeschalteten Bewerbungsverfahren waren 44 Teilnehmer ausgewählt worden, 38 Büros hatten Arbeiten eingereicht. In der ersten Sitzung des Preisgerichts im November 2008 waren davon 30 ausgewählt und zur zweiten Phase des Wettbewerbs, dem Realisierungsteil „Neubau der Universitätsbibliothek“, zugelassen worden. Mit ihrer baulichen Neuordnung verbindet die Universität das Ziel, die wissenschaftliche Interaktion in Forschung und Lehre zwischen den Fächern sowie zwischen Stadt und Universität zu stärken. Vorgesehen sind die Konzentration der Geistes- und Sozialwissenschaften auf dem Campus Firmanei sowie die Konzentration der Naturwissenschaften und der Medizin auf dem Campus Lahnberge. Das Wettbewerbs-ergebnis ist ein wichtiger Schritt, durch die Verbindung von moderner Forschung und Lehre an einem traditionsreichen Standort die Attraktivität der Universität zu steigern. #### **Duale Hochschule Heidenheim, Neubau mit Bibliothek, Heidenheim – Germany 2010**

PPP-Projekt-Partner: Strabag Real Estate GmbH, Köln, Ed. Züblin AG Direktion Stuttgart Bereich Ulm / Neu-Ulm

Duale Hochschule Heidenheim für Wirtschaftswissenschaften, Informatik und Sozialwesen

Auftraggeber: Land Baden-Württemberg vertr. durch Vermögen und Bau Baden-Württemberg, Realisierungswettbewerb: 05.2006, 1.Preis, Planung und Ausführung: 2006-2010, BRI: 66.000 qm BGF: 16.500 qm HNF: 8.700 qm

Der Neubau der Dualen Hochschule setzt durch seine prägnante Gestalt ein Signal für einen zukunftsweisenden Bildungsort; von weither sichtbar ist die Duale Hochschule Anziehungspunkt und Bildungsstätte junger Menschen. Die Konzentration der Baumasse fördert ein intensives Umfeld, durch die offene Struktur im Inneren wird eine kommunikative Atmosphäre mit großen Allgemeinflächen geschaffen. An drei Gebäudeecken werden jeweils zwei Geschosse zu einem großen Luftraum zusammengefasst, die den öffentlichen Bereichen wie Foyer, Aula und Bibliothek vorbehalten sind. Die klare Form des Quadrates, die umlaufende Anordnung der Räume an den Fassaden und der Erschließungskern in der Gebäudemitte erleichtern die Orientierung und ermöglichen eine hohe Flexibilität in der Nutzung auf. (Spreen)

Heidenheim an der Brenz is a new landmark: Last week inaugurated Prime Minister Stefan Mappus the Cooperative State University of Spreen architects . in the 50,000-inhabitant large city in eastern Baden-Württemberg with its eight stories is the compact, square building a new high point in the urban landscape. The internal structure is dressed with the black plates Aluminum building is differentiated: the individual stories are interspersed with two-story areas. At the corners serve the higher public use spaces such as foyer, library with Leese hall or auditorium. The individual floors each house the classrooms of a course. Each floor is thus a kind of "functional study island." Great, green shimmering windows represent the connection to the outside world; they do acted as a showcase of the city to the university and vice versa, so the Munich architect Jan Spreen. He sees this as "a symbol of the traditionally close relations with the Cooperative Institute for society, industry and commerce". The storied cross-glass surfaces, combined with the recessed strip windows, will help that the bullets are withdrawn and one of the building as an abstract body , an "educational sculpture" perceive. #### **Max-Planck-Institut für Europäische Rechtsgeschichte, Bibliothek, Frankfurt am Main – Germany 2006 – 2013**

Beschränkter Realisierungswettbewerb 1. Preis 2006, Mitarbeit Per Königeter, Johannes Löbber, Justus Etemeyer  
Bauherr Max-Planck-Gesellschaft, Planungsbeginn – Fertigstellung 2007 – 2013, Gesamtbaukosten 19,88 Mio €, HNF 5000 m<sup>2</sup>

Bei dem vorgeschlagenen städtebaulichen und architektonischen Konzept des Instituts für europäische Rechtsgeschichte ging es darum, eine Balance zu finden zwischen dem verständlichen Anspruch der Max-Planck Gesellschaft nach Eigenständigkeit und der städtebaulichen Intention, auch diesen Baukörper als Teil des Ensembles des neuen Campusgeländes mit dem dominierenden Bau der Zentrale der IG Farben zu begreifen. Aus einem erdgeschossigen Sockel, der alle Teile des Gebäudes über einen Kreuzgang zusammenbindet, werden für die unterschiedlichen Institutsbereiche mehrgeschossige Baukörper entwickelt. Die Anordnung und Orientierung dieser Baukörper richtet sich nach den funktionalen und räumlichen Anforderungen der verschiedenen Funktionsbereiche. So riegelt das Freihandmagazin gleichsam als Lärmschutzwand den Blockinnenbereich von der viel befahrenen

Hansaallee ab. Die dazu gehörigen Büroarbeitsplätze sind in den ruhigen Innenhof orientiert. Die Projektbüros liegen zum Park nach Süden ausgerichtet, mit Blick auf das zentrale Gebäude der IG Farben. Der Wohnbereich liegt in der nordwestlichen Ecke des Grundstückes, und orientiert sich mit seinen Wohnräumen ebenfalls in den Hof. (Staab)

### Universität Potsdam – Neubau Informations-, Kommunikations- und Medienzentrums Golm - Germany 2004 – 2011

Bauherr Brandenburgischer Landesbetrieb für Liegenschaften und Bauen - Niederlassung Potsdam, Planungsbeginn – Fertigstellung 2004 – 2011, Leistungsphasen 2 – 8, Gesamtbaukosten 25,89 Mio €, NF 7.250 m<sup>2</sup>

Auf der Grundlage eines übergeordneten Entwicklungs- und Freiraumkonzeptes wird der Baukörper der neuen Bibliothek als kubischer Solitär entwickelt, welcher durch seine innere räumliche Logik und seine städtebaulichen Anforderungen plastische Verformungen erfährt. Städtebaulich sind die beiden Erschließungsseiten bestimmend. Eine zentrale Grünachse, beginnend am Bahnhof von Golm, ordnet den gesamten Campus. Zu dieser zentralen Eingangssituation richtet sich der Haupteingang des Gebäudes. Ein weiterer Eingang befindet sich diagonal gegenüber und ist dem südlichen Campus und den zentralen Parkplätzen zugeordnet. Diese Diagonale setzt sich in der inneren Erschließung des Hauses fort. Zwei kaskadenartige Treppen verbinden das zentral gelegene Foyer mit den Lesebereichen in den darüber gestaffelten Ebenen. Aus der Differenzierung zwischen den aus klimatischen Gründen nur schwach tagesbelichteten Buchstellflächen und den hellen luftigen Lesebereichen wird das architektonische Grundthema des Hauses entwickelt. So ziehen sich die Lesebereiche als räumliches Kontinuum durch das Gebäude und erhalten so die unterschiedlichsten atmosphärischen Qualitäten. Räume mit Ausblick über den Campus wechseln mit innenliegenden introvertierten Leseplätzen, die über ein Oberlicht mit Tageslicht versorgt werden. Zwei über alle Geschosse eingeschlossene Innenhöfe versorgen die Erschließungsbereiche mit Tageslicht und unterstützen die Orientierung im Haus. Die großen Magazinbereiche sind im Untergeschoss untergebracht. (Staab)

Die erst 1991 gegründete Universität Potsdam ist die größte des Landes Brandenburg und hat sich in den vergangenen Jahren als bedeutender Forschungsstandort etabliert. Während der zentrale Campus in unmittelbarer Nachbarschaft zum Schlosspark von Sanssouci liegt, befinden sich die meisten Institute der Mathematisch-Naturwissenschaftlichen und die Humanistische Fakultät in Potsdam-Golm. Ein dritter Campus an der Stadtgrenze von Berlin ist Griebnitzsee. Den Standort Golm prägen moderne und architektonisch auffällige Gebäude, welche in ein übergeordnetes Entwicklungs- und Freiraumkonzept eingebettet sind. Als vorläufig letzter Baustein des Masterplans wurde im vergangenen Herbst das markante Informations-, Kommunikations- und Medienzentrums, kurz IKMZ, von Staab Architekten eingeweiht. Kulturbauten sowie Gebäude für Forschung und Lehre, Büro und Verwaltung zählen zu den Kernkompetenzen des Büros. Eine zentrale Grünachse, beginnend am Bahnhof Golm, ordnet den gesamten Campus. Zu ihr ist der Haupteingang des neuen quaderförmigen Bibliotheksgebäudes ausgerichtet, schräg gegenüber befindet sich ein zweiter Eingang, der zu den Parkplätzen orientiert ist. Die Fassade des Solitärs schimmert wie ein schwarzer Edelstein in unterschiedlichsten Facetten und markiert deutlich seine zentrale und funktionale Bedeutung innerhalb der gesamten städtebaulichen Struktur.

Das ganze Gebäude ist punktsymmetrisch aufgebaut. Vom Foyer aus führen die beiden gegeneinander versetzten offenen Treppen zu den verschiedenen Leseebenen. Die kräftige Farbgebung in Rot und Orange erleichtert die Orientierung.

Zur offenen Raumfolge gehören auch zwei Freihandbereiche. Im Kontrast zu den Lesesälen sind sie in ihrer Gestaltung sehr materialbetont mit roh belassenem Sichtbeton und Estrich.

Ganz anders hingegen die Wirkung im Inneren. Was man von außen nicht vermuten würde – der Innenraum erstreckt sich offen über mehrere Ebenen, präsent sich farbenfroh und lichtdurchflutet. Ein scheinbar merkwürdiger Kontrast, der sich bei näherer Betrachtung jedoch mehr und mehr auflöst und seine ganz eigene Logik offenbart. Der gesamte innere Aufbau ist punktsymmetrisch, zwei kaskadenartige Treppen in leuchtendem Rot und Orange verbinden das mittige Foyer mit den verschiedenen Lesebereichen in den oberen Ebenen. Deutlich spürbar wird zudem die fiktive Diagonale, welche im Erdgeschoss die beiden Eingänge miteinander verbindet. Doch das eigentlich entwurfsbestimmende Thema heißt Licht. Helle, luftige Lesebereiche mit viel Tageslicht stehen nur schwach beleuchteten und vor direkter Sonneneinstrahlung zu schützenden Stellflächen für die Bücher gegenüber. Geschickt ineinander verschachtelt, lassen die Architekten Räume mit unterschiedlichster Atmosphäre entstehen – großzügige Räume mit Aussicht über den Campus wechseln sich mit introvertierten Leseplätzen, nur erhellt durch Oberlichter, ab. Dazwischen immer wieder spärlich beleuchtete Zonen für Bücherregale mit fast kellerartigem Charakter. Eine spannende Raumfolge mit hoher Aufenthaltsqualität, die durch den entsprechenden Einsatz von Materialien und einem deutlichen Unterschied im Ausbaustandard unterstrichen wird. Nach oben abschließendes Highlight ist die begehbare Dachterrasse, die ebenfalls zum Lesen und Arbeiten genutzt werden kann.

Der differenzierte Innenraum bietet unterschiedlichste Ein- und Ausblicke. Die Studenten können aus einem vielfältigen Angebot an Leseflächen auswählen, wo sie sich für ihre Arbeit am wohlsten fühlen.

Dieses differenzierte Interieur galt es in der Fassade abzubilden, ohne den gewollten monolithischen Charakter des Baukörpers zu stören. So entstand die Idee einer scheinbar geschlossenen Hülle mit mosaikartig angeordneten Elementen aus bedrucktem Glas und Naturstein, bei der die einzelnen Fensteröffnungen nach außen nicht sichtbar gemacht werden. Die z.T. auf die Gläser aufgedruckten Steinstrukturen fungieren wie ein zusätzlicher Blendschutz, bieten aber dennoch genügend Transparenz. Zudem ähneln die Glasflächen durch die Bedruckung in ihrer Optik den Natursteinelementen, sodass keine zu großen Kontraste, sondern das gewünschte Zusammenspiel der einzelnen Facetten betont wurde. Deutlich in Erscheinung treten hingegen die großen Öffnungen, durch die Tageslicht auf die Leseplätze fällt sowie die Fenster im Verwaltungstrakt, die zusätzlich mit vertikalen drehbaren Sonnenschutzlamellen, ebenfalls aus Glas, ausgestattet wurden. Auch die beiden Freihandbereiche mit ihrer rhythmischen Fenstergliederung sind an der Fassade ablesbar.

Das facettenreiche Spiel an der Fassade entsteht durch Bekleidungs-elemente mit vier verschiedenen Ober-flächen: polierter und satiniertes Glas sowie bedrucktes transparentes und bedrucktes satiniertes Glas. Eine spezielle Unterkonstruktion erlaubte die flächenbündige Montage.

Konstruktiv konnte die ebenmäßige Bekleidung geschickt mit einem vorgehängten hinterlüfteten Fassadensystem gelöst werden. Sowohl die gläsernen Elemente auf einer Aluminium-Rahmenkonstruktion als auch die mit einer Leichtbetonplatte verklebten Natursteintafeln aus schwarzem Granit ließen sich auf einem einheitlichen Befestigungssystem montieren. Damit auch die Fugen optisch zurücktreten, wurden sowohl die Kanten der Platten als auch die dahinter liegende Dämmung schwarz kaschiert. Katja Reich in Detail 09.02.12 (<http://www.detail.de>)

## **Staatliches Bauamt I, Köln – Germany**

### **Bibliothek für das Ingenieurwissenschaftliche Zentrum, FH Köln – Germany 2001**

Neubau der Bibliothek für das Ingenieurwissenschaftliche Zentrum der Fachhochschule in Köln-Deutz, Kubatur: 13.500 m<sup>3</sup>

Am 9. Februar 2000 wurde in Deutz der Grundstein für einen Bibliotheksneubau der Fachhochschule Köln gelegt. Mit einer Nutzfläche von 2.100 Quadratmetern wird das nach den Plänen des Staatlichen Bauamtes Köln I entstehende dreistöckige Gebäude die größte FH-Bibliothek in Deutschland beherbergen. Der quadratische Grundriss des Neubaus bildet eine abgeschlossene Form und ermöglicht kurze Wege für die innere Organisation der Bibliothek. Neben 800 Leseplätzen werden den Studenten 60 PC-Arbeitsplätze und ein Multimediaaal zur Verfügung stehen. Eine gläserne Brücke verbindet das neue Haus mit dem Hauptgebäude der Hochschule. Die unterschiedlichen Funktionsbereiche sind an der Ausbildung der Fensterflächen auch von außen ablesbar: Horizontale Fensterbänder ermöglichen eine gleichmäßige Belichtung des Lesesaals und der Arbeitsflächen, Bereiche mit Sondernutzungen sollen mit farbig gestalteten Fensterflügeln zusätzliche Akzente in der Fassade setzen. (<http://www.baunetz.de>)

### **Hochschulbibliothek der Fachhochschule Regensburg – Germany 2006**

Fläche: 3.645 qm, davon 2.388 qm HNF, Baukosten: € 9,100.000, Gesamtkosten: € 9,200,000, Einrichtungskosten: € 806.000

Das neue Bibliotheksgebäude besteht aus einem zweigeschossigen, halbrund geschwungenen, verglasten und klimatisierten Baukörper und aus einem separaten, zweigeschossigen Bibliotheksverwaltungstrakt. Unter- und Erdgeschoss werden durch einen Lastenaufzug sowie einen Personenaufzug erschlossen. Eine innere Erschließungsachse verbindet die beiden Gebäudeteile der Bibliothek untereinander. Die beiden Ebenen des Lesesaals sind über großzügige Lufträume verbunden. Sofort nach dem Eintreten bietet sich eine hervorragende Orientierung. Die Mitte wird durch eine kreisförmige Lichtkuppel und über eine elegant geschwungene Stahltreppe akzentuiert. Eine architektonische wie bibliothekarische Besonderheit stellt die kreisförmig um den Luftraum herum konzentrisch angelegte Anordnung der Regale, Lesetische und Beleuchtung dar. Im Untergeschoss führt ein Ausgang auf eine begrünte Leseterrasse, die unmittelbar an den See grenzt. Die tragende Konstruktion der Gebäude besteht in wesentlichen Teilen aus Stahlbeton. Die Tragwerke der beiden Säle sind sichtbar und raumprägend ausgeführt: im Lesesaal der Bibliothek als eine netzartige Konstruktion aus unterspannten Einfeldträgern. Darüber ist eine Lage aus Brettsperholzplatten angeordnet. Ein interessantes Detail stellt die Stahl- und Glaskonstruktion der Lichtkuppel dar. Die Glaselemente enthalten eine bedampfte Folie, die die einfallende Strahlung wie ein Prisma reflektiert und auf der Seite gegenüber dem Sonnenstand ungehindert Durchblick ermöglicht. Die Fassaden sind aus Stahl- und Aluminium-Pfostenriegelkonstruktion ausgeführt. Es wurden handelsübliche, wirtschaftliche Materialien verwendet. Weitestgehend wurden die Materialfarben belassen, die Stahlbauteile und die Möblierung sind in Grau- und Aluminiumtönen gehalten. Einen markanten Farbakzent stellt die Auslegware dar. Im Verwaltungstrakt und im Magazin findet sich ein orangefarbener leicht gemusterter Linoleum-Bodenbelag. Im Lesesaal fällt ein warmes, kräftiges Rot des Teppichbodens auf. ### **Universitätsbibliothek Tübingen Ammerbau – Germany 2002**

Fläche: 8820 qm HNF, Benutzerfläche: 4467 qm, Neubau; Erweiterung, Erweiterung Kammerstruktur, Gesamtkosten: € 19.615.000  
Baukosten: € 18.900.000, Einrichtungskosten: € 715.000

Nach fast dreijähriger Bauzeit ist der Erweiterungsbau der Tübinger Universitätsbibliothek im Oktober 2002 seiner Bestimmung übergeben worden. Der rote Klinkerbau jenseits der Ammer ist zu einem ästhetisch ansprechenden Gebäude geworden. Der Zugang erfolgt von der zentralen Achse der Wilhelmstrasse aus. Der Nutzer betritt das Hauptgebäude und findet im 1. Stock den Eingang zum ehemaligen Allgemeinen Lesesaal. Dieser ist "Vorraum" zum Ammerbau. Die problemlose Verbindung zwischen Vorraum und Ammerbau stellt eine freitragende Brücke über die Ammer her. (<http://www.bibliotheksportal.de>)

Am 19. September 2002 wird in Tübingen nach fast dreijähriger Bauzeit der Erweiterungsbau der Universitätsbibliothek eröffnet. Das neue Haus, das aufgrund seiner Lage am Fluss Ammer auch „Ammerbau“ genannt wird, beherbergt auf vier Geschossen eine Freihandbibliothek mit 300.000 Bänden. Geplant wurde das 20-Millionen-Euro-Projekt vom Staatlichen Vermögen- und Hochbauamt Tübingen. Der kammförmige Neubau ist das fünfte und vorläufig auch letzte Gebäude der insgesamt 2,9 Millionen Bände zählenden Uni-Bibliothek. Die Geschichte der Neubauten in diesem Jahrhundert begann mit dem schräg gegenüber liegenden Bonatz-Bau (1912), dann folgte das Hauptgebäude mit Magazin (1963), die Zweigstelle an der Morgenstelle (1974) und schließlich der Ausbau der alten Waschküche (1990). Der Ammerbau nun wird über das Hauptgebäude erschlossen. Vom ersten Stock aus gelangen die Nutzer in den bestehenden Allgemeinen Lesesaal, der als „Vorraum“ für den Neubau fungiert. Über eine frei tragende Brücke kommen die Studierenden in den Erweiterungsbau, der neben der Bibliothek auch 36 Arbeitsräume sowie Schulungsräume für Multimedia-Anwendungen fasst. Eine zweite Brücke führt vom Ammerbau in den Zeitungssaal in der benachbarten Waschküche. Die Fassade aus roten Naturziegeln wird durch Loggien und horizontale Fensterbänder mit Aluminiumrahmen gegliedert. (<http://www.baunetz.de>)

### **Literatur:**

**BuB Forum Bibliothek und Information, 2010, 1, 64-70**

Im MedienHaus werden die städtischen Medienaktivitäten konzentriert und mit einem anspruchsvollen Programm kino einschließlich Cafe private Dienstleistungen aus dem Medienbereich integriert. Das Projekt wird in kooperativer Partnerschaft von

Stadt und privaten Beteiligten entwickelt und realisiert. Im MedienHaus werden sein: die Stadtbibliothek, das Medienzentrum, die Touristinfo der MST, das Kino Rio und Rick's Café. (<http://www.kulturserver-nrw.de>)

Auf vier Etagen erstreckt sich dann die Bücherei, im Erdgeschoss teilt sie sich die Grundfläche mit einem Café, einem Programm kino und der MST. Entschieden ist, welche Themen auf welcher Etage ihren Platz finden. Zudem erhält jede Etage ihre eigene Farbe. Im Erdgeschoss werden Unterhaltung, Freizeit und Reisen untergebracht sein (violett), im ersten Geschoss der Bereich Information und Wissen (rot), im zweiten Eltern und Kinder (grün) und im dritten Pädagogik und Schule (orange). Der Bücherbus wird integriert und bekommt im Medienhaus seine Garage. Über die Etagen verteilt existieren 40 PC-Arbeitsplätze mit Internetanschluss. Auch ein Tonstudio zieht in die Räume ein. Neben dem zentralen Treppenhaus gibt es zwei Fluchttreppenhäuser sowie ein kleineres. 160 000 Medien werden am Viktoriaplatz untergebracht sein, weitere 61 000 befinden sich in den Außenstellen. Die Bücherei wird durch eine luftgestützte Betonkernaktivierung auf 20 bis 21 Grad klimatisiert. In den oberen Geschossen steht der Bücherei die volle Länge des Gebäudes zur Verfügung: genau 65,52 Meter. 44 Mitarbeiter werde in der Bücherei ihren Arbeitsplatz besitzen. Die Touristeninformation der MST teilt sich mit dem Kundencenter von RWE/RWW im Medienhaus rund 200 qm, optisch nur getrennt durch eine Schrankwand. Heike Blaeser-Metzger von der MST: „Wir wollen schon am 29. Juni den Betrieb aufnehmen.“ Die Kosten für das PPP-Modell mit dem privaten Partner, der SKE Facility Management, liegen bei zirka 41,2 Mio €, 14,8 Mio € entfallen auf Planungs-, Bau- und Finanzierungsleistungen, 26,4 Mio € auf Betriebs- und Bauunterhaltungsleistungen für 25 Jahre. (<http://www.derwest.de>)

Der offene, kommunikative und weiträumige Charakter des Gebäudes wird die Nutzer einladen, davon zu profitieren. „Es entsteht keine übliche Bibliothek, sondern ein Dreh- und Angelpunkt für die Kommunikation. Café, Filmvorführraum, Tonaufnahmestudio, Computerterminals und eine Terrasse im Innenhof mit Sitzgelegenheiten ergänzen das Programm rund um die Bibliothek“, erläutert Oberbürgermeisterin Dagmar Mühlenfeld. Die Lagerung der Bücher hat einen besonderen Bedarf an das Raumklima. Die Bibliothek wird mittels einer luftgestützten Betonkernaktivierung klimatisiert. Durch die gleichzeitige Nutzung einer ausgesprochenen energiesparenden Form der Kälteerzeugung werden die erforderlichen Luftigenschaften in den Räumen wirtschaftlich sichergestellt. #### **Kommunikations- und Informationszentrum Universität Ulm – Germany 2001**

Bauherr: Vermögens- und Hochbauamt Ulm, Vergabe: 1988, I. Preis, Nutzungstyp: Bibliothek, Medienzentrum, Büro  
BGF: 5.828 qm, HNF: 3.879 qm, BRI: 25.000 cbm, Konstruktion: Holztafelbauweise, bzw. Mauerwerk + Wärmedämmverbundsystem, verputzt

Es wurde versucht, die Konzeption des Einfachen, fast alltäglichen, die der Uni zugrunde liegt, einzusetzen und dennoch eine "echte Bibliothek" zu erhalten. Die Entscheidung für einen quadratischen Baukörper mit eingeschnittenen Lichthöfen nimmt das Wesentliche dieser Absicht auf, einerseits eine lapidare Bücherschachtel, die jedoch andererseits durch die Art der Belichtung, durch den konzentrierten Innen- Außenbezug, durch die Behandlung des Dreidimensionalen, kurzum durch die Anwendung und Modifizierung des gewählten Architekturprinzips und eines klassischen Bibliothekstypus. Die vertikale Schichtung, beginnend mit der unteren Ebene, die sich über Lichthöfe und Lufträume zu einer großen zweigeschossigen Bibliothekshalle entwickelt, schafft die beabsichtigte räumliche und architektonische Wirkung. Darüber - ebenfalls den Lichthöfen zugeordnet - liegt die Bibliotheksverwaltung. Sie ergibt mit den unteren Geschossen zusammen eine komplexe, geschichtete und zunehmend gerichtete räumliche Verdichtung, die nach oben zunimmt. Unten noch marktplatztartig offene Raumübergänge, horizontal und vertikal, oben zunehmend geometrisch-funktionale Ausrichtung. (Steidle)

#### **Haus der Photographie, Bibliothek, Hamburg – Germany 2004 – 2005**

Bauherr: Deichtorhallen Ausstellungen GmbH

Durch die Körber-Stiftung konnten 1989 die Deichtorhallen von Paul Kleihus zu einem großen Ausstellungszentrum umgebaut werden. 2003 entscheidet der Hamburger Senat und Prof. H. C. Gundlach, dass für Prof. Gundlachs bedeutende Fotosammlung die südliche Deichtorhalle zum „Haus der Photographie“ um- und ausgebaut werden soll. Neben den hohen Anforderungen, die es im Bereich Klima, Sicherheit, Flexibilität, Lichtsteuerung und Archivierung zu erfüllen galt, sollten neue Nutzungen wie Verwaltung, Buchshop, Restaurant, Bibliothek und ein großer Seminarraum dem „Haus der Photographie“ die Möglichkeit geben, an jedem Tag dem Publikum als kultureller Anlaufpunkt zur Verfügung zu stehen. Der architektonische Weg, dies zu erreichen, ist sehr einfach und konsequent durch ein „Haus-im-Haus“-Konzept umgesetzt worden. Ein neues Haus wurde bis zu der Höhe von 6 m ohne Dach eingefügt. Die neue Architektur sollte sich nicht in den Vordergrund stellen, sondern die Schönheit und Kraft der alten Markthalle erhalten bzw. ergänzen. (Störmer)

**BDA-Preis Hamburg 2002**

In dem mit privaten Mitteln errichteten "Schumann Flügel" sind zwei ganze Geschosse für die Bibliothek entstanden. Von einem hellen Vestibül aus zugänglich, zieht die Bibliothek durch die einladende Glasfront an der gesamten Längsseite des Leseraumes selbst die Gäste des Museums in die Bibliothek. Schöne alte Gingko-Bäume im Innenhof verstärken die angenehme Sicht und den offenen Eindruck. Als Herzstück hinter den Kulissen des neuen Leseraumes in der Innenhofebene und im Tiefkeller steht das Kompaktmagazin. Grauer Sichtbeton, aluminiumfarbene Fensterrahmen, viel Glas und ein ahornhell melierter Parkettfußboden verlangten nach adäquatem Design für die gesamte Möblierung. Üblager, Victoria, *Steigender Zustrom an Nutzern*, in: *BuB (Buch und Bibliothek)*, 03,12, pp. 223 – 224

1. Preis EU-weiter, offener Realisierungswettbewerb, entschieden am 11. November 2005, Ausloberin: Bundesimmobiliengesellschaft m.b.H., Wien, vertreten durch BIG Services Salzburg, Größtes Bauobjekt im Rahmen des Gesamtprojekts "Uni-Park Nonntal", Salzburg, 17.000 m<sup>2</sup> Nutzfläche; Baukosten: 30 Mio. Euro

Der Neubau der Kultur- und Gesellschaftswissenschaftliche Fakultät der Universität Salzburg verfolgt städtebauliche und ökologische Ziele: Einerseits ist das neue Haus der Herzstück des neu gestalteten Stadtteils Nonntal, des sogenannten Uniparks. Zugleich setzen Universität und BIG einen Meilenstein in Sachen ökologische Energieversorgung: In Salzburg wird die bis dato größte Geothermie-Anlage Österreichs errichtet. „Der Bau ist der Ersatz für die Ende der 1960er Jahren errichteten Plattenbauten, die eigentlich nur als zehnjähriges Provisorium gedacht waren. Mit dem neuen Haus wird etwas längst Versprochenes realisiert“, freut sich Elisabeth Werner, die Leiterin der zentralen Wirtschaftsdienste der Uni Salzburg. Ausgelegt ist das Gebäude mit 17.000 Quadratmetern Nutzfläche auf 5500 Studierende und 300 Lehrende. Sämtliche Abteilungen sowie zentrale Einrichtungen wie Bibliothek oder Hörsaalbereich sind dicht übereinander gestapelt und auf kürzester Distanz vertikal miteinander verbunden. „Das Objekt ist ein anspruchsvoller Solitär, wie er dem Range einer Universität zukommt. Er ist kompakt und doch durchlässig und stellt ein Bindeglied zwischen Stadt und Landschaft dar“, erläutert Architekt Martin Bockelmann vom Architektenteam Storch, Ehlers & Partner aus Hannover. Das zweigeschossige, quadratische Gebäude steht auf Sockeln. Der zwischen den Sockeln mit der Bibliothek und dem schwebenden Quadrat der Fachbereiche eingeschobene offene Campus erzeugt die gewünschte Offenheit zwischen Innenstadt und Nonntal. Zur Stadt hin geht der Campus in einen großzügigen Vorplatz über. Im Zuge des Neubaus werden auch die öffentlichen Verkehrs- und Freiflächen rund um die Universität neugestaltet. "Im Sinne geistiger Offenheit sind die Fachbereiche mit Hilfe gläserner Wände weitgehend transparent gehalten. Wesentliche Fassadenelemente sind metallisch changierende bewegliche Lamellen, die im Licht spielen und dem Baukörper Festigkeit geben, ohne unangenehme Schwere zu erzeugen", schildert Bockelmann. (<http://www.big.at>)

Die Freiräume der Kultur- und Gesellschaftswissenschaftlichen Fakultät (KGW) der Universität Salzburg sollen das Studieren unterstützen, indem sie eine Atmosphäre schaffen, die die Freiheit der Gedanken ermöglicht. Die Freiräume der KGW zeichnen sich aus durch Ruhe und Offenheit; sie finden sich in verschiedenen Maßstäben auf verschiedenen gestalterischen Ebenen. Der städtische Platz, führt die Stadt im Norden und Westen an den Campus heran. Der im Süden anschließende Freiraum ist das Bindeglied für den anschließenden Landschaftsraum. Der halböffentliche Platz auf dem Dach, bietet besondere Aufenthaltsqualitäten und inszeniert ungewöhnliche Ausblicke. Innenhöfe, stellen den Übergang von Innen nach Außen dar und erzeugen poetische Bilder, klar und reduziert. Wes&Partner Landschaftsarchitekten, Hamburg (<http://www.wesup.de>)

**Kulturzentrum Stadt Boxberg – Germany 2007**

#### **Awards:**

Initiative 2009/2010 "Bauen und Wohnen im Bestand", Preis für das Projekt Kulturzentrum Stadt Boxberg

Der zunehmenden Problematisierung mit Jugendlichen (zunehmendes Gewaltpotential, Straftatsbestände, fehlende bzw. mangelnde Erziehungskraft der Eltern usw.) möchte die Stadt Boxberg mit einem Projekt für Kinder und Jugendliche entgegenwirken. Die Lage des hierfür vorgesehenen ehemaligen Bauernhofes (Anwesen Volk) im Seebuckel 20 ist zentral, umgeben von Schulzentrum, der Umpfertalhalle, des evang. Gemeinde-zentrums, des Kindergartens sowie Freizeiteinrichtungen für Kinder- und Jugendliche. Heute schon besteht eine direkte Anbindung an ÖPNV. Dies ermöglicht auch für die Nutzung des geplanten Projektes eine gute Anbindung für Kinder und Jugendliche aus den umliegenden Teilgemeinden. Die Konzeption sieht vor, die beiden ehemaligen Scheunen in eine behindertengerechte Bibliothek sowie einen Mehrzweckraum mit einer Gesamtnutzfläche von 440 m<sup>2</sup> umzugestalten. Das ehemalige Wohnhaus soll als Jugendhaus fungieren. Hier sollen den Jugendlichen Freizeiteinrichtungen wie Tischtennis, Kicker, Brettspiele Basteln, Werken usw. zur Verfügung gestellt werden. Desweiteren soll das Internetprojekt „Chatten statt Kloppen“ dort seinen Platz finden. Die ehemaligen Stallungen weichen einem Neubau, welcher mit einer Nutzfläche von 220 m<sup>2</sup> der Kinder- und Jugendbetreuung dient. Hier soll auch das Büro für eine/n SozialarbeiterIn untergebracht werden. Herzstück dieses Projektes bildet der Innenhof mit einer Freilichtbühne. Dieser kann als vollwertiger Raum für Kinder- und Jugendliche betrachtet werden. Hier können sämtliche Freizeit-aktivitäten durchgeführt werden, aber auch Ausstellungen und Workshops in größeren Gruppen durchgeführt werden. (Überbau)

## **Klaus Uhlmann Architekt, München – Germany**

**Universitätsbibliothek München, Bibliothek des Historicums, München – Germany 1999**

Am 17. November 1999 wurde in München nach vierjähriger Bauzeit das sogenannte „Historicum“ in der Schellingstraße eingeweiht. In dem vom Universitätsbauamt der Stadt geplanten Hochschulbau werden alle historischen Disziplinen unter einem Dach vereint sein. Das Gebäude schließt an einen denkmalgeschützten Altbau in der Amalienstraße an, der völlig entkernt wurde und nur noch als Fassade stehen blieb. Gemeinsam mit dem Architekten Klaus Uhlmann baute das **Universitätsbauamt** das ehemalige Institutsgebäude der Forstwissenschaftlichen Fakultät nach den Bedürfnissen der Historiker um. Hier wurden vor allem Seminarräume untergebracht. Das Herzstück des Neubaus bildet die sechsstöckige Zentralbibliothek, die auf einer Fläche von 3.000 Quadratmetern 275.000 Bücher und Zeitschriften aufnimmt. Sie öffnet sich über eine vollverglaste Fassadenfläche zum neu

entstandenen Salinenhof und wird ihrerseits von den Institutsräumen der Fakultät eingefasst. Wissenschaftsminister Hans Zehetmair hob in seiner Festrede die hervorragenden Arbeitsbedingungen des neuen Hochschulgebäudes hervor, die optimale Voraussetzungen für den wissenschaftlichen Austausch böten. Die Baukosten für das insgesamt 6.500 Quadratmeter Nutzfläche umfassende Historicum belaufen sich auf rund 54 Millionen Mark. (<http://www.baunetz.de>)

## **Oswald Mathias Ungers \* 1926 - + 2007**

### **Libraries:**

#### **Badische Landesbibliothek, Karlsruhe – Germany 1983 - 1991**

Der Baukörper der Bibliothek besteht aus einer äußeren Schale und einem inneren Kern. Die Schale nimmt den Maßstab der vorhandenen Blockbebauung, des Liegenschaftsamtes und des Altbaus Ritterstraße auf; der Kern, der sich aus der Schale erhebt, korrespondiert mit der Stephanskirche. Diesem architektonischen Konzept entsprechend werden die Materialien eingesetzt: die Schale ist rau, aus Stein und mit Schieferdeckung; der Kern ist im Material feiner, geputzt und mit Kupferdeckung, die den Bezug zur Stephanskirche verdeutlicht. Die Ablesbarkeit zweier selbständiger Baukörper ist auch im Innenraum gegeben: Kern und Schale sind durch eine verglaste Fuge und durch teilweise bis in das Erdgeschoß reichende Lufträume voneinander getrennt. Baukörpergestaltung und Materialeinsatz sind also nicht formal begründet, sondern dienen der Verdeutlichung des architektonischen Konzeptes. Dieses Konzept ist städtebaulich bestimmt, korrespondiert aber auch mit der Nutzung des Gebäudes. Der geometrisch strenge Baublock der Landesbibliothek umschließt einen Innenhof mit vorgefundenem Baumbestand und nimmt den Maßstab der bestehenden Blockbebauung, Motive der gegenüberliegenden Stephanskirche und die Formensprache der klassizistischen Umgebung auf. Der Baukörper besteht aus einer äusseren Schale, der mit Naturstein verkleideten, schiefergedeckten Blockrandbebauung, und einem inneren Kern, in dessen Zentrum die kupfergedeckte Kuppel des Lesesaals liegt. Die Schale nimmt vorwiegend interne Nutzungen wie Verwaltung und Cafeteria auf, im Kern befinden sich die Publikumsbereiche, der Lesesaal und die Magaine. Kern und Schale sind im Innenraum durch eine verglaste Fuge und Lufträume sichtbar voneinander getrennt. Die Abmessungen und Lage der Bauteile sowie die Bodenbeänge sind auf einem Quadratmodul aufgebaut. Der Lesesaal ist als mehrgeschossiger Pantheonraum auf quadratischem Grundriss mit Arkaden, Wanddurchbrüchen und Kassettenfüllungen ausgebildet. Auf Ornamentik wurde verzichtet, technische Installationen sind verdeckt geführt. Die Bibliothek nimmt die östliche Hälfte eines Blocks ein. An der Ritterstrasse wird sie ergänzt von einer klassizistischen Hauszeile und dem entstehenden 3. Bauabschnitt. Ungers nennt diesen Teil des Blocks einen »geschlossenen Plan«, bei dem »Raum und Objekt identisch« sind. An der Herrenstrasse bilden Vorkriegsbauten ein dichtes Geflecht, einen »Pocheplan«, bei dem »Raum gleich Objekt« ist. Dazwischen, in der Eingangszone, stehen »Objekte im Raum« (»Komposit-Plan«). Eines dieser Objekte ist das ebenfalls von Ungers gebaute »Torhaus« an der Erbprinzenstrasse. Im Hof stehen Plastiken von Georg Herold, Per Kirkeby, Sol Le Witt und Hubert Kiecol. Der Erweiterungsbau für die Badische Landesbibliothek in Karlsruhe stellte sich für Oswald Mathias Ungers als reizvolle Aufgabe. Karlsruhe gehört zu den wenigen Städten in Europa, die auf einen barocken Idealplan zurückgehen, dessen Struktur bis heute und trotz der Zerstörungen des Krieges ablesbar ist. Die besondere historische städtebauliche Situation bestimmte deshalb auch den Maßstab und die formalen Eigenheiten des Entwurfs. Geschickt nutzt Ungers das durchaus problematische Baugelände, flankiert von historischer Bausubstanz und einer Platzanlage des Klassizismus. Die Wiederherstellung eines Stadtgrundrisses, an den sich die Architekten mehrere Jahrhunderte gehalten haben, war auch das zeitgenössische Anliegen, und so steht die neue Landesbibliothek in ihrem Gesamtentwurf, aber auch in ihren Details in einer konkreten und wohlgedachten Beziehung zur Geschichte der Stadt seit dem 18. Jahrhundert. (<http://deu.archinform.net>)

2008 Deutscher Städtebaupreis, für das Jüdische Zentrum München

2011 Deutscher Architekturpreis, Auszeichnung für das Jüdische Zentrum München

Das Jüdische Museum als drittes Gebäude errichtete die Landeshauptstadt München das Jüdische Museum. Das Museumsgebäude ist als freistehender Kubus konzipiert. Ein umlaufend verglastes, transparentes Foyer ist das Schaufenster des Museums und präsentiert sich auch nach außen als öffentlicher Raum. Neben dem Informations- und Kassenbereich befinden sich hier die

Museumsbuchhandlung sowie eine Café-Bar. Im ersten und zweiten Obergeschoss sind zwei Wechselausstellungsebenen sowie Studien- und Lernbereiche untergebracht. Das Untergeschoss nimmt die Dauerausstellung des Jüdischen Museums auf. (<http://www.juedisches-museum-muenchen.de>)

Am 22. März 2007 wurde in München der Neubau des Jüdischen Museums eröffnet. Das Gebäude steht in unmittelbarer Nähe zur neuen Synagoge am Jakobsplatz und wurde wie diese vom Büro Wandel Hoefler Lorch entworfen und realisiert. Die Saarbrücker Architekten hatten 2001 den entsprechenden Wettbewerb gewonnen (BauNetz-Meldung vom 9. Juli 2001). Das Museum ist – wie die bereits eingeweihte Synagoge (BauNetz-Meldung zur Einweihung) und das benachbarte Gemeindezentrum – ein Teil der als „Dorf“ konzipierten Planung des neuen jüdischen Zentrums am Jakobsplatz. Die Maßstäblichkeit des städtebaulichen Entwurfs orientiert sich an der vorhandenen kleinteiligen Bebauung und präsentiert sich dennoch als zusammengehöriges Ensemble. Gemeinsam strukturieren die drei Häuser den seit dem Zweiten Weltkrieg brach liegenden Jakobsplatz in der Münchner Innenstadt neu. Das dreigeschossige Museumsgebäude ist als frei stehender Kubus mit einer Blickachse zum gegenüber liegenden Münchner Stadtmuseum konzipiert. Das umlaufend verglaste Foyer im Erdgeschoss ist das Schaufenster des Museums und präsentiert sich auch nach außen als öffentlicher Raum. Mit der Besucherinformation, der Museumsbuchhandlung und einer Café-Bar ist es zentrale Anlaufstelle für die Besucher. Im ersten und zweiten Obergeschoss sind zwei Wechselausstellungsebenen sowie Studien- und Lernbereiche untergebracht. Das Untergeschoss nimmt die Dauerausstellung des Jüdischen Museums auf. Die drei Galerieebenen bieten insgesamt 900 Quadratmeter Ausstellungsfläche. Der klar geschnittene, kubische Baukörper des Museums zeichnet sich durch eine zurückhaltende Gestaltung in Struktur und Material aus. Die oberen beiden Geschosse sind durch Natursteintafeln verkleidet, nur das Erdgeschoss ist umlaufend bündig verglast. Erschlossen werden die beiden Obergeschosse durch eine elegante, einläufige Treppenanlage entlang der Längsseite des Hauses. Dieses haushohe Treppenhaus ist in Sichtbeton ausgeführt. #### **Zentrum für Information und Bildung, Unna – Germany 2003 – 2004**

Bauherr: Kreisstadt Unna, Bauweise: Stahlbetonbau, Nutzflächen: 4.100 m<sup>2</sup>, Bruttogeschossfläche: 19.600 m<sup>2</sup>, Baukosten: € 8.700.000 mio, Neubau und Sanierung

Auf dem Gelände der ehemaligen Lindenbrauerei in Unna entstand der Neubau des Zentrums für Information und Bildung. Im Gebäude untergebracht sind die Stadtbibliothek, die Volkshochschule, das Stadtarchiv und das Kulturamt der Kreisstadt Unna. Die Haupterschließung innerhalb des Gebäudes erfolgt über eine von Süd nach Nord verlaufende Passage, von der aus sämtliche Institutionen auf kurzem Wege erreicht werden können. Eine Besonderheit der Bauaufgabe war die Integration der unter Denkmalschutz stehenden Schwankhalle der ehemaligen Lindenbrauerei. (Weicken)

#### **Stadtbücherei Suhl – Germany 2004**

Vorhaben: Die Stadtbücherei, eine Einrichtung der Stadtverwaltung Suhl, war im östlichen Flügel des Hauses der Philharmonie, Bahnhofstraße 4, also in unmittelbarer Nähe des Standortes für den Neubau, untergebracht. Der Neubau ist Standort der Stadtbücherei Suhl einschließlich der Kinderbibliothek. Durch den Neubau wurde eine fachgerechte Unterbringung der Stadtbücherei Suhl ermöglicht und ein kultureller Anziehungspunkt gebildet.

#### **Lage:**

Das Baugrundstück ist in der Bahnhofstraße 10 und wird dem engeren Stadtzentrum zugerechnet. Es ist günstig fußläufig erreichbar direkt im Anschluß am auptfußgängerbereich Steinweg und dem Bereich Platz der deutschen Einheit/Herrenteich.

#### **Städtebau:**

Das Gebäude orientiert sich an der Flucht der Bahnhofstraße. Durch die gewählte Dimension integriert sich das Gebäude in das ausgewiesene Denkmalensemble. Der Zugang wurde, abgewandt vom Fußgängerstrom, seitlich vom Gebäude mit einem Eingangsbereich angeordnet. Funktionen: Freihandbereich Untergeschoss : Studienbereich / Regionalkunde Untergeschoss, Veranstaltungsbereich Untergeschoss, Empfang : Verbuchungstheke Erdgeschoss : AV-Medien 1.Obergeschoss, Kinderbibliothek 2.Obergeschoss, Kindersachliteratur / Verwaltung 3.Obergeschoss

#### **Gebäude**

Der Neubau besteht aus einem großflächigen Untergeschoss (Unterhaus) und einem viergeschossigen würfelförmigen Baukörper (Oberhaus), der an der Bahnhofstraße situiert ist. Das Oberhaus besteht aus Deckenscheiben, die auf Stützen liegen und über einen Erschließungskern verbunden und stabilisiert werden. Der Erschließungskern erstreckt sich vom 3.OG bis in das UG. In diesem Kern ist ein Aufzug vorgesehen, der eine innere Erschließung auch für Behinderte ermöglicht. Das Oberhaus ist allseitig mit einer Glasfassade umschlossen. Das Unterhaus ist auf der kompletten Nordseite und im anschließenden Eckbereich verglast. Das Dach des Unterhauses besteht aus einem Flachdach. Das Dach besitzt 4 rechteckige LicVorhaben. Das Unterhaus ist auf der kompletten Nordseite und im anschließenden Eckbereich verglast. Das Dach des Unterhauses besteht aus einem Flachdach. Das Dach besitzt 4 rechteckige Lichtschächte in denen jeweils eine RWA - Anlage vorgesehen ist. Die Dachfläche wird durch unterschiedliche Oberflächen gestaltet.

#### **Konstruktion**

Das Gebäude wurde in Stahlbeton - Skelettbauweise erstellt. Dadurch wird eine flexible Raumgestaltung möglich. Die Gründung des Untergeschosses ist als Pfahlgründung ausgeführt. Das Oberhaus hat ein bekiestes Flachdach. Das Dach des Unterhauses besitzt im Eingangsbereich und um das Oberhaus herum einen Gehbelag. Die nördliche Fläche ist mit einer extensiven Begrünung versehen. Fassade

Das Oberhaus besitzt eine Glasfassade, welche ein mehrfarbiges Erscheinungsbild hat. Dieses entsteht durch Glasscheiben, die mit mehrfarbigen Texten bedruckt wurden. Die nichtbedruckten Flächen sind transparent. Die Glasscheiben sind geschosshoch und sind in einer Pfosten - Riegel - Konstruktion vierseitig gehalten. Die Fassade besteht aus einer Zweischeiben Sonnenschutz – Isolierverglasung. Das Unterhaus hat an der Nordseite die gleiche Fassadenausführung.

#### **Energie**

Die Stahlbetondecken werden durch eine thermische Bauteilaktivierung zum Heizen und Kühlen genutzt. Gleichzeitig werden die nicht verkleideten massiven Bauteile als thermische Speichermasse genutzt. Das Oberhaus verfügt durch seine großflächigen

Verglasungen über ausreichende natürliche Belichtung. Im Unterhaus wird über die Nordfassade, einen Deckenausschnitt und die Lichtschächte ein Großteil natürlich belichtet.

#### Lüftung

Um den notwendigen Luftwechsel zu realisieren ist eine Zwangslüftung vorhanden. Die Zwangslüftung unterstützt die Kühlung und entfeuchtet die Luft in den Sommermonaten. Im Winter ermöglicht die Anlage eine Erwärmung und Befeuchtung der Luft bzw. des Gebäudes. Die Lüftungsanlage ermöglicht eine Energieeinsparung durch Wärmerückgewinnung. Lichtschächte in denen jeweils eine RWA - Anlage vorgesehen ist. Die Dachfläche wird durch unterschiedliche Oberflächen gestaltet.

### **Bundesarbeitsgericht Erfurt, Bibliothek – Germany 1999**

1995 1. Preis

Fast genau zehn Jahre nach dem Mauerfall konnte am 19. November 1999 der Umzug des Bundesarbeitsgerichts von Kassel nach Erfurt abgeschlossen werden. Bereits 1995 hatte die Berliner Architektin Gesine Weinmiller mit ihrem Entwurf eines strengen monolithischen Baukörpers den Wettbewerb für sich entschieden. Durch seine kompakte Form ermöglicht der viergeschossige Neubau einen großen Freiraum zu der angrenzenden barocken Festungsanlage. Der von dem verstorbenen Zürcher Landschaftsarchitekten Dieter Kienast geplante Park bildet durch die Freiheit seiner Gestaltung einen spannungsreichen Kontrast zur Strenge des Hauses. Die Architektin selbst sieht die Haltung ihres Entwurfs in einem „Spannungsfeld zwischen Offenheit und Intimität, zwischen Repräsentanz und Bürgernähe“. Der Besucher nähert sich dem Gebäude über einen steinernen Innenhof und gelangt durch ein niedriges Entree mit Pfortnerloge in ein liches zweigeschossiges Foyer. Von diesem Raum aus werden alle öffentlichen Bereiche des Hauses erschlossen. Im Gegensatz zu Justizgebäuden vergangener Zeiten führt der Weg zu den Verhandlungssälen nicht nach oben, sondern über eine bewußt sehr flach gehaltene Treppe nach unten. Das Gebäude ist streng achsialsymmetrisch geplant und verfügt über eine klare Nutzerstruktur, die die Orientierung erleichtert. Aus Sicherheitsgründen mußten öffentliche und interne Wege strikt getrennt werden. Die Bibliothek (**größte Arbeitsrechtliche Bibliothek in der Bundesrepublik**) im ersten Geschoß umschließt einen begrünten, begehbaren Innenhof. Durch die geringe Gebäudetiefe wird sie in allen Bereichen natürlich belichtet. Das Gebäude ist als eine Stahlbeton-Pfosten-Riegel-Konstruktion ausgeführt, deren Achsfelder im Wechsel jeweils zu einem Drittel mit Schiefer-Paneelen ausgefacht sind. Durch die versetzte Anordnung der Paneele in den verschiedenen Stockwerken wird der kompakte Baukörper rhythmisiert. Dies wird zusätzlich unterstützt durch Glasschiebeläden, die als Sonnen- und Blendschutz individuell vor die Fenster gefahren werden können. Durch diese unterschiedlich platzierten Glasscheiben entsteht ein subtiles Farbspiel, das die Strenge der Fassade aufhebt. Das Gebäude bietet auf 7.800 Quadratmetern Nutzfläche Raum für 200 Gerichtsmitarbeiter. Am 22. November können sie in den neuen Räumen die Arbeit aufnehmen. (<http://www.baunetz.de>)

### **Bürgerhaus Unterföhring – Germany 2010**

Projektdaten Wettbewerb 7/2006: 1. Preis, LP 1-5, 6 und 7 in Koop mit Haindl & Kollegen, München, Künstlerische Oberleitung, Planungsbeginn 2006, Ausführung 03/2008 - 08/2010, NGF / BRI: ca. 6.275 m<sup>2</sup> / ca. 34.000 m<sup>3</sup>, Kosten (brutto): ca. 30 Mio € ARGE mit Klaus Wiederkehr, Landschaftsarchitekt BDLA, Nürtingen, Subplaner: Bez + Kock, Architekten BDA, Stuttgart

Ein über drei Geschosse offenes vielfältig beispielbares Foyer bildet das Herz des neuen Bürgerhauses in Unterföhring, das die unterschiedlichen Funktionen miteinander verknüpft und spannende Blickbeziehungen ermöglicht.

Die Fassade aus eloxierten Aluminiumplatten unterstreicht den präzise geschnittenen Baukörper. Je nach Sonnenstand und Blickwinkel schimmert das Eloxal kräftig rot bis schwarz. Der Sonnenschutz besteht aus horizontalen Klappläden aus perforierten Aluminiumplatten, welche stufenlos nach oben geschoben werden können und so je nach Tageszeit und Nutzung das Gesicht des Hauses verändern.

Energetisches und ökologisches Konzept:

- Kühlung durch Grundwasserbrunnen
- Wärme durch Anschluss an Tiefengeothermieprojekt der Gemeinde Unterföhring
- Photovoltaikanlage (63,2 kWp), ca. 72.500 kWh pro Jahr

Raumprogramm

Saal mit Bühne (über 600 Personen) • Bibliothek (800 m<sup>2</sup>) • Restaurant mit Biergarten • Soziale Beratung • Musikschule • Vereinsräume • Bundeskegelbahn • Mietpartyraum • Hausmeisterwohnung auf dem Dach • Tiefgarage (ca. 120 Stellplätze) • Marktplatz mit Marktdach (Werkgemeinschaft)

### **Peace Palace, Bibliothek, Den Haag – The Netherlands 2003 – 2006**

Bauherr: Carnegie-Foundation, Den Haag, BGF: 7.600 m<sup>2</sup>, Bausumme: 17 Mio. Euro

Der Internationale Gerichtshof, die Haager Akademie für Internationales Recht und das Permanente Schiedsgericht residieren im „Peace Palace“, einem Bau im Stil der Neorenaissance. Der damit verbundene Neubau bietet Raum für die Belange der großen Fachbibliothek, für Konferenzen und Workshops und die Verhandlungen der Gerichtshöfe.

Architektonische Leitmotive waren das Spiel mit geometrischen Grundformen und der Umgang mit der Symmetrie und Gestalt der Gesamtanlage. Drei Elemente – der trapezförmige Lesesaal, der elliptische Konferenzsaal und ein linearer Bürotrakt – sind, architektonisch und funktionell durchdacht, miteinander verbunden. Ein Zentralfoyer verbindet Akademie und Bibliothek und fungiert als einladender öffentlicher Raum. Die Verkleidung des Lesesaals, der Alt und Neubau wie eine Brücke verbindet, ist mit gestrahlten Edelstahlschindeln verkleidet und setzt einen starken gestalterischen

Akzent. (Wilford)

### **Erweiterungsgebäude des Deutschen Technikmuseum, Bibliothek, Berlin – Germany 2001**

Auftraggeber: ARGE Deutsches Technik Museum, Bauherr • Projektentwickler: Berlin, vertreten durch Senatsverwaltung für Wissenschaft, Forschung und Kultur, Architekt: ARGE Deutsches Technik Museum, Helge Pitz und Ulrich Wolff, Projektdaten: ca. 6.000 m<sup>2</sup>, Pfosten-Riegel-Fassade, ca. 6.000 m<sup>2</sup> Glasdächer, Gebäudefunktion Museum, Technische Daten: Niedrigenergiegebäude, steuerbare Lichtlenklamellen zur Tageslichtlenkung und als Sonnenschutz, Bewegliche Sonnenschutz-Lamellen

Dieser stadtbildprägende Bau mit einer Gesamtnutzfläche von ca. 20.000 qm ist ein Werk der Berliner Architekten Ulrich Wolff und Helge Pitz. Er wurde 1996 begonnen, 2001 erfolgte die Schlüsselübergabe.

Der "Rosinenbomber" vom Typ Douglas C-47 B "Skytrain", der über seiner Terrasse schwebt, ist mittlerweile zum Wahrzeichen des Deutschen Technikmuseums geworden. Auf 12.000 qm in vier Etagen präsentieren hier die Bereiche Schifffahrt (seit Dezember 2003) und Luftfahrt (seit April 2005) ihre Schätze. Auf einer Sonderfläche von ca. 1000 qm werden aktuelle Sonderausstellungen gezeigt. Außerdem stehen das Historische Archiv mit ca. 7,5 Regalkilometern Akten und die Bibliothek mit über 500.000 Bänden den Interessierten zur Verfügung. Schräg gegenüber dem Potsdamer Platz bildet der Neubau mit seiner eigenwilligen funktionalen Architektur in Verbindung mit dem historischen Eingangsgebäude in der Trebbiner Straße und dem ehemaligen Anhalter Güterbahnhof den herausragenden "Höhepunkt" am Gleisdreieck. (<http://www.sdtb.de>)

Am 21. März 2001 wird der Erweiterungsbau des „Deutschen Technikmuseums Berlin“ (früher: „Museum für Verkehr und Technik“) im Rahmen einer feierlichen Schlüsselübergabe an den Nutzer übergeben. Die Eröffnung des Gebäudes für das Publikum erfolgt allerdings frühestens ab Herbst 2002. Der Neubau am Schöneberger Ufer in Berlin-Kreuzberg, der an den vorhandenen Altbau des Museums angrenzt, ist für die Abteilungen Schifffahrt und Luftfahrt errichtet worden. Der Entwurf stammt von einer Arbeitsgemeinschaft der Architekten Wolf und Pitz, Berlin, die inzwischen auf eine dreizehneinhalbjährige Planungs- und Bauzeit zurückblicken. Der Neubau liegt in herausgehobener Lage auf einem spitzen Eckgrundstück, das zum Landwehrkanal hin weist. Durch die ehemaligen Bahnanlagen des Potsdamer Bahnhofs und die hier in Hochlage geführte U-Bahn ist der Ort durch Verkehrsbauwerke gekennzeichnet. Die Architekten haben versucht, mit dem Neubau einen „städtebaulich markanten Punkt“ zu schaffen. Dies ist vor allem dadurch gelungen, dass vor der Fassade ein historisches Flugzeug, eine C 47 „Skytrain“, hängt, das an die Berliner Luftbrücke 1947/48 erinnern soll (Detailfoto als Zoom-Bild hinterlegt). Nicht nur das Flugzeug ist abgehängt, sondern auch wesentliche Teile der statischen Konstruktion sind als Hängeträgerwerk ausgeführt, das an einem markanten Gitterträger abgehängt ist. Damit konnten mehrere Bereiche geschaffen werden, die stützenfrei überspannt werden. Hier haben im Inneren Großexponate ihren Platz, die schon während der Bauzeit in das Gebäude gehievt worden waren, darunter ein Lastkahn und eine Ju 52 „Tante Ju“ der Vorkriegs-Lufthansa. Das Gebäude mit einer Nutzfläche von rund 20.000 Quadratmetern ist zu exakt den Baukosten entstanden, die die Architekten 1988 ermittelt hatten: 140 Millionen Mark. Allerdings sind während der Bauphase rigorose Sparmaßnahmen durchgeführt worden, die die Nutzbarkeit stark beeinträchtigen: So hat man in der zentralen Ausstellungszone auf die ursprünglich geplanten Rolltreppen verzichtet, und ein im obersten Geschoss liegendes Restaurant mit Terrasse und spektakulärem Blick ist als Rohbaustelle liegen geblieben. Die am schwersten wiegende Sparmaßnahme betrifft allerdings die Eingangssituation: An Stelle einer repräsentativen Brücke, die in das Foyer im 2. Obergeschoss geführt hätte, betritt man den Neubau nun mittels eines kleinen Verbindungsgangs zum Altbau gleichsam „von hinten“. (<http://www.baunetz.de>)

**Umbau und Erweiterung einer ehemaligen Scheune zur Stadtbibliothek Weikersheim – Germany 2008 - 2009**

Bauherr: Stadt Weikersheim, Baukosten: 810.000 Euro, Fläche: 390 m<sup>2</sup>

**Awards:**

**Beispielhaftes Bauen im Main-Tauber-Kreis 2004-2010**

Die Stadt Weikersheim hat die Stadtbücherei in ein altes Scheunengebäude verlagert. Das Gebäude grenzt an eine Gewerbebrache, die durch neue Wohnbebauung aufgewertet wird. Um alle Funktionen der Bibliothek am Standort unterzubringen, wurde ein Erweiterungsbau vorgesehen. Der Neubau wurde so mit dem Bestand verbunden, dass die Eingriffe in die Struktur der alten Sparrenkonstruktion minimiert werden können. Ein Verbindungselement bringt zusätzlich Licht ins Gebäude. Die Bibliothek als ein wesentlicher Baustein im kulturellen Angebot der Stadt erhält angemessene Räume, in denen auch die Erweiterung des Medienangebots möglich ist und Raum für Veranstaltungen zur Verfügung gestellt werden kann. Der Neubau besteht aus einer Holzständerkonstruktion mit klarer Orientierung zum Vorplatz und enthält alle technische Infrastruktur der Bücherei. Durch die einfache Konstruktion wurde eine wirtschaftliche Lösung erreicht. Die alte Sparrenkonstruktion in der Scheune und die Bruchsteinfassade blieben sichtbar erhalten und wurden durch ein Stahlträgerwerk ergänzt. Eine neue Wendeltreppe leitet die Besucher in die oberen Geschosse. (Wypio)

#### **Stadtbibliothek Stuttgart, Stuttgart – Germany 2008 – 2011**

Die Baugenehmigung wurde schließlich 2007 erteilt, der Baubeschluss durch den Stadtrat der Stadt Stuttgart erging am 18. September 2008, der erste Spatenstich erfolgte am 8. November. Am 5. Juni 2009 fand die Grundsteinlegung für die Bibliothek 21 statt. In den Grundstein wurde das erste Buch der neuen Bibliothek eingelegt. Es handelte sich dabei um ein von rund 600 Personen gestaltetes und von Studierenden der Stuttgarter Hochschule der Medien gebundenes Werk. Ebenfalls im Juni 2009 wurde bei einer Überprüfung festgestellt, dass das geplante Wasserbecken wegen mangelnder Bodenstabilität und die Natursteinverkleidung des "Herzraumes" zu erhöhten Kosten führen. Deswegen wird das Wasserbecken durch eine Grasfläche und die Natursteinverkleidung durch einfachen Putz ersetzt. Am 12. Mai 2010 wurde dann die Fertigstellung des Rohbaus mit dem Richtfest gefeiert und erklärt, dass man mit keinen weiteren Kostensteigerungen rechne und den geplanten Eröffnungstermin trotz zeitlichen Rückstandes von ca. 2 Wochen auf Grund des harten Winters am 24. Oktober 2011 plane. (<http://www.wikipedia.org>)

Kann man der Aufforderung, eine öffentliche Bibliothek an der Schwelle zum nächsten Jahrtausend zu bauen, die zudem noch eine nie dagewesene Nutzungskonzeption mit höchsten Ansprüchen hat, überhaupt gerecht werden? Gibt es einen Gebäudetyp, auf den man zurückgreifen könnte oder müßte man Architektur ganz neu definieren? Die Verfasser dieser Arbeit haben sich entschieden und legen einen dezidierten Entwurf vor, der auf architektonischen Grundtypen basiert:

Die Bibliothek, ein Atriumraum mit Galerien aus Bücherwänden

Der kontemplative Raum, in introvertierter Zentralraum mit Oberlichtauge

Das Forum, ein stufenweise eingesenkter Saal

Der explizierte Rückgriff auf Raumtypen mit starker Aura wird in die Zukunft gewendet. Dies gelingt, da die Räume sich ganz abstrakt „heruntergeschliffen“ (wie die Verfasser sagen), zur Verfügung stellen und so neu bespielt und interpretiert werden können. Die Archaik der Räume in ihrer reduzierten Abstraktion birgt das „futuristische“ Potential. Dies ist die Chance und die Herausforderung für die Bibliothekare, die das Haus benutzen werden. Wenn die Verfasser den meditativen Herzraum mit einem dichten Kranz von Bildschirmplätzen umgeben, dann wird die introvertierte Situation noch einmal verdoppelt, ein Beispiel für die dichten Atmosphären, die den Entwurf auszeichnen. Es ist also kein einfacher glatter Entwurf, sondern ein Haus mit Charakter, an dem man sich reiben kann. Eine mögliche Landmarke in der Topographie öffentlicher Räume der Stadt Stuttgart. Nach außen in den Stadtraum hinein steht das Haus selbstbewußt da: ein öffentlicher Solitär im neuen Stadtteil, der sich als Kubus auf sich selbst bezieht und mit 2 zusätzlichen Geschossen über die durchschnittliche Dachebene ragt. Als Solitär befreit er sich teilweise von städtebaulichen Vorgaben, bietet sich aber mit Eingängen an allen vier Seiten zugleich rundum dar. Die schlichte und einfache Kubatur unterstreicht die öffentliche Bedeutung als Haus des Buches, der Medien und als Zentrum für die Öffentlichkeitsarbeit. Es präsentiert sich auf einer umgebenden Wasserfläche. Diese Wasserfläche nimmt die Baulinien auf und schafft Raum zwischen der Bibliothek und dem IMAX/Science-Center. Dieses wird über eine lange Galerie an den Wasserbecken prominiert erschlossen, nimmt sich sonst aber in seiner städtebaulichen Bedeutung gegenüber der Bibliothek zurück. Die genaue städtebauliche Position des Solitärs wird im Preisgericht kontrovers diskutiert, der Solitär als solches aber in seiner Bedeutung für die Heraushebung aus dem städtebaulichen Gewebe ausdrücklich gewürdigt. Die Füllung der angrenzenden Straßen mit Bäumen erscheint nicht zwangsläufig, insbesondere am Mailänder Platz sollten die Fernblicke erhalten bleiben. In die Wasserfläche schneidet sich ein Gartenhof ein, der als Spielfläche für den Kindergarten dient. Hier liegt der Kindergarten zwar richtig neben dem Kindermedienzentrum in einem hohen Sockelgeschoss, seine Grundrißorganisation muß jedoch überarbeitet werden. Von drei Seiten betritt der Benutzer die Bibliothek über die Wasserfläche, der vierte Eingang liegt in der vorgegebenen Bauflucht an der Moskauer Straße. Im Haus eröffnen sich alternative Wege, ein Rampenweg zwischen den Fassaden, der Einblicke in das Geschehen auf den Etagen bietet und der sich langsam um das Haus windet – und ein Treppenweg, der von allen vier Eingängen aus jeweils in einer Vierteldrehung die nächste Etage erreicht. An dieser Stelle legen auch die vier Aufzüge für den schnellen und direkten Aufstieg in die oberen Etagen. Die Vielfalt und Klarheit der Wege machen das Haus ausgesprochen benutzerfreundlich. Die Treppenwege sind nur weitere Elemente im Prinzip der Raumschalen. Im Innersten der Herzraum, drumherum die Bildschirmstationen, dann die Treppen, die doppelte Wand mit Nebenräumen, anschließend die offen nutzbaren Etagen mit Seitenlicht, und zuletzt der Rampenweg der Außenfassade: eine äußerst komplexe Raumschichtung, die doch wieder sehr einfach und übersichtlich ist. Die großen zentralen Lufträume sind das Charakteristikum des Entwurfs, tragen aber auch zu einem großen Bauvolumen bei, das sich in hohen Kosten niederschlagen könnte. Dies wird unter Umständen durch die kompakte Figur und die ökonomische Fassade kompensiert. Die übersichtliche Organisation des Hauses ermöglicht zudem einen wirtschaftlich günstig und flexiblen Ablauf des Bibliotheksbetriebes. Tageslicht an allen Arbeitsplätzen und Aufenthaltsbereichen ist nicht nur ein weiteres wirtschaftliches Kriterium, diese ausgeklügelte Lichtführung trägt zur Atmosphäre des Hauses bei. Die Mischung von Rückzugsbereichen und Zonen öffentlicher Begegnung durchzieht als räumliches Thema das ganze Haus. Die Auslobung hat mit ihrem hoch ambitionierten Ansatz Themen aufgeworfen, auf die dieser Entwurf mit ausdrückstarken Räumen eine Antwort findet.

### **Libraries:**

#### **Stadtbibliothek Bergheim (NRW) – Germany 2004**

Der an das Kulturzentrum angrenzende Neubau der Stadtbibliothek hat eine markante parabelförmige Gestalt und ähnelt einem Schiffsbug. Eine Kupferfassade umgibt den Gebäudeteil für die Bibliothek. Das Erdgeschoss ist durchgängig raumhoch verglast, so dass Innen- und Außenbereich eine Einheit bilden. Die beiden Obergeschosse sind im Gegensatz zum Erdgeschoss als reine Lochfassade ausgebildet. Die Fenster sind mit stehenden, liegenden und quadratischen Formaten völlig frei in der Fassade platziert. Von der Haupteingangsseite am Hubert-Rheinfeld-Platz wird durch einen vorgesetzten zweigeschossigen Glasbaukörper der Haupteingang markiert. Großzügige Transparenz durch die Glasfassade zum Foyer, Leseraum sowie der MEDIO.LOUNGE heben die Trennung zwischen offenem und geschlossenem Raum weitestgehend auf. ### Literatur:

db Deutsche Bauzeitung, 20.11.2010, pp.46-51

the horse on the ceiling new states in front of the stables  
new positions in front of the stables for quite a while now, students instead of soldiers have drawn ranks inside the old horsemen barracks. a creative campus has been shaped in the north of münster. the leonardo-campus consists of the art academy, the münster school of architecture (msa) and the department of design. the book inventories are consolidated in a library and stand behind walls of a part of the former stables. the shelves require more space. but where? in the past horses stood in front of the stables, now books are going to stand here. framed by a glass façade, whose large-sized glass panels will be reinforced by glass fins. up front three study carrels, for undisturbed learning, will shape the façade. the study carrels serve as a bearing. in the back there is a table for group work, with a curtain to the visually and acoustically separate if necessary. in the rear section the roof rests on three columns, whose form reflects the frozen movement of horses legs, which moved here in former times. between the new and old roof, a seam-of-light illuminates the stable wall, in front of which horses were formerly tied up. stairs and openings in the wall prevent standstill. (zauberscho(e)n)

Nur wer um die sprichwörtlichen Qualitäten jener grundsoliden aber selten wirklich anmutigen Bauten weiß, welche der Bau- und Liegenschaftsbetrieb (BLB) für die Hochschulen des Landes NRW in Eigenregie errichtet, nur der wird das kleine Wunder so richtig begreifen können, das seit geraumer Zeit auf dem Leonardo-Campus der westfälischen Stadt Münster zu bestaunen ist. Unerwartete Praxisnähe: Studierende und Lehrende kooperieren. Bei der Bebauung des weitläufigen Leonardo-Areals, auf dem die Fachhochschule Münster mit den Studiengängen Architektur und Design sowie die Kunstakademie Münster untergebracht sind, handelt es sich überwiegend um denkmalgeschützte Kürassierkasernen und Stallungen aus dem Jahre 1901, ergänzt durch ein neueres Kunstakademiegebäude (von Günther Domenig \*06.07.34 Klagenfurt -15.06.12 Graz, RESOWI-Zentrum Universität Graz 1993-1996) sowie einen Neubau für die Designer. Die zentrale Bibliothek für alle Fachbereiche ist im Inneren des Campusareals in einem der alten Marstallgebäude untergebracht und bedurfte dringend einer Erweiterung. Dafür legte der BLB einen schlichten Vorentwurf vor, der die Bibliothekserweiterung hinter der jetzigen Bibliothek versteckt hätte. Dies erregte bei einigen Architekturstudenten der Gruppe „Zauberscho(e)n“ im Masterkurs von Prof. Herbert Bühler heftigen Widerspruch. Woraus ein Gegenentwurf entstand, der den neuen Bibliothekstrakt als regelrechtes Schauobjekt mitten ins Zentrum des Campus rückte. Es blieb jedoch nicht beim Vorschlag. Als Gemeinschaftsprojekt von Studierenden und Lehrenden konnte der Entwurf im Rahmen der vorgegebenen Budgetierung und wachsam vom BLB beäugt auch tatsächlich realisiert werden. Damit war das Wunder von Münster perfekt. Farbenlehre in einer leuchtenden Büchervitrine Die Idee der Arbeitsgruppe „Zauberscho(e)n“ mit Andreas Schüring und Stephan Weber (und Mathias Horstmann in der Entwurfsphase) bestand darin, die neuen Bücherregale vor den alten Pferdestall mit der bestehenden Bibliothek zu stellen, dreiseitig umrahmt von einer raumhoch durchlaufenden, nur durch Glasschwerer ausgesteiften Glasfassade. Das dicke, von einer Firma gesponserte Spezialglas ist nicht grünlich, sondern klar und damit besonders transparent. Bei Tag spiegelt sich das Grün der Bäume in den Fassaden, bei Nacht präsentiert sich die neue Bibliothek hingegen wie eine illuminierte Vitrine als regelrechter Eyecatcher und Fokus des gesamten Campus. Der lange Bibliotheksraum ist unterteilt in drei Zonen. Im vorderen Bereich gibt es zur Schmalseite hin Leseplätze und an der Längsseite drei leicht schräg gestellte, abgetrennte Kabinen zur ungestörten Lektüre. Es folgen die langen Reihen mit Bücherregalen. Neusachliche, an den Regalen befestigte Industrielleuchten aus Frankreich sorgen für eine ephemere horizontale Ebene aus Licht. Vor der hinteren Stirnwand steht ein ovaler Tisch für Gruppenarbeit und Präsentationen. Durch einen oval um den Tisch herum geführten Akustikvorhang kann der Raum hier flexibel und organisch für eine „Denkzone“ abgetrennt bzw. geöffnet werden. Außen ist der Vorhang bedruckt mit einem digital generierten Motiv aus Rafaels Gemälde „Schule der Philosophen“. Gottfried Sempers Feststellung, der zu Folge Farben weniger schreiend wirken als blendendes Weiß, wurde der Raum in Anlehnung an Corbusiers „Polychromie architecturale“ farbig gefasst. So entsteht ein delikates Zusammenspiel von grüner Decke, weißen Stützen und schwarzem Fußboden mit dem roten Ziegelton der angrenzenden Backsteinbauten und der jahreszeitbedingten Farbigekeit der Bäume. Im Dialog mit dem denkmalgeschützten Reitstall Der wie ein Flügel ausgebildete Dachkörper aus Stahl ruht auf drei auffällig dekonstruierten, kastenförmig verschweißten Stahlstützen. Ihre eingefrorene Dynamik wurde digital abgeleitet aus den Bewegungsstudien eines Reiters von Eadward Muybridge aus dem Jahre 1878; eine Reverenz vor dem Genius loci des angrenzenden ehemaligen Reitstalls. Zwischen dem Dach der neuen Bibliothek und dem alten Reitstall für die bereits vorhandene Bibliothek wurde eine von farbig lackierten Stahlprofilen eingefasste Lichtfuge installiert. Diese setzt die historische Stallwand inklusive der vielen auffälligen Ringe zum Anleinen der Pferde theatralisch ins rechte Licht. Automatisch gesteuerte Lüftungsklappen am Fuß der Glaswände lassen Frischluft in die Bibliothek eintreten, welche über dieser Glasfuge oben entweichen kann. So ist für eine natürliche Be- und Entlüftung gesorgt. Ebenso präzise wie geschickt inszenierte Durchgänge in die Bibliotheksräume des denkmalgeschützten alten Marstalls sowie skulpturale, in die alte Backsteinfassade eingehängte Treppen verbinden Alt und Neu nach Art einer „promenade architecturale“. Außen wurde an der Traufe des Daches auf Fallrohre verzichtet. Was bei Münsters sprichwörtlichem Regenreichtum verblüfft. Das bei Schlechtwetter wie ein transparenter Schleier herabfallende Regenwasser wird jedoch in einem Graben gesammelt und ökologisch abgeleitet. Vor dem Graben steht als Kunstinstallation ein hoher Mast, der sich bei näherer Betrachtung als Blitzableiter entpuppt. Mithin hat das junge Team von „Zauberscho(e)n“, unterstützt von seinem Mentor Herbert Bühler, tatsächlich ein kleines Kabinettstück zuwege gebracht. Denn sein aus Protest heraus geborenes Low-Budget-Projekt ist zum Dreh- und Angelpunkt, zur sprichwörtlichen Corporate Identity einer ganzen Hochschule geworden. Das ist für einen Erstling wahrhaftig ein unglaublicher Mehrwert, der zur Nachahmung anregen sollte. Münster ist mit diesem „kleinen Wunder“ um eine wesentliche architektonische Attraktion reicher geworden. Eine Verbindung von Alt und Neu wie bei einer „promenade architecturale“: das schwarze, skulpturale Treppenelement ist vor der Backsteinwand geschickt in Szene gesetzt. Rechte Seite: Ein Vorhang trennt den Gruppenarbeitstisch vom restlichen Raum ab. (Baumeister, Oktober, 2010, pp. 62-68)

Im Norden von Münster liegt der „Leonardo Campus“. Hier sind in den letzten Jahren Einrichtungen und Institutionen der Kunstakademie sowie der Fachbereiche Architektur und Design der FH Münster angesiedelt worden, um die inhaltlichen Schnittflächen der Arbeitsbereiche besser nutzen zu können. Auch die Buchbestände wurden in einer zentralen Bibliothek versammelt, die in einer ehemaligen Reiterkaserne auf dem Gelände untergebracht wurde – statt Pferden stehen nun also Bücher in den Stallungen. Für die Menge an Büchern musste jedoch zusätzlicher Raum geschaffen werden. Für diese notwendige Erweiterung wurden von Studierenden der FH Münster – oder: münster school of architecture (msa) – Entwürfe erarbeitet. Aus einem dieser Entwürfe (namentlich von Mathias Horstmann, Andreas Schüring und Stephan Weber) entstand dann mit den Münchner

Architekten Bühler und Bühler die Planungsgemeinschaft zauberscho(e)n für die Realisierung des Entwurfs. Dieser zeigt sich nun als helle, transparente Erweiterung des backsteinernen Kasernengebäudes. Früher standen hier die Pferde vor den Stallungen, nun stehen hier die Regalreihen, leicht gehüllt in eine großzügig Glasfassade, die von Glasschwertern ausgesteift wird. Der 400 Quadratmeter große Raum ist dreigeteilt: Im vorderen Teil stehen drei Studierkabinen, die konzentriertes, zurückgezogenes Arbeiten ermöglichen sollen. Im mittleren Teil stehen die Bücher und im hinteren Bereich ein Tisch für Gruppenarbeiten, der mit einem Akustikvorhang abgetrennt werden kann, dessen Außenseite mit einem digital veränderten Motiv aus Raffaels „Schule der Philosophen“ bedruckt ist. Beim Tragwerk wiederum wurde auf das bereits erwähnte Pferdemotiv zurückgegriffen. Aus dem Erläuterungstext: „Die flügel-ähnliche Bedachung steht im hinteren Teil auf drei Stützen, deren Form ein Moment der Bewegung der Beine der Pferde ist, die sich früher hier bewegten. Sie sind digital entwickelt und Produkt einer computergesteuerten Stahltechnologie.“ Der neue ist vom alten Bau durch eine Lichtfuge abgesetzt, durch welche die historische Stallwand direkt beleuchtet und inszeniert wird. Treppen und Durchgänge sorgen für eine enge Vernetzung der beiden Gebäudeteile. Als i-Tüpfelchen eines sowieso schon sehr gelungenen Gebäudes wurde auch der Regen, der in Münster häufig fällt, in Szene gesetzt. Entlang der gesamten Längsseite fällt das Regenwasser vom schrägen Dach durch eine offene Traufe direkt über die Glasfassade. Am Fuß der Fassade wird es von einer Rigole gesammelt und für das Gebäude genutzt – ein zusätzlicher Reinigungsaufwand der Glasscheiben sollte daher zu verschmerzen sein. (<http://www.baunetz.de>)

### Sheik-Zayed Library, Dubai – Dubai on design

International architecture practice Cheungvogl shared with us one of their latest projects, Sheik-Zayed-Library, located in Dubai. More images and architect's description after the break. Metaphorically, the structural design is rooted deeply into the ancient culture of Dubai. Respecting traditional disciplines and incorporating the significance of organic forms, symbols and patterns, the design seeks to redefine traditions as well as continues to test new boundaries for the future. As we critically question the 'whys' and 'how's', finding the reasons for everything, there is no room for imitations. This symbol must be a unique phenomenon – a flower growing out of the desert ground. Following the rational thinking of looking deeper into nature and plant structure such as bamboo, we understand that the structure is made up of multiple strands of fibre, tightly knitted together. The cross-section of the bamboo fibre and bamboo yarn is filled with various micro-gaps and micro-holes. Scientific tests have proven that higher shear strength was observed for bundles of fiber having smaller diameter rather than larger ones. Similarly, we have applied a thin layer of secondary structural mesh to 'glue' the primary structure together. Here, the secondary structure – the skin of the facade acts as bracing to the primary structure. The primary structure remains as filigree of thin elements. They become a series of load transporters, working together to transfer the loads down into the roots – the foundation. The circular plan renders equality in many perspectives. Equal views and equal loads. Wind and seismic load is also reduced in a circular form compared to a square or triangular form. A light mesh consists of primary and secondary steel members wrapping around the 7.7m diameter concrete core, supporting the huge cantilever slabs forming three levels of viewing platforms. On the top two levels, the structural mesh defines the space for the viewing platforms without entirely enclosing it. These spaces provide the visitors with 360 degree panoramic views of Dubai at 165 meter datum. The city has presented the world a collage of amalgamated large-scale developments in innovative forms. Dubai has vigorously convinced the world of how built forms are used to convey technological power and growth. Today, the challenge for Dubai is to balance the rapid development to a more considered and grounded city able to sustain its quality through time. The fashionable, creative and exciting aspects of Dubai bring about a kind of dramatic growth that yearns for a moment of calmness. A pause. Gazing upon the functional and the practical. Here we question the basic principles – the fundamentals of what people need. The project embraces diversity and we understand that 'needs' do change. Therefore, flexibility is key to everything, to cope with endless evolving conditions. A successful city seeks to provide a built environment within which people can develop, network, consolidate and compete on the global platform. We span between the macro down to the micro – to understand and embrace differences. The project focuses on the need to provide a 'place' in the city of Dubai for people to pause and reflect. A place to contemplate. Spiritual. Tactile. A place in between things. A place where the soul is conditioned, the mind is charged. A blurry quiet slow space Is our definition of 'quality'. Outside in 70000m Locating at the peripheral of the city's urban corridor, Sheik Zayed Road, the site captures the entire view of the city quietly from a distance. The structure will stand in between many internationally recognizable forms that celebrate the commercial success of Dubai city. A seamless integration of the structure in between the already dynamic urban corridor requires a bold and yet simple gesture. The understanding of time – between 'then' and 'now' becomes the framework for the design. The desire to capture time in memory and space. 700m Enhanced by a structure that has a distinguished identity and a sense of place. One of the major challenges of this project is to examine and generate new urban structure that is sustainable and sensible to those who inhabit these grounds. It is critical to recognize the existing urban spaces and render the site with a bold and simple gesture that is unique, resilient and supportive of local needs. The connection between the city and the existing park infrastructure has been seamlessly integrated. The new grounds for the structure is distinguished by a field of bamboo trees with solar lamps within the landscape. 70m The seamless connection between the structure and its landscape gradually allows one to descend down into the building quietly and spiritually. The ground is a place that is slightly submerged into the ground, sheltered from the sound of the city, the sandy wind and the sun. It creates a place that is naturally cooled by a thin layer of water beneath the structure. The light web hovers against the edges of the site, supporting facilities such as children library and conferences, providing a sustainable environment that sustains different climatic conditions. The design of an organic plan is responsive to the evolving needs of its people. A place for interaction. A place for cultural exchanges. A place for quiet thoughts. A place for documenting the notion of time. 7.7m The core is based on a 7.7m diameter structure that composes two passenger lifts with a feature helical stairs and a fire escape stairs intertwined around it. The two set of stairs are designed to be stacked on top of each other to maximize the core's efficiency, yielding 7.7m floor to floor height. The design of the core is consistent throughout the building with minor adjustments to cater to different requirements of each platform. Inside out The circular plan is an ancient and universal symbol of unity, wholeness and infinity. It represents the power of endlessness, eternity. Forever here. The structure becomes the framework that supports different experiential qualities. The structure expands and tightens fluidly and subtly at various datum, allowing one to document the city from different angles. Platforms at various levels will also allow one to document the changing of time. Platform 0.00m DTM Entrance sits proudly on a sheet of reflecting water. One is to descend slowly through the thin cuts that mark the entrances at ground level. The entry approach is one that signifies an inverted dome. It houses spiritual qualities and quiet thoughts. Platform 11.55 DTM This platform provides an enlarged contemplative place for one to get closest to the framework, the tactile quality of the structure is a part of the experiential quality within the space. The blur between the structure and the metal mesh provides a magical translucent quality that changes according the different times of the day. Symbolically, the structure is clothed with a white shawl, providing a light shade from the sun. Within this space, 140m of the structure is revealed. The play between body and space is heightened by the crisscrossing between the curved structural members and the bracing of the metal mesh. Platform 150.52 DTM As one ascends upon the upper levels, the oval platform allows one to look back upon time. Viewing through the cuts on the floor slabs to get glimpses of the city from oblique angles will evoke other senses of the body. Platform 157.85 DTM This platform is expanded into three levels similar to a stretchable spring. It is a fluid gesture that describes the experience of travelling through space and time.

The first stop allows one to pause and rest at the cafe. Adjacent to it, is the lower portion of the viewing platform where a series of circular ramps surround the edges of the facades. The view out is always protected by shades, either by the shape of the building or the fine metal mesh on the outer skin. Platform 165.50 DTM At roof level, the relationship between the mind, body, space and city is all amalgamated. A journey that is flexible enough to cater changes through time. The sum of all these parts has provided places for thoughts and senses to wander freely. (<http://www.designboom.com>)

## **P & T (Palmer Turner) Architects & Engineers Ltd., Hong Kong – Hong Kong**

### **Shunde Library, Foshan – China 2006**

26.200 m<sup>2</sup>, RMB 137.000.000

The library, together with a performing arts center and two museums, forms the new cultural center of Shunde, a fast-growing district with a population of about 1 million located in Foshan in the Pearl Delta Region. Standing on the previously context-free district center, the library and its neighbors adopted bold geometries. Functionality and meeting the tight budget were the major concerns in design, resulting in a simple rectilinear form that was easy and cheap to build. Free of odd shapes, the plan allowed for flexibility of layout. The “no-frills” approach turned functional elements—like the reading booths and the staircase—into design features. Additionally, climatically responsive facades minimized energy consumption while careful planning and a clear segregation of day and night zones cut management costs. The library, apart from serving the community as a district main library, also houses two exhibition halls on its lower floors, which take up more than a quarter of the total gross floor area. Formed by colonnades of reading booths, the lobby was designed to resemble a gigantic bookcase that orients visitors to the correct sections of the library, while reading areas are punctuated with gardens and courtyards. The theme of bamboo (in Chinese ideology the scholar of nature) was reflected in the design of the elevation and choice of materials. The interior of the library follows the Chinese idiom (bright windows and tidy furniture), which defines the ideal study environment for Chinese readers. Except for the west side for energy reasons, the all-glass facades with considerable shading from the projecting features allow a flexible layout of the reading spaces while a minimalist interior provides visitors with a neat and harmonious environment for reading and study. (P & T)

## Hungary

### Török és Balázs Építészeti Kft., Budapest – Hungary

#### Libraries:

#### Regional Library and Knowledge Center, Pécs – Hungary 2010

Project Area: 13,180 sqm

Pécs, a multicultural city with a rich history, was the European Capital of Culture in 2010. For the location of the new library a remote, run down, undeveloped plot was chosen. This meant the new building did not have the constraint or possibility to directly match other buildings. During the design process, I aimed to dynamically synthesize the dualities which appear in many ways. In the building a “beehive” represents the ideological center and refers to permanence. This is a place of abstract thinking: a metaphor for the freedom of knowledge and also, in reverse, for the knowledge of freedom.

I see beauty in the idea that my response for a knowledge center is a building where the focus is not on concrete, permanently changing knowledge but on the possibility of thinking: in-other-words, an empty space which can be filled with the thoughts of the people in it. The ground floor reception room is horizontally open, and the upper floors are, in accordance with their activities, rather introverted. The extensive “beehive”, un-functional in any common sense, connects these differently characterized spaces. In terms of forms, the inner, abstract space is analogous, archaic and organic.

#### Section

The spaces surrounding the “beehive” are the result of rational planning; with their flexibility they express the possibility of change. The facades are defined by the airy, white ceramic-coated glass, which represents the latest technology. The inner surface of the “beehive” is an independent work of art: The Zsolnay ceramic tiles, with their world-famous eosin coating, refer to the use of local historical characteristics. The dual-use of material is intentional. It is important that an architectural work can be read in different ways: it should be local and international, stylish and traditional, historical and contemporary, but first of all have self-identity.

**Libraires:**

**Amin Shipping Container Library, Batu – Indonesia 2013**

surabaya-based firm dpavilion architects have recently completed a colorful library in batu made from eight recycled shipping containers that cost eight million rps (820 USD) each. they are standardized modules suitable for a variety of uses, affordable, and they symbolically hold the books that will open the children's eyes to the very world the containers have travelled before ending up as a library and polyclinic. in the small cosmopolitan agricultural town, a clash between the contemporary city and the village clash; where the gap between the rich and poor is increasingly widening, the project aims at leveling the playing field by providing an educational facility with over 6,000 books and a small clinic all for free, in an attempt to improve the quality of life for all the locals. each of the colored boxes are attributed to a different function: the blue volume is for entertainment and popular books; the red containers extend out as a canopy over an open-air circular reading terrace, and holds the science and technology books; the yellow is reserved for the women's reading room; the green greets visitors with the main lobby space. the actual built structure provides only the foundation for the containers hoisted upon steel stilts. the container then becomes the perfect building component, economically and metaphorically, using its unique properties to introduce a world beyond the site to the children of batu. the library stands as a progressive structure leading the transition from a rural to an urban context, at the same time questioning the role of architecture as a result of commodity and materiality.

#### **Libraries:**

**Tullow Civic Centre and Library, Carlow County, Tullow – Ireland 2005**

Local Authority, DEHLG, 400 m<sup>2</sup>, €1.744.000

Tullow Library is located on the banks of the River Slaney. The floor area has been raised to avoid the possibility of flooding. A riverside promenade runs alongside the building. The library is located on the ground floor of a two-storey building. The building exhibits the following elements of sustainable design: tinted glazing; 1st floor cantilevered overhang to shade the library interior from summer sun; Brise-soleil to reduce solar glare during winter months; double height void in reading area and reception desk area which admits maximum natural light. Library Details Local Authority Name Carlow County Council

Date Opened 16 September 2005, Type of Building Purpose-built library, Size (m<sup>2</sup>) 400, Cost of Library €1,744,501

Funding Sources Local Authority, DEHLG, Sustainability / Future Proofing Natural/passive heating & cooling

Shading/overshadowing, Solar access (<http://www.librarybuildings.ie>)

### **de Blacam und Meagher Architects, Dublin – Ireland**

<http://www.deblacamandmeagher.com>

#### **Libraries:**

**Dublin City University, Dr. Tony Ryan Academy of Entrepreneurship, Dublin – Ireland 2009**

The Tony Ryan Academy for Entrepreneurship was set up in conjunction with Dublin City University as a centre to train entrepreneurs in management skills and advanced technology.

The Academy is conceived as a building for the 21st Century, environmentally friendly building with minimal CO<sub>2</sub> emissions.

The building uses natural ventilation, deep overhangs and adjustable and automatic shading to reduce the requirements for artificial lighting and air conditioning, dramatically reducing the energy consumption of the building, in stark contrast to a "typical" building of this nature.

The building is architecturally concerned as a great glazed hall, elevated above the landscape to which are attached the lecture theatres in the form of tall titanium shells. The open planned Great Glazed Hall was conceived as a great meeting space, in which students could "gather to develop ideas" and "build networks", while engaging with mentors, coaches and experts. The education process of the Academy was conceived by the Client to be generated by the students, as much as the Curriculum and teachers. This glazed hall contains reading and meeting areas, seminar rooms, library, offices and a canteen that opens out onto a timber deck. The large glazed areas are shaded from the sun by deep overhangs and automatic shading blinds, resulting in a very pleasant interior regardless of the weather.

The titanium clad lecture theaters sit to the west of the campus. They are set in a water pool, which assists in dramatically reflecting sunlight off the titanium shells. By design, the height and volume of the lecture halls create a stack ventilation system, which alleviates the need for air conditioning. Air is cooled as it is drawn over the water pool to ventilate the Academy. The theatres buck the black box tradition of the lecture hall and are bathed in indirect daylight from rooflights. (de Blacam)

**Library, Galway Mayo Institute of Technology, Galway – Ireland 2009**

The redevelopment of existing building as a college of Art and Design and School of Music, which includes a newly built Library and Sculpture Workshop. The School of Art of the Galway-Mayo Institute of Technology is located in a former seminary built for the Redemptorist Order in the 1940's.

The primary design concern was to create a coherent lucid plan from an institutional building characterised by a shallow depth of plan, high ceilings and long somber corridors. This would then enable each department of art school to communicate and react easily with one another.

The introduction of a three-storey circular void and a white limestone floor into the central entrance hall formalised the space to create an appropriate sense of arrival. Tall, glazed and pivot doors introduced light into the adjacent institutional corridors whose forbidding quality was improved by new light maple floor-boarding. A new five-storey library was located at the building's eastern corner. Constructed of oak a winding staircase links all floors and focuses a strongly unified space. Readers in the study carrels of the upper galleries can admire the distant views of Galway Bay. (de Blacam)

## Library Abbeyleix, Abbeyleix – Ireland 2003

### **Awards:**

**RIAI Irish Architecture Awards 2009  
Best Conservation/Restoration Project**

Library Abbeyleix awarded Best Conservation/Restoration Project Historically there are four phases of development of the Market House, the original rectangular plan with a small central capola on the ridge, the 1890's reconstruction in a rural Italian style with new tower on the East elevation and the addition of mullion and transom windows, the Fire Station Free State Art Deco transformation to use as a fire station with library on the first floor and the present Laois County Council commission to a branch library. It was the Architect's ambition to re-pave the square (really it is a crescent), and this was achieved by re-planning the car parking and planting Italian Cypress (*Cupressus Sempervirens Sastiatia*) to compliment the 1890's building. During the course of the 2008 works the suspended timber vault was uncovered and exposed to view, the barn form which compliments what was manifest externally.

The design of the library as a great room surrounded by books on three floors and a central reading room in the middle of the square of the town. The design of each floor incorporates particular features of the library. The ground floor has entrance from South, librarian's desk, Art Gallery, fireplace and catalogue. The first floor has adult lending, IT, reproduction, reference desk and librarians office. The second floor is the childrens library with story telling theatre, children's desk and craft area. (de Blacam)

## Box Architecture, Dublin – Ireland

<http://www.box.ie>

### **Libraries:**

#### Ballyroan Library, Dublin-Rathfarnham – Ireland 2013

Architects: Box Architecture, Architect In Charge: Gary Mongey, Lighting Design: Wink Lighting, Area: 1,510 sqm

The AAI are hosting a site visit to Box Architecture's current project, a new modern library in Dublin on Saturday 17th November. This new project is the final phase of three new buildings, a library, a community and pastoral centre which create a local community civic hub in Rathfarnham, Dublin. The main construction works, carried out by MDY Construction Ltd, are now completed and the fit out currently ongoing. The development will be open to the public in Spring 2013.

(<http://www.architecturefoundation.ie>)

The library was built in the 1980's and served the community well over the past decades. However the library became outdated, in need of upgrading and became too small to deal with the collection of resources available to the community for reference or borrowing. After much consideration the existing building was demolished and rebuilt, doubling the size of the original library. A complete rebuild was deemed quicker, less disruptive, economic and a better environmentally sustainable solution....

(<http://www.archdaily.com/347844/ballyroan-library-box-architecture>)

## Bucholz McEvoy Architects, Dublin – Ireland

<http://www.bmcea.com>

### **Libraries:**

#### Westmeath County Council Civic Offices and Library, Mullingar - Ireland 2009

Westmeath County Council Headquarters is a low energy civic office building located at the heart of an important archaeological site. The building is an open and transparent building of public service and is carefully woven into the historic archaeological context, creating an ensemble of new and old buildings, which together bring new meaning and civic values to this site. The new building is a civic place, internally a sculpture of light, created primarily with glass, timber, and concrete, externally an open and transparent expression of local government. The structure is designed to provide a vessel for the transparency attributed to local government, a civic building accessible by all, while providing both a comfortable work place and a pleasant experience for visitors. The building form is principally organized in two axes and two buildings; one north-south which contains the library and cafe and establishes the principal relationship with the existing County Building, and the other an east-west curved office block. The library is accessed from the main public space with its double height reading room addressing the public park. The curved office spine looks to the south, addressing a new public park over the excavated ground. The entirely naturally ventilated building maximizes passive design principles and creates an environment in-balance with the nature. The design of a structure in its construction and operation consumes less of the environment's natural non-renewable resources. A double facade combined with an atrium lung serve to effect all of the ventilation in the office building. The main atrium of the building is conceived of as a light-filled glass and timber hall, where the presence of the existing County Building and the historical remains are linked. Movement across the site, through the building, and to the public park takes place through this space constantly reinforcing the connection to County Building. On the first floor link bridges connect the existing County Buildings to the reception/meeting room at the intersection of the bridge and the office block. The building form is principally organized in two axes and two buildings; one north-south which contains the library and cafe and establishes the principal relationship with the existing County Building, and the other an east-west curved office block. The library is accessed from the main public space with its double height reading room addressing the public park. The curved office spine looks to the south, addressing a new public park over the excavated ground. The entirely naturally ventilated building maximizes passive design principles and creates an environment in-balance with the nature. The design of a structure in its construction and operation consumes less of the environment's natural non-renewable resources. A double facade combined with an atrium lung serve to effect all of the ventilation in the office building. The double facade acts as a ventilation chimney driven entirely through wind pressure, while acting as an acoustic barrier. The double facade ensures fresh air supply year round, without opening a window out to the noisy train tracks. The atrium, the main public space, is also the ventilation lung of the building, providing supply air to the offices.

## **Carr Cotter & Naessens, Cork – Ireland**

<http://www.ccnarchitects.net>

### **Libraries:**

#### **Dún Laoghaire, Rathdown Library – Competition 2007 (2012 – 2015)**

The proposed design is a response to the particular context in the centre of Dunlaoghaire and includes the remaking of Moran park. The brief includes a cultural centre and County Library, accommodated in a complex arrangement of interlocking voids and volumes forming a compact site plan. The form of the building relates to the immediate surrounding yet has a civic presence on this significant site. (Carr)

Construction of the new Dun Laoghaire Rathdown Library/Arts/Culture/Community complex at Moran Park, at an estimated cost of €36.6m, has been approved by DLR County Council. The project is the outcome of an RIAI design competition, which was won by Carr Cotter Naessens Architects. The Part 8 scheme for this project was approved by the Council in November 2009. The tender process has now been completed with the award of the tender to John Sisk and Sons and vacant possession of the site secured. This major cultural addition for DLR will comprise the following facilities:

- Major public library, which will include a dedicated children's library, teen space, local history & reference sections and space for Council archives
- Arts/cultural facilities including a multipurpose hall, a gallery, arts workshops & training areas and facilities for artists in residence,
- Community meeting rooms
- Public café and a major public plaza
- Office accommodation for the Council's Library HQ and Arts Office functions.

"This is by far the most significant public infrastructure development in Dún Laoghaire for over 100 years", said the Cathaoirleach, Councillor Bailey, adding "it will make a major contribution to the regeneration of the town and to the county".

The project was approved by Council in at its March meeting as part of its Capital Expenditure Programme of €165m over the 4 year period 2012 to 2015. Approximately €13m of the total expenditure of €165 will be funded from the Council's own resources, with the balance of €52m coming from non-Council sources – mainly grant aid from central government Departments.

## **FKL Architects (Michelle Fagan, Paul Kelly, Gary Lysaght), Dublin – Ireland**

<http://www.fklarchitects.com>

### **Libraries:**

#### **Library & Local Areas Office, Dublin-Baldovle – Ireland 2004**

### **Awards:**

RIAI Architecture Awards 2004

AAI Award 2003

At the end of a residential terrace, the site has an unspoilt view across Dublin Bay to Ireland's Eye. The brief was to refurbish an existing public library and adjacent green space and to provide local area services offices, a public meeting room and exhibition space for Fingal County Council. The concept for the new extension is based on a folded tube wrapping around the back and side of the existing building. At ground floor level, the end of the tube addresses a new public space, while at first floor it addresses the view out to sea. The tube is clad in granite with a subtly changing pattern that registers the twisting of the form. Internally a timber lining progresses through the tube leading visitors past the public counters to the main above – a large public reading room. (FKL)

## **McCullough Mulvin Architects, Dublin – Ireland**

<http://www.mcculloughmulvin.com>

### **Libraries:**

#### **Caherciveen Library & Art Centre – Ireland in development**

The site for the Caherciveen project is located on a corner at the entrance of the town, sloping from the urban edge of New Market Street to the Fair Green with views to the hills beyond. The brief includes a library, local area offices, a theatre and art gallery around a covered public space- a forum for the whole town with spaces to meet, think and create, offering potential synergy between activities. The plan makes a ramped pedestrian route within a rectangular ground plan; spaces are set around it, with offices at an upper level. This is a free-standing building; there are four facades- it can be accessed from all sides; the form is slate-clad, a hard quartz-like, light reflective mound shaped by the double-height spaces within. It is both landscape and ancient monument, bringing the extraordinary context of South Kerry into the streets. (McCullough)

#### **Tubbercurry Civic Offices and Library, Tubbercurry – Ireland 2006**

The Tubbercurry Civic Offices and Library project was built to provide public services for the people of South Sligo; it contains Local Authority offices, facilities for the Health Board, a library, as well as courtroom space for the Western Circuit. The site is urban- located on a side street near the town square; it was formerly occupied by houses, two of which were retained in the project. The houses were small, lightly imprinted on the ground, but had long gardens running in plots back from the street- luxuriant, overgrown, generous fingers of space. The project was an opportunity to explore modern concepts of urbanity in a small Irish town : the front façade is set into the street and the plan opens back into a series of narrow fingers echoing the original house plots, inviting access deep into the scheme. Space is held between two floating planes; the building is covered by a single undulating zinc roof like the horizon line on the local landscape. It is interrupted by rooflights- large segments cut and folded up , smaller circular lights over the library. The ground floor is stepped like a piece of open ground with the floor plate folded down in a ramp; two floors of office accommodation are incorporated within the envelope at one side. The rectangular plan can be accessed at several places- including a ramp which runs from the car park and is threaded through a narrow throat of space into the lobby; further routes are set between grids of structure and screens from the front out to the car park at the rear- where their line is visually extended in the paving. (McCullough)

### **Thurles Arts Centre and Library, Thurles – Ireland 2006**

1.350 m<sup>2</sup>, €5.875.000

This building's geometries arise out of its very particular location - crouched like a cat at the medieval gate of Thurles and stretched around a bend in the river Suir. A singular folded roof encloses very different volumes, rising and falling like a small mountain range from a strong base - the boardwalk extended over the river. Crisp zinc planes define the library/media zone from the arts and theatre spaces, the entire building cranking to face the river with sheer planes of glass. Two storeys of library and research space are coupled to the high volume of the auditorium by the lower entrance and arts space. In the library a deep cut in the ceiling plane brings light and air to the centre of the plan. The exhibition space has a similar slice through the roof plane to conduct daylight. An introverted, reflective space, its walls splay out towards the riverfront, taking up the geometry of the site. Shielded behind the monolithic concrete entrance wall, the space can be glimpsed through a porthole when arriving, or alternatively closed off for hanging. The theatre foyer is similarly a compressed volume caught between auditorium and boardwalk.

( <http://www.worldarchitecturenews.com> )

Thurles Library is located in The Source Library and Arts Centre. The building enjoys a riverside setting on banks of the river Suir, adjacent to the town bridge, with a fully accessible riverside boardwalk. A single undulating zinc-clad roof encloses the two functions of the building, with a shared roof-lit exhibition space providing a central focus. The shared entrance and foyer ensures users of one element of the building are made aware of the other. The narrow, elongated site is located on a bend in the river. A glass facade faces out onto the river. The branch library is on the ground floor and the Tipperary Studies Department and community space is on the 1st floor. Throughout the building colour has been used to indicate function; red for information, orange for vertical circulation and white and black for concentration and relaxation. A rooflight brings natural light and ventilation into the research area on the 1st floor. (<http://www.librarybuildings.ie>)

### **Waterford City Library, Waterford – Ireland 2004**

2000 m<sup>2</sup>, €5.000.000

The existing public library on Lady Lane in Waterford City required complete refurbishment and an extension onto an adjoining site (an undertaker's yard) to provide better library and information resource facilities for the 21st century. Constructed in 1905, the existing building has a Classical facade in smooth sawn Kilkenny limestone; a lower elevation of rusticated limestone to Bakehouse Lane was terminated by a small caretaker's/librarian's house. Internally, the spaces centred on a double height roof-lit reading room; the plan had been substantially altered during extensive remedial works carried out in the 1970s. The project - now L shaped with the addition of the new site- offered opportunities for juxtaposition between a modern building and layered intervention into the fabric- especially in the manipulation of section and light to create a new diagonal circulation across the plan. The existing entrance was closed up and transferred to the extension; this new block fills the site with entrance and mezzanine within the same volume at ground floor- there is a library level over and staff facilities in a set-back floor which emerges out of the new building and extends across to pin the existing library: the floors stop short of the rear wall to provide a full-height void. Internally, the existing building was renewed and the double height reading room lined out with a dark timber skin which hides and reveals the old structure beneath it; balconies cross it at different levels. The space between old and new is fluid; there is a sense of the external envelope running from board-marked concrete to painted brickwork. Using light and section, the project tries to forge a link between the elements, moving from entrance mezzanine to reading room across the plan. A new storey was also added to Bakehouse Lane, echoing the language of the new extension, making it a three- dimensional city block rather than a flat street elevation on Lady Lane alone. Facade choices were made to establish the continuity of limestone across the new elevation, but the new works were given a different stone patterning to establish their integrity. (McCullough)

Waterford Central Library & HQ is a four-storey L-shaped building, extending to 2,000 square metres, refurbished and extended from the original Carnegie Library, built in 1905. For an early photograph from the National Library of Ireland's collection depicting the laying of the foundation stone of Waterford Free Library by Andrew Carnegie click [here](#). The library occupies a prominent corner site. The foyer, adult lending and children's library are located on the ground floor; the exhibition space, newspapers & magazines, and local studies and research area are on the first floor; the Business & ICT Information area, music and audio-visual areas are on the 2nd floor. The 3rd floor contains staff offices, facilities and the plant room. The building was extended into an adjoining undertaker's yard in 2004. The extension incorporates part of the 12th century city wall. The floors stop short of the rear wall to provide a full-height roof-lit void. Interesting bridge connections link different areas of the library. The interior is finished in American walnut wood panelling, exposed brickwork and concrete board marked walls. The exterior of the original building is finished in Kilkenny cut limestone ashlar. Some of the architectural features of the original classical style Carnegie library are full-height doric pilasters, roundheaded windows, string course, cornices, parapet and a floating pediment. The building receives natural lighting from floor to ceiling windows, lightwells and rooflights, and is naturally ventilated throughout with openable windows. The reference room can be divided into two spaces using a sliding partition. ( <http://www.librarybuildings.ie> )

### **Rush Library, Dublin – Ireland 2003**

St Maur's Church dominates the village green on the Western edge of Rush: Fingal County Council commissioned McCullough Mulvin Architects to transform it into the town library. The work combined investigation and conservation of the existing structure with a particular concern for the rescue of ordinary materials, making a distinctive intervention into it, an undulating walnut plane which fills the nave, the shape barely contained, pushing tensely against the older shell. On plan, it is like a clump of seaweed, reference to its marine location; in section, it forms an inverted U, the space between, formed like a city street, deforms the route from entrance to 'altar', forcing it to meander, glimpses of a coloured termination lost and found again. Externally, the churchyard became a garden, strips of concrete inset with names of the town and library interspersed with channels planted with grasses and vegetables, the spirit of the graveyard- and the towns agricultural basis- extended for a new generation. (McCullough)

### **Usher Library, Trinity College, Dublin – Ireland 2002**

The new Usher Library in Trinity College is a landmark building for Dublin. The project - initiated as an international architectural competition design collaboration with KMD Architecture- provides 750 undergraduate reader places and space for 350,000 volumes in a state-of-the-art library building with exposed boardmarked concrete and granite finishes. The concept establishes three prismatic sculptural blocks on a podium set North-South across the site; the two longer blocks are connected by an atrium. The taller is closed and stone-clad and dedicated to book storage (a tower of books), the other, lower, more dynamically shaped in stone and glass- contains reading rooms with views over College Park; the third block is for a Book Conservation Laboratory. Each block is served by a core at one end which anchors the plan; each is designed as a solid planar element without advance or recession- the line of stone cladding is carried through into the atrium in timber panelling. The atrium glazing is perceived as a separate shard-like element, while the Conservation Block roof is an origami-like folded plane of glass and metal. The new building forms a functional unit with the existing Berkeley and Lecky libraries - all three are connected under podium level the Berkeley has been retained as the main entrance to the whole complex - a new staircase descends from it to a new orientation space

serving all three. The new library had to fit into a very strong urban context, standing on an edge condition between Trinity and Dublin; it keeps to the grid of the College while recognising the line of Nassau Street. The building is like a gateway - three books forming open space between them framing views and routes from the city into the College. By its shape and location on the site, the project establishes two strongly configured urban spaces at podium level - one against the rear of the Berkeley, open at the corners in the Trinity manner, with generous steps from the Park and Library square- the other between the new Library and the street- which will serve as a public and tourist access to the College. (McCullough)

## **McGarry Ni Eanaigh, Drogheda Co. Louth – Ireland**

<http://www.mcgnie.ie>

### **Libraries:**

**Monaghan Education Centre, IDA Park, Knockaconny C. Monaghan – Ireland 2002**

625 m<sup>2</sup>, €1.400.000

### **Awards:**

**AAI Special Mention 2003**

**RIAI Irish Architect Exhibition Winner 2003**

Designed by McGarry Ni Eanaigh architects the centre is a training facility for primary and secondary school teachers, space for social interaction was a critical aspect of the design brief. Materials used include brick, cedar, self-coloured render and metal sheeting. (<http://www.thenbs.com>)

## **Murray Ó Laoire Architects, Dublin – Ireland**

### **Now: Mola Architecture, Dublin – Ireland**

The origins of MÓLA Architecture are inextricably linked to the legacy, success and ultimate demise of Murray Ó Laoire Architects, at one time one of Ireland's largest and best design practices. Founded in 1979 by Sean O'Laoire and Hugh Murray the practice grew into a highly successful company with offices in Dublin, Limerick, Cork, Moscow, Bratislava and Aachen and at its peak 280 staff. Recognising their collective strengths, talents and experience Michael O'Carroll, Sean O'Laoire and Ralph Bingham decided to form a new entity. Thus MÓLA Architecture was founded in Dublin in April 2010 to provide a collective vessel for their former colleagues to operate and practice as architects and urban designers. The delivery of good architecture is about the determination, talent and personalities of the individuals who create and nurture that process. As such, and with our talented team and consultants, we believe we have the capabilities to provide a high quality service and commitment to design. The projects featured on this website represent the collective wealth of experience and involvement of the Directors, staff and consultants of MÓLA Architecture.

<http://www.molaarchitecture.com>

### **Libraries:**

**The Glucksman Library & Information Services Building, Limerick – Ireland 2008**

The building is segregated into three projecting glass “fingers” arranged around two central atria off the main spine of the building. This spine is designed to cater for all the book stacks and volumes and is primarily brick clad with a waffle slab floor. The “fingers” contain all the reading spaces and computer points and is serviced with a raised access floor. The two Atria act as environmental “lungs” for the building controlling, with the BMS, the internal temperature and climate (Murray)

**UCD (University College Dublin) Health Sciences Complex, Dublin – Ireland 2008**

At the centre of the complex is the library, which acts as both a focal point and a link between the four schools. This is surrounded by the specialist teaching facilities which include laboratories, simulated hospital wards and student Resources rooms (Murray)

### **Awards:**

**Opus Architecture & Construction Awards 2008**

**Cork School of Music, Cork – Ireland 2007**

Located on the banks of the River Lee, the CIT Cork School of Music provides a bespoke academic facility in a unique city centre setting. The 12000sqm ‘state of the art’ School provides music studios, 450 seat rehearsal hall, theatre space, music library, recording and dance studios, offices, classrooms and lecture theatres.

Externally the palette of red sandstone, buff limestone, blue brick and animated glazing reinforces the design of a confident, civic, and contemporary set-piece by the river. The theatre, rehearsal hall and tuition studios are solid and geological in form while the curved limestone façade reflects the river bend. In contrast the top floor library and studios act as light boxes, benefit from stunning city views and are reflective of the sky.

The main rehearsal hall, although a simple rectangular box, has great acoustic and performance flexibility. Primarily a student training space it also allows for multiple configurations through hydraulic stage, moveable ceiling and pivoting wall panelling. To achieve the rigorous acoustic performance criteria many of the spaces utilise ‘box within box’ construction with floating floors and ceilings, splayed walls and services isolated from the primary structure. Unlike most third level institutions there are minimal staff offices as they are innovatively incorporated within the music studios. (<http://archiseek.com>)

**Wilton/Cork Shopping Centre, Bishoptown Library, Cork-Wilton – Ireland 2007**

This new-build community library provides an accessible centre for reading and learning for the West environs Area of Cork City. Located within the grounds of the main retail centre of Wilton and Bishoptown, the building provides easy access to a wide range of literature for all age groups (Murray)

**Leitrim County Library, Balinamore – Ireland 2006**

Client: Leitrim County Council Service, Consultant: Cogan Shackelton Consulting Engineers, Architects: Murray O'Laoire Architects Value: €2.900.000, 1280 m<sup>2</sup>

The county library in Ballinamore, County Leitrim consists of main public library, local studies, genealogy section, county archive, office accommodation, community function section, meeting rooms, exhibition area and multi-purpose room. The construction process required the demolition of the existing two-storey town centre building and the construction of a new two-storey / part three-storey on the full footprint of the site. The key feature of the project was to provide a building sympathetic to the surrounding town centre buildings. This was achieved by the use of natural lighting, glazed courtyard and punched hole window with rendered gable walls and varied storey heights of the individual building with feature zinc and natural stone surroundings.

The internal accommodation centres around the central void visually connecting all functions and allowing people the benefit of the natural light.

The building was nominated for the OPUS Architecture & Construction Awards 2005. (<http://www.kilcawleyconstrion.com>)

### **NUI – National University of Ireland, Galway Information Technology Centre, Galway – Ireland 2001**

Client: National University of Ireland, Galway , Contract Size: 4,800 sq.m. , Contract Value: €9.5 million

#### **Awards:**

**RIAI Regional Award: Western Region 2002**

**Construction Excellence Award 2001**

The Information Technology Building was commissioned in late 1998 and afforded Murray O' Laoire Architects the opportunity to develop some of the site planning issues and architectural treatment suggested in the earlier Arts Millennium Building on the NUI, Galway Campus. The building was intended to meet the teaching and staff requirements of the rapidly expanding I.T. Department at the University, providing under-graduate computing laboratories, post-graduate and research laboratories, collaborative teaching space, classrooms and lecture theatres; staff offices and common areas in its 4,800 sq.m of accommodation. The Client brief demanded an architectural response which simultaneously: • embodies the accommodation and academic aspirations of the Information Technology Department • presents a new, appropriately treated "public" face for the University on its highly visible eastern flank • terminates the East-West movement axis of the campus at the river frontage • addresses in a positive manner for the first time the very specific physical context of the site and the University's relationship with the river. To provide the physical presence required in achieving these ambitions a number of devices are used to increase the apparent scale of what is a relatively modest brief. In the first instance the footprint is deliberately kept compact, necessitating a minimum of four floor levels. Thus when juxtaposed with the long low slung two-storey monolith of the Arts/Sciences building the increased scale and impact of the new building is immediately highlighted. The use of a podium base with limestone walls, containing the ground floor and plant accommodation, surmounted by a three-storey pavilion further emphasises this contrast in scale and accentuates the stand-alone, independent nature of the building. The podium idea is further developed as a device to anchor the building to its physical context, intervening between the gentle curving sweep of the riverbank and the orthogonal lines of the existing campus buildings. A series of stepping grassed terraces, formed using low random rubble retaining walls which describe the contours of the site and change progressively in outline from that which mirrors the river to one which reflects to the building's footprint. These stepping terraces are also used to draw the eye or indeed the building's users approaching from various directions up to the main entry / concourse level at first floor. The first floor is the level at which the bridge connection to the existing building occurs and which accommodates all of the teaching facilities for university wide usage. It is accordingly the natural level at which to locate the main external entry point and concourse space. The remaining three levels are similarly discrete in terms of function. The ground floor (podium) contains the under-graduate computer laboratories which require ready but not quite as universal access as the first floor teaching spaces. The second floor is dedicated solely to research and post-graduate uses with a range of computer laboratories of varied sizes and layouts. Its segregation from the computing and teaching facilities at the lower levels is deliberate, ensuring a more secure quieter environment at this level. The top floor contains all the staff offices and staff common areas in response to the Information Technology Departments request to maintain its current ethos of encouraging easy interaction between staff members of different sub-departments. The staff accommodation is arranged in a U-configuration about a south-facing terrace with views to the river, City and sea in the distance. A generously proportioned open staircase linked to a large lightwell rises up through the building, giving a datum or point of reference at each floor level. The building occupants are also returned to the river at each half landing on the staircase as an orienting device as they travel between floors that are arranged in a markedly contrasting manner. The lightwell also ensures the penetration of daylight deep into the heart of the building in the primary circulation areas. Ancillary and plant areas are confined generally to marginal or awkwardly shaped spaces such as the underside of the tiered lecture theatres or the podium steps and ramps. The roof level is to be kept free of plant generally given the building's high degree of visibility from most directions, the top of the stairwells providing a small amount of localised plant area within their enclosure.

### **Galway/Mayo IT Learning Resource Centre, Galway – Ireland 1998**

Client: Galway/Mayo Institute of Technology, Contract Value: €20.3 million

Galway/Mayo Institute of Technology Galway, Ireland, The Plan – Architecture & Technologies in Detail (Italy) No. 006, June 2004, pp.50-59

The cooper clad sails acutely project out from the building permitting light to filter into the library area and they also provide a degree of protection from the direct sunlight. >These sails by their form, act as acoustic baffles and internally reflect light deep into the library plan. Framed views are strategically gained at the sail junctions where strip windows are inserted (Murray)

The Galway/Mayo Institute of Technology was established in 1972, and a Master Plan was compiled in May 1998. MÓLA were engaged by GMIT to review the Master Plan and design a new facility comprising a new Library IT Department, 300 and 250 seater Auditoriums, 40, 60, 90 and 100 seater Lecture Theatres, Entrance Foyer and Directorate. The building is zoned into two distinct volumes, Lecture Rooms and Library IT Department. The hub of the scheme is located where the two linear rectangular forms intersect containing the 250 seater Theatre and 350 seater Theatre, Foyer, Café and Exhibition Area. The South edge of this face is flanked by a 2-storey structural glazed screen from which the Café Area and Exhibition Area operate with Galway Bay acting as a backdrop to these activities. The hub lies along the main actual route through the existing College linking the various Departments, Canteen Area, and future Student Resources Centre. This access is emphasised externally by springing a bridge from the Campus

plaza to the main circulation route on the Ground Floor. A landscaped area acts as a buffer zone between the new building and the Dublin Road. Part of this area is dedicated to a Campus plaza creating a public space, permitting a wide variety of Student activities to take place with the new building acting as a backdrop. The scale and treatment of the building creates a specific character and accumulates at the Eastern end with vertical projecting copper sails. The copper clad sails acutely project out from the building permitting light to filter into the Library area and they also provide a degree of protection from direct sunlight. These sails by their form, act as acoustic baffles and internally reflect light deep into the library plan. Framed views are strategically gained at the sail junctions where strip windows are inserted. The concept addresses the desire to create a significant and identifiable form enhancing the exterior image and appearance of the Institute in keeping with its status as a successful, prestigious and ambitious Third Level Institute of Education. (Murray)

## **Scott Tallon Walker Architects, Dublin – Ireland**

<http://www.stw.ie>

### **Libraries:**

#### **National University of Ireland, John Paul II Library, Maynooth – Ireland 2012**

The proposed extension is located to the East of the existing John Paul II Library on the south campus at NUI Maynooth and will result in of 9,995 m<sup>2</sup> of usable floor space. The proposed extension is based on the same planning grid used in the current building and is linked to it with a full height atrium. The form of the extension is similar in terms of height and mass however the proposed extension exhibits a different external aesthetic, a result of the requirement to control the internal environment yet maximise the amount of natural light entering the building yet allowing views out. The external appearance of the design projects a sophisticated elegant appearance appropriate to a new state of the art facility. (Scott)

#### **Dundalk Institute of Technology, Library and Information Resource Center, Dundalk, CO, Louth – Ireland 2001**

4.909 m<sup>2</sup>

The new Learning and Information Resource Centre is sited opposite the new main entrance to the campus on the Dublin road, and was envisaged as a ‘flagship’ building for the rapidly expanding Institute.

A double height entrance concourse functions as the main circulation space, from which link corridors connect to the hospitality training building and the original College buildings. The Concourse areas also facilitate a variety of exhibitions and social functions. The Library on first and second floor is a state of the art facility, with open plan study areas, a quiet reading room, casual seating areas, as well as group study and seminar spaces. A roof garden is located at first floor, which enhances the feeling of space and openness. Light is brought deep into the plan with five zinc clad roof lights, located above light wells in the floor slab below. These are temperature controlled and permit a stack effect cooling of the building. (Scott)

#### **Dublin City University, Library and Library Resource Center, Dublin – Ireland 1995 - 2000**

Client: Dublin City University, Area: 10.400 sqm

### **Awards:**

**2002 SCONUL Library Design Award**

The brief for the new Library required a modern, flexible facility, incorporating the latest advances in library technology and facilities, reflecting the status of the University as a young, progressive, dynamic learning establishment and as a centre of academic excellence. 10,000 sq. m. of floor space has been provided, accommodating 1500 seats, 250,000 books and 50,000 journals.

The building has been planned with a vertical hierarchy with the main library service activities at lower levels and academic activities on upper floors. The central concourse area is roofed with a glazed barrel vault allowing daylight to penetrate to the centre of the building. ‘Study Cells’ on each floor are expressed externally by the projecting bay windows and by the distinctive top lit lanterns at roof level which allow light and natural ventilation to enter the building. (Scott)

#### **University of Dublin, Trinity College, Rowan Hamilton and Biotechnology Building, Library, Dublin – 1990 - 1993**

### **Awards:**

**1993 Construction Excellence Award Special Commendation**

**1993 PLAN Regional Awards Highly Commended**

The principles established in the East End Masterplan and in the construction of the O’Reilly Institute were further developed in these buildings, designed and built under one contract. The Rowan Hamilton brief was for a series of large undergraduate lecture theatres and a science library.

The biotechnology building is a research facility, some of which is commercial leasable space. The section concept of the Masterplan proved itself both adaptable and flexible, so with the constant of the renovated Westland Row houses and the student street behind, new sections were evolved to suit the functional requirements, and a double height colonnade at ground level on the college side was introduced. The cladding, as with the O’Reilly Institute, was in modular etched granite aggregate GRC panels. (Scott)

## **Shaffrey Associates Architects, Dublin – Ireland**

<http://www.shaffrey.ie>

### **Libraries:**

#### **Johnston Central Library and Farnham Centre, Cavan Town – Ireland 2006**

CLIENT: Cavan County Council

### **Awards:**

**RIA. Exhibition Award**

- **NDA Accessibility through Excellence Award**
- **Public Library Buildings Awards U.K. and Ireland**
- **Mary Finch Accessibility Awards**
- **Highly commended ‘Architecture meets Practicality Award’**

Johnston Central Library and Farnham Centre is a new, three storey cultural and administrative building for Cavan County Council, housing the county library headquarters, central library, county archive and arts office, a new cultural events space, genealogy department, tourist office and council offices. It is located adjacent to William Farrell's fine sandstone Courthouse on the principle street in the town and on the site of the former Protestant Hall. The brief required a building of civic presence which would also be open, easy to engage with and inviting and could accommodate the complex functional requirements of a number of services. Current societal concerns obliged a serious engagement with more sustainable design and construction solutions to reduce the demand on high energy service installations and informed a decision to apply both the latest innovations in low energy technology – geothermal heat pumps, low energy lighting solutions - while also adopting an integrated approach where the building itself is designed to maximise natural ventilation, natural daylight, etc. The societal imperative was also driven by Cavan County Council to produce a building which incorporated the latest best practice standards of accessibility for all. The design process involved intensive early and ongoing consultation with the client including upfront research and joint visits to similar building types. A collaborative approach to design development was pursued in an endeavour to produce integrated structural and service solutions. From the outset careful consideration for the needs of all users, with particular thought given to those with disabilities, was a strong objective of the client and the brief. Thus, the building is designed to be legible and easy to use with level access to the principal public facilities and generous lift and stair access to upper floors. Materials have been selected for their acoustic and tactile as well as visual qualities so that those who may have one or more of their senses impaired will still have sensual enjoyment from their environment.

During both the design and construction stages consultations were held with representatives of the NDA and with the local Cavan Library Advisory Group which includes local people with disabilities and professional occupational therapists. Out of these consultations came approval and development of such design solutions as the brass tactile warning strips to front stairs, tactile limestone at external entrance area, the non-standard provision at the ground floor accessible toilet, control of lighting quality and levels internally and externally and, other solutions to meet the universal access prerogative.

The Farnham Centre and Johnston Central Library is a recipient of the inaugural National Disability Authority's Excellence through Accessibility Award..

Architecturally, the building design has attempted to respond to all the above and a practice interest in the inseparability of building craft and design craft to produce a building which will endure well. At the centre is the atrium, which acts as gathering space linking physically and visually the different functions distributed within the three floor levels and enabling people on all floors to experience the length, breadth and depth of the building while enjoying the benefits of fresh air and natural light.

The building steps back to accommodate the mature Horse Chestnut trees – survivals of the original Protestant Hall complex which chart the seasons and guard the building - and forms a civic space onto Farnham Street. Materials have been chosen for their visual and textural qualities, with an emphasis on materials which are natural, handcrafted and perform well over time. Light also forms part of the building's palette of materials and consideration has been given to capture the changing patterns of light against the masonry, bronze, glass, over the course of a day and throughout the seasons in an attempt to augment the tactile qualities of the building. The use of lime mortars and plasters throughout - their structural properties allowing the elimination of expansion joints in the long brick elevations - bring added environmental benefits in terms of internal air quality, acoustics and future recycling. (Shaffrey)

#### [Lismore Library Headquarter, Lismore – Ireland 2005](#)

The restoration, adaptation and extension of the former Christian Brothers' Monastery at Lismore, to accommodate Waterford County Library Headquarters and Area Offices. The original building, was built in 1872 and extended in 1930, it is located on a prominent site. Lismore is a town of significant architectural quality. Designing a sizeable new extension to a Protected Structure within an urban context as Lismore, and in such a visually prominent location, was challenging. The requirements of the brief included a large bookstore and processing facility and a number of offices. The approach was to repair and enhance the architectural qualities of the existing building. The architectural solution for the extension traditional materials in a contemporary manner. It forms a long south-facing elevation to the former monastery garden. The varied forms of the extension pick up the rhythm of the complex roof in the historic building. The visual impact of this new element is softened by the copper cladding, and the adjacent mature. The masonry elements of the extension are constructed entirely with lime mortars and plasters/renders—lime chosen for its environmental, structural and breathability qualities. A sedum roof is used on parts of the extension and the entire complex is now heated with a geothermal system. The building has a total area of 750m<sup>2</sup> was completed and occupied in May 2005 following an 18 (Shaffrey)

#### [Shay Cleary Architects, Dublin – Ireland](#)

<http://www.sca.ie>

#### [Libraries:](#)

#### [UCD Newman Library Spatial Integration Concept, University College Dublin, Dublin – Ireland 2010 on design](#)

The project proposes the creation of a multilevel concourse space which will join the Newman Building with the James Joyce Library and in doing so create a new dynamic educational complex for the Arts. The amalgamation of existing structures and new build elements will provide a unique gathering and movement space on the campus. Our proposal looks at this initiative as a significant opportunity to create a hub which can be pivotal to an extensive enlargement of the complex over time obviating the necessity to develop a completely new building for this purpose on other college lands. It is therefore very much in line with the aspirations of the Campus Development Plan 2005 – 2015 in relation to providing accommodation in a more sustainable fashion. In that document higher density is proposed generally along with buildings of appropriate scale for the campus. Our project endorses these aims through the creative reuse and extension of existing built stock and an appropriate increase in scale at the core of the overall campus. (Shayn)

#### [Cork County Library, Cork - Ireland 2009](#)

Cork County Library Headquarters

Cost €23,500,000, Gross Floor Area c.4430sqm

The library is phase two of the Cork County Council Civic Campus. It is the headquarters for a twenty two branch county wide network of local libraries and provides administrative offices and a large book processing facility for Cork. There is limited public access at ground and first floors. The building is L shaped in arrangement with a six storey wing on its western side enclosing a landscaped south facing public courtyard. A two storey horizontal wing encloses the space to the north. The provision of this new public amenity is made possible by locating the large book processing facility and archive storage below the courtyard level. It is lit and ventilated by two landscaped courtyards. The six storey block at ground floor contains the main entrance as well as public functions such as drama and music collections along with a flexible lecture and exhibition space. A double height undercroft at the southern end of this wing provides loading and delivery space for books. There is flexible office space on all the remaining floors.

The library is primarily a naturally ventilated building. It employs a combination of fixed vertical glass louvres and external automatic blinds which provide sun shading and protection from wind buffering allowing the opening of windows in comfort. The facade responds to the local climate ensuring optimal environmental conditions at minimum energy costs. (Shay)

#### **Navan Education Centre, Navan-Athlumney – Ireland 2000**

This building provides facilities for in-service training of teachers. It consists of a series of meeting rooms and a main seminar room, state-of-the-art library/resource room, an IT training suite and administration and general social areas. These various elements are expressed as individual volumes, joined by a glazed foyer and a two storey linear circulation space. The most significant space is the main seminar room, which is expressed as a large volume over the main entrance, addressing the north-west corner of the site nearest the town. The foyer/social area - the first space which one enters - can be used for informal gatherings, and it is glazed towards the existing stone perimeter stone wall. The remaining accommodation is organised around a double height, top lit circulation space with the larger rooms on the western side and the smaller spaces facing eastwards towards an earth bank. Parking is placed towards the northern boundary and is surrounded by planting. A triangular lawn space is formed between the building and the earth bank. The building is finished in a smooth render. (Shay)

#### **Blackrock Education Centre, Dún Laoghaire, Dublin – Ireland 1997**

2.000 sqm

This was the first purpose built in service training building for teachers to be commissioned by the Department of Education & Science. The project creates a private inner courtyard, around which are grouped the various elements of the programme. Entry to the building is via a smaller outer courtyard which establishes the transition from the campus to the more private world of the centre. The first and most open part of the entrance hall is addressed by the elliptical seminar room, the library and the administration and director's office suite. Leading off the foyer is a linear circulation/meeting area which looks onto the courtyard. It also serves the group rooms, which can be interconnected in a variety of combinations. The library, with its reading area is also expressed as a special element. The final, most private side of the garden is formed by the research base which looks back towards the entrance foyer. The courtyard is of rolled gravel and is planted with specimen trees. It is a tranquil space, acting as a focus around which the elements are placed. Externally, the building appears as an amalgamation of various forms around a walled enclosure, with trees visible from the outside. The external finish is an off-white render, rather like the colour of Portland stone. (Shay)

#### **Arthouse, Multimedia Centre For The Arts, Dublin – Ireland 1995**

Project Particulars, Cost €3.100.000, Contracting Authority Temple Bar Properties Ltd.

##### **Awards:**

Regional Award 1997

Arthouse is a four storey over basement building incorporating an existing 19th century house. It houses the first Irish multi media exhibition / installation / performance space with full recording facilities and production unit at basement level, a large exhibition area for documentary exhibitions at ground floor, a library, catalogue archives, and networked information resources at first floor. Facilities also include a commissioning agency, a large workshop / lecture room for training and development and a suite of rental offices along with accommodation for artists agencies,

In urban design terms the project forms one side of a new Curved Street which constitutes part of the Temple Bar Framework Plan by Group 91 Architects of which this practice was a constituent member. The building also creates a new end to the long city block between the Curved Street and Dame Street. It has a more transparent centre corresponding to the void of the city block and allows south light to penetrate through the facade to the new street. This central space takes the form of a raised toplit atrium which becomes the focus of the building and which can be opened onto the street for special events or performances. (Shay)

The design of the Arthouse required that it defined one side of the new Curved St. in Temple Bar, and that it gave expression to a new building typology.

With considerable skill the architect has fulfilled both aspirations and created a building of serious architectural quality. The external exposure of the light filled central space connects it to the street and confirms its accessibility. The disposition and scale of wall opens reflect the use of internal spaces. The corners are not junctions but continuations of the main wall plane. With clarity and style the Arthouse makes a significant contribution to the redevelopment of Temple Bar.

##### **Client's Comments**

Arthouse is the first purpose built multimedia centre for the arts in the world. The challenge was huge in both the development of the brief and the design of the building, as there were no role models on which to work. Its architectural merit is not only that it is a beautiful building but that it functions in practice to the best aspirations of its users. (<http://www.irisharchitectureawards.ie>)

#### **Wilson Architecture, Cork – Ireland**

<http://www.wilsonarchitecture.ie>

##### **Libraries:**

#### **Post Graduate Research Library, UCC University College Cork, Cork – Ireland 2006**

Four storey over basement extension to existing Boole Library consisting of 6000m<sup>2</sup> largely comprising of reading rooms and group study rooms providing additional 700 reader places and special collections areas. External materials include oxidised copper, red sandstone and large areas of glazing that overlooks the original Victorian Quadrangle.

### Libraries:

#### **National Library Singapore – Singapore 2004**

Areas: Total gross area (GFA): 51,493 sq.m., Total gross area (GFA incl. parking): 55,565 sq.m., Total nett area (Net assignable area): 30,797 sq.m., Total construction floor area(CFA) 70,686 sq.m., GFA plot ratio : 1:5:2

No. of Storeys: 15 storeys (98 m high) and 3 basements, Client: National Library Board

#### Development Brief:

The Client, The National Library Board (NLB) has earlier established a set of planning principles as the basis for design. These include:

- A place for the people to provide an open, hospitable and conducive learning environment for the people of Singapore.
- A National and Civic Institution with a distinct character, reflecting Singapore's multicultural heritage and its aspirations to be a leaning nation.
- A National and Civic Institution.
- A symbol of NLB's mission and role.
- A fully flexible and functional clear building.
- A costs effective building.
- User friendly, comprehensible to visitors and convenient for everyday staff use.
- An efficient building with integrated systems.
- A building for the tropical climate.

#### General Design Features:

Our design intention is to provide the NLB with a state-of-the-art library design and an innovative library in the tropics that serves as an icon for the region and locality. It is to be a facility that meets the NLB's requirements and objectives, including being a cultural facility and a unique and enjoyable civic place for Singapore.

##### • Planning

The NLB building builtform consists of two blocks that are separated by a day-lit internal street and connected by bridges at the upper levels. The larger block contains the collections and sits over an open-to-the-sky naturally ventilated civic plaza, with promises of 'outdoor' events and cafés.

##### • Builtform

The blocks are a juxtaposition of formality and asymmetry – The curved, smaller block contains the noisier, public activities (exhibition, auditorium, multi-media) that will sit alongside a larger, rectilinear block that houses the library collections. The division of the brief into two halves generates spatial differentiation of what's inside outside and on the other side. It presents the library culture as being more fun, that the building can become an urban motivator for civic activities, that a library becoming a "place for the people".

##### • Aesthetics

The elevations of the building design is an assemblage of sunshading blades (9 m deep at some locations) devices that boldly define the aesthetics for the building besides having daylight shading and anti-glare performance that in totality gives the image of a contemporary climatic-responsive [in this instance tropical] built form.

##### • Urban Design (Plaza)

The internal street serves as a link between two prominent streets (ie. Victoria Street and North Bridge Road). At the heart of the scheme the Public Events Plaza, a communal space that becomes the main focal point of the site and subsequently leading one into the main foyer and library proper. This public space is further animated with Café's, a library shop and possible retail areas. The axis of the street also exemplifies the St. Joseph church across the street by means of framing the view towards the church from the street. Over 6,300 m<sup>2</sup> is designated a 'green space' through out the library that creates urban "Skycourts" providing a positive psychological effect on building users and improving general working environments.

#### Ecological Design Features • Low Energy Design Modes

The Passive design modes strategies used are : daylighting (where possible), good solar orientation and configuration, sunshading, natural ventilation, façade design, building colour and landscaping. These are assembled together into a collective strategy for low energy and high comfort. Most of the library workspaces and collection areas will operate in the Active mode (full air-conditioning and artificial light). A clear acknowledgment is made that comfort is as much a question of lifestyle and perception as it is about cost and energy. Into this blend of the Active and Passive, a third strategy Mixed Mode is adopted, where natural ventilation is supplemented by mechanical means such as fans, in central transition spaces (lobbies, foyers, courtyard). These are supported by airflow and energy simulations, along with predictions of comfort.

##### • Energy Embodiment Analysis of the Building

Significant attention has been paid to the key factors in lowering energy embodiment and lowering environmental impact in the building as compared to the typical office building type. The environmental impact of the National Library Building is lower as compared to a typical office building which is a very positive outcome. The fact that the specs within the library are generally of a greater volume compared to typical conditions is also encouraging. The total energy embodiment was calculated to be 17 GJ/m<sup>2</sup> which is within accepted benchmarks for commercial buildings [ie. between 10 – 18 GJ/m<sup>2</sup>]

##### • Green Materials & Specifications

Our design approach also involves the holistic consideration of the careful selection of materials used in the designed system and the endeavor by design to reduce the impacts of this use on (and its integration with) the natural environment, over the life-cycle of the designed system. The intended use of recycled and reused materials generally such as the carpet wall fabrics and sustainable-forested local timber will reduce impact considerably.

##### • Building Performance & Buildability

By virtue of the simulation conducted on the energy consumption, the National Library Building consumes around 185 KWH/m<sup>2</sup>/annum, which is far more efficient than a typical commercial office tower (210 KWH/m<sup>2</sup>/annum) in Singapore.

Daylighting, sunshading and wind tunnel test (including natural ventilation) studies were also conducted, providing the basis for the façade design and specifications. (Hamzah) see also: <http://www.nlsg>

## Italy

### **2A+P/A Associates, Roma – Italy**

Gianfranco Bombaci, Matteo Costanzo

<http://www.2ap.it>

#### **Libraries:**

### **IED LIBRARY, Rome – Italy 2009**

Client: IED Istituto Europeo di Design, Year: 2009, Size: 400 m<sup>2</sup>, Costo: 100.000 €

The project is the transformation of a car components shop into a library and reading rooms for the European Institute of Design (IED). (2<sup>o</sup>+P/A)

### **Maria Grazia Cutuli School, Herat – Afghanistan 2011**

2000 m<sup>2</sup>, € 150.000

The building is comprised of a boundary line formed by a seemingly random arrangement of modules. It hosts eight classrooms, a double-height library, a secretarial office, staffrooms and a caretaker's house. Both external and internal spaces contribute to the shaping of the educational environment. (2<sup>o</sup>+P/A)

In 2001 Maria Grazia Cutuli, a prominent Italian journalist correspondent for the Milan-based daily Corriere della Sera, was murdered by a group of gunmen who ambushed her convoy in Afghanistan. After this tragic event, her family established the Maria Grazia Cutuli Foundation that aims to support programs on the fields of education and social promotion, for children and women, in those countries devastated by war or natural calamities, especially in Afghanistan. The beauty of the landscape, described in Maria Grazia's articles, gave us initial suggestions for developing the concept. The research for an innovative educational space as an alternative to those models related to the after-war reconstruction emergencies has been one of the key points of the project as well as the design of the outside space as a 'green classroom' and the attempt to use local technologies and construction materials mainly.

**IDEA / CONCEPT:** The school stands on a dry landscape characterized by the brown colour of the soil. Few constructions come out from this flat and dusty territory, as enclosed islands surrounded by border walls. To the north the skyline is defined by the dark Hindu Kush Mountains. The first challenge has been the research of a layout able to match functional needs and evocative spaces. After several meetings supported by lots of sketches and study models, the workgroup chose an articulated layout: a series of linked boxes containing both the classrooms and the connection corridors. The only two-floors volume is the library that acts as a symbolic landmark for the village. The border walls, which were required for security reasons, define, together with the boxes, a complex sequence of voids and volumes. Both external and internal spaces contribute in the definition of the educational environment. Among the classrooms there are small and intimate outdoor spaces where kids can stay, play and relax under the shadow of about fifty trees. The main courtyard, embraced by the building represents, the most relational space of the school. Inside the school area and protected by the walls, there are also different vegetable gardens as a natural extension of the classrooms.

**REALIZATION:** After the first stone setting, the works started immediately and proceeded very quickly. Afghan workers carefully followed our drawings but using different construction processes from ours. We use to build the structural frame and afterwards the walls enveloping the spaces. While Afghani construct all the elements at once, foundation, pillars, walls and only at the end the concrete beams and roof. In a certain way their construction methods are similar to the ones used in Italy for the reconstruction after the Second World War. Every week we received from the work's director, the engineer Taheri, reports, pictures and updates on the percentage of realised works. It was not so easy to control all details at such a distance and thus, at the end of November 2010, three members of the workgroup visited the site to define the last finishing.

**MATERIALS:** The structure of the building is a reinforced concrete frame, closed by solid bricks. All the materials and the applied technologies have been defined according to the local uses. All the façades and the border walls will be painted using different tones of blue. This colour is usually used in Afghanistan and the aim of the project is to create a blue landmark visible from the surroundings. The orientation of the classrooms and the design of the façades have been thought to assure the right amount of daylight and natural ventilation. The windows have been designed as iron frames, painted in red to make contrast with the blue of the walls.

**PROJECT COSTS:** Construction cost is about 150.000 €, including expenses for the realisation of the garden. Maria Grazia Cutuli Foundation has provided for all the funds. The Italian daily newspaper Corriere della Sera will donate fifty computers and the Provincial Administration of Catania is going to grant the realisation of the school playground. The colour fabric Coloroficio San Marco from Venice, donated the whole amount of paintings.

## **5+1 AA Alfonso Femia Gianluca Peluffo, Genoa – Italy**

<http://www.5piu1aa.com>

### **Libraries:**

#### **Biblioteca “Umberto Fracchia”, Casarza Ligure – Italy 2008**

**Biblioteca, ludoteca e auditorium nella ex Villa Sottanis**

**Client: Comune di Casarza Ligure, 581,7 m<sup>2</sup>, € 1.779.000**

The aim of the project is to highlight the quadrangular structure of the building by reducing the number of rooms, in order to obtain larger spaces and eliminate the distribution system of the historic building. The stairs and the external lift will be a sort of “junction” attached to the main structure of the villa, enabling to achieve continuity between external/internal areas (villa/garden). (5+1 AA)

Il progetto per la realizzazione di un nuovo centro culturale per l’infanzia nella ex–Villa Sottanis di Casarza Ligure prevede la realizzazione di una biblioteca, una ludoteca ed un auditorium. A rappresentazione del nuovo centro sono state scelte una serie di filastrocche di Gianni Rodari, che è stato e continua ad essere il più grande favolista del novecento. Attraverso le sue opere, a cui l’edificio renderà esplicito tributo, si può interpretare il carattere culturale e ludico del progetto. Villa, interno, esterno, polifunzionalità, flessibilità, nuovo, preesistente, percorso, sorpresa, pubblico, “domestico”, giorno e notte, sono le parole chiave poste alla base della filosofia/strategia progettuale tesa a chiarire senza perdere, enfatizzare senza declamare, usare senza svilire. Questa strategia è stata sviluppata secondo i seguenti punti:

1. rendere evidente l’impianto “quadrato” a villa, con il nuovo uso, eliminando completamente il sistema distributivo dal profilo interno del manufatto storico.
2. rendere continuo il rapporto dello spazio interno della biblioteca al piano terra con lo spazio pubblico esterno, realizzando una nuova gradonata che disegna il “piede” della Villa e ne permette un uso più dinamico e coerente con il giardino.
3. definire attraverso l’uso dei materiali (dalla pietra, alla resina, al legno, all’ardesia di copertura), un parallelo “stratigrafico” con la sovrapposizione delle funzioni.
4. realizzare un sistema distributivo come una somma di elementi “giunto” con la villa, elementi “interposti” con l’area di pertinenza (l’avanzamento del corpo scale trasparente e dell’ascensore), ed elementi “ancorati” alla volumetria principale (la scala di emergenza esterna).
5. rendere omaggio a Gianni Rodari, tra realtà e magia.

Il progetto prevede la completa rifunzionalizzazione della Villa attraverso una suddivisione/stratificazione degli spazi che sia in grado di dialogare con il manufatto e con un uso “contemporaneo” dello stesso. La suddivisione dei piani sarà modificata per dare un’altezza maggiore al secondo piano, attualmente più basso rispetto al piano terra ed al primo, prevedendo pertanto l’eliminazione del sottotetto, al fine di realizzare una sala conferenze da 147 posti in uno spazio unico posto sotto la nuova copertura in legno, mantenendo la geometria delle falde dello stato di fatto. Per quanto attiene la divisione interna della Villa (che si sviluppa su tre piani per circa un totale di 600 mq) la scelta è stata quella di mantenere l’impianto planimetrico dello stato di fatto al piano terra, mentre per i piani superiori si è scelto di dare maggior respiro agli spazi, attraverso la diminuzione del numero dei locali esistenti a favore di nuovi ambienti più ampi, considerata anche la loro nuova destinazione d’uso, la versatilità futura e la polifunzionalità che si vuole conferire all’edificio. (<http://www.europaconcorsi.com>)

The construction of a new library has provided the opportunity to recover an ugly building, owned by the municipality and left unfinished since the Eighties, while also radically rethinking the library services themselves. Thus the new library truly becomes a significant social catalyst for the city and its community life. Although subject to severe constraints (the structure first and foremost), the project rethinks the container as made for the content, modifying façades, volumes, morphological and material characteristics to achieve an expressive architecture capable of communicating the new public mission of the building. Everything combines to define the function of a new 'urban condenser': the design, materials and colours of the façades; its wide windows overlooking the street, behind which the spiral stairs wind sculpturally, connecting the floors. As all floors have a small surface area, five levels were needed to develop the structure: to make up for this unfortunate internal articulation and to invite users to explore the whole building, each floor overlooks the adjacent ones and there are double height spaces with overhead lighting. The entrance area (what's new, music and performing arts, topical issues) is located on ground floor and the first underground level; the first floor hosts the children's section; open-shelf areas and reading spaces occupy the second and third floor; at the second underground level there is a conference and party hall and a warehouse. The building is completed by an equipped study room on the first underground floor (with a view of the gardens) and a panoramic reading terrace.

## **Alterstudio Partners, Milano – Italy**

Alterstudio Partners was founded in Milan by Giorgio Faccincani, Marco Muscogiuri and Matteo Schubert in 1996. Micaela Bordin becoming an associate in 2007.

Alterstudio Partners has a dynamic, flexible work structure and is capable of organising its staff as required, creating work and study groups, in order to respond optimally to the different situations of different projects.

Alterstudio Partners collaborates with engineering companies, universities, graphics and communication agencies, architecture companies and atelier, artists, industries, craftsmen.

Alterstudio Partners has collaborated with professionals and experts of various sectors: these meetings are an important part of the working and researching path.

### **Libraries:**

#### **Biblioteca Civica Sondrio – Italy 2013**

Refurbishment of public library, Sondrio, 2011 – 2013, Client: Province of Sondrio, Sector Culture and Municipality of Sondrio, Functional design, design of furniture and interiors, Cost of works: Furnishing and finishing 103.000,00 €

The public library of Sondrio, founded in 1862, has been located since 1936 in the Villa Quadrio. The villa was designed by the architect Adolfo Zacchi in 1913 for Emilio Quadrio and Teresina Tua, who then donated it to the town of Sondrio so that it would become the seat of the library. The project aims to rethink the functional distribution of the library and to replace of most of the existing furniture to make the rooms more flexible and more comfortable, to make the library a place to meet, with a stronger focus on multimedia and topicality. In particular, the large hall on the ground floor and the magazines and newspapers area on the first floor will be completely renovated, with informal seating, shelves arranged on wheels and bistro tables, in order to become the

“living room of the city”, a meeting and conversation place, where to leaf through a newspaper, have a coffee or browse a magazine, read a book or surf the web. (Alterstudio)

### **MedaTeca, Meda – Italy 2008 - 2012**

New library and public archives, Meda, 2008 – 2012, Client: Municipality of Meda, Library gross surface area: 1.910 sqm I  
Cost of works: 1.750.000,00 € I

The construction of a new library has provided the opportunity to recover an ugly building, owned by the municipality and left unfinished since the Eighties, while also radically rethinking the library services themselves. Thus the new library truly becomes a significant social catalyst for the city and its community life. Although subject to severe constraints (the structure first and foremost), the project rethinks the container as made for the content, modifying façades, volumes, morphological and material characteristics to achieve an expressive architecture capable of communicating the new public mission of the building. Everything combines to define the function of a new ‘urban condenser’: the design, materials and colours of the façades; its wide windows overlooking the street, behind which the spiral stairs wind sculpturally, connecting the floors. As all floors have a small surface area, five levels were needed to develop the structure: to make up for this unfortunate internal articulation and to invite users to explore the whole building, each floor overlooks the adjacent ones and there are double height spaces with overhead lighting. The entrance area (what’s new, music and performing arts, topical issues) is located on ground floor and the first underground level; the first floor hosts the children’s section; open-shelf areas and reading spaces occupy the second and third floor; at the second underground level there is a conference and party hall and a warehouse. The building is completed by an equipped study room on the first underground floor (with a view of the gardens) and a panoramic reading terrace. (Alterstudio)

### **Biblioteca Parco Sempione, Milano – Italy 2011**

Refurbishment of public library, Milan, 2010 – 2011, Client: Abaco Forniture sr, Design of furnishing, Functional and interiors program: Sector libraries of Municipality of Milan

Nel rinnovamento della Biblioteca gli architetti si sono trovati ad operare, guidati dal capitolato di appalto del bando di gara, in un edificio di grande valenza storico architettonica. Si tratta infatti di una delle costruzioni realizzate in occasione della Decima Triennale del 1954, il “Padiglione Soggiorno” di Ico Parisi e Silvio Longhi che, terminata l’esposizione, venne donata alla città con funzione di biblioteca. Il progetto intende ispirarsi allo spirito originario con il quale venne ideata, valorizzando al meglio gli spazi interni e risolvendo le criticità presenti. Innanzitutto è stato progettato un bancone suddiviso in due moduli su ruote, che, grazie al loro disegno e alle dimensioni, ottimizzano il poco spazio a disposizione e possono essere utilizzati affiancati o separatamente. Per le novità e le proposte selezionate dai bibliotecari vi sono appositi espositori a torre, anch’essi su ruote, dotati di ripiani mobili e inclinabili. Per gli e-reader è stata progettata una soluzione ad hoc in sintonia con i materiali e il linguaggio degli altri espositori: una particolare struttura su ruote con ante in vetro, dotate di serratura e illuminazione interna a led. Lungo la curvatura esterna della “chiocciola” è collocato il patrimonio documentario, direttamente accessibile dall’utente su scaffali bifronte su ruote, dotati di illuminazione autonoma, ed espositori a torre come quelli dell’area di ingresso. Al piano rialzato vi è l’area dedicata al cinema, alla musica, alla navigazione su internet e alle riviste. Al piano seminterrato vi sono l’ufficio, un corridoio per esposizioni temporanee, un deposito e i servizi igienici. Particolare cura è stata prestata alla grafica e alla scelta degli arredi di design: dalle linee eleganti, leggere, contemporanee, ma al contempo non distanti dal design anni Cinquanta che ispira l’architettura dell’edificio. Tra questi, spiccano le poltrone “Orange Slice” (Pierre Paulin, 1960), ad esso coeva. Grazie a questa ri-progettazione del lay-out distributivo è stato creato un luogo che permette la massima flessibilità d’uso, consentendo di organizzare diverse attività in momenti differenti e in futuro di ripensare facilmente la distribuzione funzionale di spazi e servizi. (Alterstudio)

### **Biblioteca Civica, Prato – Italy 2007 - 2009**

New public library, Prato, 2007 – 2009, Client: Municipality of Prato, Archiplan srl, Consultancy for allocation, interiors and furnishing design, based upon a project by Archiplan srl, In collaboration with Archiplan srl (architectural project), Dr. F. Neri (library and librarian programme director), and the architects D. Cesaroni and G. Nobiloni (librarian consultants) Library gross surface area: 2,660 sqm, Cost of works: Furnishing and finishing 1,850,000.00 € I

The reuse of former shearing factory Campolmi (half of which is already hosting the Textile Museum) becomes an opportunity to radically rethink the library itself and its organisation. The functional design and design of the furnishings aims to reconcile the extraordinary architecture of an industrial heritage building and the innovative architecture of the library services, aiming at a tight integration of the various planned activities (information, education, research, creative use of leisure time, recreational and social activities), and to bring out the distinctive features of the librarian programme (multiculturalism, availability of significant special funds, advanced reference service, highlighting multimediality and the integration of paper and digital documents). The distinctive features of this project are many. The wide entrance hall has been conceived as a large ‘Market Place’ (following a suitably laid-out ‘three-level’ model), welcoming and informal, with shelves and displays on wheels, multimedia workstations, a cafeteria and a large desk for staff (information, loans, etc.) designed as an interactive installation, with video screens and interactive boards. Other such information and reference desks are to be found throughout the library. In the reading rooms the open-shelf collections are organized by themes, disrupting the Dewey Classification. An ‘Art and Creativity Area’ is to be set up on the first floor, where all art, music, and performance-related materials are gathered in one room, to foster the development of creativity. This aim will also be pursued through workshop stations equipped with dedicated hardware and software that will enable users to experiment with artistic creation in the fields of music, visual art, graphics, web design and video-art. (Alterstudio)

### **Biblioteca Comunale, Paderno Dugano –Italy 2006 - 2008**

New municipal library, Paderno Dugano, 2006 – 2008, Client: Municipality of Paderno Dugano, Consorzio Sistema Bibliotecario Nord Ovest, Consultancy for architectural design and furnishings of the new library designed by the architect Gae Aulenti in collaboration with: G. Stefanini e R. Clerici – Consorzio Sistema Bibliotecario Nord Ovest and B. Bruccoleri, F. De Ponti and S. Candido -Public Library of Paderno Dugano, Library gross surface area: 2,750 sqm; auditorium, exhibition spaces, offices and commercial activities: 1,250 sqm, Cost of works: construction works, structures, and library facilities 3,806,590.00 €; green spaces, structures, and facilities cultural centre 2,723,505.00 €; library furnishing 484,004.00 €; furnishing of auditorium, offices, and exhibition spaces 160.129,00 €

A new centre for the town, with a library, an auditorium, business and residential spaces, and a porticoed square. The library itself, built in exchange for a deduction in urbanisation costs on a design by Gae Aulenti, stretches lengthwise between the square and the railway, opening towards the former with green courtyards and wide glazing, and raising against the latter its tall walls punctuated by windows. The use of bricks and sheds and the building typology are all intended to evoke the industrial buildings of the pre-existing factory. Inside, a series of wide rooms of various sizes, connected by a full-height gallery with overhead lighting, are re-interpreted by the allocation and functional design to adapt it to the librarian programme drafted by the Municipal Cultural

Service: the underlying idea being that of the library as an information centre and a place of social aggregation, flexible and capable of meeting the manifold needs of the various users who will also inhabit its spaces, and far from the traditional notion of a library solely made up of rows of books and study tables. (alterstudiopartners)

### **Libraries:**

#### **Biblioteca di Maserada sul Piave, Maserada (TV) – Italy 2009**

amaca architetti associati - monica bosio, martina cafarò, marco ferrari, carlo zavan, viale monfenera, 14 Treviso (TV), Italia

Tel: 0422 210029 - Fax: 0422 210029 [amacassociati@amacaarchitetti.191.it](mailto:amacassociati@amacaarchitetti.191.it) -

The competition project included the refurbishment of the central areas of Maserada with the proposal for placement of a cultural center, consisting of the new Library, the Museum of Nature and the Great War Piave, multipurpose space for temporary exhibitions and an auditorium. It followed the commission for the final draft and the only enforcement Library, 650 sq.m., is characterized as multi-cultural area near the gym to achieve within the existing campus school. A great cover that defines an inner space characterized from the joint articulation of internal gradients and volumes that emerge from the façade. Overall, the building contains reading rooms divided by age, the newspaper, the toy library, media library, the room for youth associations and the music room. Each area is divided by walls at different heights that create security and privacy when required, but provide insight into the space in its entirety. Beside the input more transparent and structured contrasts the east side, to which 'will support' subsequent expansions, characterized in the "wall of books" continuous, containing up to 3000 volumes, which scans and articulates the space of various reading rooms. New Library Maserada entitled to the writer Mario Rigoni Stern, was inaugurated April 18, 2009 and open to the public. (<http://www.europaconcorsi.com>)

### **Libraries:**

#### **La Nuova Manica Lunga della Fondazione Cini (New Long Sleeve Cini Foundation), Venezia – Italia 2005 – 2009**

1.164 m<sup>2</sup>

The ancient Benedictine dorm island of San Giorgio Maggiore in Venice turns into a major center for use book and documentary. Yesterday, the Fondazione Giorgio Cini officially presented to the City "Long Sleeve", the new arm of the library complex housed in the former dormitory of the Benedictine monastery designed by the late John Buora 400. L 'intervention functional restoration bears the signature of the architect Michele De Lucchi, who won the 2005 international design competition "Long Sleeve, New Library." The project involved the restoration of the corridor's Long Sleeve with the construction of shelves and on the ground floor gallery, reception, workstations for multimedia consultation, lounge areas, meeting and conference rooms, and the recovery of the treasure room, the ' office of the curator and the cells use to store. With over 1400 linear feet of shelves, of which 1000 are on open shelves (about 100 thousand volumes), New Long Sleeve is now the heart of the library complex of the Cini Foundation. "The great hall is transformed into the library, taking inspiration from Longhena - explains Michele De Lucchi - with open shelves in the whole extent of the walls with tables for consultation in the middle. A second level is made with a balcony which is accessed by stairs ramp directly placed on the heads side of the North and South and central transept. The structure and shelves are made of metal. The perspective effect is so marked by the doubling of the lines leading to the horizon without changing the visual impact of the room. To maintain the presence of the small cells, the same is repeated on the front of the shelves. The surprise of the unusual size of the ports has been highlighted by this framing created by another wooden doorway that, besides having the function of supporting the balcony of the second level, produces a new perspective effect with a small door inside a larger door. The central space may remain empty and so essential, with only long tables needed for consultation: other tables are available in some cells for meetings, meetings, conferences and media activities. In the cells towards the Bacino di San Marco are arranged service functions to the library: librarians' offices and consultation rooms are arranged in the central area for obvious reasons of security and control. The cells are designed all the same reconstructing the original monastic effect even where the partitions have been killed and large rooms have been realized. Are lined with shelves and used for as low as possible: the shelves covering the entire interior walls, leaving gates as big as those of input, to connect cell to cell in the center of the partitions and all aligned with each other. The arrangement of shelves along the walls of Central Hall maintains the historical perception of the unity of the environment and further criticizza the static condition of the building because the weight is placed against the walls. The lighting of the New Long Sleeve is designed with the criteria of "territoriality", which really serves to give light and to avoid a spread of light which prevents the concentration and study. The center aisle was dedicated to the use of illumination directly be integrated into the shelving, made of LED lamps equipped with fire extinguishing system, placed at the top to make it more convenient consultation possible and illuminating to read the titles only interested party. The fire protection systems are integrated into the lighting supports and disappear completely from sight. The light is placed on the tables on special fixed structures and directed straight to the floor. In cells instead adopted a solution to ceiling with recessed lighting with energy-efficient light sources. " The official opening of the New Long Sleeve - scheduled for January 11, 2010 - will be an opportunity to reactivate all the other areas of the librarians of the Foundation, including the historic Library of Longhena temporarily closed for reorganization of the materials. The opening of the new library will also result in the arm symbolic inauguration of the International Centre for the Study of Italian Culture Vittore Branca, future international center of humanistic studies in the residential facility (90 beds) will be inaugurated in June 2010. ## **Walter Angonese Architekt, Caldaro (Kaltern) – Italy**

<http://www.angonesewalter.it>

### **Libraries:**

#### **Biblioteca Caldaro (Kaltern) – Italy in design**

Nach vielen Jahren des Wartens besteht nun für die Öffentliche Bibliothek Kaltern die Möglichkeit ein neues Haus zu bekommen. Das Siegerprojekt wurde vergangene Woche ermittelt. Das Projekt von Arch. Walter Angonese hat die Jury überzeugt. Das Bauwerk mit seiner innovativ gestalteten Architektur soll zu einem sichtbaren "Haus des Buches" werden. Dabei werden Elemente des Ensembles, in welchem der Bau eingebettet sein wird, aufgegriffen und neu interpretiert.

Die neue Bibliothek wird von zwei Seiten zugänglich sein: vom Ortszentrum über die Goldgasse und vom Parkplatz Trutsch.

#### **Municipio e centro culturale, Figline Valdarno (FI) – Italy in costruzione**

Committente Comune di Figline Valdarno, Prezzo € 4.000.000, Superficie Costruita 3.010 mq

Collocato nel settore sud della città murata, l'intervento interessa la trasformazione di un ex-edificio scolastico costruito nei primi anni del Novecento. Il progetto riguarda la realizzazione di un centro polifunzionale: biblioteca, archivio, museo dell'Antica Spezieria Serristori, gli uffici comunali e la sede del Municipio. Il nuovo corpo di fabbrica mantiene l'originaria configurazione a "C" accentuata dal prolungamento delle due stecche preesistenti ma conquista un diverso ruolo urbano attraverso l'inserimento di un'ampia copertura a sbalzo – sugli ingressi dalla strada e dal parco retrostante – e una torre che definisce un nuovo landmark per la città. L'articolazione funzionale evidenzia la suddivisione in due parti che distinguono gli spazi lavorativi per gli uffici dell'Amministrazione – al primo piano e nella torre – da quelli pubblici, concepiti – questi ultimi – come estensione del piano terra alle piazze coperte sottostanti i nuovi sbalzi, utilizzabili per manifestazioni temporanee o espositive. L'intero complesso è reso omogeneo da un rivestimento in pietra naturale che declina in chiave contemporanea i caratteri costruttivi e materici del contesto. (Archea)

#### **Biblioteca Comunale di Nembro (BG) – Italy 2007**

Location Nembro – Bergamo, Project Biblioteca e centro culturale, Client Comune di Nembro, Structures Favero&Milan Ingegneria, Temperature Control Systems Studio Tecnico Zambonin, Electrical Systems Eros Grava, Plan 2002, Realization 2005-2007, Cost € 1.888.250,00; Buuilt Area 1.875 sqm, Volume 11.200 cum  
Contractor Zeral srl Costruzioni edili.

A building erected in 1897, intended as a primary school, that has been used for many purposes over the years, first becoming town hall, then kindergarten and finally consulting room. The request of the municipality was to solve the contingent state of abandon, turning the building into a library, to provide the town with a facility dedicated to education and information of the residents. The strategic position in relation to the urban tissue, the architectural character of the original structure, closed on three sides, and the need for new spaces oriented the project towards the addition of a new wing in the form of a new construction that closes the only open side, that once faced a courtyard. The new building, connected via the basement, is separated from the existing structure on all sides, thus underscoring a difference that, in spite of the communicating plan, bears witness to a constructive and formal choice that establishes a dialectic contrast with the historical character of the original building; completely transparent, it is characterized by its surface, made of terracotta elements measuring 40x40 centimeters, glazed in carmine red, supported by a structure made from coupled steel profiles. This building technique has made it possible to screen and filter the sunlight. The choice of earthenware has been suggested precisely by the typical characteristics of the material, its performance as a screen protecting from light and its link to traditional building methods, but also by the contemporary image created thanks to the assembly technique and its durability. A large room with computers available for consulting is located in the basement, which also provides access to the new building and its reading room that contains, in the manner of a casket, the precious books available for consulting; the triple height is exploited by two projecting mezzanines housing numerous reading desks, while the main study rooms are located on the ground and first floor of the old building. (Archea)

#### **Biblioteca e Auditorium di Curno (BG) – Italy 2009**

Location Curno – Bergamo, Project Biblioteca e auditorium, Client Comune di Curno, Structures Studio Myallonier, Systems Studio Armondi, Plan 1996, Realisation 1999-2009, Cost € 2.000.000,00, Built Area 1.960 m<sup>2</sup>, Volume 8.200 m<sup>3</sup>, Contractor Viola Costruzioni.

The site for the building of a new public library and a small auditorium with 250 seats has been found inside an existing school campus. The location has suggested the idea of a project centred on the continuity of the surrounding public area. The building, conceived as a kind of open book, is therefore characterized by a sloping roof which is terraced to form stands, and which may be used for open-air events, to extend the public square in front to the roof of the building. The plan distinguishes the activities which pivot on the rectangular hall of the auditorium from the areas of the library, whose perimeter consists of a longitudinal outline characterized by the jagged geometry of the external facade. The line of demarcation and communication between the two areas takes the form of a new urban itinerary, a triple-height void paced horizontally by a system of split levels which in their turn serve as communication paths, and vertically by a succession of uprights which structure the entire wall as container case of books. The materials, which have been reduced to the essentiality of an untreated concrete mixed with colour, have made it possible to mould the vertical surfaces as the pages of a conceptual book, engraved here and there with letters. (Archea)

#### **Biblioteca Civica a Chicasso nel Movicentro – Italy 2007-2011 in corso**

localizzazione: scalo merci ferroviario di Chivasso, committente: Comune di Chivasso, importo opere: € 2.534.443, superficie utile: 1.800 m<sup>2</sup>

#### **Biblioteca Civica a Cologno Monzese –Italy 2010**

#### **Biblioteca Comunale a Fiorano Modense – Italy 2006-2011**

Committente: Comune di Fiorano Modenese, importo opere: € 3.025.130, superfice utile: 1.408 m<sup>2</sup>, collaborazioni: Studio Buonomo Veglia

Il 1° ottobre 2011 è stato inaugurato il un nuovo centro culturale polifunzionale di Fiorano Modenese, che unisce in un'unica sede la biblioteca, la ludoteca e l'archivio comunale.

Realizzato con una spesa di poco più di 3 milioni di euro finanziati interamente da Fiorano Gestioni Patrimoniali, società con partecipazione unica pubblica, il Bla mette a disposizione della città 1.700 nuovi metri quadri all'interno di una struttura costituita dall'intersezione di due corpi parallelepipedi a uno e due piani fuori terra.

All'interno, un processo progettuale condiviso ha creato spazi in grado di soddisfare le richieste dei bibliotecari e del Comune, soprattutto l'unificazione dei servizi e l'ottimizzazione di spazi, funzioni e personale, e ha permesso di definire alcuni principi guida. Innanzitutto la chiarezza

architettonica, ottenuta in un edificio che accorpa volumi dalle forme semplici e predilige la posa di pochi e selezionati materiali; la modularità di proporzioni e dimensioni; la semplificazione degli elementi costitutivi; l'industrializzazione del processo costruttivo. Il BLA sorge su un'area di proprietà del Comune, in sostituzione di due ex scuole elementari, ed è concepita su tre livelli: il piano interrato è destinato alle centrali tecnologiche, il piano terra ospita le sale della biblioteca, della ludoteca e quelle dedicate alla didattica, il primo piano accoglie lo scaffale aperto e la sezione di storia locale della biblioteca, oltre all'archivio storico.

L'edificio, con due corpi affiancati a formare un angolo, ricorda la sagoma di un libro e allude all'esperienza della lettura. Con un'anima strutturale in acciaio, la biblioteca presenta un rivestimento esterno realizzato in materiale ceramico locale; Fiorano è fra le capitali mondiali del gres porcellanato, materiale che tuttavia non è particolarmente diffuso nel contesto locale, l'obiettivo dell'Amministrazione era quello di promuoverlo anche localmente attraverso la realizzazione di architettura di qualità.

Le tre realtà culturali, biblioteca ludoteca e archivio, fortemente radicate sul territorio, erano finora limitate nella loro funzionalità dalla carenza di spazi; riuscivano, tuttavia, a fornire un servizio graditissimo e richiestissimo dalla popolazione.

La costruzione del nuovo edificio ha catalizzato ulteriormente l'interesse e ha consentito maggior affluenza e migliori servizi per il pubblico, in spazi gradevoli e confortevoli.

### **Palazzo Branciforte, Palermo – Italy 2012**

Palermo. Palazzo Branciforte nel Mandamento Castellamare in via Bara all'Olivella, fu edificato alla fine del XVI secolo da Nicolò Placido Branciforte Lanza conte di Racuja e fu una delle più eleganti dimore di Palermo. Alla fine del XVIII secolo i nobili proprietari lo abbandonarono per trasferirsi alla Marina e l'edificio fu acquisito dal Monte di pietà che lo utilizzò come filiale del «Banco dei pegni dei poveri» per custodirvi i beni non preziosi. Nel tempo il Palazzo è stato più volte manomesso: durante le guerre dell'Ottocento e del Novecento, ha subito bombardamenti e gravi danni. A fine anni novanta è stato acquisito dal Banco di Sicilia che ha apportato modifiche alla struttura realizzando diversi corpi aggiunti e suddivisioni interne. Da dicembre 2005 è divenuto proprietà della Fondazione Sicilia che, sotto la guida di Giovanni Puglisi, nel 2008 ha dato finalmente il via al restauro affidandone il progetto allo studio di Gae Aulenti.

L'intervento s'inscrive nel solco del dialogo culturale tra la Lombardia, il Veneto e la Sicilia che, nel Novecento, ha determinato il restauro e l'allestimento museale di Palazzo Abatellis curato da Carlo Scarpa (1953), e tra 1960 e 1970 gli interventi dello studio BBPR tra cui spiccano Palazzo Amoroso in piazza Santo Spirito, la sede della Banca Commerciale (oggi Intesa) in via Mariano Stabile e la nuova sede del «Giornale di Sicilia» in via Lincoln. Un dialogo che, a partire dall'idea di continuità e dalla teorizzazione del «fare architettura collocando l'opera non sul luogo, ma nel luogo e dunque nella storia», ha dimostrato che il linguaggio dell'architettura moderna può leggere, interpretare e ricucire i frammenti della città antica senza snaturarla e perseguendo, attraverso un uso critico della referenza storica, la via della continuità e dell'innovazione nella difesa dell'autonomia estetica del luogo, della cultura e della tradizione.

Il punto di partenza dell'intervento a Palazzo Branciforte è stata l'eliminazione dei corpi aggiunti nel cortile d'ingresso: scelta che ha permesso la riapertura dell'antica strada interna che attraversa l'edificio connettendolo al quartiere. Sulla via interna si attesta la Cavallerizza dove, grazie alla realizzazione di una maglia di pilastri in metallo collegati a un sistema di travi in fondazione e al colmo, è stato riportato in luce il doppio colonnato in marmo che era stato inglobato nelle murature realizzate per supportare il carico della sovrastante struttura del Monte dei pegni. In questo spazio, restituito alla sua originaria unitarietà, è ospitata la collezione archeologica proveniente dai depositi della Fondazione: oltre 4.700 pezzi in teche antisismiche, aderenti alle murature e disegnate dallo studio Aulenti insieme agli altri arredi.

Sul fronte opposto della strada interna si apre il cortile che ospita una nuova fontana ed è allocata una scuola di cucina con il ristorante in cui sarà esposta la collezione di maioliche prodotte tra Quattro e Settecento; al piano terra trovano inoltre posto la biglietteria, il bookshop e la sala conferenze.

Al primo livello è ospitata la **biblioteca** che renderà fruibile un patrimonio librario di oltre 40.000 volumi. L'importante intervento strutturale ha permesso la realizzazione dell'ampia biblioteca con sala lettura sul cui perimetro si attesta un sistema a due ordini di ballatoi e ospita al soffitto un dipinto murale di Ignazio Moncada. Della biblioteca fanno inoltre parte la sala del fondo Giuseppe Spatarisano, allievo di Ernesto Basile, e la sala del fondo Franco Restivo. Dal piano si accede alle sale espositive dedicate alle collezioni filatelica, numismatica, dei bronzi e a quella di stampe e disegni; alle sale di rappresentanza della Fondazione e agli spazi dell'antico Monte dei pegni che conservano intatto l'audace e labirintico sistema d'impalcature in legno con scale, palchetti, ballatoi e scaffalature costruito dopo il bombardamento del 1848 per la raccolta degli oggetti pignorati. Qui, l'intervento conservativo si è basato sul restauro della struttura lignea e sul consolidamento delle strutture murarie, restituendo lo spazio di straordinaria forza evocativa alla fruizione pubblica, con la possibilità di realizzarvi mostre temporanee. Ai livelli superiori sono infine ospitati ulteriori uffici per il personale della Fondazione, la foresteria e alcuni atelier per artisti che potranno lavorare e alloggiarvi.

Con la sua articolata proposta il nuovo polo di Palazzo Branciforte è un'ulteriore tappa nel percorso culturale della città. Poco lontani si trovano, infatti, il Museo archeologico Salinas, prossimo alla conclusione dei lavori di adeguamento impiantistico e restauro; il serpottiano Oratorio di Santa Cita, il Parco archeologico del Castello al Mare e il Palazzo Abatellis. Inoltre, attraverso la gestione integrata dei servizi, c'è la volontà di costituire una rete con il Museo di arte moderna ospitato nel complesso monumentale di Sant'Anna.

L'intervento testimonia che, grazie alla volontà della Fondazione Sicilia di contribuire allo sviluppo culturale del suo territorio, è possibile realizzare un intervento che coniuga conservazione e innovazione. Vista la sinergia positiva che questo nuovo polo potrà innescare nel miglioramento dell'offerta culturale, c'è da auspicare che il prossimo passo sia l'organizzazione di un concorso d'architettura per la realizzazione del nuovo Museo di arte contemporanea, di cui a Palermo si sente sempre più la mancanza.

#### **Libraries:**

#### **Torino Cultural Centre, Torino – Italy 2006 – 2010**

600.000 m<sup>2</sup>, € 176.000.000

Project guidelines: The library is located along the north side of the site in order to have it facing entirely over the park and receiving ideal indirect light. The big theatre building is designed within a double courtyard linked by the outlines of the pre-existing industrial complex, the layout of which will be maintained as a memory of this area of the city. The gallery lobby, public, covered and air-conditioned, crosses the site from east to west along the footprint of the original building and will serve as a strong ordering and connecting element. The Belvedere occurs as a natural, albeit extraordinary accentuation of the layered, undulating facade of the Library. It leans out in the form of an upward spiralling tower which finishes 40 metres above with a glazed viewing platform. The vertical connection systems of the Foyer lead to the Open Air Theatre which is located on the roof of the main theatre. The stepped stage is connected by a catwalk bridge to the great Belvedere Terrace above the Library. The new Public Park is integrated in and connected to the internal accesses of the new Cultural Centre building and is closely linked to the Library building as well as the outside urban context by means of contemplative pathways which gradually draw the visitor into the Park. #### **Libraries:**

#### **Campus delle Cultura ex ospedale Sant'Andrea (former St. Andrew's Hospital), Vercelli – Italia 1<sup>st</sup> prize 2008**

Emilio Caravatti the winner of the international design competition for the Campus Culture in Vercelli, within the area of 'former hospital S. Andrea. Following a detailed analysis of the large empty space created the dismantling of the hospital, and with constant awareness of the scale of the system, the project was designed to achieve an urban and social destination area. Hence the choice of an imposing structure, built in constant communication with the surroundings. The ratio between the volume and area the size of the existing urban form takes the new urban square, marked by green pools of water that, in their length, enhance the morphology of the near arcade. The new assembly hall and the classrooms will be housed in Hall 18 of the former hospital. The block will generate a lively area around her city's public, to link Viale Garibaldi, the new square and directional flows toward the station. The relational schema of the building keeps the section originated from the neoclassical pavilion. The huge columns of the pavilion "ex 18" leads to the courtyard - a place of connection between the functional units (libraries, universities, parks, cities) - and it regulates access to the public by confirming its strong urban vocation. The university library and public library will instead be located where once stood the female ward and the hospital pharmacy. All volumes are connected by a long porch. A library tower is designed as a "fifth and vanishing point of the square, silent mass of cement mixed with earth tones, leaning in close and complete the continuity of the existing borders. " The area devoted to parking is divided into two parts arising from the presence of so many concrete slabs tilted in opposite directions to each other. (<http://www.archiportale.com>)

#### **Biblioteca Civica, Bressanone (Brixen) – Italy 2010 1. prize**

The competition for the construction of the new public library in Piazza Duomo in Bressanone has a winner, it's the trio of architects Padua Carlana Michel, Luca Mezzalira Pentimalli and Curzio, who have a premium equal to 19,000 euro . See the new cultural function will be the building of the former Finance and portions of the court - both to consolidation efforts - along with a new volume. Second and third prize, amounting to 14,000 euro and 9,000, respectively, are going to study German and Swiss Sturm und Wartzeck MOCA Medine Altiok. The construction costs provided by the municipality amounted to 3 million and 800 thousand euro. "The complexity of 'intervention in the approach between the new and existing buildings, creates a tension between the parties that defines its character: building a "quiet" and identity at the same time, engages in the ordinary buildings of the former finance and the court ... The goal of providing flexibility is expressed in the redefinition of urban access and interior spaces of buildings in order

to satisfy the different demands from 'administration itself. Selecting a few key points of entry can be made completely or only partially permeable space of the library at different levels," the designers explain. Particular attention has been given by designers compared to the modulation of natural lighting during daylight hours of the day. "Direct sunlight is the enemy of the book, it must be controlled and manipulated to avoid the deterioration of paper and at the same time must meet the very essence of architecture. The design choices that effect have been identified in only one direction to fulfill different purposes. The south wall of the building with no interesting sights is rendered completely blind to prevent the entry of direct sunlight on the inside and equipped with a "wall-library" that occupies the full height of the building, a sort of curtain wall that becomes manifest in the library as a repository of knowledge. Priority is given to large holes in places where it is interesting to frame elements of the urban landscape as the bell tower and roof of the Cathedral on one side and the diocesan museum the other two erker of giant order that the extension of the external massing of the building and all 'manifest the internal spatial characteristics typical of Nordic culture, are to comply with the alcove where you can stand to read or admire the scenery. The placement of large windows, which define the limits of space and climate between the interior and exterior, is known from direct indirect, consisting of a widespread and intense beam of light at points where there is greater influx of people and stay within the new library. Another device designed to capture the light, and provide perceptive suggestions otherwise denied, selecting intensity and direction, is to install two large skylights on top of the pitch covering complex. The light passes through the entire building height, reaching the ground floor through a system of retreat of the floors, playing a key role in the system of insights between the different floors of the library, "reads the draft report provided by the trio winner. Another feature of the project is the organization of the sections of the library. The proposal calls for the creation of a double shell perimeter sandwiched between the exterior walls of concrete and wood leather interior, "a kind of bark that surrounds the internal space freeing fully functional from any obligation. It is thus possible to accommodate those who have the need for growth and change over time, typical features of a modern library, complete the projects. (<http://ww.archiportale.com>)

[Civic Centre with Public Library, Auditorium, Offices and Child Care, Ranica \(Bg\) – Italy 2006 - 2010](#)

The civic centre rests in a strategic position half way between the historical heart of the city and the new expansion areas. It will house a civic library, a kindergarten, office spaces and a conference hall. Aim of the project is to set rational connections between the new cultural nucleus, the city centre and the traffic system. The open and public areas become key aspects in the project: an investigation on the meanings of 'piazza' (square) and of 'crossing' has generated the concept of 'ground'. Traditionally, in Italy, the 'piazza' is defined by physical and visual elements that limit its space but it is also characterized by an institutional presence (a city council, a market, etc...), that defines its meaning. his project aims at generating a new form of 'piazza' where the physical boundaries blur into the open space, creating new public spaces that welcome pedestrians, allowing them to penetrate the constructed mass, which is raised above the ground. The centre is organized onto two levels, the perimeter of the first floor juts out by 2 mt. The idea is that of a massive volume, raised above the square level. Underneath the volume the system of connections and public spaces mixes with the system of accesses and internal areas. The lower ground is characterized by a strong permeability therefore the buffer spaces between inside and outside gain strength and importance. Inside, at ground floor, two open air patii cut through the first floor mass to bring light and air to the lower level. The two volumes differ in mass as well as in material: the rendered ground floor is juxtaposed to the lightness of the polycarbonate sheets that define the first floor. The simplicity and integrity of the external volume is subverted in the internal spaces, which become complex in a three dimensional space creating a 'urban scenario', but maintain an explicit and clear internal distribution. The main areas within the public library are defined by volumes that organize the space creating flows and allowing people to orient within the building, just like one orients oneself within a city. In the main hall, balconies, volumes, connecting bridges, all contribute to set an harmonic relation with the inner patio. (DAP)

The recently completed Cultural and Community Center of the North Italian town Ranica, near Bergamo, is a "new piazza" of the town developed. Here are all the functions that need a little community, concentrated in one place: a public library, community hall, a kindergarten and a small dance and theater center. The architects studio DAP + Giaconia Paola (Milan) describe their design - 2005 emerged as the winner of a competition project - said: "The Piazza has always been a place, physically and visually, is limited by the surrounding buildings. With our project we want to blur these sharp boundary between solid and void. "

The new building is located at the interface between the center of the village and a new housing development here and will act as a threshold between old and new. The rectangular building consists of a recessed floor and a far-protruding above floor. Also as regards the materiality of both floors are very different. While the glass floor and therefore is transparent, which consist of colored facades of the upper storey, semi-opaque polycarbonate panels. Inside, the individual functions in different cubes are stored. Several interior patios also divided the floor plan. Also the access corridors and stairways were designed as places that required as a meeting and meeting points of a high quality stay. (<http://www.baunetz.de>)

[Elsa Morante Civic Library, Lonate Ceppino \(Va\) – Italy 2006 – 2008](#)

The restoration and extension of this historical building revolved around the creation of a new building, narrow and long, that runs parallel to the existing one. The complex contains the community public library and some office space. The new building house all service and distribution spaces (vertical connection), this to minimize the demolishing intervention within the historical building. This new volume, also defines a buffer zone between the old and the new, between the historical building and the city: it is a public accessible space, container of information for the community. The dialectic between old and new is the driver of the whole design, and it has oriented all design issues. The dialogue between the two volumes has been reinforced through the juxtaposition of

matter and lightness, solidity and instability, opaque and glazed materials in order to create a foreground/background relationship. The volume of the new building runs very close to the old one on the ground level but then it bends away from it as it develops in height. This choice was made in order to allow more vital space for the old building. The new building is entirely wrapped in light, white, punched metal sheets. When crossing openings the sheet metal overlaps the glazing and the diameter and dimension of the punches increases to allow for more light inside. (DAP)

The building of the Public Library is one of the emerging architectural presence within the urban area of Lonate Ceppino.

The recovery of the historic building, the former Oratorio San Michele is done in accordance with seniority in both design solutions, both in the choice of materials and finishes, all aimed at enhancing the original features of the building. The book, with a rectangular floor plan, is on two levels: the ground floor had housed the headquarters of the existing library, while the upper floor was unused. To complete the structure and the provision of necessary environment was then created a volume expansion parallel to the eastern front, the new volume, which combines in a discreet way to seniority, contains links, vertical service spaces, the warehouse, bathrooms for public swimming for the staff and facilities uprights. This made it possible to adapt the historic building functional needs by bringing out all those elements that would have been more invasive, this choice allowed to minimize the demolition work and has facilitated the sharing of service areas. The operation of adjusting the space to express functional requirements, provides for the elimination of the volume facilities, abutting the east side of the historic building, as expansion of existing architectural inadequate. It 'was also eliminated the staircase and not significantly affected compliance with current standards. The project involved the rehabilitation of the structure acting on the presence of moisture, plaster, floors, roof. Outside, the building features a main front entrance that reads, in the highest part, as a decorative element independent of the structure of the roof, this façade, stands out beyond the eaves of the building. The design of the main front side refers to the idea of an unfinished tower in the end, it is a two-dimensional shape that is not reflected in the interior. The decorative elements are found on the main front entrance door, where both the above are framed by window frames and fit into an overall design of tables arranged horizontally by horizontal bands placed at different heights, while a system of vertical pilasters on the front lines north, south and west divides the sequence of windows on the lower level is higher than that. The east front is devoid of all the decorative elements described and appeared before dell'intervento strongly affected by the presence of a volume containing local service, leaning against the building and new construction. The library features a large open space organized for specific areas: the reference area with a small newspaper near the entrance area, the area children, shelving and tables for the consultation, the upper floor houses a flexible space for conferences and exhibitions. The architecture of the new volume is characterized by a profile that tapers in the top, one side seems inclined to leave more space to retreat to the foot of coverage seniority. The dialectic between historical building and new extension is the key to all the action and is the theme that has guided the design choices. The relationship between the two admissions was played contrasting materiality and lightness, strength and instability, opaque materials and reflective materials. The emphasis of differences enhances the characteristics of both volumes in a mutual relationship of figure and ground. The new volume is designed as a light shell white sheet with holes on all sides. In correspondence with the openings behind the plate overlaps altering its perforated, the holes gradually increase the diameter to expand to pass the light inside. This type of coating generates from outside the image of a loss of consistency of the housing. The historic building and the new extension are connected in a central position by a low block with glass roof, which is located in the entrance area: this allows a greater flexibility of interior space. A link was also provided on the first floor through a volume of fitting fee covered, externally, in wood. Inside the volume expansion is monochromatic, with floor enamel and resin on the walls, while in the historic flooring is oak, the coverage of the original wood floor was restored and consolidated. The ladder and walkway are in white metal and have oak treads. Beyond the first level was built a sloping walkway that leads to a small room lit by a corner window. This small area is the culmination of the particular spatial sequence that develops inside the building. The lighting in common areas, is carried out carpets incandescent ceiling. Spaces of the library are equipped with libraries in wood, designed as modular combinations that develop at different heights. The storage unit is the generating element of the whole interior, has the form of a simple box and is designed to be mounted in order to create libraries with varying elevations and modified. (<http://archinfo.it>)

#### **Restoration of “Spedale di S. Antonio” and Public Library Lastra a Signa – Italy 2006**

#### **Restoration of Industrial Building and Public Library, Castellanza (Va) – Italy 2004**

Part of more extensive plan to redevelop the area, the new Civic Library in Castellanza is housed inside an old industrial building facing onto the river Olona. Together with the outside spaces the entire project acts in the small city like an authentic territorial zip, inevitably bringing together a range of services, not just information but also leisure facilities. So there aren't just reading and references areas but also conversation and meeting rooms, as well as zone serving no set purposes. The project leaves the factory structure exactly as it was: the building is a simple flat-roofed brick body on two floors that has been restored by bringing out its distinctive elements: the brick walls, the concrete decorations, the vaulted roof and the inner light pillars. The new projecting steel bow-windows are the elements that characterize the new intervention creating a strong relationship between inside and outside. They replace preexisting fixtures and are now used for communication/exhibition purposes or as simple coloured light-boxes: the windows, in fact, are characterized by a lighting that gradually changes its colour. The interiors, ranging from the ground-floor conference and exhibition hall to the spacious top-floor library, are shaped like an archipelago of “functional islands” floating in a free structure and standing out through their contrasting colours and materials. But, most significantly, they differ in terms of the times, ways and speed with which they are used, because the project took this opportunity to devise a civic centre from a cutting-edge technological viewpoint, gluing everything together along multimedia lines. Hence there is a polycarbonate “tunnel” for quick consultation at a PC, spaces serving for more in-depth uses and purposes, and the study rooms ensuring greater privacy without losing visual contact. All complementary means that are simultaneously present, enveloped by one single space in which interaction and isolation are shaped along softer lines more than physical-distributional layering, making this facility the result of a custom-designed project geared to performance. The library by the Italian Rationalist Grassi is a subdued affair whose brickwork and vertical window shapes stand it in good stead with the surrounding buildings which include a quartet of monumental houses. The library consists of two elongated portions - a public library and an office section - around an interior court. An entrance pavilion and a narrow terminating block for horizontal and vertical circulation link the two parts. (<http://www.architectureguide.nl>)

with: [Maria Grazia Eccheli](#), Verona (VR) - Italy

The building complex which goes by the name of the Walled, is merely the result of various and successive modifications and structural typology of an ancient convent of cloistered nuns - hence probably the name of Walled - then and now through a radical transformation. Addition of bodies, the male prison in Florence, from the end 800 until the '70s. A few years ago going through a considerable administrative effort and planning by the municipality of Florence the creation of a recovery plan which has already led to the conversion of part of the complex for residential use. The plan was expected to allocate part of the building complex at the University of Florence for your needs. E 'in this context that fits the design of the new library of the Faculty of Architecture. This localization in addition to seize an opportunity, is linked, more significantly, the fact that in the structural plan of the University of Florence across the Faculty of Architecture was deployed in the area east of Florence - Santa Croce district - through in fact, the recovery of other disused prisons: Santa Verdiana and Santa Teresa. The walled part of the overall assigned to the project, involves building and courtyard Y air time, is currently used for parking, which borders the alley Young Italy. All locked up by the high prison walls. This building was built not on the abutments of the convent, but rather in its gardens, is the type most original part of the complex because it is linked, by the book, the archetype of the Panopticon. The building program, a collaboration between the faculty, the designers and managers of university libraries, plans to create a structure that can play multiple roles: conservation, reading, communication, display, etc ... The project strategy was defined in relation to three basic choices which constitute the inner structure of this library: three choices that all point to the seamless integration of existing and new. The first was to re-use the "arms" of the prison as bookshelves, storage in elevation, open for consultation related to students' reading rooms and through small bridges that take advantage of the openings in the sides of the arms themselves. The cells for nearly a century were places of detention, is now transformed into a space of freedom. This act of appreciation has a practical aspect is not secondary because doing so fails to act on the existing light with a restructuring, respectful of the existing technological and typological structure. The second choice is focused on the desire to throw in the high walls of the prison - about 12 m - as part of the library. Starting from the consideration that represent more than a 'chance that a no or just a constraint of the project. Few, but large openings - including the entrance to the Library by Avenues - not a glimpse of the second skin detachment, consisting of metal and glass facade of the new building. This dialogue between existing masonry structure and new metal and glass, in fact, a new role assigned to the prison walls, noise protection of the avenues and support systems for the attenuation of sunlight. From inside the reading room there is a moment where you can recapture the feeling of being within the urban life, the more chaotic, a bay window extends beyond the one great window to the streets. The third choice concerns, employment for obstruction, which volumetric and planimetric, the yard air time - in fact, the obstruction height is confined within the walls, all detached from the existing structures of varying degrees between 3 and 2 meters. This is to make more clear the distinction, from the inside of the reading rooms of what is existing and what is new. Again, the linguistic strategy is probably the daughter of the will and the necessity of distinguishing between the building structures for static and technological reasons. The occupation of the courtyard of air time once again involves an inevitable metaphor for this is the place of mobility, and the rest of the meetings. Three elements and drill vertically through the central volume, three elements that serve as emblematic places of the library: the central square court is formed as a reading room open to the city, the cylinder of the vertical links as a place of physical communication between the parties to ' building, and the cylinder of the conference room and the ramp dell'emeroteca, as a place of cultural communication. These three elements become boring holes in the roof skylights with their volumes and draw a hanging garden of stone. The recovery plan of the Municipality of Florence to establish a link from the

orthogonal paths to the new Piazza Madonna della Neve - born from the remnants of another prison yard. The design of the library takes up this topic and the two opposite entrances to the library as the head of this connection: in this way, the ground floor of the library assumes the value of an urban gallery crossing. The entrance to the library to the Old Lady of the Snows, in this space where residences overlook the recovery and other business and social help, view the daily presence of students, the completion of the square and make a living and dynamic place. The square already has a configuration result of a project of the municipal offices. The new project aims to achieve only a sort of profane at the old entrance to this wing of the prison as a 'ear, a mouth separate from the structure for continuing on and readable seniority (<http://www.europaconcorsi.com>)

### **Libraries:**

#### **Pontificia Università Lateranense, Biblioteca Beato Pio IX, Roma – Italy 2006**

Client: Pontifical Lateran University Chancellor: S.E. Mons. Rino Fisichella, Project: Library Extension- new reading rooms and direct consultation book stacks + Refurbishment of University Auditorium Project, Start: 2003, On site: January 2004, Completion: October 2006, Costs: Building: Euro 7m, Interiors: Euro 1m, Areas: Auditorium: 660 m<sup>2</sup>, Library Extension: 2000 m<sup>2</sup>

#### **The New Reading Rooms and Auditorium Restoration of the Pontifical Lateran University**

On commissioning the project for the new library extension to the Pontifical Lateran University the chancellor Mons. Rino Fisichella was quite clear in his main objective: to bring the activity of reading and the consultation of books as the central occupation of the university.

The new reading rooms and book stacks for free consultation are enclosed in in the new extension placed closer to the heart of the university with access from the main spine of the first floor corridor. The reading rooms are now concentrated in a single volume with access to 70,000 volumes and 750 publications housed in the six floors of book stacks in a fire-protected tower. Externally, the new building is placed next to a central block of lecture rooms of the "E" shaped plan. Although it is carefully aligned with the existing volume and clad in the same brick, the new block nevertheless assertively declares its modernity in the play of suspended volumes in light and shade.

The library's presence can be perceived from the university; through a series of viewing cones created by joining the window reveals (that once gave on to the exterior) to apertures closed with fire glass in the book stacks. It is entered from the first floor corridor of the main building down a flight of basalt stairs under the first level of the book stacks into a spacious foyer. This is where the locker room, computer indexes-laid on an articulated table, card index, professors reading room and librarians posting are set.

The library is arranged so that for every two floors of book stacks one sloping ramp, "U" shaped in plan, connects them. The book stacks are as low as possible to avoid the use of ladders to reach the highest shelves and, given the thin floor slab, are made look like a set of bookshelves themselves. They are connected vertically by a staircase set between the containing wall and an interior façade of bookshelves facing the reading ramps dedicated to publications, to form in effect a book tower. The slope of the ramps is determined by joining the regularly spaced floors of the book stacks to the irregular cuts in the façade which creates the reality (not simply the effect) of volumes floating in light.

These ramps are the reading rooms- they are levelled with mahogany platforms that accommodate the reading tables at the level changes. These are also made of mahogany block-wood and house the up-lights for ambient lighting.

#### **Auditorium**

The main assembly hall was restored to conform to modern safety and comfort standards as well as to incorporate the normal technical specification of a modern conference hall- projection facilities, sound diffusion and acoustic control.

The stepped floor was redesigned to provide safety aisles. A new false ceiling and the panelling to the side walls incorporating the black-out system for the existing windows and new seating complete the new design. The curved ceiling expresses an almost elastic quality especially in the treatment of the proscenium architrave defined as a frame pushing the surface into a double curvature. Either side of the stage the entrance doors are completely flush with the plane curving down from the ceiling. The side walls have been clad firstly with a layer of sound absorption panels and then a series of vertical wooden planks set at varying angles to produce a kinetic wave effect. In correspondence with the windows the planks rotate about the vertical axis to regulate the natural light. Considerable care was taken in the design of the seats. The idea was to achieve a rounded form derived from a moulded upholstery filling. In this case the module is made up a single arm/backrest with the join between modules in the middle of the backrest. When it came to final production Poltrona Frau decided to adopt a more traditional technique, especially for the upholstery filling- and presented a superbly crafted leather armchair, multiplied by 560. ### **Libraries:**

#### **Biblioteca di Legnano – Italy on design**

3.000 m<sup>2</sup>

Today May 22, 2008, at the hall of the Municipal Council, the jury announced the results of the design competition aimed at producing the new Public Library of the City of Legnano. The winning project of Lombardini22 is characterized by a strong integration of the library with the Park and is able to bind the two parts of the city, Legnano and the so-called Oltresempione, with a rich system of pedestrian and road network that add quality to the system of social relations between the historic center and the expansion of the city. The Library acts as an open book on the city, building a porous, cross. Thanks to the plan at court typical Lombard it, opens onto the park and embraces it, creating a strong dialogue and emotional space. Library and park in Legnano interact giving a place of interests, where the quality of life depends on the synergy between the green in this city and the architectural quality, creating a new figure of values and beauty. Integrated into the urban fabric and using the most sophisticated technology, the structure comes from a great awareness of environmental issues. The structure of the building, low and integrated with the park and the surrounding land, is thought to play a regulatory and normalizing effect of the microclimate of the city. The coverage in plant mass, as well as improve the thermal insulation of the building, while playing a draining effect creating a slow release, reducing the risk of flooding, increasing the amount of oxygen, humidity and thus the cooling reducing the presence of carbon, the level of suspended particulate matter and noise of the city. The creation of open space-to-ceiling allows natural ventilation inside the building, fullheight spaces and openings in the northsouth and east-west bringing together volumes of air with different temperatures, that will regulate the temperature through the roof openings motorized and controlled by temperature sensors. The separate collection of waste, recycling water, energy saving heat and electricity, the use of public transport and bicycles were the thoughts behind the design. Great satisfaction in Lombardini22 announcement the victory, with an increasing background

noise and big hugs and compliments through Architect Alessandro Longo, who has guided and inspired the project team “It ‘a result of which we are proud,” says Paolo Facchini, president of Lombardini22”. Today we are talking about us through the architectural quality of our projects, not only for the integration, time and costs that are always on the basis of our approach. It ‘a fine time for this property which has just approved a positive financial year 2007 and that momentum has started 2008 with a series of prestigious appointments”. ( Lombardini)

Porzia Bergamasco, “It ‘s time to read”, in “Casamica” (Italy) March 2012, n.1, p.69 Presentation of the new library at Maranello, built according to criteria of sustainability and energy savings

Porzia Bergamasco, “Projecting Culture”, in “ATCASA.IT” March 2012 Surrounded by water, this building developed by Arata Isozaki and Andrea Maffei is a multipurpose space to store books for a recreational and cultural entertainment

The MABIC replaces a former warehouse, which have maintained the perimeter walls and lies in adherence to some residential buildings. The library, protected by a transparent curvilinear skin, on which is grafted the matt block containing the support functions, engages in the old volume. The cropped area between the glass facade and the perimeter wall is occupied by a body of water, which extends north to the road. The access, covered by a canopy with a triangular section that continues the organic shape of the building, is located to the west, overlooking the new square.

The building on two floors, including a basement, occupies a gross area of 1062 square meters.

A first filter area, the lobby, home to centrally scale, through which you access the multifunctional room, located downstairs, well maintained independent of the library itself. Inside the lobby, next to the entrance, are also located the bank loan and the desk of “Maranello Terra del Mito”, and, on the other side, the newspaper library and the local culture area. The hall leads directly to the service functions, such as wardrobes, toilets and office, and to the toy library also accessible from the consultation area, as well as the office. Along the corridor is also located the elevator, which leads to the underground space.

A second dual access, cut inside of the glass wall, leads to the main rooms of the library divided by age. A central double-sided shelving system scans the space separating the areas for young people from the encyclopedic area, intended for mature audiences. The stoneware colored floor planks and the white furnishings combine to create a diaphanous and absolute space, in which books and encyclopedic volumes, also distributed along the curved wall, become the predominant elements. The transparent wall provides great natural light in the reading room, supplemented in internal areas with skylights. The artificial light, produced by energy saving fluorescent lights, integrated by LED lamps on the tables, enables an increase by stages of artificial lighting in order to limit energy consumption.

The outer tub water constitutes the element of interconnection between the perimeter squared existing walls and the MABIC’s curved surface. On the bottom of the tank, as on the roof, there is a layer of white gravel, which reduces the “heat island effect”. The completely vegetated outer walls, acting together with the water, provide for: the improvement of microclimatic conditions, air purification, noise mitigation, as well as psychological and social benefits. The basement, also accessible by lift, in addition to the multipurpose room equipped with storage, hosts a video and music library, a reading room, toilets for the public and staff, and technical spaces. The multipurpose space is illuminated by spotlights LED rails.

The air conditioning system exploits a geothermal plant, which covers the primary energy for summer cooling by 85% and the primary energy for winter heating by 93%, savings more than the 45% energy summer consumption and the 30% in winter, compared to a heat generating methane gas. A solar panel system provides more than 50% of domestic hot water.

The building also features a system of disposal/collecting rainwater used for irrigation. (Maffei)

## **MDU Architetti, Prato – Italy**

<http://www.mduarchitetti.it/mdu.html>

### **Libraries:**

#### **Biblioteca Comunale, Greve – Italy 2011**

This is the dawning of Greve in Chianti (FI), the New Library Town of MDU Architects, a young studio consisting of Prato Valerio Barberis, Alessandro Corradini, Cristiano Marcello Marchesini and Cosi. The project, covering a total area of 400 square meters, was born from the desire to create a structure capable of responding to the growing and increasingly diverse cultural demands of the capital and surrounding areas. The purpose of the library of Greve, whose implementation will end next year, will be to establish itself as a new central meeting place and public as well as a site responsible for the performance of specific cultural activities, a significant element in the urban and social fabric of the country with a highly recognizable image and its representative of a public institution. The architectural image of the library is due to only two themes: the “soundness” of the base consists of blocks of travertine, and the weight of the overlying clay volume. The base, it is heavy, durable, solid, but inside is a big double-height entrance hall, information desk and lending and a large two-storey high racking divide this space from the office administration and other intended for local cultural activities and entertainment. Upstairs, inside the brick volume, is the reading room (255 square meters), overlooking the central void to full height, ensuring the performance of different functions in separate domains but visually communicating with each other. In the reading room of the dose of natural light, and its diffusion in a harmonic way, is through the

Eingang zum Platz und mit der Hauptschaufseite auf den Schulhof orientiert ist, sind die „lauten“ Bereiche untergebracht wie Kinderbereich und Zeitungen. Über eine Treppe im Luftraum erreicht man das Obergeschoss, das in seiner Haupterstreckung quer zum Erdgeschoss liegt und die ruhigen Bereiche der Bibliothek beinhaltet. Zweigeschossige Fensteröffnungen an der Ostseite zum Platz und an der Nordseite sorgen neben zwei Fensterbändern im Süden und Norden für die notwendige natürliche Belichtung. Die großformatigen Öffnungen sollen die Bibliothek nach außen hin sichtbar machen und deren Bedeutung als öffentliche Bildungseinrichtung vermitteln.

#### Konstruktion

Das neue Rathaus wird als „massives“ Gebäude ausgebildet, in Anlehnung an die Massivität der umliegenden Gebäude. Putzfassaden mit großformatigen Öffnungen, teils bündig in der Fassade sitzend, teils tief ins Mauerwerk eingelassen, betonen die Materialität und bestimmen das Erscheinungsbild. Die Fensteröffnungen sind vorwiegend nach funktionellen Gesichtspunkten gestaltet und schneiden den Baukörper als Fensterbänder dort auf, wo es vom Grundriss her notwendig ist. Ein Lichtschlitz in der letzten Decke über Treppenhaus und Luftraum ermöglicht eine großzügige Belichtung von Treppe und angrenzenden Erschließungsflächen.

#### Haustechnik

Grundlage der technischen Gebäudeausstattung sind folgende konzeptionelle Ziele: Möglichst geringe Betriebs-, Wartungs- und Instandhaltungskosten bei gleichzeitiger Erfüllung der Anforderungen an ein öffentliches Gebäude. Dies bedeutet eine hohe Nutzungsqualität für Besucher, Mitarbeiter und Ausstellungsgut durch eine ausgeglichene, stabile Raumtemperatur und durch eine gute Raumluftqualität. Ein weiteres Ziel ist eine integrierte unauffällige Technik für Heizung, Kühlung, Belüftung und Beleuchtung. Mit einem ökologisch orientierten, ganzheitlichen Klimakonzept entsteht ein Gebäude mit Vorbildcharakter. Mit vier wesentlichen Maßnahmen werden diese Ziele umgesetzt: Gebäudeklimazonen je nach Anforderung, energieeffiziente Primärenergieversorgung, optimierte Gebäudehülle, abgestimmtes Haustechnikkonzept. ## Renzo Piano Building Workshop, Architects, Genoa – Paris, Italy – France

<http://www.rpbw.r.ui-pro.com>

### Libraries:

#### Renovation and Expansion Pierpont Morgan Library, New York, NY – USA 2000 – 2006

in collaboration with Beyer Blinder Belle <http://www.beyerblinderbelle.com>

Client: The Morgan Library

Located on Madison Avenue, in Lower Manhattan, the Library is one of the world most important museums for rare books, manuscripts and drawings. Intervention was necessary to meet new requirements that were much needed by the library. These included improved internal circulation and the creation of new spaces within the perimeter of the complex. An additional aim was to reunify the existing buildings and restore a sense of harmony to the overall complex. Three new pavilions accommodate entrance facilities, exhibition galleries, a new reading room, and administrative offices. An internal piazza connects the spaces, facilitating circulation between the six different wings of the Morgan Library. Covered by a glazed transparent roof, the piazza is the heart of the project, the place where all activities meet. To create a unity of scale, the new pavilions respect the proportions of the three original buildings. Beneath ground level, a storage space for the museum's collections is created by digging deeply into New York's hard schist: a total area of 136.000 sqf. (76.000 new and 60.000 existing) distributed over 5 floors. There is also a 300 seat auditorium situated in this part of the project. (Piano)

#### Cultural Center Jean Marie Tjibaou, Noumea, New Caledonia 1991 – 1998

Client: Agence pour le Développement de la Culture Kanak. Renzo Piano Building Workshop, Architects – P. Vincent, senior partner in charge.

Jean-Marie Tjibaou (January 30, 1936 – May 4, 1989) was a leader of the Kanak independence movement and a politician in New Caledonia. The son of a tribal chief, Tjibaou was ordained a priest but abandoned his religious vocation for a life in political activism. He was appointed mayor of Hienghène in 1977 and the head of the pro-independence FLNKS in 1984. On 4 May 1989, he was assassinated in Ouvéa by another Kanak. A cultural leader in the promotion of the indigenous Kanak culture, the modern Jean-Marie Tjibaou Cultural Centre, designed by Italian architect Renzo Piano, is named in his honour. (<http://www.wikipedia.org>) see also: <http://www.adck.nc/presentation/la-centre-culturel-tjibaou/jean-marie-tjibaou>

During the negotiations of independence from the French, the territory of New Caledonia requested that the government of the metropolis, chaired by François Mitterrand, build a center in Noumea for the promotion of Kanak culture and dedicated to the memory of the political leader Jean Marie Tjibaou, assassinated in 1989. In this work, the architect Renzo Piano joined Pacific and modern cultures. The year work ended, 1998, the architect was at the White House receiving the prestigious Pritzker Prize, considered the Nobel of architecture from U.S. President Bill Clinton. The Cultural Center Jean-Marie Tjibaou was discovered as the most innovative and exciting project in the city, about 10 km from downtown. It sought to make a tribute to a culture based on respect for its history and traditions, past, present and future, as well as its sensitivity. The project was based on the indigenous population of that part of the Pacific, its culture and its symbols, which are very old but are still very alive. Since the beginning of the design process, Piano studied the use of air currents and launched the search for a way to express the traditions of the Pacific with a modern language. That means putting the technology and methods European traditions aside and serving the expectations of the Kanaks. The concept and design of the Cultural Center Jean-Marie Tjibaou in Noumea in New Caledonia, was generated by the need to maximize ventilation in a humid climate. The project builds on the topography of land, vegetation and the breeze from the lagoon to create rising air currents, which are then removed by extraction towers, with the distinction of being the highest building on the top of the hill. It should not be an absolute travesty of this culture or imitation, or an approach from a colonial perspective. Neither could it be a completely alien concept. This is a town that has its own ways, vegetation and public spaces, and is located in direct contact with the ocean. The cultural complex is composed of ten houses, all of different sizes and functions. The small houses are 63 square meters, the medium houses 95 square meters and large houses, 140 square meters. Their heights range from 20 to 28 meters, with a circular floorplan, which are grouped into three villages, each with a distinct role. All of them are connected by pedestrian walkways in the form of spokes evoking the central promenade of traditional villages.

#### Villa 1

One part of the cultural package is aimed at permanent and temporary exhibitions and contains an auditorium and an amphitheater.

#### Villa 2

In the second group of huts are divided spaces administration, research, library and a conference room.

#### Villa 3

Finally, other studies contain cabins for traditional activities such as music, dance, painting and sculpture.

#### Structure

The structure and operation of the cabins Caledonia replicated and adapted architectural and socially. They all have created a structure shaped peinetta iroko. Reminiscent of the huts and crafts Kanak, the slender ribs of the lath structure and among them are seamlessly integrated in the lush landscape and the culture of its inhabitants.

#### Structural Tubes

Although these ancient wooden slats were also, on this occasion, the union has made structural tube horizontal and diagonal bracing rods of stainless steel. These structural elements reminiscent of traditional mainstays such as the spine of the fish to avoid the beams warped long. Renzo Piano describes the structures that are curved like huts, built with wooden beams and nerves are looking containers archaic archaic, whose interiors are equipped with all the possibilities offered by modern technology.

#### Materials

Vernacular buildings are born of intense communion with nature. They used perishable materials and their implementation on the territory is based on a very fragmented. Following these references were used traditional materials and construction systems, and also won the respect of natural elements such as wind, light and vegetation. The cabins are built with wooden materials in combination with iroko sober and discreet as steel, glass or cork, which provide simplicity to their interiors. According kanaka culture should have been built with wood from young palms. The wood siding and stainless steel, based on the shape of huts regional kanakas provide protection from the weather when it is needed, but also allows the passage as necessary to ventilate as wind strength and direction. (<http://en.wikiarquitectura.com>)

The Centre, entirely devoted to the Kanak culture, lies on a narrow strip of land surrounded by water. Ten pavilions modelled after the shape of traditional kanak huts, with heights varying from 20 to 28 metres, are at the core of the scheme. Organized in groups of thematic villages, the pavilions are immersed in vegetation, thus expressing the millenary kanak Relationship with nature. Housing cultural facilities (exhibition rooms, a library, an auditorium, an amphitheatre and studios for traditional activities), the huts are made of iroko wood, combined with steel and glass, and built respecting traditional construction methods according to the most sophisticated engineering studies. These contrasts are the expressing of the essential challenge of the project: that of paying homage to a culture with its traditions without falling into a parody of it. (Piano)

#### **Biblioteca Collegio San Carlo, Milano – Italy 2007 – 2008**

500 m<sup>2</sup>

In 2005, commissioned by the Fondazione Collegio San Carlo, Architects Giancarlo and Francesco Ragazzi Boys study and Partners sign the restoration project of the eighteenth century and the library of the Collegio San Carlo in 2007 and the interior design of the library / media . The restoration project involved the porch of the library with the elimination of the sixteenth Infill masonry performed in parallel addition of the second floor and dell'altana. To ensure the immobility of the gallery have included structural elements incorporated in the design of steel frames of the same porch in mid position of the column, gneiss, Doric with Attic base. Furthermore, the restoration of the gallery has unearthed the morphological conformation original material of vaults that are valued by a particular LED lighting mimetically inserted on the chains of the time. On the walls of the gallery were also found artifacts graphs probably dating from the sixteenth century. The floor of the gallery is that the library room is Medon brick replacing the previous tile and cement terrazzo and other stone materials. The salon has undergone renovation, the wooden floor and the beautiful arch decorated discovered during investigations stratigraphic operating budget on the walls. The new school library media has been designed according to the guidelines of ' IFLA (International Federation of Libraries Associations) with computer support and image Hi-Tech 's use of materials such as glass, aluminum and steel in contrast with the spatial values, morphological and material sixteenth and eighteenth century enhanced by restoration. The library has a specific connotation of place multifunctional (adaptable configurations targeted distribution) needs to teaching and research students of the College, but also open and alive to the city to interact with shows, exhibitions and meetings. #### **Biblioteca digitale Palazzo Paleotti, Bologna – Italy 2007**

committente: Comune di Bologna, importo lavori: 200.000 €, dimensione/programma: 750 mq aperti al pubblico, cronologia: completato nel 2007

Il progetto degli arredi delle sale di lettura al primo piano delle ex scuderie bentivogliesche di Palazzo Paleotti parte dall'attuazione del concetto di flessibilità applicato ad uno spazio. Sono sviluppate infatti due differenti modalità operative. Una flessibilità passiva, in cui gli elementi architettonici sono fissi ma interpretabili in maniera differente dall'uso che ne viene fatto e una flessibilità attiva nella quale gli arredi sono mobili e si riconfigurano materialmente in spazi differenti. (sgLab)

#### **Libreria Sala Borsa, Bologna – Italy 2000**

committente: Comune di Bologna, importo lavori: 9.500.000 €, cronologia: progettazione 1998-1999, realizzazione 1999-2000

L'edificio che fu sede della prima sala borsa di Bologna è uno spazio, che relaziona e accomuna una molteplicità di ambienti la cui contiguità, se vista attraverso una logica formale, è l'unico fattore aggregante. Frammenti di epoche differenti, susseguendosi in una stratificazione che continua da oltre duemila anni, hanno determinato la complessità di un simile complesso architettonico. Dai primi progetti di sola biblioteca alla soluzione finale dell'integrazione con un sistema commerciale basato sulla libreria lo studio ha curato i vari passaggi sotto tutti gli aspetti, dai restauri alla progettazione degli arredi. #### **Kindergarten mit Dorfbibliothek, Pretttau (Bz) (Scuola materna e biblioteca a Predoi) – Italy 2011**

An Stelle des alten baufälligen Kindergartengebäudes aus den 70er Jahren wird in Pretttau auf knapp 1400m ü.d.M. ein neues zweigeschossiges Gebäude für Kindergarten, Schul- und Dorfbibliothek sowie Mensa der Grundschule errichtet. Im Erdgeschoß ist die Bibliothek, die Küche und der Foyer- und Merzwekbereich untergebracht, welcher gleichzeitig als Essraum dient. Im Obergeschoß befinden die Räumlichkeiten des Kindergartens für eine Gruppe mit bis zu 30 Kindern. (Sifter)

Dopo la demolizione dell'esistente scuola materna di Predoi risalente agli anni 70 ed ormai obsoleta, al suo posto, su ca. 1400m al di sopra del livello di mare è stato costruito un nuovo edificio che ospita su due piani fuori terra la scuola materna, la biblioteca comunale e la mensa per l'adiacente scuola elementare. Al piano terra si trovano la biblioteca, la cucina e la zona d'ingresso multifunzionale in quanto funge anche da sala pranzo per i bambini della scuola. Gli ambienti del piano superiore sono destinati esclusivamente alla scuola materna frequentata da ca. 30 bambini. La nuova costruzione ubicata nel centro del paese, in vicinanza della scuola elementare e della piazza comunale, reagisce al contesto locale con la configurazione del volume, la forma del tetto ed i materiali utilizzati. Aspetti principali per la progettazione come la ricerca di qualità per gli spazi esterni, il soleggiamento e l'illuminazione naturale dell'edificio nuovo e di quelli esistenti, la relazione visiva con le preesistenze, il rispetto delle altezze, la necessità di spazi coperti hanno determinato la forma irregolare della pianta e la facciata monolitica con i diversi intagli nella volumetria. L'edificio nuovo si incastra nel pendio naturale e non prevede nessun gesto architettonico sul lato nord quasi completamente chiuso. Sulle altre facciate sono disposte liberamente finestre in legno di diverse misure che fuoriescono leggermente dalla facciata intonacata. Al piano terra un intaglio nel corpo edilizio forma l'accesso principale protetto all'edificio e rappresenta quasi una vetrina per la zona d'ingresso retrostante. Questo spazio polivalente interposto tra cucina e biblioteca, dalla quale è separato solamente da una parete di vetro, può essere utilizzato come mensa per l'adiacente scuola elementare ma si presta anche ad ospitare molteplici attività culturali come piccole conferenze, letture, lavori in gruppo, ecc. Dalla zona d'ingresso si giunge alla scuola materna del piano superiore attraverso una scala ad un'unica rampa offrendo traguardi visivi inaspettati da diversi punti. La scuola materna è concepita come ambiente unico composto da una serie di vani aperti, trasparenti, realizzati in maniera fluida e con doppie altezze che permettono una relazione visiva tra i livelli. Attorno ad un ampio spazio centrale contenente il guardaroba dei bambini si distribuiscono i servizi sanitari, l'amministrazione, la sala gruppo per i bambini ed alcuni spazi secondari. Il tetto a due falde con il suo intradesso in legno si articola su tutto il primo piano e rende possibile la creazione di piccoli spazi sospesi sotto il tetto dove poter giocare, leggere, nascondersi e dipingere. Anche le finestre dal parapetto basso invitano i piccoli a sedersi e giocare. Una grande terrazza coperta paragonabile ad una loggia ed un accesso al parco giochi nel giardino completano il programma planivolumetrico. (<http://europaconcorsi.com>)

##### **Libraries:**

#### **Libreria e Archivio Storico a Palermo – Complesso Monumentale ex Oratorio di Sant' Elena e Costantino, Palermo – Italy 2007**

La nuova biblioteca-archivio storico dell'Assemblea Regionale Siciliana è stata realizzata nell'ex Oratorio di Santa Elena e Costantino, da cui prende il nome, costruito alla fine del XVI secolo a fianco al Palazzo dei Normanni a Palermo, oggi sede del governo della regione. Storicamente l'oratorio ha ospitato la Confraternita della Madonna di Monserrato, la Madonna nera legata al culto di origini spagnole, di cui resta un quadro, parzialmente ritoccato negli anni Venti nel volto e nella sorprendente aggiunta di un guanto di plastica nera. La sua struttura attuale è quanto resta dopo l'incendio che nell'Ottocento ne ha bruciato il transetto, oggi trasformato in cortile interno, e dopo alcuni rimaneggiamenti, riconoscibili anche nell'inserimento del pulpito di legno decorato proveniente da un'altra chiesa.

Il progetto di restauro dell'intero complesso, affidato alla Soprintendenza, è stato di tipo conservativo: al primo piano, è particolarmente interessante il pavimento in ceramica dipinta con le storie di Costantino, che sarà protetto da grandi tappeti disegnati da Italo Rota.

Il progetto architettonico della biblioteca è una sorta di grande installazione. Si è scelto di mantenere intatta la "struttura" dei luoghi e di conservarne anche l'atmosfera, in modo da ispirare ai futuri utenti una certa spiritualità. "C'è un uso diverso dello spazio, ma non un riuso", precisa Italo Rota. "Abbiamo creato una sedimentazione contemporanea, visto che tutta la storia di Palermo è segnata dalla sedimentazione di culture e architetture diverse. Ed è una storia che affascina chiunque vi si accosti".

Il progetto si sviluppa per fasi. La prima, appena conclusa, interessa il grande oratorio con copertura a capriate lignee e cappelle laterali, accessibile dal cortile interno. L'ambiente è scandito da nove elementi di acciaio inox che lo trasformano in una sorta di bosco artificiale con effetto specchiante che crea un interessante gioco di continui rimandi visivi. Tale bosco è formato da sei "funghi" tecnologici – che risolvono anche gli aspetti funzionali del progetto (l'illuminazione e l'aggancio dei piani di lettura rotanti) – e tre "pali" ai quali sono collegati i grandi dischi bianchi che riflettono la luce. Un unico palo nero s'inserisce in questo bosco; la sua banderuola superiore rileva la presenza di una postazione con microfono, monitor, webcam e piano di appoggio. L'effetto di un

bosco prolunga idealmente l'intervento che sarà realizzato nella seconda fase e che interesserà il cortile, per il quale sono previsti tre "funghi" che nella parte superiore ospiteranno un mini giardino pensile, da ammirare dall'alto. Tutti gli elementi dell'allestimento sono su disegno.

La libreria nasce dall'assemblaggio di moduli d'acciaio laccato delle dimensioni e colori diversi (giallo, rosso e bianco). Il colore ritorna nella base e nelle pedate della scaletta con struttura di acciaio inox e nel sorprendente contenitore disegnato per raccogliere gli elementi di cancelleria. © Luca Racioppo. ἀρχιτέκτων . #### **Mediateca Sandro Penna di San Sisto, Perugia – Italy 2004**

Abbiamo voluto creare un luogo dove vivere la cultura divenga esperienza sorridente, allegra, leggera, con particolare attenzione rivolta a bambini e ragazzi ed ai loro nuovi modi comunicativi; uno spazio colorato, luminoso, sempre diverso: anche la lettura può essere piacevole quanto un gioco. L'edificio è in parte interrato, sfruttando la naturale pendenza del terreno ed in parte emerge come se un grande disco fosse atterrato nella città. Per l'ingresso principale dal viale alberato abbiamo creato una piccola piazza, luogo di aggregazione e foyer all'aperto del teatro, conservando le essenze arboree presenti e creando "varchi" nel terrapieno esistente. Lì si trovano le grandi vetrate retroilluminate, con gigantografie di pagine tratte da libri, che si possono aggiornare periodicamente, un grande libro luminoso. Lo spazio al primo livello è destinato ad accoglienza, con dotazione di computer portatili agli utenti, uffici e ad area dei periodici, emeroteca, con poltrone e tavolini. Da questo spazio si può accedere al teatro, con una sala per 250 posti, che ha comunque il suo ingresso principale. Il secondo livello accoglie la parte più consistente dei libri, che sono contenuti nella grande libreria circolare centrale accessibile dall'interno e dall'esterno, tramite un ballatoio vetrato, da cui si ha la visione di tutto lo spazio centrale, fino ai grandi lucernari a oblò che illuminano il cuore dell'edificio. In questo livello un piano di studio perimetrale circolare posto alla stessa quota del prato esterno crea al fruitore, dalle pareti vetrate, una visione rilassante; il tavolo può essere integrato con penisole removibili che si possono comporre, creando spazi di studio sempre diversi; altri tavoli, dalla forma organica, aggregabili e disaggregabili, le poltroncine in materiale colorato traslucido ed i grandi divani imbottiti dalla forma sinuosa completano l'arredo. Lo spazio bambini del terzo livello è stato pensato appositamente per le loro esigenze, le librerie sono in materiale leggero e trasparente, le sedie colorate adattate alla loro altezza, i contenitori per i giochi e cartonati di facile accesso; un sipario, compatto e scorrevole su guide curvilinee, viene utilizzato per le attività teatrali dei più piccoli. La grafica si basa sulle nuove icone comunicative che nascono dai telefonini cellulari, internet, MTV. La biblioteca-mediateca, di 800 mq. è completamente cablata per consentire il collegamento internet e rete biblioteche da tutte le aree accessibili. I controsoffitti acustici, ed i pavimenti, in colori chiari, sono stati studiati per garantire un' ideale condizione di tranquillità ed un regime sonoro controllato. Si è puntato molto sul controllo microclimatico e ambientale dell'edificio. Per quello che riguarda l'illuminazione, si è scelto di sfruttare al massimo la luce naturale, filtrata attraverso le vetrate rosa, colore rilassante e che favorisce la concentrazione, e quella zenitale dei lucernari, integrata da un lato dall'illuminazione con disegno a raggiera con specifici apparecchi che assicurano omogeneità sul piano di studio, e da un'illuminazione mirata a "mettere in scena" l'edificio ed il suo l'ingresso, per gli eventi serali legati all'attività teatrale. © Italo Rota . #### **Mediateca Civica di Anzola dell'Emilia – Italy 2002**

Anzola d'Emilia è, come altri comuni di questa Italia contemporanea, un comune ricco che vive nella cintura di una città non ancora metropoli, Bologna, ma che di quella ha tutti i problemi caratteristici: servizi pubblici sempre al di sotto delle necessità, popolazione mista che cerca strategie di integrazione, mobilità, sicurezza, e la ricerca di una nuova identità che possa rappresentare la complessità crescente. In particolare sono proprio i comuni di questa cintura che cercano una propria identità definita rispetto al capoluogo.

Anzola dell'Emilia, negli anni settanta, abbandona la sua specializzazione agricola grazie all'insediamento di alcuni stabilimenti legati all'industria alimentare dolciaria lungo l'asse vitale di tutta la regione Emilia Romagna: la Via Emilia.

Inoltre è oggetto di nuovi insediamenti abitativi, quartieri PEEP, che la pongono come valida alternativa residenziale a Bologna: un paesaggio tranquillo non distante dai primi rilievi dell'Appennino tosco-emiliano.

Negli anni novanta, arrivato il benessere grazie ad una popolazione che non conosce la disoccupazione, l'amministrazione comunale disegna una strategia per dotare il comune di servizi avanzati e nello stesso tempo di disegnare un centro storico, un'immagine propria nella quale riconoscersi, partendo da due edifici simbolici: la "casa gialla", un edificio funzionale alla vita della campagna e la scuola Edmondo de Amicis, la tipica istituzione scolastica statale di inizio secolo '900: una grande fabbrica regolare dagli ampi spazi con lunghe teorie di finestre tutte uguali. E' all'interno di questo edificio che si colloca la mediateca di Anzola dell'Emilia, che risponde all'idea dell'amministrazione, che bandirà un concorso nazionale di architettura, di farne una casa per la cultura, una casa per la solidarietà e il luogo del confronto sociale e politico.

Il progetto raccoglie le premesse dell'amministrazione interpretandole in una strategia che dialoga con la storia dell'edificio. Gli spazi storici della scuola, testimonianza di certa pedagogia italiana, sono già, al primo impatto, particolari: dilatati nelle dimensioni, fuori scala, mettono fuori scala l'adulto che vi si addentra. Gli ricordano il loro essere stati scolari.

A questa idea dello spazio impositiva, pedagogica, il progetto affianca un sistema più fluido e allo stesso tempo plastico dai confini incerti. Un grande volume assemblato per sommatoria di situazioni, che si guardano tra loro, che si osservano e si fondono mentre si riflettono nelle grandi specchiature in vetro. La visione intera, dal giardino, di questa nuova ala rimette insieme le differenti situazioni (i salottini per la lettura, i banchi per la consultazione, gli angoli per l'ascolto musicale, l'angolo gioco dei bambini), come singoli tasselli della vita tenuti insieme in una immagine cromatica dell'esperienza. La luce e il colore sono il tema di fondo di questo spazio e sono la vera materia della quale lo spazio si compone. Ciò che unisce e separa, l'architettura, è costituito dalle pellicole in cristallo che permettono di vedere, di vedersi e di essere visti una composizione unica, sintetica. Ogni singolo spazio, ogni situazione, della biblioteca si compone dell'elemento sensibile e visibile. Il primo è quello che ci accomoda nel percorrere e nell'uso dello spazio, il secondo è quello che ci fa sentire parte di un'unione.

#### **Campus Universitario, Biblioteca e Laboratori, Udine – Italy 2008 on design**

The new buildings designed for the university campus of Udine are going to complete the whole structure with some missing functions as main library and departments laboratories. Both are extremely functionally flexible and based on a simple design: Two parallel buildings are separated by an empty green space with connections at superior levels. This solution allows a construction by consecutive phases. The structural frame is minimized and modular, as to obtain an entirely open internal space free to change according to new functional requirements. (Nicoletti)

#### **KB Center Library Building, Gorizia – Italy 2006**

1.800 m<sup>2</sup>, € 650.000

The KB Center is a space for cultural and social interaction dedicated to the Slovenian community in Gorizia, located in the heart of the city's 19th century development. The main goal of the center is to promote Slovenian cultural activity within a multi-ethnic framework. The center brings together 13 organizations dedicated to different cultural interest and age groups. Among these are a library, two educational institutions, the Slovenian Cultural and Economic Association and a music school. The brief required the adaptive reuse of an existing building as well as the realization of a new two storey structure to house the library in the interior courtyard. The design of the new building establishes a dialogue between the historical context of the site and a contemporary architectural language through its form, which is largely influenced by the physical constrictions of the historical city. The new building was conceived as 'a large piece of furniture which slides on the courtyard floor', in order to maintain the intimacy of the courtyard and garden. The frameless facade is realized in synthetic wood and glass in order to create a delicate insertion into the urban fabric with neighboring buildings less than five meters away. The large windows act as program displays allowing for visual connects between the interiors of the library and the refurbished garden space. The ground floor houses the new Qubik cafe towards the street. The cafe together with the new wide event terrace on the first floor, and with the conference room on the third floor enthuse the space with public activity.

## Japan

### **Tadao Ando Architect & Associates, Osaka – Japan**

<http://www.andotadao.com>

#### **Libraries:**

#### **Museum of Picture Books for Children (Picture Book Library), Iwaki City, Prefecture Fukushima – Japan 2005**

The building occupies 492.07 m<sup>2</sup> of space, with the total floorspace amounting to 634.05 m<sup>2</sup> in Ando's building. Decorations are minimal, largely consisting of the books themselves in a cover-out display that dominates the space. The only three materials used in the building are fair-faced reinforced concrete, glass, and wood. Though some may consider concrete a sterile or bland material, Ando sees it as warm and complex. He states, "Concrete can be very rich in color ... the gradations of color create a sense of depth". The simplicity of color is noted by some reviewers who mention the fact that the Western notion of child-friendly decor is less stark and angular. In the Picture Book Library the only color is supplied by the bright patterns of the books themselves. The corridors are kept deliberately dark, in defiance of a possible Western preference for evenly light-filled spaces. "You will be able to see the light because of the darkness," says Ando. (<http://en.wikipedia.org>)

#### **International Library of Children's Literature, Tokyo – Japan 2002**

Located within Ueno Park, The International Library of Children's Literature, a branch of the National Diet Library, is a renovation and expansion of the former Imperial Library built in 1906 and expanded in 1929. The subtle interventions of Ando create a dynamic juxtaposition between the old and the new while creating the first national library dedicated to children's literature. The interventions of Ando are quite simple and elegant; a glass volume that pierces the renaissance-style street facade at a slight angle to form an entry, a continuation of this glass volume on the courtyard side to form a cafeteria, and a full height glass facade on the courtyard side that encloses a lounge space between it and the existing facade flanked on each end by a concrete volume containing vertical circulation. The transparency and weightlessness of the glass facade allows for the continual reading of the old through the new. The existing facade was restored exactly as it was and the structure of the existing building was reinforced structurally against earthquakes. This new lounge area has a columnless interior, the glass facade supported only by vertical fire resistant steel supports. Because of its transparency and weightlessness it reads as part of the terraced exterior courtyard space. In addition to the insertion of these glass volumes, concrete volumes and glass facade, Ando inserted two beautifully crafted wood cylinders into what used to be the reading room and is now the Children's Book Museum on the third floor. The form of these cylinders follows the form of the existing molding on the ceiling and defines smaller, more intimate, exhibition spaces within the larger room. When seen from outside of the room, they are provocative objects within a traditional space of white plaster moldings (<http://www.galinsky.com>)

### **Atelier bow-wow, Tokyo – Japan**

<http://www.bow-wow.jp>

#### **Libraries:**

#### **Ikushima Library, Kokubunji – Japan 2008**

site area 123.89 sqm, building area 47.07sqm, total floor area 96.56sqm, structure wood

Two of my favorite projects by the Tokyo firm Atelier Bow-wow are the Nora House (shown above) and the Ikushima Library. One aspect of their work I find especially interesting is how they often refrain from creating all-white spaces. Most of their firm peers stick to white walls, floors, and ceilings, eschewing the expression of a building's structure and materiality in an attempt to make the building's reality feel evanescent. Conversely, Bow-wow often makes use of structural expressionism and tangible building materials to ground their spaces. Their use of these methods is not ideological, as it is in many Western practices. The use of structural grids or rules often becomes a piece of the building parti in the West. In contrast, Atelier Bow-wow makes their wood structures emphasize the strange forms their buildings often take on. In other words, the form of the building drives the structure, and the structure is used to reemphasize the form. The strangely shaped roofs in the Nora House become more tangible and real when you see the simple framing system used to hold them up. Likewise with the Ikushima Library. The wood slats of the library ceiling are laid in the direction of the ceiling's apex, emphasizing its pavilion-like shape. Along with the horizontal lines of the bookshelves, the space feels dynamic while at the same time static. The house is just as much a place for books and learning as it is for living. To quote the architects: "We came up with a space for the books first and then imagined people living there... in this house dedicated to the printed word, books are the only thing visible from the street. The people here are only lodgers." (<http://intotheloop.blogspot.com/2010/08/nora-house-and-ikushima-library-by.html>)

#### **A library for the future**

Reading – for the sake of knowledge or enjoyment, or to explore the world of the human imagination – is one of those experiences that gives you a sense of emotional and spiritual richness quite different from economic or monetary well-being. In this sense, the act of creating a space that surrounds you with books is undoubtedly linked to the creation of a new, enriched sense of public values. Libraries in Japan are moving towards a model that encourages readers to stay and linger, instead of their original function as spaces for collecting and lending out books. Reflecting the general trend for libraries to facilitate reading as well as other functions, this library uses compact automated shelves that operate as a closed stack system. This is combined with halls and meeting rooms that promote social exchange between its users, much like a community center. The facility is also expected to serve as a new hub for social life among the local community.

For a public library such as this, we thought that the most important thing to have would be a reading room that provides visitors with a pleasant, comfortable space to read. This environment would allow users to experience the joy of reading while surrounded by a treasure trove of books with a overwhelming physical presence, something that the convenience of electronic and digital books cannot offer. For this project, we proposed a simple space measuring 45m by 45m with a height of about 12m, enclosed by a “punching wall” and supported by 25 pillars that would function as a storehouse for books and a hub for human communication. This huge, massive volume served as a reading space in keeping with the mood and setting of a library. What we wanted to do, in other words, was to design a certain “atmosphere” for books and reading. This library consists of a single quiet and tranquil room that resembles a forest, filled with soft light and a feeling of openness reminiscent of the outdoors. One successful example of such a space is the old Bibliothèque Nationale (National Library) in Paris designed by Henri Labrouste, a masterpiece that was built using the most advanced steel construction technologies of the 19<sup>th</sup> century. The building represents a continuous relationship that brings books and humans together even as it changes and evolves, transcending time and history. This simple box-like form also contains within it a certain freedom, however: this is a space that permits a composite mix of various media that will continue to change and evolve against the backdrop of an information-centered age. The overall structure of the library resembles an internal three-layered floor covered with a large box that we refer to as a “cake box”. The large external “punching wall” in the cavernous reading room features some 6,000 small openings (measuring 200, 250 and 300mm) across its entire surface that allow a soft, uniform light to enter the building. In addition, the burden of seismic force from any earthquakes is born across the entire expanse of this wall. A floor heating system that warms and cools the building under the floor has been installed in order to make this large space comfortable to inhabit, while large natural ventilation openings in the roof ensure a pleasant and comfortable indoor environment during the

warmer months. Calibrated and calculated with the utmost precision, this beautiful “cake box” space will hopefully become a new symbol of the western part of Kanazawa, a city that continues to face rapid urbanization. (<http://www.japan-architects.com>) (<http://www.architonic.com>)

Kanazawa — Despite the altering reading culture, libraries still continually emerge in Japan as one of the indispensable public utilities. For Japanese people, a library isn't just the place one goes to for the sake of reading and borrowing books, it's also the place where people spend their time recreationally and creatively. Kanazawa recently welcomed its latest public library, Kanazawa Umimirai Library. With Kazumi Kudo and Hhiroshi Horiba of Coelacanth K&H Architects responsible for the architectural direction, the building's exterior surface is punctured, creating 6,000 small openings that allow soft natural light to come into the interior space during the day. At night, the building glows with the internal lighting piercing out through the openings, adding new vibrancy to the urban fabric of this historical city. art4d # 183.Aug.-11 (<http://www.art4d.com>)

Kanazawa Umimirai Library

This is the third library in Kanazawa City, combined with halls and meeting rooms that promote social exchange between its users, much like a community center. The facility is also expected to serve as a new hub for social life among the local community. For this project, we proposed a simple space measuring 45m by 45m with a height of about 12m, enclosed by a "punching wall" and supported by 25 pillars that would function as a storehouse for books and a hub for human communication. This huge, massive volume served as a reading space in keeping with the mood and setting of a library. What we wanted to do, in other words, was to design a certain "atmosphere" for books and reading. This library consists of a single quiet and tranquil room that resembles a forest, filled with soft light and a feeling of openness reminiscent of the outdoors. (K+H)

### **Libraries:**

**[Musashino Art University Museum & Library, Tokyo - Japan 2010](#)**

Gross square footage: 69,095 sq.ft.

Built in 1962, Musashino Art University's combined gallery-library is one of the school's treasured original buildings. Designed by architect **Yoshinobu Ashihara (\*1918 - + 2003)**, the Modernist concrete edifice occupies a prominent position amid the school's 27-acre campus, a checkerboard of solids and voids 25 miles west of central Tokyo. But even treasured architectural gems have a shelf life. And after 40-plus years, the building had become cramped and outdated. Dividing the gallery-library's program in two, the school administration decided to turn the historic building into a museum and erect a new library on the adjacent site. It then held an invited competition for the dual commission. Sou Fujimoto trumped the five other contenders and wowed the jury with a single, spiral-shaped bookshelf encased in a glass box. Evoking the atmosphere of a traditional reading room, this geometry resolved the two conflicting goals common to many libraries. While the labyrinthine paths between book-lined walls inspire the unguided exploration of the library's sizable collection, the radial organization system cutting through the shelves enables the beeline search for a specific book. Abutting the existing building, whose renovation will finish this spring, the new, 69,000-square-foot library fills what was one of the only open plots left on the now-congested campus. Though the site is surrounded by a variety of academic buildings and the main cafeteria, it had few constraints, since many of these older structures are slated for redevelopment in the near future. The broad pedestrian thoroughfare to the north, lined with flowering cherry trees, was the logical place to enter the building and start the spiral wall. Composed of wooden bookshelves enclosed with glass, the spiral begins as a freestanding, 28-foot-high wall that rings the building perimeter and then curls in to define concentric layers of space inside. Visible from multiple directions on the campus, this wall immediately identifies the building's function as a place of books. Students enter through a large opening in the wall into a small vestibule that serves as the three-story library's primary entrance. Nestled between the new and existing buildings, exterior stairs ascend to the second floor, where an ancillary entrance connects the two structures and leads to a covered terrace at the rear of the library. Back at grade, the tunnel-like vestibule opens onto a dramatic, double-height periodicals section followed by a circulation desk, rare book room, catalogue gallery, and offices on the ground floor. While private study carrels line one wall, rooms for meetings, research, and exhibits separate the secured book-storage area. Upstairs, a reading room and open stacks fill almost the entire upper floor. Additional shelving and storage occupy the basement. With room for 300,000 volumes, the new facility has over twice the capacity of the old library. “The whole space is continuous but on two levels,” says Fujimoto of the library's main floors. In the spirit of a fantastic Piranesi etching, the architect blurred the boundary between upper and lower levels with tiers of stepped shelves big enough for sitting, vast void spaces puncturing the second floor, and a web of narrow catwalks winding their way among the colossal shelves. And while a run of gentle risers graciously leads up to the reading room, elevators and enclosed staircases offer alternate routes at either end of the building. Though the enclosed programmatic elements partially obscure the spiral downstairs, it is clearly legible upstairs, where the floor-to-ceiling bookshelf winds repeatedly around the reference desk in the middle of the room. Between the spiral's 16-foot-high shelves, furniture and lighting designate functional zones. Carefully positioned for easy access, low bookcases fill the layered rings of space, while communal tables, individual desks, computer-lined counters, and select designer chairs from the school's substantial collection clearly define seating and study areas. The lighting scheme also helps orient library users as they navigate the mazelike space. Rows of task lights dot the balconies, and a cluster of pendant fixtures hovers above the reference desk. “It is like walking through a forest,” explains Fujimoto. “Bright lights invite you to go here or there.” During the day, sunshine boosts the installed ambient light, gently illuminating the entire room. In addition to expansive picture windows, skylights interspersed with opaque panels stripe the roof and fill the room with muted rays. Directly beneath, a dropped ceiling made with double panels of polycarbonate honeycomb disguises the overhead ducts and beams while diffusing the daylight from above. Mirroring the shelves below, the surface of the glossy panels reflects the rows of books, making them appear to go on forever. Cutting across the three-foot-thick bookshelf walls are sequences of rectangular openings of varying proportions and sizes, each one determined by multiple model studies. They alleviate the concentric geometry, framing views within views and creating a sense of depth in the space. At the same time, these breaks in the walls facilitate the library's book classification system. Physically, this system is manifest with wedge-shaped sections that radiate out from the reference desk. These sections correspond to different numbered subject categories. White, plastic supsize graphics affixed laterally to the shelves identify each section. Made of lightly stained, laminated basswood, the double-loaded interior shelves straddle the line between architecture and furniture. Their partitions and backing boards conceal and are pinned to the library's steel structure: a rigid frame system of beams and oblong columns supporting a fire-rated substrate. “The columns are really more like small braces,” explains Fujimoto. Due to the walls' quirky shape and irregularly spaced openings, the columns could not stand in grid formation. But the voluminous bookcase wall provided plenty of room for alternative positioning, and extra beams ensured stability. At the building's exterior, the shelves are stained dark brown and have been chemically treated for fire protection. Moreover, along with concealing the insulation, these shelves hide the steel hardware that secures the exterior glazing. Though the 3-foot-square panes appear to float in front of the wood cases, square metal fasteners affix the 0.3-inch-thick glass sheets together and anchor them to the building's structural frame.

Beyond reinvigorating Musashino Art University's aging campus, Sou Fujimoto's library champions books — an especially noble achievement at a time when the printed word is facing an uncertain future. "Anyone can read at McDonald's," says the architect. "But enjoying, concentrating, and relaxing in a library surrounded by books is a special experience." Yet the building is curiously longing for books. Both inside and out there is an abundance of empty shelf space. Initially Fujimoto envisioned walls of books filled up high to the ceiling. But in the end only the first seven rows are actually in use, since shelves above six feet require extra measures for earthquake protection and stepladders for access. "After completion, I found that emptiness is better," reasons the architect. "If you fill up all the shelves, it is just a bookcase. But if you leave it part empty, it is full of potential." Lined with towering bookshelf walls — whose empty shelves represent the library's potential as a place to use and house books for years to come — an integrated cascading stair and series of stepped shelves serve as a connection between the two main levels and provide plenty of room for students to sit or recline as they read, sketch, or catch up on text messages and e-mail. ### **Libraries:**

#### **Nuova Biblioteca Maranello, Maranello, Prov. Modena, Reg. Emilia-Romagna – Italy 2011**

Client: Maranello Heritage s.r.l., Program: New town library and exhibition center, Dates: Competition: April 2007, Expectation of appointment: June 2008, Opening: May 2011, Dimensions: Lot area: 850 sqm. Gross built area: 1175 sqm. Gross area of the project: 1175 sqm. Height above ground: 5.3 m, Construction, Facilities: reinforced concrete and steel, Facades: curved glass room Lifts: geothermal energy saving.

The competition site is located at Via Vittorio Veneto in Maranello (Modena), within an established residential fabric. The building is bordered to the north courtyard of a residential building to the west with a public green area to the south by a residential building constructed in adherence to the east and other residential buildings and partly in adherence. The project we propose has an area of 1175 square meters. This restructuring of the existing building through the maintenance of the perimeter walls of the sides of the north, east and south neighbors with some residential buildings, the demolition of the central parts of the building and construction of the library as a volume contained within the height limits of the old building and developed partly above ground and partly underground. Is located on the west side access to the new library. The project was developed by defining three main areas, corresponding to an area of consultation, a large reading room and the multipurpose rooms, the latter used independently. Within these three main areas are planned: the areas of consultation and storage of the library, the newspaper, the sound library and video library, the recreation center, multipurpose room, study hall, the historical city, the room exhibitions and temporary installations. Within these spaces have been provided for providing the service stations to consult catalogs and Internet access, the bank loan for the users, the administrative offices for library staff and the storehouse the library. It 'was a planned subdivision of Reading under the category of potential users and particular attention was given to the spaces for children aged between 0 and 6 years for those between 6 and 10 years and those between 11 and 14. Students in high school and university but have spaces for consultation and study which do not interfere with others. The building consists of three main volumes designed to best meet the functions contained therein. On the ground floor there is a transparent volume that houses the cafeteria, with an adjoining room service and a large bar, exhibition space for the association "Maranello land of myth and all areas of consultation and the library reading. The volume is mirrored on the surface of water that surrounds it and the water reflected the deep green ivy that enriches boundary walls maintained by the project. A shelter projecting to the public space and architecture makes it recognizable from the road within the absolute white resin floor and furniture glows green exterior reflected through continuous glass wall that runs along the curved shape. The light that pervades the open space of the library performs in a play of reflections bouncing off the white elements of the furniture, floors and structures, water and the continuous glass transparent. One volume mat is placed on the south side, also pure white, to hold the service areas, stairs down to the basement and playroom, equipped with a window to allow natural light. The basement consists of a box which is accessed via a staircase and an elevator for disabled people, as a freight elevator for the books. Now we are in a space formed by the multi-purpose hall and exhibition space, which can be set as desired. In this area are also located underground space for storing the librarian of the library heritage and the historical city that has special consultative small spaces. (<http://www.europaconcorsi.com>)

#### **Quatar National Library, Doha – Quatar 2002 –**

The building, which in the drawings seems to vibrate in the air as if about to take off, will be made up of three elements. The ground floor will house the Contemporary Art Museum, along with a Museum of Science and Natural History with a large common entrance area. The two museums will be housed in a podium structure 9 metres high, from which three imposing columns 120 metres tall and 18 metres in diameter will rise. These columns constitute the true operative and functional heart of the project, as they will not only be the site of visitors' vertical movements but form the central core around which the rooms of the National Library will be built. All five levels will bend around the three columns between 60 and 93 metres above the ground. These "wings" will make the building look as if suspended in the air, giving the complex a particularly imposing, evocative appearance. The lowest of them will house the children's library, offices and technical rooms. The biggest of the levels will measure 7,000 square metres and house the bookshelves and reading rooms. Visitors will be guided through two entrances: one on the western side, where the parking lots are located, and another on the portico to be built on the seaward side, with a view of the Corniche. The complex will also include a coffee-shop and a large restaurant at the top of the three columns offering a fantastic view out over Doha Bay. The lot on which the complex is to be built measures over 50,000 square metres, and the building's total surface area will be 22,000 square metres. The arrangement of the three columns at the corners of an imaginary triangle accentuates the dynamism of this imposing structure, which is also underlined by the step structure of the 7 levels, which gradually grow wider as they rise upward. The "wings" overlooking the Corniche are longer than those at the back, so that the building looks as if it is about to "take off".

**Detail 2008.01-02**

**Architectural Record 2008.1**

This is a library for an art university located in the suburbs of Tokyo. Passing through the main entrance gate, the site lies behind a front garden with small and large trees, and stretches up a gentle slope. The existing cafeteria was the sole place in the university shared by both students and staff members across all disciplines, so the first impetus for our design was to question how an institution as specialised as a library could provide an open commonality for all. Our first idea was for a wide open gallery on the ground level that would serve as an active thoroughfare for people crossing the campus, even without intending to go to the library. To let the flows and views of these people freely penetrate the building, we began to think of a structure of randomly placed arches which would create the sensation as if the sloping floor and the front garden's scenery were continuing within the building. The characteristic arches are made out of steel plates covered with concrete. In plan these arches are arranged along curved lines which cross at several points. With these intersections, we were able to keep the arches extremely slender at the bottom and still support the heavy live loads of the floor above. The spans of the arches vary from 1.8 to 16 metres, but the width is kept uniformly at 200mm. The intersections of the rows of arches help to articulate softly separated zones within this one space. Shelves and study desks of various shapes, glass partitions that function as bulletin boards, etc., give these zones a sense of both individual character and visual as well as spatial continuity. On the sloped ground level, a movie-browser like a bar counter and a large glass table for the latest issues of magazines invite students to spend their time waiting for the bus in the library. Climbing the stairs to the second floor, one finds large art books on low bookshelves crossing under the arches. Between these shelves are study desks of various sizes. A large table with a state-of-art copy machine allows users to do professional editing work. The spatial diversity one experiences when walking through the arches different in span and height changes seamlessly from a cloister-like space filled with natural light, to the impression of a tunnel that cannot be penetrated visually. The new library is a place where everyone can discover their style of "interacting" with books and film media as if they were walking through a forest or in a cave; a new place of arcade-like spaces where soft mutual relations form by simply passing through; a focal centre where a new sense of creativity begins to spread throughout the art university's campus. (<http://www.dezeen.com/2007/09/11/tama-art-university-library-by-toyo-ito/>)

#### **Sendai Médiathèque, Sendai-Aaba-ku, Miyagi – Japan 1995 – 2000**

7 stories, 2 basements, 29.682 m<sup>2</sup> Location: Sendai-shi, Japan

### **Awards:**

#### **2006 Royal Gold Medal by the Royal Institute of British Architects (RIBA)**

With the intentions of designing a transparent cultural media center that is supported by a unique system to allow complete visibility and transparency to the surrounding community, the Sendai Mediatheque by Toyo Ito is revolutionary in its engineering and aesthetic. Six steel-ribbed slabs, each 15-3/4" thick, appear to float from the street, supported by only thirteen vertical steel lattice columns that stretch from ground plane to the roof. This striking visual quality that is one of the most identifiable characteristics of the project is comparable to large trees in a forest, and function as light shafts as well as storage for all of the utilities, networks and systems. Each plan is free form, as the structural column lattices are independent of the facade and fluctuate in diameter as they stretch from floor to floor. The simplest intentions of focusing on plates (floors), tubes (columns), and skin (facade/exterior walls) allows for a poetic and visually intriguing design, as well as a complex system of activities and informational systems. The four largest tubes are situated at the corners of the plates, which serve as the principle means of support and bracing. Five of the nine smaller tubes are straight and contain elevators, while the other four are more crooked and carry the ducts and wires. Upon approaching the Sendai Mediatheque, the public is led into a continuation of the surrounding city into the double height hall of the main entrance through large panes of glass. This open square includes a cafe, retail shop, and community space that is capable of supporting film screenings and other events. Another aspect unique to this building is the involvement of many designers, as the interior of each level incorporated another person. Kazuyo Sejima designed the ground floor, placing the administrative offices behind a translucent screen. The Shimin Library found on the second and third levels include a browsing lounge complete with internet access and specially designed furniture by K.T. Architecture. The gallery space of the fourth and fifth levels contain a flexible exhibition space with moveable walls, and also a more static space with fixed walls and a rest area with seating designed by Karim Rashid. Ross Lovegrove took charge of the sixth level, adding a 180 seat cinema and green and white furniture fitting to the audio-visual multimedia library. The tree-like nature of the metal columns of the Mediatheque are continuous with the natural surroundings of the area, as the design is found on a street lined with trees. The building changes along with the seasons, its openness reflective of the summer green and also the streets during winter.

(<http://www.archdaily.com/118627/ad-classics-sendai-mediatheque-toyo-ito>)

#### **New College of Social Science, Taipei – Taiwan in construction**

After twelve arduous years, and costing 1.61 billion N.T. dollars in total, the construction project for the College of Social Sciences finally held its ground breaking ceremony on March 2nd, 2010, at 10 o'clock in the morning. President Si-Chen Lee, Dean of the College of Social Sciences Dr. Yung-Mao Chao, former President Chen Sun, Chairman of Tung-Ho Steel Mr. Jen-Shyong Ho, Chairman of Taiwan Cement Corporation Mr. Cheng-Yun Koo, Mrs. Cecilia Yen Koo and her family, Chairman of International Cultural and Educational Foundation Mr. Jie-Zhou Liu, Japanese architect Tayo Ito, Chairman of Fu Tsu Construction Mr. Chih -Sheng Lin, top echelon administrators from the university and dignitaries from society attended the grand occasion.

In his speech President Lee said that the relocation of the College of Social Sciences back to the main campus symbolizes a new era in the development of National Taiwan University. He was thankful to the alumni for their generous donations which he believed would make the faculty and students at NTU work all the more harder to build a better future for our country.

NTU is moving toward globalization. The buildings of the new College of Social Sciences specifically invited the internationally renowned architect Toyo Ito to be the designer for a good reason, i.e., that they are mutually complementary.

President Lee believed that the College of Social Sciences building will not only become a representative architecture for NTU campus in the 21st century, but will also become a paragon of campus open space for Taiwan.

President Lee emphasized that, in the history of National Taiwan University, 1.6 billion is the largest amount ever spent on any public construction. Of the 1.6 billion, 40% of which was donated by NTU alumni. Besides thanking all the donors, special thanks are due to Chairman Jen-Shyong Ho of Tung Ho Steel, Chairman Cheng-Yun Koo of Taiwan Cement Corporation, and Chairman Jie-zhou Liu of the International Cultural and Educational Foundation, whose large amount donations brought the construction project into fruition.

Former President Chen Sun pointed out: "Relocating to the main campus has been the expectation of the faculty and students of the College of Social Sciences for decades, and it also sits well with a comprehensive university. In 1984, the second year when I was President of NTU, the site was a nursery of flowers. In 1985 the site was reclaimed by the university and designated as the future space for the College of Social Sciences. The College of Law evolved from a Department of Business into a College of Management, then it was relocated to its present site in Gongguan, the Department of Sociology, the Institute of National Development, and the Institute of Journalism comprised the first phase of relocation; now the Department of Political Science and the Department of Economics also relocate back to the main campus, completing the relocation of the College of Law."

In making his speech, Dean Yung-Mao Chao said humorously that in addition to the presence of hardwares, softwares are equally important. So in the future he expects to set up some seminars and scholarships to complete the picture. Aside from thanking the major donors, he wants to extend his deepest appreciation on behalf of all faculty and students of the College of Social Sciences to the small amount donors.

The total floor area of the College of Social Science Building is 53231.69 square meters (roughly 16102.6 ping). It is an architecture with eight stories above ground and two basements. The main building measures 168 meters from East to West, 26 meters from North to South, and 31 meters in height. The areas above ground measures 29664.5 square meters, and the areas under ground measures 23567.19 square meters, in which the reading room in the library measures 50 meters by 50 meters, and 6 meters in height. This is a building of complete thoroughfare, and the cost of it amounts to 1.61 billion N.T.

The fundamental design of the construction project was done by Toyo Ito & Associates of Japan, whereas the detailed designs were co-executed by Toyo Ito & Associates, Fei & Cheng Associates, and A + B Design Group. Fu Tsu Construction, a famous domestic construction company, won the construction bid on December 17th, 2009. After completion, the new College of Social Sciences will provide faculty and students a new teaching and learning environment, and change the situation in which students had to commute between the main campus and the College of Social Sciences. The interaction between the College of Natural Sciences and the College of Social Sciences is expected to upgrade and enhance after the College of Law and the College of Social Sciences relocate to the main campus. In essence, the new College of Social Sciences will bring about a new appreciation of the architectural style in NTU. In an international environment, not only should the teachers and students pursue international exchange, but the campus environment can be improved as well through cross national architectural experiences.

The construction project for the College of Social Sciences received enthusiastic support from alumni, and we invited architects of international caliber to conduct fundamental design and detailed design on a pro bono basis. Our purpose was to build a landmark architecture for National Taiwan University. Up to now, the major donors who have contributed over 100 million N.T. dollars are as follows:

Chairman Jen-Syong Ho of Tung Ho Steel donated 200 million N.T. in 2004, which included 7500 tons of steel, and 80 millions in cash, plus 10 millions for detailed design. Then, owing to design needs, the amount of steel donated was increased to 8100 tons. So, Chairman Ho's personal donation includes 8100 tons of steel (market value over 150 million) and 90 million in cash, amounting to 240 millions in total.

Mr. Cheng-Fu Koo, the deceased Chairman of Taiwan Cement Corporation, promised to donate 100 million N.T. to NTU before his death. His son, the current Chairman of Taiwan Cement Corporation, Mr. Cheng-yung Koo, also donates 90 million on behalf of his family, of which 30 million was to be used for the design and decoration of "Cheng-Fu Koo Memorial Library." Therefore, the total contribution from the Koo family is at 190 million N.T. dollars. Mr. Jie-Zhou Liu, Chairman of the International Cultural and Educational Foundation, donated 110 million N.T. dollars, of which 20 million was used for detailed design and other related expenses. Premium Award Architectural Institute of Japan

Shiranuhi town, where this building is located, is named after a mirage that appears once a year above its bay. This "Shiranuhi"

phenomenon appears in the most ancient collection of Japanese myths, called the "Nihon Shoki", and forms the basis of identity and culture of the region. The design of this architecture attempts to express architecture as a phenomenological existence, having a transient and ever-changing appearance. The project aims at creating the environment which harmonizes the entire site with surrounding area and improves its quality. Zelkova avenue, proposed and constructed as a main access to the facility, is a symbolical green axis which outlines existing administrative zone and public recreation zone and enables various access to the existing facilities. Certain "depth" is added to the whole area with green hill. Soundproof measures are taken against the noise of adjoining Japan Railways. 95 m-length exterior is composed of aluminum louver which reflects light subtly and stands for a symbol of "Shiranuhi", a regional specific mirage rising on the surface of the sea. It is loved by local people as a landmark which connects the antiquity and the future. Civic Plaza is a central core of the town, where buildings and environment are totally developed so that cheerful and friendly environment open to the local public would be produced. South-oriented spacious lawn plaza is constructed with promenade, artificial hill and forest. Multipurpose wooden stage and benches, open-air sculpture, basin, and plants are settled. The aluminum brise-soleil, distinctive with its exterior, has effective sectional form and louver angle whose performance is proved by the sunshine and daylight simulation. It controls strong daylight of the southern region to keep bright and comfortable internal environment and energy saving. Internal circulation of the barrier-free facility is realized in a series of museum and library on a single flat floor. With mobile display walls which are operated easily by hands of a woman, the exhibition room achieves a flexible space which allows various exhibition programs. The museum accommodates and exhibits the collection of international artists from Shiranuhi district: Manabu Mabe, Hideo Noda et al. The library is open to the public who enjoy reading books in the open-shelf reference space. (Kitagawara)

Japan's largest museum opens its doors: It's been three decades since architect Kisho Kurokawa began designing what is now Japan's largest museum. With its striking facade of waves of glass, it encompasses an astounding 48,000m<sup>2</sup>, making it the largest in Japan. With no collection of its own, the National Art Center, Tokyo's 12 exhibition rooms will be divided between shows organized by nationally recognized art associations (ten rooms) and those used for curated exhibitions (two rooms). Alongside the state-of-the-art exhibition spaces are a restaurant and three cafés, a shop, an auditorium, three lecture rooms and a public art library containing 50,000 publications, largely art exhibition catalogues. Also, as part of their "outreach to the public," the museum will offer educational programs, lectures, gallery talks, internships and volunteer programs. For 2007, the 43 volunteers and ten graduate-students and museum-professional interns have already been selected. The building is a work of art in itself. The eye-catching design by Kisho Kurokawa is best appreciated from the Roppongi Hills observatory. With a "mori no naka" (in the middle of the woods) theme, the architect based the curved frontage on computer-rendered rhythmic images formed by mountains and the seashore. Inside, the atrium blends two huge conical pods with natural wood flooring, andon-style lights that illuminate a bank of slatted walls, and leafy views of Aoyama Cemetery. It's a breathtaking welcome that befits the museum's original concept as a hirakareta bijutsukan—a museum opened to all. (<http://worldarchitecturenews.com>)

The National Art Center, Tokyo is located in the Roppongi district at the center of Tokyo. Roppongi is a downtown area known for its numerous high-scale restaurants, boutiques, foreign offices in addition to being home to many 'creators'. The building is made up of seven enormous column-less display rooms, each 2000m<sup>2</sup>, a library, an auditorium, a restaurant, a cafe and a museum shop. The floor area of the National Art Center, Tokyo totals 45,000m<sup>2</sup>, making it Japan's largest museum. The National Art Center, Tokyo will not be a space for archiving works of art, but is a space for exhibiting public open exhibits and travelling exhibits. The largest exhibit in Japan, the Nitten Exhibition, supported by the Nitten Japan Fine Arts Group, displays a collection of over 12,000 works annually, taking up an area of 10,000m<sup>2</sup>, or more than 5 display 'blocks.' The jurying process for these types of exhibitions will begin in the basement, where works will be brought in one by one at the loading area and only the pieces selected will be brought by service elevator to the display blocks. Medium and small sized public exhibits will most often be held in one 'block' and will be judged, separated, held and displayed as they are unloaded from trucks in the basement in a functional rhythm. One display 'block' can, moreover, be divided by partitions creating smaller spaces. This being the first super functional facility of its kind, it would be fair to call it a gigantic display machine. Designed to rival the mechanical display space is the atrium facade, an enormous transparent undulation. As the trees surrounding the museum grow, they will enclose the atrium in a forested public space. Also in the atrium space are two inverted cones, the upper portion of both featuring the restaurant and cafe. The atrium connects with the Roppongi downtown as one part of the street, perhaps to be an element of Roppongi's famous nightlife. (Kisho Kurokawa)

## **Maki & Associates, Architecture and Planning, Tokyo – Japan**

<http://www.maki-and-associates.co.jp>

### **Libraries:**

#### **Fukui Prefectural Library and Archives – Japan 2003**

Structural System Steel Frame / Steel Reinforced Concrete / Reinforced Concrete Number of Floors 4 Stories + 1 Basement Site Area 70,000m<sup>2</sup>, Building Area 12,919m<sup>2</sup>, Total floor Area 18,436m<sup>2</sup>, Structural Engineer Hanawa Structural Engineers Mechanical / Electrical Engineer Sogo Consultants.

The Fukui Prefectural Library and Archives is located in the rural suburbs of Fukui city, surrounded by lush rice fields and adjacent to the Asuwa River, situated in a desired natural setting. To take complete advantage of this environment, this building establishes a positive relationship with the surrounding setting. The open stack reading rooms are spread out across one floor, and most of them are enclosed by glass curtain walls, creating a visual connection between the inside and outside. The majority of reading areas are situated along the perimeter of this space, allowing visitors to enjoy the scenery as they take breaks, viewing the gardens nearby, or gazing far out to the distant mountains. (Maki)

### **MIT Media Lab, Massachusetts Institute of Technology, Cambridge, Massachusetts – USA 2009**

Design collaboration Leers Weinzapfel Associates, Structural design Weidlinger Associates, Inc. SDG, Structural Design Group Facility design Cosentini Associates.

MIT Media Lab, Massachusetts Institute of Technology, for the design and art activities, which also provides an excellent base functionality and architecture. There is Media Research, the Center for Bits and Atoms, arts and science university programs related to media and other relevant groups will be accommodated in a while is not unique organization departments and disciplines. Its activities have developed a wide range of operas ranging from quantum computing. This facility is one of seven research groups and arranged around a central atrium that develops three-dimensional, top-floor exhibition space and events, and views of the Charles River in Boston, lecture halls, conference rooms, cafes and from being configured. (Maki)

### **Republic Polytechnic, Singapore – Singapore 2007**

(Polytechnic)/Library/Gymnasium/Auditorium Structural System Reinforced Concrete / Steel Frame Number of Floors 11+1 Basement Site Area 200,000m<sup>2</sup> Building Area 70,000m<sup>2</sup> Total floor Area 210,000m<sup>2</sup> Local Architect/General Planner DP Architects Pte. Ltd. Structural Engineer Meinhardt (Singapore) Pte. Ltd. Mechanical / Electrical Engineer Beca Carter Hollings & Ferner (S.E.Asia) Pte. Ltd. Landscape Architect Ohtori Consultants Environmental Design Institute/ Acoustic Consultant Nagata Acoustics Inc., Acvicon Acoustics Consultants Pte. Ltd.

While the campus maintains existing green areas of the site and coexists with the existing topography, it also introduces new landscape elements which make contrasts to the natural wilderness. The new landscape strengthens the sense of place and ties the various campus buildings together as a whole. As a master plan strategy, the Republic Polytechnic is conceived as a campus with a central nucleus of main educational programs. The central nucleus contains 11 identical learning pods and a staff administration building. Two elliptical spaces of common facilities, namely the Lawn and the Agora, unify these learning pods. These formal spatial compartments are brought together by generous spaces for congregation, where a myriad of informal interaction between students and faculty can take place. The central nucleus is connected by bridges to the main administration building, Cultural Center, indoor parking and gymnasium facilities. (Maki)

### **Naito Architect & Associates, Tokyo – Japan**

#### **Tokomachi Public Library, Tomamachi – Japan 1999**

Tokomachi public library (Niigata Prefecture-Tokamachi) 1999. Primarily, the success of this project is the social impact to the community, becoming a benchmark or milestone. The space is large and of high quality, the differences in height give a lot of movement and the books are posted inside the walls disappear and make them stand the pillars sustaining the cover. Only 16 columns support the roof of 3,100 m<sup>2</sup>. This through the use of structural systems assembled by prefabricated elements are articulated. The importance that was given to the light through 4 skylights over the whole building, like all perimeter windows. ([http://www.caracolarquitectura.com/arquitectura/index.php?option=com\\_content&task=blogcategory&id=428&Itemid=41](http://www.caracolarquitectura.com/arquitectura/index.php?option=com_content&task=blogcategory&id=428&Itemid=41))

#### **Belen Park Library, Medellin – Columbia 2008**

Today I went towards the southwest sector of the city to visit Biblioteca Belén. Biblioteca Belén is named after the comuna for which it's situated. Designed by Hiroshi Naito, Belén is the only Library Park designed by a non-Colombian Architect. The Biblioteca is similar in the programmatic function of its sister libraries, having a play room for children (Ludoteca), Mi barrio room, Adult and Children libraries ample public spaces and an Auditorium. What Belén offers it's residence besides these basic functions is a chance to explore a bit more about Japan and Japanese Architecture; the Biblioteca offers a room solely dedicated towards Japanese literature and culture and the entire campus for the library park is skillfully planned to mimic traditional Japanese Buddhist monetary design. The best attribute of the park is it's ability to stitch the linear gap that use to exist between the surrounding neighborhoods to the east and west; The library park is perfectly positioned to link neighborhoods at this critical juncture along Carreras 76 and 80a. Biblioteca Belén's park aspects can be broken down into 3 spatial zones... Park, Cloister, Plaza with each serving different roles. The Park, mimics the openness feeling of Carrera 80a by providing a great field for lounging in the grass all while catching sounds of practicing musicians out of the Escuela de Música and Salón de Ensayo (rehearsal room). The Plaza, mimicing the density of Carrera 76, serves as a more intimate setting for outdoor performances with it's plaza and stepped plinths against the Teatro. The Cloister, rotating around the tranquility of a motionless water pond are the main service buildings of the library. The use of the largest programmed buildings to surround the pond creates a visual and auditory break that allows one to shed a sense of the outside world and relax into the peaceful world of reading. #### **Achi Village Library – Renovation, Extension, Achi-mura, Nagano Prefecture – Japan 2004**

6488m<sup>2</sup> (357m<sup>2</sup> extension to the renovation). Achi Village Library - Renovation extension  
Three-story community center of RC, 3-storey building community structure

Central facility of the four villages Achi (building office, building community health centers, community centers center) connected by a corridor pergola, and at the same time integrating the facilities of the pieces, the library generous to repair a large first floor of a central community center planning and service. Renovating the first floor of the Central Public Hall, and expansion in the steel in the west plaza, which developed a library that is integrated with generous square. The square and the west parking lot at the time of the event, planting, and improve the exterior. (Nakamura)

### **NASCA Co., Ltd., Tokyo – Japan**

Nobuaki Furuya, Sachiko Yagi

<http://www.studio-nasca.com>

**Libraries:**

#### **Obuse Library Architosho Terrasow, Obuse, Nagano Prefecture – Japan 2009**

Architect: Nobuaki Furuya+NASCA, Site area 10,511.44 m<sup>2</sup>, Area 998.53 m<sup>2</sup>

## Literature:

Shinkenchiu 0911, GA JAPAN 101

This library becomes a new "plaza" in Obuse. It becomes a place in which a lot of one people can gather under the roof. Moreover, it becomes light that shines on surroundings like an andon at night.

Machitoshō terraces is a place that becomes the starting point of the plan that becomes "Library where the entire Obuse-cho lived" that ranges to the center from Obuse Station to the town.

## Nikken Sekkei Ltd.planners, architects, engineers, Tokyo – Japan

<http://www.nikken.co.jp>

### Libraries:

#### Fukuyama City Study Hall (City Central Library), Fukuyama – Japan 2006 – 2006

13.789 m<sup>2</sup>

This is a comprehensive facility with a library of 650,000 books as the core function. It also integrates historical data room, conference room, childcare support center, and broadcasting university satellite space etc. While bringing in the sceneries of the neighboring central park into the reading room, the two are closely linked together by merging the boundary of the library and park. Facing the neighboring central park, there are leveled overhanging eaves. The width is set according to simulation of exposure to sun. During open hours, there is almost no need to use the window blinds throughout the seasons. The reading room is a two-story 40m square structure. In order to feel the change of time in a day in a planar layout with large depth, there are multi-story high ceiling window and a small waterfall on the west side. This allows the people to feel the external environment centered on natural light regardless of where they are in the reading room, experiencing the feeling of walking in the park and being close to books. (Nikken)

#### Kokugakuin University, Academic Media Center, Tokyo – Japan 2006 – 2008

17.382 m<sup>2</sup>

This is the fourth of the five phases of the redevelopment plan of the Kokugakuin University Shibuya campus, which is to last 8 years. The facility has the spot for research activities in the university, which include the data room for displaying research results on archeology, theology, and university history, multimedia classrooms, research labs, and the largest library in Tokyo, storing one million books. At the center of the building, the six-story court properly connects the functions together. Abundant lighting makes it a bright and open space. Accompanying the natural lighting windows which span across the entire redevelopment and the technology of which is getting more refined as time passes, ventilating by gravity creates flow of wind. It reaches level S on the Comprehensive Assessment System for Built Environment Efficiency (CASBEE). It is dedicated to reducing environmental burdens by focusing on conserve energy, save resources, and recyclability, while raising environment quality and performance. In addition, on the detail treatment for the building, it attempts have people feeling the original texture of materials such as concrete, steel, glass, wood, and stone etc. Being in harmony with the equipments, it applies simple equipments with utmost necessity. The sloped roof at the top of the multi-story court and the Sapling Tower, which is in the neighboring land on the south side, act as the symbol of the university, accompanying each other on the axis. (Nikken)

Kokugakuin University is an institution of learning and education, founded with the dual mission of exploring and passing on Japan's traditional culture and the unique Japanese mind running at its base, while simultaneously adopting and creatively developing the learning of other countries. (<http://read.jst.go.jp>)

#### Tsushima Municipal Communication Center, Tsushima City - Japan 2005 – 2006

19.977 m<sup>2</sup>

This is constructed in the town of Tsushima Izuhara (Previously Shimoagata-gun), which is merged from 5 towns. It is a complex composed of commercial facilities, event hall, library, and conference rooms, etc. This is a new symbol building, of Tsushima, which welcomed the Korean communique envoy as the gateway of Asia in history. In order to not bring repressiveness to the surrounding low buildings the building is of low height (up to four stories)but stretches long to fully use 140-m long site. In the building, clear-cut functional zoning is decided on the floor-by-floor basis. There is a large tiled roof, which acts as the welcome gate, looking on the Izuhara port. The building is created as a pedestrian network spot in the town. (Nikken)

#### Inazawa City Library – Japan 2005 – 2006

4.967 m<sup>2</sup>

This is a library, which is the spot for community activities and exchanges, next to the citizen assembly hall. The main body is a general open-shelf reading lobby capable of storing 130,000 volumes of book. It is a column-less space of 50 meters in width and 18 meters in depth. In addition, there are children's reading room, regional data room, and research room etc. It is connected to the existing citizen assembly hall via a pedestrian bridge, striving to achieve activeness for the area. The exterior vertical surface is of shot blast board tile combined with tilted colored pre-cast concrete plate to form a bright and quiet atmosphere. In the general reading lobby on the second floor, the aluminum reflector top light directs natural sunlight through its broad light duct into the lobby to create a bright and comfortable reading space. In addition, under-floor air conditioning and radiating cooling/heating air conditioning system in combination are used for energy saving purpose. (Nikken)

#### Otsuma Girls Jr. High School, Tokyo – Japan 2002 – 2005

16.746 m<sup>2</sup>

It is a private women school with consistent education of middle and high school. For the entire reconstruction project would be undertaken in the center city with limited space, while partial existing school facility in use, the project was divided into two parts-- construction proceeded in the order of schoolhouse to gymnasium. Both schoolhouse and gymnasium have multi-layers. It not only has the need for multiple function but also the need of "comfortable space" for school life in the atrium and the roof-top square. The schoolhouse has its special classroom, library and administrative offices from B1 to F3 and the normal classrooms from F4 to F9 in atrium area, a inner open space in the school. The gymnasium is a two floor arena on which top it has multiple-purpose roof-top square. The outer is surfaced by hard aluminum columns and it controls the reflection of sunshine so that its aluminum checks reflect the subtle expressions. The inner interior consists of wooden material. And by top light and the combination with its indirect reflection, it forms a space with women-school-like flavor-- the touching warmth embraced by the soft lights. (Nikken)

#### Shibaura Institute of Technology, Toyosu Campus, Tokyo – Japan 2003 - 2005

61.934 m<sup>2</sup>

The location of this project at the Toyosu 2・3-chome area, which was the site of the shipyard dock and factories of the IHI, is undergoing urban redevelopment. In the recent years, following the push of urban construction such as high-tech companies, large-

scale collective residences, and business facilities, a brand new gateway image of Tokyo is being formed here. As an important project in this process, the theme of this project is to "create a futuristic and urban campus". The site is facing the canal. The campus court is located on the axis connecting to the community street of the area. There is also an event stage in the gate-shaped void space in Research Building. While reducing the effect of wind, the unique style of the "gate" is a campus icon that leaves a deep impression to students. The characteristic of the campus planning clearcut functional arrangement made by piling up various functions in the vertical direction. As a result, there are communication building, classroom building, experiment building and research. On the eighth floor of the research building, there is a library, which is designed as a university utility center. On the way to this place, there are, successively, the multipurpose space, business department, classroom, and roof garden etc. They are connected by a void space with artworks and escalators, forming an integrated space. Between the students and teaching staffs, this motivates the face-to-face communication that can create a space full of life and vibrancy.

#### **Hiroshima University of Economics, Media Information Center, Hiroshima – Japan 2003 – 2004**

7.557 m<sup>2</sup>

This is a new building that gathers PC rooms, which used to be scattered in the campus. The building also houses a studio used for broadcasting high-definition television for the new curriculum of Media Business. The site is located on a south-east facing slope, from which people could see the city view of Hiroshima. To create better view from the building, we designed a tier section on the south side and a broad terraces on the east side. In order to avoid direct sunlight and create gentle lighting in the PC rooms, we planned the light court in the center; and we also designed corridors around the classrooms to create more space and a better view. For exterior, we used the same tiles as the existing buildings, while structured a facade with iron, glass and concrete to express the modern style. In this design, we take the horizontal line as a basic tone and the glass stair boxes as a symbol. (Nikken)

#### **The International Library of Children's Literature, Tokyo – Japan 1998 – 2002**

6.671 m<sup>2</sup>

This facility is a research center and a library for global children's book collection and exhibition. The former building is Imperial Library, whose first phase was completed in 1906 and second phase was completed in 1929. The construction plan is terminated afterwards. This project is to preserve and reuse the building and to add some new functions. The project objective is to utilize the original structure and space as much as possible, in the mean time renovate the building into a comfortable and safe one with up-to-date IT functions. While keeping the original space, we increase the quake-resistance with retrofit engineering method. To control the expansion work in minimum, we build underground utility room, corridor/swing core, and gate etc. We add a simple and transparent structure as curtain wall, which harmonize well with the original facade. (Nikken)

#### **Hoshi University "Shinsei kan", Toyko – Japan 1999 – 2001**

16.968 m<sup>2</sup>

This is the new building for Hoshi University, with functions of lecture halls, laboratories, library and welfare facilities. The exterior extends the old building's lemon image, and further improves the modern style to suit the scientific research activities going inside the building. The building is transparent from entrance to atrium. To suit the various situations that laboratories might have in the future, the building has much flexibility with long span, free access piping pit, and facility balcony, and also high safety with seismically isolated structural system. Inside the central atrium, there are gentle large stairs leading to lecture rooms, which also becomes the common area for students. (Nikken)

#### **Kakegawa City Library – Japan 1999 – 2001**

4.617 m<sup>2</sup>

This is the central library of Kakegawa city, which has proclaimed its life-learning plan as the national pioneer. The library serves as the local center of culture and information, located at the city's history and culture symbol zone with Kakegawa Park and Nihon Hotoku Sha on the side. To coordinate with the surrounding historical and cultural environment, while not showing magisterial arrogance, we design the over-ground part as a low-rise flat building, with ridge roof made of Japanese tiles. Visitors could see through the building from outside. The open reading zone is on the first floor. All sections surround the service core center like a donut shape. The underground meeting sections integrate with each other though the open area. Inside uses large wood structure and wooden decoration materials to create bright and warm reading space with natural lighting. (Nikken)

#### **Ibaraki Prefectural Library, Mito – Japan 2000**

8.700 m<sup>2</sup>

For the construction plan, the old Assembly Capital of Ibaraki Prefecture completely constructed in 1969, accompanied with keeping the prefecture's main building, was set up as symbol of the prefecture, and the plan was devised for reconstructing it into the library, with preserving its appearance. In the old site, all of the constructed structures, except for main building and this Assembly Capital, were dismantled, and they were newly consolidated into the prefecture's park. Based on the concept that old Assembly Capital should be constructed again into new library, with still ever leaving the "memory of its old space", some structures such as its facade, Assembly Hall, entrance hall, and others were designed to maximally keep their existing characteristics. For the Assembly Hall case, it was changed into the reading room combining with audiovisual hall by installing large-scale electric screen, and for the concrete-cast well of the entrance hall, the harmony without a sense of incompatibility between already existing spaces and new technologies was considered to use aluminum materials probably to fix acoustic materials, with a viewpoint of increasing the acoustic performances. In addition, barrier-free construction was realized to remove the possibility that it seemed to be much different from old Assembly Capital. (Nikken)

#### **Guangzhou Library – China 2006 - 2011**

Co-designed by Guangzhou Design Institute

Zhujiang New Town District, Guangzhou, Guangdong Province, People's Republic of China

Owner Bureau of Culture of Guangzhou Municipality, Site area 21.067 sq.m., Building area 7.828 sq.m., Total floor area 98,000 sq.m., Structure RC / SRC / S, Floors 10 aboveground, 2 basement, Building height 50m, Parking capacity 364 cars

Guangzhou New Library is the final facility to be completed in a new cultural zone planned by the Guangzhou City Government. Approximately 4 million books will be stored and displayed on the open shelves in the library. Designed to complement the surrounding buildings, the structure's exterior is reminiscent of a pile of books, characterized by numerous layers of thick stones that also shield those inside from the strong sunlight of the Guangzhou region. Yet this sunlight is itself an asset that the building takes advantage of, with its two large atrium spaces and two structural light slits positioned for optimal levels of daylight and overall unity. (Nikken)

## **SANAA Architects (Kazuyo Sejima & Ryue Nishizawa), Tokyo – Japan**

<http://www.sanaa.co.jp>

### **Libraries:**

#### **Bibliothek Rolex Learning Center ,EPFL (École Polytechnique Fédérale de Lausanne), Lausanne – Switzerland 2007 -2009**

15.000 m<sup>2</sup>, CHF 110.000.000

#### **Literature:**

Aymonin, David, *Offen, flexibel und entwicklungsfähig wie das Internet. Die Bibliothek des Rolex Learning Center der École Polytechnique Fédérale de Lausanne*, in: *BuB. Forum Bibliothek und Information*, Jg. 62, 2010, 10, pp.720-722

The Rolex Learning Center, a university study centre by Japanese architects SANAA, opens in Lausanne, Switzerland next week.

The centre is located on the campus of science and technology university EPFL (Ecole Polytechnique Fédérale de Lausanne), and will be open to both students and the public.

#### **SANAA DESIGNED ROLEX LEARNING CENTER OPENS AT EPFL IN LAUSANNE, SWITZERLAND**

Built on the campus of EPFL Ecole Polytechnique Fédérale de Lausanne, The Rolex Learning Center designed by the internationally acclaimed Japanese architectural practice, SANAA, will open on 22 February 2010.

The Rolex Learning Center will function as a laboratory for learning, a library with 500,000 volumes and an international cultural hub for EPFL, open to both students and the public. Spread over one single fluid space of 20,000 sq metres, it provides a seamless network of services, libraries, information gathering, social spaces, spaces to study, restaurants, cafes and beautiful outdoor spaces. It is a highly innovative building, with gentle slopes and terraces, undulating around a series of internal 'patios', with almost invisible supports for its complex curving roof, which required completely new methods of construction.

"The Rolex Learning Center," Patrick Aebischer, President of EPFL, said, "exemplifies our university as a place where traditional boundaries between disciplines are broken down, where mathematicians and engineers meet with neuroscientists and microtechnicians to envision new technologies that improve lives. We invite the public into this space to convey the message that working in science is working for the advancement of society."

EPFL is one of the world's leading universities in technology and science, renowned for its innovations in research and learning. It is currently ranked number one in Europe alongside Cambridge in the fields of Engineering Technology and Computer Sciences. The campus, on a site overlooking Lake Geneva and the Alps, brings together over 4,000 researchers, and 7,000 students, who work in a highly collaborative environment with international experts in engineering, science and industry.

The Rolex Learning Center has been financed by the Swiss government and major Swiss businesses. Rolex's participation in the project is the fruit of a long-standing relationship with EPFL in research into materials science and microtechnology for watch design, and its deep rooted tradition of philanthropy in the arts, science and culture through the Rolex Awards for Enterprise and the Rolex Mentor and Protégé Arts Initiative. Logitech made the initial contribution that launched the architectural competition. Losinger, member of Bouygues Construction Group and sponsor, was the principle contractor for the building. Credit Suisse, another financial partner for the project, will have a Future Banking Laboratory in the building. Further internationally active Swiss partners who contributed to the finance, research, and innovation of the building are Nestlé, Novartis, and SICPA.

17.02.2010 (<http://www.dezeen.com/2010/02/17/rolex-learning-center-by-sanaa>)

The most audacious aspect of the new library is its lack of physical boundaries. The large open space is defined by its artificial geography. It groups silent and calm zones along its hills and slopes, rather than offering traditional cloistered study rooms. As well as providing social areas and an impressive auditorium, the building lends itself to the establishment of quiet zones and silent zones, acoustically separated areas created through changes in height.

The slopes, valleys and plateaus within the building, as well as the shapes made by the patios, all contribute to these barrier-free delineations of space. In addition, clusters of glazed or walled "bubbles" make small enclosures for small groups to meet or work together in.

Inside, the hills, valleys and plateaus formed by the undulation often make the edges of the building invisible, though there are no visual barriers between one area and the next. Instead of steps and staircases, there are gentle slopes and terraces. Clearly, but without dividing walls, one area of activity gives way to another. Visitors stroll up the gentle curves, or perhaps move around the space on one of the specially designed "horizontal lifts," elegant glass boxes, whose engineering is adapted from everyday lift design.

The topography lends an extraordinary fluidity to the building's flexible open plan - a flow that is emphasized by fourteen voids in the structure, of varying dimensions. These are glazed and create a series of softly rounded external 'patios', as the architects describe them. The patios are social spaces and provide a visual link between the inside and the outside. They are very much part of the building.

(<http://www.arcspace.com/festures/sanaa/rolex-learning-center>)

#### **Zollvereins School, Essen – Germany 2006**

Architekten: Sanaa, Tokio (Entwurf); Böll und Krabel, Essen (Ausführung), Klima- und Energiekonzept: Transsolar, Stuttgart, Bauherr: School of Management and Design, Essen

...Der Würfel mit einer Kantenlänge von 35 Metern ist von Kazuyo Sejima und Ryue Nishizawa vom Büro Sanaa aus Tokio entworfen. Vier Geschosse mit unterschiedlichen Raumhöhen bieten zusammen 5.000 m<sup>2</sup> Nutzfläche. Die zum großen Teil offenen Räume werden durch 134 Fenster in vier Formaten belichtet, die im Inneren zu sehr unterschiedlichen Beleuchtungssituationen führen. Mit dem Gebäude ist den Architekten die Kombination traditioneller japanischer Baukunst mit Elementen der modernen Architektur gelungen. Das offene Raumkonzept wird nur durch die Möblierung und über

Sichtschutzvorhänge gegliedert.

Die Reduktion auf das Wesentliche findet sich auch bei der Tragkonstruktion und dem technischen Ausbau wieder, so sind einerseits alle tragenden Elemente auf ein Minimum reduziert worden und andererseits wurde die gesamte Haustechnik in die Wände und Decken verlegt.

Energieeffizientes Bauen

Dem filigranen Konzept des Gebäudes standen die strengen Auflagen der EnEV entgegen. Die Architekten entschieden sich aus ästhetischen Gesichtspunkten für Sichtbeton als vorherrschendes Material. Bei einer konventionellen zweischaligen Bauweise mit Kerndämmung wären so Wandstärken von 55 bis 60 cm entstanden. Da diese Wandstärken wiederum das architektonische Konzept in Frage gestellt hätten, entwickelten die Energietechniker eine Extremlösung, die Idee der aktiven Wärmedämmung war geboren.

Dafür sind in die einschalige Betonwand Kunststoffrohre eingelegt, die die Innenwände auf angenehme 18°C halten. Dies führt unweigerlich nach Außen zu erhöhten Temperaturverlusten, die durch das individuelle Wärmeversorgungs-konzept wieder ausgeglichen werden können.

Die Wärmeversorgung erfolgt durch das Grubenwasser aus den ehemaligen Steinkohleabbau-schächten. Das Wasser wird aus ca. 1000 Meter Tiefe an die Oberfläche gepumpt und besitzt eine durchschnittliche Temperatur von 29°C. Bisher wurde das Wasser mit Kerndämmung in die Emscher geleitet, jetzt wird ein Teil davon für die Design-Schule nutzbar gemacht.

Durch die Nutzung der vorhandenen geothermischen Wärmequelle konnten die hohen Wärmeverluste für die 30 cm starken ungedämmten Betonwände hingenommen werden. Die geringen Temperaturextreme der Betonfassade konnten auch in den statischen Berechnungen zum Tragwerk berücksichtigt werden, es wurde weniger Bewehrung benötigt, um die Wand rissfrei zu halten.

(<http://www.detail.de/architektur/news/zollvereinschule-in-essen-aktive-waermedaemmung-der-betonschale-009041.html>)

Our aim was to achieve transparency in the concrete structure. We wanted to design a simple cubic building to compliment the existing buildings and achieve continuity within the site. The seemingly coincidental organization of the openings, windows in three different sizes, create an unusual interaction with the surroundings and the interior. We have made many big openings in the facades to create different daylight situations inside the building. The position of the windows are defined by the interior programs. By varying the ceiling heights each floor has a very different atmosphere. (SANAA)

## **Fumio Toki Associates, Tokyo - Japan**

GA Japan 2002/11

Domus 2003/4

The national library, which was constructed as a center facility in Kansai Science City in Kyoto. It was elected by the international competition from total 496 application works. The major of it was underground, and the environmental architecture with natural lighting and rooftop gardening, etc. was achieved. (Toki)

## **TOMURO Atelier + Kenichi Nakamura and Associates, Tokyo – Japan**

**Libraries:**

[Nishimachi International School, Yashiro Media Center, Tokyo – Japan 2007](#)

school library in a residential neighborhood serves as a "home" for books. By Naomi Pollock : "Bean bag chairs are impossible in Japanese school libraries," says architect Kenichi Nakamura. But the dual language Nishimachi International School is no ordinary learning environment and its homey Yashiro Media Center is no ordinary book receptacle.

A collaboration by TOMURO Atelier and Kenichi Nakamura and Associates, the 4,223-square-foot facility—Japan's only bilingual elementary school library—marks a corner of the school's 38,130-square-foot, central Tokyo campus. It faces low-scale apartment buildings and single-family homes, including the stucco clad residence designed in 1921 by the U.S. architect William Merrell Vories for the school founder's family. The heart of the campus, the historic house contains primarily administrative offices, but its first floor held the library until it moved next door where the family horse carriage was once garaged. In deference to the founder's house and the site's rigid code restrictions, the building is residential in scale and character. Entered via a narrow outdoor passage, the library contains three levels. While the circulation and reference areas fill the ground floor, reading areas for older and younger students are above and below. Two glass-enclosed, vertical elements—the elevator shaft and the grand stair—bookend the narrow building and allow soft daylight to filter down to its lowest level. The product of a 20-foot long steel cantilever, the transparent stair enclosure abuts the street on two sides and engages passersby with glimpses of activity inside. An oversized, mullioned window upstairs serves as an emergency exit while framing views of outdoor spaces. Elsewhere wall openings were minimized to maximize interior shelf space. Silvery aluminum panels cover the exterior, imbuing it with a fresh, contemporary look while nodding politely to the grey colored masonry next door. Truly a home for books, the Media Center, unlike most school libraries in Japan, is relaxed and inviting. "We envisioned it like a living room," explains Reiko Tomuro. While a lamp lit cluster of upholstered furnishings and floor cushions beckons borrowers as they enter the building, the upper floor capped by its soaring, slanted ceiling is reminiscent of a traditional reading room minus the usual code of silence. Top to bottom, all three floors ensure that a good read is well within reach of even the littlest book browser. (<http://archrecord.construction.com>)

University-Hakodate public Open Space = open-minded , "Complex Systems Science" and "information architecture" with the university's Department of Information Systems of the two. We are architectural design firm, proposed a studio-like space or the architecture department at the University. Form a substantial work of students and researchers in the Department of the two, since I thought that type of operation very similar to when we designed the building. Time alone to think, if you want to work in a team is a space that can be freely deployed in various situations. Flexible space that the "studio" call. The teachers have a lab right next to the studio. Between the laboratory and studio are separated by clear glass, which is to see the picture of each other. The open configuration, such as what the university's computer network with a focus on, since I thought it would be more important among people directly involved. "Open Space = Open Mind" is the slogan for this university. (Excerpt from GA Japan46). Future

### Tianjin Library – Cina 2012

Use Library Site area 37.800 m<sup>2</sup>, Building Area 13.700 m<sup>2</sup>, Total floor area 55 000 m<sup>2</sup>

Library planning in the area of culture Tianjin, 55,000 m<sup>2</sup> total floor area is a large library collection of books 5,000,000. Whole wall is arranged in the shape composed of grid. Walls that intersect orthogonally overlap above and below while. In addition, look for the intricate architecture of the 10 layers are provided between each tier mezzanine floor of a five-layer architecture. A steel truss structure of the wall. Central Library on the first floor, entrance hall has a north-south direction leaving, the library can be freely accessed by anyone. Also, fly over the hall wall beams. There is arranged bookshelf, the entire library-like space and surrounded by bookcases. Cross wall, while making a big open space, making even a small space that segment. Visitors can be read in various places while visiting the library. (Yamamoto)

#### **Libraries :**

#### **Myongji University Bangmok Library, Seoul – Korea 2007 - 2010**

Project Architect: Taijip Kim, Design team: Kiyoung Han, Mijung Kim, Myunghee Jang, Sun A Park, Kyungsu Jeong

New library provides a cultural icon for South Korea's capital

It is the recent remarkable trend that the library has been emerging from the space for simply reading and studying, so as to become the new space for users to communicate with the various information and tools. Reflecting the whole current trend, Gansam Partners planned Bangmok Library, a high technology research information center where users can communicate with various media and tools, taking in a wide view of the overall academic cultural contents of the university. In order to reflect the library as the place where knowledge from every field communicates and students interact while avoiding any sense of barriers and distance with the existing university buildings and neighbourhood residential area, the free curve of the mass shape was originated by adding a square mass which holds the bookshelves functionally, completing the present form. The architects used U-Glass for the outer surface of the free curve to better show the curve's image. IPE, a wood material, was used for the square mass to show the image of book, paper and bookshelves. U-Glass creates a warm and soft atmosphere by holding the filtered soft light instead of reflecting the shining direct light. The wood will age like the books and show their traces. As you enter the main entrance on the 1st floor, you can see Interactive Garden that is the indoor garden and also the hub of Bangmok Library. Once arriving here, students can reach every spot by stairs and open elevator: international conference room and free reading room on the 1st floor, group studying room, study garden and exhibition hall on the 2nd floor, bookshelves organised by field, multimedia database corner, ucc studio, plus an educating room and small theater on floors 3 and 4 respectively. The non-specific shape of various spaces are all made for studying. Students may seat around the round table or seat alongside the curve handrail and windows, or choose the opened reading corner on stairs. On each floor, the irregular void form along with the resting spot (Green Spot) on 3rd & 4th floor creates communicating and exchanging figure. (<http://www.worldarchitecturenews.com>)

The massing started off with gently curved form which seeks to welcome the student body of Myongji University and harmonizes in its surrounding of residential area and other university facilities. The square mass was subsequently inserted to serve as the functional zones to contain the books. The curvilinear outer skin comes to life with U-GLASS, and the square mass is expressed with wood (IPE) that relates to the nature of books, paper, and bookshelves. U-Glass doesn't directly reflect light, but filters light to create a warm and comfortable ambience; wood ages, similar to books, and archives the flow of time in its materiality. The interactive garden is the big lobby that connects 1F-4F, and is designed to become a liberating space, unlike the traditional libraries of silence and restriction, and is filled with liveliness from skylights filtering natural light and interior gardens.

1st floor is divided into two major zones, reading zone, and seminar zone. A psychological barrier between the two zones is established via 60cm of floor height difference, and the lobby serves the role of merging, and separating the two zones. One can easily see the diverse areas of the library while ascending via the emphatic interior staircase and the glass elevator, which add much dynamism to the library designed to serve as the vessel of activities of the students,

2nd floor holds both students' study zone and administration facilities; there are 14 study rooms and the Bangmok memorial exhibition on the second floor.

3rd floor is connected to the Student Center via a deck that serves as an additional main entrance, it contains diverse collection of books, dissertations, and periodicals. There are also education rooms, a small auditorium, multi-media facilities, and a UCC studio.

4th floor is also arranged similarly, with more space allocated to serve as open study spaces, available in forms of round tables, window-side seats, lobby-facing desks, and seating staircases.

The void spaces of each floor are meant to be staggered, so that from edge of each floor, one can see the floors below. Spatial diversity created via changes in floor and ceiling heights make up this unconventional, yet user-friendly library filled with comfortable and memorable spaces. (<http://www.archdaily.com>)

### **S.A.M.O.O. Architects, Seoul – Korea**

<http://www.samoo.com/Eng/>

#### **Libraries:**

#### **National Library of Multifunctional Administrative City, Yeongi-gun Korea 2009**

Area 22,790m<sup>2</sup>, Floors 4 Stories and 2 Basements, Year 2009 Awards Winner, Design Competition, 2009, Collaboration Keun Jeong Architects & Engineers Inc.

E-BRARY concept for future library design: E-BRARY is short for Emotional Library. The idea behind this concept was that if the 1st & 2nd generation libraries were in analog and digital format, the libraries of the future will be in digital format but with analog characteristics, thus becoming an emotional library. Strategically, this concept is further developed through the creation of emotional form, space and experiences throughout the building. The creation of the 4 storey, 2 basement E-BRARY will provide citizens and government personnel of Multifunctional Administrative City (Sejong) with rich contents and cultural experiences that will promote community space within the region. It will not only function as a central cultural facility but as a new urban landmark that can symbolize the Multifunctional Administrative City (Sejong). Through the unique image of the building, and through the unique location of the library, it will become a dynamic symbol and a new identity to the city of Sejong. The purpose of the construction of the E-BRARY is to create a central urban landmark of Multifunctional Administrative City.

(<http://www.worldarchitecturenews.org>)

The branch library of the National Library of Korea and the first of its regional library will be built in the Multifunctional Administrative City. The 'E-BRARY', a compound word of Emotion and Library, implies a library that accommodates digital in the analog form while reflecting the human touches. Grounded on three strategy concepts of the 'emotional shape, emotional space and emotional experience', the National Library of Multifunctional Administrative City aims to be not only a research-oriented library but also an open library to the inhabitants. Off to the north of the land connected from the central office building to the central park lies the main entrance and exit for the pedestrian access. The central square and the pedestrian plaza in the west forms an open space centered on pedestrians in connection with the cultural facilities in the surroundings. The water park in the east and the neighborhood park in the south are connected with a circulation type green area. In the outside space stands the book theme park and the sculpture park in consideration of the wedge type green axis directed to the city from the central park. Its shape sitting softly on the pine tree hills and a pond if the first page is being turned exudes the sensitivity feel. Such design has stemmed from the image that the information is being transferred to become the icon that signifies the dynamic city. (SAMOO)

**Sungkyunkwan University, Samsun Library, Suwon – Korea 2009**

23,742 m<sup>2</sup>

To keep up with the rapidly changing world of information in the digital era, there is a need for an arena for information exchange that not only systematizes given information but also provides us with the needed information. Key to this design is having a central point within the campus where people can exchange information. It would be a place for studies of new concept, a space of multifunctional complex which makes students want to stay and utilize to the fullest the future-oriented cutting-edge information facilities. The theme named the 'Digital Library' has been the most basic concept to apply in this design. A series of images where books unfold expresses the open space where a surplus of information abounds. In addition, the growth curves of the leaves of a ginkgo tree, which is the symbol of Sungkyunkwan University, have been modeled to be integrated in the front of building. The Digital Library which has been embodied with transparent and metallic materials is set to reorganize the context of the campus as a hub of information exchange in the heart of the campus. Once entering the indoor space of the Digital Information Center, an excess of bright lights come through a large hall and the sharply protruded conference rooms represent the vivid vibrancy of students full of dynamism and energy. The conference rooms that come in varying sizes induce the respective spaces to avoid isolation by floors but to be connected with each other, providing students with the joy of dynamism. (<http://www.worldarchitecturenews.org>)

**Yonsei University, Samsung Library, Seoul – Korea 2008**

<http://library.yonsei.ac.kr>

After winning the design competition in 2002 for the Yonsei Samsung Library for Commemorating the 120th Anniversary of Yonsei University, we redesigned it in 2005 when the program for the architecture was changed by the client. The new building is located behind and in parallel to the Central Library. A decked square is created in front of the College of Law, adapting to the flow of pedestrians within the campus. By accommodating the activities of the students, a second core of the campus is derived from the existing core. The elevation is designed by applying a module of 6.9 meters in size, modified from the 6.7-meter module of the Yonsei Samsung Library. With the openness and transparency created by the curtain wall, the verticality emphasized by the mullions and the horizontality of the trellis of the roof, the modern architecture is in harmony with the existing Library. Honed granite is used for the exterior skin to mix in with the Central Library and the College of Law, constructed in an open-joint method. The canopy of the main entrance and the TPG glass at the back transform the massiveness the stone building might produce into refined exquisiteness. The core is separated on its west, assuring spatial independence and flexibility of the library. The space is visually open by being surrounded by outer walls on three sides and by sharing the courtyard with the inner space. (SAMOO)

## Lithuania

### **4plus , Vilnius, Kaunas – Lithuania**

<http://www.4plus.com>

#### **Libraries:**

[Library of Šiauliai University, Renovation, Šiauliai – Lithuania 2008](#)

[A. and M. Miskiniai Public Library, Utena – Lithuania 2008](#)

Size of library: 3.120m<sup>2</sup> Architects: Donaldas Trainauskas and Darius Baliukevičius (“D. Trainausko studija”, UAB “Vilniaus archija”), Constructors: UAB “Statva” (Virginija Bakšienė, Vitas Merkevičius), Interior design: UAB „Matomų idėjų jėgainė“ Furniture supplier: UAB “Ambinga”, Overall Cost: € 2.609.000

#### **Awards and recommended reading:**

Traditional event of Lithuanian architecture biennial exhibition “Žvilgsnis į save” (“Introspection”), award for best realization of the project

#### **Detailed description:**

The new building of the library was opened in March of 2008 after 3.5 years of reconstruction. Library project has been created by the architects from D. Trainauskas studio. The authors of the project are Dainius Trainauskas and Darius Baliukevičius. Technical project managers are Virginija Baikštienė and Vitas Merkevičius, general constructor - UAB “Statva”.

The idea was to destroy existing stereotypes of a conservative library and to build an open, light and transparent library, to create the sense of freedom. Stairs were replaced by ramps in order to make the library easily accessible for everybody, including disabled people.

The total area of the library is 3120 m<sup>2</sup>. Spaces are located in 3 floors and 6 levels. 3 main zones of the library are designed for library users.

The first floor is intended for leisure. People can read fiction, current periodicals. Here both a video library and audio library are available.

The conference hall and children zone are located in the 3rd level of the building between the ground and second floors. Children can read, use the internet, play computer games, do some creative works, and listen to fairy-tales.

The second floor is designed for learning and information. Here, premises are separated by glass partitions. Visitors can find everything what they need for studies – books, periodicals, reference, local studies, use databases and internet. Besides, there is a space for temporary exhibitions.

On the third floor, administration of the library is settled.

The library invites any bypassed. People may move freely through all premises, library’s collections are open and walls/partitions are transparent. It is a place designed for leisure, studies and cultural/educational events.

The total cost of Library renovation including all facilities is 9 million litas, 70 % committed by the Government of the Republic of Lithuania, and 30 % by Utena District Municipality. (<http://www.librarybuildings.info/country/liuthania>)

### **G. Janulytės Bernotienės Studija, Kaunas – Lithuania**

<http://www.janulyte.lt>

#### **Libraries:**

[Library and Health Sciences Information Centre, Kaunas University of Medicine, Kaunas – Lithuania 2007](#)

Size of library: 4.076m<sup>2</sup>, Overall Cost: € 3.570.000

#### **Awards and recommended reading:**

„The most impressive design“ award by journal „Namas ir Aš“ (House and Me) (2007);

A Year Interior Diploma in exhibition „Architektūra: Kaunas’07“ (2007);

„Architect of the Year“ title (2007);

Award for the best project in exhibition „Lietuvos architektūra 2005-2007 žvilgsnis į save“ [Lithuanian architecture 2005-2007 Introspection];

#### **Architectural idea or principle:**

The idea was to transform a traditional library into a “learning tool” where learning and research process could be performed at the library – starting from search for information up to the typography of research work. Minimalism architecture expression of the building exterior is enriched with double glass surfaces and a bay-window on the southern facade. The approaches are decorated with the symbolic sculpture „Consillium“ (Board of Doctors) by stasys Žirgulis. The inside is notably spacious and stylish. Trimmed concrete material leads the idea of exposing materials and offers a successful combination with stone tiles, tarket flooring, glass and steel. All architectural solutions seem to be though over very carefully like using a purposely motivated interface. A hi-tech impression of the building lies with a tectonically harmonized duet of form and function. (Archiforma: Lithuanian architecture review, 2007, No2, P.21.)

### **Saulius Jusky, Kaunas - Lithuania**

#### **Libraries:**

[Panevėžys County Gabrielė Petkevičaitė-Bitė Public Library, Panevėžys – Lithuania 2006](#)

5.000m<sup>2</sup>

#### **Awards and recommended reading:**

In 2006, architect Saulius Jušky was awarded National Culture and Art Prize of Lithuania for achieved harmony between contemporary architecture and historic environment in the design of Panevėžys County Gabrielė Petkevičaitė-Bitė Public Library and its interiors.

In 2006, in the contest, held by the Kaunas branch of Architects Association of Lithuania, the group of architects headed by Saulius Juškys, who created the interior for Panevėžys Gabrielė Petkevičaitė-Bitė Public Library, was awarded for the best realization of the interior.

In 2006, the Lithuanian Confederation of Industrialists awarded the company AB „Iglus“ with Gold Medal for the reconstruction of Gabrielė Petkevičaitė-Bitė Public Library, and the building was named the Product of the Year.

The library is known for its exceptional architecture – after the reconstruction, the old buildings and the new extensions of the library complex are combined in such a way as to harmonize different – historic and new – architectural expressions. The architect Saulius Juškys has been awarded the National Culture and Art Prize of Lithuania for achieving harmony between contemporary architecture and historical environment.

The library can hold 700 000 items of publications, 200 000 visits are recorded annually. The library is named after Gabrielė Petkevičaitė-Bitė, a famous Lithuanian author, public figure, teacher of the end of the 19th century and the beginning of the 20th century.

Architectural idea or principle:

The complex of library buildings include two old buildings, a fragment of the third building and two extensions. After the reconstruction the internal area has expanded from 1000 m<sup>2</sup> to 5000 m<sup>2</sup>. The architect turned the external wall of the former building into an interior detail preserving the former historic building and combining it with innovations. Multicoloured wall of the library interior is the imitation of the backs of books, a combination of the old and the new.

The old buildings are related to the historical past of Panevėžys. In one of them, in the period between 1880 and 1930, there were located the first printing house in Panevėžys and a bookshop, there was published the first town newspaper. Between 1932 and 1941 there was located Panevėžys state public library. The other building was constructed in 1920 for social purposes. It was a Neoclassical building with monumental forms and splendid decor.

The old buildings were restored keeping to heritage protection requirements – there were preserved the facade and the size, as well as the fragments of historic architecture: shapes of windows and staircase, details of decoration, vaulted brick ceiling in the computer classroom, a fragment of staircase in the basement.

The most impressive interior opens in the inner courtyard of the building. Standing one in front of the other, the Neoclassical building and the new extensions are connected with a terrace. The entrance to the terrace is from the semicircular staircase of the old building. The inner courtyard is covered with a pitched glass roof. Straight on the roof of the old building there is located a reading room – through the glass roof comes the sunlight, other premises can be seen. Awnings protect against sun.

The most dominating and eye-catching is the facade of the Neoclassical building of the beginning of the 20th century. On the right side abuts the new four-storey building serving as a background and contrasting with the orderly symmetry and solemnity of the first building. The view from the left side is the most diverse – in one line stand the facade of the former printing house, the new annex, the narrow facade of the former synagogue and a fragment of the remained brick wall – the height, proportions and colours of these buildings are different. (<http://www.librarybuildings.info/country/liuthania>)

## **R. Paleko Arch Studija, Vilnius – Lithuania**

<http://www.palekas.lt>

**Libraries:**

**Vilnius University Library, Vilnius – Lithuania 2012**

Building size 13.800 sq/m

ARCHITECTS: R.Palekas, B.Puzonas, A.Palekienė, P.Išora, M.Šiupšinskas, M.Zemlickaitė, L.Sužiedelytė, A..Barzda, J.Garšvaitė, V.Bavarskis  
The library is on the outskirts of Vilnius. A relatively quiet and leafy location of the existing university campus is about to change significantly. In upcoming years, a new agglomeration of education facilities will emerge here. The library is located near the pinewood, at the intersection of the main pedestrian path and a new access road. Neighborhood of the forest has inspired a spatial conception of the library - cozy inside spaces and their linkage with the nature. An intimate amphitheater-plaza is welcoming a visitor. A glazed entrance hall is a continuation of the plaza space. The same as the outside, it has concrete floor and terracotta facades. The ground floor, which functions as a central circulation space, also includes a conference hall, cafeteria, periodicals-reading room with an open-air terrace. As walking further, one is entering reading rooms located on several floors which are connected by an atrium, focusing the view to the forest. Two glazed facades face the wood and illuminate the trees at night. At the daytime, the trees are sunlit and become a visual part of the interior. The spaces are diverse and easily transformed. In the interior, white color dominates and exposes books as well as people. We believe that the library should radiate an emotional charge because it is a place of non-material creativity and spirituality. Therefore, we have chosen the scenery of expressively and unpredictably varying silhouettes as the main architectural language. The volumes are clad with white terracotta elements. The facades are arranged so that all joints and gaps are horizontal and run parallel around the building despite different angles of leaned surfaces. Rooms are naturally ventilated via window openings. Solid south-side partitions hide people and books from direct sun and overheating. Site size 9132 sq/m Building size 13.800 sq/m (Paleko)

## Malaysia

### T. R. Hamzah & Yeang International, Kuala Lumpur – Malaysia

<http://www.trhamzahyeang.com>

#### Libraries:

#### National Library Singapore – Singapore 2004

Areas: Total gross area (GFA): 51,493 sq.m., Total gross area (GFA incl. parking): 55,565 sq.m., Total nett area (Net assignable area): 30,797 sq.m., Total construction floor area(CFA) 70,686 sq.m., GFA plot ratio : 1:5:2

No. of Storeys: 15 storeys (98 m high) and 3 basements, Client: National Library Board

#### Development Brief:

The Client, The National Library Board (NLB) has earlier established a set of planning principles as the basis for design. These include:

- A place for the people to provide an open, hospitable and conducive learning environment for the people of Singapore.
- A National and Civic Institution with a distinct character, reflecting Singapore's multicultural heritage and its aspirations to be a leaning nation.
- A National and Civic Institution.
- A symbol of NLB's mission and role.
- A fully flexible and functional clear building.
- A costs effective building.
- User friendly, comprehensible to visitors and convenient for everyday staff use.
- An efficient building with integrated systems.
- A building for the tropical climate.

#### General Design Features:

Our design intention is to provide the NLB with a state-of-the-art library design and an innovative library in the tropics that serves as an icon for the region and locality. It is to be a facility that meets the NLB's requirements and objectives, including being a cultural facility and a unique and enjoyable civic place for Singapore.

#### • Planning

The NLB building builtform consists of two blocks that are separated by a day-lit internal street and connected by bridges at the upper levels. The larger block contains the collections and sits over an open-to-the-sky naturally ventilated civic plaza, with promises of 'outdoor' events and cafés.

#### • Builtform

The blocks are a juxtaposition of formality and asymmetry – The curved, smaller block contains the noisier, public activities (exhibition, auditorium, multi-media) that will sit alongside a larger, rectilinear block that houses the library collections. The division of the brief into two halves generates spatial differentiation of what's inside outside and on the other side. It presents the library culture as being more fun, that the building can become an urban motivator for civic activities, that a library becoming a "place for the people".

#### • Aesthetics

The elevations of the building design is an assemblage of sunshading blades (9 m deep at some locations) devices that boldly define the aesthetics for the building besides having daylight shading and anti-glare performance that in totality gives the image of a contemporary climatic-responsive [in this instance tropical] built form.

#### • Urban Design (Plaza)

The internal street serves as a link between two prominent streets (ie. Victoria Street and North Bridge Road). At the heart of the scheme the Public Events Plaza, a communal space that becomes the main focal point of the site and subsequently leading one into the main foyer and library proper. This public space is further animated with Café's, a library shop and possible retail areas. The axis of the street also exemplifies the St. Joseph church across the street by means of framing the view towards the church from the street. Over 6,300 m<sup>2</sup> is designated a 'green space' through out the library that creates urban "Skycourts" providing a positive psychological effect on building users and improving general working environments.

#### Ecological Design Features • Low Energy Design Modes

The Passive design modes strategies used are : daylighting (where possible), good solar orientation and configuration, sunshading, natural ventilation, façade design, building colour and landscaping. These are assembled together into a collective strategy for low energy and high comfort. Most of the library workspaces and collection areas will operate in the Active mode (full air-conditioning and artificial light). A clear acknowledgment is made that comfort is as much a question of lifestyle and perception as it is about cost and energy. Into this blend of the Active and Passive, a third strategy Mixed Mode is adopted, where natural ventilation is supplemented by mechanical means such as fans, in central transition spaces (lobbies, foyers, courtyard). These are supported by airflow and energy simulations, along with predictions of comfort.

#### • Energy Embodiment Analysis of the Building

Significant attention has been paid to the key factors in lowering energy embodiment and lowering environmental impact in the building as compared to the typical office building type. The environmental impact of the National Library Building is lower as compared to a typical office building which is a very positive outcome. The fact that the specs within the library are generally of a greater volume compared to typical conditions is also encouraging. The total energy embodiment was calculated to be 17 GJ/m<sup>2</sup> which is within accepted benchmarks for commercial buildings [ie. between 10 – 18 GJ/m<sup>2</sup>]

#### • Green Materials & Specifications

Our design approach also involves the holistic consideration of the careful selection of materials used in the designed system and the endeavor by design to reduce the impacts of this use on (and its integration with) the natural environment, over the life-cycle of the designed system. The intended use of recycled and reused materials generally such as the carpet wall fabrics and sustainable-forested local timber will reduce impact considerably.

#### • Building Performance & Buildability

By virtue of the simulation conducted on the energy consumption, the National Library Building consumes around 185 KWH/m<sup>2</sup>/annum, which is far more efficient than a typical commercial office tower (210 KWH/m<sup>2</sup>/annum) in Singapore.

Daylighting, sunshading and wind tunnel test (including natural ventilation) studies were also conducted, providing the basis for the façade design and specifications. (Hamzah) see also: <http://www.nlsg>

## Mexico

### **Legorreta + Legorreta, Mexico City – Mexico**

Ricardo Legoretta \*07.05.1931 Mexico City - +30.12.2011

#### **Libraries:**

#### **Postgraduate Building, Faculty of Economics, UNAM, Library, Mexico City – Mexico 2010**

Location: Mexico City, Mexico, Area: 5,500 m<sup>2</sup>, Client: Universidad Autónoma de México, UNAM, Interior Design: Legorreta + Legorreta, Landscape: Legorreta + Legorreta, Year: 2010

#### **Awards:**

Award to “Project of the year 2010”. Obras Magazine. Mexico

The building is located in the south of Mexico City, in the main campus of UNAM, in an area designated for buildings of the postgraduate programs, near the sculpture space, an emblematic place in the city. The building has a base covered with rock to integrate it to the natural stone in the site and create the impression that the building emerges from the existing rock. On top of this base there are two important volumes, and one of them is resting on top of the other one, but rotated 90 ° and creating a cantilever. There is a bridge on the first volume that creates a big window which frames an ecological area and at the same time is the visual culmination of the communication axe with the other postgraduate buildings, achieving with this a better integration to the context. (Legorreta)

#### **Georgetown University School of Foreign Service, Library, Doha – Qatar 2011**

Location: Doha, Qatar, Area: 50,000 m<sup>2</sup>, Client: KEO International Consultants, Associate Architect: Francisco Cortina Landscape: Landscape Architects Inc., Carter, Romanek, Year: 2011

School of Foreign Service, of Edmund A. Walsh School of Foreign Service the Georgetown University’s Campus in Qatar, is integrated within the northern side of the Education City Campus.

The mayor design intent is to break down the monumentality of the overall building to a more human scale to achieve a feel like home atmosphere making the students feel comfortable. The building is a composition of various smaller departments in order to give it a village-like character. (Legorreta)

#### **Carnegie Mellon College of Business and Computer Science, Education City, Doha – Qatar 2009**

Location: Doha, Qatar, Area: 40,000 m<sup>2</sup>, Client: Qatar Foundation and Qatar Petroleum, Associate Architect: Francisco Cortina, Executive Architect: Halcrow Consulting Engineers and Architects Ltd., Year: 2009

In Education City the government of Qatar, under the leadership of Emir Sheikh Hamad bin Khalifa al Thani and his wife Sheikha Mozah Bint Nasser al-Missned, has been investing the money earned by their country from oil and natural gas in education. It is a great challenge to design universities that symbolize the future of education in the Arab world, demonstrating an openness to the Western world while maintaining their own Islamic identity. Without a doubt these efforts in the field of education will transform this society and prepare it for the 21st century. (Legoretta)

#### **South Chula Vista Library – USA 1995**

Location: Chula Vista, U.S.A., Area: 4,000 m<sup>2</sup>, Client: Chula Vista City, U.S.A., Associate Architect: Leason Pomeroy Architects Interior Design: Marshall Brown & Assoc. Year: 1995

#### **Awards:**

1995 Orchid Award for Architecture, handicapped accessibility, graphics and signage, interiors, landscape architecture, lighting and planning

The educational needs of a growing multicultural population in the border area and reaffirm the interest of the union of two cultures led to design this building with outstanding abstract geometric shapes in the landscape of the city of Chula Vista. The different scales of the volumes to identify the various areas within the Library and foster within them that define different spaces and public areas of privacy. (Legoretta)

#### **San Antonio Central Library, San Antonio, TX – USA 1995**

Location: San Antonio, U.S.A., Area: 22,300 m<sup>2</sup>, Client: San Antonio City, U.S.A., Associate Architect: Davis Sprinkle & Robey Architects, Executive Architect: Johnson – Dempsey & Assoc., Year: 1995

#### **Awards:**

1995 Imagineer Award “The Mind Science Foundation”

The city of San Antonio requested a building that the community could celebrate as its own. The program required state-of-the-art technology for the information access. The design challenge was to achieve an architecture identifiable as a public building while accommodating the library functions. Described by local critics as an “ingenious blending of design and function”, the new building expands the role that the library is expected to assume. Books remain a critical element, but architecture, art, and technology also received due consideration. The design seeks to entices visitors to discover something new on each visit and thus to attract them back for repeat visits.

The geometry of rotated and cutaway boxes was largely determined by fitting the spatial requirements into the site while generating a friendly and inviting building. The exterior is a visual wonderland of shapes, angles, and openings that create an interplay of light and shadow, both inside and outside. At street level a stone wainscot introduces scale. A sense of mystery is evoked by blending natural light, shadow, and geometric forms. The main mass of the library is a six-story box surrounding a yellow skylit atrium that serves as a focal point for each floor. Several terraces are accented by large geometric constructions. Triangular and rectangular baffle walls painted purple or yellow on the third-floor terrace invite

visitors to wander outside. The terrace on the west is bordered by a slightly raised water channel that drops into a circular pool. Beyond this channel stands a grove of palm trees. A sense of freedom was evoked by varying the size and shape of library floors to give each a unique character. Visitors are thus encouraged to discover the building in all of its variety, natural intrigue, and wonder. Graduated child-size stacks are among the unique features of the children's library. Scaled-down furnishings and abundant natural light place young people at ease in an environment tailored to their needs. (Legorreta)

## **Museotec, Mexico City/Miami – Mexico**

### **Libraries:**

#### **Jalisco State Library Public Library, Guadalajara – Mexico 2005 in process**

The new Public Library of the State of Jalisco is a gate, literal and symbolic, which communicates the community of the city of Guadalajara which the cultural whole of the University of Guadalajara. The controlled and shaded light is the "leit motif" in the interior of the new library. Each façade has a different treatment, by means of a covering with copper plates, closed, perforated or as mullions, which work as an acoustic and thermic diaphragma. (Museotec)

## **REC Arquitectura y Construcción, México City - Mexico**

<http://www.recarquitectura.com>

### **Libraries:**

#### **Biblioteca Central UAEM (Universidad Autónoma del Estado de Morelos), Cuernavaca – Mexico 2011 under construction**

The building complex is conceived in sub elements, each element rationally positioned and connected to one another with three generating ideas: culture, cultivation and domesticity.

##### **Wagons:**

Volumes dedicated to book collection and reading rooms with clean circulations, but above all with close proximity between books and reading tables, echoing the way it occurs at home and its domesticity in having things within close reach. The building structure is flexible for additions, modifications or reproductions within the same site or serving as models for different places inside or outside the university campus.

##### **"L" Building:**

This volume serves as boundary for the central space and contains administrative, public and service spaces such as: multi-purpose rooms, videotheque, hemertheque, auditorium for 143 people, theses, computer and meeting rooms, cubicles, chief of services, private collections, restrooms, book storage, machinery room, clean water cistern and rainwater cistern.

##### **Lobby/Vestibule:**

The double high space performs different functions and the resulting form is entirely rational. The main access features a 5.6m glass curtain with a concave silhouette designed to protect the space from isolation, likewise, columns and different structural elements are projected towards the exterior in order to work as brise - soleil. Inside, the building's main facade works as a canvas to deploy a timeline in which historical facts are xerographed within the architecture; divided vertically in modules of 1.2 meters width to show chronologically key moments in history from 1500 B.C. to 2000 A.D.; and horizontally in learning areas, looking for a recreational strategy to interrelate important events in history in a holistic context.

##### **Central Patio/Central Courtyard:**

The central patio with a raindrop shape offers, aside from natural light and ventilation, a triple function of the building with its context; first, it seems like an interior street that ends with a natural mound in the exterior, second, if observed from the wagons, the building is perceived as if the viewer were on the outside, and finally, when the visitor is located at the last wagon towards the main access, the central patio seems confined with a local tree species called "gold rain", this is the way in which the same volume allows the viewer, depending on his position, to experience a street, a building from the outside and a central courtyard.

##### **Agriculture:**

This action embraces self resources, society and education; instead of proposing landscape design and gardening which would eventually need future budget for maintenance, the library landscape strategy is focused on partnering with the faculty of agriculture to surround the building context with orchards and vegetable gardens, interrelating the library socially with another university faculty and allowing the faculty of agriculture to gather and concentrate its land needs while creating synergy within more areas of knowledge.

##### **Light:**

The lighting strategy was based on the idea of light bouncing in one or two surfaces at least, this effect would generate a different light intensity in the interior; for example, in the wagons, the three skylights would received different illumination since the way they are place embrace light from the dawn to light from the dusk. The skylight of one of the wagons was oriented towards the north in order to have homogeneous natural light, in the double high stairs and multipurpose rooms, the roof walls were conically shaped in order to look for zenital light; finally, there was left a gap between the double high space ceiling and the elongated bar in order to take advantage of the 12pm light bouncing against a orange surface to provide warmth light at noon. ##### **Megalibraries for a nation of readers**

Since it opened nearly three years ago, the megalibraries, Fox government's cultural project, it has only been open to the public for 11 months. Designed by architect Alberto Kalach, the megalibraries can accommodate up to two million books and protects the skeleton of a whale, a piece made by Mexican artist Gabriel Orozco on purpose for the site (Photo: Jorge Luis Gallegos / El Universal)

Carlos Rojas Urrutia, El Universal, Mexico City Wednesday February 4, 2009, 00:05

The best plan that gave the team of Vicente Fox to realize the slogan "make Mexico a country of readers," was launched when the former President signed on April 23, 2003, as part of World Paper, a deal that brought together six federal agencies to build a "modern library, which together architectural advances, technological and librarians", which would be only the "central unifying principle" on which they would establish a network of information and reading. Opponents of the construction of the Mega José Vasconcelos Library of Mexico Siglo XXI, argued that to attract people to read was to create a distribution system and efficient dissemination of books and not consummate a work that was described as Pharaonic and white elephant . Anyway, on May 16, 2006 opened the doors of the most important cultural project of the Fox administration. But it was during the early months of President Felipe Calderon when he fell on a controversial structural megalibraries and use that has not finished yet. In March 2007, the PRD federal deputy, Jose Alfonso Suarez del Real, denounced the use the Mega Library was assigned to the company Film & Tape Free Agent, for its facilities in a fashion show and taking pictures spring-summer catalog of El Palacio de Hierro. In its complaint accompanied with 15 images from that catalog, which earned him the waiver from the Director General of Libraries of Conaculta, Saul Juarez. Then, two months after his appointment as director of the Mega Library, Ignacio Padilla faced complaints from users who told of leaks, staves erected by the rains, bathrooms and elevators were not working and an auditorium flooded, was so that just 10 months after his inauguration in January 2007, it was decided to close the campus indefinitely and inject another 23 billion dollars to address the weaknesses. Ignacio Padilla resigned on 16 August of that year. Nearly two years after Vicente Fox presented to the Mexican-inspired building in the country of readers who wanted to drive, the Mega Library of Mexico "José Vasconcelos" reopened on November 30, 2008, with 10 hours of the morning 20 pm, Monday through Friday. The first day of February of this year, Sergio Vela appointed Fernando Alvarez del Castillo as the second director in the history of the Library "José Vasconcelos". The megalibraries occupies 40 thousand square meters next to the former Buenavista railroad station, today's final whereabouts Suburban Train. Outside there is a botanical garden, which contains almost 60 000 specimens of 168 species of trees, shrubs and herbaceous. Designed by architect Alberto Kalach, the megalibraries intends to return, in the words of its creator, "the concept of the ark, home to the human knowledge." From that idea, proposed the creation of a building that can accommodate oblique up to two million books and a roof protects the skeleton of a whale, a piece made by Mexican artist Gabriel Orozco expressly for the site. Its collection consists of public and private funds. It has a computer room equipped with \$ 30 million donated by the Bill Gates Foundation and the network "Prometheus Winner", developed by the University of Colima, that will help the technical processing and control of the body of the National Network Public Libraries (RNBP). Funding from the Biblioteca José Vasconcelos Siglo XXI, which amounted to just over one billion dollars, was divided equally between the federal government's fiscal resources and the revenue from the patronage that led Bernardo Dominguez, Francisco Barrio financial sponsor. Since the opening of the megalibraries, for 32 months, has been open to the public for just 11. It is estimated that in fullness of operation, the megalibraries serve 4 million visitors a year. (<http://www.eluniversal.com.mx>)

Vasconcelos Library is located at the Hip Street or Area I North, between North and Aldama Insurgentes, Colonia Buenavista from the central Cuauhtemoc Mexico City, Distrito Federal. The main entrance to the exhibition gives an esplanade that connects with the former Buenavista railroad station, so it is not surprising that dipped in the last rail of the urban environment where they erected, the building resembles a gigantic train car. One of the best ways to get to the library is by means of public transport, either Metrobus, as it is a few steps from Insurgentes Avenue, or Metro, as it is located opposite the station and the terminal Buenavista line B, Buenavista-Pantitlán and very near the station on line 3 Guerrero, University-Indios Verdes. The location is fortunate, because in a radius of 15 miles are located ten Sixteen delegations of Mexico City and eight neighboring municipalities of Mexico State, which is a geographical network which concentrate about 14 million people, three of them in an area of 5 miles. Also in this area is planned to develop a communications and transportation complex, which will be rehabilitated to the former railway station and commuter rail terminal in Mexico City that will connect, in a first stage, Buenavista in Cuautitlan and Huehuetoca subsequently, in the northern state of Mexico. For the construction of the new cultural precinct, the Ministry of Education in conjunction with the National Council for Culture and the Arts was designated as the entities responsible for implementation and operational coordination of the project, for which it was determined that they were basically supported The following bodies: an advisory committee composed of scholars, practitioners and experts in various fields, a Board responsible for fundraising and donations for the construction and equipping of the building, as additional means for the fiscal resources to do so, a public trust management to ensure smooth implementation, transparent and efficient, in addition to the Technical Committee responsible for the channeling of resources and project supervision. After approval of the operational structure of the project, a first step was the establishment on 18 March 2003, the Advisory Committee, which considered the participation of representatives of major institutions specializing in the field of library , architecture, and technology. This Committee was careful to give a very particular weight to library science sector, with the representation of the main professional and research bodies like the National Association of Librarians, the National School of Library and Archive, the University Library Research Center, College of Library of the UNAM and the Bibliographic Research Institute through the National Library. In early May 2003, we published the notice of the International Architecture Competition to select the proposal for the execution of the Project Executive. For the development of the competition was formed in addition to an organizing committee, a technical committee for the implementation of competition, and was also a tender advice. The contest took place in two stages. The first was a presentation by participants of a conceptual framework consisting of a sketch of the library. The proposals were evaluated by an international jury was composed in its various stages by the Mexican Carlos Mijares (architect), Ricardo Rodriguez (architect), Daniel Ruiz (Civil Engineer), Jorge Gamboa de Buen (architect) and Jorge von Ziegler (writer and Director General of Conaculta Library), as well as foreign architects Shigeru Ban, from Japan, Aaron Betsky, the United States, Tod Williams, U.S.; Peter Rowe, U.S., Mark Robbins, United States, and Luis Fernandez-Galiano, Spain. Statements were also made: Mr. Reed Kroloff, as a consultant, Robert Rohlf as a consultant in libraries, and as coordinator of the Technical Committee the architect Ernesto Alva Martinez. The competition involved 592 proposals, of which 459 were for Mexican architects and 133 foreign architects from 31 different countries. Among the most prominent are counted by Rem Koolhaas, Zaha Hadid, David Chipperfield, Eric Owen Moss and bright offices worldwide. This phase ended with the selection of the top seven proposals submitted by Josep Lluís Mateo (Spain) Team Mazanti Broid + Bonilla + (Mexico-Colombia), David Chipperfield (UK), Hector Viglicca (Brazil), Juan Carlos Tello (Mexico), Alberto Kalach (Mexico) and Eric Owen Moss (USA). For the second stage, the finalists produced a bill that was introduced to a different jury, but made with the same criteria above. For selection of the winning project, the jury evaluated the seven drafts submitted to the final stage of the competition. The process was first on the presentation and explanation from each of their respective pre-finalists, then the experts in library and structures that made the observations considered relevant, then held a series of votes that each juror said that in his opinion the project was likely to be elected. In this way we selected the winner of the seven pre-projects, which proved to be the one conducted by the Mexican Alberto Kalach with a team of Juan Palomar, Tonatiuh Martinez and Gustavo Lipkau, who outlined a linear building with a symmetrical section in which privileges the central space, botanical garden, in addition to the apparent solidity of their walls slightly inclined, with a single structural frame that can be repeated modular. It was also felt that the winning project is an integrative proposal that allows a balanced partnership of cultural space with natural space within a symbiosis Library / Botanical Garden. The winning team is composed by Alberto Kalach who has been particularly interested in the union of architecture with the landscape and nature. Among his most notable projects is Mexico City Future: The City of Lakes, has taught at several universities in Mexico and the United States, the architect and essayist Juan Palomar who imbued his work has developed

continuously in search of the poetic situation is has taught at ITESO and Technology Guadalajara Lipkau Gustavo graduated from the Faculty of Architecture of the UNAM, among other awards, has received the prize in Lino Library Picaseño of their alma mater, and the landscape Tonatiuh Martínez, who has extensive experience in advising on landscape design. In addition to the designation of the winner, the jury decided to award the second to Eric Owen Moss and partners, and third place to David Chipperfield Architects. Eric Owen Moss (Los Angeles, California, USA), is a graduate of Arts and Master of Architecture from the University of California. As director of the firm Eric Owen Moss Architects, since 1973 has designed and built several award-winning architectural works. Finally, the Englishman David Chipperfield, founded in 1984, the firm David Chipperfield Architects, a firm of international repute, a supplier of integrated architecture, master planning, interior design, product design services and furniture, which has carried out urban planning, furniture and tall towers in the United Kingdom, Germany, France, Holland, China, Japan, Italy, Spain and the United States. The terrain of the new Library Vasconcelos occupies an area of almost four acres square—37.692 meters, of which one third is occupied by the building that is surrounded by a botanical garden that protects and insulates the sound library also to offer visitors a taste of the national flora, as it has been created from specific criteria for classification and sorting. Thus, the proposed architecture of Alberto Kalach and his team has as main feature the use of this new public infrastructure to develop a green area covering not only the grounds of the library, but extend to adjacent spaces. The construction system is based on a particular subject to three-dimensional structure that makes up three consecutive spacecraft to form a long linear building. The outer shell is rigid concrete frames, while the inside is steel. The south facade facing the street hip, polished concrete is apparent. It appreciates the access ramp to the underground parking. In the west facade is the main entrance. This game presents a facade tucked into the ground floor is tilted and has attached a series of umbrellas to reduce the incidence of solar rays into the enclosure. The architectural design of a cube, so that all space is modulated by the geometric shape. The interior structure is hung from the exterior structure, which allows the architectural plan is free, so that the construction is based on a suspended system, from which hangs structure which makes the property is supported by columns metal heads. The library building, which according to the design of the architects emulates a living organism, is modulated into three sections between each of the modules are in service areas. Is 270 meters long and 28 meters high. The amphitheater is bright thanks to the play of transparency that gives the ceiling and walls of glass. It has three upper levels, a ground floor and basement parking. The books are located in a series of hanging bookshelves, located in the central part of the structure, forming a sort of backbone, which allows travel throughout the building. The library is divided into ten thematic areas corresponding to: Natural Sciences and Mathematics Applied Sciences, Social Sciences, Literature, Fine Arts, Religion, Philosophy, History and Geography; Consultation Publications and Newspapers, General Inquiry, Language and Library Youth and Cultural Services, in addition to the annexes consisting of an auditorium, library and administrative area. Downstairs there are several multipurpose rooms. From the lobby you can appreciate the game of doubles and triples heights. In the middle third is where it reaches a height of 28 meters. At the center are the steps that lead to conflicting level of consultation. The tile floor is finished in granite and the redwood. At the center of the lobby, between shelves of books, a huge fleet gray whale skeleton forty feet long that greets visitors. The sculpture is a creation of visual artist Gabriel Orozco, who required the work of an expert group which undertook a cetacean almost complete rescue that was found on Sand Island in the Biosphere Reserve of Vizcaino, in Baja California South and move your bones to Mexico City to reshape its skeleton in a metal frame designed to hold the mammal. Orozco worked the 137 bones with graphite to draw with geometric shapes that follow the dynamics of bone structure. Vasconcelos Library was opened on May 16, 2006. It has a staff consisting of 365 people who meet profiles in various disciplines (including 125 librarians). It has a capacity of four thousand 783 concurrent users, with four thousand places reading and 750 computers connected to Internet. The shelf is hanging open and read the options are many, and you can use reading places, the outdoor room, or take the form of home lending. While its initial stock was 500 thousand volumes is projected to grow to half a million volumes and consultation. Also, the library is a data center and telecommunications in the near future link to more than seven thousand state and municipal libraries operating throughout the country and constitute the National Network of Public Libraries, to this end, the museum has with the most advanced systems and library developments, technological, educational and architectural. It also has a language laboratory, a cafeteria and a bookstore. Moreover, the main auditorium of the campus library began with a gala performance of dance, music and song, featuring talented young nationals. This space thousand 100 square meters and capacity for 520 spectators, is equipped with advanced technology and is ideal for holding conferences, roundtables, academic meetings, film, theater, music, dance and dramatic readings. (<http://www.indaabin.gob.mx>)

Jonah who was to survive for seven days inside the whale, in his mind building a space where it could accommodate such a creature. But the mind is always larger inside than outside, and the space was developed into a large vault which Jonah was filled with his thoughts. I had thoughts of all kinds and was organized according to different categories, created a numerical system to catalog and was designated a color to each one to recognize it. Day by day Jonah discovered a new place in space and realized that the dome was growing as he traveled. The whale had been lost in the immensity of his memory and felt a great loneliness. It was so one day he ventured outside and found herself in a garden surrounded by trees and plants with shapes and colors are impossible to categorize, felt life growing between his feet and could hear the rustling of the leaves that they said: Jonah Where have been the leaves, stems and branches? And Jonah answered them, are suspended in time, like the skeleton of a whale. Text: Pedro Rosenblueth

### **Biblioteca Pública Guadalajara, Jalisco – Mexico concurso 2006**

Designed to serve more than four thousand users simultaneously, the new Central Public Library? José Vasconcelos?, Will house one and a half million books and will feature virtual museum, language lab, science room, music, exhibitions and conferences as well as an area to care for people with special needs. On a surface of 37 thousand 692 meters square, erected in the grounds near the old train station in Buenavista, north of Baghdad, will be inaugurated on Tuesday by President Vicente Fox The project architect Alberto Kalach, which was selected from more than 590 proposals, had a cost of almost one billion pesos (949, 034, 168, 63) and is designed to cater for four thousand 783 users simultaneously. It has a library area of 11 thousand 692 meters square and is surrounded by a botanical garden, covering an area of 26 thousand square meters and will have greenhouse, parking, cafeteria, conference rooms and projections as well as a museum. Of the five levels that comprise the library, three are of the acquis and reading, as in the first usurious find periodicals, a collection of the Youth Library, and a language laboratory as well as providing care for people with special abilities. The second level will protect works of literature, fine arts, philosophy, psychology, religion, geography and history, while in the following texts will be on science, math, technology and social sciences. The new "Biblioteca José Vasconcelos? will have 750 computers connected to the Internet, service to be offered for free to the public in general. In this space, will also have music room, exhibition area, interactive science room, virtual museum, auditorium, library news and, four thousand places dedicated to reading. The head of the National Council for Culture and the Arts (Conaculta), Sari Bermudez, said that unlike other public places as the Palace of Fine Arts and the National Auditorium, the new? Biblioteca Vasconcelos? not charge admission, because their motto is? Public Library all the books are yours? . Source: Notimex. (<http://noticias.universia.net.mx>)

#### Libraries:

#### Bibliotheek Nieuw Waldeck, Den Haag, Kijkduin, Den Haag – The Netherlands 2008

De openbare bibliotheek Nieuw Waldeck is na de opening, zo'n 25 jaar geleden, toe aan een nieuw interieur. Samen met het architectenburo Millie's is er een ontwerp gemaakt voor de restyling van het interieur van deze bibliotheek. In de plattegrond uit de jaren 80 zijn diverse muren en obstakels verwijderd waardoor een grote open ruimte ontstaat en de entree zich opent naar buiten. Alle meubels die in deze ruimte zijn geplaatst zijn specifiek voor dit project ontwikkeld. Doordat er met warme kleuren en materialen wordt gewerkt ontstaat er een rustige en uitnodigende sfeer. Door de positionering van de nieuwe meubels worden verschillende sferen en plekken gecreëerd, door de meubels niet al te hoog te maken heeft men tegelijkertijd een goed overzicht in de bibliotheek. see also: <http://www.fjbv.nl> (FJ Stands & Interieurs B.V., Bussum, The Netherlands)

#### Libraries:

#### Openbare Bibliotheek Lingewaard, Lingewaard (Prov. Gelderland) – The Netherlands on design (Concept)

AEQUO is designing a new library concept, which goes further than merely being a library, for the Municipality of Lingewaard. The central question is to how the library it can remain visible as a public and information-lending institution in each of the locations. After all, today's world is changing ever more rapidly, and competitors lie waiting to pounce more than ever. Instead of drawing a line of defence, the new Lingewaard Library has chosen to throw open its doors to cooperation. The library programme will be divided into several information shops, all of which can be individually expanded with the functionality of competitors. In this manner, the magazine lounge will gain a tourist information point and a municipal social support spot, growing into an info shop, keeping the inhabitants of Lingewaard much more up-to-date than in the past. The unique thing about this concept is the way in which expansion and cooperation with the library has been dealt with. Basically, this will result in a dynamic and spatial version of Trivial Pursuit, as each of the six library locations can be filled or expanded with "pieces of pie" according to need. The library's need – and its partners. (AEQUO)

#### Bibliotheek Roden, Roden-Noordenveld (Prov. Drenthe) – The Netherlands on design

Library design for Roden Aequo a small upgrade in order to maximize use of the existing furniture. Condition for the design, the Housing Handbook which has already created for Aequo Biblionet Drenthe. In addition, it takes into account the presence of the CBK and Informatiewinkel. The command is: make an attractive entrance area, attractive presentation of the collection and reading and recreation rooms, make multifunctional use of space and a design office and a separate youth culture corner. In the design the residential areas linked to the open side of the building giving the visitor sees people instead of cabinets. High interior elements are in the high parts avn space and low interior elements such as sitting, staying, internet, etc. are linked to light in the lower parts of space. By building part is a banner presentation element coupled to a collection segment. By writing on the walls, etc.'s desk is a "warm welcome" feeling. (AEQUO)

#### Bibliotheek Ijsselstein, Leek & Ijssel (Prov. Utrecht), Ijsselstein – The Netherland in progress (2011)

For Library Lek and Ijssel Aequo designs for three of its branches a new interior. The site Ijsselstein will soon move to a newly constructed building and the establishment Wood South. The site is Vianen its current building renovation and expansion. From the statement "media rich" to the Library Lek and Ijssel are going to present itself as a customer oriented organization and gave these developments seized the opportunity for its new ideas on presentation, communication and self-service in practice. The design concept of Aequo based on principles from the retail, allowing visitors to view from the entrance to the various departments. By creating clear sight lines with a new 'invisible' cabinet system with much attention to frontal presentation, communication at various levels, standard view on large displays and a sophisticated lighting, the attention of the media. There is room for individual adaptation and in cooperation with partners such as the Art Library, Tourist and Cultural Platform with sufficient commonality to efficiency advantages. It is also the new national branding incorporated into all plans as well as communication of color. Special features are highlighted by a number of specials that in collaboration with designer Irene Müller are designed. (AEQUO)

### **Bibliotheek Leeuwarden, Leeuwarden (Prov. Friesland) – The Netherland on design (2010)**

Leeuwarden for the Central Library in The Fair monument, designed an innovative and inspiring AEQUO library concept that both the library and function as a Stock Exchange building is positioned as a progressive cultural facility in Leeuwarden. Here is the preservation of historical and spatial quality of the building is an important starting point. The new library features a welcoming, open and transparent appearance and has a magnetic effect on the audience. The customer will be inspired, challenged and invited into the library to study and long stay. The design consists of removing all connections between the old context and built from the 80 and adding a new autonomous objects. Within the space blobs are placed in various shapes, colors and functions, which house the collection. The installation manifests as a large piece of furniture across multiple layers. Because the reading café also serves as a secondary entrance to the theater / debate center outside library opening hours operate separately and thus a major player within the cultural spectrum of Leeuwarden. (AEQUO)

### **Bibliotheek Heteren, Heteren (Prov. Gelderland -Zuid) – The Netherlands 2010**

For Library Heteren Aequo interior designs for the new library in an existing building. This building [the former town] is extended to a community school where in addition to the library, 2 primary schools and childcare will host itself. The library presents itself as an educational meeting where the focus is on developing reading and media literacy for youth to 14 yrs and recreational reading for youth and adults. This is due to finalize the installation of and cooperation with other institutions in the Community school. In designing the plan, several design layers are defined as handling the entry, information delivery, presentation, digitization, communication, meeting, routing, collection, internet, kids and side orders. These eleven layers are combined an overall plan that is recognizable as a library in the Gelderland-Zuid region where Aequo by a space designed for Ruimte Kwaliteits Plan. This is a guide for all libraries in the region, Heteren where the thitd bilding. (AEQUO)

### **Bibliotheek Uithoorn , Uithoorn, Amstelland (Prov. Noord-Holland) – The Netherlands 2010**

Designs for the Library Uithoorn Aequo a restyling of the interior. The library is in its current form already about 20 years housed in a building designed by architect Rietveld (1965, Gerrit Rietveld, the only church that Rietveld designed, now library and community center of the neighborhood Zijdel Worth). Following the introduction of new technologies and the implementation of a new program, upgrading of the library interior desirable. Key words here are "seduce and meet" and the priorities include upgrading the capabilities for meeting, create temptation by frontal presentation and launch of retail communication technologies and upgrading the entrance. The plan Aequo provides an inexpensive and simple setup making the building more visible and the true treasure, Rietvels room is unlocked. (AEQUO)

### **Flevo Meer Bibliotheek Lelystad, Lelystad (Provincie Flevoland) – The Netherlands 2009**

AEQUO is designing the interior of a new, urban library for the Lelystad Library in the heart of a new area in the city centre. Library Lelystad is Europe's first Department Store of Knowledge. In the design retail elements are taken from their usual context. This creates a new tension field, revolving around temptation, inspiration and encounters. The library, 3.650 m<sup>2</sup> and 3 storeys, is divided into 27 shop-in-shops based on interest profiles each with their own colour and sphere. Through triggering-store communication [windowdummies mannequins with T-shirts as communication aid, lightboxes and overhead communication] the attraction of the product itself is the central focus. (AEQUO)

For more Flevo Libraries Foundation has Aequo the interior of a new library in the metropolitan heart of the new part of the design center. Lelystad Library is the first European Knowledge Warehouse. In its retail interior design elements from the usual context. This mix of familiarity and alienation creates a new tension which is all about seduction, inspiration and meet. The library, 3650 m<sup>2</sup> and three floors, is divided into 27 shop-in-shops based on interest profiles, each with its own color and style. Through trigger-using in-store communication [mannequins, mannequins with T-shirts as communication medium, light boxes and overhead communicatie] the appeal of the product-centered put. With the opening of library Lelystad is also launching the innovative cabinet by Aat Vos Designed aatvos | K02 site. This cabinet is constructed entirely of extruded aluminum and available in any width and height.

In Lelystad Flevo this month the library which opened office Aequo the interior design. Ath Aequo Fox believes that the current time for a new library typology, partly because the function of the vanishing community centers must overcome. To attract more visitors, he seduction strategies that went into the design of stores are used. The library should remain where the less fortunate in society, but also an attractive place for people who have money. This end, the architects compete with the warehouse where people are tempted to shop and consume: a library, such an enticing place to be to stay and to borrow books. To this end, the architect several seduction strategies that consumers in shops and department stores to get buy, also used in the design for the interior of the library. The decor and signage, and communication within the library, resemble the interior of stores. Not only the design differs from the traditional library facility on the library bookcase has its own system. This was designed by K02 Aat Vos and has no system allowing measurements in each size available. Entirely in the style, the shelves were replaced with presentation boards and presenting tableaux. (<http://www.architectenweb.nl>)

### **Bibliotheek Vleuterweide, Vleuterweide (Prov. Utrecht) – The Netherlands 2009**

For Library Utrecht Aequo a new interior design style this week for the first time the public was shown in the renovated branch Vleuterweide. Thursday, January 19 Alderman Harm Janssen opened the second library of Utrecht 'new style'. This is characterized by a striking use of color, bright and clear layout, lots frontal presentation, clear communication and information, a new collection of layout and special furniture. Much of this furniture and custom made by Aequo designed for the library of Utrecht, where we have been inspired by the simplicity, clarity and expertise of Dick Bruna and Gerrit Rietveld. The new interior style is based on a manual, which the library of Utrecht Aequo previously made. Vleuterweide The library is the second in a row: in December 2008 opened branch Tuinwijk in the same style. (AEQUO)

For the Library Utrecht designs AEQUO a new interior-style which was shown in the rebuild department Vleuterweide to the public for the first time...The library is characterized by a striking use of colors, bright and clear grouping, many frontal possibilities for presentation lucid communication and information, a new classification for the collection and special furniture. Aequo designed much of this furniture and measure work, which was inspired by the simplicity, clarity and craftsmanship of Dick Bruna and Gerrit Rietveld. The new interior-style is based on a manual, which Aequo made for Library Utrecht. (AEQUO)

How can multiple disciplines within a map are placed so that they both each other and enhance the urban environment. This was the central issue within the interior project "Cultural Campus Vleuterweide" and "community center The Crystal Rotterdam Nesseland" that AEQUO recently realized. Within the Cultural Campus Vleuterweide, designed by Vera Yanovshtchinsky architects from The Hague, designed AEQUO furnishing the information square. In this square, all users of the campus [including the Church of Utrecht, Utrecht Library, Utrecht Centre for the Arts Foundation and Church Leidsche Rijn] together, and together they offer information to users, visitors and interested. Equivalence and cooperation are the pillars method of AEQUO and are also evident in these projects forward. Instead of an adjacent arrangement of the functions suggested AEQUO for both projects for the program to rewrite a new program for the joint functions. The starting point was that not the customer, but customer-centric: the degree of publicity or privacy, in other words the gradient of the function determines the position of the program within the interior. That yielded new and interesting perspectives. Architect Aat Vos commented: "The plan for the information square Vleuterweide is conceived as a passenger compartment of a monastery with a large monastery bank on further consideration a range of features

includes." Information Landscape Within the architecture of the Cultural Campus Vleuterweide is 'the monastery' as metaphor. The buildings are austere, stately and modest, but unmistakably present and connected via easily accessible areas. The partners of the Campus Culture sharing facilities and spaces. Thus, the indoor school, for example using the library. The Information Plaza - which also forms the entrance of the campus - has an interior design firm and also from natural materials including stone and laminated wood beams. The square is like an information landscape in which all functions are united by AEQUO an exciting and inspiring whole. The landscape is an integrated combination of tables, chairs, stools, lounges, information screens, presentation columns, boards and leaflet displays. The eye-catching multi-functional unit includes a display, brochures, computers, gaming, magazines and reading areas and is made of untreated oak tapis and finished with felt strips upholstery in warm colors. Inspiring stay places AEQUO designed besides furnishing of the Information Plaza of Culture Campus Vleuterweide also the interior of the house library: fully compliant with the new style from the Handbook and by AEQUO Interior Utrecht Libraries has been established. In the design focus for presentations, communications, segmentation and stay new collection center locations. (<http://www.architectenweb.nl>)

AEQUO created for the library of Utrecht a new style of decoration, which was presented in the converted area Vleuterweide for the first time the public. The library offers its striking colors, bright and distinct groupings, many frontal presentation areas, clear roads and ads, a new classification for the collection and special furniture. Many of the custom-made furniture designed and aequorin, which were inspired by the simplicity, clarity and craftsmanship of Dick Bruna and Gerrit Rietveld. The new design is based on a style guide which aequorin has specially devised for the Library of Utrecht. The library Vleuterweide is the second of a series: the library Tuinwijk opened in December 2008 in the same style. (<http://www.arcguide.de>)

### **Cultural Centre de Kristal, Bibliotheek, Nesselande (Rotterdam) (Prov. Zuid-Holland) – The Netherlands 2008**

(De Kristal designed by Meyer and Van Schooten, Amsterdam)

Aequo is designing the interior and finishing touches for Humanities[restaurant, care hotel, day-care], the Buurtwerk Alexander Foundation [café, rooms, activities], and the Rotterdam Library – located in De Kristal and designed by Amsterdam architects Meyer and Van Schooten – in the new Rotterdam neighbourhood Nesselande. Instead of an adjacent ranking of functions, AEQUO has suggested rewriting the programmes, combining them into a single new programme for all the functions. The departure point isn't that the client play a central role, but the customer: The degree of openness, or – in other words – the functions' privacy gradient will dictate the programme's position within the interior. This will result in new and interesting perspectives. The plan, which is under quite considerable spatial pressure, is regarded a trade fair or exhibition: Within a single room, the various functions are placed in pavillons, which are separated from the architectural exterior, thereby resulting in a spatial and inspiring plan. (AEQUO)

### **Bibliotheek Ridderkerk, Ridderkerk (Rotterdam) (Prov. Zuid-Holland) – The Netherlands 2008**

For the library design Ridderkerk Aequo a restyling of the interior. The previous interior from the 80s and was now both aesthetically and functionally from the time, and suffered from a lack of transparency and oversight. Although the library modest resources at its disposal, it was decided the entire interior to take the kick. Not only did the library more frontal presentation make the collection more attractive presentation, had also made space for meeting, reading and accommodation, including coffee and a theater facility in the program. The plan designed by Aequo combines all these new features in an orderly manner to each other, and - much more importantly - at the entrance. Thus a library created directly by entering its price structure and gives the visitor is invited to explore the space. Through a sophisticated color and materials with some existing furniture a surprisingly modern and pleasant library development. (AEQUO)

### **Bibliotheek Amstelveen, Middenhoven (Prov. Noord-Holland) – The Netherlands 2008**

This new built is a result of reconstruction of the building in which the library is situated. The Library Amstelveen has grasped this opportunity to put her new ideas about presentation, communication and selfservice into practice. The interior is based upon a number of retail principles, through which the visitor will be drawn into the building by creating overview and see-through by means of visible lines, communication and light. The accent shifted to the products themselves – the media – as a result of extraordinary usage of color. An inventive lightplan provides in combination with a dark ceiling and almost invincible installations for an exceptional accent. This makes the communication stands out more. Special functions as a huge reading table and a magazine reading terrace are situated in the lightest places of the interior; these special features make it a library worth exploring. (Aequo)

Start of work: April 2008

Completion: September 2008 Explanation: In early September, the new interior of Library Middenhoven n Amstelveen by FJBV to client Amstelland Libraries completed. FJBV provided all finishing and interior elements for the 660 m2 library. The striking design comes from the pen of Aequo Architects. (<http://www.fjbv.nl>)

### **Bibliotheek Tuinwijk, Tuinwijk, Utrecht (Prov. Utrecht) – The Netherlands 2008**

After a major renovation (both new construction and renovation of the existing panel) is Tuinwijk library on Dec. 16 reopened to the public. It is the first neighborhood library 'new style' with extended opening hours and a new development plan. It is the work of two artists known Utrecht as a starting point: Gerrit Rietveld and Dick Bruna. The collection is housed in six "rooms" each with its own world. FJBV care of the interior elements. (<http://www.fjbv.nl>) (see also: Bibliotheek Vleuterweide)

### **Bibliotheek Alblasserdam, Alblasserdam (Prov. Zuid Holland) – The Netherlands 2007**

Designs for the Library Alblasserdam AEQUO a substantial expansion of the existing building largely on the original foundations. It is already the second increase of the building, previously was a part 'glued'. This made the entrance very unhappy in the armpit of a wall buckling come to lie. The new expansion, the entrance to their original position in the design of Van den Broek & Bakema returned. The building is brick and is elaborated in detail with many stout vertical vents that filter the light. This gives it a tough and stubborn character and can compete with the neighbor, a very present large brick church. Together they form a new and strong facade of a shopping plaza, which the library itself much better on the map, and in passing a given item is of cultural life in Alblasserdam. (AEQUO)

### **Mediatheek Delft, Delft (Prov. Zuid Holland) – The Netherlands 2007**

Voor de Mediatheek Delft ontwerpt AEQUO in directe samenwerking met architect Liesbeth van der Pol een Interieurconcept in een bestaand casco, dat eveneens grondig wordt gerenoveerd. De Mediatheek bestaat uit diverse afdelingen en collectieonderdelen, die elk een eigen identiteit houden zonder het contact met elkaar te verliezen. De collectie wordt gebruikt om diverse „kamers“ of „winkels“ te maken veel verschillende sferen, waardoor de bezoeker een ontdekkingsreis maakt binnen het gebouw. Kleur en licht worden gebruikt om de oriëntatie binnen het interieur te organiseren en het karakteristieke casco [Groosman, ca. 1970] te benadrukken. Het interieurontwerp wordt voorts gekenmerkt door veel zachte materialen die een brug slaan tussen de bezoeker en het betoncascos van het gebouw. Zachte zitelementen, prachtig meubilair, balies die bekleed zijn met leer, veel onbehandeld MDF als basismateriaal voor kasten, etc. Nieuw is dat op elke plank van elke kast voor het eerst frontale presentatie van alle media mogelijk is, waardoor de bibliotheek veel meer de uitstraling van een verkooppriimte krijgt tot nu toe het geval is. (AEQUO)

### **Bibliotheek Zwolle, Stadshagen, Zwolle (Prov. Overijssel) – The Netherlands 2007**

1.200 m<sup>2</sup> see also INBO Architects <http://www.inbo.com>

After Zwolle-Zuid (35,000) is the second largest city Stadshagen expansion for Zwolle. This suburb, built towards Kampen is one of the largest in the Netherlands.

Stadshagen If I is finished, there are 8500 houses and there have been about 23,000 people. The district is part of Stadshagen Worker I and consists of four neighborhoods, each with its own character and atmosphere. From

Zwolle for the library's interior design AEQUO its largest new store in Stadshagen. This site, designed by INBO Architects from Amsterdam, try the library, a new interior concept together with AEQUO is shaped and where the library collection in a new way together. Instead of the traditional classification in novels / youth / information A new approach found in bringing together media shops around areas of interest from customers. There are six: childhood, youth, lifestyle, stress and success, art and culture and music. The different shops are visible by bright colors and an explicit presentation and communication ability of each store. The interior is further characterized in that the entire collection as a freestanding cabinet in the room, creating an aisle is created between the library collection and the fully glazed facade. On this wall are placed several functions: working, reading, sitting and presenting. (AEQUO)

#### [Bibliotheek Vlissingen, Vlissingen \(Prov. Zeeland\) – The Netherlands 2005](#)

For library design Vlissingen AEQUO a design concept that suits the building. The library is situated at an inner city location in a building that is entirely new hand, and also includes a number of historical buildings. These buildings are small subsets groups that are accessed through a gallery. Because each room a different atmosphere meekrijgen the image of a journey through various special collections and enhances the surprise tour of the library increases. The means used for technical reasons minimal budget, but strong enough to make identity differences and limited primarily to flooring, lighting and furnishings. (AEQUO)

#### [Bibliotheek Zetten, Zetten \(Prov. Gelderland\) – The Netherland 2005](#)

Library Moves for a theater designed AEQUO library making the local club is still more than before going to the library. The inclusion of the little-used library in the main hall of the cultural center, emergency room from birth and financial considerations, it appears as a theater, library value to public life can offer. The hall is not lost, but is used twice. In the stands, the public can view the presentation, the youth lounge and chill and the library will organize group received. The collection of different areas which made the search in the library is a small discovery. (AEQUO)

#### [Stadsbibliotheek 's. Hertogenbosch, \(Prov. Noord-Brabant\) – The Netherlands 2005](#)

3.000 m<sup>2</sup>

Aequo is designing an extensive restyling, which will help define the Den Bosch Municipal Library's image in the next decade: The library is more just books; it's the new meeting place in the heart of the community. In the central hall, a monumental courtyard centred on an old orphanage, the books give way to a city lounge, complete with espresso bar and lunch spot. In the surrounding rooms, the collection is presented in the form of small shops within the library's main structure Each part of the collection receives an appropriate and inspiring touch. The reading room, including the magazine area, will be subdued blue, the DVD/CD shop a recognisable magenta, the youth library [complete with Skoolzône and mini-theatre] will be a daring orange, while the lounge is placed on a relaxing carpet with sunflower motif. The lounge is centrally located in the heart of the plan, and it's a pleasure to spend some time: Live catering ensures there's always fresh coffee, sandwiches, and soup. By combining this room with magazines, comic books and the internet, this has become a nice room to spend some time and meet friends. (AEQUO)

The City Library at Hinthamerstraat in Den Bosch has acquired a completely new interior. The metamorphosis was recently completed. Responsible for the design of this architect's Ath Fox AEQUO Architecturals from Harm. Intensive teamwork is in Fox's method focus. This time he collaborated with FJ Stands & Interiors from Bussum (coordination / delivery) and four-pack designers from Den Bosch (branding / signage). The City Library will this redesign a larger social function. The Bossche Bieb is more than just a library: it also fulfills the function of café, meeting space and venue for attending various lectures and cultural events. This is a contribution to the City Library Den Bosch with its strong social character to the dynamic interaction between people, their interests and cultures. The total budget for the redesign was 1.5 million, of which 1.1 million was funded by the municipality. Colours as guide the use of bright colors usually runs like a thread through the new interior. Colors as a signpost to the different areas and should be tailored to different audiences. This creates a shop-in-shops, each with its own identity, tuned to a specific audience, which is expected this will make greater use of the materials offered by the library and information. For example, the department image and sound completely made of the color fuchsia pink. When you walk, you see that a quiet reading room will spread through the use of cobalt blue. Visitors are literally surrounded by color in the new City Library, for not only the walls are painted a certain color, the flooring and ceiling the same color. Additionally, the library can be a color changing lighting change the ambiance. Thus, this cooler on sunny days through the ceiling to illuminate blue and vice versa on cool days through the ceiling to illuminate purple. The interior communicates with the visitors! Materials The materialization of the new interior also represents the identity of the new library Bossche. Contemporary, professional and elegant. And above all: to be sustainable without truttig. "I think the visitors will subconsciously feel that the library services breathes a new style," says architect Aat Vos. He chose a striking color scheme of the room, and held all the major furniture - or interaction moments as he prefers to call - white. This creates a clear contrast with the existing building. Fox: "The conscious creation of contrasts create a new harmony between the historic building as host and guest as the contemporary interior. I strongly believe in this method, the interior supports the building and vice versa. " Lunch at the Library Users of the Den Bosch City Library can not just go for borrowing include books, DVDs and CDs, but also a (hot ) lunch or coffee. In the middle of the library you will find an Bieb Square with a catering area with seating. Here visitors will find not only the possibility to have a cup of coffee to eat on a low table or a magazine to consult on a high table, but he can also sit in some comfortable lounge seats. The square is added to by specially designed for this project with gravel carpets and bright sunflowers. Youth Wing homework room with a real eye-catcher are the three big white bright orange cubes on the youth section. Cubes not only act as financial support, but also with an entrance at the center include beanbags and viewing and listening options. In one of the three cubes is the Skool Zone: a homework room where the young visitors with all modern conveniences such as computers and printers, is provided. The City Library is, after the introduction of the first homework room Hellevoetsluis, the second library; in the Netherlands that this phenomenon offers to young visitors. New identity anticipation of the rebuilding four pack designers last year prompted the new corporate identity for the library design. It introduced the city's library gradually shorter name 'library' to the audience down to adjust to this new name. The library is a source of knowledge that is accessible to everyone, it is a central meeting place. Considering this information pack has four bright and open wordmark design, where a clear 'i' information is visible. To the dot on the 'i' is an open circle, a metaphor that represents the public space where everyone is welcome. Four pack designers have already designed many communications media. There are flyers, posters, posters template (that the library itself can provide text), bookmarks, labels, invitations, name tags, lanyards, canvas bags, plastic bags, T-shirts, and an Internet busblettering modification made. The previous identity bit dusty in boring colors modernized. There are now no fewer than twelve colors with which the library can enrich its new publications. This increases the visibility of the City Library in the city. Signposting a logical consequence is that four-pack designers designed the signage in line with this style should be. This is very successful. The house style is versatile. Not only graphics, but also in the industrial area. The twelve corporate colors to come back in the clear and unambiguous signage, the visitor

is not only lyrically receive help, but also visually. Especially with a repeat visit, the visitor quickly able to find the right department, because the color has been a clear function and thus enhancing the work orientation. Visitors will find this very pleasant. The colorful palette in which the various rooms of the library were painted, dovetails seamlessly. The colors in these rooms are beautifully recognizable signs posted in: orange for the youth room for example, or green and purple for the fonothek novels. The signage consists of door signs, elevator signs, displays, maps and there are even letters from 'altuglass' laser cut lettering for the counter. Is still working on improving the system catalog and website, so that everything will soon get a clear and bright design. 100% in line with the identity of the library: informative and inspiring! Increased service levels The renovation coincided with the transition to a new "self service" checkout system using scanning technology. Customers can borrow books and return them to a so-called "pillar", without requiring an employee to only have to come. Librarians are also changing their function - they now carry a more advisory role - less use of their own workplace. All counters are removed from the old library. By the flexible movement of the library staff the new space, visitors chance to all kinds of questions which the employee can reply directly by actually have to look for that "one book or one CD. As a natural consequence that the service level of the city library goes up. Then and Now The monumental building of the Municipal Library in Den Bosch dates from the fourteenth century and has a long historical story, from 'Show House' for the poor to nursing home. Since 1974, the building houses the library Bossche. The last renovation took place in 1993. "Based on the presented proposals Aat Vos and his proven expertise in library interior design we have chosen Aequo. Aat Vos and his project team have our priorities (additional focus on youth, the library as a meeting place, self-service customer and the new role of librarians) in the interior able to integrate," says director Hans Derks of the Foundation Public Library's Hertogenbosch. (<http://www.architectenweb.nl>)

#### **Bibliotheek Nijverdal, Nijverdal (Prov. Overijssel) – The Netherlands 2005**

For Library Nijverdal designs AEQUO in direct collaboration with Samas and Ronald Costeris an interior concept that bridges the gap between the monumental architecture of the building and a very specific program requirements of the library, where much attention and space is required for different user groups. The solution is found by the library collection is largely transparent to most places on the walls which not only the building aesthetically and functionally maintained, but also floor space for specific reception, sitting, reading and meeting furniture. Thus, various study tables, information desks, stairs and living room for reading for different users spheres surrounded by a unifying book collection. (AEQUO)

#### **Bibliotheek Zuidlaren, Zuidlaren (Prov. Drenthe) – The Netherlands 2005**

For Library Zuidlaren AEQUO an interior design that makes room for space. With an extremely low budget is actually just cleaned up: all the books along the walls, window or no window. This creates very unique rooms, each with its own feel to get by with minimal resources the center of the room for a different filling in an Internet workstation, a youth reception, a stage or seating. The asymmetrical wall lighting creates an attractive presentation of the book wall and also for a more spacious interior. Interested in this extreme makeover, and how much you can do for less? Ask the photos of the old situation with AEQUO look and be amazed by the result. (AEQUO)

#### **Openbare Bibliotheek Den Haag, Filiaal Segbroek, Den Haag ( Prov. Zuid-Holland) – The Netherlands 2005**

For the Library in The Hague Segbroek AEQUO designing a bracing interior with an inspiring and welcoming. This area of The Hague library breaks with past rows of bookshelves, instead of shelves that take up space, the bookcases are now used to define spaces. Within these areas, a particular group are received. Much attention is given to open spaces while maintaining social safety and security, and the walls are invariably used to house the collection. Special boxes for running or windows and doorways. The furniture with brightly colored fabrics create a constantly changing arrangement possible in order to respond to constantly changing conditions. The strong colors creates an unmistakable identity and of space, and also ensures that the library will be remembered and therefore gets a place in society. (AEQUO)

#### **Openbare Bibliotheek Den Haag, Den Haag (Prov. Zuid Holland) – The Netherlands 2005**

AEQUO is designing the first restyling in the Hague Municipal Library's ten-year existence. The traditional library division has had its day, and the library is searching for new possibilities to connect more effectively with its clients. The relationship between city and library is especially strengthened by reorganising the cabinet layout and creating space for relaxation and encounters. The orientation within the interior is also improved by adding a supporting colour to each floor in this white building. A lot of attention is paid to introducing presentation possibilities, and a many seating, reading, and meeting places are being made. The brightly-coloured chairs on the ground floor are sure to put the spotlight on the public. The spots have become so popular that wait times are now a fact. The signing, designed by CreaBea, supports the new library's image. (AEQUO)

For the first floor of the Central Public Library The Hague Aequo designing a new device which will provide space for debate, reading, and staying present. Five years ago the ground was completely renovated and a reading lounge bar and function. The intention is to the first floor of these functions involve. It is a multifunctional cultural space, the "literary salon of The Hague", and a stage for cultural performances and activities. The furniture is simple and quick way to another form appropriate to the function of the floor at that time. The look is appropriate in the architecture of the building, designed by architect Richard Meier. Placing a furniture object that is free in the space allows, within the framework of building a new layer to add. By color is a 'virtual' space framed. This reduces the overall space more intimate and manageable design and distinguishes itself as an independent identity that a guest in the building of Meier. (AEQUO)

#### **Bibliotheek Floriande, Haarlemmermeer (Prov. Noord Holland) – The Netherlands 2005**

see Rau: <http://www.rau.eu>

Haarlemmermeer Architecture Award [nomination], for the interior of the Library Floriande in Hoofddorp. Quote from the jury: "An interior with a public appearance. Several individual components are properly used. Especially the design of the floor is nice. Beautiful color and materials. "

1.800 m  
For Library Floriande in Haarlemmermeer AEQUO design an interior that reflects the urban center position and the orientation function of the building in the residential area. From the inside looking out and from outside to inside, its essential design principles. This creates the idea of the invisible interior. This leads to a light as possible and see Baar design with much attention to the lighting and translucent materialization. The cabinets are positioned at all times the view of the neighborhood is preserved, and made of a material that these see-through is not blocking, and also an atmosphere introducing appropriate to a modern public space. by the above all island ceilings to allow a special color light to make the library is able to create a light mood and message to its visitors and passers-by across. The orientation function of the building is important because it strengthens. Within striking that visitors can do much themselves: there are many Internet terminals, and lending take place is fully automated and decentralized information desk has been replaced by an information point. The library carries the title of National Sample Library. (AEQUO)

#### **Bibliotheek Nieuwerkerk aan der IJssel, Nieuwerkerk (Prov. Zuid Holland) – The Netherlands 2003**

800 m<sup>2</sup>

For Library Nieuwerkerk a rebuilding plan designs AEQUO an end to the gray image of the library. Because the library is housed on top of a mall, it is important to stay a climate boost.

The warm and uncluttered space and invites to stay discovery. Read on a terrace next to the stage enough space for meetings, reading newspapers and magazines and drinking coffee. In consultation with the local kids, a lounge comic who created their own further decorated. The interior is unique in design in an L-shape: the long side for collection, for short stays. In the armpit of the fully automated and removal equipment of the first fully automated library in the Netherlands. Another special feature: local information desk are completely deleted and replaced with "floor managers": walking between the cabinets and easily approachable staff. (AEQUO)

#### **Bibliotheek Huizen, Huizen, (Prov. Noord-Holland) - The Netherlands 2002**

1.200 m<sup>2</sup>

For the Library houses designs AEQUO an interior that the library late in line with its neighbors under the same roof: the library as part of the entertainment center. The design is a bridge between the recreational part of entertainment and educational aspect of it and thus the library a new way to position within society. The design is a challenging battle with budget and program, and succeeds wonderfully in a large visual impact on visitors to bring her: this is an interior that is remembered, so the library retains its place in society! The use of basic colors used to create its own identity with little additional financial effort asks all the basics are bare aluminum or galvanized metal, the 'touchable' parts of the interior are wood. Blue light from an open ceiling and a bright red cast floor holding each other in an exciting balance caught and give the plan a very special amenity. (AEQUO)

#### **Bibliotheek Pendrecht, Rotterdam (Prov. Zuid Holland) – The Netherlands 2002**

600 m<sup>2</sup>

For Library Pendrecht AEQUO an interior design that many colors of the neighborhood symbolizes. The collection is in a street along the walls of the room, so there remains an open central area. Each table has a different color EMALIT and symbolizes one of the many cultures where this library is its service to target. (<http://www.fjbv.nl>)

#### **Bibliotheek Leiden, Leiden (Prov. Zuid Holland) – The Netherlands 2002**

Following a request from the City of Leiden in the Library of Leiden in December 2002, it was investigated whether and how the Central Library is housed in the former orphanage on the Highland Kerkgracht Leiden. The Library of Leiden has to deal with the consequences and respond to changes in society. As a result, more space should be for meeting, recreation, information and regional facilities. AEQUO's research focuses on the implications of these substantive changes to the space program. and the extent to which the former orphanage will be able them shelter. This creates an attractive and inspiring images, and a good insight into the possibilities of both the library function and the use of the orphanage. (AEQUO)

#### **Bibliotheek Haarlem, Haarlem ( Prov. Noord-Holland) – The Netherlands 2002**

For Easy Reading Place (Makkelijk Lezen Plein) Library Haarlem, the first MLP in the Netherlands, designs AEQUO along with the Library of Haarlem, after extensive study and an inspiring design a cabinet wall that challenges and surprises, inspires and invites the same time. The info-snack-wall is inspired by the famous frikandels wall, but provides important resources for healthier mind and tries to bridge the gap between dislektische children, children with learning difficulties and their parents on the one hand, the existing resources at the library, media and other knowledge. The info-snack-wall works with a carefully calibrated collection, and together with the specially developed bank that the kids much protection and safety, become a resounding success. (AEQUO)

#### **Bibliotheek Hoorn, Hoorn (Prov. Noord Holland) – The Netherlands 2001**

see also: Klein Architecten <http://www.kleinarch.nl>

For the Horn Library design AEQUO a renovation plan that breaks open space. Three existing buildings in a loose bunch on a new way linked to the main stage is turned over and passages are highlighted and enlarged. The space a new momentum and the perception of a larger whole to intensify a bright blue PVC flooring applied with a new direction and a tight grid. This flow of existing spaces in a new naturally into each other and the impression an enhanced library service. The color scheme is simple: buildings are white, the floor space blue, moments of entertainment and information are wood, and special areas red. A play-reading and cave for kids is an exciting journey, an auditorium with lots of light and color capabilities of the space for an exciting night out. (Aequo)

FJBV has been commissioned in the Library Horn and the branches Kersenboogerd and Risdam, the new intake units provide.

This new way of taking books, designed by Aequo Architects is revolutionary and has not previously been used in NL-Libraries!

#### **Bibliotheek Opmeer, Opmeer (Prov. Noord Holland) – The Netherlands 2000**

Designs for the Library Opmeer AEQUO a small area adjacent to an existing historic farmhouse. The expansion is independent of the bubble developed and refers to the hay houses in the vicinity of the project are often built to the area of the farm to increase. The design of the expansion contrasts in everything with the bell: one versus many materials, a versus much detail, simple vs. complex design. The whole is made of slate. The sober house is elaborated by a new harmony this contrast with the monumental dome. (AEQUO)

#### **Bibliotheek Veldhoven, Veldhoven (Prov. Noord-Brabant) – The Netherlands 1999**

For Library Veldhoven AEQUO an interior design that positions the library as a mature, professional organization, much quality information to offer. Much attention is given to front presentation, and special collections in particular [custom] cabinets are installed. also develops AEQUO for this project's Display Units 04, a modular system that can respond to changing presentation needs of the library without directly wholly replaced to be. A multifunctional reading the journal collection, located on the most beautiful room of the library on the floor, makes a visit more worthwhile. (AEQUO)

#### **Bibliotheek Volendam, Volendam (Prov. Noord-Holland) – The Netherlands 1999**

For Library Volendam AEQUO designs with very modest means an interior plan in an existing building. The plan features a central open space, making presentations, exhibition and meeting a given sanctuary, surrounded by a shell formed by the collection. The plan is organized by a strong use of color. By making a tour through the skin of the entire library bookcases unlocked. The walls are kept free for art and temporary exhibitions, which creates a quiet space that focuses attention on the user and his target. The graphic designer and artist Gijs Dragt designed as an extension of the interior wall decorations and the new style. (AEQUO)

#### **Bibliotheek Oss, Oss (Prov. Noord-Brabant) – The Netherlands 1996**

For Library Oss AEQUO an interior design plan with a number of distinctive custom features that the various building components together. Moreover, using a sophisticated logistics system waiting for the bar to a minimum and can be made much more compact than the old situation was. This makes room for presentations and meeting returned to the user. Various furniture presentation ask the attention of visitors and share space in traffic and residential areas. The look is modern and high quality, which the library itself as a professional service positions. The interior is also in the leading role the library in Oss her professional world has been playing for years. (AEQUO)

#### **Stadsbibliotheek, Antwerpen – Belgium 2005**

Dutch-German project bore the name and interior plan on April 22, 2005 Antwerp opened to the Coninckplein the doors of

the new Central Public Library Permeke. Named after Oscar Permeke, the former owner of the Ford garage where the new library is located, but also his cousin, the expressionist painter Constant Permeke. The chosen name was nominated in the project of architect Aat Vos (AEQUO Architecturals), FJ and Schulz Speyer Interiors & Schulz Benelux. This Dutch-German team, which is signed for the design and the interior of the largest public library in Belgium with its 5000 m<sup>2</sup> of public space. In Permeke building also housed the council offices. The total construction cost for the project amounted to 25.9 million Permeke. Permeke The renovation of the building at the Coninckplein is part of the Structure Plan for the sustainable development of Antwerp North. This area, located around the station, has a strong multicultural and was for many years as a problem and disadvantaged area. The building is an important Permeke social functions and in addition to a library and council offices distributed in meeting places (reading café, botanical garden, auditorium, meeting rooms) and room for the 'Impulse' educational projects of the city of Antwerp. (<http://www.architectenweb.nl>)

For the Library of the City of Antwerp in collaboration with Ronald AEQUO design a winning contest Costeris a plan that implements the old Ford garage in Antwerp. AEQUO discovers the relationship between the garage and the painter Permeke and works based on this one concept. The library, which incidentally is also a city hall belongs, has two worlds: an informal market zone and a formal library. The formal library has a double bottom, because a clever sliding between the cabinets can create a large space. The informal market zone is potentially different every day because all the used furniture can easily be moved. The industrial feel of the old garage is still visible and gives the room an added dimension by the use of only one color [red] is enhanced. Red represents the blood of the forgotten minority city dwellers and is visible but also many unseen places into the interior. (AEQUO)

#### **Library Idea Stores, London – UK 2008**

For the Idea Stores in London, the most innovative library concept in the world, Aequo designs the restyling of the youth department. Or better, an extreme makeover of the Children's Library. The Idea Stores offers a combination of learning and reading as an integrated concept in the London Township Tower Hamlets, an important district of the metropolis with 230.000 inhabitants. Besides learning and reading are inspiration, encounters and social safety important standards for the success of the 4 stores. (AEQUO)

Aequo BV architects is selected by Idea Store to design the renovation of two of their establishments in London, England. The two libraries are part of the British Idea Store, the most innovative library concept in the world, and are located in Whitechapel and Crisp Street. After an intensive selection Aequo was given the assignment because their proposed working method corresponds best with the vision of Idea Store. De design approach of Aequo is based on the revitalisation and intensification of the base values of the Idea Store library concept. A little children's look and feel will be added to the Idea Store corporate identity. The new children's libraries will further enhance the strength of the Idea Store brand and will give a new dimension to the experience of a visit to a library. The completion date of the new children's libraries is expected after Summer 2008. (<http://www.designer.com>)

#### **MFA (Multifunctionele Accommodatie) Bisonspoor, Maarssen (Prov. Utrecht) – The Netherlands under construction**

De gemeente Maarssen heeft ten behoeve van de architectenselectie voor de multifunctionele accommodatie Bisonspoor een Europese aanbesteding uitgeschreven. In het nieuwe MFA Bisonspoor worden gehuisvest een zwembad, sporthal, jongerencentrum, bibliotheek en ca. 30 appartementen. De lokatie voor het MFA Bisonspoor ligt juist op het snijpunt van twee werelden. Een wereld van woonerven, water en groen en een wereld van rechte wegen, steenachtige openbare ruimte en hogere gebouwen. Geïnspireerd door deze unieke ligging op dit markante snijpunt hebben wij een visie ontwikkeld die opent, verbindt, zichtbaar maakt en structureert. Hiertoe stellen wij enkele verfijningen van het stedenbouwkundig model voor: - afschuiving van de hoeken maken bredere doorgangen en doorkijken langs het gebouw; - woningbouw dicht op het plein plaatst deze binnen de contour van de flankerende woningbouw - woningbouw verdwijnt uit het zicht van de bestaande laagbouw woningen aan de zuidzijde - afschuiving van de hoeken van de woningbouw maakt brede doorzichten. Al met al ontstaat zo een royale en zichtbare overgang tussen de twee sferen van centrum en woonwijk, en fungeert de nieuwe massa stedenbouwkundig niet als barriere maar als uitnodigende entree. Het lage bouwdeel reageert op de meer amorfe structuur van de woonwijken, het dak wordt nadrukkelijk als vijfde gevel ingezet en als dakpark begroeid ingericht. Zo zet de groene sfeer vanuit de woonwijken zich als het ware door over het gebouw. Het zwembad is aan het verbrede buitenwater gelegd zodat de binnenbaden als een boot in het water drijven. Grote glaswanden zorgen openheid. Aan de meer stenige zijde manifesteert de bibliotheek zich als een transparante zone in de plint nadrukkelijk aan het nieuwe entreeplein. De hogere woonbebouwing neemt de richting van het centrum op. Door de kleine verschuiving over het entreeplein, ontstaat een prominente kop en een dynamisch samenspel met de overige hogere woongebouwen. Zij omkaderen samen duidelijk de grotere pleinvorm waarbij de nieuwe bebouwing een accent op de hoek van het centrum legt. Samen met de toren nabij het station markeren zij het centrum van Bisonspoor. Het nieuwe MFA Bisonspoor zal zich zo niet alleen voegen naar zijn omgeving en deze onderling verbinden, maar tevens aan deze omgeving een hoogwaardige impuls toevoegen die de ingezette vernieuwing van Bisonspoor gretig zal omarmen. (<http://www.architectenweb.nl>)

#### **Faculty of Science, Mathematics and Computer Science, Library of Science, Radboud University, Nijmegen – The Netherlands 2011**

University Realty Company, Radboud University Nijmegen Size: Approx. 52.000m<sup>2</sup> GFA building with laboratories, practicals, workshops, library, lecture classrooms, offices, restaurant and auditorium. Also approximately 8,000 m<sup>2</sup> gross floor area and parking (motor) bike.

Housing for the sub-faculty of Physics, Chemistry, Biology, Mathematics and Computer Science building in separate wings, adjacent to a common internal street corners with coffee and photocopying facilities. Here the interaction between different research groups and between teachers and management employees. The facade is designed to both blinds and blackout is possible and a lively, changing image. (AGS)

#### **Nijmegen ROC Technovium, Nijmegen – The Netherlands 2011**

Client: Board of ROC Nijmegen. Size: 18,000 m<sup>2</sup> GLA

Building with workshops, practice rooms, study landscapes, offices, auditorium, also approximately 8,000 m<sup>2</sup> gross floor area and parking (motor) bike split-level.

Technovium is the partnership between the technical (vocational) education and technical business in the Nijmegen region and houses next to the technology sector of ROC Nijmegen also several corporate training. The founder brings the technique to express a high degree of transparency and a superstructure, which as a "stealth" floats above the substructure. (AGS)

### [Openbare Bibliotheek Wageningen, Wageningen – The Netherlands 2008](#)

Size: 2000 m<sup>2</sup>, 55,000 collection items, adjusting walls, opening in first floor gallery and stage serving a total of 125 seats, children's corner, ch eestafel, several reading areas, flex office workers, corporate and signposting.

Description:

Typical of the existing architecture of the 70s was her non-verbal character. When regeneration was a marked increase dialogue between the library and the city. Clarity, overview and transparency are the basic themes in the transformation of this library. A library as an information provider is a book with a clear table of contents easily accessible to inform, but in addition they must seduce, captivate or delight. This project was the association of libraries in the context of innovation dubbed as Best Practice. (AGS)

### [ROC \(Regionale Opleidingen Centra\) Carolus, Nijmegen – The Netherlands 2007](#)

The ROC Nijmegen is one of about 45 so-called Regional Opleidingen Centra, ie regional training centers, which are almost entirely responsible for the implementation of vocational education in the Netherlands. The ROC provides both youth and adult education and training in vocational education at the secondary level and adult education. To its offer also includes customized training programs for companies and organizations. On ROC Nijmegen currently about 12,000 youths and adults for vocational training or further education are enrolled. They are well cared for by 1,100 employees. About 40 percent of all inhabitants of the Netherlands has undergone training at a ROC or are in the process.

The building has its programmatic intent is a clear difference between the ground and floors. On the ground floor as much as possible, "consulting rooms" situated on a broad internal street. Among others we find a beauty salon, grand café, book shop, kindergarten, fitness center, travel shop, bakery, grocery store, along with study area and student support. Much of these stores are operated by external parties, commercial, and thus provide for the students of the ROC an inspiring, stimulating and realistic practice environment by working here. The "street" of the atrium are shaped like squares seating object instances shards from the facade. Pu forms are finished with a signal red polyester coating not only serve as informal "street furniture" but carry their strong sculptural character added to the recreational value in this complex. Consulting Rooms, [open study landscapes](#) and common areas as such as coffee-corners and Restaurant all designed by us and guided to completion. vision was to design the customer, especially the students very seriously. We have chosen the level of organization and materialization to pick up some chic that respect is shown to user and as professionally as we possibly can. Persuasion is thus the students an inspiring and positive attitude is encouraged. The building finishes chosen for smart solutions by using warm colors and textures to work in utilitarian products such as suspended ceilings, carpet tiles and glass interior walls with of color films. This all complemented by additional lighting, and richer appearance of loose and fixed furnishings. The entire course within the (lower) budgetary frameworks of a 'normal' school design.

### [Gemeentehuis Hof van Twente, Goor \(Prov. Overijssel\) – The Netherlands 2006](#)

ontwerp: Daan Josee. Het nieuwe gemeentehuis voor de Hof van Twente is gesitueerd in het centrum van Goor. Het gebouw is ingevlochten in het bestaande stedelijke patroon. In dat stedelijk patroon komen grote schaalverschillen voor. Aan een zijde ligt het gebouw aan een grote open ruimte van 80 bij 80 meter, aan de andere zijde grenst het aan een voor Goor typerende winkelstraat met panden van twee tot drie lagen met een kap. De bebouwingsvlek heeft een zeer gelede vorm, met een grillige contour en uitlopers tot in de kleinste schaalgebieden van de omgeving. Door de lokatie loopt ook nog een nieuw te bouwen stedelijke doorgang, die het doel heeft de looproutes in het kernwinkelgebied te bekorten en de publiekstromen te bundelen. In het midden van de bouwkael is een hoofdmassa ontworpen in de vorm van de letter U met zo lang mogelijke ontwikkelingslijnen voor de interne organisatie. Naar de periferie van de locatie ontwikkelt het gebouw zich naar de schaal van de planranden, waardoor dit grote gebouw zich ontspannen in de omgeving nestelt. Aan het plein ontwikkelt het gebouw zich tot zijn maximale hoogte van 16 meter. In een stedelijk venster van 16 bij 20 meter toont zich hier de hal van de burgers. In dit gebouwtwerp centraal staat. Programmatische flexibiliteit. Bij een gebouw dat is ingevlochten in een fijnmazige bestaande stedelijke structuur bestaat het risico dat het caleidoscopische exterieur een interieur voortbrengt met vele discontinuïteiten, waardoor het gebouw niet als een doorlopend geheel gebruikt en beleefd kan worden. Het is van het grootste belang dat het gebouw als het onderkomen van ?n organisatie beleefd wordt en door de gewenste stedenbouwkundige geleiding geen insnoeringen kent, waardoor domeinigen culturen die zich vervolgens kunnen vervreemden van het gezamenlijke doel. De vele beeldfacetten van de stad omzetten in een heldere ononderbroken interne organisatie, zonder verlies van de verrassingswaarde van de stad, beschouwen wij daarom als de belangrijkste opgave. Bij het gemeentehuis voor de Hof van Twente hebben we de aanspraken van buiten en van binnen met elkaar verzoend door in het midden van de kavel een 80 meter lange ?ruggengraat? te ontwikkelen ( de bodem van de U) met alle faciliteiten en kantoren daarin. Zodoende kon een lang aaneengesloten werkplekgebied worden ontworpen met een minimum aan indelingsverlies en een maximum aan indelingsvrijheid. In de loodrecht op de ruggengraat ontwikkelde uitlopers versmelt het gebouw met de omgeving. Hoofdropzet. In hoofdlijnen bestaat het gebouw uit een een plattegrond in de vorm van de letter U. Door het pasmaken van het gebouw in de omgeving bevat deze U verschillende uitlopers die haar verankeren in de grillig gevormde randen van de bebouwingscontour. In de U bevinden zich de werkplekken voor de ambtelijke en bestuurlijke organisatie. De open zijde van de U is naar het grote plein gekeerd en is dichtgezet met glas, het eerder genoemde stedelijke venster voor de hal van de burgers. Dit venster is het meest in het ooglopende bouwdeel aan het plein. In feite is de hal voor de burgers de beelddrager geworden voor het gemeentehuis. In de U is, vrijdagend, een veelhoekig bouwlichaam geplaatst. Hierin zijn alle vergader- en overlegplekken ondergebracht. Dit vo-lume is bijna volledig van glas waarvoor een oregon pine lattenscherm (louvres) is aangebracht. In de avonduren, als het licht brand is dit overlegcentrum over een grote afstand op het plein zichtbaar als een reusachtige lampion. Vanuit de drie zijden van de U kan middels glazen bruggen het centrale overlegcentrum vanuit alle hoeken bereikt worden. De raadzaal heeft een bescheiden plaats in een van de benen van de U. Aan de zijde van de hal voor de burgers is die voorzien van veel glas. Zowel de raadzaal als de ruimten in het overlegcentrum worden ook gebruikt door theater en conferentiecentrum de Reggehof. Opmerkelijk aan de hoofdropzet van het gebouw is dat, gezien van buiten naar binnen, de werkruimten van de ambtelijke en de bestuurlijke organisatie, de overlegplekken en de hal voor de burgers met de baliewerkplekken en de informatie en documentatieruimten als het ware in elkaar genesteld liggen, bijna zoals de rokken van een ui. Door deze opzet is de grenslijn tussen de verschillende functiegroepen zo groot dat de kans op gezochte en spontane uitwisseling maximaal is. De ?schillen? zijn voorzien van veel vensters van verschillende vorm en formaat en met en zonder glas zodat er zicht is in aangrenzende domeinen zonder dat de beslotenheid van het eigen domein verloren gaat. De transparantie in dit gebouw is daardoor veeleer een subtiel spel van verbergen en onthullen dan een te open expositie van het besloten werkveld in het publieke domein. Over het algemeen geldt, dat als je kunt zien, je ook gezien kunt worden. Combinatie met

andere functies, synergie. In dit gebouw zijn een gemeentehuis, een bibliotheek, een politiebureau en een zorginstelling samengebracht. Ook wordt het gebouw gekoppeld aan een theatergebouw, waarvan de functies voor het gemeentehuis worden benut. De raadzaal is zo gesitueerd dat die als kleine theaterzaal door het culturele centrum gebruikt kan worden, het restaurant van het gemeentehuis loopt door in de foyer van het theatergebouw en de keukenvoorzieningen liggen daartussenin. De politie heeft een loket in de frontoffice van het gemeentehuis en de bibliotheek is met een brug over de passage verbonden met de hal van de burgers. De grote zalen en vergaderruimten in zowel gemeentehuis als theatergebouw worden wederkerig benut om op die wijze een bijna doorlopende programmering voor die ruimten te bereiken. De looplijnen door het gebouw zijn zo gebundeld dat de kans op toevallige en spontane ontmoetingen wordt bevorderd. De verbinding van theater- en evenementencentrum De Reggehof met het gemeentehuis. De beglaasde doorgang bestaat uit grote deuren waardoor een bevoorradingsauto (bierauto) het plein kan bereiken tijdens de Goorse school- en volksfeesten. (Kristinsson)

### **Gemeentehuis Dantumadeel, Damwoude (Prov. Friesland) – The Netherlands 1999**

Het motto voor de inzending voor het ontwerp van het gemeentehuis van Dantumadeel was “tussen bestuur en uitvoering”. Het motto verklaarde de ligging van deruimte voor de burgers tussen de ambtelijke en bestuurlijke vleugels. Het gemeentehuis is gerealiseerd op het terrein van de voormalige gemeentewerf. Het terrein is omgeven door in hoofzaak twee onder één kapwoningen. De entree van het gebouw ligt door middel van een voorplein aan de Voorweg. Vs het geldende bestemmingsplan mocht niet hoger worden gebout dan 7.00 voor de goot en 9.00 m voor de nok. De opbouw van de geboumassais zo gekozen dat degrootstectoegeestane hoogte in het midden wordt bereikt, en naar de randen toe larger is. Zo toont het gebouw zich naar de planranden met bescheiden maten, terwijl de omvang van het gebaau zichtbaar wordt in de binnen en buitencaanwezige witte vleugel, waarin het bestuur is ondergebracht. De plattegrond is in de lengte-as verdeelt in een aantal funktiestroken. Een strook met de werkruimten voor de ambtelijke organisatie, ondergebracht in het kantoorgebouw in de vorm van de letter „E“. En strook met de publieksgerichte werkruimten van de ambtelijke organisatie. Een strook waarin de hal is ondergebracht, waarin alle diensten aan de burger worden aangeboten. Een strook waarin de werkruimten voor het bestuur zijn ondergebracht, in de vorm van een witte gebouwvleugel van 90 m lang. Enn strook waarin een aantal funkties als raadzaal, kantine, archief en bibliotheek volgens, het plug-in-principe aan de publieksruimte zijn gekoppelt. (Kristinsson)

#### **Libraries:**

### **Openbare Bibliotheek (Stadsbibliotheek) Roermond, Roermond – The Netherlands 2001**

In the center of Roermond, the square where the Down Street and Bergstraat meet, stands the new public library of Roermond. A prominent place in the city, easily found for all visitors to the library. The former hotel and business premises 'Golden Lion' and 'Bell' were completely renovated and therefore, where appropriate monument restored. Behind the buildings on the site of these buildings had no way suitable for a modern library. They were geamoveerd and at the rear is a completely new building built. The smaller office-like spaces in library support for the renovated building housed large overzichtbehoevende and book rooms in the building. The property "Golden Lion", built in the mid 18th century, is a registered monument. Not because of the significant architectural achievement in the past been conducted but the historical narrative that reveals the property. Valuable it is visible that the building was originally three houses. Or actually two and a half house witnessed the half wooden beams under the roof adjacent to the former barbershop next door. The roof form, the different floor heights, the placement of the windows in the facade show this clearly. When these buildings were combined into a larger whole, in order to ratify, a central entrance created a neoclassical list and a curved pediment style elements in the 19th century often has been used. Central to the building was a modest decorated wooden ladder placed. This central staircase is located near a light court to the importance of the stage and stressed the sense of indoor nature takes away. Bell is also the building in Art Nouveau style lay still fully intact and very worthwhile to cherish. The structure of the building, which is in particular the history reveals as much as possible in its value to the functions of the library are housed in the main building organizational vertically grouped. The old original wooden beams of the two side panels are maintained and the light court at the main stage, although this glass-covered. The library as a whole consists of a renovated building and for an entirely new building behind. The rear building is in an introspective environment typology for the rear areas of binnensteedse streets. This characteristic of introspection, however, fits very well with the function and use of a library. It is important that the architectural quality, which is to do without actually view from the building is achieved by the spatial quality of the interior. The floor areas of the library are therefore surrounded by large open spaces that bring daylight to the lower floors. The facade of the building is actually the full height of the building a few meters from the floor areas. The contact between the floors of course affect visually established. The open stairs in the voids provide logistics for a comfortable bridging the floors. The fact that between the building and construction also behind a large void is present, the transition between old and new to every walk on the bridges connecting palpable. The rear of the building which in some places has largely disappeared, because the rear building was demolished, this will set a new meaning. There are big holes left, with or without glazed put in order from the new building in the old building to look as if looking into a dollhouse. From the new library floor shows the three original facades of the light court, or half the old rafters of the attic, as wooden objects from the past placed against the background of the inside finished zolderkap white abstract. Thus the situation where the new public library is established and continually made manifest is the next chapter of the ancient monument understandable. There is very carefully made to a building where the atmosphere of the old and new parts are equivalent. The old buildings, as noted, few interesting architectural elements are thus neutralized to the abstraction level of timelessness. Because of the shape, structure and scale, the history palpable but otherwise all completely white stucco walls and all window and door openings are easily abstracted into a "hole in the wall, filled only with toughened glass. Same level of abstraction is evident in the building where the floor areas are reduced to furniture, large tables stacked concrete completely free in a huge white space. The wooden railings, referring to the archetype of a library, winking at the old building with its wooden staircases and old wooden beams. The building is no color used, at least not added. The colors you see are all the natural colors of the materials. Zinc, concrete, wood and lime present in their original beauty. They represent simplicity. And beautiful simplicity leads to timelessness.

### **Campus Hoogvliet (Bibliotheek), Rotterdam – The Netherlands 2014**

The Campus Hoogvliet is a key project in the plan to restructure the Hoogvliet area of Rotterdam. The location of this new educational and cultural campus lies within the district Zalmplaat. Modernist intentions and a park like setting characterize this postwar neighborhood. The Campus Hoogvliet will, one completed, create a unique spot within the Hoogvliet neighborhood that will

provide a platform for education, sports, cultural and work opportunities. The central question raised while designing the campus was the ideas of “connections”: how does the design of this campus connect to the surrounding areas of the neighborhood, while still acting as a cluster of buildings and spaces that are uniquely related to one another? How will each building maintain its own character, while still allowing for common activities to occur within the general public space of the campus? (Arets)

### **Universiteitsbibliotheek Utrecht – The Netherlands 1997 - 2004**

The UBU, comparable to a data recorder, is more than a place where people can consult books, it is a place where they can work in a concentrated fashion, but also one where they can meet other people without the need of any other stimulation except the atmosphere that the building radiates. The book depots, which seem to float, divide the space into zones and are interconnected by stairs and slopes. All in black figured concrete on which a partly double-glazed façade to which a silk-screened figurative pattern has been applied in order to let natural light into the building encases the reading rooms rest. The glass façade also encloses the car park like a smooth skin, thereby making it an integral part of the complex. On one side it is the university site where the view from the raw interior offers a filtered prospect of the open countryside surrounding it, on the other, there is the view of the long slopes situated beside the inner courtyard that work as blinds to filter the view of the car park. Based on the idea that silent communication is important in a building where there is hardly any talking, the atmosphere is determined with an emphasis on creating a sense of security. That was essential for the choice of a black interior. A light, shiny floor provides enough reflection of natural or artificial light to illuminate some of the 42 million books that are on open shelves, while the long white tables make it possible to read a book or to consult electronic information without too much effort. The individual workplace with full facilities is the key element, and has been positioned in such a way that the user's choice of a workplace also determines the degree of communication with other users. Absorption versus confrontation, working in a concentrated way versus communication, is the main premises in this library where the infrastructure has more than one function. The route is also programmed by it, since the bar, the lounge area, the reception corner, the auditorium, the desks, all fitted with red rubber and other programmes such as shops, add an extra dimension to the route, thereby breaking down the mono-functionality of the library program. ### **mfa (Multifunctioneel Centrum) Veluvine, Nunspeet (Prov. Gelderland) – The Netherlands 2009**

At the spot where the paint factory in the past Veluvine stood under the same name, a multifunctional accommodation achieved. The design unites a very diverse program, including a secondary school, sports halls, a theater, a cinema, a library, a music school and a regional training center in a building. The chosen concept ensures that the comprehensive program in a natural way to the green space suits. The building can be conceived as a village in miniature: all components are in a central area. The lobed design a structure for building and grab the green, gently rolling terrain together. Parking in the hilly terrain under the building and realized the school rooftop. This allows the site as a green landscape are performed. The chosen materials and detailing, such as brown-black mixed with relief brickwork, fit the rural character of the building. The design is a clear and systematic manner designed so that all programs share a natural way together. (BDG)

### **Bentham Crouwel Architects, Amsterdam, Aachen – The Netherlands**

<http://www.benthamcrouwel.nl>

#### **Libraries:**

### **Gerrit Rietveld Academie, Bibliotheek, Amsterdam – The Netherlands 2003**

The Gerrit Rietveld Academie occupies two buildings: the main building, designed by Gerrit Rietveld, and the new building from 2003, designed by the architectural firm Bentham Crouwel Architects.

#### **The Rietveld Building**

The main building was designed by architect and furniture designer Gerrit Rietveld between 1950 and 1963 and completed in 1966. It is the largest of Gerrit Rietveld's buildings. There was a long period of preparation between its commission and its completion, during which important developments took place in Rietveld's way of designing. Gerrit Rietveld did not live to see the building's completion, as he passed away while construction was still going on. The academy moved into the building in 1967. When the school

became part of the higher professional education system in 1968 and was given the status of Academy for Fine Arts and Design, the name was changed to the Gerrit Rietveld Academie in honour of Rietveld. Much of the building was renovated in 2004.

#### **The Benthem Crowel Building**

The new building was designed by Benthem Crowel Architects and built in 2003 as an expansion of the Rietveld Academie. Studios can be found on the north side of this building, and offices in the south wing. The south and east facades of the building are clad with 16,000 cast glass elements. The building houses the departments of Fine Arts, Audio-visual, and the Master's programmes of the Sandberg Institute. The library, Buro Rietveld and a small exhibition area are located on the ground floor. (<http://www.gerritrietveldacademie.nl>)

#### **Province of Zeeland Archive, Library, Middelburg – The Netherlands 1994 - 1999**

A mansion designed in 1765 by J.P. van Bourscheit in the old town centre of Middelburg was chosen to house the new Province of Zeeland Archive. The historic interior was restored and primed to receive the documentary and administrative part and the restoration divisions. In the garden behind the building is a three-level underground repository, and in a new-build pavilion in the garden are the public zone, reception, reading rooms, meeting/exhibition room and coffee corner. The pavilion's triangular form derives from the yards between houses that are a characteristic feature of Middelburg. A staircase and lift in the central void connect all repositories with the reception and reading rooms and with the passages on the three floors. Like the historic part the new-build portion is a solid affair, though the toned-down finish of metal and concrete contrasts with the interior of the old mansion. Client: Rijksgebouwendienst, directie Zuid West, Architect: Benthem Crowel Architecten In cooperation with Architektenburo Verlaan & Bouwstra, Artists: Frans Franciscus Lydia Schouten, Gross floor area 7800 m<sup>2</sup> (Benthem)

#### **Forum Mittelrhein (Stadtbibliothek Koblenz), Koblenz – Germany 2012**

Zum Baustart (Nov. 2010) des Einkaufszentrums „Forum Mittelrhein“ auf dem Zentralplatz in Koblenz haben die Projektpartner ECE und STRABAG Real Estate mit der RREEF Investment GmbH eine Vereinbarung zur Übernahme eines 94,9-prozentigen Anteils an der Projektgesellschaft für den offenen Immobilienfonds grundbesitz europa getroffen. ECE und STRABAG Real Estate werden eine Minderheitsbeteiligung von insgesamt 5,1 Prozent halten. Das Investitionsvolumen beträgt insgesamt rund 145 Millionen Euro. Die vorbereitenden Arbeiten für das Bauvorhaben haben im August begonnen. Ab Herbst 2012 soll das Forum Mittelrhein eine Mischung aus Kultur, Bildung, Handel und urbaner Platzgestaltung bieten. Das Projekt umfasst ein fünfstöckiges Kulturgebäude mit ca. 12.000 qm Nutzfläche sowie eine Einkaufsgalerie mit rund 20.000 qm Verkaufsfläche und ca. 80 bis 90 Fachgeschäften, Restaurants und Cafés. Zwischen beiden Gebäuden ist die Schaffung eines ca. 6.000 qm großen, urban gestalteten Platzes beabsichtigt. (<http://www.ece.de>)  
Team gs : gernot schulz : architektur GmbH, Prof. Gernot Schulz, Verena Bick, Raphaella Burhenne de Cayres, Ufuk Celik, Fabienne Fouquez, Andreas Kimmel, Anja Knieper, Marcus Wagner, Andrea Zoll  
Entwurf: Benthem & Crowel, NL - Amsterdam / D - Aachen

Der neue Kulturbau auf dem Zentralplatz ist ein einzigartiges Gebäude. Der Entwurf überzeugte die Jury des Architekturwettbewerbs nicht nur durch Ästhetik, sondern auch mit städtebaulicher Funktion. Im Erdgeschoss erwartet den Besucher ein großzügiges Foyer mit einem beeindruckenden Lichthof, der bis hinauf zum Glasdach in über 30 Metern Höhe reicht sowie einem Café mit Innen- und Außenbestuhlung. Hier kann man mit Hilfe eines verglasten Panoramaaufzuges hinauf zur begehbaren Dachterrasse fahren, um neue Perspektiven auf Koblenz und das Mittelrheintal zu gewinnen. Im Erdgeschoss finden auch die drei unterschiedlichen Nutzungen Ihren Auftakt: Das Mittelrhein-Museum, die neue Stadtbibliothek und ein Touristenzentrum zum Thema UNESCO Welterbe Mittelrhein. "Assoziation und Inspiration für den Entwurf des neuen „Forum Mittelrheins“ war das Bild von von Felsen in der Strömung. Wie Gesteinsbrocken, die im Lauf der Zeit von der Strömung des Flusses geformt werden, soll die Bebauung am Zentralplatz sinnfälliger, die verschiedenen Ströme aus dem angrenzenden Stadtraum lenken. Durch die funktionale Trennung und die Entwicklung zweier unabhängiger Baukörper, spannt sich der neue Zentralplatz im Herzen Koblenz auf. In der urbanen Dichte und der starken Frequentierung liegt eine der Hauptqualitäten des Ortes, die es herauszuarbeiten gilt." Architekturbüro Benthem&Crowel Amsterdam/Aachen see also: <http://www.gernotschulzarchitektur.de>

Im weißen Kulturbau werden Mittelrhein-Museum, Stadtbibliothek und die Koblenz-Touristik jeweils einen eigenen Bereich bekommen. Die Nutzungen sind mit einem gemeinsamen Foyer von ca. 550m<sup>2</sup> miteinander verbunden. Dem Museum stehen auf drei Etagen rund 2.500m<sup>2</sup> für Dauer- und Wechselausstellungen und der umfangreichen grafischen Sammlung zur Verfügung. Die neue Stadtbibliothek wird auf 4.100m<sup>2</sup> Angebote der Jugend- und Erwachsenenbibliothek sowie der Mediathek, dem Archiv und weiterer Literatur- und Medienangebote auf vier Etagen bereithalten. Die Bereiche (ca. 1.350m<sup>2</sup>) der Koblenz-Touristik bestehen aus einer Informationstheke im Erdgeschoss und aus einem Ausstellungsbereich des Präsentations- und Informationszentrums für das UNESCO Welterbe Mittelrheintal im Erd- und Untergeschoss. Bei Bedarf steht die Wechselausstellungsfläche des Museums auch dem Informationszentrum zur Verfügung. Das Foyer mit seinem 32m hohen Lichthof kann mit 600 Sitzplätzen bestuhlt werden. Ein gläserner Panoramaaufzug für 25 Personen befördert Besucher bis zur Aussichtsterrasse auf der Dachterrasse. Teile der Dachterrasse sind durch Glaswände abgetrennt - sie stehen den Besuchern der Bibliothek als Leseraum zur Verfügung. Alle Bereiche im Kulturbau sollen barrierefrei erreichbar sein. #### **de Waard (The Triangle), Egmond aan den Hoef (Prov. Noord Holland) – The Netherlands 2006**

4.600 m<sup>2</sup>, €3.500.000

On the edge of Egmond aan den Hoef is a building made with a shopping center, a library, commercial space and seven apartments. The various functions are housed in a compact volume at a slope vegetation. The location on the edge of dunes and buildings provides the project design. The building has two contrasting faces. On the side of the dune vegetation responds to the sloping of the building along with a sound-proof earthen wall as a landscape element on the artificial environment. The horizontal and vertical cut-outs of openings and roof terraces show that the slope is part of a building. On the side of the village is a vibrant transitional zone between inside and outside realized. Behind a steel colonnade are the stairs, elevators, walkways and entrances to the mall, library, commercial space and housing. The stores are accessible through a central winkelhal. In the design phase is an analysis of more extroverted and introverted shopping. The advantages and disadvantages of both models for public and supplies are inventoried. On that basis, geziende location and limited retail space program proposed an "introverted" solution with a central winkelhal. " Simultaneously, a large opening in the sloping roof from the hall a unique view of the landscape. The two-storey high hall also provides spatial relationships between the shopping center, library and commercial space. Also from the library and the homes will look into the bulb fields and dunes. On the ground floor is a supermarket and five dagwinkels van 100 m<sup>2</sup> located at about 100 m<sup>2</sup> of replacing existing retail. On the first floor are the existing settlements of Egmond-aan-Zee, Egmond-aan-den-Hoef Egmond-Binnen and a public library of 800 m<sup>2</sup> together. Also on this floor 400 m<sup>2</sup> of commercial space. Finally, on the second floor, seven houses have been completed. These contribute to the vibrancy of the area and ensure social control as a library and shops closed. (<http://www.architectenweb.nl>)

## **van den Broek Bakema, Rotterdam – The Netherlands**

<http://www.broekbakema.nl>

### **Libraries:**

#### **Faculty of Mathematic & Physics, Bibliotheek, Leiden University, Leiden – The Netherlands on design (2009)**

The Faculty of Mathematics & Physics at Leiden University consists of a collaboration of several autonomous institutions. By bringing these institutions together under one roof, cooperation at the intersections of research themes and institutions is stimulated and strengthened. Research is concentrated in the wings of the building. Between the wings is a central area that contains mainly teaching and a number of specific functions. Above these functions, in the central area, is a plaza that is stepped upwards and where the users of the building can meet. This plaza is the vibrant heart of the building, with functions like a restaurant, reception desk, library and flower garden. At a smaller scale, in the research wings, meeting areas are placed close to the cores. The existing saucer-shaped building with lecture halls, which is to remain intact, is located at the forecourt of the complex. (Broek)

#### **Cultuurhuis Winschoten, Bibliotheek, Winschoten ( Prov. Groningen) – The Netherlands 2008 in progress**

BVO 20.229 m<sup>2</sup>

This multiple commission is for the design of a cultural centre and a parking garage as part of the urban development plan. In addition, the surrounding site is to be landscaped in such a way as to allow for parking on ground level and for an inviting route to or from the centre of Winschoten.

##### **Cultural strip**

The cultural centre houses a theatre with a seating capacity of 700, an events hall, flat floor room, public library, radio and television studios, the Centrum voor de Kunsten (art centre) and the cultural cafe. The building is, in essence, one interconnected strip of cultural facilities. Placed side by side in a row, these facilities are connected by a generous common hallway from which the different functions each have their own entrance. With a height of thirteen metres and a glass facade and glass roof construction, this space is highly transparent. This hallway opens out into the library and also serves as a lobby for theatrical performances and events in the events hall or the flat floor room. As the public space is, in a sense, continued in the building we have also extended the facade inside. All the library and lobby walls are constructed of brick, for instance. Users pass through this shell to the other functions, where the construction materials are tailored to that particular function.

##### **Parking garage**

The parking garage with 414 parking places is a large cylinder placed in the ground. It is in essence a long, concentric parking street. The interior ring is open to allow natural light into the garage at all times; this also simplifies the ventilation process. Supply air is blown into the garage through the outer cylinder and the air is carried out through the open interior cylinder. (Broek)

#### **Windesheim University of Applied Sciences, Building X, Interior Building X, Zwolle (Prov. Overijssel) – The Netherlands 2009 /2010**

(BNA Building of the year 2011 Regio East)

Bij het interieurontwerp van gebouw X heeft de behoefte aan flexibiliteit in combinatie met de sterke identiteit een bepalende rol gespeeld. De hoofdopzet van het interieur is neutraal. Alle basiselementen van het gebouw zijn wit of heel licht van kleur. De kolommen, trappen en hellingbanen zijn in wit beton uitgevoerd, kernen waarin zich trappenhuizen, liften en toiletten bevinden zijn hoogglans wit geschilderd. Met open en gesloten systeemwanden kunnen ruimtes eenvoudig toegevoegd of gewijzigd worden. De vloeren hebben een afwerking als gietvloer in een warm grijze tint. Op specifieke plekken wordt met afwijkende materialen en kleuren gewerkt.

##### **Objecten in kleur**

Binnen de neutrale opzet zorgen objecten in kleur voor oriëntatiepunten in het gebouw. Deze punten markeren de verkeersroute die door de flexibel indeelbare ruimte heen loopt. De objecten zijn bijvoorbeeld postvakken, pantry's balies, vergadercellen en zitmeubels. In de kernen en overige gesloten ruimten van het gebouw, zoals de toiletten, collegezaal en tv-studio, is het uitgangspunt voor het interieur grijs in combinatie met een accentkleur.

##### **Gebouw als decor**

Naast objecten als kleuraccenten in het neutrale gebouw, is er een aantal vaste elementen aan te wijzen die een bijzonder uiterlijk krijgen. Door verticale vlakken (wanden, schermen, gordijnen, folie op glazen wanden) en horizontale vlakken (tapijt, vlonder) kleur te geven, ontstaat er een decor voor plekken in het gebouw met een eigen identiteit en sfeer. Op deze plekken bevinden zich de collectieve ruimtes voor alle gebruikers; de studielandschappen, docentenruimtes, vergaderruimtes, concentratiecellen en overlegruimtes. Het interieur vormt een tweede laag ten opzichte van het gebouw, afgestemd op het gebruik van de ruimte en de plek.

Broekbakema is ook verantwoordelijk voor Gebouw X en het Masterplan van de campus. (Broek)

## Corlaer 2 College, Nijkerk (Prov. Gelderland) – The Netherlands 2006

(BNA Building of The Year 2007 East)

Corlaer 2 is a school for general secondary and pre-university education in Nijkerk. Small-scale, identifiable, safety, teamwork, integration of teaching domains and learning by means of learning are distinguishing marks of the concept. Inside the characteristic knowledge canyon at the centre of the Corlaer 2 College bridges and a central staircase smoothly connect the split-level floors to each other. The ideal base for a progressive independent study centre concept based on the idea of the open plan office. Work spaces for working in teams are linked to individual and joint silent rooms which are crossed by relaxation isles. To learn from and with each other in an inspiring environment in which for individual differences in learning (extrovert / introvert) a place inside the building will be reserved. The programme is based on a modern education concept in which teaching domains consist of a small number of traditional classrooms and a series of study spaces for more or less individual education. It is expected that the Corlaer 2 College will house 800 pupils in the future. Therefore the central services such as auditorium, cvk-drawing, music education and bins / toa are ready for these numbers. A possible extension will then only concern classrooms and individual study rooms. The split-levels inside the building strongly support the desired teaching methods and education concept. Teams can easily be enlarged or scaled down. The floors no longer form an obstacle because education domains simply run through the entire building; from floor 1 to floor 4. The façades are a statement against austerity and evenness. The playful division is a translation to the new education concept. It is based on the idea to utilise the differences between pupils which would yield more motivated pupils with higher results. (Broek)

## Bibliotheek Rotterdam, Rotterdam – The Netherlands 1999 – 2004

9.500 m<sup>2</sup>

### FROM BOOK CASE TO KNOWLEDGE MARKET

During a period of twelve years the character of the Municipal Library Rotterdam has changed. At the necessary, profound renovation we took care of the architectural aspects (Gemeentsbibliotheek Rotterdam 1977-1983, Jap Bakema 1914-1981). Counters, toilet facilities, conference rooms and showcases were renewed or added by us. At the beginning of the eighties we also designed the building to which later on also the Central Discotheque Rotterdam and the Information Centre Rotterdam have been moved. A profound new thought on the function and renovation were therefore needed. We used the altered way of consuming information as a guideline for the new interior arrangement. At the first half of the nineties the surrounding area changed considerably. Nowadays the Binnenrotteplein two days per week serves as a market ground. Inside the building this market square transforms into an internal information square. Renovation also served as a way of getting rid of lack of maintenance and nuisance. During the operation that was carried out in phases the library building could be kept open.

Large fixed elements work as an intermediary between the large building and the loose mobile inventory. The counters and toilet facilities give structure to the spaces and give them dimension. Striking use of colour gives accents to the interior arrangement. At ground floor level by means of situating new counters and toilet facilities a natural separation of logistic streams is created. A new room on the first floor is specially designed for presentations. When the large pivoting doors of practically entirely matt glass are opened, the space is transformed into the library space. The 'stadsstudiehuis' at the upper floor provides a quiet working environment. Here young and older people make use of the working spaces, which vary from small meeting rooms to individual computer working spaces. (Broek)

## Cultureel en Educatief Centrum “De Binding”, Langedijk – The Netherlands 2007-2008

GFA: 9.600M<sup>2</sup>, Construction Costs: €11.200.000 EX TAXES

Opposite the municipality building of Langedijk a new Cultural and Educational Centre is going to be realised. This Centre will house a high school, a library, a music school and an artist's gallery, a toy library and a youth activity centre. These functions are enclosed within rectangular islands which are connected by a north-south orientated street. The main entrance lies at the beginning of this street and is signposted by a prominent cone shaped volume. The percussion room from the music school is situated in this volume. An auditorium for the high school is positioned at the other end of the street and can also be used for theatrical production. This auditorium is a round volume and half of it sits in water and it also looks over the surrounding polder landscape. (Burger)

## IJwijk community school, Hoofddorp (Gemeente Haarlemmermeer) – The Netherlands 2006

programme: two primary schools, sports hal, day-care centre, community centre, police station

date of commission: 2003, date of construction: 2005 – 2006, gross surface: 10.970 m<sup>2</sup>, volume: 38.400 m<sup>3</sup>

The integrated community school is a part of the IJwijk Centrum, an urban development plan which was also designed by de Architecten Cie. The school occupies two whole blocks that linked by the main hall of the community centre, the heart of the complex. Besides the two primary schools and the community centre, the complex comprises a toddlers' centre with two day-care units, two playgroups, and three groups for after-school childcare, a sports hall, and a neighbourhood police post. The multifunctional character of the complex is enhanced by the diversity of users taking full advantage of the collective spaces as well as

the facilities that are available. Large openings with deep reveals mark the individual entrances for the various groups of users. The complex is prepared for 23 optional 'school dwellings': classrooms which in the future can be converted into housing units without much adaptation. In character and the use of materials, the brick exterior matches the other buildings of the IJwijk area whereas the main hall in the middle of the schoolyard is clad with contrasting natural stone. The names of the two primary schools, 'Klavertje Vier' (Four-leaf Clover) and 'De Brandaris' (The Lighthouse), are reflected in the colour scheme and design of the courtyard gardens, lending each one its distinctive character. (Cie)

#### **City Library, Rijeka – Croatia date of commission 2005**

Gross Surface 5.949 m<sup>2</sup>

The organizing element of the library is its structure: mesh membranes and the central patio with the staircase. The patio is designed in relation to the sunrays trajectories in order to bring light into the building, while the floor plans are flexible, organized in different sections for visitors and library staff. The interior has walls, parts of mesh membranes which articulate every floor through the landscape of unexpected spatial configuration. (Cie)

### **Claus En Kaan Architecten, Amsterdam – The Netherlands**

<http://www.clausenkaan.com>

#### **Libraries:**

#### **Huis voor Cultuur en Bestuur, Nijverdal, Gemeente Hellendorn – The Netherlands 2003 – 2007**

The design for the Huis voor Cultuur en Bestuur ( House of Culture and Administration) of the municipality of Hellendoorn consists of a series of impressive brick barrel vaults giving this town hall its bold character. Not only does it accentuate its most important public function, it gives Nijverdal – a little over one century old, and without any architectonic signature – strong new identity. The offices of the existing town hall dating from the 1960s are incorporated in a large public complex, which comprises not only a new representative wing of the town hall with management and meeting facilities and a council chamber, but also cultural facilities including a library, a theatre, a tourist information office and several commercial facilities among which a grand café. The textile of the council chamber and other parts of the building is designed by Claudy Jongstra, overprints and signing are from graphic designer Reynoud Homan and the balcony is the work of artist Norman Trapman. (Claus)

Claus and Kaan have often inspired by buildings from the fifties and sixties of the last century. So even in this House for Culture and Governance. The shape of the building is reminiscent of the Adventskerk in Aerdenhout K. L. Sijmons (1958) and the Kimbell Art Museum by Louis Kahn (1967-72). (<http://www.architectuur.org>)

<http://www.jocoenen.com>

#### **Libraries:**

#### **Centrale Openbare Bibliotheek Oosterdokseiland, Amsterdam – The Netherlands 2001 – 2007**

#### **Literature:**

de Architect 2007-9

Bouwwereld 2007-15

H. de Haan - Jo Coenen, 2004

The Amsterdam Public Library is the central one of three large new buildings on the restructured Oosterdokseiland, near the Central Station. The programme consists of a library of almost 30,000 m<sup>2</sup> (including theatre), a large café, and 9,000 m<sup>2</sup> of office space. As in the Milan library design, a raised plinth offers a refined transitional area between the upper and lower floors, and here too the reading and study rooms are like terraces, though this time they are not arranged in a spiral but are placed around large and tall empty spaces. A terrace on the top floor accommodates the library theatre and conference rooms. The main shape of the building is attuned to the surroundings: both the apartments on the west side and the wide avenue on the east side leading to the conservatory must receive enough sunlight. At the same time, situated as it is beside the open waters of the Oosterdok, the library has to contribute to an attractive skyline. (Hilde de Haan / Coenen)

In the original masterplan, Amsterdam's new public library was to have had meeting rooms on the roof. Jo Coenen moved these to the rear of the library facing the tracks. Consequently this key public building, although one in a series, occupies an appropriately autonomous position. This status is strengthened by setting back the front facade to create a public entrance plaza with a canopy. These interventions do mean however that space and available daylight are at a minimum. So the library before anything else is a compact three-dimensional puzzle with daylight incidence a key factor. Walls and ceiling have a gleaming white finish, one reason being to distribute the light as evenly as possible. A zone of lifts, stairs, escalators and voids stabbing through the building acts as its spatial spine drawing the disparate components together. (<http://www.architectureguide.nl>)

#### **Stadsbibliotheek Maastricht – Centre Céramique, Maastricht – The Netherlands 2003**

The „Centre Céramique” is located in the northern part of the new city district of Maastricht, Céramique. It accommodates a range of functions: a library, townhall, exhibition rooms, City Archives and the European Journalists Centre. A café connects the „Centre Céramique” to the „Bordenhal”, which has been converted into a theatre. With Plein 1992, this complex is becoming a new city meeting place. Thus, the fourth square is coming into being in the City of Maastricht, alongside the Vrijthof, the Markt and the Onze lieve Vrouwenplein. A planned pedestrian and cyclist bridge will connect the „Centre Céramique” to the western shore of the river Maas and, consequently, to the historic inner city of Maastricht. To the west, towards the river Maas, the „Centre Céramique” creates a smooth transition between the City Hall and the adjacent square. It offers a view of the opposite shore. The openness of the building is enhanced by the glass façade of the City Hall with its 8m to 12m high open space. This essential design is sustained in the building. Thanks to the shifting lay-out of the empty spaces on the upper levels, a vertical walk along the various departments of the library will provide surprising perspectives. The choice of materials – concrete, glass, wood and aluminium – creates a special atmosphere which is further accentuated by the interior decoration and the lighting. The bond with the history of the location is cited in every possible way. For instance, the reading room in the basement is bordered by the defensive rampart and the city moat, both constructed in the 16th and 17th centuries around the Wijck city quarter. From the wooden reading bays one has an interesting view of the city moat. The wall runs like a thread through the different buildings, thus becoming a connecting element. Here, Jo Coenen links past and present to create an integrated whole, showing the field of tension between the city and the interior. (<http://www.architectenweb.nl>)

#### **(NAI) Nederlands Architectuur Instituut, Rotterdam – The Netherlands 1988 – 1993**

The commission for the Architecture Institute – after a competition that was limited to six firms – marked the start of Coenen's international recognition. The institute is conceived as an ensemble of relatively autonomous architectural elements, which are above

all important as a whole. They transform what used to be an amorphous gap in the city into a piece of compact, significant urban design. The institute comprises four main components with different functions: 1. the banana-shaped concrete archive building as a new wall for the south side of Rochussenstraat; 2. a box-shaped, brick-covered exhibition hall as appendant to the Museum Boijmans Van Beuningen opposite; 3. a transparent (glass and steel) block on a series of columns for the library and administration, overhung by an enormous steel canopy that turns it into a landmark; and 4. a socle (concrete in combination with glass and glass bricks) that accommodates a café and lecture room as well as placing the NAI on a pedestal. The moat and bridge over it make an essential contribution to the monumental quality of this complex. (Coenen)

## **Jeanne Dekkers Architectuur, Delft – The Netherlands**

<http://www.jeannedekkers.nl>

### **Libraries:**

#### **OZW– The Netherlands 2006**

20.350 m<sup>2</sup>, €2.300.000

The OZW health care and well-being training institute is a new landmark for the architectural landscape of the VU University. It embodies an innovative training concept that combines intermediate and higher level vocational training programmes and university programmes. The softly shaped brick walls that bring to mind the Amsterdam School are in keeping with the nature of the training programmes. The window spacing emphasizes the verticality and main outlines of the exterior and immediately draws attention to the transparency and vitality of the interior: a playful combination of training centres around atria. From the south side, the atria gradually and diagonally lend access to the facilities. Long sightlines reduce the size of the building. From the base, for instance, one can see all the way up to the sixth floor. The utility core is incorporated in the 'back bone'. The private offices are at the far ends of the building. The public base is transparent and the mysterious volume of the lecture hall inside catches the eye. The training institute is a playful landscape to roam in, see people and meet people. (<http://www.archdaily.com>)

A remarkable building at De Boelelaan, next to the VU Main Building, home to the OZW, an experimental collaboration of a wide range of care training courses at various levels, from vocational to university. A gentle and humane education building that clearly fits care and therefore designed with flowing lines. The staggered, deep windows emphasize the height of the building. Because of the size and scale use, the building became a stout appearance on the campus of the University, a predominantly straight, some amorphous environment. With his towering character the weight of new principles and forms a benchmark for the future. The building does justice to the new identity of education: transparency and layering of the various programs. They are both reflected in the building. Daylight falls like a waterfall in through diagonal sight lines on different levels and thus promotes orientation and interaction. The open learning centers, coupled with the voids, are the heart of the teaching of the various users and are easily visible to both students and teachers. The interior exudes openness and color used to highlight a number of distinctive places. The most striking element is the classroom, in the space of the main hall hangs a large oval volume. "Absolutely one of a stone building that represents the aspirations of the VU." (<http://www.architectenweb.nl>)

## **diederendirrix b.v., Eindhoven – The Netherlands**

### **Libraries:**

#### **Huis voor Cultuur, Oosterhout – The Netherlands 2010**

The House of Culture is the new home of gallery 5, De Bussel, H19 and the Film Theatre. The plan is part of the masterplan Sant Oosterhout Rhine and the new cultural heart of Oosterhout. The program includes a theater with a great hall of 650 seats, two smaller halls and restaurants, the library, the center of the arts, cinema, 40 homes and a 2-storey underground garage with approximately 450 locations. Total approximately 27,000 m<sup>2</sup> GLA. (diederendirrix)

#### **De Hangar, Eindhoven – The Netherlands 2005 – 2009**

In the center of Lake Empire VINEX district of Eindhoven, is a typical aircraft hangar along with several other valuable industrial heritage buildings like the memory of the former airport Welschap alive. With the redevelopment and extension to a complex of educational and recreational features, the hangar transformed into the vital cultural center of the district. A balcony at the hangar, a sunken gymnasium with insight from the entrance patio, bridges the patio cross, a sunken garden, an elevated children's playground, an amphitheater at the entrance of the community school, they are the essential ingredients that the recipe constitute a clear, rational, orderly but vivid and idiosyncratic complex. Features: Community school (primary school, nursery, playgroup, after school care, infant), library and media center, Center for the Arts, Community Centre, Youth Room, Gymnasium, Fit & Wellness Club. (diederendirrix)

#### **Vertigo, Technical University Eindhoven, Bibliotheek Bouwkunde, Eindhoven – The Netherlands 1998 – 2002**

A smooth and continuous body with an ambiguous relationship between transparency and solidity. The old rugged hull has a new special glass façade, based on the synergy between environment and aesthetics. The typical rhythmic structure of the original facade with its ongoing IPE profiles is the dominant vertical lines. Between them, the glass is stacked in a succession of clear glass and screen-printed glass. The hull with its grand portals and concrete cores remains a distinctive feature. The interior has the utilitarian feature of the former laboratory building as an acceptable quality. The internal organization is focused on efficiency and flexibility. Users are flexible, differentiated by a range of areas. Overview and spatial continuity with a generous view on the city skyline are the qualities of the high floors. The floor height of 5200 is exploited to maximum effect to optimize the daylight. Concentration versus communication, encounters and exchanges as a hermetic design concept, but primarily as a user activating environment.

Two special operations disrupt the rationality of the program. The building is designed as a combination of entrance and amphitheater design. A second intervention concerns the sawing floor areas from the 6th floor which creates a high atrium. The atrium acts as a binding layer spatial theme for the staff. The topical working chambers between floors to increase the contrast with the generous space around. Project Team: B. Dirrix, H. Aspers, H. Knipscheer, H. Korteweg, I. Westerveen, J. van de Ven, M. Vlemmix, R. Leunissen, R. Meurders; (<http://www.architectenweb.nl>)

When the former Chemistry Laboratory was converted into the new accommodation for the Faculty of Architecture, Building and Planning, its bare concrete skeleton was refurbished with a curtain façade that strikes a balance between massiveness and transparency. The smooth glass skin is a low-tech energy façade, and for that reason it is sealed for 70%. On the exterior, the glass has an enamel print of the scaffolding of Gaudi's Sagrada Familia – architecture's symbol of the for-ever-unfinished project. The bare, sandblasted concrete, which bears every trace of this structure's previous life, is present in the interior, which, by virtue of the generous floor height of over 5 m, has plenty of air. The studios are located behind the horizontally organized facades at the bottom

of the tower; the faculty staff is housed just above, around a glass-roofed atrium created from the 6th floor down by cutting out segments of all the floors. Work rooms have been grouped around this vertiginous hole. (<http://www.mimoo.eu>)

### **Industrion, Kerkrade – The Netherlands 1993 - 1997**

The position of the museum generates two types of space: one urban and one landscape. The first, the forum focuses on the visitor who comes from the center and is also suitable for events. The second compartment, a connection to the vast landscape in Germany, and the wooded hillside on the opposite side of the track. A free, architectural interpretation of the mijnbok symbolizes the most turbulent industrial history of Limburg. The big wheels are my coat to strengthen their impressive effects. The frame acts as an "elevated surface" in the sense that unreachable objects and relics exhibited in public spaces. The hall acts as a viewing platform overlooking the library, the wisselexpositie, auditorium, offices, the museum garden and terrace. At the end of this corridor begins the scene tour of the museum spaces. (diederendirrix)

#### **Libraries:**

### **Cultural Centre Canadaplein, Alkmaar Public Library, Alkmaar – The Netherlands 1997 – 1999**

Cultural centre: three institutions under a single roof. The new Cultural Centre of Alkmaar is situated on a square, called Canadaplein, on the edge of the historical town centre. The new buildings were designed as one volume, accommodating different functions: the Municipal History Museum, the Central Library and the music school Artiance. The music school has a three storey high entrance on the side of the square. By using black linoleum, steel and birch doors the school has been given an elegant appearance. Daylight enters the corridors' ends. The spaces that need sound-insulation most, like studios, lie entirely walled-in. By way of the glass front, the visitor enters the foyer of the Museum. The glazed roof lends the atmosphere of a covered urban square to the central hall. The stairs on the central axis offer the visitor different routes through the building. The glass roof lends a striking transparency and lightness to the compact museum, whereas its precious objects are well protected against daylight. An important role has been reserved for the auditorium, which hangs in this space like an independent white box. Any rivalry with the imposing church has been avoided by giving the Cultural Centre a modest materialisation. The former Interkruis building has been given a skin of wooden slats that also cover the glass front of the newly built structure. Behind this wooden façade the different structures (old and new) are visible. In this way a certain stratification was obtained that renders the building soft and transparent and makes it fit in with both the large scale church and the small scale buildings of the historical centre. (Döll)

"Behind this wooden facade the different structures (old and new) are visible. In this way a certain stratification was obtained that renders the building soft and transparent and makes it fit in with both the large scale church and the small scale buildings of the historical centre". Global Architecture Document, nr. 67, 2001

### **OSG (Openbare Scholengemeenschap), Hengelo Learning Centre, Hengelo – The Netherlands 1999**

The school with a 11,000 m<sup>2</sup> sports hall is situated in the striking surroundings of the Tichelwerk Park. The compact building, with its robust appearance, accommodates modern teaching facilities. There are individual workspaces for approximately 1,200 secondary school pupils, a computer classroom and a multi-media library with flexible computer workstations. By centralising these functions in one area the latest ideas on teaching in Holland, called the "study house", are given shape. The school building is one of the first new schools that complies with the requirements of the Dutch "study house" school model: in addition to the 43 rooms for group teaching, it has special working spaces where students of the senior classes can study individually or in small groups. These include, for example, a multimedia center with computer workstations. As the site was limited in scale, Döll designed a compact building. The four storey high front, facing the park, forms the prominent side of the school. Here the classrooms and the main entrance are to be found. The front shows a combination of brickwork and red cedar, with a regular pattern of windows, slightly interrupted on occasion. On the other side of the building, a green-bordered car park and a two store high bicycle shed retain the distance between the residential area and the school. Here, the residents' view is taken into account: the schools' roof slopes down towards the two store high rear and is covered with a moss and sedum layer. On this side, partly below ground level, the multifunctional auditorium and the sports hall are located. (Döll)

### **Openbare Bibliotheek Almelo, Almelo – The Netherlands 1994**

As the location for its new public library, the municipality of Almelo chose a site opposite the city hall, which was the final design of the De Stijl architect J.J.P. Oud. Not only the vicinity of the latter building but also the complexity of the urban surroundings and the ambitious programme were the ingredients of a very challenging project. The building consists of two volumes in a split-level arrangement apparent in the section, separated by an open space. The relatively narrow separating void is crisscrossed by staircases which interconnect different levels and which make it possible to apprehend the dynamic of the interior spaces. The volumes are all distinct in their shape and materials. The somewhat receding transparent saw tooth facade of the ground floor contrasts with the closed character of the copper frontage on higher floors. By following the form of the street, the slightly curved, copper-clad east facade is largely responsible for the image of the library. The three self-enclosed, smaller volumes terminate in a wide glass front of one storey height. The zinc-clad roof structure facing the city hall has the appearance of a separate volume. The ultramarine finish of the end elevations and the developing patination of the copper-clad east facade enter into a respectful dialogue with Oud's building due to the contrasting materials. (Döll) "As an uncompromising, spectacular and innovative piece of modern architecture, it perfectly represents the ambitions of the client as well as being a pretty fair reflection of Döll's own desires." (Wallpaper Sept/Okt 1996)

### **Hochschulcampus Bielefeld (Bibliothek), Masterplan, Bielefeld – Germany on design (2007)**

Client: Bau- und Liegenschaftsbetrieb NRW, Düsseldorf.

The assignment for the competition was the design of an urban master plan of an app. 16,5 ha area situated on the edge of the German Teutoburger Forest. The programme consists of 150.000 m<sup>2</sup> new estate of the Fachhochschule Bielefeld and the expansion of the existing building complex of Universität Bielefeld. Besides the Hochschulcampus offers space to prospective university and private research institutions and beginning knowledge intensive companies. An important basic assumption of the design is the careful integration in the valuable natural, wooded environment. (Döll)

Sobald in der zweiten Jahreshälfte 2013 der Ersatzneubau Universitätsstraße bezogen ist, kann mit den Sanierungs- und Modernisierungsarbeiten am Universitätshauptgebäude begonnen werden. Die Arbeiten werden bis 2025 dauern. Geplant sind sechs große Bauabschnitte. Am Ende dieser langen Bauphase wird sich die Universität Bielefeld mit einer erstklassigen Infrastruktur für optimale Forschungs- und Studienbedingungen präsentieren. Wir wollen auch künftig exzellente Wissenschaftlerinnen und Wissenschaftler nach Bielefeld holen und junge Talente für ein Studium bei uns begeistern. Dazu brauchen wir eine Infrastruktur und Arbeitsbedingungen, die unser Campusmanagement noch effektiver machen. Hans-Jürgen Simm, Kanzler der Universität Bielefeld. 152.000 Quadratmeter: Herausforderung an das Facility Management Das überaus komplexe Vorhaben stellt den Bau- und Liegenschaftsbetrieb NRW und die Universitätsverwaltung vor große Herausforderungen. Der Gebäudekomplex verfügt über eine Nutzfläche von rund 152.000 Quadratmetern. Während der

Arbeiten werden die jeweiligen Bauteile komplett geräumt. Parallel muss gewährleistet sein, dass der Universitätsbetrieb ungestört weiter laufen kann. Im Facility Management der Universität laufen bereits die Flächenbedarfsrechnungen und erste Vorbereitungen für das Umzugsmanagement. So müssen zum Beispiel die Bedürfnisse der naturwissenschaftlichen Fakultäten mit ihren großen Laborflächen im Detail berücksichtigt werden. Hier finden unter anderem Langzeitversuche statt, die eine räumliche Umquartierung sehr kompliziert machen. Für die Sanierung werden erhebliche finanzielle Mittel in dreistelliger Millionenhöhe benötigt. Das Land NRW hatte im September 2009 eine Finanzierungszusage für den Ersatzneubau und damit für den Einstieg in die komplette Modernisierung des Universitätshauptgebäudes gemacht. Ende der 1960er Jahre war das Universitätsgelände noch ein Getreidefeld am Rande der Stadt. Im Hintergrund zeigen die Kräne das Entstehen des Aufbau- und Verfügungszentrums an, in dem am 17. November 1969 der Lehrbetrieb mit drei Fakultäten und 270 Studierenden begann. (<http://www.campus-bielefeld.de>)

Am 22. Juni 2007 hat die Jury des städtebaulichen Wettbewerbs zur Entwicklung eines neuen Hochschul-Campus Bielefeld den Siegerentwurf bekannt gegeben. Das Gewinnerteam besteht aus den Städteplanern und Architekten Döll - Atelier voor Bouwkunst b.v. aus Rotterdam und GTL Gnüchtel Triebswetter Landschaftsarchitekten aus Kassel. Angetreten zu dem kooperativen Wettbewerb waren fünf renommierte Entwurfsteams von Architekten und Landschaftsplanern. Aufgabe der fünf Teams war es, einen Vorschlag zu entwickeln, der den aktuellen Campus der Universität zusammen mit dem Erweiterungsgelände "Lange Lage" zu einem neuen und zukunftsfähigen Gesamtcampus werden lässt. Laut Jury zeichnet sich der Siegerentwurf insbesondere durch eine starke Verknüpfung des Universitäts-Stammgeländes mit dem Erweiterungsgelände "Lange Lage" aus. Der öffentliche Raum im neuen Campus wurde ebenfalls sehr positiv bewertet. Außerdem verzahnen sich die im Konzept dargestellten Baufelder, laut Jury, hervorragend mit der Landschaft. (<http://www.detail.de>)

## **dok architekten, Amsterdam – The Netherlands**

<http://www.dokarchitecten.nl>

### **Libraries:**

#### **Scheringa Museum, Opmeer – The Netherlands 2004 - 2010**

A new Scheringa Museum for Realisme has been designed of brick and reinforced concrete to stand in the flat polderland of North Holland. It has been designed as a house in three parts, linked by a central axis for orientation. The house for the public contains the museum shop, the museum café and other facilities. A mezzanine floor for the offices and the library extends over the whole width of the building. The house for the collection is enclosed and intimate and affords space for the paintings, the works on paper and the sculptures. Thanks to the structure of the building and to the inventive handling of zones of light and the technical facilities, the division of the building is adapted to the collection. The guest house, at the rear of the museum, provides space for changing and guest exhibitions. Here, too, it is possible to create large and small spaces, giving curators the maximum say over the arrangements. (dok)

#### **Mediatheek, Delft – The Netherlands 2007**

Haarlemmermeer Architecture Award [nomination], for the interior of the Library Floriande in Hoofddorp. Quote from the jury: "An interior with a public appearance. Several individual components are properly used. Especially the design of the floor is nice. Beautiful color and materials. "

The media library is part of the Hoogoven Building (former blast-furnace building) in Delft, which also houses shops, restaurants and cafes, apartments and bicycle storage sections. The most important materials of the building are glass and ceramics - dark bricks for the ground floor and orange bricks for the upper storeys. The media library is situated on the Cultuurplein (Culture square), embedded in the surrounding buildings. Its entrance is immediately recognizable there by the high glass façade that has been erected two metres in front of the existing frontage. This exposes the media library to the square, with its activities perfectly visible from the outside. The staircases are located behind this glass façade. Thus, a living image is created there, together with the activity on the square at ground level. On first floor, the visitor emerges under an eye-catching glass roof that runs the entire width of the premises. This visual link acts as a clarifying and structuring element. An important role in the orientation of the visitor is also played by the interior. Here a transition is made between the hard industrial shell and the warm, soft materials of the interior. The interior walls also play an important part in the signposting and orientation of the space. The display cupboards have been placed so that they create individual spaces that are small-scale, transparent and conveniently arranged. (dok)

#### **Basisschool Focus, Haarlem – The Netherlands 1997 - 2005**

The Focus school comprises two primary schools for children with special needs, in leafy surroundings. The starting point for the design was the vision of the head of the school and the project team. The children at the school require a peaceful environment, and this needs a particular approach, with for example areas where the children can play separately, alongside spaces where the support staff sit together to exchange ideas. The building comprises six small clusters containing classrooms, which are separated from one another both visually and acoustically, with their own entrance and play area. These clusters are indirectly linked to the triangular heart of the school containing the assembly hall and library. The teaching assistants and special needs teachers sit around this centre. All the spaces are covered by a façade shaped as a big cushion, that lends the building a sense of sanctuary. (dok)

#### **Coornhert Lyceum, Haarlem – The Netherlands 2000 - 2004**

The Coornhert Lyceum is a public school for secondary education with 1580 pupils. Besides teaching leading to a certificate, the school aims to provide personal and cultural development. During recent years, the school has experienced major developments resulting from changes within the education system and the increase in its number of pupils. There was an urgent need to extend the 1961 building with classrooms, a media library and individual study facilities. The extension plan seized the opportunity to make improvements for the higher traffic flows. A new entrance, new hall and a corridor have been constructed between the old and new buildings. These provide access to the stairwells, existing corridors, the individual study rooms and the new media library. The exterior is made light and warm by use of large sheets of glass and timber frameworks. The façade structure of the existing building is continued in the new extension. The interior has been kept light with striking highlights of colour, and the extension has created an inner garden. The concrete elements, benches and hillock make the garden a good meeting place on beautiful days. A pleasant spot to spend the break, and for studying and cultural activities. (dok)

### **Libraries:**

#### **Sint Nicolas Lyceum, Amsterdam-Zuid – The Netherlands 2008 – 2012**

12.000 m<sup>2</sup>

A unique school, uniquely located, the Sint-Nicolaaslyceum is a school with high ambitions and driven by sports, culture and knowledge. The new SNL building will settle into its role and location and find its own iconic footing between the city and the Zuid-as; between culture and commerce. Other than the new location of the school and its surroundings, the identity and ambition of the lyceum played a major role in the new design. The school for HAVO, VWO and Gymnasium is located along the Amsterdam Zuid-as, and is part of the future Beethoven plan. The new school is also inextricably linked to the lush Beatrixpark. The spacious atrium in the heart of the building looks out onto the park and connects the proposed public square with the existing park. This building's design and environment should motivate its students and encourage an inquisitive education. (DP6)

#### **ICOON, Amersfoort – The Netherlands 2010**

The ICOON cluster forms part of the central plan for the new Vathorst quarter in Amersfoort. The programme comprises a school for secondary education combined with a branch of Schools in Art, and includes a local theatre, library, day-care centre, and a sports facility. These special functions will help the ICOON become the area's future cultural heart. The building consists of several volumes that house the main functions. Between these volumes lie the traffic zones, and the whole is capped by a meandering 'plaza landscape'. (DP6)

#### **Hogeschool Utrecht (Library), Amersfoort – The Netherlands 2007 – 2010**

The HU in Amersfoort has relocated to a new building where different disciplines can share a collective space. The ground floor spatially connects through to the first floor through stairs and large voids. The sightlines this design choice creates encourage spatial awareness, orientation and transparency and makes for easy encounters and dynamism. The floors higher up along the red face of the building are more peaceful, but they also enjoy the spatial transparency created by the voids. As a direct result of the neutral floors and the white, homologous ceilings, the overall quality of the building's interior is calm and collected. Some of the walls are carried out as 'poster walls': walls with portions covered in collages, posters or banners, that can be modified by the users of the HU. The formal language of the unique elements is orthogonal, with three basic types: white, wood and multi-colored. Special interior elements for the different courses also have large, easily interchangeable lettering painted on.

#### **Extension Rietveld Lyceum, Doetinchem – The Netherlands 2004**

The Rietveld Lyceum school is housed in one of the last buildings designed by the famous Dutch architect, Gerrit Rietveld. The introduction of the educational concept of study centres and the loss of the use of an annexe meant that an extension was required. The new facilities will provide some 900 square metres of space to accommodate 7 classrooms as well as reading rooms for 2 study centres. The basic concept of the extension is to treat the building and its environment as an integral unit by looking for a solution that not only provides more room while at the same time creating a focal point for the school, but also adds to the quality of the parkland. The solution was to lower most of the extension below ground level. The resulting view is of a timber-clad volume that rises out of its surroundings. Daylight is provided by patios, which also act as points of orientation where the study centres find a place of their own. (DP6)

#### **TNO/Geoscience Utrecht, Utrecht – The Netherlands on design**

On the edge of Universiteitsterrein "the Uithof" in Utrecht on behalf of the new building of the Dutch TNO Institute of Applied Geosciences built. This institute is the central geoscientific information and research in the Netherlands. The buildings, housed in a square volume with the dimensions 80 x 80 m, three storeys high, consisting of office space situated around a glass-roofed outdoor space. Them in large part on the first floor is an outdoor atrium. This atrium serves as a central circulation space, allowing visitors from the slightly raised ground floor entrance on the building led into. In the basement next to the entrance to the semi-public office and laboratory functions housed. The semi-public features include a library, an auditorium and a restaurant with meeting rooms. The design of the building distinguishes this part of the building by a transparent structure opposite the closed laboratory section. This separation is accentuated by a sloping wall that flows into an air shaft bovendaks. The air shaft is an important part of the air control of the atrium. The new building from the entrance by means of ramps connected to the adjacent university buildings. (<http://www.architectenweb.nl>)

#### **University Library and Department of Mathematics and Computer Sciences, University Eindhoven, Eindhoven – The Netherlands 2013**

The campus of Eindhoven University of Technology (TU/e) will get a new heart for 55 million euro. A new building will be erected which is to be the meeting place for students, staff, researchers and visitors. Wednesday December 1 witnessed the starting signal for this first project of Campus 2020: the TU/e's accommodation plan. Completion of the new building is expected for the summer of 2012.

New heart

The new building will be the new heart of the TU/e campus, measuring 25,000 square meters and providing accommodation for the university library as well as some 900 study places for students. Above part of the large covered hall and the building for central student facilities, a five-storey building will be erected for the Department of Mathematics and Computer Science. It was designed by architect ir. Joost Ector of Ector Hoogstad Architecten. The building will be realized by construction company Hurks, Imtech Building Services, Oskomera, ABT, Nelissen ingenieursbureau and Hevo building management. The overall management will be the responsibility of the university's Real Estate Management.

"The university campus should be an attractive working and learning environment, a relaxed setting for international students and scientists to meet. The new building will house the Department of Mathematics and Computer Science, while a central place will be allocated to the university library as well. A grand café and a large covered hall will emphasize the meeting function even more", says the TU/e Executive Board.

Campus 2020

Campus 2020 is the accommodation plan of TU/e for the site where the university was founded in 1956. The university has nine Departments with a total of 7,000 students and 3,000 staff members. Campus 2020 is to be realized over the next decade and the total investment involved amounts to some 250 million euro. Campus 2020 fits in with the transformation of the TU/e grounds into a Science Park, which is to include permanent accommodation for students as well as a place where research enterprises can be established.

For more information see [www.tue.nl/campus2020](http://www.tue.nl/campus2020) (<http://www.architectenweb.nl>)

In the heart of the campus, the library and the central library of the university. Moreover, also a pub lunch, the Notebook Service Centre and the sale of lecture notes. The building is a large number of amenities including several studies classrooms and many individual study areas. (<http://www.tue.nl>)

### **Learning Center, Delft University of Technology, Delft – The Netherlands 2013**

Hoogstad sector was chosen as architect for the first major construction project at TU Delft outside the property. That the university announced today. Architectural means for the construction of Delft Chem Tech and the Department of Biotechnology of the Faculty of Applied Physics a unique architectural hat trick ': all three Dutch technical universities are now realizing a design by Ector Hoogstad Architects. The Delft University has Ector Hoogstad Architects chosen for the project following a European tender procedure. The complex consists of 26,000 m<sup>2</sup> of laboratories, universities and offices. The location is Technopolis, the new business campus along the A13, adjacent to the university grounds. The draft vision Ector Hoogstad Architects proposes a square-shaped building with a central space in the heart, partly inside and partly outside. According to Joost Ector is such a vital meeting place in a school building. "Space is the social heart of the building. Education is not just about passing on knowledge, but mainly to the development of new knowledge by sharing. Organizing and staging encounters between users is the starting point. " The new assignment in Delft means that all three Dutch universities are designing Ector Hoogstad Architects realize. For the University of Twente is building an office complex with teaching and research laboratory nano (40,000 m<sup>2</sup>). It was already the new master plan for the UT campus made. And Eindhoven University of Technology alumnus Ector chose last year for the new building for the Central Student Services and the Department of Mathematics and Computer Science (26,000 m<sup>2</sup>). The realization of this begins in 2009. (<http://architectuur.nl>)

### **“Orion” Learning Center, Wageningen University, Wageningen – The Netherlands 2013**

Ector Hoogstad Architects will design the new education building of Wageningen UR. The complex will be located between the Atlas and Forum buildings and its name will be 'Orion'. The hunter in Greek mythology after whom the constellation in the northern winter sky is named signifies power. Ector Hoogstad's design vision is emphatically inspired by nature. Logic, efficiency and sustainability are the starting points for this building, according to architect Joost Ector. In addition to a large number of auditoria and other study and class rooms, there will also be a student restaurant. To get a good idea of the users' wishes, the staff of the architectural firm will be working on campus for two weeks. Students and staff also had the opportunity to convey their wishes during meetings with the architect in April (2009). Orion, which should be finished at the end of 2012, is intended to form the social core of Wageningen Campus, together with Forum. Ector Hoogstad previously designed education complexes for the technical universities of Delft, Eindhoven and Twente. Info: [elisa.salentijn@wur.nl](mailto:elisa.salentijn@wur.nl) (<http://www.wur.nl>)

Ector Hoogstad Architects, on the order of Wageningen University and Research Centre (WUR), a large school building design: Forum II. It was announced today. The new complex joins between the familiar buildings of Rafael Viñoly and Quist Wintermans Architects. Gebouw designs themselves when preparing the winning design vision Ector Hoogstad Architects is strongly inspired by nature. This will close the agency with the motto of WUR: To explore the potential of nature, to Improve the Quality of Life. "We try to move as a designer in nature. Logic, efficiency and sustainability are therefore the principles for this building. They can lead to a clear building, which to some extent self-designs," said architect Joost Ector. Heart Social Forum II receives a large number of lecture halls, classrooms and study as well as catering. The student restaurant is on the ground floor, directly above the lecture. Some of these will be switched into a large, auditorium-like room. Higher in the building - where it is quieter - get instruction and teaching labs. Everything is interwoven with a large number of study places and landscapes. The building will therefore, together with the Social Forum I heart shapes of Wageningen Campus. More universities Wageningen University and Research Centre is the fourth university which Ector Hoogstad Architects is currently active. For the technical universities of Delft, Eindhoven and Twente builds teaching and research office complexes totaling over 100,000 m<sup>2</sup>. The new theme-building should be ready in 2013. (<http://architectuur.nl>)

### **Picasso Lyceum, Zoetermeer (Prov. South-Holland) – The Netherlands 2009**

In true vision of the school office has received a modest height of only three layers. The lower the better is the motto, because vertical distances in a larger barrier in communication and interaction than horizontal distances. The location in Zoetermeer offered just enough room for such a low building. The new building is so wide and deep and covers the tricky, because infrastructure pinched lot almost full. Striking is the organization of the building, which is divided into different "domains", each with clusters of related subjects. The added value of this is organizational cohesion and the ability to easily cross-curricular projects to launch. The six areas are language, people and society, exactly, art, sport and ICT. The domains are connected via a covered street, and consist of large and small classrooms around a Werkplein. This open study landscape 'is also equipped with modern ICT facilities such as interactive whiteboards. Although the building was officially opened today, it is already in use for several weeks. The school houses a "population" of about eleven hundred students and teachers. Moreover, the idea that the building not only serves as a school, but also a role in the district receives. Thus, the assembly hall during the week after the sounding of the last school bell used as a full theater. (<http://architectenweb.nl>)

### **Utrecht University of Applied Sciences, Library, Department of Education, Utrecht – The Netherlands 2008**

The Department of Education (FE) forms the westerly closure of the "kashba-zone" of the Uithof. In this hundred-metre-wide strip, buildings bunch-up close together with patios and rooflights providing daylight penetration. The colourful west façade gives the HU a face towards the city, makes the building scale-less and abstract, while also alluding to the speed of the traffic racing past. The façade is an expression of the occupants and their diverse activities, a metaphor for the HU's multifaceted community. (<http://www.mimoo.eu>)

### **Avans University of Applied Sciences, Tilburg – The Netherlands 2007**

In its architectural expression, the building presents itself like a system of floor-areas whose in-between spaces are filled with glass. Behind the façades - finished in pigmented concrete, aluminium ceilings, steel-slatted balustrades and timber window and door frames - a grey-hued and green-accented world opens up. A horizontal and vertical scenic landscape beckons you to enter, meet people and have the time of your life. (<http://www.mimoo.eu>)

### **HES School of Economics Studies, Amsterdam – The Netherlands 2003**

The ambition of Hoogstad Architects for the project is unchanged. The assignment is a challenge to make a college building by the scale can be interpreted as a small village and that the large urban dynamics will assume, a very positive impact on the environment. Several thousand mostly young users coming into the building to study, teach, work, collaborate and meet. Today's educational

beliefs which pupils are regarded as individuals with a great responsibility, with personal guidance plays a leading role must be reflected in the project. That means an "adult" building, where classrooms are no longer taking the main role but where the emphasis is on independent study and offered a continuous invitation to discovery, development and meeting. One must avoid that the building businesslike. Finally a program is not the start of a career but to prepare them. In the main urban form these considerations translate into a volume that is clearly recognizable as a mass present, yet its design reification occurs. It features two play an important role. The first is the curved facade, the building provides a striking silhouette and unlike a flat facades "sympathetic" look designed. Then there is the recognition of the various functions to the materialization of the facade and the implementation of greenhouses, which takes a look deeply in the building "permit. Stramanweg to play a complementary role to the greenhouses. Here, she breaks the only transparent (due to a mandatory building line) flat facade of the building, which the rhythm of the residential buildings on the other side gets a sequel. The entrance of the building is focused on the future square on the west side, from space and public transport argued the most logical place. Immediately after the main entrance leading a circulation route through the most common features of the building as central teaching rooms, restaurant, shops / cafes etc. spread over the ground and first floor. On the second floor there are functions with a common, but less "public" character, such as library and computer center. On the third and fourth floor are the areas of education clusters. So take upwards the noise and intensity of use off. The ambition Hoogstad Architects for this project is unchanged. The task challenges us to make a college building that the scale can be interpreted as a small village and that the large urban dynamics that are expected from this, a very positive impact on the environment. Several thousand mostly young users coming into the building to study, teach, work, collaborate and socialize. Today's educational beliefs which pupils are regarded as individuals with a great responsibility, with personal guidance plays a major role, the project must be reflected. That means a "mature" building, where classrooms are no longer occupy the main role but where the emphasis is on independent study and an invitation is offered to continuous discovery, development and meeting. It must ensure that the building businesslike. Finally a program is not starting a career, but to prepare them. In the main urban form considerations translate into a volume that is clearly recognizable as a mass of presents, but also by its design reification occurs. It features two play an important role. The first is told, curved façade, which gives the building a striking silhouette and unlike a flat facades "sympathetic" character is intended. Then there is the recognition of the various functions of the facade and the implementation of greenhouses, a deep look "into the building" permit. Stramanweg to play a complementary role to the greenhouses. Here they form transparent interruptions of any (due to a mandatory building line) flat facade of the building, which the rhythm of the residential buildings on the opposite side will be repeated. The entrance of the building is focused on the future square on the west side, from spatiality and public transport argued the most logical place. Immediately after the main entrance leads a circulation route through the most common features of the building, such as central teaching rooms, restaurant, shops / cafes, etc. spread over the ground and first floor. On the second floor there are functions with a common, but less "public" character, such as library and computer center. On the third and fourth floor are the rooms of the school clusters. So take upwards the noise and intensity of use it. a photo: Christian Richters Photo 2: Marcel van Kerckhoven.(<http://www.architectenweb.nl>) The HES School of Economics and Business is situated a stone's throw away from the Amsterdam Arena. The biggest design challenge was clear from the first moment; how to create suitable accommodation for some five thousand, mainly young, students in the sober surroundings of Amsterdam South East? The building has been conceived as a town within a town; as a network of wide and narrow streets, squares and gardens (in the form of "serres", or glazed buffer zones). Countless voids offer sight lines which visually interlink the different levels. The building ensures that the users are optimally visible to each other, thereby generating encounters. The four 'serres', or conservatories, are glass-enveloped outside spaces with a Mediterranean climate. They provide a "break-out space" and can also encompass a variety of activities. The large north serre has a step-by-step rising floor, creating a space able to accommodate large gatherings of people. (<http://www.mimoo.eu>)

see: [Meecano](#) architecten.

The University of Utrecht in the Netherlands commissioned an urban master plan by the Office of Metropolitan Architecture (Art Zaayer) in the eighties, and has since invited several well known Dutch architects to contribute to the University campus "De Uithof". The faculty for Economics and Management (FEM) is part of the Kasbah zone of the campus which aims to preserve the existing feeling of open space by strongly condensing building programs and allowing collective spaces only within their footprint and not between the buildings. The design for this faculty follows and enhances these principles of the master plan in order to create a new sense of unity for the faculty. Previously the FEM was accommodated in seven buildings at five different locations scattered around the city. The six departments of the faculty sought to define a new single identity while at the same time preserving a sense of independence. The identity of the faculty as a whole is determined by its collective spaces; entrance lobby, library, "mediatheque", restaurants and lecture halls for up to 400 people. These are all positioned at the front of the building complex and can be rented out as conference rooms, which increase the activity in this public zone. There are three patio gardens within the building with specific characteristics; the Water Patio, the Jungle Patio and the Zen Patio. These spaces provide a visual focus for orientation and are perceived to be the heart of the building. The more specific educational functions, such as classrooms and staff facilities are located at the rear of the building. Each department centers on a "study square", where students can meet for informal study purposes. The building program forms several groups that are expressed by distinct architectonic typology and materialization. The ground floor provides the main orientation area for the building from which the other floors are easily accessible. Internal circulation routes are spacious to cater for the large numbers of students. They each have a different character to aid orientation. Contrary to its large scale (23,000 m<sup>2</sup> gross floor area) the building remains easy to comprehend for visitors. By developing the principle of the Kasbah zone to its full extent, the new FEM combines a unified and strong exterior with a rich and complex quality of the inner space. of indoor and outdoor spaces, their respective status, their interrelationships, the way they are distributed (their address) constitute the rules of urban architecture. In our view, it seemed important that the respective position of each of the elements of the scheme allow the status of the outdoor spaces extending from them to be emphasised. The media library therefore becomes the logical extension of Place du 11 novembre, the clear glass used in its fully glazed façade (possible thanks to the double skin) providing transparency during the day and, conversely, allowing light from the media library to illuminate the square at night. (Egeraat)

#### **Cultureel Kwartier Assen - The Netherlands 2012**

It was once the site of the English landscape garden, soon is the place where past, present and future, young and old, locals and visitors meet. An alternate place in the tradition of the typical squares, streets and parks as Assen knows it. With a new square, the Pelinckhof and a new cultural center. A new meeting place for culture-loving Assen, but also part of a vibrant walking between catering to the market and shops around the Merchant Square. Enrichment of the public memorial ring Assen, all major public facilities in the downtown area: City Hall, courts, Drenthe Archive, the Museum of Drenthe and Joseph Church. Assen is rich in character squares and parks, including the Market Square, Merchant Square Garden and the Governor Brink. That wealth is a significant new area added to the Pelinckhof, a new square in Assen. Connection between the Koopmans Square, the canal and the Market The Pelinckhof, the new square of Assen, the cultural link in the new trail between the Koopmans shops around the square and around the hospitality market. In summer this route have further enlivened by the pleasure in Kolk. Space for culture, living and working The main entrance is from the Pelinckhof smoothly into the Culture Portal: central location in the building. An open, transparent and bright hall theater, cinema, the Centre for Visual Arts and the Library Assen own place and have a vivid picture. Central is the grand-café, are easily accessible. (<http://www.cultureelkwartier.nl>)

#### **Cultureel Centrum Meppel, Meppel – The Netherlands 2003 - 2005**

Het complex biedt order meer orderdak aan de Stichting Activiteiten voor Ouderen (SAO) en het Regionaal Instituut voor Musicische Vorming (muziek, dans, beeldende kunst). De bestaande Vledderschool is voor dit deel verbouwd en uitgebreid met een nieuwe vleugel. Hierin zijn een aula, dansdramaruimte, poplokaal, slagwerklokaal, regieruimte en diverse muziecklokaal ondergebracht. In de tuin zijn een podium en zitelemente gemaakt, zodat hier kleinschalige openluchtvoorstellingen gegeven kunnen worden. (Greiner)

#### **Palet, Multifunctioneel Centrum, Dordrecht – The Netherlands 2000**

Een huis als kleine stad Multifunctioneel centrum PALET is een van de laatste toevoegingen aan de 20 jaar oude wijk Stadspolders. Het gebouw is centraal in de wijk gelegen aan het Dudokplein, ingeklemd tussen het NS station aan de spoorlijn Dordrecht-Geldermalsen en het winkelcentrum Bieshof. Na een leefbaarheidsonderzoek in de wijk, kwam de gemeente tot de het traditionele sociaal culturele werk. Welwas er behoefte aan een ontmoetingscentrum van hoge kwaliteit met een aanbod van activiteiten die aansluiten bij de hedendaagse vrijetijdsbesteding. Zo ontstond het idee om een centrum te maken dat naast sportactiviteiten en sociaal- cultureel werk ook een bibliotheek, een grand café en diverse commerciële ruimten onderdak biedt, een huis als een kleine stad. Geheel meer dan de som der delen Uitgangspunt bij het ontwerp was dat het geheel meer moest betekenen dan de som der delen. De verschillende functies tonen zich naar buiten toe. Ook vanuit de hoge hal tonen de verschillende functies zich aan elkaar en aan de bezoeker. Een duidelijk gemarkeerde entree aan de zijde van het winkelcentrum leidt de bezoeker langs een gebogen glaswand naar de centrale hal. De hal is gedacht als een overdekte verlenging van de openbare straat. Het glasdak boven de hal draagt aan deze sfeer bij. Convexe glaswanden geven de ruimte een bijzondere dynamiek; het komen en gaan van de bezoeker wordt hierdoor begeleid. De trappen en de glazen liftschacht ondersteunen dit beeld van beweeglijke ruimtelijkheid. Op de begane grond bevinden zich de openbare bibliotheek, het grand café Boekmans en een commerciële ruimte. Op de Aan de buitenzijde is op deze wijze het gebouw sculpturaal bepaald door het contrast tussen de open glasvlakken en de gesloten metselwerkvlakken van geuanceerde handvormsteen met verdiept voegwerk. Aluminiumgolfplaat, wit stukwerk en hardsteen zorgen voor verdere materiaalcontrasten. De golvende kap houdt de verschillende onderdelen bij elkaar. In het interieur gaan ruimte en kleur hand in hand. Op diverse plaatsen, zoals in de kleedruimten, is gewerkt met gekleurde tegelwanden. Ook de vaste meubels en de inrichting van de bibliotheek zijn ontworpen door Groeneweg & Van der Meijden. 1e verdieping is een spelzaal met kleed- en was ruimten gesitueerd. De spelzaal, met vaste tribune en nis ten behoeve van een verplaatsbare tribune, is ook geschikt voor allerlei culturele activiteiten. Geperforeerde houten platen op de wanden geven de ruimte een warme sfeer en zorgen voor een goede akoestiek. De zaal is in de hoek grenzend aan de hal voorzien van een groot hoekraam, dat zowel zicht biedt op de hal als daglicht toelaat in de spelzaal, zonder dat dit een hinderlijke zonlichtinval geeft. Op de 1e en 2e verdieping bevinden zich verder de commerciële ruimten. De 3e verdieping is geheel ingericht voor het cultureel werk. De gebogen kap komt hier in het interieur terug waardoor een bijzondere ruimtelijkheid ontstaat. De buitengevel van deze verdieping is voor een groot deel gesloten waardoor binnen een grotere intimiteit wordt verkregen. Via de glaspuiken van de hal valt toch rijkelijk daglicht binnen. (Groeneweg)

### **Cascade. Cultureel Centrum & Bibliotheek, Hendrik-Ido-Ambacht – The Netherlands 1997**

De opgave was om een uitnodigend en herkenbaar gebouw te maken waarin verschillende culturele activiteiten en de bibliotheek een onderdak zouden krijgen. Het uitgangspunt daarbij was om het geheel meer te laten zijn dan de som der delen. De situering in een parkachtige omgeving was de aanleiding om het gebouw trapsgewijs te laten oplopen en zo als het ware uit het park te laten verrijzen. De grote zaal, uitgevoerd in gele baksteen, vormt het hoogste punt. De bibliotheek bevindt zich in het laagste gedeelte. Een open goot verzamelt het regenwater van de platte daken en voert het water als een waterval (cascade) af naar de vijver. Aluminium zonweringsluifels versterken de expressie van het gebouw en geven het gebouw als het ware vleugels. De wijkende gevelwanden verhogen het uitnodigende karakter van het Cultureel Centrum. De entreehal is ontworpen als een overdekt plein van waaruit de diverse verdiepingen en activiteiten te overzien zijn. Ook de bibliotheek is door een glazen pui visueel verbonden met de hal. Een brede trap voert vanuit de hal naar de foyer op de eerste verdieping die in open relatie staat met de hal. Van hieruit heeft men naar twee kanten een wijds uitzicht op de omgeving. De grote multifunctionele zaal is met een uitschuifbare tribune voor 300 toeschouwers ook geschikt als theaterzaal. Om de zaal overdag voor ander activiteiten aantrekkelijk te maken is deze ruimte op diverse manieren van daglicht voorzien. Waar de noordgevel van het gebouw als het ware openbreekt valt indirect daglicht binnen. Een lichtstraat in het dak werpt daglicht op de galerij in de grote zaal. Op diverse andere plaatsen is met licht vanuit het dak gewerkt. Visuele en ruimtelijke relaties d.m.v. vides en doorkijkjes geven het gebouw een sfeer van openheid en ruimtelijkheid. De fietsenstalling op het voorplein is gemaakt van cirkelvormige betonnen muurtjes. Hierop zijn onder leiding van Akelei Hertzberger door bewoners van Hendrik-Ido-Ambacht mozaïeken aangebracht. In het plaveisel van het voorplein zijn regels van diverse dichters opgenomen. (Groeneweg)

### **de Mayboom. Social Cultureel Centrum, Made – The Netherlands 1993**

In dit ontwerp voor een Sociaal Cultureel Centrum in Made is de kapel van het oorspronkelijke klooster dat op deze plek stond geïntegreerd in de nieuwbouw. De basisvorm van het ontwerp verwijst naar de oervorm van een klooster in het algemeen: een bouwwerk rondom een binnenplaats. Deze van oudsher gesloten vorm moest hier echter ook beantwoorden aan de vraag naar openheid en toegankelijkheid. Door het openbaar maken van de cirkelvormige binnenplaats, het hart van het gebouw, en het introduceren van een dubbele entree is de toegankelijkheid sterk bevorderd. Glazen puien in de gevels en in het interieur dragen bij aan een open karakter, en door een afge wogen gebruik van daglicht wordt binnen een lichte sfeer verkregen. Om aan te sluiten bij de schaal van de bestaande omgeving is het gebouw geleed in afzonderlijke volumes. De bouwmassa van het oude loostercomplex is in moderne vorm herbouwd met een duidelijk herkenbare bibliotheek op de begane grond en daarboven nog twee bouwlagen. Samen met het behoud van het Oude Mannenhuis, het oudste onderdeel van het klooster, is hierdoor de ruimtelijke karakteristiek van de Kerkstraat behouden. De vele gebogen lijnen en ronde vormen in de plattegrond volgen de beweging van het publiek. Zij geven het gebouw een vloeiende beweeglijkheid die past bij een cultureel centrum. Deze vormgeving sluit ook aan bij de bestaande kapel met zijn roosvensters en sacristiekapellen. In de materialen en kleuren is gezocht naar een contrast met het bestaande. De plaats waar oud en nieuw elkaar ontmoeten en versterken is de hoge hal met de om de liftschacht cirkelende trap. Hier krijgt men een verrassend zicht op het grote gerestaureerde roosvenster van de kapel. De Mayboom biedt onderdak aan: een bibliotheek, een theaterzaal met foyer, een balletzaal in de oude kapelzaal, een kinderdagverblijf met speelplaats op het dakterras en diverse zalen voor het sociaal-cultureel werk. (Groeneweg)

#### **Bibliotheek Wommel, Wommel – Belgique on design**

Meervoudige ontwerp opdrachten voor een bibliotheek in de gemeente Wommel (België). Een transparant gebouw, opvallend door zijn eenvoud, geplaatst in een parkachtige locatie is het uitgangspunt van het ontwerp. Het ruimtelijk ontwerp is opgebouwd. Het ruimtelijk ontwerp is opgebouwd uit een haaks omgezette 4.80 m hoge boekenkast met daarop een plat dak. De activiteitenruimte ligt achter de boekenkast en is voorzien van een tribune. De glazen gevels van de bibliotheekruimte laten rijkelijk daglicht toe en bieden de bezoekers uitzicht op de fraaie omgeving. Een goede toegankelijkheid en een heldere ruimtelijke organisatie maken het gebouw gebruiksvriendelijk. (Groeneweg)

### **Groos & Co. architecten, Hilversum – The Netherlands**

#### **Libraries:**

#### **Stadhuisterrein Huizen – The Netherlands 2001**

This is a multifunctional complex in downtown Hilversum. Live, work, a library, restaurants, a bowling alley, a movie theater complex and a dance opportunity housed in a building right next to the town. These features are combined so that they are mutually complementary and reinforcing. The shape of the building was partly motivated by the desire to strengthen coherence of the environment and the center of the church more meaningful. The horizontal curved wall on the east and north side, the still somewhat cluttered space public order. To the west is the small scale of the historic village responded. The complex consists of two main volumes and is divided into three programmatic areas. The living and working volume appears under the roof of the cultural and entertainment volume to continue and then culminates in a Grand Café. Cultural and entertainment center is conceived as a spatially continuous container activities and functions with a peak towards the bus station and next to the entrance of the town. This fluid space form is both complex program of activities planned and organized response to the large differences in scale and function of the surrounding area. (Groos)

#### **Universiteitsbibliotheek Binnenstad (City Centre), Utrecht – The Netherlands 2005 – 2009**

The former palace of Louis Bonaparte built in 1807, situated on the Drift in the historic city centre of Utrecht, has undergone a total redesign over recent years. The first and most prominent part of the Universiteitsbibliotheek Binnenstad (University Library City Centre) and the main entrance to the 'Drift cluster' on the Drift are now complete. The library accommodates an 8.5 kilometre collection and 350 study desks and carrels. Over the coming years, work on the adjoining section will go ahead with the same intensity and ambition until the UB Binnenstad takes final shape. The whole complex contains six buildings with listed status that served primarily as book stores and archives. The buildings were architecturally very dated and neglected. As a result of numerous alterations made over the years, the original structure and character of the buildings had been lost. As the architects, Grosfeld van der Velde is responsible for the design, which has been produced in close consultation with DHV (detailed drawings and project management). The design was based on the concept of creating a natural meeting place for education and research, for employees and students, and for the university and the city in the heart of the Drift Cluster. A place where students and books take centre stage. The core values for the identity and perception of the complex include accessible, transparent, inviting, representative and restful. In addition to providing a functional and pragmatic solution for the programme of requirements, the design accentuates the intrinsic

qualities and spatial layout of the different buildings, each of which has its own strengths and complements the others. The materials, details and colour scheme have been specifically chosen to draw the buildings together to create a unified whole. Particular attention has also been paid to integrating the complex installation techniques and the design of the interior components, such as study desks and carrels, search terminals, the library counter and fittings specifically developed for this project. Most of the study areas are situated at the front of the library and the collection is at right angles to the front of the building in an open arrangement. This makes the building light and transparent and encourages interaction. It creates a studios, attractive work environment where students can walk in and around the collection at their leisure and where there is space to meet for informal contact. The heart of the complex is the entrance to the library that has a new layout and design that naturally complements the existing building, enhancing the traditional features while creating a new, modern presence for the Universiteitsbibliotheek Binnenstad. (Grosfeld)

Het voormalige werkpaleis van Lodewijk Napoleon uit 1807, gesitueerd aan de Drift in de historische binnenstad van Utrecht, is de afgelopen jaren grondig verbouwd en gerenoveerd. Hiermee is de Universiteitsbibliotheek Binnenstad alsmede de hoofdentree van het Driftcluster aan de Drift gereed gekomen. De bibliotheek huisvest 14 kilometer collectie en 800 studieplaatsen.

Het gebouwencomplex is een aaneenschakeling van zes rijksmonumenten binnen het universiteitskwartier dat in de afgelopen 200 jaar voornamelijk dienst heeft gedaan als boekenopslag en archief. De afzonderlijke gebouwen bezitten allen een eigen karakteristiek en zijn sterk herkenbaar als onderdeel in het geheel. Door de vele verbouwingen in de tijd zijn oorspronkelijke waarden van het complex verloren gegaan. Het complex is opnieuw herkenbaar en uitnodigend gemaakt door op diverse strategische locaties entrees te creëren die leiden naar de centrale, publiekstoegankelijke ruimtes. Door deze entrees manifesteert het complex zich als een open en transparant gebouw in de stad. Een groot plein, dat te betreden is via de Wittenvrouwenpoort, biedt de mogelijkheid voor grote evenementen voor universiteit en stad en geeft eveneens toegang tot het complex via de entrees in de het centrale gebouw en via de ondergrondse fietsenstalling. Vanuit de centrale entree verspreiden de bezoekersstromen zich verder in het publiek toegankelijke deel van het complex, in de aangrenzende tuin met de entrees van de onderwijsgebouwen en het beveiligde gebied van de bibliotheek. De centrale entree is zeer ruimtelijk van opzet en heeft een representatief karakter waardoor een natuurlijke ontmoetingsplek van medewerker en student, van universiteit en stad ontstaat. Omdat de centrale entree in het hart van het gebouw is bedacht zijn de diverse verkeersstromen beheersbaar gehouden. Het restaurant van de bibliotheek is gelegen aan de Drift en is vrij toegankelijk voor zowel gebruikers van de bibliotheek en als voor bezoekers van de stad. De ingang van het restaurant bevindt zich ook in de centrale entreeruimte van het complex. Een hermetisch, introvert gebouwencomplex is zodoende getransformeerd in een doorwaadbaar en transparant ensemble.

Het uitgangspunt van het ontwerp is het realiseren van een natuurlijke ontmoetingsplek van onderwijs en onderzoek, van medewerker en student, van universiteit en stad in het hart van het Driftcluster. Een plek waar zowel de student als de boeken centraal worden gesteld. Toegankelijk, transparant, uitnodigend, representatief en rustgevend zijn enkele kernwaarden voor de identiteit en beleving van het complex. Naast de functionele en pragmatische oplossing van het programma brengt het ontwerp de intrinsieke kwaliteiten en ruimtelijke structuren van de onderling sterk afwijkende gebouwen terug aan de oppervlakte. Bewust is daarbij gekozen voor een eenduidige materialisatie, detaillering en kleurstelling waardoor er eenheid ontstaat in het gebouwencomplex. Daarnaast is er bijzondere aandacht besteed aan het integreren van de complexe installatietechniek en het vormgeven van alle interieuronderdelen zoals studietafels, raadpleegplekken, balies en de speciaal voor dit project ontwikkelde armaturen. De studieplaatsen zijn grotendeels gesitueerd aan de gevel, de collectie in open opstelling staat haaks op de gevel. Hierdoor wordt het gebouw licht en transparant en nodigt het uit tot interactie. Er ontstaat een studieuze en sfeervolle werkomgeving waar studenten kunnen dwalen tussen de collectie en waar ruimte wordt geboden aan ontmoeting en informeel contact.

Het hart van het complex bevindt zich ter plaatse van de entree van de bibliotheek waar een nieuwe invulling is gemaakt die zich op een vanzelfsprekende wijze voegt naar het bestaande gebouw en daardoor een vernieuwende monumentaliteit geeft aan de Universiteitsbibliotheek Binnenstad. (Grosfeld)

## **Group A, Rotterdam – The Netherlands**

### **Libraries:**

#### **Cultureel Educatie Centrum, De Bilt (Bilthoven) – The Netherlands on design**

Implementation of a fully integrated multifunctional building, comprising three elementary schools, a day-nursery, a child daycare centre, a library, a music school, and youthcare facilities centre. Senior housing is situated on the upper floors of the building. As the building is operated by eight different user groups, sound understanding of individual needs and wishes of each of them is essential to the design process. The architectural appearance of the building not only has to reflect these individual needs, but should also represent their ambitions in a collective and powerful identity. GROUP A has designed a compact, flexible and inspiring building to serve the different user groups of the CEC, the resulting visitor flows, and their shared facilities. The practical template for the design is defined by clear and functional public-private programmatic zoning, clustered functions, multifunctional spaces and minimum walking distances. A carefully modelled buildingmass containing all functions (user groups) is dictated by daylight-access, orientation of spaces, access, and urban context. Within a publicly accessible building with large numbers of visitors, careful attention should be given to pedestrian flows in and around this building. Clear overview and easy access for the public are essential in this. A generous and collective main entrance for that purpose is recognisably positioned on the urban square, with two functional sub-entrances positioned on the parkside. The main entrance provides access to a, from the square clear visible, semi public innerspace along which the entrances to the various CEC users are grouped. Both spatial layout as well as orientation within the building should by no means cause any confusion, as where the architectural expression is supposed to excite and surprise. Vista's, composition and materialisation have been earmarked by GROUP A as the appropriate architectural means for this purpose. (Group A)

#### **College Apeldoorn, Apeldoorn – The Netherlands 2010**

The Police Academy in Apeldoorn is returned to them by Aterlier Pro and expanded historic building, the former Minor Seminary at Arnhemseweg in Apeldoorn. Hanrath architect has designed the layout for the library and open learning in the atrium of the complex. The emphasis is on meeting with fellow students and colleagues, meeting with media and inviting facilities for independent study in many methods. Monday, September 6, 2010, the new complex was officially opened by Queen Beatrix. (Hanrath)

#### **Bibliotheek Deurne (VVV | Uitpunt library in Deurne), Helmond de Peel – The Netherlands 2010**

Van een duistere bank naar een duidelijke bieb. Hoe maak je in een donker voormalig bankgebouw iut de jaren tachtig een overzichtelijke bibliotheek ? Antwoord: door de collecties aan elkaar te rijgen met behulp van een tachtig meter lange rode draad. Die bestaat uit voorzieningen als zelfbediening, studie,zit- en computerplekken browsebakken en koffie. Zo komt de bezoeker ook op de meest varafglegen delen van de bibliotheek. (Hanrath)

Introduced in 2007 Hanrath architect in the library of Deurne (North Brabant), the **common thread** that the various functions in the building together. Two year later, Hanrath architect of the thread through. By the tourist offices in the library to integrate, can benefit from longer opening hours. Furthermore, the out point, the tourist office and library are now housed under one roof, to the convenience of residents and visitors of Deurne. The common thread is adjusted so that the Tourist | out point within its range. All sales and information contained in the thread. In addition, new storage space created, a showcase and a desk job. Effectively form the Tourist | out point and a whole library. (Hanrath)

#### **Muziek in de bibliotheek, Rotterdam – The Netherlands 2009**

Client: ProBiblio, Rotterdam

Probiblio is a full service provider for public libraries in North and South Holland. Probiblio strives to be a specialist library sector to contribute substantially to the success and quality of the libraries in its service area. Probiblio offers a wide range of products and services to libraries and this can take full advantage of the benefits of scale offers. (<http://www.probiblio.nl>)

Muziek zoeken, bestellen of gewoon luisteren. In opdracht van ProBiblio en samen met de Centrale Discotheek Rotterdam (CDR) ontwikkelt hanratharchitect een concept voor Muziekpromotie in openbare bibliotheken. Het project bestaat uit twee delen: 1. een informatiezuil waarmee mensen kunnen zoeken en bestellen in Muziekweb.nl, de grootste muziekcollectie van Europa; 2. een semi-mobiele zitgelegenheid waar mensen op een ontspannen manier kunnen luisteren naar thematische muziekverzamelingen vanaf een iPod. Inhoudelijk en muzikaal wordt het project ondersteund door de CDR. In 2009 vindt een pilot plaats in verschillende bibliotheken. Bij gebleken succes worden de meubels in productie genomen. Trefwoorden voor de semi-mobilie luisterplek zijn herkenbaarheid, comfort, schaalbaarheid en beveiliging. (Hanrath)

Music in the Library, Music search, order, or just listen.

Commissioned by Probiblio and together with the Central Discotheque Rotterdam (CDR) develops Hanrath architectural concept for a music promotion in public libraries. The project consists of two parts:

1.a kiosk that allows people to search and order in Muziekweb.nl , the largest music collection in Europe;

2.a semi-mobile seating in a relaxed manner where people can listen to theme music collections from an iPod.

Musical content and the project is supported by the CDR. In 2009 a pilot project held in different libraries. With proven success in the furniture production.

Keywords for the semi-mobile sweet spot his familiarity, comfort, security and scalability. Libraries in North and South Holland who wish to apply for the pilot should contact Ellie van der Meer from Probiblio . (Hanrath)

#### **Themabus Probiblio, Rotterdam – The Netherlands 2009**

Client: ProBiblio 23m<sup>2</sup>

A themabus that appeals to the imagination.

A typical example of clever recycling: within the existing infrastructure of the organizing ProBibliobus Hanrath architect a new design. Unlike Bibliobus known that as many books to bring the people, the need themabus only accommodate a limited number of materials. More important is the promotion function. As part of the Children's Book Drive themabus example along the primary schools in North and South Holland to children familiar with the library. The children see a PowerPoint presentation, create jobs and get the opportunity to books and articles on the bus to view. To make themabus Hanrath architect maximum use of existing

elements. The layout is easily interchangeable. The bus can optionally be equipped with a regular or front shelves. The back is magnetic. There is a flat built, operated from a laptop, browse bins and glass display cases. A look at the new themabus and your imagination is automatic in the course of the establishment. Just go for a theme. (Hanrath)

### **Bibliotheek Leidscheveen, Den Haag – The Netherlands 2009**

Client: DOB (Dienst Openbare Bibliotheek) Den Haag, 850 m<sup>2</sup>

Blaue wanden wijzen de weg. De door hanratharchitect ontworpen bibliotheek is onderdeel van een woon-/winkel-complex van AWG architecten uit Antwerpen. Op 850 vierkante meter kan men rustig lezen en comfortabel ontspannen onder het genot van een vers gemaakte espresso, cappuccino of frisdrank. Het filiaal is voorzien van een ruime sortering tijdschriften en kranten. In het Wijkmedia-atelier kunnen bezoekers hun eigen filmpjes maken en monteren. Drie blauwe wanden met balies laten zien wat men waar kan doen: lenen en terugbrengen, klantenservice, informatie, gaming en café. (Hanrath)

Relax with an espresso and a good book Library Leidscheveen is clearly visible on the corner of a residential / retail complex of AWG architects. It is an important facility in the suburb Leidscheveen. Except in books the library also provides a good cafe with freshly made Italian espresso and snacks. There is much room for relaxation and the supply of journals is more extensive. For activities can easily be created room for 140 people at the heart of the library. (Hanrath)

### **Airportcity Library v2 – Schiphol – The Netherlands 2009**

Client: ProBiblio

Het idee spreekt bij veel reizigers tot de verbeelding tijdens een tussenlanding duik je de bibliotheek op het vliegveld in, op zoek naar rust en ontspanning. Hanratharchitect gaat in opdracht van ProBiblio een tweede concept ontwikkelen voor een bibliotheek op Schiphol. De bibliotheek komt achter de douane en is voornamelijk bedoeld voor transferpassagiers. Het moet onderdeel gaan uitmaken van een Cultuurplein aan de Holland Boulevard. In de bibliotheek op Schiphol kunnen mensen die op doorreis zijn tot rust komen, inspratie en energie opdoen en meer komen over Nederland. Het is bijna jammer dat het vliegtuig weer moet opstijgen. Het eerste concept kon niet generaliseerd worden, omdat de plek van het ontwerp niet beschikbaar was. Om dit probleem in de toekomst te vermijden, is het tweede concept onafhankelijk van plaats en variabel in grootte gemaakt. De bibliotheek is het meubel en de meubels zijn de bibliotheek. Hierdoor kann dit concept eenvouding én herkenbaar herhaalt worden op andere vliegvelden. Op termijn kunnen daardoor misschien ook materialen worden geleend voor tijdens de vlucht. Tot die tijd zorgt deze bibliotheek ervoor dat de tussenstop van de transferpassagiers prettig verloopt. Er is een belangrijke rol weggelegd voor Holland-promotie. Wie ook tijdens de vlucht ontspannen will blijven, kann zijn MP3-speler vullen bij de downloadstations in de bibliotheek. (Hanrath)

#### **Airport City Library v2 - Schiphol**

Pleasant stops.

For Schiphol Hanrath architect half designed library concept. The first draft could not be realized because of the design space was not available. To address this issue in the future to avoid the second concept independent of place and made variable in size. The library is the furniture and furnishings, the library. This concept could easily recognizable and repeated at other airports. In time, perhaps a result materials are borrowed for the flight. Until then, this library makes sure that the stop of the transfer passengers comfortable runs. There is an important role for Holland promotion. Whoever wants to remain relaxed during the flight, his MP3 player to complete the download stations in the library. (Hanrath)

### **Kamerbibliotheek Haastrecht – The Netherlands 2008**

Thirty square feet it measures. On Tuesday, September 16 is one of the smallest libraries in the Netherlands, the library room in Haastrecht, officially opened by the deputy of Mr. Culture. Of English Courts sleeve of the province South Holland and Mr. Alderman. Crouwers of the municipality Vlist. The Library Room, located in the Court of Stein in Haastrecht, is part of basic library Krimpenerwaard and was developed in collaboration with the municipality Vlist and Regional Care Consultation central Holland. The Chamber Library differs in some points of an ordinary library. Thus, the Library Room smaller than an average library. The large-scale lending of materials is not an issue. It is possible to consult the House Library catalogs and materials to order, pick up and bring back. For the villagers the House Library will feature a meeting, where citizens' initiatives come to life. It is also possible that local organizations themselves or in conjunction with other activities. You can read, gather information via the Internet, meet others and attend activities. Hanrath architect designed the interior.(Hanrath)

### **Bibliotheek Laakkwartier, Den Haag – The Netherlands 2008**

Client: DOB Hague, 390 m<sup>2</sup>

Vloeiende vloeren. Doordat de vloerbedekking doorloopt over de kasten, lijken ze uit de vloer omhoog te rijzen. Van voor naar achter lopen de kasten op in hoogte. Hierdoor ontstaat er over- en doorzicht en komt er zoveel mogelijk daglicht binnen. De verschillende doelgroepen vinden zo vanzelf hun weg in de bibliotheek. Het voorste deel van de bibliotheek is gereserveerd voor logistiek, ontmoeting en activiteiten. (Hanrath)

Smooth floors.

Because the carpet through the boxes, they seem to rise from the floor. From front to behind the cabinets in height. This results in over-and-through and comes out as much natural light as possible. The different groups are so self their way into the library. The front section of the library is reserved for logistics, meetings and activities. (Hanrath)

### **Kamerbibliotheek Vlist – The Netherlands 2008**

Client : ProBiblio, 30m<sup>2</sup>

Minimale maat, maximaal gebruik. In Vlist komt één van de kleinste bibliotheken van Nederland te staan. De kamer-bibliotheek, op basis van een concept van ProBiblio, met maar dertig vierkante meter. De kamerbibliotheek wordt ondergebracht in de activiteitenruimte van het dienstencentrum voor ouderen, het Hof van Stein genaamd. De collectie bestaat uit een kleine wisselcollectie van fictie en prentenboeken voor kleine kinderen. Daarnaast zijn er veel tijdschriften en kranten aanwezig en staat er een internit pc. Essentiële delen van de wandkast zijn afsluitbaar, zodat de ruimte buiten openingsuren van de bibliotheek ook functioneel blijft. Tijdschriften, kranten en prentenboeken kunnen altijd gelezen worden. (Hanrath)

#### **Library Room Vlist**

Minimal size, maximum use

In Vlist is one of the smallest libraries in the Netherlands to stand. The library room, based on a concept of ProBiblio, measuring only thirty square meters. The library room is housed in the space activities of the service center for the elderly, the Court called Stein. The collection consists of a small change collection of fiction and picture books for small children. There are also many magazines and newspapers and there is an Internet PC. Essential parts of the enclosure can be locked so that the space outside opening hours of the library remains functional. Magazines, newspapers and picture books can always be read. (Hanrath)

## **Bibliotheek Langedijk – The Netherlands 2005 - 2008**

Client: Bibliotheek Langedijk, 1.700 m<sup>2</sup>

Een bibliotheek die niemand over het hoofd ziet. Bibliotheek Langedijk is over twee lagen gevestigd in het gebouw “de Binding” in Zuid-Scharwoude. In het complex van Burger Grundstra Architecten (see also: **Burger**) bevinden zich ook een middelbare school, een muziekschool, een aula en een creativiteitscentrum. De bibliotheek moet dus opvallen. Op de begane grond halen volwassenen hun boeken. De eerste verdieping is voor de jeugd en voor activiteiten. Om de bibliotheek goed zichtbaar te maken in het uniforme gebouw is achter de vide en dubbelhoge gele wand geplaatst. Aan de kant van de trap worden de aanwinsten tentoongesteld. Aan de achterkant bevinden zich de kranten en tijdschriften. 's Avonds wordt deze wand fel aangelicht. (Hanrath)

A library that nobody overlooked.

Library Langedijk is on two levels located in the building 'The Bond' in South Scharwoude. In the complex **Burger Grundstra Architects** are also a high school, a music school, an auditorium and a creativity center. The library must stand. On the ground floor adults get their books. The first floor is for the youth and activities. To make the library visible in the uniform building behind the yellow double-height atrium a bulkhead. On the side of the staircase, the gains exhibited. At the rear are the newspapers and magazines. At night, this brightly lit wall. (Hanrath)

## **Bibliotheek Moerwijk, Den Haag – The Netherlands 2005**

Client: DOB Den Haag, 400 m<sup>2</sup>

It must of course be nice to stay in the library. To achieve the right atmosphere was Hanrath architect Moerwijk in library use of a limited number of major elements: a bank of 16 meters, large reading tables and a wardrobe of nearly 200 meter. This creates more space and flexibility.

More atmosphere in the living room Moerwijk. It must of course be nice to stay in the library. To achieve the right atmosphere was Hanrath architect Moerwijk in library use of a limited number of major elements: a bank of 16 meters, large reading tables and a wardrobe of nearly 200 meter. This creates more space and flexibility. Because the counter functions are incorporated into the wall, the staff more mobile and closer to the customer. Also creates more space for activities. The arrangement provides an overview of the cabinets and a natural separation between quiet and busy areas. (Hanrath)

## **Hans van Heeswijk Architecten, Amsterdam – The Netherlands**

<http://www.heeswijk.nl>

**Libraries:**

### **Gemeentehuis en Bibliotheek Heerhugowaard, Heerhugowaard – The Netherlands 2003 – 2007**

Total gross floor surface 19.000 m<sup>2</sup>. Extension and complete renovation of the existing town hall and development of a new public library and public underground parking under the city square. Total gross floor surface 19.000 m<sup>2</sup>. Commissioned by Municipality of Heerhugowaard

The center of Heerhugowaard, 30 miles north of Amsterdam, is changing dramatically. Central to the metamorphosis is a new city plaza right next to the Town Hall which dates from 1982. A new wing with information and social services for the public opens up the building to the outside world and invites it to come inside. A busy urban department store is created by interweaving public functions, where various services remain recognizable. The existing brick buildings are joined by two distinctly recognizable wings: a municipal department, clad in bluestone and a library with a wooden exterior. The 30 feet high entrance hall provides spatial coherence. An ambulatory around the adjacent courtyard connects the existing cube of the meeting hall with the new free-form spaces containing service counters, the book library with cafés for reading and internetting, the art lending library and the wedding room. A cupola topped with a mezzanine offers a splendid view of this new heart of Heerhugowaard. (Heeswijk)

### **Cultureel Educatief Centrum- (Ganzenhoef Cultural & Educational Center Ganzenhoef), Amsterdam Zuidoost – The Netherlands 1999 - 2005**

Building block over 6 layers with covered atrium and an open patio. Housing on the top, educational centre in the middle and public facilities on the ground floor, parking underground. Gross floor surface 19.500 m<sup>2</sup>. Commissioned by SFB vastgoed bv, Amsterdam At the beginning of the 90's, twenty years after its conception, the southeastern extension of Amsterdam needed a complete overhaul. The aim was to replace too much of the same by more variation. New low-rise housing is taking the place of apartment buildings and, most importantly: much-needed facilities are being added. Culture to get to know each other better, education to get ahead in the world. As open as possible. CEC Ganzenhoef offers just that. Functionally, it combines a teaching center with a place for various cultural activities. Spatially, it's accessible and transparent. And from an urban planning viewpoint, it's an example of compact land use, with a combination of housing on top and cars parked underground. Outside, the crescent of the south wing embraces and shelters the green courtyard of the preserved apartment building. Inside, the atrium opens up to daylight above and welcomes neighborhood people. What appears to be an aloof building from a distance, turns out to be accessible from closer up. (Heeswijk)

### **Art Lending Library, Breda – The Netherlands 1989-1991**

Original gateway building by Laureys Drijfhout, dating from 1643

Gross floor surface 3.500 m<sup>2</sup>, Commissioned by De Beyerd, Breda

It all started in 1987, when the Art Centre De Beyerd in Breda needed an annex in the courtyard to create a new entrance lobby. This addition also provided better circulation within the building, allowing a more flexible use of space. From that moment on, a number of commissions followed for adaptations, furnishings and interior designs for this Cultural Centre. The most fundamental of these was the construction of an art lending library on an adjacent lot in 1991. Seen from the street the ground floor is completely visible. A light well with two staircases separates the new building from, and at the same time connects it to the 17th century Renaissance façade next door. The outer wall of the exhibition rooms on the two upper levels facing the street is made of translucent glass, framed in 32 steel rectangles. To the outside world, this centre presents itself as an abstract and minimal work of art. The upcoming transformation of De Beyerd into a Museum for Graphic Design incorporates this extension. (Heeswijk)

## Architectuurstudio HH (Herman Hertzberger) Architects and Urban Designers, Amsterdam – The Netherlands

<http://www.ahh.nl>

### Libraries:

#### Utrecht University, New Building Faculty of Science (Library), Utrecht – The Netherlands 2006 – 2011

The new Faculty of Science is located as a freestanding building on a prominent site of the University Utrecht campus. Approximately half of the building contains laboratories and the rest provides education and work space on various and open floors, grouped around the central hall. This atrium-like space is directed to the outside in a covered outdoor area with an open classroom, where there is an opportunity of open classroom, where there is an opportunity of open air events. The “oval” freestanding building, is an island on this area, is on the border between the inside and outside and provides all opportunities for meetings, which all contribute to social cohesion. (HH)

<http://voutu.be/wO4xUSWa7NI> (Flashmob tijdens opening)

Utrecht University Faculty of Science late for her to realize a new building at the Uithof. The new building replaces the FAFC Wentgebouw among others, also known as the “punch card”. The new building comes at a prominent place on campus, at the corner of the Leuvenlaan and Universiteitsweg. HH Architecture Studio is responsible for the design, construction technology for the construction Pieters. The building contains classrooms, laboratories and flexible work spaces and the shape of a horseshoe enclosing a central hall. This hall is covered, so a five-story atrium is created. In the hall as a separate element of a meeting designed building, where central facilities are.

#### Floor Flooring

The office and laboratory areas in the building have a traditional building constructive. The wings consist of a column grid of 7.20 m by 7.20 m with a flat slab floor. The columns are against the walls to put in which a relatively slender structural floor possible. This guarantees a great flexibility. The floors in the atrium and stabbing fields with flexible workplaces. These islands provide great sight lines.

#### Cantilever

On the entrance side of the building is an area of 30 by 60m as many column kept. This zone is supported by two concrete cores within the perimeter of the building standing. The construction of the five floors above the entrance kraagt lying all around on the ground. The ceiling goes up slowly. On one side of the core is one storey high, wide concrete wall designed as a bar works. On the other hand, a height of only 2m available. Four of the five floors are suspended from a high floor truss on the top floor. This is the technical layer where the diagonals of the truss is less disturbing.

#### Facade Construction

The facade of the Universiteitsweg is designed as a two-story steel frame. The facade design is cantilevered steel beams back to the nuclei. The cantilever trusses with steel tie rods for biasing the fixed nuclei. The tie rods are the core walls around at the back of the nucleus where to draw the balance to make the weight of the 4m high concrete beam. To the deflections of the cantilevers to reduce tension on the rods are placed. (<http://www.dearchitect.nl>)

#### Noordelijke Hogeschool Leeuwarden, Leeuwarden – The Netherlands 2010

The existing building Bonnema is a late example of structuralism . Hertzberger, one of the most prominent architects in this movement, chose to leave the building intact. Instead of blocks to add, was a 30,000 square meter ring placed around it. Seen from above is the two-story building a frame around the existing building. In places where an entrance “underneath” to the courtyard is created, the existing section also visible from the side. The expansion is flexibly designed, focusing on new and freer forms of education. Because the support structure is inserted into the walls, column-free space could be left. This creates opportunities for a freer arrangement of facilities. These include everything from flexible work places, landscapes and study lounges. The old building is not completely unaffected. In the labyrinthine corridors is more order made by two mutually perpendicular axes to turn it into main streets. These streets are also connected to the building. In the old building cross each other in the central area, which has a skylight. With the renovation and expansion facilities are also added as a theater and a new library and bicycle. The construction has lasted three years and 89 million euros. (<http://www.architectenweb.nl>)

...Although the initial intention was that the old Bonnema part would only be affected to a minimum extent, this inviolability gradually turned out to be illusory. It was clear right from the outset that the central space in the Bonnema building would have to form the heart of the now double-sized complex, purely due to its position near the large lecture hall, the library and the kitchen. A mixture of old and new became essential, if only to facilitate the amenities for the greatly increased number of users. Moreover, the intimacy of Bonnema threatened to become almost stifling as a result of the contrast with the new building with its walls completely of glass. Thus arose the need for more openness, and all resources were deployed to give the limited available space as much light and air as possible. A considerable hole in the roof with a simple glass covering brought great relief. The aim was to adapt the existing building to new insights, yet to alter it as little as possible. It is startling to experience the amount of concessions you have to make to respond to the changes of insight that have arisen within the short space of twenty-five years and have now made the building, which undoubtedly satisfied all the scrupulous requirements then, entirely obsolete. The conclusion must be that in our day and age, in which insights change so rapidly and radically, there is no future for buildings that borrow their architectonic form from the expression of different functions or the programme of requirements. (Hermann Hertzberger, Transformation and Extension, in: Hogeschool Leeuwarden, 010: Rotterdam 2011)

#### CODA (Cultuur Onder Dak Apeldoorn) – museum, municipal archives and library, Apeldoorn – The Netherlands 2000 – 2004

The periphery of Apart was defined by the building lines of the city block in the making, so that the existing “House of Fine Arts” is enclosed in something resembling a courtyard. The stairs fronting this fine-arts house were drawn into an undulating indoor landscape covering the museum space below, half of which is tucked underground. Programm-wise the building is in fact a multiple-occupancy building which besides museum accommodation includes an extension to the adjoining public library plus the municipal archives, with a reading room, offices, study spaces and a restaurant. All these components face outwards through an all-glass skin which stresses their accessibility as well as giving a view through to the courtyard. This transparent basement cum display case is topped off with a hermetically sealed box housing the municipal archives. Entirely without fixed walls, the large museum space is for the most part sunk beneath the courtyard where is curved roof makes for a rippling street surface. (HH)

#### Library Breda and Centre for Art and Music De Nieuwe Veste, Breda – The Netherlands 1991 – 1993

The complex sits for the most part on a large inner courtyard, with a small garden crafted round a protected group of rare mulberries. It is an amorphous space left between the surrounding existing developments and oversailed by a large roof which, on the side to the street and following the original curving building line, reinstates this characteristic curve if only in the roofline. Set beneath this large roof on the upper level is the Center for Art and Music, a sort of elongated box suspended above the undivided library space covering the entire surface of the available site. The unique value of these trees informed the spatial configuration of

the entire design. More than that, it was the original inspiration for the chosen structural arrangement of tree-like columns allowing the greatest possible intervening space, a distance that is reduced in the ceiling to accommodate spans more favourable to the lightweight steel construction of the roof. (HH)

## **Hootsmans Architectuurbureau, Amsterdam – The Netherlands**

### **Libraries:**

#### **New Courthouse and Renovation of the old Courthouse, Zwolle - the Netherlands 2004 - 2014**

Building Surface: 16.420 m<sup>2</sup> new and 11.725 m<sup>2</sup> Conversion, Client: Rijksgebouwendienst

### **Literature:**

Cobouw, no 62, April 1, 2009

De Stentor, June 26, 2008

De Stentor, June 20, 2008

de Architect, January 2007

SMAAK, no 28, October 2006

The existing courthouse in the city of Zwolle designed by architect Kruger dates from 1964. As soon as the mid 1980s there arose a need for extension. After many years of successive plans a new start has been made at the end of 2004 which is now under construction. Our design comprises a new court building and the renovation of the old one. The new building is located next to the old one; at the ground floor they are spatially connected. In contrast with the closed and introverted features of the Kruger building, the new building is transparent and accessible, with its public spaces directed to the surroundings. Its form is determined by the existing urban fabric, directions and boundaries, as well as by the heights and positions of the trees. In this way an urban coherence and new views are created. The new building consists of four programmatic layers. The first one contains an underground parking of two floors connected on the -1 floor to the old parking. The second layer is the ground floor with the entrance zone and facilities like storage, archive, prison cells, interrogation rooms and rooms for technical facilities. The old building's entrance zone is connected here to the new visitors entrance. The third layer consists of a two floors layer with a corridor (public waiting room), courtrooms, council chambers and a library. The upper layer consists of three floors with office rooms. In line with its function each layer has its own type of construction, installation and materialisation. (Hootsmans)

## **IAA Architecten, Enschede – The Netherlands**

<http://www.iaa-architecten.nl>

### **Libraries:**

#### **Saxion Hogescholen Bibliotheek, Deventer – The Netherlands Commissioning 2008**

The study area which is on the first floor of Saxion Deventer was transformed into a space where a library, information center and Open Learning Centre have merged. It is a completely new design, in which a small concentration of cells and Back Office are included. And some are specially made furniture, including a fully adjustable front desk and a series of seating elements. For tapestry of IAA has made specific designs. (IAA)

#### **Kulturhus Olst, Olst - The Netherlands 2005**

The kulturhus Olstad is part of the town Olst. In one village, intricate setting IAA has designed a building that despite the voluminous program, in scale and size compatible with its context. Through the use of a certain scale resources, such as bay windows and dormers, it varies with the eaves height and a variety of window openings, add the building in its environment. The two main volumes are two layers with a hood and contain a wide range of program elements, ranging from theater, ballet room, lunchroom trade shop, library, copy shop to meeting rooms and music rooms. Besides a number of regular users, approximately 35 organizations will use the Kulturhus. Between the two volumes is a spatial hall designed with voids and a street light, the public counter of the municipality and such on the first floor foyer of the hall. Multifunctionality, flexibility and transparency play an important role in this building. Accordingly, we used flexible panel walls and glass folding partitions for multi-purpose spaces to make. In addition, the various functions do not interfere in some areas and additional noise features installed. (IAA)

#### **Berechja College, Urk (Prov. Flevoland) –The Netherlands 2001**

Achieved is an extension of the Berechja College Urk, amounting to around 1,600 m<sup>2</sup>.

The expansion includes a new pupil entrance with walk through wardrobe, a local block and a new teaching space. In addition, against the existing existing school a new library added that a whole with The auditorium is created. The design takes into account a possible future expansion. (IAA)

#### **Libraries:**

#### **Visser 't Hooft Lyceum, Leiden – The Netherlands 2008**

The recent extension of the Visser 't Hooft Lyceum, together with the previously designed by our office houses an ensemble, which is in scale and appearance differs from the mainly single-family existing neighborhood.

The expansion includes theory classrooms, subject rooms, a music room, a crafts room and a bicycle cellar. The construction and renovation of the existing school with the necessary adaptations to recent educational reforms. The design has been a constant interplay between the development of the educational model and design of the new learning environment. four learning areas are literally the backbone of the school: two domains, language, domain, People and Society Science and a domain. These are housed in a two-storey building that is the core of the new school. Each learning area consists of three classrooms and an instruction called learning plaza. The leather squares are equipped with workstations for group work and individual work. The property is complemented by two science labs. By a rearrangement of the program in the low-rise occurs on the ground floor space for creative subjects. On either side of the auditorium with stage facilities are equipped library and subject rooms for drama and communication courses. Drawing and local crafts have direct access to the existing patio. The new staff room and the new gym form by this procedure is no longer a separate domain but are linked to education. The south facing facade alternately wooden louvers and screens to provide, and special glasses to apply a high light yield guaranteed. Daylight provides illumination in dark days for completion. The renewal of the school for 660 students plays an important role in achieving such a compelling character today in secondary education is required. By the school a clear face on the street creates visibility in the neighborhood. The interiors of the learning areas to focus on the water creates an increased visibility of the educational activities and openness to the neighborhood. The finish of the walls consist of brick, wooden windows and aluminum sliding-glass door windows. Use of color and design reinforce the difference between the different classrooms. (<http://www.architectenweb.nl>)

#### **Library / Study Area Faculty of Veterinary Medicine, Utrecht – The Netherlands 2008**

Interior design: architects Kingma Roorda, m<sup>2</sup> gfa number: 3592 m<sup>2</sup>, number of floors: 2

The entrance of the study area is formed by a wide oak staircase, which is part of the establishment of the entrance hall. A large reading table and a second stage, which allows you to watch the library on the floor, form a welcoming gesture for entering the study landscape. The group rooms are mainly located on the facade. Workstations are located in the vicinity of the working spaces. Study areas and study rooms are located in the lee of the stairs to the library. The library collection is located on the floor. Existing or new skylights provide this level of daylight in the middle of the room. Bookcases are interspersed with glass cabinets and form a filter between the different areas, ranging from see spots, quiet places to study areas. The study areas and check points are grouped in different ways: in groups of four or long rows. The working group rooms and offices are located on the wall here. (Kingma)

The starting point for the renovation is that the whole building is abandoned after 10 years. A reallocation of functions within the existing building needs during this time expressing a newly developed model of education. Concentration of teaching rooms and laboratories forms the basis of this model. Landscape study and library, together with the lecture for the first few years the core of the faculty. In the later years of the study shifts the attention of students towards laboratories (in building construction) and clinics (across the underlying ground). The design of Kingma Roorda architects is based on a study area / library combined with group rooms on two floors. The working group with widely varying occupancy rooms are concentrated on the ground floor, the rest are on the floor. The private individual study areas are grouped together and spread over ground and floor. The study sites are grouped in a variety of ways to create different atmospheres. The entrance of the study area is formed by a wide oak staircase, which is part of the establishment of the entrance hall. A large reading table and a second stage, which offers a view of the library on the floor, form a welcoming gesture before entering the study landscape. The working areas are mainly located on the facade. Workplaces are located in the vicinity of the working spaces. Study rooms and study rooms are located in the lee of the stairs to the library. The library collection is on the floor. Existing or new skylights provide this level of daylight in the middle of the room. Bookcases are interspersed with cabinets to form a filter between the different areas, ranging from check points, study areas to quiet areas. The study areas and check points are grouped in different ways: in groups of four or long rows. The working group rooms and offices are located on the wall here. Materialisation color and emphasize the character of different areas and reinforce the desired atmosphere (by lighting, noise, isolation, openness). There is the materialization pay more attention to acoustics, lighting and lighting of the room. Stairs, parts of floors and walls are made of Slavonian oak. The walls on the ground floor are made of small parts on the floor slats are used. The parts and blades are spaced from the wall, to improve the acoustics. The gap has damping material. The narrow

parts return to the topical oak ceilings. The color of the floor is a derivative of the color of the wood. The use of color respond to the existing building and reflects the history of the building. Coffered ceilings remain visible and concrete floors are gravel where needed aangeheeld. The existing structure is painted in a hue derived from the original color. The color of the interior of the cabinets and counter the 'found' color of the original desk. The floor and walls of the study areas turns this color again in an enhanced shape. #### **Bibliotheek, Open Leercentrum en Appartementen, Stadskanaal, Groningen – The Netherlands 2007**

9.000 m<sup>2</sup>

De locatie ligt midden in het centrum van Stadskanaal. Uitgangspunt van het ontwerp is dat bibliotheek, open leercentrum en appartementen samen één object vormen. De woontoren vormt door zijn hoogte een duidelijk herkenningspunt in de omgeving. Eenheid in vormgeving moet er voor zorgen dat de woontoren de identiteit van bibliotheek en open leercentrum versterkt: die toren, dat is de bibliotheek! Het gebouw is als een rotsachtige sculptuur vormgegeven en verandert in een paar sprongen in hoogte van 1 tot uiteindelijk 15 lagen. Het laagste punt grenst aan de voetgangers-/fietsroute, het hoogste punt bevindt zich op de hoek van het generaal Mazcek plein en de Europalaan en is gericht op het centrum van Stadskanaal. Ramen zijn als gaten in de massa. De geschaafde steen, met veel kleur- en structuurnuance, versterkt de rotsachtige uitstraling van het gebouw. (Klein)

#### **Gemeentehuis / Bibliotheek, Hof Van Twente (Goor), Overijssel – The Netherlands 2006**

Inpassing.

Het nieuwe gemeentehuis voor de Hof van Twente is gesitueerd in het centrum van Goor. Het gebouw is ingevlochten in het bestaande stedelijke patroon. In dat stedelijk patroon komen grote schaalverschillen voor. Aan een zijde ligt het gebouw aan een grote open ruimte van 80 bij 80 meter, aan de andere zijde grenst het aan een voor Goor typerende winkelstraat met panden van twee tot drie lagen met een kap. De bebouwingsvlek heeft een zeer gelede vorm, met een grillige contour en uitlopers tot in de kleinste schaalgebieden van de omgeving. Door de lokatie loopt ook nog een nieuw te bouwen stedelijke doorgang, die het doel heeft de looproutes in het kernwinkelgebied te bekorten en de publieksstromen te bundelen. In het midden van de bouwkael is een hoofdmassa ontworpen in de vorm van de letter U met zo lang mogelijke ontwikkelingslijnen voor de interne organisatie. Naar de periferie van de locatie ontwikkelt het gebouw zich naar de schaal van de planranden, waardoor dit grote gebouw zich ontspannen in de omgeving nestelt. Aan het plein ontwikkelt het gebouw zich tot zijn maximale hoogte van 16 meter. In een stedelijk venster van 16 bij 20 meter toont zich hier de hal van de burgers, die in dit gebouwontwerp centraal staat.

Programmatistische flexibiliteit.

Bij een gebouw dat is ingevlochten in een fijnmazige bestaande stedelijke structuur bestaat het risico dat het caleidoscopische exterieur een interieur voortbrengt met vele discontinuïteiten, waardoor het gebouw niet als een doorlopend geheel gebruikt en beleefd kan worden. Het is van het grootste belang dat het gebouw als het onderkomen van een organisatie beleefd wordt en door de gewenste stedenbouwkundige geleiding geen insnoeringen kent, waardoor domein-eigen culturen zich ontwikkelen, die zich vervolgens kunnen vervreemden van het gezamenlijke doel. De vele beeldfacetten van de stad omzetten in een heldere ononderbroken interne organisatie, zonder verlies van de verrassingswaarde van de stad, beschouwen wij daarom als de belangrijkste opgave. Bij het gemeentehuis voor de Hof van Twente hebben we de aanspraken van buiten en van binnen met elkaar verzoend door in het midden van de kavel een 80 meter lange 'ruggengraat' te ontwikkelen (de bodem van de U) met alle faciliteiten en kantoren daarin. Zodoende kon een lang aaneengesloten werkplekgebied worden ontworpen met een minimum aan indelingsverlies en een maximum aan indelingsvrijheid. In de loodrecht op de ruggengraat ontwikkelde uitlopers versmelt het gebouw met de omgeving.

Hoofdoepzet.

In hoofdlijnen bestaat het gebouw uit een een plattegrond in de vorm van de letter U. Door het pasmaken van het gebouw in de omgeving bevat deze U verschillende uitlopers die haar verankeren in de grillig gevormde randen van de bebouwingscontour.

In de U bevinden zich de werkplekken voor de ambtelijke en bestuurlijke organisatie. De open zijde van de U is naar het grote plein gekeerd en is dichtgezet met glas, het eerder genoemde stedelijke venster voor de hal van de burgers. Dit venster is het meest in het ooglopende bouwdeel aan het plein. In feite is de hal voor de burgers de beelddrager geworden voor het gemeentehuis. In de U is, vrijdagend, een veelhoekig bouwlichaam geplaatst. Hierin zijn alle vergader- en overlegplekken ondergebracht. Dit volume is bijna volledig van glas waarvoor een oregon pine lattenscherm (louvres) is aangebracht. In de avonduren, als het licht brand is dit overlegcentrum over een grote afstand op het plein zichtbaar als een reusachtige lampion. Vanuit de drie zijden van de U kan middels glazen bruggen het centrale overlegcentrum vanuit alle hoeken bereikt worden. De raadzaal heeft een bescheiden plaats in een van de benen van de U. Aan de zijde van de hal voor de burgers is die voorzien van veel glas. Zowel de raadzaal als de ruimten in het overlegcentrum worden ook gebruikt door theater en conferentiecentrum de Reggehof. Opmerkelijk aan de hoofdropzet van het gebouw is dat, gezien van buiten naar binnen, de werkruimten van de ambtelijke en de bestuurlijke organisatie, de overlegplekken en de hal voor de burgers met de baliewerkplekken en de informatie en documentatieruimten als het ware in elkaar genesteld liggen, bijna zoals de rokken van een ui. Door deze opzet is de grenslijn tussen de verschillende functiegroepen zo groot dat de kans op gezochte en spontane uitwisseling maximaal is. De 'schillen' zijn voorzien van veel vensters van verschillende vorm en formaat en met en zonder glas zodat er zicht is in aangrenzende domeinen zonder dat de beslotenheid van het eigen domein verloren gaat. De transparantie in dit gebouw is daardoor veeleer een subtiel spel van verbergen en onthullen dan een te open expositie van het besloten werkveld in het publieke domein. Over het algemeen geld, dat als je kunt zien, je ook gezien kunt worden.

Combinatie met andere functies, synergie.

In dit gebouw zijn een gemeentehuis, een bibliotheek, een politiebureau en een zorginstelling samengebracht. Ook wordt het gebouw gekoppeld aan een theatergebouw, waarvan de functies voor het gemeentehuis worden benut. De raadzaal is zo gesitueerd dat die als kleine theaterzaal door het culturele centrum gebruikt kan worden, het restaurant van het gemeentehuis loopt door in de foyer van het theatergebouw en de keukenvoorzieningen liggen daartussenin. De politie heeft een loket in de frontoffice van het gemeentehuis en de bibliotheek is met een brug over de passage verbonden met de hal van de burgers. De grote zalen en vergaderruimten in zowel gemeentehuis als theatergebouw worden wederkerig benut om op die wijze een bijna doorlopende programmering voor die ruimten te bereiken. De looplijnen door het gebouw zijn zo gebundeld dat de kans op toevallige en spontane ontmoetingen wordt bevorderd. De verbinding van theater- en evenementencentrum De Reggehof met het gemeentehuis. De beglaasde doorgang bestaat uit grote deuren waardoor een bevoorradingsauto (bierauto) het plein kan bereiken tijdens de Goorse school- en volksfeesten. (Kristinsson)

#### [Gemeentehuis Dantumadeel, Dantumadiel – The Netherlands 1999](#)

New town with a library of Dantumadeel to Damwoude. The situation on the former site of Public Works in Damwoude, amid a residential neighborhood, prescribes that layer should be built. The space for citizens is placed between the administrative offices and the administrative wing. The shape of the hall and offices is a large contact area possible between the citizen and the general public of the civil service. (Kristinsson)

<http://www.liag.nl>

#### **Libraries:**

#### [Hogeschool van Arnhem en Nijmegen, FED Faculteit Educatie, Bibliotheek, Nijmegen 2013](#)

The design for the new building answers to the sustainability ambitions of the university of Arnhem and Nijmegen. The building reacts to its context and transforms it. The result is a powerful and independent form, which enhances the environment around it. The human scale in this environment will be reintroduced and the new building will take into account of this environment. The new building for the Faculty of Education will be the final phase as well as the new face of the master plan for the Campus Nijmegen. The building will mostly have green facades in combination with glass that ensure a comfortable indoor climate and exceptional amounts of daylight in the building. On the south side of the building the sunlight will be controlled by the use of louvres. By making good use of the present height differences on the site, an artificial landscape can be created where 'rocks' with special functions are placed. This landscape runs from inside the building through to the outside. The 'roofs' of these rocks will be used as study landscape. Wide staircases function as galleries. The two floating educational wings above the landscape are connected by an atrium that provides for generous amounts of daylight and interaction in the building. The building will mainly be used for educational purposes and has a total size of 14.000m<sup>2</sup> usable floor area. Due to the atrium, the whole structure is visible at a glance. On all levels the corridors can also be used as study areas. The students can decide how and where they want to study. Sustainability on all levels. All used resources will serve multiple purposes to increase the durability of the structure. The whole construction of the building for example is one large heat exchanger, which holds all of the buildings energy that is present at that time. By using an innovative combination of the ventilation system and the conditioning of the building, a significant amount of energy can be saved. Durability has been taken into account at all levels: water usage, material usage, air quality, acoustics and visual comfort are the most obvious examples. The well being of the user and flexibility of the interior are fit out the foremost design points. The design meets the highest requirements of durability for buildings that is required in the brief by the HAN. LIAG finds it especially important that the sustainability leads to a healthy in- and outdoor climate. The building will eventually be a positive addition to the campus in biodiversity, energy, health and clean air. The structure will be a healthy building, which will result in a pleasant environment for staff and students. LIAG developed a master plan for the campus of the HEAO Arnhem and Nijmegen, which forms a part. In that building are also the Board of Directors, the auditorium and the central library established. Typical of the complex is 180 meters long central atrium, surrounded by alternating theory classrooms and offices. In the void "hang" glass study rooms for project work. The entrance, the library and auditorium literally stab as a wedge to go through this education. (LIAG)

#### [Faculty of Engineering \(Library\), Hogeschool Arnhem Nijmegen – The Netherlands 2009](#)

9.100 m<sup>2</sup>

The building is the 2nd phase of the new master plan according to which the entire South Campus will be modernised. The master plan contains a six phase plan for completely replacing the old Technical College complex from the 60's with new buildings. The campus will then consist of six, four storey pavilions that will be connected by two storey buildings in which communal functions can be housed. Parking will be under the buildings so that a characteristically green landscape will be created, a natural extension of the Presikhaaf Park. The Engineering department is a fusion of Mechanical Engineering, Industrial Product Development and Electrical Engineering. The main building consists of four storeys with the lower two floors, similar to the adjacent department of Architecture and Civil Engineering, consisting mainly of glass with the two floors being of a more closed character. The façade of the building consists for 95% of steel and glass reflecting the technical character of the faculty. The remaining 5% is formed by diagonal wooden window frames on the lower two floors creating a visual link with the trees in the immediate vicinity.

The lower two floors house the workshops and laboratories. Cross pollination between the various departments is stimulated by the open and transparent nature of this part of the building, making what the students are doing and learning inside visible on the outside. By locating two enormous conservatories on strategic corners of the lower building the faculty is given 'display windows' to display itself and the work of its students. A large organic 'study landscape' is created in the atrium between the ground floor and

the first floor, a bit below the level of the first floor. By making this study landscape a bit lower it forms a link between the two levels. There is a more direct link with the ground floor as the students can see the workshops and everything going on down there. The upper two floors mainly house classrooms for theory and workplaces for the lecturers. By making a patio here covering two floors it was not only possible to create a very efficient design but it is also possible to bring daylight, via large skylights, into the heart of the building. In adherence to the master plan for the whole campus, the building is raised half a storey to create a semi-sunken parking garage. To enhance sustainability a compact building was designed with relatively little façade area in relation to its surface area. The structure of the building is composed of concrete floors and columns in a framework 7800 x 7800 mm, making the layout of the building very flexible. A different layout can easily be created if required in the future. Durable materials that require little maintenance and have a long lifespan were of course used. (LIAG)

### Faculty Economic and Management (Library), Hogeschool Arnhem Nijmegen, Nijmegen – The Netherlands 2009

approx. 17.500 m<sup>2</sup> (in two stages)

In 2006 LIAG began the design of the FEM-building. The existing LIAG faculties on the HAN-campus in Nijmegen grew out of their housing places and expansion in short term was of great importance to keep answering to the need of good educational areas. The emphasis in this project lies on an open educational building where there can be a lot of interaction between the users. In the entire building mass cantilevers, constrictions and wall deflections have been applied that react to the existing buildings in the area. With this design, a building is created that continuously surprises and reacts to the adjacent faculty of Health, Behavior and Society with its total concept. The light blue facade of steel creates a cool icy landscape of the building on the campus of Nijmegen. The sustainability of the building The environment has been used as a base for the development of the HAN building. There has been chosen for a compact design with a durable climate control. It is a sustainable building. Lights and escalators will be using presence detectors. The furniture's are made of materials that belong to the least environmental damaging category. The entire plan in the final-phase (final acceptance in spring 2011) consists of 2 levels of underground parking and 3 floors above ground with a total magnitude of approximately 25.000m<sup>2</sup> usable floor area. The design of the building has been particularly well accepted by the wealth committee of Nijmegen. (LIAG)

### Keizer Karel College Amstelveen, Amstelveen – The Netherlands 2008

3.287 m<sup>2</sup> (extension)

The Keizer Karel College in Amstelveen (senior general secondary education (HAVO), university preparatory education (VWO and Gymnasium)) is a sister school of the Alkwin College in Uithoorn. After LIAG had carried out the extensions of the latter to the full satisfaction of the client, LIAG was commissioned to do the extensions for the Keizer Karel College. The building is a tidily designed school building with two floors and a number of inner courtyards or patios. An interesting point was that there were entrances separated by a patio. Having run out of space the school needed to expand. After a model study the choice was made to extend the north side of the existing building. The new wing was connected to the existing building by covering one of the patios. This joined the two entrances with an indoor 'street'. The indoor street has become the new heart of the school, containing a recreational area, the study square, and with the passageways for the rest of the school leading off from it. The school building is close to a highway exposing it to a high level of noise and fine dust, which means that the windows may cannot just be opened. LIAG developed a special kind of window with an extra pane placed at 50cm from the façade which wards off the noise and fine dust from the highway and makes it possible to open the windows for the necessary ventilation on the north facing façade. The extension has a bright colour scheme giving the school a cheerful atmosphere, a place where students like to hangout. This is apparent from the fact that even before final delivery of this new wing the school requested a further extension on its roof. The building application for this extension has been submitted to the municipality. (LIAG)

#### Bibliotheek Zwanenveld, Nijmegen – The Netherlands 2009

1.200 m<sup>2</sup>

Meeting place for young and old course, lending books to the core of a library, but it is now no longer the only activity taking place there. Reading the daily morning newspaper or a round of surfing the web is just as popular. Libraries are more and more venues for young and old. In a few months Nijmegen Library, Zwanenveld location, say in this matter. The existing, outdated, cluttered interior has been transformed into a vibrant new environment. Clear structure in the old division of the library was little more structure to explore. Including through a complicated entrance and a disproportionate circulation desk was looking statement. Reducing structure was one of the main goals of Luijten | Smeulders | architects. And the separation of active and passive angles and places, because that creates peace. Luijten | Smeulders | architects created a central square where a group meeting a private island is located. In these elements, visitors can read a book or just computing. Target each audience has its own place in the new library. Children's literature, for example, at the back. Young people are simply not feel all day to be monitored. Near the entrance is a reading café positioned for a lively look outward to create. Also, the books sorted by theme and each issue gets its own atmosphere and experience. Luijten | Smeulders | architects with the design of the Nijmegen library created a place where young and old feel at home. (<http://www.architectenweb.nl>)

### **Libraries:**

### Amsterdam University College (Universiteit van Amsterdam (UvA) en die Vrije Universiteit (Libravy), Amsterdam 2010 – 2012

Cross fertilization of ideas and talent:

Science Park Amsterdam, the international knowledge centre in the Watergraafsmeer neighbourhood is the new home for the Liberal Arts and Sciences program at the Amsterdam University College. Science Park is located in the eastern part of the city, close Amsterdam's historic seventeenth-century city centre. In 2012, 900 international students will enter the new school. Surrounded by other science buildings, the Science Park provides an interesting environment for the AUC with optimal opportunities for cross fertilization of ideas and talent. The park has an urban character in which buildings, landscape and public space are strongly intertwined. Science Park encompasses a program of 500.000 m<sup>2</sup> in Total including office buildings, laboratories and educational facilities, hotel, conference facilities, sports and cultural programs, restaurants and housing.

Roof sculpture:

The new AUC will be located next to the Anna Hoeve, a historic farmhouse, which is surrounded by mature trees. Together, they form the new entrance to the Science Park, which is accessible from both the city and the new train station. Mecanoo designed an inviting sculptural building that matches the design language and materialization of the Anna Hoeve, creating contrasts with the more business like architecture of the Science Park. The building's characteristic zigzagging roof creates a strong sense of identity for the Amsterdam University College. The faculty offers an optimal environment to study in. Daylight enters deep into the building from an attic where the more contained, quiet study areas and library are housed. The AUC is an inspiring and sustainable building for the students and their teachers. It is a place where one can study, learn, debate, work together and relax; a house where talent, ideas and ambitions come together.

Sustainability:

The AUC is a sustainable building. The GreenCalc + score is set at a building index of 200. The compact building mass creates an optimal ratio between wall and floor surface and the relationship between open and closed surface in the facade is optimized. The building uses thermal storage and concrete thermal massing. The large roof area has moss cover that provides insulation and water storage. Sensors which detect movement and daylight monitors are also applied throughout the new building. (Mecanoo)

### Cultureel Centrum Canadaplein en Theater de Vest, Alkmaar – The Netherlands 1999 – 2000

Mitarbeiter: Anne Busker, Aart Fransen, Toon de Wilde, Alfa Hügelmann, Robin Kerssens, Vanessa Wegner, Rogier Laterveer, Hank 't Wout, Jeroen Luyckx, Jasper Kaarsemaker, Pieter Spoelstra, Christian Quesada van Beresteijn, Gareth Williams  
Projektleiter: Michel Tombal, Henk Döll, Bauherr: Stadt Alkmaar, Objekt: Theater de Vest, Alkmaar, Planung: 1998-1999  
Projektdatei Nutzfläche (renoviert) NF: 4175 qm Brutto-Rauminhalt (renoviert) BRI: 15840 cbm, Baufertigstellung: 2000

Transitions

The Canadaplein in Alkmaar borders the public space surrounding the Grote Sint Laurenskerk (Great Saint Lawrence Church). Initially, the three walls gave the square a closed character. With the construction of the new Cultural Centre, featuring a museum, a library and a music school and with the extensive renovation of the Theatre de Vest, a restaurant and a grand café, the area has been transformed into a lively cultural square. The design brief was defined as the creation of transitions, from public to private and from open to closed. The cultural facilities must be easily accessible and inviting to visitors without compromising the building's function. The open square transforms in several stages, leading into the enclosed atmosphere necessary for music practice, reading, visiting the theatre or an exhibition.

Roof lights

An existing building from the 1970s had to be incorporated into the new Canadaplein Cultural Centre. The naked concrete facade of this building has been clad in wooden shutters that become a continuation of the new facade. The museum has an entrance hall on the square. Roof lights and an atrium bring daylight and penetrating views through the building even into the basement. A five meter high storey provides space for the city's finest 16<sup>th</sup> and 17<sup>th</sup> Century Guild paintings. The music school has its own three-storey entrance on the square. Music practice takes place in internal chambers or in rooms on the north side. Acoustics are controlled by keeping the windows closed. The entrance to the library is located on a side street. On the side of the square, the facade openings reach to ground level, giving the impression that and library merge.

Theatrical:

The Theatre de Vest was built in the 1970s and features visible framework and an interior with many corners and slanting walls. Financial and environmental considerations prevented the building's demolition and replacement. Through a new high glass facade on the square and an equally high copper wall, the foyer is imbued with a theatrical appearance. Behind the curved copper wall are the box office, cloakroom and the main auditorium. The small auditorium has been enlarged. A stately staircase leads to the upper foyer providing a view of the Grote Sint Laurenskerk. Behind a heavy brick framework, the restaurant, grand café and the theatre feature operable glass walls that create a connection with the terrace and the square. The restaurant's eye-catcher is a fourteen-metre long concrete bar. (Mecanoo)

Das Kulturzentrum besteht aus drei Bereichen: historisches Museum, Zentralbibliothek und Musikschule. Mecanoo fassten alle drei Bereiche in einem Block zusammen, der zudem einen Altbau integriert - heute überwiegend als Bibliothek genutzt. Das Kulturzentrum ist vom Theater nur durch eine schmale Gasse getrennt, die als Durchgang und optische Verlängerung der Fußgängerzone dient. Eine gläserne Brücke verbindet die Gebäude und markiert zugleich den Übergang zwischen Altstadt und Grachtenring. Die gläserne Front des Anbaus weist - voller Respekt - auf den imposanten Turm der St. Laurenskirche.

Der Neubau vermeidet jegliche Konkurrenz: So ist der Glashaut und auch der Kopfseite des Altbaus eine horizontale Struktur aus Holzlatten vorgehängt - je nach Lichterfordernis in unterschiedlichem Abstand montiert. Hinter der neutralen Hülle kommen alte und neue Struktur zum Vorschein. Jede der drei Einrichtungen verfügt über einen eigenen, separat erschlossenen Bereich: Die Musikschule ist in einem schmalen Riegel gegenüber dem Theater untergebracht, die Bibliothek liegt zur Straße. Zwischen beide Bereiche schiebt sich das Museum mit den rückwärtigen Ausstellungsräumen. Die Dauerausstellung ist zu beiden Seiten einer zentralen Erschließungsachse angeordnet, die in Form von Himmelsleitern durch das Gebäude verläuft. Die Erschließungszonen dienen zugleich als Lichtfilter: Mehrgeschossige Lufträume fangen Tageslicht ein und schaffen helle, großzügige Treffpunkte. In der Eingangshalle entsteht der Eindruck eines öffentlichen, überdeckten Raumes. Warme Materialien strahlen Ruhe und Komfort aus: Oregon Pine, weißer Putz, Stahlbeton, sandfarbener Linoleum-Boden. Vom Foyer schaut man in einen zweigeschossigen Ausstellungsraum herab, der für temporäre Ausstellungen genutzt wird. Das Auditorium schwebt als weiße Box frei im Raum und ist über eine Brücke mit der Bibliothek verbunden. Stege, Lichtbänder und Patios schaffen ein fließendes Raumgefüge, verbinden die unterschiedlichen Kultureinrichtungen zu einem Gesamtorganismus. Bleibt zu hoffen, dass der kulturelle Austausch zwischen den Besuchern ähnlich rege ausfällt. Die Voraussetzungen hierfür sind geschaffen!

P. Vollaard e.a. - Bibliotheek Technische Universiteit Delft, 1998

A. Betsky e.a. - Mecanoo Francine Houben, 2008

The main library serving Delft University of Technology is sited on a lawn behind Van den Broek & Bakema's general assembly hall of 1966. This lawn gradually rises to become the roof of the triangular library; this is where the entrance is. An omnipresent cone with an open top pokes through the grass roof. The glass facades leaning forward attentively along the approach roads have an irregular pattern of hatching stressing the horizontal. Though most of the books are stored in a special area in the basement, part of the gargantuan collection is visible in a 'stack' reaching up the full height of the main library hall. The hall has a foyer-like feeling of openness with its scattering of furniture including the organically shaped book issue desk. The thrusting cone, which dominates here too, is given over to silent study areas; offices and reading rooms line the library's glass external walls. Durability and energy efficiency feature prominently in the building, as witness the underground aquifer reservoir for heat and cold storage, the great insulating properties of the grass roof and the use of climate facades for the external glazing. (<http://www.architectureguide.nl>)

#### **Symbiosis:**

In designing a large new university library, various references come to the fore. Famous libraries, ranging from the old Bibliothèque Nationale in Paris (1875) by Henri Labrouste to the Stockholm Municipal Library (1927) by Erik Gunnar Asplund, have called for an advanced contemporary building. Today such a building must be a gateway to the digital highway but must also refer to important traditions, including access to knowledge and the rarefied atmosphere of study within a splendid environment. In the case of Delft, with a thousand workstations and facilities to accommodate three thousand students each day, the building must also be the heart of the university and provide a landmark within a campus the size of a small town. The design must also consider its relationship with the centrally placed auditorium, the brutalist building by Van den Broek and Bakema, great names in the history of the university and Dutch architecture. Through contrast, a symbiosis has been established – the towering concrete of the auditorium and the landscape in which the library is sited form a new unity.

#### **Pushpin:**

The large lawn roof is tilted up at one corner like a sheet of paper held by a single point. The hollow beneath houses the library. A Cone, the symbol of technology, pierces the library and the landscape, affixing them like a pushpin. With a grass-covered roof, high-performance glazed facades and subterranean storage for heating and cooling, the building reaches high standards of sustainability. The entrance affords a glimpse of the sunken book stacks for rare and irreplaceable books. Inside the towering suspended bookcase for the less fragile books astonishes the visitor. The deep blue background gives the wall-to-wall racks the feel of a theatre set. The columns in the central hall are not only structural but also provide lighting and heating. The sloping metal ceiling continues without interruption across all spaces above a floor the colour of Saharan sand.

#### **Perspective:**

A library must provide an environment that enables concentration through silence. Comfortable furniture and pleasant lighting. Daylight penetrates the building not only through the climate-control glazing in the facade but also through the cone that pierces to the heart of the building. The cone also gives form to a variety of study rooms. The space that adjoins the central hall contains long tables with three hundred workstations with partitions in a shifting perspective indebted to Labrouste. (Mecanoo)

### **Faculteit voor Economie en Management, Utrecht – The Netherlands 1993 – 1995**

#### **Awards:**

1993, Nomination Mies van der Rohe Pavilion Award for European Architecture European Union and the Fundació Mies van der Rohe, Barcelona,

#### **Settlement:**

From the beginning of the 1960s Utrecht University campus has been located outside the city, on the De Uithof terrain. A master plan by OMA/Rem Koolhaas from the early 1990s designated zones to be filled with high-density development to spare the

landscape. Each zone has been given a character of its own. The Faculty for Economics and Management, for five thousand students and four hundred staff, lies in a zone known as the 'Casbah'. Based on the notion of this traditional North African form of settlement, the long shallow building has only three storeys with a neutral facade enclosing a sheltered world of patios, rooms, halls, footbridges, stairs and leisure places.

Space:

The building, which has a rectangular basic form, is a system of constantly converging or connecting spaces. Groups of students can walk around the building with ease. The corridors and passages are framed by the classrooms and offices. The entrance area is the assembly area or congress zone. It consists of a large open space in which the lecture rooms appear to hang. The balconies between these closed boxes, the staggered layers and connecting links are places for the students to meet casually or enjoy a moment of leisure. Focal points such as the multimedia centre and the restaurant are located on the ground floor. Light enters the building via three large patios with different layouts. In the largest patio luxuriant bamboo suggests a jungle, while the other two are more calm – a Zen garden and a 'water' patio provide a glimpse of the charming landscapes.

Veil:

The facade has various forms – sometimes exposed and sometimes with a veil or skin. Facades of cement slabs are concealed behind steel grids and wooden lattices in seemingly random trellis patterns. Other parts of the facade have their entire breadth covered with gigantic blinds, a series of moveable aluminium lammellas. (Mecanoo)

### **Openbare Bibliotheek, Almelo – The Netherlands 1991 – 1994**

Construction costs €5.800.000, Gross floor area 4.780 m<sup>2</sup>

#### **Literature:**

de Architect 1995-2

Archis 1995-7

GA Document 45

Architecture in the Netherlands, Jaarboek 1994-1995

K. Somer - Mecanoo, architecten, 1995

The Times - 29/01/1994

Mecanoo's building consists of two elongated volumes divided by a long well of stairs separated from the library itself, which fans out in Aaltoesque fashion. The all but hermetic black brick slab contains services; the second slab housing all other library facilities has a head elevation of bright blue enamelled glass, yet is dominated by the curved copper-clad front. On the ground floor this portion is almost all glass and contains a reading room cum café, an information centre and the entrance and book issue desk, marked by a void with a spectacular concrete 'viewing-island'. The wealth of materials, forms and details add up to a heterogeneous building. (<http://www.architectureguide.nl>)

The library is built on a small plot of The Beacon. The facade follows the curve on this side of the street. At the rear, the building has a fan shape. By stairs and an elevator in the central atrium, visitors can reach the upper floors. It is in this project uses a variety of materials. The building has a zinc roof, including the offices are located. The facade of The Beacon has a coating of copper. This wall is a large window that overlooks the Town Hall Square and a number of small "portholes". At front end of the building, the walls are lined with purple panels EMALIT. The rear is made of black bricks. (<http://www.architectuur.org>)

### **University Campus, Moskau – Russia on design**

The master plan comes from the Dutch office Maxwan, one of the first building block to be de Architecten Cie.

(Amsterdam) design. Since it seems almost logical that the new, 40-acre university campus designed by an agency of Delft: Mecanoo Architecten, who have now presented their plans. On the campus attracts the "National University of Science and Technology" (MISIS), one of the leading technical universities in Russia. She gets here seven institution building, research facilities, a library, a conference center, dormitories for up to 10,000 students and 3,000 employees as well as hotels, cafes, a cinema and several shops. The architects: "The new campus receives through the woods and the lake is a natural beauty. The central element is a campus park where people can meet. Also, the Institute building opened to the green areas. On the lakeshore are the library and student center, each with their own identities have, a gateway, which will be both the construction business for the new MISIS campus." Among the ecological characteristics are that the campus will be completely car-free, in addition to rain water natural lighting and ventilation are used. In addition, local materials are used to be mostly built in prefabricated elements. (<http://www.baunetz.de>)

The National University of Science and Technology (MISIS) is one of the leading Russian technical universities and will lead the country in its transition into an innovative knowledge economy. MISIS grew out of two prominent players in the industrialization of the Soviet Union in the last century, the Moscow Academy of Mines and the Moscow Steel Institute. The Nobel Prize in Physics for Professor Alexei Abrikosov's work in the field of superconductivity launched the University into the international spotlight in 2003. The new 100 acre MISIS campus will form the core and catalyst for the development of Project A101, a new 13,000 acre district of Moscow where 300,000 new residents are expected over the next 20 years. The campus comprises housing for 10,000 students and 3,000 academics, seven faculty buildings, several research institutes, a library, business centre, hotel, recreation park, cinema, cafes and shops. A condition of the project's financing by President Medvedev is that construction shall begin by year's end and the campus realised within 7-10 years.

Location:

The 100 acre site was donated by Mashtab development with the strategy of creating a strong catalyst for Project A101, with the University campus at its heart. The campus is strategically located only three kilometres from the Moscow Ring Road (MKAD) just east of the Kaluzhskoye Shosse highway which links Moscow with southern Russia. A future tramline will run parallel to the university linking with Moscow city centre and Project A101.

Urban campus:

The campus holds a natural beauty with forest and valley lake as prominent features. The campus plan embraces this quality through a central campus park as the campus core. The park becomes the central public meeting place for staff, scientists, students and professors to share ideas or socialise. The faculty buildings open out onto the park, furthering the atmosphere of openness, innovation and cross fertilisation of ideas. The urban grid design provides planning flexibility to allow for future growth and the two-phased construction. Building's themselves shall be flexible so as to adapt to growing student numbers and to the most advanced communication and media technologies that are sometimes difficult to anticipate. Facing the lakefront and main entry to campus, the Student Centre and Library function as gateway buildings, each with their own identity, and create a brand for the new MISIS, exhibiting the latest in sustainability and technology in order to attract international students and top researchers. The campus residence typology is based on the principles of the courtyard and is divided into townhouses, patio and courtyard, with each with green spaces featured strongly. The campus heart is car free, providing a cohesive, safe and pedestrian friendly campus.

Sustainability:

The MISIS campus plan reflects the innovative character of the university through smart sustainability measures including a 45 degree building orientation which avoids full north exposure, maximum of natural light, use of local materials, prefabricated, elements to save on construction time and energy, future proofing through flexibility of the urban grid, climate walls, thermal heat and cold storage, natural lighting and ventilation and rainwater storage. (Mecanoo)

### **'New Icon of Iskandar Development Region, Johor - Malaysia 2007 on design**

Design for a park with two 150-meter high waterfall towers, conference center, mosque, central library, amphitheatre and Residences.

A gift to the citizens of Johor, the new pedestrian park on a former Palm tree plantation will give the public a library and a mosque carved out of the natural topography in the surroundings of a beautiful park landscape. Iconic towers with waterfalls symbolize the fountain that gives life to its surroundings. Buildings will nestle comfortably in their surrounding landscape with little impact on nature. The new park is composed of rhythmic, metric patterns, an arabesque, that is centred around the symbols and motifs of Islam, with radiating geometric patterns throughout the landscape, on walkways and inside and outside of buildings.

**Circulation patterns:**

The hexagonal landscape pattern faces the holy city of Mecca with two perimeter roads that provide access to the park. The commercial buildings are located in this transitional area leading into the park; from natural topography to urban landscape. Placing the buildings in the transition zone keeps their impact on the park low, and creates circulation patterns throughout the park with plazas that link to the geometry of the park design.

**Fountain of life:**

Water; one of the most symbolic and important element of Islam, providing ablution and representing the infinite is featured throughout the park. Hexagonal water ponds collect rainwater and irrigate the park while flowing into a natural lake creating a graceful transition in the sloping landscape. The waters' source is sprung from the two iconic building towers at the top of the park's slope, a fountain of life from their waterfalls.

**Terrace slopes:**

The landscape features only local vegetation ringed concentrically. The first ring of vegetation creates a mysterious gateway to the park with a border of the plantation's original palm trees. Tea plantings comprise the next ring of vegetation on steeply sloped and inaccessible areas of the park. The Tea plants create and accentuate the rhythm of the terraced slopes and provide a contemplative landscape. Recreation grass meadows and sculptural flowers are in the park's centre where the earth is level. This makes it suitable for friends and families to come together and enjoy picnics and play or relax or attend public events. Ficus trees with their large twisting roots create natural sculptures and the indigenous flowers are of the most vibrant and beautiful.

**Iconic towers:**

The park's fountain is formed by two iconic towers that project out of the mountain overlooking the park. A waterfall flows into the park's water ponds providing rhythm and sound. The towers are symbols of life and balance, with cantilevered plates that allow the water fall from the tower tops. The building's skin is glazed with differing translucencies giving the appearance of water itself. The water not only reflects an important Islamic symbolism, but also provides natural cooling and water collection. During special occasions, the waterfall can begin its flow from the towers' tops. At the buildings' base are the cultural and congress centre with offices above.

**Mosque of light:**

The dome shapes of the mosque surface like air from a turbulent water, providing bubbles of peace and contemplation. The dome's ceiling is cut through with hexagonal arabesque perforations allowing in natural light. These patterns echo those experienced throughout the park and constitute an infinite pattern that extends beyond the visible material world. In the mosque's interior is mihrab indicating the qibla bathed in natural light.

**Library and open air amphitheatre:**

The amphitheatre is cut out of a slope, taking advantage of the natural topography. The steps leading to the library serve not only as an entrance, but also as seating for the open air amphitheatre. In this way, the amphitheatre is never a lonely space, instead, it is vibrant with visitors and readers. The library lays under grass and is naturally cooled. Skylights punched in the ceiling allow natural light to permeate throughout. (Mecanoo)

### **Wei-Wu-Ying Center for the Arts (Library), Kaohsiung - Taiwan 2010 – 2013**

**Awards:**

2008, 1st prize Cityscape Architectural Award Cityscape Dubai

2009, 3rd prize International Design Award IDA Los Angeles urban planning

2009, Chicago Athenaeum International Architecture Award

2009, Chicago Athenaeum Europe

**Programme:**

Theatre complex of 141,000 m<sup>2</sup> in the Wei-Wu-Ying Metropolitan Park with a total capacity of 5,900 seats: Concert Hall 2000 seats, Opera House 2250 seats, Playhouse 1250 seats, Recital Hall 500 seats, public library of 800 m<sup>2</sup>, rehearsal / education halls for music and dance, 2 congress halls with 100 and 200 chairs and stage building workshops.

**Face:**

Kaohsiung is one of the world's largest sea harbours with five million people living in the region. A high speed train line connects the city with Taiwan's capital, Taipei. The harbour city of Kaohsiung wants to change into a multifaceted city with a state-of-the-art service industry and a rich cultural life. As a result, a new metro system is to come online in 2009 and in the Wei-Wu-Ying Metropolitan Park, a former military compound of 65 ha., a grand complex for concerts, opera and theatre is being realised. The programme consists of a concert hall with 2000 seats, an opera house with 2250 seats, a theatre hall with 1250 seats and a Recital Hall with 500 seats. An international competition was organised for the design of the park and the performing arts center. There is hardly any misunderstanding with regard to the ambitions of this project; the park and the arts complex must, with one gesture, give Kaohsiung another face. An international jury chose the design of Mecanoo because of its great imagination, oneness of the arts center with the park, modern theatre techniques and incorporation of the subtropical climate.

**Banyan:**

The large park and performing arts center merge with one another. The centuries old Banyan trees in the area formed a source of inspiration for the design. Its crown can grow so wide that according to legend, Alexander the Great could so wide that according to legend, Alexander the Great could take shelter with his entire army under this tree. Mecanoo's building at 225 metres by 160 metres resembles the crown of a Banyan. Banyan Plaza and sheltered public space in between halls creates a porous space wherein interior and exterior blur. In the subtropical climate, grasses and plantings on the roof

provide natural and efficient cooling. >The roof holds an informal public space where city inhabitants can stroll, practice Tai Chi or meditate. Where the roof touches down to the earth, an open air theatre in the tradition of the ancient Greeks, is created with space for thousands of visitors. The surrounding park becomes stage and set.

**Butterfly Garden:**

Slopes, valleys and water pools create intimate public spaces varying in size, scale and proportion. Meandering paths lead to a botanical garden, a bamboo grove, a playground, a tea pavilion and a butterfly garden. The park design is a logical continuation of the performing arts center with its public open spaces and roofscape. (Mecanoo)

### **Birmingham Central Library, Birmingham – UK 2010 – 2013**

**Places:**

Centenary Square is the largest public square in Birmingham and is situated in the heart of the city. At the square are the Baskerville House, a building designed in 1936 and the famous Repertory Theatre (REP), a concrete building designed in 1964. The square lacks identity and sociability. The arrival of the Library of Birmingham to Centenary Square offers a unique opportunity to transform the square into a lively public space with three different atmospheres: historic, cultural and entertainment. The three buildings are located on the plaza conceived as an ensemble: three palaces that tell the urban development of three different periods. The busiest pedestrian route from the city, the red line, leading pedestrians to Centenary Square. The overhang of the library is not only a large canopy that provides shelter to the common entrance of the Library of Birmingham and the REP, but also makes possible a great city with wonderful balcony views of the events on the square.

**Rotunda's:**

The Library of Birmingham is a transparent glass building. Its delicate filigree skin is inspired by the artisan tradition of this once industrial city. Elevators and escalators dynamically placed in the heart of the library forms connections between the eight circular spaces within the building. These rotundas play an important role not only in the routing through the library but also provide natural light and ventilation. The roof top rotunda houses the Shakespeare Memorial Room, designed in 1882. This Victorian reading room is lined with wood from the first Birmingham Central Library. Its prominent position as a rooftop aerie makes this delicate room visible from the square. The REP with its unique and beautiful auditorium will be renovated. New workshops, staff accommodations and a shared theatre and foyer space will be created for both the REP and the library.

**Sustainability:**

The Library of Birmingham is a BREEM excellent rated building and incorporates grey water systems and ground source heat pumps. Although the Library is a transparent building, it maintains energy efficiency through the buffering capacity of the building mass and the atria. Sun shading and reflective materials within the facades block the harsh rays of the sun during the height of afternoon while allowing natural daylight into the interiors. The ground floor benefits from the mass of the soil which provides buffering and insulation. The circular patio cut out of the square creates a protected outdoor space and invites daylight deep into the building. The building will incorporate a mixed mode and natural ventilation strategy. The façade will respond to external conditions and openings will allow fresh air intake and outflow. The addition of soft landscaped roof spaces will further enhance the immediate surrounding conditions. (Mecanoo)

### **Kaoshing Public Library, Kaoshing – Taiwan 2010 – 2011**

The Kaohsiung Public Library is a new cultural destination with 38,000 m<sup>2</sup> of multimedia, research, study and entertainment, theatre and conference centre. The new library complements other cultural buildings in development around Kaohsiung Harbour, including the Maritime Culture & Pop Music Center, the Business Exhibition and Convention Center and the Wei-Wu-Ying Center for the Arts also designed by Mecanoo.

**Eco cube:**

Mecanoo's 603 meter eco cube is integrated into a garden plaza landscape. Decked with potted plants and populated by trees within its spacious three storey interior voids and roof deck, the new library provides a visual and material connection between the indoors and outdoors while creating its own natural microclimate. The library is surrounded by tall buildings which in harmony with the pergola provide shade to the library garden. The pergola lets natural daylight into the lower level of the library, creating a pleasant shopping and social destination. Visitors may choose to enter the library in one of three ways; via the descending plaza stairs into the shopping area with cafes; over the plaza and gardens; or from the rear of the library directly from the street, which allows students from local school direct access. The library interior features large 3,500 m<sup>2</sup> floor plates with connecting voids for openness and flexibility.

**Shadow and shelter:**

A grand deck over arcs the library garden and provides sheltered urban space. Elevated from street level, it provides a buffer zone between the inner garden and the urban fabric surrounding the site. The garden performs as a protected exterior library space and offers pockets of private spaces to cater to visitors who would like to read or study as well as, performance space, social meeting spaces as well as a playground and a central multifunctional space connected to a large children's theatre with flexible indoor and outdoor seating capacity for an audience of 400 to 1000. (Mecanoo)

## **Meyer en Van Schooten Architecten, Amsterdam – The Netherlands**

<http://www.meyer-vanschooten.nl>

**Libraries:**

### **Openbare Bibliotheek Almere, Almere – The Netherlands 2001 - 2010**

Public building containing public library (ca. 11,000 m<sup>2</sup>), shops (ca. 2850 m<sup>2</sup>) 30 apartments (ca. 3750 m<sup>2</sup>) and a strategic reserve (ca. 2300 m<sup>2</sup>)

The wedge-shaped of Almere's new public library site occupies a prominent position next to the town hall, with its apex on Town Hall Square. The block accommodates several different functions. The Diagonaal frontage is lined by retail spaces, on Wandellaan there are 30 apartments, while the southwest corner contains a strategic reserve of over 2000 m<sup>2</sup> for the library. The principal element of the block is the public library. Although the welcoming main entrance lies on the square, the library is emphatically present on all sides of the block. The library is succession of spaces which together form a route some 400 metres in length. An escalator near the entrance carries visitors up to the first of a series of ascending terrace floors which bring them to the second floor. On the second floor the route continues via an escalator to the study centre on the fourth floor or to the auditorium.

The building has a figure of eight ground plan and the combination of several loops gives the library its clarity and flexibility. Large light wells make for an inviting and lucid interior. Glass walls throughout maintain contact with the outside world, while the light wells and the garden provide contact between the different parts of the building. While the apartments are a clearly distinguishable element, they are nonetheless an integral part of the whole. (Meyer)

Block 3 in Almere's new city centre includes the public library, thirty owner-occupied flats, ground-floor shop units and space capacity for the library. As long as this space capacity remains unused, it will be let to service providers. The block has a triangular ground plan and consists of two sections: (1) a triangular four-storey base containing the shops, the library and the space capacity, and (2) a rectangular five-storey block of flats rising from the south-east corner. The block is sculptural in form, with angled asymmetrical façades, recesses and cavities. As seen from above it has a hole in the centre, with an enclosed open-air garden separating the shops, the library and the spare capacity. There is no front or back to the building in the traditional sense – each façade is autonomous. With its apex projecting onto Stadthuisplein and its tall (eight-metre) entrance, the building is a striking piece of architecture and urban design and a prominent feature of the cityscape. OMA designed the heart of the new city centre on two levels, an architectural device that serves to separate shoppers from other traffic. Beneath the sloping level is a second level for other road users, with features including separate bus and car lanes and ample parking space for cars, supplier's vehicles and bicycles. Block 3 is on the edge of one of the slopes on the angled upper level. This level slopes from north to south, with a 6-metre change in height up the angle. The increase in height within Block 3, from the north to the south façade, is 4.2 metres. This means that the various changes in height have been compensated for and resolved within the building. The solutions are visually reflected in the interior of the building as well as its façades. (Meyer)

#### **University of Amsterdam (UvA), Science Faculty, Library – The Netherlands 2003 – 2009**

Programme: Laboratories, storerooms, workspaces, dispatch bay, library, study centre and offices located in the Science Park in Watergraafsmeer in Amsterdam. Ca. 15,500 m<sup>2</sup> gfa

The new building for the University of Amsterdam's Science Centre (FNWI) is the product of a collaboration between Architectuurstudio HH, MVSA, and Rudy Uytenga Architectenbureau, which acted as the coordinating architect. The idea is that the combination of divergent architectural styles produces a complex that will offer the staff and students of the different science disciplines a shared home with a variety of places and characters. Each of the three sections has its own identity. The wing designed by MVSA is an accumulation of three programmatic elements. At ground floor the support services. The first floor, reached via a wide staircase from the central hall, contains the most public functions - the library and study centre. The spaces here spill over into one another, creating a landscape of widely different forms and uses, from the central student plaza with service desks and the 'sciences' lounge, to the hushed, monastic-style study spaces which were fitted out by MVSA. The third programmatic component consists of three floors of flexible laboratory spaces, which could be converted into offices if needed. The laboratories are situated directly across from the office floors designed by Uytenga. Devoid by the lightwell is which floods the space with natural light. The elevations reflect the vertical organization of the wing. On the ground and first floors the glazing is floor to ceiling. On the laboratory side the window band is much narrower in the interests of a stable internal climate. The closed facade panels carry a pattern of black burls that are an abstract representation of microscopic images of skin cells.

The University of Amsterdam is realizing the Faculty of Science (FNWI) in the St. Annapolder, Watergraafsmeer. After judging the limited competition the panel selected to combine the designs of three participating architects. As a result a design consortium was formed lead by Rudy Uytenga as the coordinating architect together with the offices of Herman Hertzberger and Meyer and Van Schooten. The new science building is designed as a whole and internally divided into four sections. Parts 1 and 4 designed by Uytenga, part 2 by Hertzberger and part 3 by Meyer en Van Schooten. The substructure contains public functions, the superstructure accommodates the more private functions of the variety of different faculties currently located on many locations around Amsterdam into one single building. Therefore it is a critical that the design of the new building provides a unified front to the user and visitor. Part 3, designed by Meyer and Van Schooten, has three sections. Is the complete ground floor which is equipped with modern facilities for the Technical Department, Purchase and supply rooms. These essential processes become visible because the façade is largely made of glass. On the first floor of part 3 the library and reading room are situated making the most public area. The accompanying spaces flow into each other creating a great "landscape" where the students can concentrate on their study or interact with other students. The study centre can be reached via a wide stairway in the entrance hall, which is central spine of buildings. The 2<sup>nd</sup>, 3<sup>rd</sup> and 4<sup>th</sup> floor mainly contain laboratories and offices. Flexibility of these spaces were the starting-point of the design since research processes are continuously subject to change. (Meyer)

#### **Multifunctioneel Centrum "De Kristal", Rotterdam-Nesseland – The Netherlands 2009**

The Crystal is a multifunctional building with a distinctive architecture with a unique collaboration between many organizations and institutions in the field of healthcare and culture. These are Humanitas, Rotterdam Library, community Alexander, Health Nesseland, neighborhood organization WONIO, SONOR / Opbouwwerk, IJsselland Hospital and Pharmacy Nesseland.

#### **MH1 architecten, Nuth – Netherlands**

<http://www.mh1architecten.nl>

##### **Libraries:**

#### **Bibliotheek Beek, Beek – The Netherlands 2008**

Rebuilding and renovation of an existing library with a focus on improved entrance, reception, rental service for reading area, children's department and new media like the Internet. The former entrance, which is reached through the road and thus not visible from the street, was moved to the old service entrance to the highway and invites you to visit the new library. Modifications to the exterior, including a longitudinal slot on the back window and the white stucco facade, contribute to the contemporary look of the building. The monolithic cup oak desk accompanies the visitor from the entrance to the information desk. This desk will also separate the public area and office spaces. The volume of office space, toilets and service areas, is cut loose from the exterior, and thus stands as a free box in space. Are all subtly indicated for zoning including the youth section, the reading table, internet sites and place for the reading classes, designed as a large circular bench around a deep-pile carpet with red accent color. (<http://www.architectenweb.nl>)

##### **Libraries:**

#### **Apartments Hintham Lord, 's-Hertogenbosch – The Netherlands on construction (2011)**

Meet at the waterfront. On the former site of the old social-cultural center 'The Confession', 's-Hertogenbosch Hintham Lord is being realized. The ambitious project will house a new library, a nursing home with 90 places and a day care, elderly support center with a senior restaurant, 30 condominiums and 90 assisted living facilities. Much attention is given to the well-being. The atrium consists mainly of glass and offers wonderful views of the lake. Settle in the central area including the library, the social cultural center and a café. From the central part there are two branches in homes and offices, focused on water. The plan consists of three "flared" building blocks. This sprawling structure provides insight into the pond from the Iron Child. This urban design creates

added value for the environment compared to the current buildings. The height on the side of the district may not exceed three layers. Only the heads of the three building blocks in five, six and seven were the private apartments realized. The parking for the nursing home staff and residents of the condominiums will largely take place in parking garages under the buildings. (<http://www.architectenweb.nl>)

Meet at the waterfront.

On the former site of the old social-cultural center 'The Confession', 's-Hertogenbosch is currently Lord Hintham realized. The ambitious project will house a new library, a nursing home with 90 places and a day care, elderly support center with a senior restaurant, 30 condominiums and 90 assisted living facilities. Much attention is given to the well-being. The atrium consists mainly of glass and offers wonderful views of the lake. Settle in the central area including the library, the social cultural center and a café. From the central part there are two branches in homes and offices, focusing on the water.

Continuum Care

Nursing "The Herven" part of Dimen foundation, foundation for providing care and housing services, will disappear from its current location at the Bruistensingel in 's-Hertogenbosch. The majority of the current capacity of the Herven will be moving to the neighborhood Bossche Hintham and that become part of a neighborhood-oriented multi-purpose center. The new center in Hintham fits into the future by the providers in the region is developed. The aims to client-centered care in the district. This means that providers of care working together to nearly all types of nursing care and to offer based on the needs and wishes of clients. This cooperation is also called "continuum of care" mentioned. If necessary to treatment, welfare and adapted housing in conjunction associated with care and nursing.

Initiators and participants

The initiative for the new center was taken by Dimen, together with housing association The Little Meierij from Rosmalen. Participants in the project next to the house foundation and Dimension: the 's-Hertogenbosch, the Homecare, socio-cultural center, The Confession, [the City Library' s-Hertogenbosch](#) and the province of North Brabant. Content are the welfare clients and organizations involved in the preparation. All participants strive to the added value of being together under one roof to use for optimal use of the new center and the best possible service to the district.

Functions and users of the new care center

's new building with the care center is a part, a number of features and users will get. These are (in no particular order):

- Dimen Foundation, users of the care center with 60 beds and 30 beds pg sz including all accompanying support services, such as offices, occupational and physical therapy, recreational areas, etc.;
- Home care, with an office for the Parent-child care, office and working for Home Care Employees who work in the district, an area for day care;
- community center "The Confession" by including a large foyer hall, several small rooms and work rooms and kitchen;
- [City library 's-Hertogenbosch, branch Hintham](#) ;
- elderly welfare organization that includes an Elderly Centre;
- The Housing Corporation Small Meierij about 30 apartments for people with a zorgindicatie on the third storey of the care center and an additional rent is about 93 apartments near the nursing home to sell in the private sector.
- a senior restaurant / neighborhood restaurant;
- a garage.

Urban design and public space design in the draft the terms and conditions are included for both buildings and public space around the buildings. The plan consists of three "flared" building blocks. This sprawling structure provides insight into the pond from the Iron Child. This urban design creates added value for the environment compared to the current buildings. The height on the side of the district may not exceed three layers. Only the heads of the three building blocks in five, six and seven were the private apartments realized. The parking for the nursing home staff and residents of the condominiums will largely take place in parking garages under the buildings. Also noteworthy is that the zoning boundary of the building mass / volume of solid building constructed.

Field and relationship with the environment

The concept of community is based on the so-called "finger model" means looking ahead to the water. View of the water quality for residents. This translates itself in the sided of the blocks. The structure of the long building mass (in relation to construction costs) is a gallery solution to the most efficient choice. I did not want to front and rear. In the quality plan is an all-round solution driven. Based on "normal living" there are demands on the environment of the care center. Much attention will be given to the (limited) space around the care center an attractive garden / park setting to make the local residents but for residents and visitors to the center inviting character.

A beautiful green setting remains. And free "context-free" site. The Jan Heijmans Flat affects the amount of the complex and position of block 1 is related.

The interior of the public area done by the municipality. Here is a draft created by a landscape architect. This design supports in particular the concept of the church, that nature and culture meet.

The current location of the Confession was examined for its historical context. Community has found no reason to historie of the place in the urban design to incorporate. But there are many styles designed by us that emanated from (partly) maintain the current buildings. These are for programmatic and cost reasons dropped.

The design principle

, many different clients that a "compelling" set of requirements have issue. Rarely or never fits together. This means that different building sizes and stamienmaten needed to assemble this complex. There is a grid design, that all these pages together bind PvE. Firstly, the architecture affected by the Schedule, on the other hand the concept of structure used to PvE to knead. (Molenaar)

**Awards:**

**Dutch Design Award 2010**

A library whose decor no longer consists of books has been turned into a 'home' in which to study. The UvA's enormous collection of books is kept in closed repositories, book depots and at various open locations. A growing number of students, anywhere from 1500 to 5000, visit the University Library every day in order to study and pick up their digitally ordered books. Despite plans for a new building in the future, the university wished to have a new, temporary interior design for the 2,500 sqm space that would comprise

study rooms plus 235 extra workspaces, the canteen, the information centre with its desk, the hallways, and an automated lending area. To offer students a good second home, we wanted to achieve two important things: a space like the white page of a book where the students themselves would play the main role in determining how it is filled in, and in certain areas a domestic atmosphere where the students could also study informally. For instance, in one of the study rooms you will find a number of kitchen tables where you can work in groups under the lamp, a chesterfield couch for reading a newspaper, various sitting areas for a short break and special telephone areas in the hallways between the quiet study rooms. The columns in the canteen are transformed into illuminated trees with low energy light bulbs. Until recently, borrowed books could only be picked up at the library desk during office hours. Now the students can pick up their ordered books themselves in a newly designed red room that is open until midnight, including weekends. In red cases with 1105 red crates, piles of books lie ready for the borrowers. Because these books come from different locations, this is the heart of the University Library, with a back office hidden from view in which the books are readied for self-service with the RFID system. ## **MV Architects Marjolein Vreeburg, Amsterdam – The Netherlands**

<http://www.mvarchitects.nl>

### **Schipholbibliotheek (Airport Library), Amsterdam – The Netherlands 2010**

Schiphol is the first airport in the world with its own permanent library. The library's cultural showpiece of the Netherlands. The Library is located behind the airport passport control. Passengers can while they wait for their flight, reading and music. It is not possible to lending books. iPads are integrated into the design to listen to music or short movies about the Netherlands. Marjolein Vreeburg of MV Architects says that the library had to be put down as an attention-getter without uniformity and transparency of the entire area to lose. This is done through book slender and high towers, the void insert allowing the pass → passenger, also an impression on the first floor of the Airport Library receives. The design studio has designed include the previously Schiphol Babycare Lounge, Kids Forest and restaurant Pier 01. In the library literature in 29 languages available. There are books translated from Dutch authors and works on, among others, the Dutch architecture, art and photography. The books have a picture of the Dutch culture. The Library is located at an airport location at the airport where passengers are mostly transferring. "We want passengers to inspire the next time really to make a visit to the Netherlands", explains CEO Jos Nijhuis of the airport. "This is a cultural showpiece of the Netherlands." Besides books is via digital photos on a TV screen an image of the Netherlands is outlined. Princess Laurentien opened the library a few books to offer. She named the Airport Library, a cross-border initiative. The Airport Library seven days a week, 24 hours a day. The bookstore around the corner says not to fear competition from the new library. "I think the people who really are after buying a book," will continue to come here, explains a saleswoman. She looks even have the benefit of it. "People who only come to books and magazines to read, but buy nothing, we can now refer."

### **Libraries:**

#### **Spijkensisse Bibliotheek – The Netherlands 2009 – 2011**

A new public library, on site at inner Spijkenisse near Rotterdam, will feature the literal translation of "a mountain of reading" by creating a transparent layer around the book stacking system. With a surface of 10,000 m<sup>2</sup> the library will use a glass membrane, referred to as the "bell jar", to make a feature of the contents creating an evolving picture from the outside when books are borrowed, replaced and moved. At the corner of a major thoroughway, the library designed by MVRDV will be visible from the central market square and the church opposite (<http://worldarchitecturenews.com>)

The design "The Book Store" by architects MVRDV of Rotterdam has won the competition for the new central library Spijkenisse. The design was chosen over "The City Library" by architect Hans Ruijsenaars, and "The Sphinx" by architect Jeanne Dekkers. MVRDV is a world renowned and award-winning architecture collective that made its name in particular by the design of the Dutch Pavilion for the Expo 2000 exhibition in Hanover. MVRDV represents Winy Maas, Jacob van Rijs and Nathalie de Vries. They were among others involved in the future study for the Brabant Library in 2004. (<http://www.tijdelijkebibliotheek.nl>)

### **Libraries:**

#### **City Hall and Library, Deventer – The Netherlands 1<sup>st</sup> Prize Competition 2006**

24.000 m<sup>2</sup>, €30.000.000

The new City Hall and Library project blends into the heart of the old mediaeval centre of Deventer. A new public square, sunken in the ground, is created in the inner urban block behind the old town hall. The library and the service counters of the municipality are mixed together as one large city information centre, organized around this square. A cupola shaped building that contains the offices of the city administration covers the square and forms a large atrium. The top of the cupola is conceived as a panoramic winter garden, a public space for parties and official celebrations. (Neutelings)

#### **Culturhouse Arnhem – The Netherlands 1<sup>st</sup> prize competition design 2009, start construction 2010**

12.000 m<sup>2</sup>, €20.000.000

This cultural building is organized as a public route that meanders up from the narrow streets of the medieval city center of Arnhem. The activities of this knowledge center enroll along this public cascade: library, reading rooms, music classes, art studio's, study areas, exposition spaces, auditorium, cafeteria and bookshop. A giant bookcase as a spine for display, storage and vertical circulation forms the center of the building. Around it, large column free floors surfaces can be arranged in a flexible way. The route to the top culminates in a panoramic roof terrace, overlooking the Rhine River. (Neutelings)

#### **Eemhuis – Cultur House, Ammersfoort – The Netherlands design 2006, under construction 2010**

15.000 m<sup>2</sup>, €19.000.000

The Eemhuis is a cultural centre that combines the city library, a pop concert hall, the regional archives and an arts school. The building is organized as a vertical stacking of these programs that enhances the continuity of the public domain into the building. At the ground floor, the public square becomes a covered plaza, the foyer of the pop concert hall. At the other end, the plaza steps up gradually to form a terraced library. On the top of the stairs the library spills into a vast open space overlooking the city. Above it hovers the archive volume that forms the ceiling of this space. The attic of the building houses the arts school. The three arts departments (theatre & dance, visual arts and music) are each expressed separately as cantilevered beams that crown the complex. (Neutelings)

## [Mediacenter – The Netherlands Institute for Sound and Vision, Hilversum – The Netherlands \(design 1999\) 2006](#)

Support: Bureau Bowkunde  
30.000.000 m<sup>2</sup>, €40.000.000

The new building for the Netherlands Institute For Sound And Vision consists of five levels under ground and five levels above ground. In the underground, the national archives of Dutch radio and television recordings are stacked around a deep canyon. Above ground, a staged volume contains the media museum. The third element is the office building of the institute. The three volumes together enclose a large public atrium. The facade of the building is a screen of coloured relief glass that depicts famous images of Dutch television, a composition by graphic designer Jaap Drupsteen. (Neutelings)

## [Shipping and Transport College, Rotterdam – The Netherlands 2001 – 2005](#)

Support: ABT Bouwkunde  
Program: 30.000 m<sup>2</sup>, Costs: €40.000.000

This seventy metres high tower has a mixed program of educational spaces, offices and public functions. A route of escalators links the different departments from the lobby all the way to the top. The low-rise part of the building contains the special facilities like simulator rooms, restaurants, a media centre, a sports centre, and workshops. The cantilevered conference room overlooks the Port of Rotterdam, while the stepped student restaurant on the ground floor overlooks the Maas river. The meandering building volume forms a vertical icon for this international centre of maritime knowledge. (Neutelings)

### Libraries:

## [Trevianum School, Sittard \(Prov. Limburg\) – The Netherlands 2005](#)

The school has 2,500 pupils and 220 staff with one of the largest schools in the Netherlands. The design has put the urban power of a large building, combined with the small scale for the welfare of pupils is important according to the credo of the school each pupil counts. " The new buildings and existing building as a multifaceted and colorful ensemble designed the building in which recognizable spatial and geometric units grouped together with the old building and an inseparable whole. The units differ in shape, color and materialization. This creates visibility for individuals and groups, clarity, and identity. Space for large and small groups. The new building consists of three parts with an area of approximately 9,000 m<sup>2</sup>. The units of the new building are named for their shape: Boat, Shell, and Hook. The bridge is shaped like a ship. The existing and the new building are considered as a bridge anchors, each with a social heart in the form of an atrium. The exterior of the existing building is constructed of dark brick. Then pick up following a gradient to an orange (wooden) skin for the shell and yellow brick for Hook, interrupted by the attention when the white bridge. The addition of the new building on the old building was a linear structure that asked for meeting spaces and spatial to create differentiation. The telescoping of the recognizable geometric entities created, in addition to the atrium and the transfer zone, geometrically indeterminate restrooms as corners and stay places they serve. Space for informal meetings and consultations. The whole complex is home to the students. A village with two large squares, one passage and numerous squares, interconnected and permeated by multiform streets and roads. The application of voids and numerous vistas creates transparency and safety. The color concept is interacting with the concept of space and form. The spaciousness is the concept and the color lines in floors walls and ceilings supported and also unexpectedly changed. This creates a walkable painting in an interplay of security and resulting impulses. A stimulating work environment with spatial color and material incentives. The existing building has remained the domain of the substructure, the new second phase explicitly focused on education. The upper floor of the bridge is divided into zones and transfer library, staff rooms downstairs offers. Nowotny awarded the students a glimpse through the glass cone in the staff room. "A reference to the Berlin Reichstag by Norman Foster in which the audience looks down at the administrative center, the plenary hall." Shell Hook and offer a collection of classrooms, group work areas, work stations and computer equipment itself. Movable walls create flexible layouts in the time available. The atrium is the second major meeting of the school. Nowotny chose an organic design. "Liquid but still coherent, an outline that yields a natural circulation. You must atrium and surrounding areas really look like an urban landscape. The compositions are a la Kandinsky. Lots of color, form powerful, expressive. " Because of the budget of around 15.5 million euro would be awarded through a European tender. Ultimately, especially the concept of color Nowotny - as it is, especially influenced by the color and richness of Memphis Mendini - decisive. "I use color to compensate for the strenuous training company. Spaciousness, colors and materials have been translated into a stimulating environment. Corners, staying places, smallness, exciting colors and lighting concepts combat the threat of a large, anonymous leather company. " Inside the different areas flow into each other. The ellipse is a recurring guide. Not only in head shapes and details such as bay windows, as well as color lines. Sometimes even the deconstructive. Like the yellow / green wall of the atrium - "as if a sheet is folded. The opposite blue window suggests a rounded shape that there really is not. It is this combination of organic design and color variation that each corner of the building unique and recognizable, Nowotny emphasized. "Variegation increases the versatility of the design. The building is a village that derives its power from unexpected changes. That is the secret of a small pleasant environment. Color is used as an art form. " (<http://architectenweb.nl>)

## [OIII Architecten, Amsterdam – The Netherlands](#)

### Libraries:

## [Cultur – een Uitgaanscentrum De Graaf Wichmann, Huizen – The Netherlands 2001](#)

In a building housing, work, restaurants, a cinema theater complex, snooker, pool, bowling and the municipal library combined. The shape of the building, located next to the town, is partly motivated by the desire to strengthen coherence of the environment and the center of the church more meaningful. The horizontal curved wall on the north side borders the area. On the west side responding to the small scale of the historic village. The complex consists of two main volumes. The commuter volume appears under the curved roof to continue and then culminates in the Grand Café. Cultural and entertainment center is conceived as a spatially continuous container with a peak of activity in front of the bus. This fluid space form is both complex program of activities planned and organized response to the large differences in scale and function of the surrounding area. (OIII)

## [TU Delft TPM \(Faculty Technology, Policy, Management\) Library, Delft – The Netherlands 2000](#)

The merging of two faculties (philosophy and administration) is a new department formed large 12,400 m<sup>2</sup>. The design includes the construction of a simple U-shaped building volume that is a sunny courtyard. This is mainly offices and project rooms situated. The restaurant on the ground floor facade is transparent and offers views of the beautiful chestnut trees to the Jaffalaan. In the Garden

"floats" above the sunken car park pavilion with a transparent education including the library. On the east side of the existing building element is idiosyncratic to the amphitheatre hall, formerly the cafeteria. The building at the Jaffalaan has a similar entrance to the North and the South Side. Sustainable building measures focus on energy efficiency and a healthy work environment. Besides energy saving measures is the natural ventilation innovative system combined with an important part of the building mass accumulation. (OIII)

## **OD 205 architectuur bv, Delft – The Netherlands**

<http://www.od205.com>

### **Libraries:**

**Koninklijke Bibliotheek, Den Haag – The Netherlands – 2007**

### **Literature:**

C. Vaillant, V. Freijser and K. van Boven (ed.), *Guide of modern architecture in The Hague, The Hague, 1997, P213, 214*

Piet Groenendijk Paul Vollaard, *Guide to modern architecture in the Netherlands, Rotterdam, 2000, P235*

K. Bosma, A. Mekking, K. Ottenheim and A. v / d Forest (ed.), *Building 600-2000 in the Netherlands, Zwolle, 2007, p637*

Since the inception of the Royal Library in The Hague in 1798 the large collection of books periodically moved. Late sixties, it was decided that this library and also the National Library and Documentation Centre of the Netherlands had to be of academic libraries. To perform these functions, there was a new and larger building necessary. complex in the course of the seventies was led by **Wim Quist** realized a building complex next to the central station of The Hague. This complex had a modern government in The Hague city.

### **Interior:**

The KB is one of the buildings in the modern complex. It was designed by architects OD 205, which was famous for her designs, universities, laboratories and hospitals. Design At first glance, the building is a white solid overall, but it's actually very sophisticated set up. The building consists of different blocks (the Bibliotheekblok, the Services and the Institute Auditorium Block and Block) that are connected by an internal corridor on the first floor.

### **Facade:**

Between the two blocks walking and cycling paths. The building of the KB is technically very well put together. The reading rooms are lit by two large voids and the ceilings are so organized that they match with the facilities that are located behind. The facades of brick and KB are insulated with white aluminum sheets on vertical gutters are attached. The construction of the building is making them very sturdy and has become ideal for preserving the largest collection of books in the Netherlands. (<http://architectenweb.nl>)

In the building of the Royal Library in addition to the Library is also the Literary Museum (LM), the Netherlands Institute Art History (RKD) and various institutes housed. The building, designed by architect Arie Hagoort OD205 of architecture for example, in 1982 was put into use. Since 1995 a series of renovations undertaken primarily because of new insights for the services and the increasing computing. In the late seventies because other assumptions applied for accessibility. When desired, for example, a modest and certainly not monumental entrance. Interested parties were given access to a letter of recommendation. Once inside there was anywhere access. Now it is reversed, the KB is more aware of its role as holder heritage, focuses on a wider audience and want as many visitors. This is a welcoming environment is important, a clear and necessary logistics to the publicly accessible areas separate from personnel areas. Therefore, the building changed in many places, and where necessary extended: - Renovation and refurbishment Library reading rooms on the 1st and 2nd floor (2004-2006) including: relocation Dutch Music Institute, New microfiche room, reading room renovation special collections and a new concept: the Reading Room of the Netherlands. - Office refurbishment third, fourth and fifth floors for KB, RKD and institutions (2003-2006). - Phase 2 renewal entrance, new wardrobe (2003-2005) (OD205)

## **Universiteit Maastricht, Universiteitsbibliotheek-ICTS, Maastricht – The Netherlands 1998 – 2003**

When the public library moved to the Ceramique Centre, the building in the city centre became available for the University Library. The old construction was a hybrid complex, with remains of the renaissance period and early modern justifications.

The new renovation includes a new library, an ICT-centre, study- and workspaces.

The starting point for the design was the complex of existing buildings (the former City Library) that sits between the New and Great Hofstraat Looiersstraat located. It was our task to make this a modern, open building to which the collections of the faculties of economics, law, culture, sciences and general sciences, 700 workstations and 120 employees could find a nice shelter. The plan has the following interventions: Creating a public connection between the Great Looiersstraat and New Hofstraat, with the central courtyard located main entrance, an expansion of the building volume on the garden side and the introduction of a central zone with loft and glaskap. The existing buildings are adapted, where necessary, demolished or expanded to create a balance between existing and new. The interior has sought a relation between the various components by introducing an orthogonal grid and using a limited number of new materials. The OD 205 by eg architecture designed furniture adds by its simplicity and consistent application also contribute to the desired spatial continuity. The University now has a light and transparent building which had a pleasant atmosphere can be studied. (OD205)

### **Libraries:**

#### **Qatar National Library, Education Center Doha - Qatar 2014**

H H Sheikha Moza bint Nasser with HRH Prince Andrew, Duke of York, and other dignitaries at the Qatar National Library announcement ceremony held at the Education City yesterday. ♪ Aisha Al Musallam

By Fazeena Saleem

DOHA: A new project by the Qatar Foundation for Education, Science and Community Development to build Qatar National Library was officially launched yesterday by H H Sheikha Moza bint Nasser. The Library which will house over one million books, a rich online database and multi media production studios will officially open in 2014.

"We are pleased to embrace the promise of new, world class Qatar National Library. The Library's vision of bridging with knowledge Qatar's heritage and future demonstrates the significant role Qatar National Library will play in unlocking human potentials as Qatar builds a knowledge-based economy. A modern dynamic National Library for the Country is essential in reaching this goal," said Sheikha Moza.

The Arab Federation for Libraries and Information Person of the Year Award 2012 was also presented to Sheikha Moza during the event held at the Student Centre of Hamad bin Khalifa University in the presence of Dr Hamad bin Abdel Aziz

Al Kuwari, Minister, Culture, Arts and Heritage, Prince Andrew, Duke of York and several other distinguished guests. The launch of Qatar National Library coincides with the 50th anniversary of 'Dar Al Kutub', first national library in the Gulf Region, which opened in Doha in 1962. As a founding partner of the World Digital Library, QNL will provide innovative facilities for exploring interaction between technology and people to promote new ways of learning.

Besides housing 1.2 million books, the Qatar National Library will operate 'Qatar Reference Service' and provide access to over 60 online databases and websites and will have over 300 public computers, wifi and multi-media production studios. It will partner with British Library to digitise 500,000 records relating to Qatar. As an 'eHub' the library will make millions of electronic books and documents accessible at the touch of a fingertip, and it will not even be necessary to visit the library in person, as the archive will be accessible remotely through a mobile phone or other handheld device.

"Libraries in the modern world are not as they used to be in the past. Reader is not there only to get knowledge but also to interact. In today's world a library has to be vital, active and cater everyone's needs in the society," said Sheikha Moza to a panel which discussed on 'In the age of Ipads, Do we need Libraries?'

She was joined by Baroness Blackstone, Chairperson, British Library, Professor Hassan Al Alsereihy, President, Arab Federation for Libraries and Information Person and Dr Claudia Lux, Project Director, Qatar National Library at the panel with Ghida Fakhry Khane, News and Programme presenter, at the Al Jazeera as the moderator. "We are proud to announce the development of a project of globally unique scope and breadth in its field to bridge the gap between past and future and enable a true modern renaissance of Arab culture, education and scientific discovery," said Lux.

"The Qatar National Library of tomorrow will be created to be a place between home and work. A strong digital library and a virtual reference desk are key services the Qatar National Library will provide before the new building officially opens," she further said.

In addition to providing access to the significant digital heritage collection about Qatar, Qatar National Library will also introduce the Gulf and Arab Science online portal, which is being developed in co-operation with prestigious international partners. The platform will be launched using digitised material from the British Library's Indian Office Archive, as well as its famous oriental manuscripts.

### **Bibliothèque Municipales à Vocation Régionale (BMVR), Caen – France Competition 2010 on design**

**Partner: Rem Koolhaas. Associate in charge: Clément Blanchet**  
12 700 m<sup>2</sup> (SHON)

The Bibliothèque Multimédia à Vocation Régionale (BMVR) is located at the tip of the peninsula, a focal point of the new development in Caen. The library is designed with two intersecting pedagogic axes which encourage maximum interface between disciplines: human sciences, science and technology, literature, and the arts. With its four protruding planes, the building points to four landmark points in Caen (the Abbaye-aux-Dames in the north, the central train station to the south, the Abbaye-aux-Hommes in the east and the area of new construction in the west), and becomes a symbolic centre for the city. The library consists of two intersecting reading rooms, which encourage maximum interface between the programmed disciplines: human sciences, science and technology, literature, and the arts. In the exterior spaces created by these intersecting reading rooms, the library interacts with its surroundings, opening up to a park, pedestrian pathway and waterfront plaza. The design of the future BMVR Caen meets the Haute Qualité Environnementale, a standard for sustainable building in France. The sustainable approach responds to local climatic conditions to ensure energy efficiency. Shallow floor plans maximise available natural light, creating the ideal reading environment crucial to a library. (OMA)

### **Chu Hai College, Library, Hong Kong – China on construction (2013)**

**Program:** 28,000m<sup>2</sup> of educational facilities including library, classrooms, offices, studios, cafeteria, lecture theatres, gym, staff accommodation.

Three imperatives drive the concept for Chu Hai College's new campus: a compressed time frame of two years for completion, the natural beauty of the site – a verdant hill overlooking Castle Peak Bay in Hong Kong's New Territories – and Chu Hai's venerable history (starting in 1947) of multidisciplinary education. The campus consists of education facilities for three faculties (with 10 departments) and two research centres over a gross floor area of 28,000m<sup>2</sup>. Seventy-five percent of this space is concentrated in two parallel horizontal slabs, which are each eight stories high. The slabs are conceived with speed and ease of construction in mind: all structural elements are on the exterior, liberating the floor plane for ultimate flexibility. The slabs are connected by a 'mat' of stairs and platforms that criss-cross between the buildings, acting as a circulation space for the campus and following the natural slope of the site towards the sea. Campus life is concentrated on the mat, which facilitates encounters between staff and students from different departments and offers views of the sea, the surrounding hills, and also, thanks to the aerated facades of the slabs, into the inner life of the college itself. Beneath the mat, the 'plinth' runs between the two slabs, beginning at ground level and rising to the fourth floor. It is a multi-level network of intricate spaces – in contrast to the simplicity of the slabs – including a cluster of four lecture theatres, a cafeteria, gym, and, the core of the college, the library. (OMA)

### **Cornell University, AAP College of Architecture, Art and Planning (Paul Milstein Hall), Ithaca, NY – USA on design (groundbreaking 2009) – 2011**

Occupying four distinct buildings at the northern periphery of Cornell's Arts Quad, the College for Architecture, Art and Planning (AAP) is currently a fragmented area, dislocated from the energy of university life. The new Milstein Hall – a 14,000m<sup>2</sup> complex containing much-needed studio, exhibition and crit space, an auditorium and a new Fine Arts Library – is conceived not as a symbolic, isolated addition to the campus but as a connecting structure: a large elevated horizontal plate that links the second levels of Sibley and Rand Halls and cantilevers over University Avenue, reaching towards the Foundry building. Where a car park once stood between Sibley and Rand, a contiguous, multi-layer system of buildings and plazas will unite the disparate elements of the AAP, creating a vibrant public space adjacent to the campus's most beautiful feature, just to the north – the Fall Creek Gorge. The four existing buildings of the AAP – Rand, Sibley, the Foundry and Tjaden Hall – exhibit varying architectural styles but share a single typology: linear, corridor-based buildings that segregate the AAP's disciplines in closed rooms behind a labyrinth of entrances, security codes and dead ends. Milstein Hall provides a type of space currently absent from the campus: a wide-open expanse that stimulates the interaction of programs, and allows flexibility over time. Within Milstein Hall's upper plate, which has access to Rand and Sibley, areas are defined not by walls but by subtle manipulations of the section that trigger particular uses: a sunken area for the library, raised areas for crit spaces, and open spaces for studios – all suffused with light from floor-to-ceiling windows and a grid of skylights. The roof of the upper plate, visible from the third floor of Sibley, Rand and Baker Lab, is an open platform with views of the gorge and the surrounding campus, and is gridded with vegetation that becomes denser in the direction of the gorge. Milstein Hall is intended as a building with hidden depths: the floor of the upper plate is punctured by the bulging ceiling of the lower plate,

opening a route to the lower levels. This bump continues to slope downwards on both sides, dissecting the lower plate into three areas with varying heights and depths: the lobby (on the Rand side of the building); the basement, with computer labs and meeting areas (in the middle); and a 282-seat auditorium that gradually rises to a double-height space (on the Sibley side). Like the upper plate, the auditorium has floor-to-ceiling windows, granting views both into the lecture theatre for passersby and out of it for students. Outside the auditorium, a sunken garden, exhibition space and plaza extends to the central, domed portion of Sibley Hall, reinforcing its importance and creating, for the first time, a coherent entry sequence from the north into AAP. Milstein Hall's sheltering cantilevers, both to the north and the south east, similarly define new areas of public space and encourage new ways to navigate the interlinked AAP. (OMA)

### Seattle Central Library, Seattle, WA – USA 1999 – 2004

At a moment when libraries are perceived to be under threat from a shrinking public realm on one side and digitization on the other, the Seattle Central Library creates a civic space for the circulation of knowledge in all media, and an innovative organizing system for an ever-growing physical collection – the Books Spiral. The library's various programs are intuitively arranged across five platforms and four flowing "in between" planes, which together dictate the building's distinctive faceted shape, offering the city an inspiring building that is robust in both its elegance and its logic. OMA's ambition is to redefine the library as an institution no longer exclusively dedicated to the book, but rather as an information store where all potent forms of media – new and old – are presented equally and legibly. In an age in which information can be accessed anywhere, it is the simultaneity of media and (more importantly) the curatorship of its contents that will make the library vital. Our first operation was to "comb" and consolidate the library's apparently ungovernable proliferation of programs and media. We identified five "stable" programmatic clusters (parking, staff, meeting, Book Spiral, HQ) and arranged them on overlapping platforms, and four "unstable" clusters (kids, living room, Mixing Chamber, reading room) to occupy interstitial zones. Each area is architecturally defined and equipped for dedicated performance, with varying size, flexibility, circulation, palette, and structure. (OMA)

#### **Libraries:**

#### Central Library Cork – UK 1<sup>st</sup>. prize 2005, on design

4.500 m<sup>2</sup>

The new Central Library of Cork is carefully placed in his urban context by a highly flexible building design. The ribbon of books fits every shape of a given plot. With this flexibility the building can smoothly adapt different edges of surrounding buildings without losing the quality of its use. This three storey high folding bookshelf contains the complete knowledge and 'wisdom' of the library. In between the ribbon span the so-called bridges, holding the library's special program. The library generates a quiet ambience of concentration providing a monastery-like space with relaxing gardens and introverted outdoor spaces. By this the library of the future will be and open and inviting house to everyone. (Pasel)

These restoration and renovation of a former minor seminary in 1935 (national monument, architect Jan van Hardeveld), additional construction, fixed and loose furniture of open learning center, restaurant and conference areas. The surrounding area is in collaboration with landscape architects redesigned with a new parking facility. (Atelier Pro)

#### Hague University Square + , Den Haag - The Netherlands 2006 - 2007

The project gives the Hague University + Square after 10 years again a contemporary face. The square and the adjacent spaces in the design modified and improved with the aim of achieving an atrium that meets the new requirements of the College states: the atrium and heart and soul of The Hague University. The square has a parallel with a square. The edges define the square. The square itself remains as empty as possible for activities such as a lecture, a fashion show or job fair. On the square is a solid information achieved, a meeting place for students, staff and external parties. Monitors, long benches and an olive tree together this meeting place. The edges of the square must be alive by Yahoo realizing the talent lane ", a series of small shops that education in various ways such as an international office, an agency culture, sports desk and a career center. Through the transparent doors from the square you see what happens here. The issuance of the restaurant was moved to the square, so the restaurant now has a terrace on the square. The space on the strip garden is fully refurbished and become a restaurant. On the first floor is the library involved in the square with a large open study area. There are computer workstations and informal consultation places created through a transparent glass wall bordering the square. The design and decor are a reflection of the diverse and colorful cultures in the Hague

University. Through a mix of Mediterranean colors and a variety of recreational places has created a warm contemporary atmosphere. The cone on the square has become green as a derivative of the new style. (Atelier PRO)

### **Trias VMBO School, Krommenie, Zaanstad – The Netherlands 2000 – 2007**

Atelier PRO for the Triassic VMBO Krommenie in a school for pupils up to 1800 and realized a sports center. The challenge was for each student to create their own place. The various building blocks to head volume along the Provincial Road placed at right angles to six wings. The inlets between the wings of a glass roof fitted so as a break room and consulting room can serve. Central heart of the school is a Brink connected to a sports field.

#### **The Brink**

The Brink is the unifying element of the Triassic VMBO. This is where you first come in before it spreads over the building. By ascending terraces on both heads creates a seclusion. In addition, the terraces and galleries in major events are used as grandstands. The wings and the industries have a prominent "face" to the Brink.

#### **Substructure**

The substructure students need a home. This is designed as a "house" of two floors around a light court, where the study areas and lockers are. The teachers in these areas are "houses" included.

#### **Sectors**

The home base for the superstructure, the student sector. Within each unit are inspiring work / training places. These are designed learning environments as realistic as possible. Each sector has its own consultation and working space for the teachers, a learning center and all pupils have their own locker.

#### **Sports Centre**

The construction of a sports center and a school close to each other creates an exciting connection. As the Brink is so central to the school sports field is the center of the sports complex. From the sports field there is a view in different rooms. To the south lies the large sports hall, according to NOC-NSF standard, suitable for competitive sports and to separate into three separate fields. There is also a gymnasium, a fighting sports hall, a gymnasium and a fitness and aerobics room.

### **Library of Special Collections Amsterdam – The Netherlands 1999 - 2006**

The plan for the complex buildings of the University of Amsterdam Oude Turfmarkt is a thorough history and urban planning is based. Examination of the development of the frontage played a role in the siting and design of the new Hospital entrance through the gate. This historic port narrow wins in the architectural plan of PRO power through a high and narrow light well with a glass roof. In the complex the university museum and special collection housed in the university. The whole site has the status of national monument. The core of the plan consists of an 'internal street' which gives the complex a new main. This internal street runs parallel to the Old Turfmarkt and is also accessible from within the Hospital grounds. The addition of a new glass facade get messy behind facades of the buildings on the side of the allure Binnengasthuis grounds that the name 'hofgevel' fits. The sloping rear house, a tangible reminder of the medieval land division pattern is defined by the glass facade as it were placed in a glass case. (Atelier PRO)

### **International School, The Hague – The Netherlands 2003 – 2006**

The International School The Hague (ISH) provides a learning and living environment for children from 0 to 18 years in childcare, culture and sports. Over 1300 students representing 60 nationalities. The size of the complex (15,000 sqm gross floor area) allows full central facilities to achieve, but asks for different age groups to the introduction of a smaller scale.

#### **Fine scale**

In the design, several design elements: a Play-Group, a Primary School, a Middle, Lower and Upper cluster. Each cluster has a 'lounge' where identity is expressed. These fine scale enhances the quality of teaching and provides every student a safe private place in the development of the appropriate age group. Compared to the Dutch in an international school education is the emphasis on the specific practice areas for music, drama, art, media and science and the many sports facilities.

#### **Plaza**

Central to the building, the 'Plaza': a long, high space as our organization, which functions as a central entrance, learning center and meeting place. There are also the "labs" for art, music and lounges, but also the theater used for lectures and courses, cultural events and events supporting the IHS presents itself to the international community.

#### **Estate**

The International School The Hague, a new estate of about 2.7 hectares, is located in the urban fringe area southwest of The Hague. In this particular environment, the school has a central place. The school is like a large disk placed on a raised plinth. The rear is a large sports field for cricket, golf and soccer. In an inlet, the entrance to the axis of the streets around the driveway to a representative with water features and an elegant park-like area for riding. (Atelier Pro)

### **De Meerpal, Dronten – The Netherlands 2004**

The winning plan studio PRO provides renovation and partial new construction rather than demolition. This keeps the Meerpal traceable as the logo of Dutch architecture from the second half of the twentieth century, but adapted to the current urban situation and focus on the use of today. Urban is the current complex and a square made entirely: a covered plaza behind a glass wall when the weather can be slid open. Again, integration of functions principle but in a way that the functions are not in your way. Characteristic elements of the draft of Klingerer be made visible again: the glass box, the roof supported by six columns and the oval volumes of the former theater open. This volume is a closed oval cinema with a top terrace with walkways, as a kind of 'hub', the various functions within the building together. New components, such as theater, music and library, are - in the spirit of the original building - as loose blocks around the indoor and slightly sunken courtyard. Maintained from the roof of Klingerer as always provides the visual unity and coherence. (<http://www.architectenweb.nl>)

### **Faculty Library Het Bushuis, Amsterdam – The Netherlands 1998 – 2001**

The so-called Bushuis, at the corner of the civic and the old Irish Burgwal Haute, Atelier PRO - together with an adjacent part of the East India House - converted into a library of the Faculty of Behavioural Sciences at the University of Amsterdam. The current Bushuis end of the nineteenth century in neo-style. The area defined as the East India House is much older, but over time lost much of its original splendor. A valuable exception is the restored meeting of the Heeren XVII of the VOC. Open structure The main entrance of the library is on the civic Irish Burgwal. By knocking out non-load bearing walls and making large openings in the supporting wall in the longitudinal direction of the building, the inner structure of the Bushuis made open and read. The attic of the Bushuis is a large room with a mezzanine for study places, the old wooden floor beams are left exposed. Courtyard : For the access structure is a distinction between a secured portion and an area - even at night - is freely accessible. The library is also accessible via the East India House in the new access structure is included. The integration of the library with the rest of the faculty is crowned by a glass roof of the second courtyard. This roofed courtyard, which is furnished as a cafe terrace, has an amorphous complex heart. (Atelier PRO)

### **Probiblio, Hoffddorp, Schiedam/Alkmar – The Netherlands 1996 – 1998**

Housing the provincial library center for North and South Holland consists of three building volumes, each with its own function, structure and appearance: a rectangular office, a round 'book drum' and a triangular connector that can accommodate special functions and informal activities. The most recognizable feature is the circular book warehouse shipping area which is home to 7,500

meters of book position. The wooden cladding (western red cedar) reflects the adjacent set of wooden farmhouses and barns to Hoofdvaart. The large "window" glass block that night serves as a lantern, makes the book store a logo at the junction of the Avenue and Goedhart Hoofdvaart. The office wing has a relatively open south elevation with strip windows and blinds. The north facade, designed as a wall with holes, forms a neutral backdrop for an old farmhouse. Internal logistics: The access structure and substructure of the office wing builds on the design of the educational wing of The Hague University. An extra wide corridor zone (3.6 meters) offers space for the column-side surgeries, copy and print rooms. On the wall built from prefabricated components bearing side stitch stairs offer short diagonal connections between the floors. A skylight over the entire length of the building means that all steps "to daylight" walking. The transparent triangular connecting link between the office wing rectangular and round drum book contains the atrium with canteen and serves as formal and informal meeting space for staff and visitors. At the end of the building is a training center that included the evening is used in conjunction with the atrium. (Atelier Pro)

## **pvanb Architects, Groningen – The Netherlands**

### **Rijksuniversiteit Groningen EBR-Bibliotheek (Economie, Bedrijfskunde, Ruimtelijke), Groningen – The Netherlands 2008**

The pvanb extension to the EBR Library subtly illuminates the programme as a present-day glass cornice, and forcefully complements the context of existing and new construction. In splendid fashion, the Library reflects its relationship with the surroundings as well as presenting an evident coherence between interior and exterior. Close co-operation between the client, architect and façade constructor has resulted in an exceptionally unconventional glass façade. The extension forms the second storey of a radical renovation of the WSN Building in which, in the first phase, the three lowest storeys on the north side are renovated and extended. The ground floor and the first floor are transparent, and provide space for a new – although previously designed – (study) plaza, while the second storey, with modern leaded glass, accommodates the Library. Although the new volume manifests itself as a single unit, the extension to the Library is situated between the plaza and the WSN Building, a fact that literally created a split assignment. The Library had to form an independent, present-day extension to the existing building but also dovetail with the plaza. In addition, the Library assignment required clear spatial organization and a tranquil working ambience.

#### **Programmatic task**

The WSN-building at the Zernike Terrain is radically renewed. It is the EBR library, a new (trial) and plaza to create more study space a new building on the existing volume added. The new building takes place in two phases. In the first phase, through the lower two floors of the existing building back on the north side achieved a new volume, the lower part is reserved for the plaza and was designed by an interior office. The floor above is for a portion of the library collection.

#### **Architectural challenge**

The architectural challenge of the first phase is conceived as a multifaceted challenge. First, it was important to create a design to get an independent, unique and contemporary addition to the existing building would form, while responding to already designed the glass front of the plaza. The most important was a clear spatial and logical library to realize that in terms of design, color and materialisation with facade would form a unit.

#### **Inspiration and concept**

The overall concept of facade and interior is inspired by the typical Dutch skies. Who derive their special character and dramatic contrast and alternation between different degrees of transparency and secrecy, and the richness of hues. This concept proved to be supporting both for bringing unity and coherence in the design of interior and exterior as to create a unique and contemporary look that still matches the existing building.

#### **Facade**

The facade of the library is conceived as an abstraction of the Dutch clouds. The facade is made of glass, different degrees of transparency. There is clear, tinted, figured and colored glass. It is completely transparent glass rimmed with pronounced, more angular aluminum frames in several colors. This gives the function of this glass windows in the form of abstracted clouds. The aluminum frames are the rest of the wall used to the monotony of styles to break if the separation between different types of glass to emphasize. The styles of the steps of the plaza were drawn by the library facade. This provides balance and consistency in the overall façade. The library is recognized as a separate feature, but is also part of the building as a whole.

#### **Interior**

The interior is the concept of the cloud used to plan the layout in a fun way to strengthen and emphasize. The layout itself is clear and logical, an open space where the bookcases are central and various other functions are grouped around it, or not separated by glass walls. The bookshelves themselves are positioned so that they collectively form a cloud in the open space. This is underlined by the carpeting, which in its colors and form a cloudy sky and thus represents a simple way both the routing and layout indicates. In the light, this layout also found, over the study areas and functional fluorescent lights above the bookcases lines of light that together form another cloud.

#### **Second phase**

In the next phase will be an additional floor to the library building are linked by means of an airlift. This building can be experienced as a pavilion on the water, but actually provides shelter to a lecture, additional library space and offices. Air bridge and pavilion as a whole and have designed the shape of a cloud party, from the clouds of the library facade comes. (pvanb)

## **Quist Wintermans Architecten BV, Rotterdam – The Netherlands**

<http://www.qwa.nl>

### **Libraries:**

### **Forum Building (Forumgebouw), Universiteit en Researchcentrum, Wageningen – The Netherlands 2002 – 2007**

35.000 m<sup>2</sup>

Architectural Quist Wintermans of Rotterdam signed for the construction of the Forum, a mission of Wageningen University and Research Centre (Wageningen UR). Bringing together knowledge from both teaching and research were the key principles. He also applied to the building the identity of Wageningen as 'City of Life Sciences' to be strengthened. The desire for education and research together is reflected in the ten-storey building Forum, which consists of a large volume seems to exist. There is no less than seventy percent of the educational facilities of Wageningen University housed, including about sixty classrooms, three hundred study areas, different practical rooms and a campus restaurant for 1400. Also located in the headquarters building of the library. Striking at the large volume of the Forum building is that it appears to be composed of small buildings. Instead of individual components are to be sustained in separate volumes in the design as close to each imputed that there is only one connecting gap remained open. The gap, the agora, is a series of courtyards, balconies and voids. Two bridges provide internal connections through the air. A second round spectacular atrium void is in the library section, which allows natural light into the heart of the building. The exterior of the Forum

building looks solid, according to the serious look of a scientific institute. Brick facades with small windows emphasize the large scale of the building. In two corners there are big holes in the walls, however made. Extremely large glass panes underline as the diagonal opening of the building. Clearly, in the Forum building in an orderly way, many features have been incorporated. The life of students and teachers is undoubtedly become more comfortable through, but the question is whether the building is a symbol of the university will grow. The solid, somewhat dull character appearing in any case that it directly as a new logo on the retina is burned. (<http://www.architectenweb.nl>)

## **Rapp+Rapp, Rotterdam – The Netherlands**

### **Libraries:**

**penbare bibliotheek Utrecht, Utrecht – The Netherlands 2012**

18,000 m<sup>2</sup> library

3,000 square art house, 120 apartments, 260 parking spaces Client: Municipality of Utrecht plan development Start: 2008

Completion: 2012 building costs: €50 million

There are quite a few steps put into developing the new Library ++ 'next to Utrecht Central. The Board agrees with the final award to architects Rapp + Rapp, the plan for the redevelopment of the Smakkelaarsveld and financial impact. The design process can now go. The new library is a building that literally and figuratively to the imagination. Library Artplex and apartments under one roof , the new building is not a traditional "store house of books." The addition of such organizations Artplex (film & entertainment) and Art Library is the place for information in Utrecht, floor, relaxation and meeting. Of course you are still books, CDs and art lend. But you can also play games, attend a lecture or debate, watch a movie, a cup of coffee or a bite to eat. The building also provides space for approximately 120 apartments, parking and bicycle parking. You may receive the Utrecht Centre for the Arts also has a place in the building. There, after a decision taken. The construction costs for the construction of the new Library ++ (including housing and parking) amount to more than 90 million euros. The council is asked voorbereidingskrediet of 2.2 million euros available for the further development of vision to Preliminary Design. This is expected to be completed late 2010. According to current planning the new library opened in 2015. (<http://www.bibliotheek-utrecht.nl>)

## **Rappange & Partners Architects, Amsterdam – The Netherlands**

<http://www.rappange.nl>

### **Libraries:**

**Library Diemen – Wilhelmina Plantsoen, Diemen (Prov. North-Holland) – The Netherlands 2008**

Commissioned by the former Rabo Vastgoed Rabo office on Wilhelmina Plantsoen Diemen converted into 43 apartments, 600 m<sup>2</sup> public library, 400 m<sup>2</sup> Rabobank branch and 46 covered parking spaces. For the library, the entire interior design including furniture, furnishings and lighting. (Rappange)

On behalf of the former Rabo Vastgoed Rabo office on Wilhelmina Plantsoen grown in Diemen. The conversion of this office, the walls completely demolished. The remaining hull: floors, columns, stairwells and elevator shafts were the starting point for the new design. This resulted in 43 spacious apartments with generous terraces and logia's. On the ground floor is a bank branch, a branch of the public library and 43 indoor parking spaces. (<http://www.architectenweb.nl>)

## **RAU, Amsterdam – The Netherlands**

<http://www.rau.eu>

### **Libraries:**

**ROC Leiden, Leiden – The Netherlands 2003 - 2011**

Gross floor area: 54,300 m<sup>2</sup>

Function: Regional Training Centre in VMBO, offices, industrial, retail and parking garage

Performance: including flexible structure and layout of siding recycle. concrete and low net / gross floor ratio by integrating systems in the construction

The ROC Leiden, with over 10,000 students and 800 staff are awaiting resettlement. Drive around Lammenschans arises from such a new vision of vocational training and work a busy city: easily accessible, on a human scale and literally transparent. Lammenschans: the triangle between the Leiden-Utrecht railway (stop RijnGouweLijn), the Rhine-Schie canal and Lammenschansweg (close to A4). A gateway to the eastern flank of Leiden potential. The ROC - vocational training for thousands of students, hundreds of directions and dozens of buildings. "Innovative learning:" learning in an open, entrepreneurial and socially responsible institution where the individual career comes first ". This innovation takes the same time as the building form. The new ROC stacks and traffic capabilities to a light, ascending, meandering building on an otherwise vacant parking lot of the ROC. Thus, in the same gesture and shadow noise nuisance to adjacent residential area, the moving pressure and land costs kept to a minimum. A surprising urban design theory in which all forms of education visible. Suppose you were the small buildings of a large educational campus that is now widely distribute over the space stacking up to 5 towers sloping at 3 different large tables. You would win for outdoor plazas. Then you could loose buildings grouped on and around the table tops. That were beyond the courtyards. It was not a building but a small vertical town from different buildings. Because markets and associated ramps. Not only before the building but also in the building heights are staggered squares, with green and shops. The most central market in the center of the building is accessible via escalators. Here are the library and information center. The different activities are grouped around these markets, places of encounter and cross-fertilization. All the 'accommodation' together form the "ROC City. ROC is part of many traffic. Thousands of train passengers passing through every day Lammenschans station (purple). Disembarked, they decorated with green cover by means of ROC (green) to the present paved "active" square socket on the local bus (yellow), or the green zitplein the fast tram (red). 1,500 bicycles and 750 cars disappear under ROC (blue). Our own expedition runs from behind (pink). For a great layout flexibility, both the ceiling clouds and the connecting point for air conditioning, electrical and data cabling all tuned to a grid of 1.8 m. This allows even the smallest pattern in this room of 1.8 meters at any place in the building realized. (RAU)

**Multifunktionszentrum Antares (Tabakssteeg) Leusden Zuid, Leusden – The Netherlands 2005 - 2010**

Gross floor area: 8.400 m<sup>2</sup>

Function: 2 primary schools, nursery, playgroup, after school, public library, community center, gym and free rentable space

For the construction of the district Tobacco Lane (Leusden-Zuid) creates a truly multi-purpose center. Already in the run saw the opportunity to sum to more than the parts. Together under one roof is more than building a share, it creates additional opportunities. In the Gelderland Valley between Leusden Centre and South, west bounded by the 'cherry line (track) created the residential Tobacco Alley. Tobacco brought here in the 17th and 18th centuries temporary wealth. And tobacco fields with little in between "comfortable bunches" of alder and lime, dominated by huge barns. 'Living Village', a diverse neighborhood of 880 homes. For starters, families and seniors. A comprehensive service center of 6500 m2 will house childcare (KDV and BSO) a kindergarten, a public elementary school and a Protestant Christian, a gym, a library, community center and a 12 starter homes. Are all under the roof of a large brown "community shed", with entries in all directions. By combining internal activities, there is growing space for new products. So the library will provide the documentation for the schools and the community center with an entry form: the reading café. Hall lived in the farmhouse the farmer and his family with horses and other livestock under the same roof and Horticultural. Each in his own place around the beams and the common interior space. For all their own, instantly recognizable living room and entrance. For cattle and sheep the sunken deep litter with high and low door, the horses next door bannerlord great, the people most of the windows were. In the shadow of the linden bun. Around two patios are from the northeast corner of the two elementary schools, the library (south), the community center, the PSZ, the KDV (west) and a covered bicycle shed (north). All with one face and entrance to the street. The gym is on the first floor in the heart of the building, the BSO above the community center. At the western end of the first and second floors 12 apartments. All other user groups can also also within reach through. Each user has a smooth finished and easy to clean 'service box', with toilets, storage, kitchen and the elevator and stairs. Each box has its own distinctive, both inside and outside immediately recognizable color. In the more kept mostly gray and white interior, with a concrete floor screed with transparent white whitewashed ceiling and leaves room for the imagination, these bright boxes direction. To protect children playing outside the fences without having to place the squares two feet deeper. Bicycles can not just take away and if children are not just steps away. Also in the building are the departments studied. The transition to the next user is always marked by a very lazy kick - 5 steps of 10 cm. - Which directly represents a stand and a play object. "Together in a building 'delivers on all fronts value. Double rooms can be used: the local library is also working as a library for the school and if space remains, a theater and auditorium. The craft room at school in the afternoon for the BSO and evening courses. That makes a difference: in the land seized in construction costs in cleaning, maintenance, energy - more compact form - and to personnel. (RAU)

**Haarlemmermeer Lyceum and Public Library, Hoofddorp – The Netherlands 2000 - 2005**  
Gross floor area: 10,200 m2

Function: Montessori education VWO, HAVO and VMBO, two gymnasiums and a public library (see aequo <http://www.aequo.nl>).  
Performance: including concrete core, heat pump system, ceiling clouds, thermal storage, renewable materials balanced ventilation with heat recovery

The world upside down? An integrated school, library and space for social and cultural facilities built in a landscape that is new construction to be formed. Haarlemmermeer district Floriande and its facilities are together! The municipality of Haarlemmermeer in June 1995 along with the provincial and central government including the Covenant Implementation Vinex (Fourth Memorandum on Spatial Planning Extra) closed. According to this agreement in the Haarlemmermeer in the period from 1995 to 2005 approximately 17,400 homes built. Floriande (Hoofddorp), 6500 is the largest of four locations. A district can build a community must grow. For that you meet, get to know each other, doing things together. Haarlemmermeer Lyceum and the new library here in symbiosis Floriande to a head and heart function to fulfill: a glass cup filled with knowledge and a strong red back which everything depends. A square with room for seats, instead of bicycles. They stand on the roof. Mothers with children on their way to the library, people who are sports, school children and high school students, everyone to function separately but together - especially in the center - again and again touching. The solid red back ends in a glass head that is filled with the thoughts of centuries, blue and shimmering against the sky emerges. a quiet contrast to the surrounding buildings resurrection. Forward ranging from an introverted extrovert and a safe learning environment in communication library. On the one hand serve the individual training, on the other, the development of the individual to the community. The left flank, the various educational groups, each with their own accommodation, the library building up in age and size: Montessori, substructure, superstructure and subject rooms. The scale and 'green' tie in with the form and structure of the 'garden city' Floriande. On the right flank hooks the community with sports, an auditorium and administrative support. This end goes into a common square. Aanfietsende the pupil runs along a ramp at the edge of the square on the roof of the auditorium and descends into the school. In school, all functions by a ramp connected. It leaves the auditorium and turn it back at half height. Which initially has a gallery, forming a balcony above. Then Meet the stairs to the bicycle, and end with the hanging high in the library media center. Right under the smoke of Schiphol is not necessarily suited to the outdoors for natural ventilation. Acceding to the inside air is to be 'controlled' within. And will also edit out again: after heat recovery. The combination of concrete core with which acoustic ceiling clouds and light facilities are included ensures a pleasant indoor climate (koeling!) and excellent acoustics. (RAU)

**Faculteit der Rechtsgeleerdheid Bibliotheek Leiden, Leiden - The Netherlands 1998 – 2004**

20.000.000 m<sup>2</sup>, €29.300.000

The monumental Kamerlingh Onnes Laboratory of Leiden in the city dates from 1856. Solitary buildings of the complex in a park developed by compaction into a new city block. Until recently, physicists working in this Laboratory named after the Leiden professor Heike Kamerlingh Onnes. He reached the first temperature to a thousandth of a degree above absolute zero (-273 C) and the superconductivity discovered in passing. Other great physicists like Lorentz, Bohr and Einstein worked in the laboratory or lectures as a guest lecturer. After an extensive renovation, the complex Kamerlingh shelter to accommodate the entire law faculty. This faculty was gradually dispersed over a large number of buildings and is now back together in one building. The original building at the Stone Barn is on the outside restored the historic facade of architect of the King (King William) Henry FGN Camp (1821 - 1875) visible. From inside the building is renovated with valuable interior elements such as the impressive lecture intact. The already built in the last century, the new central entrance vestibule. The buildings on the Nieuwsteeg maintained. Of the buildings on the Zonneveldstraat the walls re-clad. The existing concrete skeleton is placed fourth floor. This is 3.5 meters from the front line put back so that the sunlight of Zonneveldstraat improves. On the side of the building Langebrug has three floors realized. Through these interventions create a new city block with a large trapezoidal-shaped area in the heart. essential and central in the Faculty of Law is the relatively large library. Storage and access to knowledge, curiosity, the desire to learn. The library is like the heart of the

faculty in the infield located and comprises one storey with two mezzanines. Daylight come around inside the library as well as through a glass tube. This is all a direct visual contact is possible with the outside environment. Around this library are the four components (three existing, new) associated logistics. This leads to a circuit of teaching, research and catering supplies around the library. On the ground floor, first floor and basement are almost all public spaces. On the other layers are not longer part of the public spaces. The lecture halls for lectures and seminars limits to the library and received by the top and side light opal-glass-brick walls. Guiding principle in all architectural interventions has been the fundamental value of daylight. has created a flexible, multipurpose building that can significantly contribute to the identity of the new Faculty of Law. By the grace of daylight. (Ruijsenaars)

#### **Bibliotheek en Kunsttuin Stadshart Amstelveen, Amstelveen - The Netherlands 1999 – 2001**

6.500 m<sup>2</sup>, €6.805.000

The public library of Amstelveen is a beautiful spot on the west side of the Square. As an important community institution is the library the entire west side of the square. On the south part, the library itself with the culture and strip on the north side of the housing and commercial buildings. Frontal, the library itself to the square. Transparent and open it gives insight into its content. But there's more, she has more faces. First she gives shape to the entrance of the city center. Flanked by the bus station above the parking garage and hotel and museum on the other hand the library is the central entrance to the large underground car park beneath the square. The road from the Imperial Karelweg sinks slowly down and across the board goes into the large car park. The library rises above ground and give space to the car. The floor of the library and curl up is the gateway to the city center. Much daylight as possible to the assists and exit. In the row direction the library is divided into a northern part with most of the support areas and a southern part which is the major lending space. Between the two sections in daylight penetrates through to the exit. The central atrium also brings natural light into the heart of the library and organizes them lying areas. In technical terms, the climate and natural central air discharge area to the backbone of the building. The side walls of the vast building to filtered light. The façade on the square is open and clear. Transparency, readability, clarity. By the grace of daylight. (Ruijsenaars)

#### **Theater Bibliotheek en Stadhuis Stadserf Schiedam, Schiedam - The Netherlands 1995 – 1997**

22.500 m<sup>2</sup>, €18.604.989

The beginning of Schiedam in the 13th century was driven from the castle to house Riviere. The castle was looted and burned down. Since 1574, it is for the Broersvest as a ruin as a silent witness to the beginning. The city government moved to the Grand Place in 1973 and came back to the city office tower in Stadserf. Around emptiness. The current Schiedam, after an eventful history has become a city of 75,000 residents, threatened by a gaping beaten bare space in the heart to fall into a western and an eastern part. The muted Broersvest as major traffic artery, which increased splitting effect. The city hall tower and the ancient ruins stood helpless in that empty heart. The main challenge in the master plan for this area was to create a new city center for all of Schiedam and therefore literally a bridge between the old core and the increasingly important field station on the east side. The connection on the back Broersvest, land of Promise to the new purpose Stadserf was an important condition. Liduina the Basilica and the Great Church conspire to make that leap. Lange Kerkstraat gets a natural extension of the Stadserf. The two church towers are a new direction and spatial link east and west. The Stadserf the new central area of Schiedam, the new city room, the new heart. The walls of this room are in close harmony formed by a residential retail and office complex on the south side, and a new administrative and cultural center on the north side. The facades are the first wall of the city room and only secondarily the skin located behind buildings. On both sides by arcades, the buildings part of its volume price as a transition to the square of the city room. In the northern part constitutes arcade central access to a multitude of functions: the Library, the city archives, theater and Stadswinkel, the central public department of the concentrated urban services. Public intensive functions such as restaurant, cafe and exhibition space nest on the piano nobile in direct contact with the city room. The library carries it from the upper layers to the vibrancy of the square. From the main entrance is a further route to the site library, archives, theater and urban. Only the new multifunctional council chamber adjoining new housing for the Board of Mayor and Aldermen is tucked away from the main entrance, and is directly linked to the various city departments in the existing house municipal offices. For evening use for the purposes of Council and committee has a separate entrance providing the Singelstraat. Under the complex is a parking garage for 92 cars and a bicycle parking for 450 bicycles. Both facilities have a direct access to the central entrance hall. The various components are situated somewhat independently and have their own specific function also got its own character and atmosphere. The public library is a room flooded with daylight which has become the will to learn can take shape, quiet but always in touch with the world around you. In the city archives is the reading room as a focal point between the well-equipped archiving facilities access to the past. The theater has its box-in-box construction is not only a beautiful backdrop for the requested list stage, but offers its remaining space, the foyer, also an additional theatrical provision for the unexpected. Even the Stadserf, the city room, can serve as the backdrop for the stage as a place for everyday or a sudden event. Stadswinkel with the information and exhibition space is a wonderful space to just enter. The parts together to try to shape the urban space, the square and surrounding streets. The history remains in the ruins and the pavement of the square prominent. Also from the Stadserf the ruins visible through the arcade around. Cross-pollination between culture, governance, history may have exciting implications, and thus could until recently desolate area will hopefully become a new heart for all of Schiedam. (Ruijsenaars)

#### **Stadhuis Apeldoorn, Apeldoorn – The Netherlands 1987 – 1992**

32.600 m<sup>2</sup>, €23.100.000

Knowing that a central location of City Hall in the center of town is essential for casual accessible using the house of the city, this design attempts to City Hall the most obvious place to take in the center, the north side of Market, on the empty spot along the Deventerstraat. Not only is the Town Hall so a dialogue with the existing Town Hall, but above you acknowledge form to the formless and desolate marketplace. The choice of the City Hall site should be considered in the long term, as a guiding mechanism for the further future. Awareness of the significance that Hall may have as the home of the city where you receive your guests as a community, where you come together for important events, is essential for the further development of Apeldoorn. The city is a living organism. By daily habit, we often develop long-term anymore, yet the sense and meaning of an intervention for the future are essential for the health of that organism. The identification of the naturalness and obviousness of the development of this city is a prerequisite. Apeldoorn has grown tremendously in recent decades. Major new districts were built, the population rose to almost 150,000. As often happens, also remains in Apeldoorn, the development of the center slightly behind. The pressure on the heart increases. Main Street is one of the busiest shopping streets in the Netherlands. Good infrastructural facilities such as the city gates, with parking, have been constructed or are underway. Compaction of the center is inevitable. The core center was 150 years ago, still is. It is amazing to see how the same core is also a city that can serve more than ten times as large. That is the power and also the charm of Apeldoorn. The center is full of new initiatives. Closer, more intense and maintaining the start, while maintaining the urban structure in the nature of Apeldoorn in such a significant degree. The City Hall is trying to market a natural and obvious way that process and send. As the Hall outwardly conforms to the surrounding buildings in the building lines and heights, as it organizes

itself around the inside Burgerzaal. As the market's main square in town, so is the Burgerzaal the central square within the building. From the market you come from a wide ramp or stairs inside the Burgerzaal the piano nobile. A beautiful area of approximately 15 meters wide, 30 meters long and 20 meters high! On either side lazy stairs in a relaxed way to connect the different floors. Bright light is on both sides, filtered by stone columns, in this great hall. All floors are organized around this central space. Burgerzaal This may be an important added value to the city, exhibitions, musical performances, major events, reception areas, and such events can take place right here. Through these activities will contribute to the Town Hall lower the threshold for citizens. The casual impulse visits may increase and contribute to an identification with your own City Hall. This space and not the council chamber or the Stadswinkel is the main area of the City Hall, not in the first place to board, the board or the municipal staff, but above all the citizens. On the west side of the Burgerzaal are the council chamber and committee rooms. On the east side is the Stadswinkel. Both areas are about 7 meters high and covered with a diffusing bowl. Together with the Burgerzaal, these spaces by changing daylight played? Backbone? part of the public. Both a low down to the basement as a layer up to the office of the Society sector is thus spatially related and is public domain as a whole. On the 4 floors above are the various areas of municipal staff. The top four layers of this thing put back the walls and, together with the orbital altitude of approximately 15 meters below the approximately 53 ° receding imaginary roof profile. On the roof of the Burgerzaal, further withdrawn from the walls, there is finally the central technical area. The structure of the building is designed so that large open-plan spaces created, with the majority of the requested work start on the outside walls is located . Deviate from the first floor flooring work something out and thus forming on both sides of the Citizens' Hall on the second floor, two patios. The vegetation of this summer patios is also a sunscreen for the council chamber located beneath and urban. The self-service areas are situated and designed so that as many employees can arrange their own environment. Ordinary radiators, open windows, ventilation through windows or special ventilation where necessary due to noise, or by suskasten dauerlüftung (as is usual in the housing), individually controlled outside awning, etc.. Night ventilation through the daytime heat stored in the structure back naturally wegventileerd. The central functions Burgerzaal operates as central exhaust. Outside air is cooler at night through the small windows in the facade, the pores in the skin, through the offices around, and through the passages extracted from natural draft in the main hall. The building drain. The town hall Apeldoorn has long again in the Netherlands the first major office building where natural ventilation plays a major role: after several years of use have been proved to be the overall saving is significantly higher than originally calculated. You could say that the offices so made, if you would like to have them at home. Where necessary (as in kitchen / restaurant, computer rooms, etc.) is a simple mechanical ventilation provision is set aside. Daylight and transparency play an important role in the design. In the colonnade can be seen a reference to the architecture, which is typical in Apeldoorn is present in the turn of the century villas built. The greenhouses, verandas and elegant wood structures in addition to a simple main mass filled at that time a similar function as the colonnade now fills. In summary you could say that the new Town Hall for a long time an image defining enrich the heart of Apeldoorn wants to be a capital gain that transcends that of an administrative council offices and, not least because of its low threshold, the inhabitants of Apeldoorn is the chance of their home, their city identification. (Ruijsenaars)

## **Seed Architects, Alkmaar – The Netherlands**

<http://www.seedarchitects.nl>

### **Libraries:**

**CEC (Cultural and Educational Centre) “De Binding”, Langedijk (Alkmaar) – The Netherlands 2008**

9.600 m<sup>2</sup>, €11.200.000

Across the Langedijk town hall, cultural and educational centre ‘de Binding’ has been realised. The centre offers accommodation to a secondary school, a library, a music school, an artist’s studio, a toys loan centre, and a youth work centre. In addition, the complex hosts numerous cultural and educational activities, such as lectures, exhibitions and theatre performances. De Binding is the cultural and educational heart of the municipality of Langedijk.

#### **Concept:**

Integration in urban fabric

The layout of the building reflects the historical town structure of Langedijk. The building consists of three parts: the islands, the route and the elements. Each part has its own materials and architecture, which refers to the local architecture of Langedijk. As a result, the exterior consists mostly of bricks, zinc, steel and wood. These materials give the building an artisanal and village-like character, anchoring the building in the Langedijk community and its surroundings.

#### **Sustainability:**

Underground storage and concrete core activation:

The building uses heat and cold storage in combination with concrete core activation. This is a technology where the concrete floors provide heating and cooling for the building, thanks to the energy stored in the soil. This makes the building extremely energy-efficient and sustainable.

daylight incidence:

Daylight incidence is an important factor for realising flexibility of use. Daylight incidence and pleasant views are considered to be universal values, as a result of which the building is perceived as a much more attractive place, with the added benefit that the rooms can be used for several functions. In addition, a view on the surroundings ensures an easy orientation inside the building, and visitors can find their way without trouble the first round.

sun blinds:

The fixed sun blinds can be adapted to the seasons: in summer, the position of the sun is high and there is little direct incidence, while in winter, the position of the sun is low, with a lot of incidence. Without obstructing the view, these sun blind keep the heat inside in winter, and keeps the heat outside in summer. The blinds require little maintenance.

materials used:

Traditional materials such as brick, wood, glass, steel and lead make the building blend in well with the village. By applying these materials according to modern standards (window sills set back, verges, greying of wood) the maintenance forecast is low.

auditorium / theatre:

The auditorium of the secondary school has a striking appearance, and is situated in the water. This site refers to the strong traditional bond between Langedijk and the water. This is still very evident in the old auction house "Broekerveiling", and the residential district "Duizendeilandenrijk", where the old lay of the land, small farmland plots criss-crossed with ditches and canals, has been preserved. The auditorium can be seen by passing traffic on the adjacent through road. The design of the auditorium also allows it to be used as a theatre hall. In the daytime, the auditorium can accommodate 600 pupils, who can eat their lunch or make their homework. In the evening, some 350 people can enjoy a theatre performance. The auditorium has a stage, balcony, ascending floors, control room, dressing rooms, artist foyer and the required theatre equipment. The theatre function could be fitted into the

auditorium by efficiently positioning the various rooms. Since its opening, several theatre companies gave performances in the auditorium, amid great interest of the Langedijk residents.

**Flexibility:**

Eighty percent of the programme is situated in universal building blocks, the islands. They have taken their direction from the Geestmerambacht Polder and are made of robust bricks. The islands proved to very flexible, so that the specific schedules of requirements of the various users could be fitted in easily. Any changes in the future can be implemented easily through the application of wall systems. The users can also use each others' facilities.

**fresh colour scheme and atmosphere:**

The interior of De Binding is characterised by a fresh colour palette. Seven palettes were developed for the floor finishing of the islands. Each user made a selection from these palettes. As a result, the various islands each have their own, recognizable atmosphere within the unity of the complex. The different colour palettes are connected by a clearly identifiable line of bright purple and green elements. These thread the colour palettes back together again, so to speak. Bright purple and green can be found, for instance, in trophy cabinets, display cases, lockers, chairs, tables, cockpits, a consultation room and a janitor room.

Most visitors to De Binding come from the direct vicinity, and for this reason we included many facets from the neighbourhood in the design and choice of materials, both outside and inside, and gave these a modern application. All visitors perceive the affluence of light through the glass in the main street as a reference to greenhouse gardening, and it also helps them with their orientation. The pupils find their way through their own side entrance and continue to the first and second floor. Walking through the main street, the users present themselves to the other visitors through shop windows and views, similar to the Dorpsstraat in Langedijk, so that the building always makes a lively impression. The alternation of building blocks and the transparent clearances help the visitor in finding his bearings. With individual inscriptions in the concrete, the users are connected with the building for ever. The materials used for the auditorium, designed as a theatre, refers to the well-known Broekerveiling Auction House, which is also partly in water. There the main street ends with a large window offering a view of the landscape of Langedijk. This part of the main street, functioning as a foyer, is also the place where the creativity centre exhibits its productions. The theatre, situated on the first floor, commands wonderful views of the surrounding area, and during a performance it is really a meeting place. The materials used, brick, smooth concrete, steel, wood, and glass, ensure that the building will retain its beauty, despite its intensive use. The various large visuals on the walls and the two highlighted colours green and purple turn the interior into a surprising experience. (Seed)

## **Soeters van Eldonk Architecten, Amsterdam – The Netherlands**

<http://www.soetersvaneldonk.nl>

**Libraries:**

**Cultuurcluster 1 Bibliotheek, Veenendaal (Prov. Utrecht) – The Netherlands 2007**

3.600 m<sup>2</sup>

In the new city centre of Veenendaal, the former Hollandia wool factory is being converted into a culture cluster, housing the library, the Het Kleine Veenlo museum, the historical society and the art-lending facility. The design was approached first from an urban design perspective. Because the complex is not located along the main route, it has been linked to a new building. This new building ensures that the main entrance is located on the new Kees Stipplein and connect to the new street structure. The old factory chimney was retained, in the courtyard between the old building and the new edifice. Because the tower is now somewhat hidden, it mainly works at a distance, in the Veenendaal skyline, and you only see it again once you are inside the culture cluster. The Nervilike columns in the new building that end in the support structure for the floors are inspired by the industrial concrete structure of the old factory. This stacking of columns and floors has been made visible from the square through the glass façade. The knitting patterns incorporated in the outer walls refer to Veenendaal's wool tradition. As in knitting, the brick walls feature variations in colour and relief, creating light and dark effects. They are brick Scandinavian jumpers in cable stitch and moss stitch, as it were, with a trim underneath that serves as a classical plinth. Weaving patterns can also be found in the play of flat and moulded clickbands in the façade. (Soeters)

## **van Tilburg Ibelings von Behr architecten, Rotterdam – The Netherlands**

<http://www.tibarchitecten.nl>

**Libraries:**

**Cultuurhuis Pléiade, Doorn – The Netherlands 2006**

4.600 m<sup>2</sup>

The dual-function hall and cultural center, providing a basis of this building was chosen, asked for very flexible and multifunctional use of space. There was a careful integration of these cultural and historical site in downtown Doorn near the church of great importance. The compact building shows itself externally as a coherent whole without the smaller scale of the environment from the sight. Inside the building a welcoming large central space that provides clarity and guidance. This space provides access to all public functions and is also a meeting place for citizens, managers and employees. In the oval public hall is also the library. The book is up at the back of the oval. The chamber is designed so that it can serve as a theater, cinema and conference room. A large glass wall on the main street, residents can see the city council and the council meeting. Underneath the building is a public parking garage. The garage provides direct access to the oval space in the heart of the building. Van Tilburg Ibelings von Behr have a long experience in sustainable building. Sustainable architecture means that a building over a long period must retain its character and should not respond to the fashion of the moment. This requires a careful choice of materials, with our low maintenance environmentally preferred materials. For example, in Doorn sedum roofs applied, the drainage disconnected from the sewer system, be innovative installation techniques, such as weather-dependent scheme, which is FSC wood. (<http://www.architectenweb.nl>)

The new Culture House provides accommodation for both the municipal and the library. The task required a flexible attitude of the designers. The program and even in the course of the change process. The program has the peculiarity that the building should be designed for two purposes, namely for some time as a town hall council chamber and offices for civil servants, then without major alterations to function as a cultural center. In the process the communication with the population and the large number of entities in the complex housed an important role. The dual function; hall and community center as a starting point of this building was chosen requires a very flexible and multifunctional building that is in his space. There was a careful integration of these cultural and historical site in downtown Doorn next to the church of great importance. The building shows itself externally as a coherent whole without the smaller scale of the neighborhood from losing. Inside the building has a large central space that provides an overview and orientation. (Tilburg)

**Stedelijk Gymnasium, Mediatheque, Den Bosch – The Netherlands 1998 – 2002**

Client Municipality of Den Bosch, Location Paleiskwatier, Den Bosch, Size 4650 m<sup>2</sup>, Design 1998-2001, Execution 2001-2002  
Costs 4 million Euros

The „Studievilla“, is the new premises of the Stedelijk Gymnasium in Den Bosch. The starting point for the design was the fact that the building should add a new concept to the existing ideas about education. Therefore the building should allow for changing forms of education. A mix between traditional classrooms and open spaces for individual education has been designed. In terms of materials the building has been made attractive for both pupils and teachers. The upper floors of the building cantilever 8 meters, sheltering the entrance. On the ground floor there are two entrances, pupil functions and an auditorium. Classrooms are located above and below the Mediatheque on the first and third floors. The Mediatheque, on the second floor is a large open/plan floor in the middle of the school. The third floor contains the schools sports hall as well as the biology and chemistry labs. The fourth floor houses staff rooms and administration spaces. (<http://www.mimosa.eu>)

Client: Utrecht Development Corporation (Ogu)

Multifunctional building: Library, PA school, art center, church, sports, information center, day care for mentally and physically disabled, community center and 55 homes.

### **Gevelbeeld**

De architectonische vormgeving van de campus is geïnspireerd op het beeld van een klooster. De uitstraling is robuust en krachtig; het grote formaat baksteen (kloostermop) en de diepe negge's in de buitenmuren zijn beeldbepalend. Het plan kent meerdere bouwdelen, die door hun programmatische invulling een divers gevelbeeld opleveren. De vormgeving van de school is ritmisch en regelmatig, de gevel van de sporthal is meer robuust en de gevel van het kunstencentrum is transparant en onderscheidend vormgegeven. De volumes op de hoeken worden in een sterk tekenend reliëfverband gemetseld. De gevels aan de binnenzijde van het plan zijn pluriform vormgegeven; naast baksteen bepalen glas, beton en hout hier het beeld. De transparante gevel van het kunstencentrum gebaseerd op een ritme van muziek. (Yanovshtchinsky)

### **Het nieuwe Cultureel Kwartier**

Ooit was het de plek van de Engelse landschapstuin, straks is het de plek waar geschiedenis, heden en toekomst, jong en oud, inwoners en bezoekers samenkomen. Een afwisselende plek die past in de traditie van de karakteristieke pleinen, straten en parken zoals Assen die kent. Met een nieuw plein, de Pelinckhof en een nieuw cultureel centrum, de Nieuwe Kolk wordt het een ontmoetingsplek. Niet alleen een nieuwe ontmoetingsplek voor cultuurminnend Assen, maar ook onderdeel van een levendige wandelroute tussen de horeca aan de Markt en de winkels rond het Koopmansplein, terwijl 's zomers de plezierjachtjes vrolijk varen in de kop van de Vaart. Een nieuw monument aan de centrumring waar eerder de rechtbank, het stadhuis, het Drents Museum en de Jozefkerk een plek kregen. Het biedt onderdak aan het theater, de bioscoop, het centrum beeldende kunst, de bibliotheek en natuurlijk een grand-café. De oude distilleerderij aan de Vaart krijgt een extraatje in de vorm van een glazen orangerie. De historische muur en de monumentale trap verbinden de Pelinckhof met haar directe omgeving. Het plein vormt de

opmaat naar het 'cultuurportaal', de hal waar alle culturele activiteiten samenkomen. Met in het gebouw ook nog eens een groot aantal woningen. Ruimte voor cultuur, wonen en werken. Een geweldige luifel markeert op het plein de hoofdentree van de Nieuwe Kolk. Hier loopt het plein bijna vloeiend door in het zogenaamde cultuurportaal, de centrale plek in het gebouw. Een hoge open, transparante en lichte hal waarin het theater, de bioscoop, het centrum beeldende kunst met beeldentuin en de bibliotheek allen een eigen plek hebben en samen een levendig beeld opleveren. Centraal hierin ligt het grand-café dat voor iedereen goed bereikbaar is. Vanuit de foyers van het theater en de hoger gelegen kantoren van de bibliotheek en Biblionet heeft men een fantastisch uitzicht op het cultuurportaal, het grand-café en de stad. De vides, de omloop van de foyers en de vele doorzichten maken van het cultuurportaal een bijzondere, lichte en feestelijke ruimte. Het theater heeft een prominente plek in het cultuurportaal. De grote zaal ligt als een ronde fel gekleurde snoepdoos in je blikveld. In de zaal omarmt het publiek als het ware de speler(s) in deze intieme houten ruimte. Twee balkons zorgen ervoor dat het publiek dicht op het toneel zit. De eigenschappen van de zaal maken het mogelijk zowel klassiek toneel als musicals, cabaret en theaterconcerten uit te voeren. In combinatie met de orkestkamer, die naadloos op de zaal aansluit, ontstaat een akoestiek, geschikt voor symfonische kamermuziek. De bioscoop ligt deels verzonken in de grond aan de Pelinckhof en is bij binnenkomst via de hoofdentree direct toegankelijk. De foyer ligt iets lager, aan het plein, en vormt de centrale ontmoetingsruimte. Van hieruit wandel je met uitzicht op de Pelinckhof naar de verschillende lager gelegen bioscoopzalen. De openheid van de foyer vormt een contrast met de zalen waar het juist gaat om de persoonlijke beleving. Omdat het cultuurportaal, de bibliotheek, de foyers en de bioscopen zichtbaar aan de Weiersstraat en de Pelinckhof liggen, nodigt het gebouw uit om naar binnen te lopen. De facilitaire, ondersteunende en logistieke ruimtes bevinden zich op een minder zichtbare plek, net als de laad- en losruimte aan de Alteveerstraat. De ondergrondse parkeergarage is vanaf de Alteveerstraat makkelijk bereikbaar voor auto's. Fietsers kunnen vanaf de Vaart zo de fietsenstalling in. Lift en trappenhuizen leiden naar boven, naar het cultuurportaal. Daglicht en kleurige wanden in de garage zorgen voor een prettige sfeer. De horeca in het gemeentelijke monument aan de Vaart nummer 2 verbindt de Pelinckhof en de horeca aan de Markt. Terrassen zorgen voor extra levendigheid aan de Vaart en de Pelinckhof. Er komt een groot aantal woningen in het gebouw. Een deel van die woningen kijkt uit over het prachtige groen van het Parkje van Huges. De hoofdingang van de woningen is bereikbaar via de Vaart. De overige woningen bevinden zich aan de Alteveerstraat en de Weiersstraat, met de ingang aan de Alteveerstraat. Deze woningen kijken uit over de stad. Ze hebben een royaal balkon op het zuiden met zicht over het groene dak. De woningen hebben allemaal een eigen parkeerplaats in de parkeergarage. De Nieuwe Kolk in de stad der paleizen Het nieuwe cultureel kwartier is een monumentaal, ambachtelijk gebouw. Het wordt gemaakt van baksteen en glas, en past daarmee in de traditie van de paleizen van de stad Assen zoals de kazerne aan de Vaart, de rechtbank en de Jozefkerk. De gevel bestaat uit afwisselend open en dichte delen, afhankelijk van wat er achter is gehuisvest. Bioscoop, theater of centrum beeldende kunst, ze hebben allemaal hun eigen gevel. Aan het gevelpatroon dat hierdoor ontstaat kun je de voorzieningen als het ware aflezen. Een ritme van open en gesloten, van licht en donker, maar altijd zo dat het gebouw ook 's avonds veiligheid en warmte uitstraalt. De details van het gebouw sluiten aan bij de rijkdom van de monumentale gebouwen van de stad. Passend in de Novelle (het beeld van de Asser school), met kernwoorden als monumentaliteit, ontmoetingsplekken, veiligheid, degelijkheid en vriendelijkheid naast warm en voornaam. Een monument voor de toekomst: De Nieuwe Kolk is een duurzaam en energiezuinig gebouw, een gebouw gemaakt van duurzame materialen, maar bovenal een gebouw waarin het prettig werken en verblijven is. Hoge ruimtes en veel daglicht zorgen voor een prettige sfeer in het gebouw. Het gebouw is energiezuinig; met hoogwaardig geïsoleerde gevels, vloeren en daken. De energie die nodig is om het gebouw te verwarmen en te koelen wordt zoveel mogelijk duurzaam opgewekt. In het gebouw wordt onder meer gebruik gemaakt van de zon als licht- en energiebron en vindt warmte en koudeopslag in de aarde plaats. Samen met de toepassing van betonkernactivering is het bovendien een schoon gebouw, met schone lucht en lage CO<sub>2</sub> uitstoot. De daktuin levert zuurstof aan en vangt fijnstof op. De kantoren hebben uitzicht op de daktuin. Een duurzaam gebouw is ook een flexibel gebouw en je kunt er op verschillende manieren gebruik van maken. Zo kan bijvoorbeeld de bibliotheek gemakkelijk gebruik maken van de kleine theaterzaal met haar foyer bij activiteiten als lezingen en presentaties. Terwijl bij grote evenementen de foyers, de kleine zaal, het cultuurportaal, en de omloop samen met het grand-café een grote doorlopende feestruimte kunnen vormen. Ook het toneel van de grote theaterzaal kan gekoppeld worden aan het cultuurportaal zodat het toneel te gebruiken is als feest- of dinerzaal. Door dit flexibele en efficiënte gebruik van de ruimtes kunnen extra inkomsten binnengehaald worden. Kortom, een gebouw met zijn wortels in de stad. (DeZwarteHond)

#### **In combinatie met Greiner Van Goor Architecten en BAM Utiliteitsbouw**

It was once the site of the English landscape garden, soon is the place where past, present and future, young and old, locals and visitors meet. An alternate place in the tradition of the typical squares, streets and parks as Assen knows it. With a new square, the Pelinckhof and a new cultural center, the New Kolk is a meeting place. Not only a new meeting place for culture-loving Assen, but also part of a vibrant walking between catering to the market and shops around the Merchant Square, while in summer the pleasure yachts sail merrily into the head of the canal. A new monument to the center ring where previously the court, city hall, the Drenthe Museum and the Joseph Church had a place. It is home to the theater, cinema, visual arts center, library and of course a grand café. The old distillery on the canal gets a bonus in the form of a glass conservatory. The historic wall and the monumental staircase connecting the Pelinckhof with its immediate surroundings. The square is the prelude to the "porch culture", the hall where all cultural activities together. With the building also a large number of homes. (DeZwarteHond)

Vermelding Jaarboek Architectuur in Nederland 07-08

Het faculteitsgebouw voor Wiskunde en Natuurwetenschappen van de Rijksuniversiteit Groningen is een van de eerste nieuwe gebouwen in de herontwikkeling van de Zernikecampus. Het gebouw bevat de centrale voorzieningen van de Rijksuniversiteit voor de hele campus. Naast kantoren en werk- en onderwijsruimtes bevat het een restaurant, een bibliotheek, collegezalen, een tentoonstellingsruimte en twee winkels. Dit programma is aan de buitenkant zichtbaar achter de volledig transparante plint over twee lagen. Daarboven zweeft een groot volume, bekleed met blauw gezeefdrukte glazen panelen, waarin de werk- en onderwijsruimtes van de faculteit gehuisvest zijn. De Zwarte Hond kreeg van West 8, de supervisor van het gebied, de opdracht mee om op deze plek een transparant gebouw te ontwerpen. De opdrachtgever wilde een snelle bouwtijd en een flexibel, licht en uitnodigend gebouw. Dag en nacht. Landschap met hoogteverschillen Twee grote atria doorboren vanuit het bovenvolume het plafond van de onderste lagen en zorgen voor daglicht en oriëntatie in het hart van de publieke vloervelden. Het maaiveld van de campus en de vloer van zowel de eerste verdieping als de begane grond zijn afleesbaar en beleefbaar als een doorlopende vloer: een landschap met hoogteverschillen. Een grote, terrasvormige trappartij met tentoonstellingsruimte leidt de bezoeker vanuit de entree

door een van de atria naar de eerste verdieping. De verdiepingshoge glazen gevels bieden een panoramisch uitzicht op de omgeving en maken activiteiten van buitenaf zichtbaar. Vanaf deze bel-etage verdelen de verkeersstromen zich verder door het gebouw. De grote, open plattgrond van de eerste verdieping ontsluit het restaurant, de bibliotheek, de reprovinkel en een grote collegezaal, en maakt in één oogopslag duidelijk hoe de bovenliggende verdiepingen bereikbaar zijn. Collegezaal: In het andere atrium zweeft de grote collegezaal als een witte wolk boven de bibliotheek. De bundeling van publieke functies op de onderste lagen versterkt het openbare karakter van het gebouw. Verkeersruimtes krijgen een lobbyachtig karakter en lopen vloeiend over in gebruiksfuncties. De ruimte is waar mogelijk open gelaten of afgescheiden met grote glazen panelen. Functies die wat meer beslotenheid vragen, zoals de balie of de uitgiftegebieden van het restaurant, zijn zoveel mogelijk als vrijstaande objecten vormgegeven. Spectaculaire binnenwereld Door dat het blauwe volume als een grote sculptuur hangt boven het publieke landschap van terrassen, vides en trappartijen, ontstaat er onderin het gebouw een karakteristieke en spectaculaire binnenwereld. Het lichte, terughoudende kleurgebruik in het interieur versterkt de ruimtelijke structuur. Het scheidt een rustige, utilitaire atmosfeer, passend bij het karakter van de faculteit. Bovenin komt echter het blauw consequent terug als kleur van de vloeren, waardoor ook in het interieur het verschil voelbaar is tussen publieke gedeeltes onderin en een meer besloten wereld boven. Staalskelet: De beperkte bouwtijd en de gewenste flexibele structuur van het interieur resulteerden in de toepassing van een stalen draagconstructie, die zowel binnen als buiten zichtbaar is gebleven. Ter plaatse van het blauwe volume is het staalskelet ingevuld met houtskelet elementen. Om het objectmatige van het gebouw te benadrukken, is het beeld van het exterieur tot een hoge mate van abstractie opgevoerd. De verschillende lagen waaruit het gebouw is opgebouwd zijn zichtbaar gelaten en interfereren met elkaar. De belijning van de constructieonderdelen en de beplating van de gevelconstructie zijn in aanzicht herkenbaar en de raamopeningen zijn in een ogenschijnlijk willekeurig patroon over de gevel gestrooid. Tenslotte is de buitenzijde voorzien van een half transparant vlies door het hele volume in te pakken met blauw gezeefdrukt glas. De opeenstapeling van lagen, diffuus zichtbaar achter het bedrukte glas, geven de gevel diepte. Daarmee krijgt de scheiding tussen gebouw en omgeving een extra dimensie. Dit effect wordt versterkt door de weerspiegeling van de parkachtige omgeving. Gezond binnenklimaat: Op verzoek van de opdrachtgever is in dit gebouw betonkernactivering toegepast. Hierdoor zitten er geen radiatoren in het gebouw. Dit scheelt niet alleen in onderhouds- en schoonmaakkosten, het levert vooral een enorme vrijheid op in het gebruik. Door de constante temperatuur in het hele gebouw zijn mensen niet aangewezen op speciale lesruimtes, maar kunnen ze overal werken. Blauw: De indigoblaue kleur van het exterieur is in samenspraak met de opdrachtgever tot stand gekomen. De diepblauwe kleur zorgt voor een sterk maar ook harmonieus contrast met de groene omgeving. Door de transparante en reflecterende eigenschappen van het glas varieert de kleur en indruk dat het gebouw maakt sterk naar gelang het weer: van oplichtend en helderblauw bij zon tot donkerblauw en imponerend bij een zwaar wolkendek. De Bernoulliborg neemt nu al een vanzelfsprekende plek in op de campus. Overdag als een bijenkorf, zoemend, beweeglijk en druk, als transparant lichtbaken wanneer het donker is. (De zarte Hond)

The Bernoulliborg, located on the Zernike Complex (Nijenborgh 9), is a new building of the University of Groningen. It can accommodate 350 staff members and 500 students. With its size of 33 by 83 meters and a height of 27 metres the building has plenty of room for the central departments of the Faculty of Mathematics and Natural Sciences and the departments of mathematics, computing science and artificial intelligence. The architects of architectural firm De Zwarte Hond designed the building, which is covered with blue silk screened glass panels and placed on a two-storey transparent plinth. Through the reflective glass, both the environment and the construction of the building are visible. In April 2008 a dome was placed on the roof of the Bernoulliborg with an observatory. The observatory contains a 40 centimeter F/8 Ritchey-Chrétien reflecting telescope which was a gift from the Gratema Foundation. It was first used in May 2008. (<http://www.rug.nl>)

### Educatief Centrum, Harkstede, Slochteren – The Netherlands 2002 – 2005

4.700 m<sup>2</sup>

programma: 2 basisscholen, kinderdagverblijf, peuterspeelzaal, bibliotheek, sporthal en kantine

Het Educatief Centrum Harkstede combineert verschillende functies onder één dak: een openbare en een christelijke school, een kinderdagverblijf, een peuterspeelzaal, een bibliotheek en een sporthal. In deze zogenaamde brede school is tevens ruimte voor een aantal gemeenschappelijke voorzieningen. Deze zullen ook door dorpsverenigingen gebruikt gaan worden. Het centrum is gelegen in een parkachtige omgeving. In het ontwerp is rekening gehouden met een toekomstige uitbreiding. Om te komen tot een zo compact mogelijk gebouw zijn de programma's waar mogelijk gestapeld. Tussen de verschillende vleugels, soms links, soms rechts van het centrale bouwdeel geïmponeerd, ontstaat ruimte voor speelpleinen en entrees. Metselwerk bepaalt het gevelbeeld. Door het verschil in hoogte tussen het centrale volume (twee lagen), de vleugels (één laag) en de dubbelhoge sporthal ontstaat een gelaagdheid die door het gebruik van verschillende metselverbanden extra wordt versterkt. Bij de positionering van de brede school is rekening gehouden met de as die vanaf de Hoofdweg naar de Dorpshuisweg loopt. Zodoende is de hoofdentree van het complex goed zichtbaar. Het park vormt een fraaie groene toevoeging aan de school- en de speelpleinen. De twee-onder-een-kappers rond het park zullen in architectonische samenhang met het Educatief Centrum worden ontworpen. (De zwarte Hond)

#### **Waitakere Central Library & UNITEC (University New Zealand, Institute of Technology) Facility, Auckland – New Zealand 2006**

Client: Waitakere City Council / UNITEC, Location: Auckland, New Zealand, Approx. Value: \$35.5M, Floor Area: 8000m2  
Completion: February 2006

#### **Awards:**

NZIA Resene Local Award for Architecture 2006

Designed by Architectus Auckland in conjunction with Athfield Architects, this project consists of the new Waitakere City Central Library, which also integrates the UNITEC collection, and new teaching facilities for the UNITEC Institute of Technology. Sited adjacent to the existing UNITEC building in Henderson, the two buildings (and a third, attached car parking building) are arranged around a new pedestrian street and urban square to form a new civic precinct. Part of a building program that includes the nearby Waitakere Civic Centre, the project is intended to act as a catalyst for the future development of the Henderson CBD (Central Business District). The Library is the largest in the City, with a depth of collection and a range of services greater than any of the city's other libraries. The collections available include a specialist the collection for the entire library system, an extensive New Zealand and Pacific collection and a developing corporate library service. The general health collection of the adjacent UNITEC Nursing and Health Studies faculties have been integrated with the public collection while the specialist textbooks have a separate section for staff and students on the upper floor of the library. The previous Henderson Library was one of the most highly used public buildings in the central business district with just on a quarter of a million visits per annum. The new building provides a greater range of services as well as providing for future growth. The new UNITEC building accommodates general teaching, laboratories, lecture and student facilities and administration. (Architectus)

### Archoffice, Auckland – New Zealand

#### **Libraries:**

#### **Papakura Library, Auckland – New Zealand 2011**

The existing Library within the mall of a 4 storey building suffered from poor design and CIPTED issues with many tenancies vacant and the library isolated on the third floor. Our approach was to open up the arcade, bring the library to the ground floor and set up access from the carpark via the lift. Part of this work involved a new frontage treatment to the main street which consisted of a new glass canopy. (Archoffice)

The new Birkenhead Library and Civic Centre is a purpose-built new generation 2,600m2 library situated on a reserve site in Birkenhead, Auckland. The architectural concept for the library is based around a simple narrative of looking through ancient trees that existed on the site to the view - thus notions of solid and void, transparency, light quality, pattern and form were considered and modeled to inform various design demands. The intention was to have a pleasant and verdant quality of light available within the building that subtly changes during the day, leading to the building becoming transparent at night. The building enjoys a unique setting in the existing elevated Neil Fisher War Memorial Reserve. Birkenhead Library and Civic Centre makes a noticeably positive contribution to the surrounding built environment. The return of a library to the heart of the Birkenhead business district, after a four year absence, has been welcomed by all. (Archoffice)

#### **Albany Library, Auckland – New Zealand 2007**

A new Area Library within an existing building. The project comprised a high IT content (DVDs and CDROMs), Adult, Young Adult and Children Fiction and Non-Fiction. It incorporated North Shore City Council's satellite area office and Mobile Library. (Archoffice)

### **Libraries:**

#### **Elmar Turner Library Extension, Nelson – New Zealand 2005**

In 1994 Upstream Design Group carried out an extremely successful conversion of a car show room into a new library for the city of Nelson. In 2004 the original designers, now being part of Arthouse Architecture Ltd, were asked to carry through with the next stage of expansion for the library. It was decided to extend in a northerly direction with a new roof form which could address the Maitai river frontage in a dynamic way. A bright red weatherboard block punctuates the change in form. 600 m2 of new building was provided with improved seating area for patrons, improved circulation, children's area, activity room, new computer teaching space and research room, and more extensive work areas for the staff. Glass screens to the computer area, stainless steel power poles and blocks of coloured flooring and walls break up the space. The new pitched ceiling reaches out towards the river and by freeing up more space the internal views of the atrium garden and upwards through the original clerestoreys are able to be appreciated again. The low energy systems developed in the original design have been carried through in the extension with natural lighting and ventilation once again being utilised. (Arthouse)

NZIA Waikato Bay of Plenty Architecture Award 2012 (Public Architecture)

### **Literature:**

Architecture NZ, Jan/February 2013 pg 59-64

Following recent development of new commercial outlets away from Whakatane's town centre, Te Koputu a te Whanga a Toi : Whakatane Library & Exhibition Centre relocates public facilities back into the centre to revitalize an area of big box retail and carparking left devoid of urban life.

Library, museum and gallery facilities are placed within an abandoned large scale retail space, reinvented to provide meaningful and effective public architecture for the people of Whakatane. Irving Smith Jack Architects won a design competition for this civic reinvention, with an architecture explored and subsequently developed through research and consideration of how an existing 'big box' can be reconnected back to public use, and to encourage greater library participation within a Provincial community. (Irving)

## **Warren and Mahoney, Auckland – New Zealand**

### **Libraries:**

#### **National Library of New Zealand, Wellington – New Zealand in design**

The National Library has announced an extensive building redevelopment in Wellington in concert with leading architectural practice Warren and Mahoney. Work on the building is expected to start towards the end of 2009 and be completed by late 2011.

"The New Generation National Library of New Zealand will be a library that never sleeps. A place where access to New Zealand's documentary heritage inspires new ideas and leads to the creation of new stories and knowledge. A library for all New Zealanders to connect with, wherever they are." Penny Carnaby, National Librarian and Chief Executive

Prime Minister Helen Clark and the Minister Responsible for the National Library, Judith Tizard, announced today a major investment in the redevelopment of the National Library of New Zealand. The redevelopment project involves capital spending of \$69 million over five years (of which \$18 million has been previously allocated), with the project due for completion in late 2011.

"The redevelopment will open up and expand the building, making its valuable heritage collections more accessible to the public, and creating almost 4000m<sup>2</sup> of additional storage and exhibition space," Helen Clark said.

"The National Library's collections are estimated to be worth \$1billion. They include material such as journals and notebooks of Katherine Mansfield, Sir Apirana Ngata's papers, and a diverse range of books, cartoons, paintings, photographs, and sound recordings. It also houses the Alexander Turnbull Library.

This development is a major milestone in the history of the National Library. A 21st century library for the digital age will be created," Helen Clark said.

The redevelopment will provide controlled storage environments, which meet international preservation standards for collections, and will enhance research space and facilities.

"The Library's collections are the nation's richest and most valuable heritage collections, as well as being a vibrant hub of contemporary knowledge. They deserve our attention and investment in how they are preserved and presented," Judith Tizard said.

"The redeveloped Molesworth Street building will be built on the existing structure. It will maximise use of public space in the parliamentary precinct, add space for exhibitions and digital services, and incorporate environmental sustainability features," Judith Tizard said.

Work on the building is planned to start towards the end of 2009 and be complete by the end of 2011. The National Library will ensure that its collections continue to be available during the redevelopment.

Design objectives for the building redevelopment

- \* Increase the level of accessibility of the building and its contents to New Zealanders and the international community
- \* Increase the quantity and quality of archival space, allowing greater capacity for the building to protect and preserve valuable collections
- \* Increase the building's internal legibility
- \* Increase the visibility of and access to the Alexander Turnbull Library
- \* Recognise the place of Māori and New Zealand's place in the Pacific and the world
- \* Use an environmentally sustainable design.

Features of the building redevelopment

- \* More exhibition and collections space, with an additional 3965m<sup>2</sup> of space
- \* Updated controlled storage environments that meet international preservation standards

- \* More prominent presence for the Alexander Turnbull Library
- \* Enhanced research spaces and facilities
- \* Interactive spaces for digital access to collections
- \* 3D and multimedia experiences
- \* Improved environmental footprint, incorporating innovative and leading-edge environmentally sustainable features
- \* Create a more multicultural presence, using external and internal design features to additionally recognise the place of Māori and New Zealand's place in the Pacific and the world
- \* Five-storey high atrium to showcase the building's valuable collections
- \* Low-energy design elements including natural ventilation, ground source heat exchange, rain water harvesting, use of bio or alternative fuels. (<http://www.sharearchitecture.co.nz>)

A project of national and international importance, a portal to the memory of New Zealand. The redevelopment of the National Library will provide a unique opportunity to transform a major national institution into a centre for research, connection and creation. Symbolically the redevelopment is charged with the responsibility to represent both the historical reality of New Zealand as well as its changing place in the world. The energetic, sculptural screen which dominates the entry façade is an abstract sculpture – a carving echoing the artistic traditions of Maori and the confidence of a country which is increasingly recognised for its ability in high technology industries. The project incorporates the entire original structure of the existing building which was completed in 1986. These ‘bones’ are retained as a vital template for the new design and will continue to provide a stable structural and environmental ‘core’ for the new and transparent perimeter. The final built result will also reflect the New Zealand government’s stance on sustainable building design and incorporates the building’s content itself into active ESD strategies.

(<http://www.worldarchitecturenews.com>)

### **Westgate Town Centre and Library, Auckland – New Zealand 2013**

The Westgate Town Square and Library is the anchoring civic component of the development of a new town centre at Westgate. This project will not only establish a benchmark for the future urban form but it will also establish its human qualities, its sense of place and provide a core community destination - the design is motivated by the desire for a dynamic, exciting and sustainable new civic environment which will serve the Westgate community for 100 years.

The new library building is compositionally arranged as a 3 level volume fronting the Town Square together with a two storey volume addressing Waru St. The main entrance is located at the corner of the site, facing the main Town Square space. This provides maximum legibility for the entrance while also adding the ‘energy of movement’ to the public open space. The most effective contemporary libraries are easily understood and navigated and are defined by clear lines of sight and excellent natural light.

The building is distinctively a ‘stacked’ form, breaking down the overall building mass and allowing clear expression of the individual floor plates and their particular activities. This floor plate configuration generates a dynamic relationship at the building’s corner, expressing the life of the library to the outside world. The building’s openness also reflects the philosophy that good public libraries are open and vibrant with community life by both night and day. This visual openness and legibility also supports engagement with the community, encouraging access and creating a welcoming destination that is both comfortable and familiar for all users.

The building form, materiality and colour also seek to reflect the informal and colourful culture of West Auckland and Waitakere. Anodised aluminium panels, zinc cladding, timber soffits and expressed concrete structure combine to provide a substantial and visually exciting architecture.

However, this informality is countered by the need for ‘civic substance’. The clear rhythm of concrete columns facing the town square reinforces the order and stability of a civic institution. This is seen as particularly important in a ‘greenfields’ situation where there are no existing ‘cues’ for civic life. Above all else, the new library building has the responsibility to capture the aspirations of a future community. To this end, its architecture cannot be transient but must embody the recognised motifs of community, tradition and civic character. Achieving these values in a contemporary way is the core challenge of the project.

#### **Sustainability**

The building is the pilot project for the development of the new ‘Custom’ rating tool for the New Zealand Green Building Council. Sustainability is a central value of this project, and our team has pioneered the ‘new age library’ in New Zealand over the past ten years. The ground has shifted, however, from simple energy conservation to the careful consideration of how a new library can act as a catalyst by having a positive impact on the immediate and wider context. At Westgate, this is achieved by considering the building and public spaces as an educational opportunity for the community. Libraries are about knowledge and learning and our concept considers the opportunity for a ‘sustainability journey’ to be incorporated into the building and public open space. The educational aspects of this concept allow the project to be a living ‘billboard’ for sustainability that can influence all of the development sites that define the town square and wider town centre.

The ambitious environmental and social aims of the project represent an opportunity to continue the legacy of leadership in the built environment shown by the Waitakere Council within the new Auckland ‘Supercity’ framework. (Warren)

### **Upper Riccarton Community and School Library, Christchurch, NZ – New Zealand 2006**

#### **Awards:**

2006

**NZIA Architecture Award Community & Cultural**

Upper Riccarton Community and School Library Christchurch, New Zealand Warren and Mahoney Limited A new facility integrates a new community library with a local high school's existing collection and IT resources. The Upper Riccarton Community and School Library draws on Australian precedents for joint-use facilities and proposes a dynamic new structure in which school and community can interact. The new library incorporates outdoor reading areas, a dedicated café, a children’s library, community meeting rooms and comprehensive multi-media learning and research tools. Four shared teaching suites provide research and tuition opportunities for students and allow school computer resources to be available to community groups after hours.

A linear ‘one box’ volume, the steel-framed glazed collection enclosure is book-ended by a ramped entry porch (where school and public interact before moving into the building) at the south and an outdoor reading room to the north. A transverse service component, clad in timber paneling, slides east-to-west across the main space and encloses back-of-house workrooms, staff facilities and the community meeting room. The cruciform plan is extended by four teaching spaces adjoining its eastern edge, which looks out to a new quadrangle and the existing music school beyond. The design represents a considered response to the Local Authority’s environmental policies and includes a number of sustainable design strategies, which have been deliberately exposed for educational purposes. The new library enclosure is passively ventilated, with motorized operable windows at high and low levels to generate cross ventilation with high-level extraction over the summer months. Passive ventilation is augmented by roof-mounted extract fans at times of peak temperature. Full-height motorized vertical louvers (automatically tracking with the sun) screen east and west-facing glazing. A raised floor slab incorporates a highly efficient pump-driven waterborne heating/cooling matrix, which responds to

seasonal temperature requirements. Solar water heating, low energy lighting, double glazing, higher-than-code insulation levels and strategically placed thermal mass complete the environmental design strategy. Stormwater collected from the building's roof is stored in an in-ground tank for reuse in the toilets and the irrigation system. Low water-use plumbing fittings have been specified to further reduce the building's annual water consumption. Runoff from asphalt parking lots, together with excess roof water, is distributed to a rain garden and drainage swales to minimize impact on local stormwater infrastructure.

<http://archrecord.construction.com>

This building is a notable New Zealand first: a purpose-built, mixed-use facility that integrates a new community library with the Upper Riccarton High School's existing collection and IT resources.

Drawing on Australian precedents, the concept provides a dynamic new structure in which school and community can interact. It also builds on the success of the South Christchurch Library, incorporating outdoor reading areas, a dedicated cafe, a children's library, and comprehensive multi-media learning and research tools. Four shared teaching suites provide group research and tuition opportunities for students during the school day while allowing the school's computer resources to be made available to community groups after hours.

The new library enclosure is passively ventilated, and uses environmentally sustainable design principles to minimise requirements for air-conditioning and its associated energy use.

In-slab heating and cooling capacity, motorised external louvers, daylight-sensitive lighting, and electronically-controlled operable glazing are some of the mechanisms that allow the building's fabric to monitor climatic changes and reconfigure itself to accommodate them on a continuous basis.

The library is a landmark structure, providing a valuable community resource as well as a much needed gateway to Riccarton High School's western precinct. (Warren)

### **Karori Library, Wellington – New Zealand 2005**

#### **Awards:**

**2006 NZIA Architecture Award Community & Cultural**

The Wellington City Council brief for a community facility included a library, public toilets, café, community centre and public urban spaces. Fronting Karori's main road and located in the heart of Karori's shopping centre, the Karori Community Centre is highly visible and easily accessible.

A staged landscaping design proposal provides access and linkages to the Library and Community Centre, the existing Art and Craft Centre, Recreation Centre, and public toilets.

The two storey library presents two main facades; a town square entrance, highly glazed with sheltering roof form to the north, and street façade, glazed at pedestrian level with upper wall, perforated with glazing to reduce solar gain, but allowing views of interior activities at the upper library level. The cladding uses hardiflex panelling set to shallow angles, providing a textured surface to the street, modulated by the regular glazing set out at ground level.

Internally, the upper level is set back from the street façade for visual, air circulation and stair connections between floors. Interior public volumes form large spaces with generous scaled ceiling heights to suit. A precast double T floor system provides floor loading requirements for library stack collections, and a reflective surface of painted patterned ribs aid lighting. Concrete surfaces are exposed providing thermal mass assisting mechanical air ventilation system, which is circulated within the concrete ground floor, to high level collection grilles along the building's length. This reduced the need for ducting services. Glazing is Low E solar control quality which has allowed greater glazed zones for visibility to the street. The client encouraged these linkages to make the library accessible. Back of house activities for staff are located along the rear of the building, away from public areas and direct sunlight. The café, run by separate tenants, is accessed from both the library, and town square, allowing interaction with library users. Provision for all the library collection requirements have been met, including a specialised spaces for children's reading, computers, video displays, and local heritage documents.

A palette of materials includes painted red walls, local artworks, and timber veneer. Flooring combines colour carpet strip inserts linking with the exterior paving patterns to the town square and proposed stage two urban areas. Reuse of existing laid commemorative pavers and a historic ramp have been incorporated into the town square's access ramp linking to the Recreation Community Centre. (Warren)

### **Whangaparaoa Library, Whangaparaoa – New Zealand 2004**

#### **Awards:**

**2006**

**New Zealand Property Council  
Education & Arts, Merit Award**

**2005**

**NZIA Local Award  
Community & Cultural**

This new generation library was designed to provide a range of community services while, at the same time, helping to regenerate and develop the Whangaparaoa civic space through high quality urban design.

The library's corner location creates a strong entrance to the Main Street shopping precinct. Window boxes cantilever out, making visual connections to Whangaparaoa's sea views. And the modest civic square that surrounds the library's entry, and aligns with the adjacent shopping centre entrance, creates an integrated community environment. In addition to the library, the structure includes a Plunket centre and a community meeting room.

From the outset, the brief was to produce a quality urban design outcome for the Whangaparaoa community. This was achieved through coordinated consultation, collaboration, and design, with careful consideration being given to energy efficient solutions and resource conservation – including a storm water retention and re-use system.

The design focuses on expressing the building's materials – double-skinned honed concrete block walls, and low emission double glazing. The natural textural finish of the walls provides a durable low-maintenance and sustainable primary structure for the project. A light-weight steel roof folds and waves over the walls, hovering lightly, and opening up to allow natural light and passive ventilation throughout the depth of the plan.

The project also provides a setting for three specially-commissioned works by local artists. A delicate freestanding bronze and stone sculpture by Peter Oxborough is located in the outdoor courtyard. While, inside, works by Lindsey Kerr and Jaqueline Oust enhance the order and rhythm of the architecture.

External lighting design also provided an opportunity to integrate art and architecture. Peter Stoneham worked with Warren and Mahoney to design the luminous blue and white lighting that animates the building, creating a presence for both day and night.

There is no doubt that the success of this project has contributed to enhancement of the built environment and to the community's connections with Whangaparaoa's Town Centre. (Warren)

## [Kristin School Library and Senior Study Centre, Auckland-Albany – New Zealand 2004](#)

### **Awards:**

**2004**

**NZIA Local Award**

**Education, (Kristin School Library & Information Centre)**

...This iconic building is built around a central gully area and surrounds the well-developed bush with the trees being preserved to add to the character and aesthetics of the building.

Effectively several buildings in one, this is a multi-purpose facility, which incorporates the Library and Information Centre, Senior Study Centre, Senior Administration and Public Gallery and Conference facilities.

The Library and Information Centre occupies the first floor of the building and houses the main library for the Middle and Senior Schools as well as a separate Junior School library. It also includes reading and seminar rooms that class groups can use for supervised reading or research-based lessons.

The Senior Study Centre on the ground floor includes a study room as well as a senior common room with an external courtyard for Year 13 students.

The large open central space has been utilised for parent dinners, art exhibitions, the Xmas shop, Middle School socials and much more....

<http://www.kristin.school.nz/web/portal/business-services/world-class-facilities>

Kristin School is, in essence, three schools – a primary school, a middle school, and a senior school – nestled within one campus. And over the past decade, Warren and Mahoney has undertaken two major projects for this innovative organisation.

The first project, completed in 2004, was an Information Centre and Library. This takes the form of a rectangular east wing and a larger, curved west wing, with the two wings linked by a gallery.

The east wing houses the school's administration area at ground level, with a junior library and associated teaching spaces above.

The west wing houses a senior study and common room at ground level, with a further library on the first floor.

In keeping with the school's green ethos, the building's form and orientation maximises the benefits of solar gain as the sun moves around the building. Extensive north and east facing glazing maximises winter sunlight, while air-foil louver blades or composite aluminium-clad blades at high level shade the interior from the summer sun.

All linea fluorescent luminaires use energy-efficient T5 lamps. Automated lighting control conserves energy use in intermittently-occupied spaces. And lights adjacent to the extensive perimeter glazing are linked and controlled via photocells which automatically turn off the lights when there is an adequate level of natural daylight.

In addition to providing daylight, a series of roof lights promote summer cooling, naturally extracting air from the interior.

Electrically-operated sashes located within the roof lights generate a draught stream which draws the warm air out of the space.

Overhangs for roof lights ensure spaces can be ventilated without the risk of rain entering.

Low-level external louvers, equipped with motorised dampers, combine with high-level motorised sashes in the roof lights to enhance ventilation during the day.

During summer, the only areas with mechanical ventilation are the computer room of the senior study, the senior library computer area, and the junior library. These are areas where equipment requires a controlled atmosphere, or where acoustic separation is required between adjacent naturally ventilated spaces.

The second project, a Humanities & Commerce Faculty and Middle School Learning Centre, was completed in 2009.

The high-profile site of the new development – bordering a predominantly residential area and North Shore Golf Course – provided an opportunity to show off the school to the wider community. At the same time, the extent of the site enabled large distances to be maintained between the new buildings and the neighbouring residences, and ensured that the neighbours' visual and aural privacy would not be adversely affected.

As the brief developed, it became evident that the school required two blocks of 12 additional classrooms. An approximate footprint for additional classrooms had been identified in the global resource consent, with each block intended to be a separate stage.

The new classrooms would be in addition to the original classroom blocks established when Kristin School opened in 1973. The first stage, the Humanities and Commerce building, would include six humanities classrooms, six commerce classrooms, faculty administration and resource areas, an ICT hub, a reception area, and workspace.

The second stage, the Middle School building, would include six Year Seven classrooms, six Year Eight classrooms, Middle School administration and resource areas, and student social space.

The classroom block is comprised of three wings, reflecting to optimise the north-orientated court, sheltering it from winter south-westerly winds and opening it to summer breezes. This green, landscaped space forms the heart of the middle school development.

Combined with the landscaped court between Stages One and Two, it helps to reduce the apparent mass of the development. A maximum depth of one classroom also ensures that natural light and ventilation are optimised, while creating a transparent learning environment.

In addition, the building form and material palette of precast concrete and cedar rusticated weatherboard plains, linked by an atrium and structured landscape, continues the architectural language established in the earlier Library and Information Centre.

(Warren)

## [Glen Eden Library, Auckland –New Zealand 2004](#)

This community library is the result of an intense design process involving architecture, landscape, art and local iwi. The library is intended to form a local community focus, connecting the commercial part of Glen Eden with the cultural facilities across Glendale Road to the west and a park across Oates Road to the south.

The building comprises two main elements that express their function, and also relate to their surroundings in appropriate ways. A narrow wing containing a Citizen's Advice Bureau and a community meeting room are located at the Glenmall end of the building and form an end to the commercial street.

This element is clad in dark-painted timber strips, and is sheltered by a large overhanging roof. The main library is housed in a dramatic space that becomes wider and taller towards the dramatic Waitakere ranges view to the southwest. Saw-tooth roofs allow natural light deep into the space, and culminate in a 4.5 metre high window wall, protected from late afternoon sun by sail-like sun shades.

Large windows to the west allow views to Glendale Road and are protected by adjustable horizontal louvres. Acoustically treated openings allow natural ventilation to the main library space. Provision for art showcases have been integrated into the design of the façade. A new urban plaza has been created at the Glenmall end of the site. A grove of kauri trees defines the other street corner and references the forests that formerly covered the area. (Warren)

## **Paraparaumu Library, Paraparaumu – New Zealand 2003**

### **Awards:**

**2004 ACENZ Silver Award of Merit**

**NZIA Supreme Architecture Award Community & Cultural**

**NZIA Architecture Award Community & Cultural**

The Paraparaumu Library is the first element of a new Civic Core for the Kapiti Coast District Council. Eventually this core will include new civic offices, a public swimming pool, and an arts centre.

The new library needed to house a growing book collection. It also needed to provide spaces for study, relaxed reading, and computer-based learning. There was also a requirement to provide archive facilities for historical material. In addition to these practical matters, the council wanted the new building to be a focus for community pride and awareness.

The 2,175m<sup>2</sup> structure is arranged on two levels. A double-height main collection volume is the dominant space. This is orientated to ensure that local hills and Kapiti Island are engaged in the building's axial plan. The landscape features also act as opposing vanishing points for the rectangular tubular form of the upper level.

The sense of density and enclosure at the entrance is increased by a three metre overhang of the upper form along the entire street elevation, while 4.5 metre cantilevers at each end of the building generate a sense of reaching out to Kapiti Island and the coastal ranges. The visual weight of the upper floor is further increased by black zinc cladding hovering over the translucent glass sheathing of the lower form. (Warren)

## **South Christchurch Library and Service Centre, Christchurch – New Zealand 2003**

### **Awards:**

**2005 ACENZ Innovate NZ Merit Award**

**NZEE Excellence Award**

**2004**

**DINZ Best Awards Commercial**

**NZIA Architecture Award Community & Cultural**

**New Zealand Property Council Education & Arts, Merit Award**

**NZIA Supreme Architecture Award Community & Cultural**

This single-storey building was designed to serve a wide range of community needs. Among these were a traditional library, a council service centre, meeting rooms, a learning centre with an IT suite servicing local schools, and an independent café.

The brief was developed through consultation with the local community which expressed a strong preference for an informal building that was responsive to the environment and acknowledged the building's unique site, bounded as it is on one edge by Heathcote River. The core concept for the building was then developed with the help of The Natural Step, and it later became a pilot for the development of the Christchurch City Council's Target Zero Strategy.

With a footprint of 2,400m<sup>2</sup>, the building is comprised of four long pavilions with mono-pitch roofs. Longitudinal circulation is provided by a sequence of corridors, with the southernmost clearly defined as enfilade and stretching the entire length of the building.

The single-storey approach was chosen for both cost and operational reasons, and ensures that all functions are readily accessible. It also allows for the book collection to be laid out in a simple, logical manner.

Users enter a light-filled space bounded to the north by screen walls that float between glazed bands above and below, and dissolve into curtains of glass to the east and west. Reducing the length of each pavilion created opportunities to form light-filled reading spaces which, to the west, open onto timber decks floating in the moat. The interior's expansive feel is enhanced by shoulder-height book stacks, making it possible to take in almost the entire space at a glance.

External decks are surrounded by a shallow moat and set in a shaded landscape of lawn and mature trees. The moat adds an element of security, while the water helps to blur the lines between private and public space.

### **ESD Features**

Sustainability features make the complex one of the most environmentally friendly buildings in Christchurch providing substantial long-term benefits for the community.

**Water use.** Rainwater from the roof is collected and stored in the moat for use in the toilets and irrigation system while low water-use plumbing fittings and waterless urinals further reduce water use.

**Material selection.** All timber has been sourced from certified sustainable sources. Where possible, non-toxic materials were used to reduce indoor air pollutants as well as minimise pollution of the environment resulting from their manufacture. Durable materials including glass and unpainted zincalume roofing minimise the use of surface finishes.

**Waste minimisation.** Preference was given to the use of building materials with recycled content. For example, the acoustic insulation is manufactured from 100% recycled wool scraps and the cement has 75% recycled content. The building was constructed in accordance with a waste management plan, drawn up in conjunction with the Christchurch City Council Target Zero Waste team, to reduce the amount of waste created during the construction process.

**Site ecology.** Planted drainage swales and retention ponds help to slow down the speed of storm water leaving the site, while at the same time filtering out pollutants such as petrol and diesel residues from roads and carparks. The overall design has been responsive to the topography and ecology - minimising earth movement and the removal of trees. (Warren)

## **New Brighton Library, Christchurch – New Zealand 1999**

### **Awards:**

**2000 NZIA Local Award Community & Cultural, NZIA Architecture Award Community & Cultural**

**1999 NZIA Local Award, NZIA Colour Award**

The brief for this project was to develop an icon for New Brighton with its underutilised foreshore. The Christchurch City Council had committed to construct a new 300m pier in conjunction with local community interests, and a terminus building housing a library and cafes was required to complete the complex.

The library is a 'new generation,' highly interactive, highly accessible and socially appropriate structure which acts as a centre for the community.

Numerous constraints needed to be overcome such as constructing a public building effectively on the beach. This meant that special erosion and tsunami conditions needed to be carefully considered. Particularly harsh environmental conditions meant that air-conditioning was required, however, though the use of roof overhangs to the north, Teflon sunshades to the west façade and high performance glazing, the energy loads were effectively managed.

The architectural team worked closely with the local community with several designs explored before the final scheme was agreed and adopted. A close working relationship with Council staff was also developed which facilitated an integrated approach to traffic concerns, parking, foreshore management and budget control. (Warren)

### **a-lab Arkitekturlaboratoriet AS, Oslo - Norway**

<http://www.a-lab.no>

#### **Libraries:**

#### **Town Hall extension and library, Søgne – Norway (2008 1<sup>st</sup> Prize) 2012**

3.800 m<sup>2</sup>, Client: Søgne Komune

The concept is to strengthen the (adjacent) surroundings and the existing building. Our wish was to make a rational expansion of the office building and a new library, which is extrovert and inviting. (These two functions in coherence/together will give Søgne's culture and administration a powerful and (obliging) presence.) The added volume on top of the existing municipality an exciting form. The library and the reception area in the existing building opens toward the square, and works as an expansion of the outdoor square. The library should be perceived as a mental and visual expansion of the square and the service-area inside. It should express the spatial context between the square on the west side and the park on the eastside, The city square forces its way through the existing municipality via the service area, and forms the library. (a-lab)

The construction of the new library and renovation of City Hall in Søgne, Norway is starting this September, Architects A-Lab is behind the new project. For images of the future library and renovated city hall, just follow us after the break.

The parish hall will be rebuilt, and the building will get a new third floor, which will allow for an outdoor scene. The future-oriented new library will be twice as large as the current one.

The old library has for many years been located in the basement and has not been easily accessible. By moving parts of the city's office space in the new top floor, an area has been liberated on the ground floor to the library. The new premises will be bright and open. Walls of glass are used between corridors and common areas to spread as much light as possible.

By incorporating the library in the expansion of the city hall, the building's identity and role in Søgne center enhances. The new building volume stands out above the Town Hall Square and forms a protective canopy for the library below. This also weaves together old and new, giving the hall an exciting look. The library and reception areas on the ground floor opens up to the surroundings and serves as an extension of City Hall in Søgne. The new building exterior will get a golden expression in the form of perforated metal plates, while the existing concrete walls and window profiles will be painted. The use of vertical glass surfaces will make the whole expression modern and inviting.

In the planning the architects used contrast actively to make the building easy to navigate for all the city's inhabitants, including the disabled. A-lab has developed a concept that will provide Søgne's culture and management in the municipality a welcoming and inviting presence in the city.

The building will be completed in autumn 2012. Hank Jarz 15.08.2011 Archdaily (<http://www.archdaily.com>)

### **Atelier Oslo Architects, Oslo – Norway**

<http://www.atelieroslo.no>

#### **Deichman Main Library Oslo – Norway on design**

#### **Libraries:**

see: **Lund Hagem architects** <http://www.lundhagem.no>

1. Holds pre-qualified competition for Deichman axis with the proposal "Diagonal" Startup - Awaiting political treatment.

Size - about 18 000m<sup>2</sup> library, approximately 37 500 commercial areas. Client - Oslo / Sea Property Cooperation - Lund Hagem Architects AS, Agence Ter landscape architects, Can Energy

Deichman Main Library Oslo is the new public library that will be in Bjørvika, as part of the Deichman axis. Library is building an environment where everything from the façade of interior meets stringent environmental standards. Intentions To integrate Deichman axis into Bjørvikabebbyggelsen and give buildings a human scale, shared buildings into three volumes. A diagonal street is established to provide the opera better access from the east, and also creates two smaller plassen in the area. The library is placed in the plot against the Common Opera to create the shortest distance to public transport, and the best views of the city, the fjord and the surrounding green hills. The building is made visible at the top of the building collars out, and announces his presence to the visitors who come from Railway Square and Central Station. Large cuts in the facade marks the entrances on three sides of the building and invite the audience in from all sides of town. The same cuts allow passersby to see into and through the diagonal lines run in the library, and at the various library environments. The library has a flexibility that allows it to absorb many future features, and divided into different audio zones. The translucent facade diffuses daylight and provides a soothing feeling to the interior. At night the building will glow and change appearance, and one can glimpse from outside the various activities and events taking place inside the library. (Atelier Oslo )

The Diagonale solution for the new Deichman Library proposes: To divide the site into three buildings. By doing this, we give each building a human scale and integrate the project into the city. To place the Library on the site towards Operaallmenningen. Library visitors are offered the best views towards the city, the fjord and the surrounding green hills of Oslo; and the shortest connection to public transport. To make the Library visible to the public. The top of the library cantilevers out to announce its presence to the visitors arriving from down town Oslo and the Central Station. At the same time the view to the opera is secured by a large cut in the volume. To create entrances to the east, west, and south. Big cuts in the facade mark the entrances on three sides of the building, inviting the public coming from all parts of the city. The same cuts give views into the different environments of the library.

To create a spectacular interior. The core of the new Deichman library is based on light and space and continuous diagonal views established between the library interior and the surrounding streets/square. Through atriums and openings in the different floors the library is united with the city outside. To communicate with the city. The façade diffuses the sunlight, giving a calm feeling to the interior. At night, the building will glow and change (<http://www.e-architect.co.uk>)

#### **Asker Culture, Asker – Norway 2004**

1. premium limited project competition 1999, Asker Kommune, Extension / conversion of content: cinema, concert and theater, libraries, youth and elderly, rental offices and business, 24 000 m2 gross area, Pilot project in October 2001, Detailed Project in collaboration with Link sheet. 2002-2003, Completed Autumn 2004, Official opening October 23, 2004

Asker culture was completed 23 October 2004. The municipality invited in 1999 to a restricted project competition was won by Dyrvik Architects A / S. The mission was to rebuild and to the existing culture from 1982. The building was constructed in cooperation between Dyrvik Architects A / S and Link Architects A / S. The cultural center is located right in the center Asker Asker culture consists of 25,000 square feet over six floors and can accommodate a large theater / concert hall, two black box theaters, meeting rooms, festal, rehearsal hall, cinema, library, gallery, youth club with a clean coffee shop, senior center and several restaurants. 7000 square meters of office space on the 5th and 6 floor used by the South Eastern Health. Entrance from Church Road. West Viken health rents offices in parts of 3 floor. Also, these offices have access from Church Road.

### **Libraries:**

#### **Flekkefjord Cultural House, Flekkefjord – Norway 2013**

Team: Dag Strass, Elliot Spring, Moritz Groba (competition)

The project, on the waterfront of Flekkefjord as town on Norway's south coast, incorporates a theater hall, a cinema, a library, a gallery, a youth club and a cultural school. The project has recently been approved for construction.

Flekkefjord's narrow streets are lined with traditional timber houses, whose small scale contrasts starkly with the massive volumes of the new Cultural Center. Mediating between these different scales drove the design process. The diverse functions of the project were divided into four individual "houses" and the spaces between them creating gathering and circulation spaces. The "between spaces" have been filled with a fanned, continuous stair which links the forecourt, the façade and the levels of the foyer within. The facades of the houses, both interior and exterior, are woven together to create three-dimensional public concourse. (Helen)

#### **Vennesla Bibliothek, Vennesla – Norway 2011**

Client: Vennesla Kommune, Team Helen & Hard: Reinhard Kropf, Siv Helene Stangeland, Håkon Minnesjord Solheim, Caleb Reed, Randi Augenstein, Competition entry: 2009, Completion: 2011, Budget: 66,4 mill NOK (excl.tax), Area: 1938 sqm gross

The new library in Vennesla comprises a library, a café, meeting places and administrative areas and links an existing community house and learning centre together. Supporting the idea of an inviting public space, all main public functions have been gathered into one generous space allowing the structure combined with furniture and multiple spatial interfaces to be visible in the interior and from the exterior. An integrated passage brings the city life into and through the building. Furthermore, the new building was open and easy accessible from the main city square, knitting together the existing urban fabric. This was achieved by a large glass facade and urban loggia providing a protected outdoor seating area. In this project, we further developed a rib concept to create useable hybrid structures that combine a timber construction with all technical devices and the interior. The whole library consists of 27 ribs made of prefabricated glue-laminated timber elements and CNC cut plywood boards. These ribs inform the geometry of the roof, as well as the undulating orientation of the generous open space, with personal study zones nestled along the perimeter. Each rib consists of a glue laminated timber beam and column, acoustic absorbents which contain the air conditioning ducts, bent glass panes that serve as lighting covers and signs, and integrated reading niches and shelves. The gradually shifting shapes of the ribs are generated through adapting to the two adjacent buildings and also through spatial quality and functional demands for the different compartments of the library. Each end façade has been shaped according to the specific requirements of the site. At the main entrance, the rib forms the loggia which spans the width of the entire square. A main intention has also been to reduce the energy need for all three buildings through the infill concept and the use of high standard energy saving solutions in all new parts. A symbiosis of structure, technical infrastructure, furniture and interior in one architectonic element creates a strong spatial identity that meets the client's original intent to mark the city's cultural centre. The winning competition entry for a new library in Vennesla comprises library, café, meeting places and administration. The project links an existing community house and learning center together and is planned to be a new high quality urban space reinforcing the city's cultural center. The project is based on 5 concepts woven together: - To bring the city life into and through the building. To create multiple layers of use and flow to be visible in the interior and exterior. To develop a timber frame construction which also contains technical installations, bookshelves, seating ect. To establish an urban loggia with a roof that covers the entry facade and is an interpretation of the existing city's facade towards the main street. Through the infill concept reduce the energy need for all three buildings. The combination of structure, technical infrastructure and furniture in one architectonic element creates a strong spatial identity which met the clients original intent to mark the cultural significance of the city enter. (Helen)

## **HRTB AS Arkitekter MNAL, Oslo – Norway**

### **Libraries:**

#### **Universitæt Stavanger – Norway 2006**

1.prize open EEA competition 2000. Won in collaboration with Stein Halvorsen Architects AS., Mission of Public Construction. Conducted by HRTB. Completed in January 2006.

The project consists of two buildings. Arne Rettedal house is a central building for the University of Stavanger, and includes the central feature with auditoriums, administration, drama and media. Building for Teacher Education is an extension of existing buildings and also the Department of science.

Total floor area is 13.700m<sup>2</sup>.

### **Rådhus med Hovedbibliotek, Tromsø – Norway 2003 -2005**

Total floor area is 20.500m<sup>2</sup> BRA. Total costs for the building (including tax) is estimated at 02 550.mill. kr.

Fokuskvartalet ( Focus District (Tromsø Town Hall, cinema and library)), Tromsø, Architect: HRTB AS Arkitekter MNAL, Client: Tromsø Municipality, Construction System / Materials: Concrete; steel; glass , Building Type: Office; library; village hall

### **Literature:**

Byggekunst 7/2005, pp. 52-58

The town hall complex also houses a cinema and library. It is located on the street Grønnegata, which also happens to be one of the town's busiest streets. However, the town hall's official façade overlooks the town square. This façade has slender soaring concrete columns that support a thin roof. The town square extends from Torghuken, by the Tromsø Sound, beyond and up the hill towards the old town hall (Rådstua), terminating above the town centre in the west. The cultural centre (1984) and the town hall are situated alongside the south-side of the town square. In general, this area has a strong communal quality. The library's glass façade and its uniquely shaped roof (a hyperbole paraboloid) make it the most characteristic building in the town centre. It has upheld this reputation since it was built as a cinema in the 1970s. In its conversion into a library, the structure underwent a significant transformation. The dense walls were torn down, along with the entire interior of the building. Only the roof shell structure and the four supporting points remained standing. In order to make room for a well functioning town hall, the old town hall was also eradicated.

Assignments for Tromsø by Beata Nemeth Winther. The project was begun in 2000 and was completed in 2005. The purpose of the building project is to collect the municipal administration and library in the "Town Hall Quarter, and to establish a new cinema with 6 halls and an open" venue "for use at important occasions for the town. Competition draft showed how three existing buildings, if necessary, could be integrated into a total new project with great ability to adapt to changing application requirements. Of the three buildings are now in the roof of Focus cinema that will be left. When the main building is finished and new movie theaters are used to the old movie theater torn out and a new library listed under the distinctive roof.

Blueprint Architecture Award 2002

finalist best refurbished public building, Norsk Lyspris 2001

Sited in an old factory block the new internal court of the school is connected to the adjacent riverside bank. Parts of the complex are torn down to bring light into the deeper parts of the building, structures are sandblasted to expose the consistency of the concrete, and the new building parts and walls are made transparent to secure an aimed social transparency of the institution. (Jarmund)

The new Oslo School of Architecture is based in an existing building from 1938, located by the Akerselva River in the eastern part of Oslo. The school is part of a larger effort to revitalise this former industrial area for education-related use. The long-term aim is a campus for arts education along the riverbank.

The project won 1st prize in an open architectural competition in 1998. The exterior of the existing building has a conservation status. The architects have kept the block open towards the river, and combined the new programme with the logic of the existing building together with the surroundings in one spatial sequence.

An access court has been cut out of the existing 1st floor slab, marking the entrance and bringing daylight in to the ground floor foyer. A strip has been cut out of the existing slab along the inside of the existing building, bringing daylight to the surrounding functions. A simple U-shaped circulation zone is established along the strip. A new string of teaching rooms completes the U and forms a bridge across the entrance area.

The ground floor is occupied by communal functions such as canteen, auditoria an exhibition spaces, workshops an library. All design studios and teaching rooms are on the 1st floor, with a view of the open interior courtyard. Offices for the research- and administration staff are on the 2nd floor.

New external walls are made by an insulated facade system, with double-glazing units in three different colours. The interior is intended to retain the workshop character of the existing building. The existing concrete structure has been exposed an chalk-blasted, and all cutting surfaces are left untreated. Floors in the main circulation spaces are polished concrete, with linoleum elsewhere and special oiled ash on floor and walls of the auditorium. Internal partitions on ground and 1st floor are covered with varnished fibrocement boards, with painted plasterboards partitions on the 2nd floor. Extensive use of glass partitions serves to retain a maximum overview and transparency.

Roof garden and covered areas have diffusion watering systems. Lawn areas subject to heavy wear and tear have been reinforced with metal grilles.

New service installations have been concentrated into seven exposed ventilation plats on the roof, to minimise horizontal ducting. The building has sprinkler projection throughout. 13.06.2008 Archdaily (<http://www.archdaily.com>)

### **Libraries:**

### **Sandnessjøen Bad og Kulturhus, Sandnessjøen - Norway in design**

The victory in the competition coming cultural focal point on the coast of Helgeland went to L2 Architects. Alstahaug invited five architects to compete in the limited planning and design competition for cultural and bathhouse in Sandnessjøen. The house will loom in the area as a building with a library, gallery, hall, cinema, café and swimming complex with several pools, so it is important that the solution contains goals.

The five layers were Nils Tveit Architects / Architecture Griff, Asplan Viak, L2 Architects, Heggelund & Koxvold and Helen & Hard / NUNO Architecture.

L2 Architects drew the longest straw and was unanimously named the winner with his proposal, "Sky." It shows a compact project with small footprint, a building of four storeys that are adapted quarter situation and provide a good starting point for area efficiency and energy saving.

Civic body is laid on the street level of the library clearly visible, with stairwell integrated into the facade and lobby as a unifying meeting with seating, dining and direct contact with the floor. The jury is "very positive" to the solution of the main entrance. Great hall and cinema also has optimal conditions, says the jury, but the gallery is unfortunate located and bathing facility has received too little space.

Much glass

The plant consists of three main parts in the longitudinal direction. Each part can be further developed for them. The concept is flexible, turn the jury fixed.

Meanwhile, the house has a horizontal layering with a contemporary style that is "conducive to creating a distinctive building." The extensive use of concrete, glass and metal sturgeon during the term, but the jury will reduce the use of glass in the facade and reveal a more energy and environmentally friendly buildings.

All fourteen architects with L2 Architects contributed in various ways: Ivar Lunde, Jon Inge Bruland, Jon Flatebø, Helge Ness, Martin Christensen, Sunniva Simonsen, Meriadeg Jan, Katrin Häusler, Thomas Løvdal, Michael Ross, Line Woxen, Sigrun Berg, Tove Linn Tjersland and Heiki Fretheim. Adviser on the landscape was the landscape architect Atsite MDL Truelsen Anne Schultz. Two teams got split second, Heggelund & Koxvold with "1,2-Northern Lights" and Architects Nils Tveit / Griff Architecture with "Sabakuhus."

The jury had six members. Among these was the architect stone hammers and architect Astrid Reikvam, which also was the jury secretary, both elected from the municipality. (<http://www.arkitektnytt.no>)

### Rommen School and Cultural Center, Oslo-Rommen – Norway 2010

Landscape Architect: Østengen & Bergo AS

The former school building was too small, and had to be replaced. The new building includes a large multipurpose sports hall, its own performance hall and an open library. Offices for the community culture school and part of the local council is also located here. The school houses 770 pupils from 1st to 10th grade. The facilities both indoor and outdoor will serve the whole community. The school is located to an almost flat site, slightly rising to the north, in a valley surrounded by hills. East of the site there are ravines with grassy slopes and valuable vegetation belts. Two power lines are crossing the area. With the largest line to the west, the project and the landscape design therefore pays more attention to the east. The vegetation belts in the east are reinforced and continue into the campus. Closer to the building, they get more cultured, and "finger-merged" with the building wings.

The concept is based on:

- Finger-merge east west

between vegetation belts and building wings in the east

between vegetation belts and parking lots in the west

- A belt of activity north south

activities and playground for all ages

Several features is incorporated on the site:

"The square " is to the south, gathers many people on special occasions and will be a nice and sunny meeting place with a variety of informal seating options.

Zones for activities are located along the "activity belt" and zones for more quiet playing closer to the building. There are a variety of seating options. Access, drop off and parking to the site is in the north and west. Drop off is mainly for transport of children in the 1-4th grades, SFO and "family learning ". The total parking capacity is 88 of which 4 HC.

Existing walkways to the school are maintained, access from south and southeast improved. A walkway from the south turns into the main axis of the plan. East of these axis are areas for residence and activities, and in the west are traffic areas and parking lots.

Existing footpaths are steep, and do not satisfy the requirements of universal design / accessibility. A new walkway is with a gradient of 1:20 is therefore built from the sports grounds in the lowest parts of the valley and up to the school. This path can also be used by the youngest school-children who do not want to pass the older kids on the way to their classroom. There are two areas for bicycle parking, a total of 224 bicycles.

Outdoor classroom: The elevated wooden decks in the quiet zones between the wings of the building, can be used as outdoor classrooms. The children can sit, lie down or eat lunch. The digital outdoor computer ground provides exciting opportunities for teaching and learning outdoors. Letters and characters are painted on the school grounds for outdoor learning. In the outer zones of the site is a green zone of existing trees and newly planted trees and shrubs. The trees are named with small signs so that children can learn the name and family of the common Norwegian forest species. (<http://www.archdaily.com>)

### Kulturhus Longyearbyen, Svalbard (Spitsbergen) – Norway 2010

Construction of Longyearbyen culture was begun in spring 2009, and the building was officially opened by the Minister of Justice Knut Storberget 2 December 2010.

The Cultural Centre is located in the center of Longyearbyen as extensions to existing buildings. The buildings are connected on multiple floor levels in the culture house vestibule area so that culture may eventually rent space in the office building to expand its functions, including the library.

Access to the public is from the walkway through the center, and access to equipment, etc.. is from the parking lot at the "rear" of the building.

Architect Øyvind Lind PW Architects describe the building as an inclined prism is greater over the stage area and the lowest of the vestibule area. The building functions in a simple and robust form. This means that the building marks a distance and settle down in the face of the audience. Near the building is an old trestles as building shape playing against.

The roof and wall scene, the two inclined surfaces are covered with roofing felt. On stage wall is placed horizontal battens under the roof covering so that it is shelving the snow settles on the winter and provide variety in building expressions. Side facades are clad in Siberian larch mounted vertically, but the horizontal overlapping bands. Doors and glass fields are in lacquered aluminum.

The building's features include an auditorium for 244 people in the sliding amphitheater, cinema engine, control rooms, a recording studio, space and artist features.

Sober materials

hall has a window with curtains so that by some arrangement can bring in daylight. Acoustic is cinema operation priority. At stage performances used sound system. Skyveamfiets center section can be moved when it is pushed along so that it becomes directly dorforbindelse between the vestibule and the saddle on the main level.

It is suitable for connection of sound and lighting equipment for performances in the hall.

The interior materials used are sober. Apart from the hall which has a parquet floor, all rooms have vinyl coating on the floor and painted plates with a distinctive color portions of the walls. Ceilings are generally suspended ceilings.

Turnkey Sandmo & Svenkerud have built the new culture in a turnkey contract for 44 million including changes and tilt transport of stage equipment.

- Cultural center should be built as an extension to existing buildings, and it had done some preliminary work on and in existing buildings before construction starts on the culture, says project manager Arne Boe in Sandmo & Svenkerud. These started about 1 May 2009 and includes the closure of the existing escape routes and establishing new ones, so that security and working for them at all times stayed in the office building were not affected or impaired during construction. This led to a very good cooperation between the contractor and the neighbors in the office building.

**Planning and Logistics**

- Challenges in building such a complex building on Svalbard are many, but the two most important is to get control over design and logistics. Project because the planners must change the way of thinking in terms of time and progress. In Svalbard, we need engineering materials a minimum of 3-4 months before it physically be performed on site. The reason is that the items to be ordered and manufactured in Norway or abroad, transported to Bodø and Tromsø to Svalbard. Båtankomster up here, we did not everyday. Logistics is very important, because we do not have any building trade we can detour back, if we have forgotten something. Once construction materials are in place, and we've embedded, is not building that much different from the mainland, with the exception of occasional extreme weather and six months of darkness, he said.

**Freezing Plate**

Culture is embedded in a freeze plate is one of several foundation methods used here.

- Freezing plate works by "pulling" of the permafrost under the building. When the process is finished, built on massive permafrost which is a good and stable foundation way

The most commonly used method is piles inserted in the permafrost. Both pelefundamentering and freeze plate is time consuming and expensive methods compared with traditional foundations on the mainland. In some cases when buildings are listed near the shoreline where the sea penetrates the ground so that there is no permafrost, buildings' foundations on the strip / dot foundations in compressed filling, explains Boe. (<http://www.bygg.no>)

**Tønsberg og Nøtterøy Bibliotek, Tønsberg – Norway 1992**

Competition: 1 prize in 1987 (113 participants), Client: Tønsberg and Nøtterøy Municipality, Size: 5,000 m2, Budget: 70 million NZ  
Completion: 1992

**Awards:**

The Norwegian Steel Prize, the European steel prices, Zandt Scandinavian Architecture price and not least Houen Fonds Diploma awarded by the Ministry of Culture.

Tønsberg Library is library of Tønsberg and Nøtterøy Municipality and County of Vestfold. The building is located in Tønsberg, the historical ground of Viking graves and a monastery plants from the early Middle Ages. The ruins of the abbey's walls and outdoor space is recovered in the library's interior and has been a source of inspiration for design. A continuous, curved forms teglmur distinguish between open and closed areas, lending library internal functions. The wall shows the monastery's original appraisal of the sea and framing a "urban" to the main street. Closest to the wall is covered urban space with curved headroom held up by branched steel columns, with associations to the convent vaults, and trees in a monastery garden that may have been central to the historic facility. The construction is poured concrete in the wall plates and covers and steel columns and roof. Facades are forblendet with bricks. Glass Facades against the city is built with braced bearing glass plates without the use of profile systems.

The Tønsberg and Nøtterøy Library is run as a mutual library for the boroughs of Tønsberg and Nøtterøy. The library was founded in 1909 and moved to this new building in Tønsberg's city centre in 1992. It was built on the site of the ruins of St Olav's Monastery and the remains of two viking ship graves, which provides an exiting contrast to the modern technology and architecture of the building. The fan-shaped glass façade gives the building a fully transparent character. (<http://www.mimoo.eu>)

**Libraries:**

**Høgskolen i Vestfold, Tønsberg – Norway 2010**

Byggherre: Statsbygg Bruker: Høgskolen i Vestfold Byggeår: Ferdig 2010 Areal: Tilbygg 16600 m2 Ombygging 3300 m2

Prosjektet er en følge av beslutningen om å samlokalisere lærerutdanningen til eksisterende bygg på Bakkenteigen. Organiseringen av anlegget er en videreføring av planprinsippet til eksisterende bygg: parallelle fløyer med mellomliggende glassgater.

Kommunikasjon i hele anlegget styrkes med en tverrgående akse som binder fløyene sammen. Til denne aksens legges også utadvendte fellesfunksjoner og læringscenteret. I enden av aksens dannes det en godt eksponert inngangshall som tydeliggjør hovedadkomsten til det samlede anlegget. Se video: <http://youtu.be/XaVkegkBXhqs> (Lille)

**Sentrum videregående skole og folkebibliotek,**

**Kongsvinger bibliotek, Kongsvinger Municipality, Hedmark County – Norway 2008**

City high school and public library, Client: Hedmark County and Municipal Kongsvinger, User: Kongsvinger high school  
Year built:2008, Area: 13,500 m2

The project is a continuation of the winning proposal for a limited architectural competition organized by the Hedmark County and Kongsvinger municipality. The project consists of a new secondary school, a library and a city park. The facility is located in Kongsvinger center between Glomma and castle. ( Lille )

**Historisk-filosofisk bibliotek Universitetet i Bergen, Bergen – Norway 2005**

Historical-Philosophical Library University of Bergen, The library is centrally located on Nygårdshøyden in green surroundings. The building was erected in 1961 as a result of a national architectural competition won by Svare and Kvilhaug. Conversion to an open and modern library of the Faculty Faculty of Arts included 7.500m2. The rebuilding was completed in 2005. ( Lille )

## Politihøgskolen i Oslo – Norway 1995 - 1996

Police Academy in Oslo, Client: Public Construction, Use: Police Academy in Oslo, Year built: 1995-1996, Area: 8200 m<sup>2</sup>

The new building represents the three phases of the Police Academy and consists of a five-storey wing along Gydas way, and a single storey wing to Trudvang Road. The new building is linked to existing school facilities with a footbridge in the 3rd storey level. The buildings are tightening up the existing block structure in the area and amplifier characteristics. The new building contains the student functions in the three lower floors with a large library and reading rooms, auditorium with 200 seats, spacious classrooms, seminar rooms and group rooms. In the two upper floors are offices and meeting rooms for teachers and trainers. (Lille)

### Hermetikken Kulturfabrikk, Sortland – Norway in design

Employer: Hermetikken AS

LPO is in the process of planning and design of a new cultural center in the "Blue City" Sortland. Here will be built a new library and concert hall. It is supplied pre-project. (LPO)

**Kulturfabrikken being built!**

Municipal Council in Sortland decided in June 2011 that Kulturfabrikken be built subject to realization of new hotel. Blåbyen Invest AS announced during Christmas that the hotel is being built, and thus are ready for a new arts event in downtown Sortland and Vesterålen. Demolition work will start in a few weeks, and in March 2014 the building can be used.

There have been thorough preparations before the decision to build was made. The basis for the content of Kulturfabrikken that were added in the program document and visualized through sketches (see details below), has given assurance that this will be a future cultural center with a multitude of opportunities for all groups. In addition, we are creating a new and different venue in the center of Sortland. Concurrent with the municipal council for the construction of Kulturfabrikken gave Nordland County Council a commitment of 20.0 million in funding for this project (absent play and county funds). From before the county council supported the project with 2.0 million is later given tilsang from the county with care plan for Culture Factory and the new hotel with kr. 2.75 million music scene expressed great joy when the Music arrangement just before Christmas gave support to 5 of rehearsal rooms built with £. 1.25 million new arts Sortland Sortland presidency decided in the meeting 28.09.07, implementation of the project New arts in Sortland. The decision was taken in conjunction with Urban Development Programme and the municipal sector plan for Sortland strategic part 2007-2019. following mandate was given for arts project: "The development of a project library, cultural hall, cinema, gallery and cultural workshops with activity facilities for arts, young and old can co-located. One such collection is necessary for the creation of the key meeting place, but also to achieve operational efficiency. "

(<http://www.kulturfabrikkensortland.no>)

### Dance House Vulkan – Oslo 2008

The total gross area is about 3500m<sup>2</sup>.

Employer: Vulcan Real Estate Ltd

Employer's Vulcan Real Estate Ltd, owned by Aspelin-Ramm Property and Anthon B. Nilsen Property.

**Interior design is a collaboration between Snøhetta and LPO.**

Dance House has become within the shell of an old machine shop located along the Aker River at Vulkan at Grünerløkka in Oslo. Dance House should be a national stage for performances of Norwegian and international contemporary dance performances and expertise place for dance. The project includes a main stage with room for 350 people, BISC, a foyer with café, operations, administration of Dance House and Dance Information, the Norwegian Information Office of dance with dance library and a video library. (LPO)

### Diakon, Library and Learning Center, Oslo – Norway 2008

Employer: Diakonhjemmets property department

The building contains offices for Diakonhjemmets hospitals and Diakonhjemmets college. The central location in Diakonhjemmets parkland, between the hospital and the college's main buildings provide an ideal base for the development of this common feature. Auditorium, library and group and lecture rooms will have a major impact on both institutions. In addition, the new building a Learning and Mastering Center (LMS) for patients and their families. The building was officially opened by Bishop Kvarme August 26th, 2011. (LPO)

### Papirbredden | School and Library, Drammen – Norway 2007

Employer: Entra in cooperation with Drammen Property KF

Transforming Union Paper Mill at Drammenselva for educational and cultural purposes. Besides facilities for College of Buskerud, Telemark College and BI, contains plant library Drammen, Norway's first co-location of a library attached to both schools, the county and municipality. Most functions are brought together in a new building on the river. The building is designed with regular floors which encloses a high atrium. Against this atrium are lecture and other special functions together in a cylindrical main form with reference to the old industrial silos in the square outside. In addition to these silos is the original "beater" restored as part of the new library. The entire facility is "The Blue Room" which both binds together and manages a continuity from the city, through the new building and out to the river. The project is developed with great rationality and implemented in a very short time after a so-called interaction model between the client, the planners and contractors. Artistic decoration of the cylindrical body shape is performed by Jon Arne Mogstad. concept for the facility and the preparation of "The Blue Room" was developed in collaboration with architect Kristine Jensen Tegnestue in Aarhus. (LPO)

In order to exploit to the full the library resources of Drammen and create a high-class, future-oriented library, three library organizations were brought together under one roof. Together they form the Combined Library/Drammensbiblioteket, which in turn is part of the Papirbredden Knowledge Centre, an integrated campus. The new library building was completed in the beginning of December 2006 and the library opened officially on 2 March 2007. Drammensbiblioteket is a coalition of three separate library organisations working together. The three partners are the county library, the municipal library and the university college library. To the visitor Drammensbiblioteket is one unit. The Combined Library serves as a link between the municipality and the university

college, helping to remove any barriers between the two worlds. The library is a creative meeting place for all and a centre of knowledge for researchers, students at all levels as well as citizens in general. (<http://www.librarybuildings.com> )

### **Møllebyen Moss, Library, cinema and museum, Moss – Norway 2003**

Employer: Møllebyen Moss

Møllebyen Moss was completed in 2003 and has since received much attention. The project won the National Building in 2004, Moss bys price for good urban architecture in 2003, and the Directorate decided in January 05 for using the project as a reference project for transformation and densification of existing urban areas.

The project's vision was to preserve and revitalize the old town by creating a public-oriented forum for knowledge and culture and integrate new architecture in the old context. Library, City Museum and cinema facilities are co-located in existing buildings, while a new building contains college center. Through proportions and orientation of the college building, the choice of design elements and materials (zinc, brick, aluminum), it is important that new buildings should show reverence and contribute to the positive promotion of the historic buildings and adjacent industrial plants. Sundby architects as and Berg & Dyring landscape architects as has also been involved in the project. Project has previously received Moss bys price for good construction practices. (LPO)

### **Lund Hagem Arkitekter, Oslo – Norway**

<http://www.lundhagem.no>

**Libraries:**

#### **Deichman Library, Oslo – Norway on design**

in collaboration with Atelier Oslo <http://www.atelieroslo.no>

The Diagonale solution for the new Deichman Library proposes:

To divide the site into three buildings. By doing this, we give each building a human scale and integrate the project into the city.

To place the Library on the site towards Operaallmenningen. Library visitors are offered the best views towards the city, the fjord and the surrounding green hills of Oslo; and the shortest connection to public transport. To make the Library visible to the public.

The top of the library cantilevers out to announce its presence to the visitors arriving from down town Oslo and the Central Station.

At the same time the view to the opera is secured by a large cut in the volume. To create entrances to the east, west, and south. Big cuts in the facade mark the entrances on three sides of the building, inviting the public coming from all parts of the city. The same cuts give views into the different environments of the library. To create a spectacular interior. The core of the new Deichman library is based on light and space and continuous diagonal views established between the library interior and the surrounding streets/square. Through atriums and openings in the different floors the library is united with the city outside. To communicate with the city. The façade diffuses the sunlight, giving a calm feeling to the interior. At night, the building will glow and change appearance as a reflection of all the different activities and events inside the library. (Lund)

Description

Deichmanske Main Oslo is the new public library that will be in Bjørvika, as part of Deichmanaksen. The library is an environmental building, where everything from exterior to interior meets stringent environmental standards.

Intentions

To integrate the Deichman axis into Bjørvikabebbyggelsen and give buildings a human scale, divided the buildings into three volumes. A diagonal street is established to provide the opera better access from the east, and also creates two small courtyard area. The library is placed in the plot of the Opera Allmenningen to create the shortest route to public transportation, and the best view of the city, the bay and the surrounding green hills. The building is made visible at the top of the building stands out and announces its presence to the visitors coming from Railway Square and Central Station. Large cuts in the facade marks the entrances on three sides of the building, inviting the audience in from all corners of the city. The same cuts allow passersby to see into and through the diagonal visibility in the library, and the various library environments. The library has a flexibility that allows it to absorb many future features, and divided into different audio zones. The translucent facade diffuses the light and gives a soothing feeling to the interior. At night the building will glow and change the look, and you can from the outside make out the various activities and events taking place inside the library. (Atelier Oslo)

#### **Stjørdal Kulturhus (Library) – Norway Competition 2010**

1 prize together Reulf Ramstad Architects AS, JST Arkitekter AS and Schönherr Norway AS

STATUS: Proposal Competition, AREA: 17,500 m<sup>2</sup>

Stjørdal Culture should be an important meeting place both locally and regionally in Stjørdal for Central Norway. A place where everyone interested in culture will come, and people of all kinds to develop their creative and practical abilities. The culture of the church will serve as a worthy venue for the city and the region's inhabitants. In addition, the hotel will accommodate visitors and help to rejuvenate the plant and the site further. The architecture will radiate the building's modern and contemporary pulse function at any time. At the same time, the project is anchored and inspired in its history and culture. Stjørdal Culture is a diverse platform for culture, art, dance and music. The building is a local meeting place for all the week's seven days. The project will be perceived as welcoming and inclusive to all. It is emphasized that the project itself is also an indigenous attraction.

### **Libraries:**

#### **Cultural Centre, Harstad – Norway 1992**

Cost: 217 million, Area: 12,000 m2

### **Literature:**

Literature: Jacobsen, Yngve, "Harstad kulturhus av internasjonalt format" in Kulturnytt 3/1992, pp. 20-21

Bruun, Ola og Jim Myrstad, "Porten mot byen - Bylandskap Harstad 100 år 2004" in Harstad Tidene 04.01.02, pp. 28-29

Bruun, Ola og Jim Myrstad, "Ved havet - Bylandskap Harstad 100 år 2004" in Harstad Tidene 04.01.02, pp. 30-31

Steinnes, Kristian, Ved egne krefter - Harstads historie 1904-2004, Harstad 2003, pp. 513-516

The Harstad cultural centre is located on the fringe of Hamneset opposite of the quay Dampskipskaia where the Express boats dock. Its closest neighbour is Harstad University College. Since the beginning of the 20th century, this area was characterised by industry and transport, but towards the end of the 1980s this era had drawn to a close. The establishment of the cultural centre was a turning point for this area and in 1996, the University College also moved here. The cultural centre houses Northern Norway's largest concert hall with a seating capacity of 1,000. This is very practical during the Festival of North Norway (FINN) which is held each June in Harstad. This building also holds a library and hotel, in addition to multiple functions related to cultural operations. The building's total area measures 12,000 square metres - including roughly 8,000 square metres previously used as an industrial area which was rebuilt as a part of the new complex. Glass is the dominating material on the south side and the building opens in this direction. A tall narrow wing, which is reminiscent of a tower, is located in the central section of the building. This divides the main façade into two. This wing is eight-storied and makes the building both distinct and easily visible - from the town centre and from the sea. (<http://www.ub.uit.no>)

Hinn Culture is a project implemented in cooperation Per Knudsen Arkitektkontor AS, Trondheim. The building houses a concert hall for 1000 people, a smaller hall for 200 people as well as the city's public library and a host of other cultural features. The project is integrated into a business hotel with 75 rooms, besides restaurant, bar and banqueting rooms.

## **Rintala Eggertsson Architects, Oslo – Norway**

### **Library in Thailand, Tha Song Yang – Thailand 2009**

Workshop with NTNU Trondheim architects students 2009

In two weeks during 12.-25.1. 2009 fifteen NTNU Trondheim architect students designed and built a two storey library building for Safe Haven orphanage in Ban Tha Song Yang village near Burma border. The inhabitants of the orphanage are 42 Karen children of different age.

The task was to use local materials and building technics to create a building that would solve the problems of education in the orphanage the best possible way. At the same time, natural ventilation systems and sunshades were studied and introduced into the building.

Materials: natural lava stone from the site, concrete bricks, wood and bamboo.

Organizing party: Tyin Tegnestue, Trondheim Norway

Workshop leader: Sami Rintala, NTNU teacher: Hans Skotte (Rintala)

sami rintala of rintala eggertsson architects lead a group of NTNU trondheim university (norway) architect students on a social project. they worked together to build a two storey library building for safe haven orphanage in ban tha song yan village, thailand near the burma border for 42 children ranging in different ages. the task was to utilize local materials and building techniques to create a building that would solve the problems of education in the orphanage in the most practical way. at the same time, the design also worked with the surrounding environment, with research on natural ventilation systems and sunshades completed and incorporated into the building. the structure was built from natural lava stone from the site, concrete bricks, wood and bamboo. the lower level of the library houses the books and a computer area while the upper level is more for lounging, play and enjoying the books. The project was organized by tyin tegnestue, trondheim, norway and NTNU teacher hans skotte. (<http://www.designboom.com>)

## **RRA Reiulf Ramstad Arkitekter, Oslo - Norway**

### **Libraries:**

#### **Cultural Center Stjordal – Norway 2010**

program: New Cultural Center with concert halls, library, church, cinema, hotel and the culture and music school of Stjordal  
client: Stjordal Municipality and Stjordal Cultural development AS, size: 17.500m2, commission type: 1st prize with Lusparken Architects, JSTA Architects and Sheönherr Landscaping. Invited competition (2010), status: Competition proposal year: 2010

The Cultural Center of Stjordal will be an important node, both locally and in the region. The center will become an inviting place for all people interested in culture in one way or another; a building where people of all kinds can explore and develop their abilities and talent. With its church, the Cultural Center will function as a worthy venue for all kinds of ceremonies for the inhabitants. In addition to this, the visitors at the hotel will contribute to vitalize the house and the park.

The project is anchored in, and inspired by the place's history and culture. At the same time the architecture should emit its modern function and the pulse of the time and place. The Center will be a platform for a wide cultural concept; a wide range of art, dance, music, film and other media. The Cultural Center of Stjordal should become an inspiring place that gives the visitors experiences and opportunities for personal display and development. (RRA)

## University College Østfold, Halden/Remmen – Norway 2005 – 2006

location: Remmen in Halden, Norway, client: Statsbygg, Norwegian Public Construction and Property Management  
size: 28 000 m<sup>2</sup>, commission type: Invited Competition 1st prize (1998), status: Phase 1 completed 2005. Phase 2 completed 2006

The key notion of the architectural strategy is the location's natural features and the use of a limited material palette. The project is situated in an old "culturscape" and special attention is paid to integrate it into its surroundings. The design is based on simple geometrical prisms, lines and slabs composed into a complex lay-out of rooms and functions. Critical functions and lines of communication are emphasised and the building expresses a balance of functional efficiency and open perspectives. (RRA)

New outlook for landmark University building in Norway: Completed in 2006, the HiØ is a building of national and regional importance. Situated between Oslo and Sweden this University building is a melting pot for many cultures and people. The challenge was to refurbish the existing complex, originally completed in the 70s, modernising it to suit the College's current and future needs, whilst adding to it new functions and spaces that would complement the existing. The key notion of the architectural strategy is the location's natural features and the use of a limited material palette. The project is situated in an old rural landscape and special attention is paid to integrate it into its surroundings. The design is based on simple geometrical prisms, lines and slabs composed into a complex lay-out of rooms and functions. More than 900 rooms are organized around common spaces, small "forums" or "agoras", reminders of what a University life is all about. Informal meeting spaces, debating arenas, and areas of personal exploration punctuate all the buildings. Hovering over all the other buildings, tracing the east-west natural ridge between two forests, is a long wood-clad volume which houses the new study rooms and office spaces. This structure is the articulating element and the spine of the whole complex. *Where this block intersects the new Library, it opens up in a series of dynamic spaces. Boxes hang from the ceiling defying the laws of physics, light pours in from sky lights and from the continuous glazed façade inviting one out onto the Library's roof terrace.* The careful choice of materials enhances the experience of this building. Concrete and glass are counterbalanced with colour and softer / warmer materials, such as wood and brick. They blend new and old together creating a unique feeling of accord and defiance, an ideal environment for learning and personal development. The double and triple height spaces created through the main buildings are changed, their volumes sculpted, shaped by the changing light conditions during the dramatically diverse Norwegian seasons. The glazed façade and multiple openings are not however a detriment to the buildings energy efficiency. In fact they reduce the need for artificial light by bringing light deep into the complex. Furthermore, by the use of mass and a structured planning strategy, the building is able to keep its internal temperature fairly constant all year long with limited heating / cooling costs for a building of this size. (<http://www.worldarchitecturenews.com>)

## Snøhetta, Oslo, New York – Norway

<http://www.snoarc.no>

### **Libraries:**

#### James B. Hunt Jr. Library, North Carolina State University, Raleigh – USA on design (2012)

20.439 m<sup>2</sup>

Snøhetta, the lead designer for North Carolina State University's planned James B. Hunt Jr. Library, has been honored as co-recipient of the 2010 European Prize for Urban Public Space. The prize is a biennial competition organized by six European institutions with the aim to recognize and encourage recovery projects and the defense of public space in European cities. The honor was awarded for the design of the National Opera House in Oslo, Norway, the largest cultural center built in the country in 700 years. Rapidly becoming an iconic building for Norway in the way that the Sydney Opera House is for Australia, the National Opera House is known for its dramatic integration with the surrounding landscape. Its sloping roof rises out of the adjacent fjord so that the building itself is not clearly distinguishable from the water that fronts it. As the committee that awarded the prize remarked, the design of the Opera House is especially noted for its ability to create a welcoming environment: "through its capacity to merge with topography and as topography, it generously offers itself to the public . . . . It draws people to the space." Snøhetta is working with Pearce Brinkley Cease + Lee, the North Carolina-based executive architect for the new Hunt Library, to deliver a signature building and a similarly iconic heart for NC State's Centennial Campus. Located on the Centennial Campus academic oval, the new library will embody the spirit of NC State's competitive advantage in science, engineering, textiles and technology, providing a research library that will be a major factor in attracting and retaining the best faculty, students and corporate partners. Hunt Library is also expected to become an international destination for those watching how research and learning can be a strong catalyst in a modern economy. The new library will also help close a serious seating gap for the NCSU Libraries, which can currently seat less than five percent of NC State's students. Hunt Library will double the amount of seats, moving NC State closer to the UNC system mandate to provide library study seating for twenty percent of the student body. Hunt Library will also reinforce the strong emphasis the NCSU Libraries places on acting as a technology incubator for the university. From its bold design, to its robotic automatic retrieval system, to the latest in computing and collaboration technologies, Hunt Library will continue to prepare the NC State community to lead in a technology-driven economy. NC State broke ground on the Hunt Library in October 2009; construction is expected to be completed in 2012. (<http://news.lib.ncsu.edu>) 13.04.10 North Carolina State University is among the most prestigious educational institutions in the United States. For over a century it has been expanding its curriculum and influence in a wide range of engineering and arts studies. Its central campus is composed of well preserved neo-Georgian brick structures connected by a series of lush quadrangles. As the university has grown steadily it has stressed the limits of its historical center and since the late 1970's it has begun to develop in a nearby area known as the Centennial Campus. The new James B. Hunt Jr. Library is among the most prestigious new buildings on campus and is seen as the flagship design for the new Centennial campus. In addition to the design of the building, Snøhetta has been involved in the refinement of the master plan. The most prominent exterior feature, a large grass plane known as the Centennial Oval, was modified to accommodate the new Library and also to more forcefully integrate the existing natural forestation and valleys of the pre-existing terrain. With 1700 new seats in a range of reading and learning commons areas, the new James B. Hunt Jr. Library is a showcase for contemporary library planning. A wide range of collaborative atmospheres are carefully planned to promote use and activity while also including quiet, protected reading areas throughout. The highest level of Audio Visual technology is also planned throughout the building to ensure ease of access to both local and remote visualization. An Automated Retrieval System is used to store books and allow for virtual browsing to two-million volumes of book. Further enhancing the library use are Graduate Reading Commons and a center for Humanities Studies. A 400 and 100 person auditorium is available for academic use to the remainder of the campus. The highest level of the building is home to the Skyline Reading Room with an outdoor terrace providing a dramatic view of the surrounding natural landscape. In addition to the library and academic functions, the building also houses the Institute for Emerging Issues, a non-profit socio-

political resource and lobbying organization. The Institute is among the most prestigious in the state and is also recognized nationally for its efforts. Each year the institute hosts a national forum dedicated to the most pressing contemporary issues affecting the world and in particular North Carolina. The building houses a large gallery dedicated to social and political issues affecting North Carolina as well as a changing exhibition area. A large common foyer joins the many institutions together and leads from the Oval level down to the lower garden connecting the building to the western portions of Centennial campus. The general character of the building opens up towards the terracing terrain and the nearby Lake Raleigh. Local industry has in the past been based upon the textile arts and the current campus houses one of the country's most prominent textile manufacture and the building seems to weave itself through the landscape. (Snøhetta )

### **King Abdulaziz Center for Knowledge and Culture, Dhahran – Saudi Arabia 2011**

The King Abdulaziz Center for Knowledge and Culture is a bold new initiative on the part of the Saudi Aramco Oil Company to promote cultural development within the Kingdom. Following an invited architectural design competition in 2007 Snøhetta has been selected to design this prestigious cultural facility. Located in Dhahran in the Eastern Province the Cultural Center will provide for a wide range of activities serving the local population and becoming a cultural landmark on both a regional, national and global horizon. When completed, the project will contain some 50 000m<sup>2</sup> of diverse cultural facilities, including an auditorium, cinema, library, exhibition hall, museum and archive. The auditorium will seat 1000 visitors and will provide for a wide range of events ranging from opera, symphony concerts, musicals and speeches etc. Together with the smaller cinema, this will be an unrivalled venue for the performing arts in the Kingdom. The library will become a center of learning containing some 300 000 books on open access and catering for all ages and categories of users. The great exhibition hall will accommodate large scale travelling exhibitions, as well as providing the setting for social events, banquets and conferences. The museum and archive facilities connect the vibrant cultural life of the center to the past and to the very roots of the society from which this center is conceived. On May 20th 2008 The foundation stone was laid by King Abdullah, the Cultural Center will be completed in 2011. (Snøhetta)

The King Abdulaziz Center for Knowledge and Culture is a bold new initiative on the part of the Saudi Aramco Oil Company to promote cultural development within the Kingdom. Following an invited architectural design competition in 2007 Snøhetta has been selected to design this prestigious cultural facilities, including an auditorium, cinema, library, exhibition hall, museum and archive. Located in Dhahran in the Eastern Province the King Abdulaziz Cultural Center will provide for a wide range of activities serving the local population and becoming a cultural landmark on both a regional, national and global horizon. When completed, the project will contain some 45 000m<sup>2</sup> of diverse cultural facilities, including an auditorium, cinema, library, exhibition hall, museum and archive. The King Abdulaziz Center for Knowledge and Culture auditorium will seat 1000 visitors and will provide for a wide range of events ranging from opera, symphony concerts, musicals and speeches etc. Together with the smaller cinema, this will be an unrivalled venue for the performing arts in the Kingdom. The King Abdulaziz library will become a center of learning containing some 300 000 books on open access and catering for all ages and categories of users. The great exhibition hall will accommodate large scale travelling exhibitions, as well as providing the setting for social events, banquets and conferences. The museum and archive facilities connect the vibrant cultural life of the center to the past and to the very roots of the society from which this center is conceived. On May 20th 2008 The foundation stone was laid by King Abdullah, the Cultural Center will be completed in 2011. The architectural concept is based upon the following six principles:

#### **The Past and the Future**

Culture grows out of the past, without culture no community or company can create a future. The design for the Saudi Aramco Cultural Center embraces both past and future, captured in the present. Both in terms of architectural expression and internal logic this proposal digs down into the past and reaches up in to the future.

#### **Introvert and Extrovert**

The King Abdulaziz Center for Knowledge and Culture concept is both introverted and extroverted. Below grade the museum and archive functions are grouped around the inner void looking inwards to the truths and knowledge to be found within Saudi Aramco and the Kingdom of Saudi Arabia. Above grade, the composition reaches out of the ground, connecting to the world beyond.

#### **Repository and Beacon**

Located below grade the Museum and Archive becomes a true repository of knowledge, in protective surroundings and stored for posterity. In contrast the Library, Children's Exhibit and Visitor Centre are expressed as beacons to scholars cross the world.

#### **Diversity and Unity**

This design takes the form of a complex composition, consisting of a number of individual and discrete components. Balance and harmony is created through interdependence. Each component is fashioned as a unique and tailor- made entity, conforming to and expressive of its own individual needs and requirements.

#### **Teamwork**

No one component can be removed. All are interdependent and rely upon each other. The resulting composition is an expression of team work. Each part can be endlessly adjusted to suit the individual and specific needs. This form for flexibility is not general or universal, but specific and individual.

#### **Energy**

The balance and harmony of the King Abdulaziz Center for Knowledge and Culture composition is not static, but dynamic, expressive of the team work and above all of the energy to be found in the people that comprise Saudi Aramco and Saudi Arabia. Evoking wonder and bearing memory of the steadfast endurance and hard labour under severe conditions in the pioneer striking of oil. (<http://www.e-architekt.co.uk>)

### **Alexandria Library, Alexandria – Egypt 2002**

Scope: Full Contract, Size: 80,000 m<sup>2</sup>, Client: Ministry of Education, Schedule: 1st prize int. comp., built 2001

In 2002 the new library of Alexandria in Egypt reopened its doors for the first time in nearly 2000 years. The culmination of an international effort lasting over 12 years, the library is one of the most contemporary in the world. In its over 800,000 square feet a range of museums and public assembly areas can also be found. Despite its large size, the building often feels humane and intimate in scale, while also having an atmosphere of dignity and calm repose. Outside of the library a large reflecting pool and public plaza link the building to the nearby Mediterranean and the city of Alexandria. The pools help to cool the area around the building and naturally collect dust to clean the air near the building. The building's unusual tilting form links the architecture directly with the landscape creating a unifying atmosphere that extends into the interior of the building. The building and grounds change atmosphere throughout the day and seasons. The water, vegetation and shape of the building help allay the sound of the nearby busy streets, creating a calm and comfortable, yet public and open space for those visiting the building and those simply passing by. (Snøhetta)

## Niels Torp Architects, Oslo – Norway

<http://www.nielstorp.no>

### Libraries:

#### BI Campus (Business and Economics School) Library, Oslo-Nydalen – Norway 2001 – 2005

Location: Oslo, Norway, Size: 100 000m<sup>2</sup>, Client:

### Awards:

Recognition: FIABI's International Property Prize 2008

European commercial Property Awards 2010

The natural lighting throughout the building along with the open walkways and courtyards all serve to create the feeling of a small town where everybody feels at home and welcome. Architect Nils Torp's vision is that there will be 8000 people in the building who are constantly on the move and that this feeling of motion and activity should be conveyed to people passing by outside.

The building has been designed like an open town where, by looking up, down and sideways, you can see activity going on. Students and lecturers can communicate openly and actively. Open terraces, galleries, small nooks and quiet areas have been created as special meeting places to add life. Each group of students -bachelor, master and executive- has its own particular area with teaching rooms, meeting areas and special facilities adapted to the students' needs. The building does not close anybody in, neither does it shut anybody out. The thousands and thousands of square metres of windows let people on the outside get a feeling of the busy life going on inside. The building is covered by a glass ceiling and comprises four blocks on seven levels. Three of the blocks are dedicated to BI. The fourth block contains offices, shops, a health centre and a large gym. There is a strong focus on future-oriented learning at the new BI campus. This is a place where 8000 students enjoy learning and feel inspired in their daily lives. There are now around 18,000 people going about their daily business in Nydalen. Half of these are students or staff of BI Norwegian School of Management. (<http://www.librarybuildings.info>)

Oslo's independent business and economics school 'BI' have established a new unified campus in Nydalen, a regenerated commercial area in the centre of Oslo. Situated adjacent to the refurbished underground station, Campus Nydalen combines Oslo's three previous separate business schools at Sandvika, Schous and Ekerberg under one roof. Each school originally offered different specialised courses, and it was an objective of BI to maintain each school's identity within the unified campus.

The new campus is a permeable, open and transparent building that exposes the activities in the building against the surrounding streets and public spaces. In addition to its educational function, the building acts as a meeting place, and is a focal point between the student environment and the surrounding business activities. Approximately 95,200m<sup>2</sup> (GEA), the campus can accommodate 10-12,000 students, tutors and administration staff. The campus is a commercial investment for BI, consisting of four buildings under one roof, three of which are occupied by the three original schools, one specialising in Executive studies, a second specialising in undergraduate courses in business marketing, and a third specialising in post graduate and masters courses in business studies. The fourth building consists of commercially let shops, office space and Nydalen Athletic fitness centre.

Set within a regenerated urban environment north of the city centre, the campus occupies one large city block, and is subdivided into four smaller blocks by two wide internal streets which slice through the campus forming a cross in plan. The building has ten levels, consisting of three levels of underground parking and a service bay, with seven levels of the student campus above ground. Externally a limited pallet of materials has been used to create a unified composition. The different functions of the campus are highlighted to provide articulation to the spaces. The auditoria with their large coloured brick walls anchor the building into the site. The library, set within its glass box on the upper levels of the building, emphasised by the horizontal lines of the solar shading cap the building unifying it as one. The reclining northern facade facing away from the city is played down and clad in copper, whilst the remaining facades expose the asymmetrical rhythm of the stairs and structural concrete columns to provide a vertical emphasis which is further articulated by the timber clad classrooms rooms and offices that are allowed to puncture through the facade between the columns.

Internally there is a hierarchical grid of streets providing a permeable network through the campus. This hierarchy is expressed in the use of differing materials throughout. The floors to the main streets and common areas consist of polished concrete and robust laminated timber parquet flooring. Carpet is used in the library to soften the noise, whilst vinyl is used in the remaining areas. The two main streets cut through the campus on a north-south and east-west axis, with the main entrance facing the underground station to the west. These streets are not only lines of communication, but also accommodate galleries of flexible areas of seating and breakout spaces providing informal meeting points for the students. The streets step down to lower ground level where they open out creating a central room that accommodates the cafeteria. The most important communication lines are easy to read in the central room, with the main stairs and lifts placed central at the intersection of the two streets, and this is also the departure point for an escalator that runs up to the Library at the fifth floor.

It has been important to create meeting places with different characters. These consist of exposed galleries on the main street near to the cafeteria, and quieter group working places and social areas in atria within each internal building, and along the facades.

The structural grid is used to define the layout of the campus. The large auditoria, classrooms and office floor plates are placed in open areas within the wide spans of the structural columns, while stairs, riser shafts and social zones are placed around secondary atria at the centre of each of the four individual buildings. This creates a flexible building that will be possible to be adapted to suit the future needs of the campus, or converted for other uses. The building is layered, with the large auditoria spanning over two floors at ground and lower ground level, classrooms located on the first floor, offices for professional and administration staff located on the second and third floors, and the library with the best location on the fourth and fifth floors offering a panoramic view over the city of Oslo towards the fjord. Additionally each building has undergraduate, masters and corporate study areas, each with their own area and meeting place located on first floor level in the atria area.

The vertical campus is open seven days a week, and is continuously animated by the students and staff that can be seen occupying the meeting and breakout spaces, or in motion on the streets, stairs, bridges, escalator and arcades as they make their way to and from their different activities. (Torp)

## Oman

### **COWI, Ruwi – Oman**

<http://www.cowi.com>

#### **Libraries:**

#### **University of Nizwa, Main Library, Nizwa – Oman in construction**

##### **Cultural capital**

Nizwa is the third largest urban community in the Sultanate of Oman, located 140 km south-west of Muscat. Nizwa was once the ancient capital of the country, the seat of Imam and the traditional centre of Islamic arts and learning. With establishment of the new

University, the Government of Oman is striving to continue this ancient tradition by providing a learning environment that will be conducive

to study and enriching in experience for all parties of education process.

##### **Mission**

The mission of the University is to promote positive thinking, and preserve the nation's Islamic and cultural heritage and identity. Its purpose is to broadly educate students and to equip them with the values, knowledge and life skills needed to enrich their lives, and to

empower them to contribute meaningfully to the progress of the society. To achieve this mission, the University shall develop dynamic,

integrative programs that would be able to provide high quality academic training and intensive intellectual development. COWI is involved in development of the new Nizwa University, which

will provide learning environment for more than 20,000 students

COWI's services: • Master Planning, • Architectural Concept, • Preliminary Design, • Detailed Design. Project Period: 2003-ongoing

Client: Higher Foundation Committee of the University of Nizwa

The doors of the new University opened to its inaugural class on October 16, 2004, welcoming around 1,200 students for the first academic year. Since the proper training facilities were not yet available, His Majesty Sultan Qaboos bin Said generously allowed the use of a Royal Boarding School as an initial campus and this site is used for educational activities until the new campus is finally created and launched.

##### **New Facilities**

The new campus is planned to be constructed on a 1,500,000 m<sup>2</sup> (1.5 km x 1.0 km) site east of Nizwa town and will ultimately house a total of 20,000 students in six faculty colleges.

##### **Master Planning and Design**

Work on the new University began in 2003, when COWI was responsible for development of the Master Plan for the new facilities.

Having completed the Master Plan, COWI has since been appointed to undertake the conceptual and detailed design for a number of buildings and facilities of the campus,

including:

- Main Administration Building
- Faculty of Engineering &

##### **Architecture**

- Faculty of Arts and Science
- Main library
- The Mosque
- Classroom Blocks
- Student Accommodation Blocks
- Entire Site Infrastructure

##### **Progress**

Design works are currently under way and construction of the new campus will begin during 2010-2011 academic year. Mosque Library.(COWI)

### **Eduardo de Pierola Arquitecto, Lima - Peru**

<http://www.eduardodepierloa.com>

#### **Libraries:**

#### **Biblioteca de la Universidad de Lima – Peru 2009**

La Biblioteca es uno de los edificios más representativos de una Universidad, por ello había que darle un carácter majestuoso y moderno, que resalte de los edificios colindantes, para que muestre su importancia. Era un edificio de poca altura, con respecto a sus vecinos, y es por eso que había de darle fuerza y protagonismo y es por ello que se le consideró darle un carácter monumental, modificando su percepción fundamentalmente horizontal y chata, a una vertical, que se imponga respecto a los edificios colaterales. El uso del muro cortina con cristal transparente, del acero y el revestimiento en ciertas paredes de fachada en granito color beige, crea volumen ligero y moderno. Se utilizó en las fachadas los muro cortina, subdividido en cristales de secciones verticales, de color natural con láminas arenadas que cubren las vigas y losas ya existentes, y con láminas transparentes el resto y con protección contra las radiaciones infrarrojas y ultravioletas. La fachada principal tiene una parte de mayor altura que remarca el nuevo ingreso al edificio. Las escaleras, mas retiradas de la plomada de fachada, tienen en cada nivel una jardinera exterior sembrada con helechos, para darle una percepción más natural, al incorporarle zonas verdes en la fachada. El ingreso está definido por una bóveda acartelada, en cristal templado, sujeta por estructura de fierro color acero y apoyada en 2 columnas para darle ligereza a su volumetría. La Plaza de la Biblioteca, se encuentra limitada por el edificio "E", la Biblioteca y el Edificio "D", en el Campus De la Universidad. Su área es, aproximadamente, 1,221.00 m<sup>2</sup>, y las características del proyecto arquitectónico se explican a continuación. (Pierola)

#### Libraries:

#### University of Gdansk, Library – Poland 2006

The Library of the University of Gdansk, apart from being an academic unit, serves as an educational and service centre of the University information system. The Central Library of the University of Gdansk in Gdansk-Oliwa, together with seven specialist libraries and UG British Library constitutes the basis for the academic library and information system. It is available for all readers, with the scientific library and a public centre of science and culture accessible for inhabitants of the whole region. 15.000 m<sup>2</sup> (<http://www.mimoa.eu>)

### Badowski Budzynski Kowalewski Architekci, Warszawa – Poland

<http://mbarch.pl>

#### Libraries:

#### Warszawa University Library – Poland 2000

Project competition for the library was founded in 1993, the fourth year of the new Polish. Years of hope, confusion, loss of old and new. For me, it was the time to really look for, identify their world and fight for simple survival. Generally, I try to follow in the direction of what we call sustainable development.

The mood and symbolism of the forms library is a result of both the direction and the fascination with the design team established by the University Library of the idea of combining free access to the collections of formalized access the catalog and service along with the simultaneous possibility of earning a computer information from international collections of university libraries. Equally exciting for us was the established way of financing investment and associated spatial link library of commercial space.

The basic design decision is the structure of the building resulting from the above. urban planning principles and guidelines that restrict the height of the building and ordering a reference to the street frontage of the building. The property generally fills a 100% land within the line of demarcation development. It has two floors underground and four above-ground. At the lowest level of 8 meters underground are parking and technical rooms, at 5 meters below the ground floor constituting a reserve for the development of storage library, planned in the first phase as a floor for rent for commercial purposes, currently rented for family entertainment center Hula Kula.

From the ground floor - reduced about 80 cm from the surrounding area to the roof, the building is divided into two parts. Library of the Vistula, and the commercial part of the city. Both these parts are connected so. "Alley". Space symbol of the unity of opposites, the space in which a variety of often conflicting events can occur. This part thanks to Robert Rzesosia commercial bank imperative undoubtedly began to live, and certainly at this stage began to displace the Library. I wonder if the University might reflect and find the will and the power balance.

All above-ground and below-ground floors are connected by shafts 7-mioma jumper divisions plumbing and electrical, elevators, stairwells and toilets.

This structure has its exterior and interior.

The exterior of the building speaks of coexistence of nature and culture, has aspirations to Mark. It has a roof and three facades so. "Organic".

The guidelines resulted urban neighborhood of the Botanical Garden Library. We proposed unity of these two assumptions - Symbol of unity of opposites of Nature and Culture - garden surrounds and covers the exterior of the library, its roof and three facades so.

"Organic", making them biologically active. Their mood determine the distribution racks and drain water from the roof to the nets, climbing over them, vegetation and green stains of patina copper laying on rough concrete. These naturally growing plants are to be ornament Structures. The fifth element of the exterior - facade of the town called "Cultures" he says about the relationship with the past. The diversity of civilizations, says the Greek - Roman and Judeo-Christian source of Polish culture. 8 tables of alphabets and codes, and form the entire façade symbolizes the facts.

It also binds with the system inputs in building the unity of the organization of the city. For six inputs from the street. Good life penetrates into the interior, to the "streets" for the binding and separating the commercial part of the library and the outer green. The system inputs and symbols library Facades imposed on some music is an expression of hope that the people have reached a state of absolute reflection of commerce and their system of values will be modified in the direction of balancing Me and My, and a reminder that tradition is about us.

The interior of the Library is the world of isolation, a world of special, artificially created a climate in which the book is as important as the reader, is the spirit world culture. The space of this world is, like any Euclidean, formed on three mutually perpendicular axes, defining relationships. The first one, oblong, designating compounds of the Temple of Knowledge in everyday life leads from the "streets" steps called "Propylaea" with "colonnade philosophers' information into the hall and then to the main reading room. The second axis, perpendicular to the first sets relationship with nature, with the surrounding park mounted electro on and covering the area of the Library. At the intersection of the first two passes third axis vertical, symbolically defining the relationship of culture and the universe. This is the backbone of ideas, faith, transcendental matters.

It consciously shape the mood to help achieve a state of sacred culture, a reminder of the need to strive for the unity of the truths of reason and revelation.

On these three axes around the lobby information is stretched network with a collection of individual compounds. Network pass through the aisles on three levels connected by stairs and elevators creates a kind of city planning books with their culmination in Agora hall information. Navigating the space determines its fourth dimension and brings vivid sense of space. It strengthens the commitment to trade with the whole culture, helps you find your place in the infinite relationships around us.

Stores closed, inaccessible to the reader and delivery, are at ground level, in the open space of the Library. From the Wislostrada and st. Linden at all levels of the band room studio preparation and upkeep.

The idea of the meaning was, and is determined by a low budget and hence each occurrence of an element is purely technological. The design of cast concrete and steel remains unfinished, gipskarton walls, floors and carpet tiles. All installations are on top, showing how a technically complex procedure is to maintain a proper atmosphere in the library. Basic spatial effects are extracted natural and artificial light.

The main problem of the project was, and is, that the idea of ideological functions and enforces the library of all the participants of the investment process somehow growing to the problem, and that it all takes place under conditions known to us all, the Polish transformation, the amount of time and energy used to achieve the objective has been repeatedly greater than average, and thus the state of the start of operations in an infinite library and fully equipped building. Initiating state's legitimate discontent, but unfortunately the creation writing at the same time focus on moving away from the provided solutions. It is a state effort to maintain the unity of the plan. I believe that the people of the University of the case of the unity of ideas and space are able to internalize and defend.

### **Libraries:**

#### **CINiBA – The Scientific Information Centre and Academic Library, Katowice - Poland 2009 – 2012**

project: 2002-12 (competition, 1st prize), design team: dariusz herman, wojciech subalski, piotr smierzewski, rafal sobieraj, adam kulesza, jacek moczała, wojciech słupczyński, Building Footprint: 2 910 m<sup>2</sup>, Total Floor Area: 10562 m<sup>2</sup>, Volume: 62 560 m<sup>3</sup>  
Net Floor Area: 12 273 m<sup>2</sup>, Gross Floor Area: 13 260 m<sup>2</sup>, Maximum Volume Storage: 2 000 000 books

The Silesian University is currently housed in a complex of buildings adapted from the facilities of the former Teachers' Training College. This unpremeditated development did not suitably reflect the prestige of this institution which is well-renowned throughout Poland. Thus, the design of the new library has become a catalyst for establishing a new campus redevelopment plan to be implemented in the coming years.

Located at the intersection of the east-west axis that forms the spine of the campus, and the north-south axis which connects the recreational grounds by the river to land set aside for further university expansion, the library reinforces the axial organization which has so far been poorly articulated. A central university square at the foot of the library, the FORUM, generates a civic gathering place that opens onto the library's grand three storey atrium.

The height of the library has been determined by the average height of buildings on the university campus. The north elevation surpassing this height is directed towards the FORUM and houses the library's closed stacks. This elevation emphasizes the rank and function of the FORUM and is in dialogue with the existing tall buildings which close the east-west axis.

The facades, clad in a repetitious fabric of rich kahan red sandstone, relate to the raw clay bricks on the neighbouring buildings without the connotation of scale inherent to a singular brick element. The exterior treatment abstracts the building's function of organized book storing while introducing a notion of mystery inseparably connected to books.

The lack of discernible scale produces a monolith when seen from afar that is gradually familiarized. Details such as the decreasing proportions of the façade tiling, the irregular cut of the sandstone slabs, as well as the windows carefully nested inside become visible.

The fenestration projects a stunning patchwork of light onto the FORUM at night, yet in the daytime allows diffused light to permeate into the library's reading rooms. The resulting strongly introverted interior composition of the library floors focuses one's attention onto the books while calming the space. Partial isolation from the external world not only influences the atmosphere within but also introduces a flow of time detached from the pulse of the surrounding city. (HS99)

#### **Raczyński Library Expansion, Poznań – Poland 2012**

The Raczyński Library has been a major cultural institution in Poznań since its establishment in 1829. In a competition, completed in 2003, for the expansion of its historic seat, the first award was won by an entry from JEMS. The design almost triples the floor area of the historic building. The underlying decision behind the design provided for placing interiors of primary importance accessible to the general public – the information desk catalogues and reading room – on the executive first floor ( piano nobile ) level, thereby continuing main architectural arrangements of the existing building. The solution became possible owing to the location of three levels of library storage suspended above the public zone. This also provided an opportunity to open up the ground-floor area to the facilities associated with the library: a bookshop, gallery and cafe. After the expansion, the light, filigree, almost transparent cast-iron colonnade of the 19<sup>th</sup> century building will remain the main entrance facade. Multiple perspective and uniformity of the facade is also reflected by the newly designed elevation facing Karola Marcinkowskiego Avenue, its piano nobile level being discreetly separated from the other levels, mainly owing to its greater transparency. The effect is present mainly in a close contact with the building. Viewed from a distance, the facade becomes much more uniform, providing a neutral background to the historic building. (JEMS)

#### **University of Poznan, Library, Poznań – Poland 2009**

Client: Adam Mickiewicz University, Poznan, Site area: 7308 m<sup>2</sup>, Building area: 564 m<sup>2</sup>, Usable floor area: 2062 m<sup>2</sup>, Total floor area: 2464 m<sup>2</sup>, Volume: 9970 m<sup>3</sup>, Competition design: 2005, Design: 2005-2006, Construction: 2007-2009

Polish and Classical Philology Faculty Library of Adam Mickiewicz University, Poznan, Poland

Architects: Jacek Bulat, Bartosz Jarosz, Joanna Kapturczak, Michał Kapturczak, Paweł Swierkowski

Interior design: Jacek Bulat, Bartosz Jarosz, Paweł Swierkowski, Katarzyna Kwiesielewicz - Broniarz

Polish and Classical Philology Faculty Library of Adam Mickiewicz University is located in the heart of Poznan - in the close proximity to historical buildings from the beginning of twentieth century, in the immediate vicinity of the Poznan Opera House and the Prussian Imperial Castle. It was designed as an extension of the Collegium Maius - the former building of "Hakata" - the Royal Prussian Colonization Commission. The parcel is hidden at three sides by the Collegium Maius and by the building of Regional Government Office. Our aim was to design of a functional and modern building, restrained in form and yet adjusted to the historical function and context. We have concentrated on the future building users - the students - the design was dictated by their taste and responded to their needs. Another tough task was to design within very strict area limits given in the local urban plan and by specified parcel use - and at the same time we had to satisfy client's programme which was very extensive in function terms. As a result a very functional yet interesting plan was created - we exploited very carefully the maximum available area without losing the leitmotiv of our idea. Additional unexpected difficulty was the parcel's ground-water situation - building was supposed to be located partially above the reminiscence of Poznan city wall and also on an underground watercourse that was disturbed by new structure. The project was an architectural competition resolved in September 2005. New library building received a form that is a structure divided horizontally in half with a massive sandstone bottom and light glass top - to represent a merge of historical content with a very contemporary form. Building facades finishes are dominated by two materials - glass and sandstone. Used stone pattern is identical to the existing one at the facades of Collegium Mains facility. At the same time some light rhythm disturbances were introduced - we like to call them "razor blades" - those sandstone forms that are led throughout the entire building elevations and are also further reflected in a floor pattern and in the interiors. #### **University Library, Wroclaw – Poland 2012**

The new Library building will be located on the banks of Odra River, in the street block between Cardinal Stefan Wyszynski St. and Szczytnicka St.

The building has been designed in a form of two solid structures. The first one will contain circulation department, general collection stacks, acquisition department and technical services for newly acquired items. The second will contain additional stacks and preservation section for special collections. Both will be separated by a pedestrian passage. Internal design of the main hall calls for a flexibility in its arrangement and setting.

#### **Ílhavo City Library, Ílhavo - Portugal 2004 - 2005**

Ílhavo City Library is located in the remains of the Manor Visconde de Almeida, a noble house from the 17th-18th century, later transformed and demolished. From the original building only the main façade, oriented southeast, and the chapel, both in ruins, were left. There was no trace from the carriage porch which completed the building on the southwestern end. However, all elements remaining from the old construction were examples of qualified architecture, in their proportion and elegance of the masonry. This type of legacy is rare in Ílhavo and it was therefore assumed that it should be preserved and integrated in the new project. The building is located on the periphery of the town, an area with little urban expansion, still fairly inarticulated and problematic. We chose not only to design an object, the library, but to intervene in the clarification and consolidation of urban fragments and volumes with no apparent overall coherence. The preliminary program, whose extension could not be confined to the space of the remaining manor, determined the intention of building three autonomous nuclei: Library, Chapel and Youth Forum. The limits of the manor and the line of the old façade were chosen as an anchorage point, where administrative areas and programmes compatible with the façade's rhythm were placed, restoring the character of the original building, which was then only a decadent scenario. There is nevertheless a clear identification of the new, which exists in symbiosis with the pre-existence. The concept behind the rest evolves from an understanding of the public and civic character of the building, whose urban role was reinforced. The design of the reading rooms and youth forum, external to the manor, establish direct morphological relations with the surroundings, thus making the architecture work in context as a closing piece which incorporates the physiomy and traces of the surroundings. This strategy would not make sense in any other context. The chapel, deprived of its most important decorative elements, like tiles, woodwork, tomb stones and furniture was restored in essence preserving all possible evidence of its lost past. The furniture and the new altar panels by Pedro Calapez, were designed in an unequivocally contemporary style, which rediscovers the typology of original polichromic work. The chapel has been reopened for religious service, just as it was before restoration. (ARX)

#### **Escola Secundária EB3 Luís de Freitas Branco, Paço de Arcos (Oeiras) - Portugal under construction**

Client : Parque Escolar EPE, 17 216 m2

O complexo escolar está dividido em 9 edifícios distintos, sendo que dos quais 4 são pré-existentes (3 edifícios com salas de aula e 1 pavilhão gimno-desportivo) e 5 serão construídos de raiz. Os restantes 5 edifícios existentes serão demolidos.

Nos 3 Pavilhões existentes ficará localizada a totalidade dos espaços destinados ao Ensino Geral: Salas de Aula de 25 Alunos, Salas de Pequenos Grupos, Sala para Grandes Grupos, bem como os respetivos espaços de apoio. Nos edifícios novos serão albergados os espaços sociais, as salas TIC, a portaria, os espaços especializados para as artes e expressões, bem como as oficinas de mecânica e eletricidade.

Prevê-se uma circulação exterior coberta para ligação entre o Pavilhão Central e as Instalações para Educação Física e Desporto, que serão ampliadas de modo a conter um novo Campo de Jogos para Basquete, Voleibol e Andebol, bem como uma Pista de Saltos. Nestas instalações incluem-se novos balneários para professores e alunos, em estreita ligação com o Pavilhão Gimno-desportivo. Para a ligação entre o Complexo Escolar e o Pavilhão Gimno-desportivo prevê-se a criação de um novo acesso em rampa elevada. (<http://www.afaconsult.com>)

### **Azores University's Library, Ponta Delgada, Azores – Portugal 1997 – 2004**

Project : Projecto de Recuperação e Ampliação do Edifício dos Serviços de Documentação da Universidade dos Açores/Biblioteca Central, Location : Campus Universitário de Ponta Delgada, Rua de São Gonçalo, Ponta Delgada, São Miguel, Açores, Client : Universidade dos Açores

The Central Library stands on a periphery site of the University Campus, occupying a narrow parcel near the parking area of the institution, next to the city limits of Ponta Delgada. Following the competition brief, the project had to maintain a small existing building. The library's functional organization takes over the existing building, which is overlapped by an assemblage of different open spaces, that are divided within themselves by different levels. Joining those plateaux at diverse highs, a system of ramps crosses through all the central space, connecting therefore the campus and the city from the inside, inviting users to pass by each of the reading rooms, in-between shelves filled by books.

In this public circulation circuit, an enormous skylight that accompanies the ramp structure gives the ambient luminance.

One other functional circulation circuit, only to be used by the library's staff, crosses the same spaces in another route, linking it to book storage areas and bibliographic deposits. The three main Reading Rooms are in between those two functional circuits; and each of the rooms is the formal result of those circuit's correlations. Each reading room assumes its own character, according to its specific contents and functions, sharing visual and formal relations with others. The sunlight exposure variation throughout the day contributes to the distinction of the library's internal spaces, adapting them to their distinct functions. plastered masonry in concrete blocks; white joinery. #### **Modernization of Garcia da Orta Secondary School (Library), Porto – Portugal 2007 – 2011**

Construction: 3.200 m<sup>2</sup>, Refurbishment: 9.300 m<sup>2</sup>, Client: Parque Escolar. E.P.E, Lisboa

This is a project that takes part of the portuguese government program parque escolar, consisting on the modernization of portugal's secondary schools, updating them to the new needs of the contemporary society. In garcia da orta school the program included some new facilities like a library, auditorium, and others. due to its particular site shape and the pavillions location, it became obvious the configuration of a new building designing a new central place. (Bak)

The architect Ricardo Bak Gordon has converted a school in Porto, which is reminiscent of a modern-style chicken incubator. In a deep red ceiling lights above the courtyard. Implementation and expansion of Garcia da Orta in the wake of a state grammar school was realized modernization measure Portuguese secondary schools and recently put into operation. Three large building blocks have been integrated into the school complex. As the ensemble is a distorted triptych of three two-storey pavilion buildings staggered between the existing buildings, the abtreppt accordingly for easy hillside. Used the buildings for a school library, an auditorium, a gymnasium and a cafeteria with a cafe and bar are on this, the covered outdoor space is connected, which lies between the library and gymnasium. This column-free space as the spaces within the building marked by his red beams. The upper long edge wall closes off the space though, but cleverly draws attention to the environment of the protected from the sun's outer space. Also in the auditorium and gymnasium in the ground-floor windows were installed. (<http://www.baunetz.de>)

#### **Modernization of Amora Secondary School (Library), Seixal – Portugal 2010**

Construction : 3.600 m<sup>2</sup>, Refurbishment : 8.000 m<sup>2</sup>, Client: Parque Escolar. E.P.E, Lisboa

The intervention project of the Amora Secondary School is integrated in the Modernization Program of the Scholarly Park of Secondary Schools, that includes the rehabilitation of the existing buildings (significantly improving its infrastructural conditions), the total or partial construction of the remaining buildings (introducing new programmatic areas capable of making an effective modernization within the school environment at the organizational-functional space level) and requalification of the exterior spaces. The interdisciplinary coordination assumed a key role, from bases defined by the Architecture and made viable by the structure, with the optimization of general network infrastructure layouts, minimizing conflict points and using energy efficient lighting systems, cooling and pumping.

Given the school size and the consumption associated, in a sustainable development perspective, allowing the rationalization of the drinking-water consumption, it was adopted gray water and rainwater reuse system for non-potable purposes.

The buildings surrounding area was carefully treated in order to minimize the influence of the outside weather, to create a better environment and rationalize the energy consumption. Accordingly, and with the greatest respect for architecture, the solutions passed through the: thermally insulating the entire exterior surface, select the glazing and promote efficient glazing shading systems. (<http://www.afaconsult.com>)

#### **Modernization of D.Dinis Secondary School (Library), Lisboa - Portugal 2007**

Construction : 2.200 m<sup>2</sup>, Refurbishment : 6.200 m<sup>2</sup>, Client: Parque Escolar. E.P.E, Lisboa

This is a project that takes part of the portuguese government program parque escolar, consisting on the modernization of portugal's secondary schools, updating them to the new needs of the contemporary society. In d.dinis school the program includes some new facilities like a library, auditorium, but also the need of linking the 5 pavillions in a central social place. this is configured into a new building that fits itself between the existing ones, connecting and concentrating the social school activities into it. ### **Libraries :**

#### **Escola Secundária Lima de Freitas, Setúbal – Portugal 2010**

Client : Parque Escolar EPE, 23 708 m<sup>2</sup>

O objetivo da Parque Escolar com esta intervenção é o de reabilitar o património edificado existente (melhorando significativamente as suas condições infra-estruturais) introduzindo novas áreas programáticas capazes de conferir uma efetiva modernização no ambiente escolar ao nível da organização espaço-funcional. A requalificação de todos os espaços exteriores, é também prevista, face à sua importante utilização.

A Escola Secundária Lima de Freitas, em Setúbal apresenta uma estrutura pavilhonar característica das escolas construídas entre finais de 1960 e a década de 80. A intervenção compreende uma área de construção de aproximadamente 20 328 m<sup>2</sup>, com aproximadamente 16 350m<sup>2</sup> de áreas exteriores. O espaço escolar é atualmente constituído por sete pavilhões, quatro com salas de aulas, um com laboratórios e salas de informática, o bloco do refeitório e um de serviços administrativos onde se concentram as áreas de direção, administração e áreas sociais da escola.

Os diversos pavilhões são interligados por um edifício novo, que promoverá a circulação coberta entre unidades de ensino. Tendo em consideração que a escola confronta directamente com o início da serra da Arrábida, o declive faz-se sentir no seu interior, razão pela qual os pavilhões se encontram implantados a diferentes cotas. ### **Libraries:**

#### **Ferreira de Castro Municipal Library, Oliveira de Azeméis - Portugal 2007**

Authority and authority type: Município de Oliveira de Azeméis, Size of library: 4.200m<sup>2</sup>

The library has been built on an area of relatively reduced dimensions, which slopes sharply. These conditions naturally affected the architectural project and necessitated a construction of more than one storey.

The architects José António Lopes da Costa and Tiago Meireles aimed to ensure that all the library’s possible functions linked together well, while avoiding a volumetrically high and compact design. They attempted to establish a balanced relationship with the building’s envelope, creating an exterior space that could be taken advantage of by the library’s users.

The library is principally laid out over two storeys. On the ground floor, the entrance, atrium and multi-functional room are to be found in the North wing. The East wing contains the children’s and young adult sections.

The first floor contains the adult section, which opens onto the inner courtyard.

The basement (floor -1), which is completely subterranean, contains the public car park as well as the ramp that gives access to the archives and stacks.

The library relates to the exterior above all through its inner courtyard, onto which all the sections open and by way of which they relate to each other.

The courtyard has two levels, separated by a mirror of water and by a line of orange trees that ends at the open-air theatre. The courtyard can function as a continuation of the bar’s open-air café. The theatre can be used for various activities and shows. There is also a covered terrace in the children’s section that can be used for open-air exhibitions.

From a formal perspective, the aim was to create a rational building, which relates well to the exterior space, a building that is transparent but not exposed, volumetrically simple while still lively, and that translates the richness and differences of its spaces. ## **Eduardo Souto de Moura, Portugal**

Pritzker Prize 2011

### **Libraries :**

#### **Paula Rego Museum, Bibliothek, Cascais – Portugal 2009**

Bauherr: Stadtverwaltung Cascais, Planung: Eduardo Souto de Moura, Grundstücksfläche: 8896 m<sup>2</sup>, Bebaute Fläche: 3.307m<sup>2</sup>  
Nutzfläche: 2.648 m<sup>2</sup>, Planungsbeginn: 2005, Fertigstellung: 2009, Baukosten: 5 Mio. Euro

2009 wurde in Cascais/Portugal ein bemerkenswertes Museum, das dem Werk der portugiesischen Künstlerin Paula Rego gewidmet ist, eröffnet. Das in roten Farben gehaltene „Casa das Histórias Paula Rego“ wurde von dem portugiesischen Architekten Eduardo Souto de Moura entworfen. Er gilt als einer der prominentesten Vertreter der Escola do Porto (die Escola do Porto ist eine Stilbewegung in der modernen Architektur Portugals. Begründet von Fernando Távora an der Fakultät für Architektur der Universität Porto). 2011 hat er den wohl bedeutendsten Architekturpreis der Gegenwart erhalten – den Pritzker-Preis. Gelernt hat Souto de Moura beim Großmeister der portugiesischen Moderne, Alvaro Siza. Aber während Siza – er erhielt den Pritzker-Preis 1992 – eine Weltkarriere startete, blieb Souto de Moura mit seinen Arbeiten eher in Nordportugal beheimatet. Während der jahrzehntelangen Salazar-Diktatur, unter der auch die Architektur korrumpiert wurde, waren Siza genauso wie Souto de Moura unter denjenigen, die in den 1970er-Jahren den Aufbruch wagten. Sie wollten eine neue, künstlerisch ambitionierte und doch volksnahe Architektur, die die drängende Wohnungsnot lösen sollte. Andererseits wollten sie bei allen Notwendigkeiten eben auch die Architektur als Kunst neu etablieren. Dass Portugal heute für das zeitgenössische Bauen eines der interessantesten Länder Europas ist, verdankt es eben dieser Mischung aus sozialer Verantwortung und Kunst- und Kulturbewusstsein. Mit den 2 Türmen in Form von Pyramiden und seinen schlichten Mauern ist das Museum im Stil den historischen Gebäuden angenähert. Der Einfluss der Architektur des Sintra-Nationalpalastes und des Klosters von Alcobaça ist unverkennbar. Souto de Moura wiederum hat seine Vorbilder in Mies van der Rohe mit seiner Suche nach der perfekten Form und Luigi Nervi mit seiner Lust an der freigelegten Konstruktion. Wie viele portugiesische Architekten ist auch Souto de Moura ein Intellektueller, einer, der gut lesbare Essays und Bücher über Architektur schreibt, die sich nicht wie viele Werke seiner Berufskollegen in Formdebatten und Prachtfotos erschöpfen. Leider sind sie viel zu selten über die Grenzen Portugals hinaus bekannt und wirkungsvoll geworden. Die Idee zu dem Museum entstand auf Initiative der Stadtverwaltung von Cascais. Da die international bekannte Künstlerin Paula Rego lange Zeit in Estoril, der Nachbarstadt von Cascais, gelebt hat, sollte für ihre Werke eine angemessene Plattform geschaffen werden. Auf den insgesamt 750 m<sup>2</sup> finden Besucher neben den Ausstellungsflächen auch ein Café, einen Shop und eine Bibliothek. Diese befinden sich in den beiden pyramidenförmigen Türmen des Museums. Die Cafeteria öffnet sich in einen grünen Garten. Zusätzlich gibt es ein Auditorium mit rund 200 Plätzen für Veranstaltungen. Das gesamte Gebäude gliedert sich in vier Trakte. Sie variieren in Höhe und Form, die Räume gehen ineinander über und sind um einen höheren Zentralraum, der die Hauptausstellung beherbergt, angeordnet. Die Farbgestaltung ist in unauffälligen, zurückhaltenden, neutralen Tönen gehalten, und der Boden ist durchgängig aus einem blau-grauen Marmor aus der Gegend um Cascais. Überall hat man als Besucher das Gefühl, willkommen geheiß zu werden, alles fließt und öffnet sich in immer wieder neuen Sichtachsen. Es gibt keine übertriebenen, modernen Abstraktionen und Ausdruckspriolen in dieser Architektur, sie ist von einer fast archaischen Anmutung geprägt – ein modernes Museum der heutigen Zeit! ## **Raj Rewal Associates, New Delhi – India**

<http://www.rajrewal.org>

### **Libraries:**

#### **Lisbon Ismaili Centre (Library), Lisbon – Portugal 2000**

The design of Raj Rewal draws inspiration from Islamic philosophy and vocabulary of design assimilates Iberian Peninsula's architectural traditions and is innovative in terms of contemporary construction technology. It is influenced by morphology of traditional spatial arrangements of courtyards (Allahmbra, Fatehpur Sikri) concept of the paradise garden and Islamic patterns. In the Ismaili Centre architectural heritage is reinterpreted in terms of functional requirements and the concept of the site in Lisbon. The public spaces of design like Jamatkhana, Social Hall and Community facilities are grouped around separate courtyards on the ground floor. The first floor is reserved for educational, institutional and Aga Khan Foundation areas around smaller enclosures of courtyards. The six courtyards and external spaces are landscaped with fountains, running water and appropriate foliage. (Ray Rewal)

#### **Indian Parliament Library, New Delhi – India 2002**

##### **Awards:**

**IBC award 2002 by the Indian Building Congress for Excellence in Built Environment for Parliament Library Building, New Delhi**

Symbolically a house of knowledge, the Parliament Library has its site next to the Parliament House in Lutyens Delhi. Both visually and symbolically, the central hall of the existing Parliament denotes power, consensus and democracy and is linked to the central core of the new complex. For the library, a formal structure is conceived within the Indian tradition, built in a contemporary idiom to capture the essence without mimicry of past historical styles. The site measures 10 acres with a built-up area of 50,000 sqm. The design for the existing Parliament follows the "Beaux Arts", the central line axis planning criteria. It is circular in plan with three axes culminating in a central dome. Courtyards form an important feature of the design vocabulary, keeping in mind Delhi's extreme climate. They help in creating a dust free atmosphere and in reducing the summer heat. The height of the building is restricted to the podium level of the Parliament House. (Rewal)

#### **National Center for Biological Sciences, Bangalore – India 2000**

The research laboratories function around serene surroundings and provide ample space for interaction amongst scientists. The roof terraces and green enclosures are an important feature of the design. The 20 acres of site gently sloping from north to south forms part of an agricultural university. Phase-I consists of research laboratories seminar rooms, lecture theaters, administration, library, canteen, animal house, student's hostels and part of staff housing. The aim of the design was to locate various functions of the phase-I in such a manner that it would look complete and harmonious in all respects yet allow flexibility for future expansion. The concept is based on a series of inter-linked courtyards surrounded by programmatic elements that facilitated the phasing of the project. (Rewal)

**[Escola Secundária de Ponte de Lima, Ponte de Lima - Portugal under construction](#)**

Client: Parque Escolar EPE, 18 669 m2

Com este projecto pretendeu-se reabilitar o património edificado existente (melhorando significativamente as suas condições infra-estruturais) introduzindo novas áreas programáticas capazes de conferir uma efectiva modernização no ambiente escolar ao nível da organização espaço-funcional.

A intervenção compreendeu:

- 1- a reabilitação dos três edifícios de sala de aulas existentes: Blocos 2, 4 e 5,
- 2- a demolição integral de um edifício de oficinas e mecânicas a substituir por um novo: Bloco 1,
- 3- a demolição integral do pavilhão polivalente: Bloco 6 que deverá ser substituído por um novo edifício com espaços de utilização idênticos;
- 4- a substituição da cobertura do pavilhão gimnodesportivo,
- 5- a reconstrução dos balneários: Bloco 3;
- 6- a construção nova de um edifício sobre o campo de jogos exterior destinado essencialmente a laboratórios.

Salienta-se a Estrutura do Edifício que enquadra o Campo de Jogos e os Laboratórios, que face às exigências do programa funcional condicionou o afastamento dos elementos verticais, pelo que temos uma solução de afastamento de 14.00m numa direcção e 31.50m na outra. A vencer o vão de 31.50m existem vigas transversais pré-esforçadas distanciadas de 7.00m entre si. Ou seja, estas vigas pré-esforçadas vão apoiar alternadamente sobre os pilares ou sobre as vigas parede longitudinais da fachada. (Serodio)

3.130m<sup>2</sup>, Furniture supplier: Design by Álvaro Siza Vieira, Overall Cost: €4.500.000

It is a two storey square shaped building, formed by an elevated volume of 45x45 meters, including a void of 20x20 meters, prolonged eastward on the first floor by a L shaped volume. The library headquarters, the library events area and the bar are on the first floor and the reading rooms are on the second floor. (<http://www.librarybuildings.info>)

**[Faculty of Architecture \(Library\), Porto – Portugal 1995](#)**

The buildings of the Porto architecture school are set on a terraced site high above the estuary of the Douro River. This area is bordered on three sides by highway exits and by Campo Alegre street, and on the east by the former estate of Quinta da Povoa - the site of the architecture school before its expansion, which houses an earlier project by Siza - the first-year Carlos Ramos Pavilion. Adjacent to the rusticated stone wall of the estate, the new faculty buildings stretch out along two vertices of a triangular site, enclosing between them a courtyard and central meeting space.

The main building on the northern side, a continuous volume which provides visual and acoustic protection from the road above, contains departmental offices, lecture halls, an auditorium and a library. Across the courtyard on the southern side are four individual studio towers, which are placed several meters apart to allow views to the river, their different heights and facade configurations conforming to variations in the program. These are connected to the main building by a series of corridors below the plaza.

The volumes of the main building and towers converge westward, where a cafe pavilion and outdoor terrace mark the entrance to the site. At the opposite end, the courtyard leads to an elevated grass platform, which in turn climbs up by a series of ramps and stairs to the former estate and garden, giving access through a narrow gate to the Carlos Ramos Pavilion. Set at the apex of the estate, this simple two-story structure is a succinct summary of the courtyard plan - a U-shaped classroom building with its two wings converging at a sharp angle. While its exterior facades are blind, the large pivoting windows facing the interior courtyard allow complete transparency between the classrooms on either side of the building, and views beyond to the garden and river.

The materials used in the interior of the more recent addition include exotic wood for the floors and wainscots, marble in the foyers and stairs, specially-designed furniture for the classrooms, auditorium and library, and skylights which draw natural light into the main spaces. #### **Bishan Public Library, Singapore – Singapore 2006**

Site area : 1,400 sqm, Gross floor area : 4,322 sqm

4-storey public library with basement and roof terrace. The prominent 'pods' cantilevered from the facade serve as intimate niches for quiet contemplation. Taking reference from the treehouse, the library interior is animated by natural light filtering through colored glass panels, resembling dappled light passing through the tree canopy.

The metaphor of a tree house was invoked from the onset of design conceptualization to create an environment for learning via a journey of discovery and play. The use of skylights, trellises and colored glass transforms incoming daylight into a myriad of shades and colours, creating an intriguing dappled light quality within the library that simulates light filtered through the foliage of trees. 'Pods' cantilevered off the main building facade exude a distinctive charisma on the exterior and create suspended alcoves at an intimate scale from the building interior. The library is raised above the anonymity of its mixed used neighborhood and sets out to stir the curiosity of the community. (Look)

The metaphor of a tree house was invoked from the onset of design conceptualization to create an environment for learning via a journey of discovery and play. The use of skylights, trellises and colored glass transforms incoming daylight into a myriad of shades and colours, creating an intriguing dappled light quality within the library that simulates light filtered through the foliage of trees. 'Pods' cantilevered off the main building facade exude a distinctive charisma on the exterior and create suspended alcoves at an intimate scale from the building interior. The library is raised above the anonymity of its mixed used neighborhood and sets out to stir the curiosity of the community. Conflicting requirements – view orientation, solar control and regulation of unprotected openings mandated by the statutory fire safety code – were satisfied by a highly rationalised spatial strategy. An internal atrium was incorporated to introduce natural daylight deep into the main circulation zone, as well as most of the library floors, and the back-of-house was concentrated as a solid core on the western elevation that also serves to shield the building from the harsh evening sun. ....(ArchDaily. Celik, Mateviž, New Architecture in Slovenia. Wien: Springer 2007

Municipal public library of Grosuplje is located in the heart of the city and represents one of the most vivid parts of public life in the community with 18.500 inhabitants. Nowadays library members represent 35% of regional population and the percentage grows noticeably every year. Library activity in the community started before the Second World War with social and trade union libraries. Independent public library was established in 1962 and later in 1967 the first professional librarian was employed. The development of the new library information system, technology, social and economic relations resulted the need for a modern library building. Library with modern technical facilities, better access to the library collection and more spacious reading room. In 2003, municipality of Grosuplje started the renovation and in 2007 the new library has been opened. With a quality ICT equipment and services and adequate respond on demanding requirements of modern learning the library fulfilled its role as a knowledge provider. Today library employs nine librarians who provide professional librarian service for each and everyone that grounds in personal and trusting relation between users and services. Library has approximately 750 visitors per day. It provides large amount of contemporary literature, electronic journals, free access to the internet and comfortable reading and studying areas. The latter are sufficiently equipped with a well chosen collection of key literature, reference material and journals. Visitors can also visit exhibitions in the gallery, drink a cup of coffee in cafeteria or join evening cultural events. For the youngest members library organises special storytelling hours. The image and identity of this library arise also from tight cooperation with local schools, kinder-gardens, cultural and other associations. ( <http://www.librarybuildings.info> )

#### **Libraries:**

#### **Brežice Library, Brežice – Slovenia 2006**

2.029 m<sup>2</sup>, € 1.703.000

The Public Library BREZICE in Slovenia, is a work of architects and Nataša Filipčič Univ. Grad Arch., Completed in 2006. The origins of the Library date back to 1880, although they began their activities until a total area of 2.029m<sup>2</sup> 1945. Té spread over two floors and houses a collection of more than 100,000 volumes. The area for children and adolescents are on the ground floor, while the adult section is on the top floor. It features the large window side, in corner , occupying the entire height of the building, and that have been embedded in the words of local writer Otto Zupančič as well as the central skylight , which means an empty space in the middle, daylight contributes to the Library. (<http://www.facebook.com>)

The Brežice library's roots go back to the year 1880, and it began to officially operate in 1945. The library kept growing despite numerous relocations to new premises and different organizational forms. Today it serves the area of Brežice municipality, with 24.500 inhabitants, and also offers basic services to people beyond its borders. This house of wisdom is a meeting point for multiple

generations. The library collection covers over 100.000 items. However, it's not just a place for housing books but a multi-purpose learning centre offering: computer literacy, reading culture, homeland material, lifelong learning and official library events. On entering the library, there is the central circulation desk with a self-service book borrowing machine. The entrance area has selected books on the walls, a literature collection and an AV-collection in the adult section. The service has been upgraded by the RFID technology. Books and non-book material for children are located on the ground floor. This is also the area for the so called Mini Bologna – a permanent exhibition of youth books in foreign languages. The collection consists of 505 rich illustrated youth books from 44 countries. The books inform children about foreign cultures, and languages and provide scripts in the original form as well. In the upper floor there is the adult section, reference and homeland collections, self-study points and e-library. The department of professional books houses a permanent collection of the local recognized Slovenian language expert, academic Jože Toporišič, PhD. The library visitors meet in a multi-purpose hall named after Savica Zorko, the library's first manager. (<http://www.librarybuildings.info>)

#### **Ahmed Baba Institute Library, Sankore precinct, Timbuktu – Mali 2009**

Gross square footage: 50,000 sq.ft., Total construction cost: \$8.36 million

Just a few miles from the Niger River Delta in Mali, Timbuktu appears as a labyrinth of single-story mud buildings. A city of near-mythic status, it is the last outpost before the great Sahara Desert, a place synonymous with being almost impossible to reach. Despite its remote location, the city boasts a heritage of scholarship that has produced an astounding number of manuscripts. The new Ahmed Baba Institute of Higher Islamic Studies and Research, completed in 2009, introduces state-of-the-art techniques for conserving, exhibiting, and studying these famous Timbuktu manuscripts. The new institute is part of a 10-year initiative to replace its aging predecessor, founded in 1970 and located less than a mile away. After French colonial rule ended in 1960, Timbuktu slid into decline and scholars went to great lengths to protect the city's legacy, even burying manuscripts in the sand. An estimated 60 to 80 private libraries formed a grassroots conservation effort in Africa. According to UNESCO, a staggering 300,000 manuscripts exist in the Timbuktu region alone. In recent years, African leaders have used architecture to reclaim their countries' intellectual heritages. Egypt, for example, commissioned the Norwegian firm Snøhetta to design a grand library in Alexandria with the goal of rekindling the city's reputation as a seat of learning. In 2001, a year before the inauguration of the library in Alexandria, then South African president Thabo Mbeki traveled to Timbuktu on an official visit, helping to found the Timbuktu Manuscripts Project and set in motion plans to construct an impressive new home for the manuscripts. dhk Architects of Cape Town designed phase one of the \$8.36 million, 50,000-square-foot Institute, creating an archive of 20,000 manuscripts and a public library with reference materials on the culture of the region. Andre Spies, the project architect for dhk, designed the institute and now heads his own practice in Cape Town called twothink architecture, which completed phase two — fitting out the interiors. Spies describes Timbuktu as being “like a dry Venice.” Just as Venice must resist sinking into its lagoon, present-day Timbuktu must fight against the encroaching Sahara Desert. The ancient city unfolds as a series of garden courtyards tucked behind imposing walls along narrow streets cloaked in deep sand drifts. Spies derived his design concept from the juxtaposition of ancient and modern Timbuktu. “The new city is much more rigid and is laid out on a grid, while [the old city] grew sporadically over time.” His design creates a hybrid of building and street, contemporary and traditional. Circulation paths create “wall play” similar to the organization of the city's streets, where openings between buildings vary in width and are “very organic,” according to Spies. The complex connects the new city to the old city via outdoor hallways and aligns its main artery with the minaret of the Sankoré mosque, a 15th-century structure made with mud and declared by UNESCO to be a World Heritage Site. To respect the vernacular architecture of the region, Spies chose to build primarily with mud, which requires maintenance after the annual rains. He found a local mason who mixed mud with concrete to make the facade rain-repellent, and he purchased mud bricks from craftsmen on the streets. Because the archive and conservation lab required more protection, the architect specified standard concrete-block cavity walls for this portion of the building. By placing the conservation lab so it faces a hallway, he let visitors watch technicians at work. And by bringing visitors down a long ramp to the subterranean archive and a small exhibition space, he created a sense of procession. An air-conditioned, 300-seat auditorium and an outdoor amphitheater can accommodate symposia and lectures. To connect the various programmatic elements, Spies designed expansive outdoor hallways that converge at a courtyard. Head librarian Baba Tandina says he enjoys watching schoolchildren fill the library, which is particularly cheerful in the late afternoon when light filters through ornate, carved screens. The screen configurations — radiating diagonals, zigzags, and pyramids — derive from manuscript graphics and West African textile patterns. The airy double-height main gathering space hosts rows of desks and shelves of books, while the upstairs provides space for private study. To reduce the amount of sand blowing into the library, the architect placed entry doors off the courtyard (rather than the street) and designed the courtyard so scholars could congregate there and enjoy air cooled by a fountain. Overall, Tandina prefers the new institute to the old one, which he describes as stuffy and too warm for the manuscripts. He knows that air conditioning is a rare luxury in Timbuktu and that many visitors will have never encountered a glass exhibition cabinet before. Yet Tandina and his staff are concerned about the dependability of the building's modern conveniences. If machines break down in the desert, technicians are 500 miles away. To test the consequences of an outage, they shut off power for two weeks, and they were reassured when the temperature of the archive room remained nearly constant. He also wishes the new fire management system had manual controls. The introduction of a new building is challenging in the low-tech, mud-built setting of Timbuktu. Albakaye Ousmane Kounta, the Malian writer, poet, and storyteller, criticizes the building as “too modern.” Whereas fortresslike walls concealed the internal configuration of the former institute, the new one blurs inside and out with outdoor hallways arrayed along a “free plan.” This modern approach is uncommon in West Africa, where public and private spaces are strictly demarcated to keep out sand, roving donkeys, and itinerant people. The new design encourages access and openness, but it has drawbacks as well. In addition, some spaces — such as the auditorium — have rigid functions not easily adapted to other uses. Since the Institute is not yet equipped to host conferences, the auditorium will probably go unused for a while. In time, the staff of the Ahmed Baba Institute will adapt to their new complex, which will enrich Timbuktu and become a locus for international scholarship. For the time being, though, Timbuktu is adjusting to the new facility. This illustrates how architecture pushes change, which is exactly what Andre Spies intended to do with this remarkable project. by Caroline James (Caroline James has worked extensively in product design and architecture. She is currently pursuing an M.Arch. at Harvard.) (<http://archrecord.construction.com>) Design concept (06-05-2005)

Professional Team: Adam Essa Shabodien Roomanay COESSA Holdings Peter Fehrsen Faghmie Christians Andre Spies dhk architects, Ganief Dollie Jaco van Heerden Letshabile Structural Engineers, Graham Clarence Target Project Management Ashley Ruiters LDV Quantity Surveyors, Goesain Johardien Taib Ogier GJA Mechanical & Electrical

concept Timbuktu was shaped over-time and the complexity of its urban patterns can be explained by the way in which people moved through the city. With the first conceptual take on this unique project, much thought was given to the movement patterns and the experiential qualities of the streets of Timbuktu. The buildings form a microcosm of the greater Timbuktu, an amazing experiential route which ties the main auditorium and outdoor amphitheatre to the library, restoration spaces and guest rooms, to form an interactive educational centre. The siting of the project is a pivotal point in the city of Timbuktu. Three main arterial roads lead to the site. The two outer roads surround the old city whilst the middle one splits it in half. This connects the site directly to the airport. Furthermore the site is at the top end of the old city, in-between the “old “ and the “new” city. The architecture relates to this interstitial zone directly in that it is a combination of sun baked mud bricks (reminiscent of the “old” city) and off shutter concrete (reminiscent of “new” city). These two materials form the main structural materials and are tectonically separated with glass. Sun filters will be hand chiseled lime stone panels of varying sizes (about 2m x 1,5m). These panels accentuate the Moroccan influence in Malian vernacular architecture. Together these materials create a contrast between older techniques of building and modern construction methods, which in turn relates directly to the position of the site. (dhk)

### **Libraries:**

#### **National Library of South Africa, Pretoria CBD – South Africa 2008**

Client: Department of Public Works, Floor Area: 33 000m<sup>2</sup>, Cost: R310m

Located on Pretoria’s Government Boulevard which links the CBD with the Union Buildings, the new National Library of South Africa is a focal point. Visitors walk up the pedestrian ramp to an open public square and the main entrance, where face brick, concrete, steel and glass have been utilized to build the most modern library on the continent, a cultural symbol in the city of Pretoria and the country of South Africa. The library will hold 3.5million books and can accommodate 1500 seated researchers with approximately 4000 users per day. (Malan)

#### **Building future history- the new Pretoria campus building**

The National Library of South Africa plays a leadership role in Library and Information Services (LIS) sector. It provides library resources to all communities in South Africa, including previously disadvantaged communities. The Department of Arts and Culture is erecting a new building for the National Library of South Africa in Pretoria, which is worth more than R200-million. The project is being executed by the Department of Public Works. The National Library will gain approximately 33 000 usable square metres of space for its book collections, reading rooms and other facilities currently scattered in various Pretoria premises. The new building will also provide approximately 1800 seats for library users. The present library building can host only about 130 users. The new building will serve as a remedy for those people who queue on a daily basis to use the library services for hours on end. The new building is nearing completion. The project will result in the establishment of the most well equipped, effective and efficient National Library in Africa. It will serve as flagship for other library institutions in the country and present itself as a centre of excellence and a symbol of upliftment for all legal deposit libraries in Africa and the world. A well equipped new National Library building the day it opens its doors – computers will be available for the man in the street to use and to learn, thus removing the digital divide. A National Library serving its purpose in providing a repository for current electronic published documents and a preservation service for all legal deposit documents in South AfricaAll communities will have a place to go for studies, reading, research and online services and will not have to queue in the streets. The auditorium and meeting rooms will be used for training and meetings, and the necessary audio-visual equipment will be available. African literature will be available in all languages for the communities. Information on AIDS, poverty and indigenous matters will be available for all people to use in all formats, accessible from within in a complete electronic database (OPAC). The Cape Town campus and the Centre for the Book are housed in buildings that are landmarks in the historical nucleus of the city. The buildings were extensively renovated in the mid-1990s, and further repairs to the campus premises were carried out in the year under review. However, valuable collections are housed at various other Cape Town premises. At some of these, preservation conditions remain unsatisfactory, and solutions are being sought. Entrance to the building will be from a raised public piazza on the corner of Struben and Andries Streets. Large double volume reading rooms, one for general study and another for specialised research, will be featured on ground level with views into spaces from the streets. This will exhibit and reflect the use of a library to the public, therefore encouraging new users to use the facility. The proposed modern glass and brick building reflects the dynamic future envisaged for the National Library of South Africa. Steel and covered walkways and ramps lead users from street level towards the entrance piazza, which can also be used for public exhibition and street art forms. #### **Literature:**

**El Croquis, 118, 2006**

The plan for the library consisted of a bundle of pieces of medium size, autonomous and of similar importance and having a situation in which landscaping and institutional aspects possessed the same importance, so it was reasonable to think about the possibilities of a vertical organization of the plan not only in functional terms – minimizing cores and circulation space, simplifying the construction, offering diaphanous floors, etc. – but also figuratively, as the central element of the block. Designed as a mid-size tower, the library can serve as a catalytic converter which reorganizes this space of collective activity in Usera establishing it as a centrepiece and giving it urban meaning, connecting the adjacent parks, resolving inequality of the terrain and adding green and paved areas to the existing one in order to create a larger entity. The interior spaces are perceived with an atmosphere in semi-darkness communicating with the exterior through isolated openings which permit to select fragments of the nearby or more distant surroundings. High ceilings and wallpaper designed by Peter Halley create an atmosphere of silent reunions as we know it from casinos or classic cafés. (herrerros)

Estando el programa de la Biblioteca constituido por un conjunto de piezas de tamaño mediano, autónomas y de similar importancia, y teniendo además una situación en la que los aspectos paisajísticos e institucionales tienen un peso importante es razonable pensar en las posibilidades que abre una organización vertical del programa no sólo en términos funcionales- minimizando núcleos y recorridos, simplificando la construcción, ofreciendo plantas diáfanos, etc.-, sino también en clave figurativa, como pieza central de esta manzana. Conformada como una torre de mediano tamaño, la biblioteca puede actuar de catalizador que reorganiza este espacio de actividad colectiva en Usera al dotarlo de centralidad y sentido urbanístico, ligando entre sí los parques contiguos, resolviendo los desniveles y aportando un área ajardinada y pavimentada que aprovecha lo existente para dotarlo de una mayor entidad. Los espacios interiores se perciben como atmósfera en penumbra comunicando con el exterior a través de aperturas aisladas que permiten seleccionar fragmentos de la proximidad o de un entorno más lejano. Techos altos y papel pintado por Peter Halley están creando un ambiente de reuniones silenciosas como conocido de casinos o cafés clásicos. (Herrerros)

Sitting on a patch of high ground, the 'Biblioteca publica Jose Hierro' could be described as a castle for the safe keeping of books and other information. Upon entering, the first thing one encounters is a dramatic triple height entrance space, followed by the discovery that the the ground floor plan is actually quite extensive, and is not confined to the footprint of the tower above. A good way to experience the building is to take the lift up to the top floor and then walk back down the stairs. The plan of the tower is divided in a two-thirds/one-third split. There are several double height spaces occupying the larger portion, with mezzanine galleries - holding the toilets and quiet study rooms - forming the smaller part of the plan. Tall slit windows, arranged in an apparently random fashion, allow in natural light. The interior walls are covered in abstracted text in different colours. Structure is confined to the core and perimeter to leave a largely column-free interior. Contributed by davidb (<http://www.mimoa.eu>)

### **Munch Museum (Library), Oslo – Norway on design**

Restricted International Competition. First prize. Usable area: 12.300 m2. client: Oslo Kommune

The future complex formed by the Munch Museum and the Stenersen Museum Collections is not only to safeguard and disseminate a basic heritage of the history and character of Norwegian culture; we find ourselves faced with a unique opportunity to develop a contemporary museum concept drawn from a transcendental urban role and a historical responsibility as a cohesive element for the community not only of Oslo but of all the nation. The Museum is conceived as an institution which is open to the city and highly visible, which must be visited many times in a lifetime because of its dynamic programs but also because of its power as a place of concentration, walks and daily relaxation in its terraces and cafes or even because of its retail spaces. The proposal as a whole is notably involved with energy and environmental sensitivity issues. The detailed explanation of the operation of the Museum installations has been made clear. This is the moment to underscore our firm position that these housing facilities, inasmuch as every other proposed building, not least Lambda's public spaces must adhere to the sustainable criteria hereby proposed, beginning with the very reduction of cost as first. (Herrerros)

As in the case of the Documentation Centre and Archives, University of A Coruña , the new Central Library Campus of Ourense (2005) of the University of Vigo was also a finalist for Galicia in the 2nd Prize of Architecture Ascensores enormous 2006 . Building architects Llamazares Jesus Castro Zayas and Carvajal Galo ( ACXT Architects ), the new library located on a slight slope inclination in a city park. The building is L shaped which differentiate the different uses of the building: the horizontal section is located below the main level of the slope, here we find the deposit of documents. In the vertical section, above the elevation and height, there are other offices, located in a 4-storey tower that aims to become an architectural landmark of the city and is inspired by the Roman milestones. The space and transition between these two sections can be found in the square has been created in the roof of the horizontal section. A place that makes the park depending on viewpoint, but above all acts of channeling communications, a deliberately horizontal communications. (<http://www.bauenblog.info>)

The building forms an elevated plaza overlooking the surrounding landscape, it is limited by the volume housing the book storage and by the tower. The latter is inspired by the baroque retables and assumes the role of an urban landmark, making the entrance to the campus. The interior space flows continuously between the various reading areas. (ACXT)

### **CEIBS Campus Library, Beijing – China 2010**

CEIBS (China Europe Internacional Business School) is the Business School leader in Asia. As part of it's growth has taken the decision of building a new Campus in Beijing contracting AXCT-IDOM Group as design architect. The new Campus occupies about 19,000 sqm in a three floors building and a basement floor in a plot 33,000 sqm in the Zhong Guan Cun Science Park in Beijing. The project is conditioned by the teaching function, the Zhong Guan Cun Science Park master planning which proposes a series of compact buildings scattered in the forest as small islands in the ocean and finally by the client's needs of building it in two phases and making it look as good and as finished also at the end of phase 1. A basement, which occupies completely the plot permitted with the more public, composes the building in phase 1 and main uses as the lecture hall, the amphitheatres classrooms, discussion rooms and bar. It is full of courtyards that like the Chinese traditional architecture give as a very good climate control and let us prioritize the relationship among different spaces not losing the complete vision of the building as it happens in the forbidden city in Beijing.

#### **Floor Plan**

In the other two floors we have some more discussion rooms and flat classrooms and other more not so public uses as professors and staff working spaces and organized as fingers linked to a long corridor. Each floor has a different shape and a different relationship with the forest. Basement relationship is with the trunk of the tree and with the courtyards full of green bamboo creating a introvert space, second floor with the crown with a similar ambient and is the third floor the one occupied by the staff and professors is the one that looks over the forest like a metaphor of a ship lookout. The traditional Chinese architecture and philosophy already fascinated us, and it has been the engine of our architectural ideas helping us to shape the project, and it is easy to recognize it in the election of the colors and materials as, mainly, in the spatial configuration of the building. This is the way the building represents CEIBS spirit of encounter between China and Europe.

#### **Section**

Now we can see finished the phase 1 ended but it will be in phase 2 when the building will be able to express the dynamic concept of balance of the Chinese yin yang in the Chinese architecture thanks to the feng shui art and, in this case,

interpreted from our European respectful point of view. (<http://www.archdaily.com>) 24.Nov. 2011

### **Libraries :**

#### **Biblioteca Publica y Centro Sociocultural Mendillorri-Pamplona -Navarra – Spain 2005 / 06**

Promotor: Ayuntamiento de Pamplona y Gobierno de Navarra, Superficie construida: 3.327,70m<sup>2</sup>

In the surroundings of the central park in Mendillorri, a civic centre and library was proposed which keeps a relationship with the surrounding area, its views, and its functions. A type of monument which distances itself from people hasn't been sought out, but rather a constructed place which plays second fiddle to the park and the palace, to the lake and the inner landscape. For that reason the plot has been altered as if it were a matter of a stone pavement in a public place. The folds create different spaces which are intertwined and multiply whilst taking advantage of the lands' unevenness. Thus the building is a square and wall facing towards the street, with its empty space and arcade facing towards the park. (<http://www.mimoa.eu>)

In Mendillorri, the public installations aim to qualify the urban nature of the central park so as to make it a resource of resources. To this end, the building must break the limits of the theoretical plot to merge in with the large green area which lends structure to the urban centre. The plot of the library has the privilege of its view and orientation overlooking the lake, the palace and the basin of the city of Pamplona. Consequently, the building must be oriented. It must take the street as a functional connection and the park as its natural surroundings. Children and young people are the focus and main occupants of the area, and use it a lot. Consequently, the new resource must be lively, dynamic, open and related to the outside, the outside being the public space. The architecture must rise out of the park, from soil excavated and shaped as part of an urbanised area. The building must welcome its users and bring them into contact with the ground or raise them to create reading areas or areas of cultural leisure. The privileged position of the plot and the horizontal nature of the park favour the creation of the building in this dimension, the existing difference in level allowing for the creation of a ground floor for complementary purposes which solves the design without exceeding the capacity limits planned in the original programme. The building includes an access and reception platform, creating a distance from the street, and presents a more opaque front which is broken by the entrance. The area resulting from the folding of the façade and roof opens out to the east, towards the park and lake from areas which are more or less open, depending on use, making for a windowed balcony, patio or terrace over the lake as required. Consequently, the building opens out horizontally towards the park and vertically to the north and south to achieve good views over nearby buildings. In the same way that the building also folds towards the city to create an access area, it also folds towards the park to prevent a flat front towards the lake, the profile of the building merging in with its natural surroundings. As for internal operation, each of the main areas (Library and Socio-Cultural Centre) has its own individual floor space, more open in the case of the library, as a platform over the lake, and more closed for the second area so that it can be used as an extension of the exhibition area. (<http://www.pampolna.es> : Municipal Works)

#### **Educational Centre Virgen de Arrixaca, El Palmar-Murcia – Spain 2001**

The building earmarked to be the future Faculty of Medicine is an independent project which is being tailored to the two scales which exist on the site, at the edge of the hospital enclosure; on the one hand the level of access similar to that of the other buildings in the hospital complex, and on the other, the chief volume of access opposite the open countryside which surrounds it. A compact area of 67.90 x 33.40 m contains a low part double in height which clearly defines the entrance by means of an open north facing patio, which takes in the narrow current plot link to the hospital grounds. This enclosure is home to the pavilions' communal spaces; the hall, the cafeteria, the administrative offices and the courses room. On top, there's a quadruple height piece structured into teaching units. The great horizontal volume appears as a compact piece in local golden stone where the different spaces are transversally articulated around empty free spaces which serve as an external reference to the internal spaces, valuable as individual parts (Libraries, Reading Rooms, Lecture Halls, etc). All these rooms are qualified by contrasting treatments according to scale light, and materials used. Thus it is that the hall space arises from the opposition between two spaces of different character, an internal one of 15x 15 x 15 m, and an external one of 9 x 9 x 9 m, which compress it and tighten it vertically. The transitions between the successive sets of episodes- empty (access area), vertical hall space, and empty space (the internal patio) each one possessing its own properties, directs the spatial tempo of the project. The central space knits together various public uses on the access level- assembly halls, cafeteria and lecture rooms- with the library on the first floor. In the rest of the building the varying University departments are placed according to the longitudinal axis which are lighted through the empty spaces excavated in the volume and which are enshrouded in a second skin screen-printed in gold, which filters the light by using the reference of the stony texture used in the building, thus evoking a dialogue between the ways of limiting the existing volume of a transparent skin and another opaque one. The stone cladding continues a treatment started in other refurbished areas in the centre, but it is identifiable through its own material value, aspired to as an element of qualification in buildings which have traditionally been subjected to functional usage, but whose image usually requires the formal strength acquired through the use of stone. (<http://www.archello.com>)

#### **Biblioteca Fitero, Navarra – Spain 2001**

### **Literature:**

Detail 10, pp. 114-119

The internal space of this monastery turns out to be the prime factor in the intervention, since this space is recovered as a staged union of three public rooms, allowing a synthetic knowledge of the constructive process of the monastic complex. To achieve this, the original volumes are rehabilitated by new covering structures which reinterpretate the wooden traditional ones. This ensures the massive character of the historical construction in stone, brick and cast. The kitchen area turns out to be an alternative entrance to the monastery, and to its own library. Its stone entrance was recovered, as well as a section by means of a wooden pyramid structure which centrally aligns the old vaulted space. This hallway leads to the horizontal refectory space, suited for the exhibition of small items and audiovisual montages. From the coffered wood panelled ceiling, a stairway leads down giving access to the library floor. (<http://www.mimoa.eu>)

The internal space of this monastic creation turns out to be the prime factor in the intervention since this space is recovered as a staged union of three public rooms, which allow a synthetic knowledge of the constructive process of the monastic complex. To achieve this, the original volumes are recovered by means of new covering structures which reinterpretate the wooden traditional ones, and keep the massive character of the historical construction in stone, brick and cast. The kitchen area turns out to be an alternative entrance to the monastery, and to its own library, hence recovering its stone entrance, as well as a section by means of a wooden pyramid structure which centrally aligns the old vaulted space, thanks to a lantern which illuminates the place. This hallway leads to the horizontal refectory space, in shade, suited to the exhibition of small items and audiovisual montages, from whose

coffered wood panelled ceiling a stairway leads down giving access to the library floor underneath its great centrally located vault, whose vertical tension confers its appearance of great height. Once you get up to the top floor, the space is organised on two contrasted levels of contemplation. At the lower level, the exhibition area seems to be defined as a continuous piece of wooden and glass furniture fixture, inclined hence preventing the reflection of troubling images, and the other upper level, characterised by its vault and its decor from the nineteenth century. In short, the intervention is trying to maintain a careful balance between the recovery of a piece lingering in the recent memory and its adaptation to possible future uses via the introduction of basic elements of spatial organisation without any interference to the accepted reading of history, thus allowing full reconditioning and hence public enjoyment of the recovered spaces. (AH)

### Educational Centre Iturrama, Pamplona, Navarra – Spain 1993

A wide watercourse links the dense and uniform city of Pamplona with the tree-lined valley of the River Sadar. Next to a road that once belonged to the historic Camino de Santiago trail, an open urban space has been shaped, surrounded by schools, with playgrounds that are linked through an opening onto the landscape that is limited to the south by a road bridge. The new building aims to crown the urban skyline without detracting from the openness of this place, half way between the city and the countryside. Hence, the main volume is set parallel to the existing residential area, whereas the different wings are cut according to the primitive outline of the terrain, preserving a small group of trees and making the most of the views and sun exposure as elements inherent to the composition. Here, the urban skyline disappears and there is also no large horizontal platform on which the neighbourhood stands, although a series of terraced spaces are generated which respond to different uses and which are transformed into urban spaces of transition towards the park. The building volume responds to a complex programme with communal areas and independent bodies that create a succession of naves and patios intersecting with the main area of surgeries and offices. A shared entrance hall that links into the public room organises movement according to a variable sequence that permits the identification of different areas and constitutes one of the objectives of this project. Internal flexibility is guaranteed through a wide span construction and straight-forward building resources, placing all the emphasis on the linear distributors and the spatial fluidity between the interior and exterior. The complex is understood as an operation of adaptation to the place in which the entire plot of land is manipulated in accordance with a strategy of opposition between empty and full, between building and patios, between raised platform and trough; to such an extent that only in their interrelation is it possible to discover the meaning of an architecture of simple forms that acquires its own personality through its relationship with the place. (<http://www.worldarchitecture.org>)

Una amplia vaguada comunica la trama densa y uniforme de la ciudad de Pamplona con el valle arbolado del río Sadar. Junto a un vial que pertenece al histórico Camino de Santiago se ha ido configurando un espacio urbano abierto rodeado de centros escolares, cuyos patios se relacionan a través de una apertura sobre el paisaje que aparece limitada al sur por un puente de autovía. El nuevo edificio pretende rematar el perfil urbano sin que el lugar pierda su condición abierta, a medio camino entre la ciudad y el campo. Para ello, el volumen principal se sitúa en paralelo a la trama residencial existente, mientras las distintas alas se van recortando según el primitivo perfil del terreno, preservando un pequeño grupo de árboles y aprovechando las vistas y el soleamiento como elementos propios de la composición. Aquí la trama desaparece y tampoco existe la gran plataforma horizontal sobre la que se erige el barrio, aunque se generan una serie de espacios aterrizados que responden a distintos usos y que se transforman en espacios urbanos de transición hacia el parque. La volumetría construida responde a un programa complejo con áreas comunes y cuerpos independientes que crean una sucesión de naves y patios maclados con el cuerpo principal de consultorios y oficinas. Un vestíbulo común relacionado con el salón de actos organiza los recorridos según una secuencia cuya variedad permite la identificación de las distintas áreas y constituye uno de los objetivos del proyecto. La flexibilidad interna queda garantizada mediante una construcción de grandes luces y recursos constructivos nada sofisticados, poniéndose todo el acento en los distribuidores lineales y en la fluidez espacial entre interior y exterior. El conjunto se entiende como una operación de adaptación al lugar en la que todo el solar se manipula según una estrategia de oposición entre vacío y lleno, entre edificación y patios, entre plataforma y vaguada; de tal manera que solo en su interrelación es posible descubrir el sentido de una arquitectura de formas simples que adquiere su carácter propio en la relación con el lugar. **Libraries :**

### Biblioteca Vilanova del Vallès – Spain 2011

The new urban development of Vilanova del Vallès is one of the most important challenges of the municipality. The library, next to the future Plaza del Països Catalans will be one more of the public equipment located throughout the Passeig del Centenari and its extension in Ronda de l'Eixample. This strategy helps to understand the first decisions of the proposal. In this sense, the representative image and the main access are located in Ronda. On the other hand, the future library will finish the Plaza. For this reason we delineate accurately this limit, raising the total occupation of the plot. In the rest of the alignments the library retreats slightly, by means of subtle curved lines. Together with the glass façades the volume has a perception very attractive, cradle in the delicate reflections of everything what happens around. The roof plan has a powerful image by means of the extensive use of conical skylights and a colourful gardening. (Alcolea) see also: **MX\_SI Architectural Studio, Barcelon** <http://www.mx-si.net>

**CASA DE CULTURA EN ENTRAMBASAGUAS. CANTABRIA**  
**ARQUITECTAS: ANA RUIZ DE APODACA Y CARMEN PÉREZ DÍAZ**  
**MEMORIA**

Entrambasaguas es una pequeña localidad del interior de Cantabria cercana a Santander. El carácter del pueblo, de pequeñas edificaciones aisladas se traduce en un paisaje dominado por verdes prados. Fruto del crecimiento experimentado en los últimos años y para atender a la nueva demanda de la población, el Ayuntamiento convoca un concurso de ideas para diseñar la casa de la cultura en una parcela junto al consultorio médico y cercana a la iglesia. El proyecto parte de una apuesta rotunda por generar una simbiosis entre espacio libre y construido dentro de la parcela. El edificio se sitúa ligeramente girado respecto al eje de la calle y el consultorio médico, creando tres espacios libres. En primer lugar un tapiz verde recibe al visitante y dota de perspectiva el acceso del edificio. Un segundo espacio destinado a aparcamiento situado en la zona menos visible de la parcela y limitado por el centro médico y el propio centro cultural, permite un uso compartido del mismo. Por último, un jardín como prolongación de la casa de cultura, acoge un parque saludable para mayores y zonas arboladas. El edificio se organiza en torno a una pieza central a partir de la cual se accede a tres espacios de iguales dimensiones que albergan dos salas multiusos y una biblioteca. El espacio de transición entre la pieza central y las otras piezas sirve para albergar los usos secundarios (aseos, almacén, control y administración e instalaciones). En

función del uso de cada sala el espacio interior se moldea a través de la forma y la luz de los lucernarios. Un espacio muy vertical de acceso se comprime para volver a expandirse en cada una de las salas. Este juego se traduce al exterior en la cubierta de zinc que se pliega creando una volumetría propia y potenciando el carácter singular del edificio. Una piel continua de piedra confiere unidad al conjunto y lo arraiga en el lugar. Utilizamos la piedra arenisca tradicional con un lenguaje propio, contemporáneo, como si de un lienzo se tratara. La piedra cizallada expresando rugosidad, sombra, en diálogo con la misma piedra al corte de sierra expresando luz, suavidad. Un juego compositivo entre las distintas texturas y modulaciones de la piedra y los huecos. Hacia el jardín el edificio se abre para dejar entrar la luz norte y el paisaje al interior de las salas. En el resto de fachadas predomina el carácter masivo de la piedra con la apertura de pequeños huecos. Durante la construcción del edificio el ayuntamiento adquiere la parcela contigua para albergar una segunda zona de aparcamiento. Se modifica la urbanización con la intención de crear un espacio de transición que permita conectar el aparcamiento con la casa de cultura. El límite del jardín se pliega, se eleva, evocando las formas de la cubierta y permitiendo que la visión del aparcamiento quede parcialmente oculta por la vegetación

### **Libraries:**

#### **Casa de cultura I biblioteca, Ortuella (Biscaia) – Spain 2010**

En mitad del municipio de Ortuella, entre la calle Catalina Gibaja y el parque de Otxartaga, se encuentra el enorme almacén de su nueva casa de cultura. A falta de unos últimos retoques, el edificio presenta una estampa casi acabada mientras los trabajos que faltan se aceleran con la vista puesta en mayo. El proyecto se ha convertido en la piedra angular de la gestión de la legislatura para el alcalde, el penevista Oskar Martínez, que se ha centrado en cumplir su promesa electoral de levantarlo sea cual sea su coste. Un empeño que no ha salido barato: Ortuella está entre los municipios más endeudados del territorio.

«Los cuatro últimos años se han echado a la basura para Ortuella, han hipotecado nuestro futuro a costa de este proyecto», critica Daniel Arranz, portavoz local del PSE. «Y lo peor de todo es que aún no saben qué uso le van a dar», añade. Nacida hace ya ocho años, la idea de construir una nueva y faraónica casa de cultura no pudo arrancar hasta 2008 debido a las discusiones y parones motivados por su elevado coste. A comienzos de aquel año se adjudicaron las obras por valor de 3,8 millones de euros. El año pasado el Ayuntamiento tuvo que inyectar otros 700.000 para cubrir varios sobrecostes y para 2011 preveía destinar otro millón más en concepto de mobiliario.

«Al final, la propia Diputación ha tenido que pararle los pies al alcalde porque incumplía la normativa foral de endeudamiento y sólo van a poder aportar medio millón, con lo que, además, van a dejar el edificio medio vacío», se queja Arranz. El concejal socialista explica que el aval mostrado para argumentar que se podrá pagar el préstamo «han sido los remanentes de tesorería, por lo que a Ortuella le espera un futuro muy negro». Sumando todo el capital invertido hasta la fecha, más los gastos que genere la sociedad pública que se va a crear para su gestión, el personal de mantenimiento y demás servicios para su puesta en funcionamiento, el coste total fácilmente superará los seis millones de euros. Una suma astronómica para un municipio que apenas llega a recaudar dos millones de euros al año en concepto de impuestos.

#### **Retraso en las subvenciones**

El edificio, en cuya construcción se han empleado más de 1.500 metros cúbicos de hormigón y por encima de 150 toneladas de acero, no acaba de encajar dentro de la fisonomía de una localidad de apenas 8.500 habitantes. A juicio de Iñaki Beitia, portavoz de la asociación cultural Plural Anitzak de Ortuella, las instalaciones están «sobredimensionadas». «A día de hoy tenemos una biblioteca en el pueblo que apenas tiene media docena de lectores al día. ¿Para qué necesitamos una tan grande?», lanza.

Esta agrupación de vecinos se dedica desde hace años a ofrecer sin ánimo de lucro la única oferta de cine en Ortuella. Proyectan películas una vez al mes en la sala Gorbea, para lo cual tienen firmado un convenio de colaboración por el que la Administración local se compromete a financiarles con 3.000 euros al año para pagar los derechos de proyección de las cintas. El Consistorio lleva ya dos años de atrasos en estos pagos para una actuación que, desde el punto de vista del colectivo, «sí que fomenta la cultura».

«¿Realmente quieren ese edificio para hacer cultura? ¿Han pensado en cómo lo van a emplear», se pregunta Beitia.

Tanto el PSE de Ortuella como Plural Anitzak coinciden igualmente en su crítica a la forma en que se está decidiendo el uso final de la construcción. «Los mecanismos de participación ciudadana para elaborar los estatutos de la empresa que lo gestione son muy deficientes, no hemos podido aportar nada», comenta Iñaki Beitia. Daniel Arranz le respalda sin dudar en este sentido: «Todavía no se han sentado a hablar con los partidos políticos ni con los grupos culturales del pueblo». (<http://www.elcorreo.com>)

#### **Biblioteca Municipal Sant Pol de Mar –2008 Primer Premio del Concurso Público, en fase de proyecto ejecutivo**

Promotor : Diputación de Barcelona y Ayuntamiento de San Pol de Mar, Superficie edificada 850m<sup>2</sup>

Este edificio se plantea con la voluntad de recrear en términos contemporáneo, el positivo espíritu creativo que se intuye en el proyecto original del edificio modernista del arquitecto Ignasi Mas i Morell. Quisiéramos poder mantener, reinterpretando-la, esta manera tan particular de mirar el mundo y entender la arquitectura. Este carácter lúdico y desinhibido que era capaz de jugar con las hojas de acanto de la arquitectura clásica, ponerlos con remate de barandilla, haciendo que parezcan algo totalmente diferente y además hacerles de cerámica y brillantes. Nosotros quisiéramos hacer arquitectura modernista contemporánea, mediterránea, lúdica y seria a la vez. Espacios claros y luminosos, con color y con la vegetación con tema principal. El edificio de Ignasi Mas i Morell utiliza las flores y los motivos vegetales como elementos ornamentales. Nuestra propuesta plantea que la fachada de la parte nueva a través de la cual nos entrará la luz y veremos fuera sea vegetal. En cuanto al programa funcional planteamos mantener la entrada principal a la puerta de la torre de la calle de Santa Clara y un posible el acceso a la sala polivalente para el otro puerta de la fachada principal del edificio. En la planta baja de la torre se ubica el vestíbulo, conectando con la zona infantil, con la zona de revistas y con la sala polivalente, espacios todos ellos situados en planta baja a cota de la calle de Santa Clara. Desde el vestíbulo sale la escalera que nos lleva al área de fondo general, construida excavando debajo del actual patio. En la planta están las zonas de trabajo interno, despachos y zona de descanso del personal, con un acceso independiente desde la zona infantil. La zona de revistas y prensa diaria es en realidad el único elemento volumétricamente nuevo que incorporamos en el edificio. Ocupa una superficie del 15% de la del patio actual y la entendemos como un elemento muy transparente y ligero, se relaciona muy bien con el lenguaje de la parte central del edificio, construida a base de ventanas. El espacio de fondo general es un volumen único con una gran fachada abierta a sur y filtrada mediante un sencillo sistema de celosía metálica ligera mezclada con elementos vegetales trepadores caducos guiados. La fachada respondería a las necesidades térmicas y de control de luz independientemente de la vegetación, que se considera en realidad como un elemento de acabado y de confort sensorial y visual, aunque a la larga acabaría contribuyendo en una medida mucho mayor el confort térmico y ambiental, así como la renovación del aire y aporte de oxígeno al entorno. En la cubierta del fondo general, o sea en el patio, colocamos unos lucernarios cilíndricos, que, con un sencillo mecanismo motorizado de apertura, a la vez que permiten la entrada de luz natural, con el consiguiente ahorro energético, combinados con la posibilidad de apertura de la fachada frontal, permiten una intensa ventilación cruzada y refrigerada por la vegetación de fachada. L'edifici parteix d'un principi de respecte a l'entorn natural privilegiat que representa un parc com el de la Muntanyeta per a la ciutat de Sant Boi. El projecte manté el màxim de zona verda amb el mínim impacte volumètric que imposa un programa tant extens com és el de la biblioteca. És per això que l'edifici es soterra en la seva planta baixa construint una coberta ajardinada amb total continuïtat amb la resta del parc. L'edifici deixa 4 forats d'entrega amb el terreny a la part posterior, i un de central, que seran patis exteriors que donaran llum i vistes a la biblioteca, garantint així la qualitat espacial a totes les estances de l'edifici. La planta 1ª de l'edifici, emergeix sobre un talús, per donar una façana més representativa a la biblioteca. (AV62)

#### **Libraries:**

### **Biblioteca Universidad Alicante – Spain 1995**

The project is located on a 126 by 66 meter lot on the University of Alicante campus, still with relatively few structures. "What is a library? A man, a book, and sufficient light to be able to read well". Thus understanding light as the main theme, the scheme formulates the reading rooms as double bayed spaces, each measuring 7 meters. The double height first bay diagonally connects with the second, of the same height, creating a well illuminated, wide space. The high windows open to the northern light. The library tables, in three stepped horizontal planes, search for and find that light. The inside of these "podium" efficiently serve to contain the bookshelves. This intervention, simple, logical, and efficient, is resolved in four large boxes, filled by light and silence, which rise above the rest of the building which responds with a functional scheme to the programmatic requirements. The first two floors are conceived of as a great stereotomic stone base. The last floor, as white boxes of steel and glass which emerge as tectonic elements in counterpoint with the first. The whole structure rests upon the earth with courtyards filled by lemon trees. Here there is a search, constant in the architect's work, for a possible typology. (Baeza)

### **Public Library Alicante – Spain 1992**

in collaboration with Pedro L. Valle López

The building, raised in stone upon the outlines of an old palace, is conceived of as a courtyard building, generated by the dialogue between two "L" shaped pieces. The first contains the two historic facades, which re-elaborate in stone all of their elements. The character of the wall is underlined not only in the treatment of the stone (with horizontal striations) but in the greater depth of all its openings. The second "L" is also elaborated in stone, in this case treated with the polish of a skin. The openings appear scratched into its surface, flush. The corridors to the courtyard appear as light elements. On the ground floor the volume of the conference

room advances upon the courtyard in the gesture of an opening fan. The main stair rests upon it, and continues with the same unfolding rhythm. This gesture is completed by the strong prismatic prow containing the general stair. Finally, a third element is introduced, the white-painted metallic structure supporting the glazed skylight that covers the courtyard. The introduction of this tectonic element gives value to the structural stone box that contains it. The white structure formed by telescoping columns and delicate triangular trusses has a double function. On one hand it is an effective architectural mechanism, causing light to vibrate, materializing, when intersecting with it. On the other hand, the compositional axis defined by the main facade and the great arched entry is turned ninety degrees, ordering the space longitudinally with the columns. (Baeza)

Area: 2764 m<sup>2</sup>

### **Literature:**

BIA. - Madrid: Association of Technical Architects. (1993) 168, November-December Title: Library at Glorieta Puerta de Toledo [Madrid]

Architects. - Madrid: Council of Colleges of Architects of Spain. (1996), No. 130. Title: Library at the Puerta de Toledo: a floating dome

Interior Design. - Madrid: Globus-Communication. (1994), No. 38. Title: Puerta de Toledo Library

Library Puerta de Toledo, Puerta de Toledo Madrid = Library, Madrid Source: AV Monographs. - Madrid: Arquitectura Viva. (1994), No. 45-46 January to April.

Social Service Center and Library in Toledo Gate = Gate Toledo Social Services Centre and Library: Madrid, 1985/1988/1992, El Croquis. - Madrid: El Croquis editorial. (1992), No. 54.

In 1982 one of the most important core to build in the area of San Francisco el Grande in Madrid was formed by the Library and Social Services centers around the square of the Puerta de Toledo. The proposed Juan Navarro Baldeweg for the redevelopment of the area around the Puerta de Toledo was awarded in the competition, building the Social Services in 1985 and the Library in 1992. As the opening years of the same 1994. To understand the orientation of this project is necessary to consider the overall design of the Puerta de Toledo. On one hand, has redefined the soil, which is of great importance in the formation of the backs of the roundabout and at the mouth of Toledo Street uptown. The plane of the square before the church Virgen de la Paloma, remains almost the same height, following its natural slope, reaching the roundabout, looking as flat balcony accessed by ramp from the plaza. This leaves it the slope, covering the development of the second installment of the Gran Via de San Francisco el Grande. This retaining wall and ramp are on the other side of the street Toledo, symmetric response in the basement of the Library. An intention very clearly explains how this building is very precise care in the scale and presence of it in the Glorieta. A disproportionate buildings on the perimeter of the square would have darkened the door of Lopez Aguado and had detached from the fire station to conservar. La pureza simple volumes, in this case the circle inscribed on an irregular polygon, the balance of these volumes, the play of solids and voids, is part of the formation of a low-level ring around the door, aiming it at the limits of appropriate scale. The high vacuum of the square across the street from Toledo dialogue with full complementarity with the drum-shaped dome of the Library. The tension in the simultaneous presence of a concavity and convexity effects are essential in the spatial experience of the roundabout. The drum volume resolved, in most of the way, very different requirements that the treatment of urban space required at that point. The exterior walls of the basement are offered in the appearance of gray granite, and the upper part of the Library stone beehive. In the design of these walls, cutting of the stone, in the composition of the holes and covered the treatment has been taken into account at all times the necessary conjunction with the Center buildings across Social Services Toledo street. The constructive solution of the cover is innovative because it uses a metal radial nerve that support a lower conical surface rusted steel wire and are secured with concrete cylinders 1m. high. It acts as a radial system bell with segments that rely on the lower structure, which allows the introduction of daylight through the upper torch and other lights at the bottom peripheral edge. The building has round, like a historical solution to these institutions. The building has four floors that have differentiated the functions of the overall program of the Library District. On the ground floor (basement) and lateral entrance houses a children's library. To this can be accessed from the top floor which allows flexible operation. This lower level also has a general repository of books and a machine room. The upper floor or street level floor contains a hall loan, and the hall. From this floor is accessible by stairs and elevators to the upper floors that correspond to the reading room, which is circular and at different levels, whereas the other services have other ways. This room also has a separate entrance from the roundabout of the Puerta de Toledo by the ramp-staircase. The room is arranged on two floors with double height area in which libraries are arranged in stages. One completes the area of audiovisual

#### **Kunsthal KadE (Library), Ammersfoort – The Netherlands 2009**

Client Rijksgebouwendienst, Main designer, Architect Juan Navarro Baldeweg Main designer, Architect ADP Architecten, consultant DHV, contractor Visser en Smit bouw Papendrecht, Floor area/size 15286 m<sup>2</sup>, building costs Cost € 36.500.000,-

KAdE occupies its own premises within the new building of the Dutch national cultural heritage department (De Rijksdienst voor het Cultureel Erfgoed), designed by the acclaimed Spanish architect Juan Navarro Baldeweg. The main feature of the eye catching new building is its large, slightly backward-tilted glass façade. The tilt on the façade has the effect of reflecting the light and reducing the visual impact of the massive edifice. This has allowed Baldeweg to make a major contemporary architectural statement on a site immediately beside the historic heart of Amersfoort, without in any way overshadowing the

adjacent medieval city gateway (the Koppelpoort). KAdE occupies the right-hand section of the 16,000 square metre building. The exhibition space covers an area of around 1000 square metres on the lower floor, with two half-floors. (<http://www.mimoo.eu>)

### [Woolworth Center, Mendel Music Library, University of Princeton – USA 1994 – 1997](#)

#### **Literature:**

**Raymond Menzez, in: Architectural Review 01 April 1999**

Music box - architecture of music library and rehearsal facility at Princeton University's conservatory of music by Raymond Mendez

Housing the [Schiede Music Library](#), rehearsal rooms and faculty offices, Juan Navarro Baldeweg's new building at Princeton University extends the existing Woolworth Conservatory of Music. The Princeton campus is an Arcadian haven of object buildings from various eras set in a mature landscape, and Baldeweg's discreet contemporary contribution adds to this lineage. Eased into the north flank of the existing Woolworth block, the new building's nougat-like mixture of different sorts and sizes of spaces is expressed through an irregular (though not capriciously so) geometry that relieves the rather stern brick orthogonality of its neighbour. Baldeweg also uses brick (a soft warm red against existing burnt umber), partnered with cream metal cladding and bands of horizontal glazing that sit immaculately flush within the taut brick skin. The handling of materials displays a quiet assurance; nothing is forced or flashy and detailing is consistently simple and refined. The west flank of the new extension opens up towards Prospect House, a nineteenth-century mansion, now recolonized as a faculty building. Given over to quieter, more contemplative activities such as the library reading room and cellular staff offices, this wing is more permeable and transparent, protected from the glare of the afternoon sun by a row of green brises-soleil. The new library, rehearsal space and staff offices are arranged around a central circulation court gouged into the heart of the building. Daylight is funnelled into this luminous gorge through two large clerestory windows. The angular V-shaped profile of the skylight roofs rises like a pair of periscopes above the brick-clad, earthbound volumes. Gently grafting together old and new parts, the tall court forms the complex's spatial and organizational fulcrum, bounded by processional flights of stairs and a huge glass wall (reminiscent of an oversized shop window or fish tank) that simultaneously encloses and reveals the music library. As it extends towards the fan-shaped lobby of the main entrance, the glass wall is transformed into a curved prow, like a sleek ocean liner. Cool white wall planes subtly reinforce the nautical allusion. A trapezoidal rehearsal hall, sunk into the lower ground level, adjoins the main entrance. Here too, a glass wall visually connects the rehearsal space with the circulation court. (<http://www.findarticles.com>)

### [Parque Can Llaureador, 1º, 2º Fase de Proyecto de Biblioteca: Parque y Masia, Teià, Maresme, Catalunya – Spain 2007 – 2009 1º Fase, 2º Fase 2011](#)

Des d'ahir, Teià ja té biblioteca. Al matí va obrir per primer cop les portes després que divendres fos inaugurada en un acte amb prop de 200 persones. Amb l'obertura d'aquest nou centre, Teià resol una mancança històrica ja que era dels pocs municipis de 6.000 habitants que no tenien biblioteca. L'alcalde, Andreu Bosch (ERC), que a finals de mes deixa l'alcaldia, va mostrar la seva confiança que l'equipament es convertirà d'aquí a poc temps en un centre de dinamització social i cultural. La biblioteca serà la primera del municipi. Ocupa una superfície de 1.167 m<sup>2</sup>, té 70 punts de lectura, sis punts de consulta d'internet i un fons bibliogràfic de 15.000 llibres i 1.300 documents audiovisuals. Una de les principals peculiaritats és que es tracta d'un edifici semisubterrani, que passa totalment inadvertit des del carrer que hi ha al darrere de l'equipament. En canvi, des del passeig de la Riera, cap on està situada la façana, és totalment visible. Els arquitectes encarregats del disseny han estat Berta Barrio i Sergi Gòdia. L'execució del projecte i l'enjardinament del perímetre han costat 3,3 milions, una bona part dels quals s'han finançat amb inversió municipal. La Generalitat hi va aportar 400.000 euros a través del PUOSC, i la Diputació de Barcelona, que integra la biblioteca de Teià en la seva xarxa, 300.000. El nou equipament es va inaugurar divendres a la tarda amb la presència del conseller de Cultura, Joan Manuel Tresserras; el president de la Diputació de Barcelona, Antoni Fogué, i diverses autoritats locals. L'alcalde de Teià, Andreu Bosch (ERC), mostrava la seva satisfacció per la inauguració del que considera un «equipament indispensable» per al municipi. «Serà un punt de referència, de moviment social i lligat a la cultura», va afirmar. Bosch, que deixa el càrrec a finals de mes, veurà com la seva etapa com a alcalde acaba amb l'estrena de tres dels seus projectes principals: la plaça de la Cooperativa (inaugurada al maig), la biblioteca de Can Llaureador i la cel·la vinera, que s'inaugura el dia 20 que ve, juntament amb el centre d'acollida turística. La finca de Can Llaureador, on està situada la biblioteca, té una superfície total de 27.000 m<sup>2</sup>. En una segona fase, que començarà l'any vinent, es condicionarà la casa antiga com a arxiu municipal. (<http://www.72dpinet.blogspot.com>)

"Public Library Torres Amat". In: TC Cuadernos , no 91 (2009), p. 116-123

Designed by the architecture of Enric Battle and Joan Roig (Project, 1991-1992; work, 1994-1997), the Public Library St. Anthony Mary Claret de Sallent is located in the old house factory Torres Amat , textile industry heritage of the past that developed over the centuries following the upper reaches of the Llobregat. It has a total area of 1.375m<sup>2</sup>. The whole building is next to the river and up the house-factory (now converted into a Museum) and an industrial house, rectangular. It is in this ship in its last two plants on one side, which houses the Public Library. The original entrance is at the bottom of a steep street, near the Llobregat, and so far removed from access to the Library. It changed the main entrance at the top of the street, on the opposite side of river. The

rectangular shape of the Library. We can distinguish different areas. The mezzanine, a large gap open, rectangular and down to the roof of the building, and where the most important element of the library: a monumental staircase to access the different rooms, located on floors higher. This scale is very important because they set different access to different uses of the library. The first section, with a gradient smoother and wider, giving access to the first floor where the rooms open access funds, seating, etc. ... and a second section, divided into two more narrow, with a stronger slope, to get to the second floor in the zone file, and thus a more restricted area and difficult access. Here we also find the elevator, the office staff and the different service areas. The first floor, with shelves placed in parallel along a straight line inside the building, in areas of vertical communication, and tables and seating discharged to the large windows. And the second floor, where the highlight of the roof trusses and follows the same arrangement of furniture and features the first floor. 1 December 2007 Daniel Gil Uncategorized [Übersetzung], in: <http://www.bauenblog.info>)

### **Libraries:**

#### **Centre Cultural al Prat del Llobregat – Spain 2010**

Promoter: Ajuntament del Prat del Llobregat, Surface area of site: 4700 m<sup>2</sup>, BUilt surface: 16390 m<sup>2</sup>, Project date: 2007  
Completed work date: 2010

The cultural centre of El Prat is situated in the Plaça Catalunya of El Prat, and contains a library, the historical archives of El prat and a meeting hall. The exterior volume of the cultural complex, covered by an elegant zinc skin, takes the form of a round body only fragmented by the bursting in of the meeting hall and the central empty space that serves as an entrance courtyard. The interior of the building contrasts with its exterior aggressiveness; the spatial successions, the work in section, the use of warm materials or the serenity afforded by the overhead light, produce an interesting atmospheric experience, particularly spectacular in the triple space that makes up the entrance to the library. (Brullet)

#### **Escuela Elisabeth, Salou – Spain 2008**

Project date: 2005-2006, Work Start Date: Agost 2006, Completed work date: 2008, Built surface area: 10.000 m<sup>2</sup>, Surface area of site: 24.371 m<sup>2</sup>

The school programme includes the whole educational cycle, from infant school, through to primary and secondary school. The general approach of the project is based on desire to establish a close relationship between all the pedagogic groups of the school, adapting personalised spaces for each one of them, yet facilitating exchanges. The idea of organising the whole complex comes from the desire to structure the school as a “small city”, with its centre, streets, facilities and green zones. In the “agora”, the centre of the school, we find the main entrance, the library, the gymnasium, the main hall, the dining rooms, the offices and the head teacher’s office. From this square with porches, towards the left we enter the primary and infant area, and to the right we come to the secondary area. There is a clear desire for the school to touch the ground and for all the conventional classrooms to have their natural extension in the garden classes. Through different pavilions and exterior spaces, which are closely related, the whole school is gradually structured. Nearly all the programme of the school is undertaken on the ground floor, except for the secondary zone which has a pavilion with three levels. With the work in an advanced stage the constructive programme has been extended with the need to cover an outdoor sports centre measuring 40 x 20 metres. From the point of view of the general consolidation plan, the project makes a commitment to generosity, extending the ground floor a great deal and, in contrast, has opted for simple and economical construction materials and techniques in order to reduce costs. (Brullet)

#### **Rehabilitació de la Biblioteca Jujol en el Ateneu, Barcelona – Spain 2008**

Property: Ateneu Barcelonès, Built surface area Ateneu: 6.000 m<sup>2</sup>, Built surface area Biblioteca: 1050 m<sup>2</sup>, Ateneu project date: 1999  
Biblioteca project date: 2005, Ateneu work start date: 2001, Ateneu completed work date: 2002, Biblioteca completed work date: 2008

The Ateneu Barcelonès is in the Palau Savassona, a late 18th-century building that has housed the offices of this institution since the 19th century. On the first body built of the palace, in 1906 the architects Maria Jujol and R. Font-Gumà adapted the space on the main floor to house the library. This early reform was superimposed over the original elements of the palace, preserving the most notable ones. Later, at the end of the 1970s, another very important reform was undertaken that added three storeys to the building

and corrupted it notably. The intervention on the palace is planned by necessity in stages and aims to improve the building technically and architecturally. The first stage of the intervention project involves a rationalisation of the use of the existing building, the strengthening of its most characteristic elements and the adaptation of the building to current needs. Specifically, three spheres of work are planned. Firstly, the search for an improvement in the vertical communication and the lighting; the second sphere of work consists of opening up the ground floor to the city and giving it uses; and finally, the third sphere envisages a new emergency stairway linked to the general vestibule where the new service for the whole building are concentrated. The second stage of the reform is concerned with the library and has been thoroughly executed. The library of the Ateneu Barcelonés is, due to the number of volumes and its collection, the most important civil library in Catalonia. The reform of this highly symbolic space faced a twofold challenge: the necessary loyalty to the historical legacy and the transformation of its functioning as a library. The space had four elements of heritage to preserve: the bibliographical collection, the classical architectural heritage, the Baroque pictorial heritage and the Jujol intervention. With this in mind, the restoration, the cleaning of the obsolete elements and the care of original forms and materials meant a continuous re-encountering of forgotten attributes. On the one hand, there was a requirement to adapt the structure, installations, heating and air-conditioning and protection technologically: in short, to equip the space so that it could deal with the impulse of a new functioning. (Brullet)

### **Libraries:**

**Biblioteca y Centro de Convivencia Actur Norte, Zaragoza – Spain 2008**

La Biblioteca Benjamín Jarnés está ubicada en el Distrito Actur de Zaragoza y tiene actualmente una superficie insuficiente para desarrollar su función. A propuesta del Consejo de Patronato se propone la construcción de un nuevo equipamiento sociocultural, en el que se reubicará la Biblioteca. Siguiendo criterios de racionalidad y economización de recursos materiales y medios humanos se acuerda la creación de un edificio que albergue un nuevo Centro de Convivencia para Mayores y la reubicación de la Biblioteca Benjamín Jarnés. Emplazada en el angular de las calles Pedro Laín Entralgo y Gertrudis Gómez de Avellaneda, la Biblioteca se presenta ante su entorno inmediato como un elemento con vocación urbana. El Actur es un barrio de expansión de 70-80, con una anodina trama de inmensas avenidas y un desarrollo residencial acelerado. Por el contrario las especies arbóreas son de las de mayor porte de la ciudad. Es un barrio que desde el coche te invita a pasear pero que debido al binomio cierzo-sección vial no lo permite.

Con la misma idea se ha considerado que una construcción que genera confort ambiental no debe descuidar los criterios de excelencia medioambiental. Así pues se han utilizado otros mecanismos de arquitectura bioclimática: fachada ventilada, acumuladores solares en cubierta para calefacción y ACS, carpinterías con rotura de puente térmico, uso de maderas con documento de reforestación, control de soleamientos, etc. El Centro de Mayores y Biblioteca se conforma como una pieza de tres plantas y sótano. El proyecto ha surgido teniendo en cuenta la prefabricación como método de control y celeridad en la ejecución de la obra. El programa se desarrolla en cuatro plantas. Se plantea un esquema de planta con patio central abierto que comunica las 4 plantas del edificio y que proporciona una gran iluminación y una relación entre los distintos espacios. Las zonas de servicios se han concentrado en la misma vertical del edificio con el objetivo de economizar y facilitar el paso vertical de las instalaciones. Las estancias destinadas a personas mayores se han ubicado lo más próximas a la cota de la calle para facilitar el acceso a ellas. El acceso principal se produce a través de un porche situado en la esquina Norte de la Calle Pedro Laín Entralgo, lugar donde se produce la máxima apertura hacia la parcela. El vestíbulo se propone como un gran espacio pasante que comunica el interior del edificio con las dos calles laterales, provocando una prolongación del espacio público de la calle hacia el interior del edificio propuesto. El salón de actos se sitúa cercano al acceso, junto a una sala multiusos que ofrece la posibilidad de albergar actividades relacionadas con los eventos celebrados en el salón de actos y una posible utilización de este espacio tras los espectáculos. La biblioteca se sitúa en la zona Norte del edificio, garantizando una correcta iluminación de este espacio. Ocupa parte de las plantas primera y segunda, relacionándolas entre sí con un gran espacio de doble altura que comunica las distintas áreas. Las zonas más transitadas se sitúan dentro de este gran espacio dejando en un lateral del edificio la sala de estudio que es la zona más silenciosa de la biblioteca. Otra característica del proyecto es la posibilidad de abrir al público diferentes áreas sin que el resto interfiera en la circulación general. De esta manera, es posible la utilización del edificio con el cierre de las dependencias que no se desea utilizar. El área del edificio destinada a personas mayores se dispone principalmente en planta baja, con el salón de actos; sótano, con el aula de dinámica y primera, con las aulas y talleres. Las aulas y talleres se separan mediante sistemas de tabiquería móvil que permiten la unión de los dos en uno, posibilitando un espacio más amplio para más alumnos. En los acabados exteriores se han seguido los criterios antes citados cubierta plana, fachada ventilada con acabado de tableros aglomerados de madera-cemento, tipo VIROC de acabado natural y carpinterías de acero y madera con rotura de puente térmico. El mínimo número de huecos aumenta el control del perímetro. En los patios, protegidos del ambiente exterior se permite la opción contraria con carpinterías de muro cortina con rotura de puente térmico Jansen y vidrios bajo-emisivos de control solar. La biblioteca trata de conciliar al paseante-usuario con el tejido. El edificio seduce con un juego de vistas cruzadas en un aparente prisma ciego. El emplazamiento nos ofrecía un retranqueo de alineación que hemos canalizado en la entrada atravesando visualmente la planta aun sin entrar en ella. Se regala una pausa en el recorrido y una invitación a entrar. Interiormente el edificio es muy sencillo comprensible en un flash a través del patio. El programa de biblioteca y centro de ocio para mayores se ordena en un tetrís de cuatro plantas entorno al vacío central aprovechando fachadas y orientaciones. De dentro hacia fuera se generan panorámicas con la tutela del edificio hacia los parking y aprovechando el porte de las especies cercanas. (<http://www.noticiasarquitectura.info>)

Architectura Viva 2003/92

El Proyecto para la nueva Biblioteca Pública de Villanueva de la Cañada responde a la necesidad de complementar los servicios que se están desarrollando en el Centro Cultural vecino, edificio del arquitecto Juan Navarro Baldeweg. La Biblioteca se ha entendido como nudo de comunicación, investigación, encuentro y conocimiento. Este tipo de edificios son cada vez menos autónomas, y dependen de estímulos y conexiones externas que les dotan y relacionan con el mundo y el conocimiento. Las comunicaciones por Internet, la consultas de bases de datos, las nuevas tecnologías de la comunicación obligan a las bibliotecas a adaptarse arquitectónicamente a estos usos, contando con ellos y encontrando una expresión arquitectónica que los defina. Desde el punto de vista arquitectónico, todo este nudo de encuentros, con usos y exigencias muy diversas, se ha resuelto espacialmente enlazando sus usos con una "espiral" ascendente de libros a través de un sistema de rampas, que al enroscarse, va distribuyendo y atendiendo a su paso los espacios que se distribuyen a su alrededor. A medida que asciende, los usos asociados a los distintos niveles, se corresponden con tareas más específicas, más complejas, más dependientes de la comunicación exterior, por lo que el camino desde la Biblioteca de Niños, hasta las salas de estudio e Internet, encuentran una expresión arquitectónica representativa del aprendizaje y el conocimiento, objetivo último de una Biblioteca Pública. Los espacios y usos diferenciados se han pensado y resuelto constructivamente de modo austero y uniforme, buscando definir estancias confortables y acogedoras sin más intervención que la de materiales naturales y la introducción de luz natural valorada de forma distinta en cada espacio. La estructura será de cerámica armada, dejando sus muros vistos al interior y encalándolos de blanco, mientras los suelos serán de tarima industrial de roble en todo el edificio, persiguiendo espacios continuos, sin interferencias visuales en sus acabados, pero definiendo muy claramente los ámbitos con la organización de sus paredes y los huecos al exterior. ## **Lluís Clotet i. Ass., Barcelona – Spain**

### **Libraries:**

#### **Biblioteca Universitat Pompeu Fabra, Barcelona – Spain 1999**

The University Library of the Universitat Pompeu Fabra, designed by the architects Lluís Clotet and Ignacio Paricio 1999, has been awarded the Years 2009, awarded each year Foundation Oscar Tusquets Blanca a work built 10 years earlier. The Library is located in the old deposit of Water Park of the Citadel, built by architect Joseph Fontserè and Master 1874. According to the records of the jury, made only by the Italian architect Alessandro Mendini, this award is due, according to him at: "The value of the transformation of an engineering building on a magical place designed to library, or rather, a reading room. The language of the intervention on the old water tank, 1874 is perfectly highlighted, and leads to an atmosphere distant, abstract and concentration, can be isolated from the outside this small city of books" (...) (<http://www.bauenblog.info>)

Think tank: in Barcelona, an extraordinary industrial relic from the nineteenth century has been imaginatively and sensitively transformed into a new university library. (Interior Design).

Dating from 1990, Barcelona's University Pompeu Fabra is a relative newcomer to the city's educational pantheon, yet today it is considered one of the most prestigious universities in Spain. With a student population of around seven thousand, it offers a range of graduate courses, along with doctoral, postgraduate and masters degrees. Emphasizing the role of a university as part of society, Pompeu Fabra has a distinctly urban character unlike most new campuses which tend to be exiled to the periphery. Installed in a series of remodelled buildings of diverse historical origin, the various faculties are clustered around la Ciutadella, near the city zoo and Olympic Village on the eastern edge of the Cerda grid. Projects such as MBM's imaginative remodelling of the Roger de Lluria barracks (AR November 2001) into lecture halls and seminar rooms are typical of the ongoing development programme which seeks to invigorate and sustain the public realm, through a process of historical consolidation and repair.

This latest project by the young Barcelona-based partnership of Lluís Clotet and Ignacio Paricio Ansuategui involves the refurbishment and conversion of the Diposit de les Aigües into a new university library. Acquired by Pompeu Fabra in the mid 1980s, the building was originally a water reservoir, designed by Josep Fontserè's and Josep Comet in 1874 as part of a lake and cascade complex sited at Parc de la Ciutadella. An outstanding example of nineteenth-century industrial architecture, the building's robust brick construction echoes the massive Roman engineering of the Mirabilis Pool in Naples, an enormous reservoir of drinking water built for the Roman fleet during the reign of Augustus.

Since it ceased to operate as a reservoir, the Diposit has undergone many different incarnations—a World's Fair pavilion, archive, fire station, film set and old people's home. This most recent use involved the construction of internal partition walls, which Clotet and Paricio have removed as part of their intention to preserve the original structure and enhance the dramatic quality of the internal spaces. The urge to impinge as little as possible on the historic fabric strongly underscores the entire project.

The building's new function responds both to the drama and practical constraints of the existing structural geometry. The rooftop water tank is supported by a dense grid of 1m thick parallel brick walls penetrated by arches to create a series of 4m wide vaults. Around the perimeter, massive brick buttresses provide lateral restraint. The resulting interior is a cavernous, cathedral-like volume made up of a rhythmic labyrinth of vaults. This heroically scaled space has been sensitively transformed into a reading room and library, the rows of desks and book stacks slotted with precise economy into the regimented structural grid. Subsequent interventions have been stripped out—for instance, the existing upper floor has been cut back to form a reading balcony around the perimeter, giving views out over the scholars toiling below. A modular precast concrete structure, independent from the brickwork, permitted the installation of a raised floor. All the necessary building services (wiring, plumbing, furniture) were installed without disturbing the original structure.

Despite the monumental character of the space, the architects have managed to create many different sorts of work and study areas, ranging from intimate, individual enclaves, to communal spaces dwarfed by the towering structure and vast vaulted vistas. The most ingenious new interventions are the skylights on the roofs tank. Each consists of an inverted mirror-glass pyramid set in a clear glass casing which funnels sunlight reflected off the water into the deep plan of the reading room below. Other interventions are more prosaic, bringing the nineteenth-century structure in line with current planning and seismological legislation. Overall, the architects have accomplished the often difficult task of injecting new life into a distinguished historic building with a mixture of rigour and sensuality. Pompeu Fabra has another happily revitalized relic. (<http://www.thefreelibrary.com>)

## **Contell – Martínez Arquitectos, Valencia – Spain**

<http://www.contell-martinez.com>

### **Libraries:**

#### **Library and Young Center, Alguazas – Spain 2011**

PROMOTOR: Ayuntamiento de Alguazas, ARQUITECTOS: M<sup>a</sup> Dolores Contell - Juan Miguel Martínez, Alguazas, Murcia / 2011

Dos son los aspectos más importantes que hemos intentado abordar en este proyecto: el primer punto se centra en trabajar el límite de lo construido, donde la ciudad se diluye con el paisaje. Transformar un no lugar, donde puntualmente toma vida en forma de mercado, en un lugar de uso para la ciudad.

El segundo aspecto trata de poner en valor la construcción existente, buscando que un nuevo uso no suponga de ninguna manera una pérdida de identidad.

Proponemos la rehabilitación de la cubierta, para que se produzca el paso de la ruina estructural a una pérgola que sirva de soporte a la vegetación, generando así espacios de sombra y una transición entre interior y exterior.

La nueva biblioteca y espacio joven se desarrollan en una serie de espacios que juegan bajo la pérgola vegetal fundiéndose con la plataforma de la estación, difuminando el límite de la actuación y abriéndose estratégicamente al exterior para captar de forma controlada las instantáneas de una nueva realidad generada por el proyecto.

Para dotar de una mayor accesibilidad urbana al centro joven y a la biblioteca, proponemos la construcción de un nuevo acceso tangencial a la plataforma de la estación, con lo que se consiguen a su vez nuevos flujos de personas en esta zona, dinamizando estos espacios.

Hacia las vías del tren el edificio se muestra rotundo, protegido tras una barrera de enredaderas, que treparán por la cubierta existente, transformada ahora en un tamiz verde.

El podium sobre el que descansa la cubierta actual se elimina, haciendo accesible la nueva construcción. Los oxidados perfiles metálicos se recuperan ahora como estructura ingrávida.

El nuevo edificio se construye con muros de hormigón, contrastando con la ligereza y estaticidad de la cubierta. Un esquema sencillo organiza las circulaciones a través de un corredor, que hace las veces de filtro y barrera hacia las vías del tren, sirve a los distintos espacios permitiendo que la biblioteca y el centro joven se puedan usar de forma diferenciada.

Los pavimentos de madera salen al exterior como alfombras de traviesas de madera que recuperan de nuevo un uso perdido, integrándose con bancos y árboles que extienden los límites de la actuación.

Las distintas estancias se abren al cielo para no contagiarse del caos del entorno, dejando pasar la luz filtrada a través de la antigua cubierta transformada en umbráculo, recordándonos que ese montón de hierros aparcados en una explanada, que un día tuvieron una función ya olvidada, son útiles de nuevo y que con el ruido de los trenes se mezclan ahora la música de los ensayos, las voces de unos amigos sentados bajo un árbol, el brillo metálico de las esculturas de una exposición, las sombras recortadas en los muros y el susurro de las hojas de los libros. (Contell)

## **Cruz y Ortiz, Sevilla – Spain**

<http://www.cruz-ortiz.com>

### **Libraries :**

#### **Biblioteca Provincial Biblioteca del Estado Infanta Elena, Sevilla – Spain 1995 – 1999**

The current library building is located in the Parque de Maria Luisa. This was the site of the Ibero-American Exposition of 1929. It lies between the Pavilion of the United States and the Pavilion of Peru, which now holds the Science Center and the consulate of Peru. The architects Cruz y Ortiz were selected to undertake the project, which started in 1995. The building conforms to the shape of the site, with six sides in all. One of the sides faces the park while another faces the Guadalquivir River. The building was inaugurated in 1999 by the Infanta Elena, Duchess of Lugo. It was nominated for the Mies van der Rohe Award for European Architecture in 2001. The two-story building conceals an interior courtyard, invisible from outside, which provides a second source of natural light for the reading rooms. The courtyard itself can be used as an open-air reading room. The structure defines a C-shaped space with the rooms fully open to the interior façade. The two floors have a combined area of 5,000 square metres (54,000 sq ft). The building is built of exposed brick and black metalwork. The ground floor is almost entirely open to the outside, while the first floor is taller and has a denser appearance. This is where the exposed brick is used. The roof is made of zinc that slopes slightly inward to the courtyard. (<http://en.wikipedia.org>)

### **Libraries :**

#### **Biblioteca Central Campus del Bierzo en Ponferrada – Spain 2004**

El proyecto para la construcción del aula en el Campus del Bierzo en Ponferrada se adjudicó mediante concurso restringido al estudio DMG Arquitectos, liderado por Belén Martín-Granizo y Daniel Díaz. El edificio se enmarca en una zona de pendiente leve aunque de perfil inclinado y con urbanización a través de bancadas y aterrazamientos. Para ello se eligió una morfología lineal componiendo un edificio formado por dos cuerpos paralelos alargados relativamente estrechos, de sección constante e interior

diáfano como si de una extrusión se tratase, expresión de la voluntad tipológica y funcional de la propuesta. Según explican los arquitectos, “ésta pretende definir espacios construidos versátiles, capaces de alojar el programa de aulas requerido y también modificaciones futuras. Entendidos como contenedores didácticos, podrán ampliarse más adelante, extendiendo la extrusión”. Ambos cuerpos se separan ligeramente abriendo un espacio entre ellos que, “en contraposición a la hermeticidad de los volúmenes principales, conforma un intersticio abierto (de cerramientos vítreos) entorno al que se articulan los accesos”. Los volúmenes se dimensionan y disponen en el paisaje ligeramente decalados y de tamaños descompensados, “en un juego compositivo medido, que por otro lado configura los espacios exteriores de relación previos a los accesos, como ágoras para la vida universitaria”. Por las dimensiones del solar y el programa, los autores consideran necesaria una construcción en altura: “se opta por disponer como sistemas de comunicación vertical escaleras y rampas, de manera que resuelven las necesidades de evacuación y accesibilidad, evitan la necesidad de disponer un ascensor y proporcionan al edificio mayor fluidez espacial y de circulación”. Se aprovecha el gran espacio de la rampa para generar un juego de luz y vistas. De manera análoga al estiramiento y dilatación de la cámara de este muro, así lo hacen las ventanas que en él se habían definido, “pasando de ser láminas transparentes sin espesor a volúmenes cúbicos de cristal”. Así lo explican los arquitectos: “estas burbujas ingravidas sobre la rampa, atraviesan este espacio completamente hasta abrir un hueco en el muro opuesto, del pasillo interior, así dotado de luz y generando una suerte de prisma cristalino que abren vistas, luces y reflejos en todas sus direcciones. Cada uno de éstos cubos pone en relación todos los espacios que en él confluyen, son sucesivamente un mirador, un gran banco-ventana y finalmente un gran hueco que enmarca el cielo”.

#### **Biblioteca pública y Escuela de Música, Almonte – Spain 2004 – 2010**

Rehabilitación de Bodega

Promotor Ayuntamiento de Almonte, Superficie 1.177,35 m<sup>2</sup>, Presupuesto 1.200.000,00 €

The project is centered on the “Los Reales de Almonte Warehouse”, registered as being of Cultural Interest, which has been rehabilitated for use as a public library, and School of Arts. Enclosed within a public square, the building is located in the “Ciudad de la Cultura” in Almonte and next to the town’s new Theatre. The library is located in a former wine cellar, a typical structure of the local area. Opened on three sides, the building is 78m long and 10.5m wide, with a total area of 821 sqm. Work included the construction of a gallery without alerting the original structure of the building to maintain and incorporate the original features. The library occupies 14 of the 17 modules, the 3 remaining modules are in the East Wing house the Arts Schools. The main Entrance is in the South-East of the building, giving it a spacious feel. Book control / loaning / administration is the first area encountered and has a controlled height. The following areas are the Press and Reading Room, which use the full height of the Warehouse. The last areas are the Children’s Area, lit by large and diffused light sources, and a small storage area and a second flight of stairs. In the upper floor there is a Reading Room and Audio-Visuals room. The project accentuates the original features of the Warehouse building, creating different spaces with each adapted to its new use. The interior design and furniture forms a fundamental part of the work, with simple designs easily repeatable within the different needs and varied program of the library and public services offered in this space. (<http://www.archdaily.com>)

El proyecto se centra en “Los Reales de Almonte Almacén”, registrado como Bien de Interés Cultural, que ha sido rehabilitado para ser usado como una biblioteca pública y una escuela de Artes. Encerrado dentro de una plaza pública, el edificio se ubica en la “Ciudad de la Cultura” en Almonte y junto al nuevo Teatro de la ciudad. La biblioteca está situada en una Antigua bodega, una estructura típica del área local. Abierto en tres lados, el edificio tiene 78 metros de largo y 10,5 metros de ancho, con una superficie total de 821 metros cuadrados. El trabajo incluyó la construcción de una galería sin alterar la estructura del edificio para mantener e incorporar las características originales. La biblioteca ocupa 14 de los 17 módulos, y los tres módulos restantes están en la casa de la Escuela de Artes. La entrada principal está en el Sur-Este del edificio, dándole una sensación más espaciosa. El control de libros/préstamos/administración es el primer espacio y tiene una altura controlada. Las siguientes áreas son la Prensa y la Sala de Lectura, que utilizan la altura de la galería. Los últimos espacios son la zona de los niños, iluminado por grandes y difusas fuentes de luz, y un área para un pequeño almacén y un segundo tramo de escaleras. En el piso superior hay una lectura y una sala de audiovisuales. El proyecto acentúa las características originales del edificio de almacenamiento, creando diferentes espacios adaptados a sus nuevos usos. El diseño interior y el mobiliario forman una parte fundamental de la obra, con diseños simples fácilmente repetibles, en donde las diferentes necesidades y programas variados de la biblioteca y los servicios públicos son ofrecidos en este espacio. (<http://www.plataformaarquitectura.cl>)

Dos de los más innovadores proyectos arquitectónicos realizados en León en los últimos dos años han sido seleccionados dentro del escogido grupo de obras que representará lo mejor de la arquitectura española en la VIII Bienal de Arquitectura de España. Se trata de los edificios de biblioteca, cafetería y edificio de servicios centrales del Campus del Bierzo, realizado por los arquitectos Daniel Díaz Font y Belén Martín Granizo, del estudio leonés DMG Arquitectura; y el Museo de Arte Contemporáneo de Castilla y León realizado por Luis M. Mansilla y Emilio Tuñón. La bienal de arquitectura es una distinción promovida por el Consejo Superior de los Colegios de Arquitectos de España, el Ministerio de la Vivienda, las universidades Menéndez Pelayo y Alcalá, la Fundación Caja de Arquitectos y la Escuela Municipal de la Vivienda de Madrid; y realiza una selección de las mejores obras arquitectónicas realizadas en España en los dos últimos años. Esta convocatoria premia la labor de los arquitectos españoles en el 2003 y el 2004, y se ha caracterizado por la gran cantidad de obras presentadas para su selección: más de 350 propuestas, entre las que se realizó una primera selección de 19 trabajos que ya incluía las dos edificaciones realizadas en la provincia. Sin embargo, finalmente se realizó una ampliación del número de trabajos seleccionados hasta llegar a las 35 obras, mucho más amplia de lo habitual, debido al elevado nivel arquitectónico. El premio de arquitectura Manuel de la Dehesa recayó en el Parlamento de Edimburgo, realizado por EMBT Arquitectes Associats; la mención fue para la explanada Forum 2004 en Barcelona, de Martínez Lapeña y Torres i Tur; y el premio de arquitectura Enric Miralles para el estadio de fútbol de Lasasarre, en Barakaldo, de Eduardo Arroyo. #### **Biblioteca Central de la Universidad de Alcalá, Madrid – Spain 2008 – on construction**

Project name: Central Library and Museum for the University of Alcalá de Henares, Year: Design: 2007 (competition, 1st prize)

Client: Universidad de Alcalá de Henares

We thought that the project for the new Central Library of Alcalá de Henares University should not be strictly limited to a refurbishment task, in which a new program and furniture are to supersede the original ones. It should be understood as an insertion into an existing party-wall, acquiring its shape, absorbing light and fresh air, and opening towards the sky as the only possible way out. This implies the creation of a new space within an existing heritage building which features its own identity, and which is as well respectfully introduced into a formerly built context. The development of spatial strategies to occupy a given volume, as well as the generation of an inner façade to link and accommodate the new uses into the already existent building, are some of the keys through which the project evolved. Besides, it was equally important to develop an independent and flexible constructive process, neutral and nuanced at the same time, which ensured the adaptation of the new program without constraining it physically.

#### **Intervention:**

Therefore, our proposal had to be respectful with the former urban layout of Cuartel del Príncipe, as well as with its presence and material condition-the whole original wrapping-, so the interior could be completely scooped out, thus transformed into a 'plot' where to carry out a Project for a library and a museum. This plot is limited by a built boundary, which binds not only its perimeter, but also its upper and lower 'façades': no basements can be dug, neither an extra volume can protrude beyond the existing roofline or alignments towards Patio Cultural or Plaza de San Diego. Hence, our proposal turned out to be a building inside a building, which emphasizes this condition through its 'non-façade' and its new storey distribution.

#### **Free space. Connectivity:**

Thus, the main access to the new library, through the front façade of the existing main building, turns out to be a filter to Patio Cultural, through where the future public courtyard will be reached. Likewise, the new Salón de la Ciudad can be reached through the building destined to host the new museum from San Pedro Street. Therefore, two aims are achieved through this strategy: on the one hand, to provide the city with new connections between the new public spaces and the already existing and, on the other hand, to provide these connections with a clear use-for them not to become superfluous, residual spaces-, concentrating in them the main accesses to the Library and the Museum.

#### **Library of libraries:**

The Project for the new Central Library is a 'Library of Libraries': a complex system of supports and accesses to these supports which must be organized from a single, controlled entrance. Hence, a clear programmatic organization seems crucial in order to understand the whole building's operation, subsequently enforcing the parts' functionality. Through a deeper analysis of the required program, a primary organigram is distilled. It concentrates the General Hall and the Specialty Collections Area inside the main bay facing San Diego Square, leaving other uses such as the mediatheque, computer rooms or newspaper library in the northern auxiliary bay. Adjacent to the main body and within the secondary wings of the main building, two vertical cores are set. The northern one is the buildings' main vertical core, as it links the main access with the whole bunch of auxiliary libraries. The access to the southern core is restricted to the library staff: it is independent from the main controlled access, and it links every single workspace with the restricted areas. The timetable flexibility of the General Hall and the Specialty Collections Area is granted by concentrating both these inside the main bay, accessed through a 24h controlled entrance. The non-24h-use program is set beyond the northern core, into the auxiliary bay, so it can be easily isolated when necessary.

#### **Piano nobile, access and vertical communication:**

Just as some of the most notorious classic libraries, such as Asplund's Stockholm Library or Plecnik's Ljubljana Library, the General Hall-the library's main space-is set on the building's piano nobile. As the main access control is left behind, the General Hall can be reached through an immaterial staircase. Then, the General Hall appears as a huge void of air and light, flanked by two 'book-walls' which isolate this space from any external bother, separating, at the same time, the uses of the main hall: the lecture room and the searching area. The general void is crossed by several volumes which host teamwork study rooms, nuancing this main space and somehow complexizing the achieved naturalness of the programmatic organization.

#### **Seat organization: general hall/specialty collection. Individual seats + teamwork halls:**

The General Hall is a deep, continuous space, but it cannot be walked through, for the reading places are placed from side to side of the hall, relegating the circulations to the peripheral book-flanked loggias. On the one hand, the General Hall hosts 500 seats (for individual or group study), while the Specialty Collections Area is furnished with 300 places within the same continuous space, but placed on top of the hovering volumes which cross the light and air void. Although these volumes dwell inside of the main space, they are acoustically isolated, enhancing teamwork efficiency.

#### **Auxiliary bay organization:**

The remaining program is developed within the auxiliary bay located beyond the northern vertical core. Depending on the hosted use, each storey is organized following two different strategies. However, both are continuous and transformable, therefore granting any possible variation which may take place throughout the building's lifetime. The auxiliary libraries scheme, together with the computer rooms, is based on a peripheral circulation system, which offsets the working space from the façade, providing the whole space with smooth, natural lighting. The second scheme, implemented in personal working spaces or meeting rooms, consists of a central corridor which allows every single room to be placed along the façade of the building. Both systems are installed once the main structure is cast, so they can be exchanged if necessary.

#### **The heritage building:**

The whole constructive process is carried out taking an extreme care for the heritage building in which the new program is inserted in, as well as for the historic surroundings, for the building itself actually plays a role in a heritage complex of an indisputable value which, therefore, must be preserved. However, this criteria does not prevent both parts of the building-the ancient wrapping and the new interior-from being regarded independently.

#### **External homogeneity:**

A full restoration of the façade is proposed, so the building shall retrieve and consolidate its presence without distorting its original appearance in terms of wall openings or materials used. Moreover, the inner façades facing the Patio Cultural will be dignified, and this space is also to be restored in a neutral way.

#### **Inner volume insertion:**

The insertion of the new volume into the existent Cuartel del Príncipe skin is carried out with a clear 'material confrontation' criterion. Concrete, wood, steel, glass and polycarbonate now face the elder brick and masonry external walls. Just like an uncut jewel placed inside an old chest.

#### **Structure/canopy:**

The structure of the library's main space is based on two bearing 'book-walls' which flank the General Hall. They are huge 'cages' made up of steel bookshelves and supports, which bear the volumes that cross the main void, as well as the light peripheral corridor slabs. The structure of the northern wing is made up of supports and slabs of cast-in-situ concrete. The canopy preserves and re-uses the original roof trusses, modifying their actual position to allow skylight into the main space. Domansono arquitectos (<http://www.architecturenewsplus.com>)

Some books and a dream...

The building is a construction like any in a garden. It doesn't hold any memories of the institutional character of libraries...

They are some walls which may have been in this place. We have tried in different ways to give the library an appearance of a labyrinth. A serie of rooms and gardens put together in a non-linear way. The building is an experiment, that shows every part of the development of the project. It's continuing changes and variations, as well as the authority of accepting the final result.The sportshall of Isozaki is our neighbour. Palafolls is building a city, as directed by the mayor Valentí Agustí, where he asks every architect to construct according to our dreams. (EMBT)

## **Campus of Fudan University School of Management, Fudan - Sha nghai- China Allocation Date June 2011**

Fudan is a part of a network of universities and their respective buildings located in Shanghai. Is also a very special and unique university with an extensive history and a very unique character. Besides the main Campus, there are two new components. These components are not closely located, they are separate pieces, so in order to establish the connection the buildings must convey the identity of Fudan and contemporary life. The footprint of the campus will be an essential element in generating an urban mixture. We strongly believe that the central Green spine between the blocks of the campus will play a major role in creating the mixture. The existing structure of the area does not have the capacity to generate any public life, the new fudan campus will create a new core in the new community. The Project has two main external landscapes. Both areas are treated differently. The central Boulevard is more urban and has big trees and water features. The internal zone introduces vegetation in between the buildings and mixes with the interior. The master plan for this new zone defines the density and heights. The new buildings must have a relationship to the surrounding buildings, the volumes must relate to the urban context, and be adjustable to the different functions. We modified the volumes of the master plan within the given specification to create that mixture. The buildings become part of a network of connections, instead of forming borders.

Fudan University is one of the oldest and most selective universities in China. The program of the business school is expected to engage about 8000 people in the complex at peak times. In this aspect the building require an easy and clear organization of the complex program. All public activities like Big Auditorium, library, museum, student food core, shops are placed on the first level, second level, and level minus one. All those public levels connect with the campus garden. The main classrooms are on the third and fourth floors. The blocks on the west side connected with bridges to establish an easy and continous circulation route for the students. On top of the classroom and lounge route are located the separate units of administration, incubator, research, conference center, etc. The theater and the museum are on the ground floor of the block on the east, and the alumni club is linked to the museum so that they can share facilities. ### **Libraries:**

**[Biblioteca Universidad Politècnica de Catalunya Barcelona, Castelldefels – Spain 2002 – 2006](#)**

6.000 m<sup>2</sup>, € 4.600.000

This project comes from a restricted competition organized by the Universitat Politècnica de Catalunya. The project's main approach was the search for maximum energy efficiency by means of diverse strategies: On the east-west sides, opaque strips are laid out to hold circulation and service areas. The strictly modulated central area has dome lighting from the north, and holds the classrooms and library. White walls contribute to the maximum use of natural light. The south façade is glass, protected by open tile work that does not allow sunlight to reach the interior of the building. The trans-ventilated tile façades help to seal out noise from nearby air traffic. The permanent water of the subsoil is used as in radiant heating and air conditioning. Support of multiple solar panels, controlled dehumidification, the use of healthy materials, etc., contribute to the aforementioned efficiency of the building. (Ercilla)

A la imatge, la Biblioteca de Comunicació i Hemeroteca General de la UAB, obra de l'equip d'arquitectes Espinet/Ubach (Miquel Espinet i Mestre i Antoni Ubach i Nuet), construïda entre 1997 i 2002. Està situada a l'extrem sud del Campus de Bellaterra, a tocar d'una massa boscosa molt frondosa. El mateix edifici serveix per a salvar el desnivell entre la Plaça Cívica, on es troba l'accés principal, i el bosc. A la façana principal hi trobem una gran àrea vidriada. L'edifici té 5 plantes: les 3 primeres estan orientades a la Plaça, mentre que les 2 superiors ho fan en direcció al bosc posterior. (<http://www.bauenblog.info>)

The campus of the Autonomous University of Barcelona is built over the Can Magrans watercourse. The differences in level of the valley's singular topography are made up by a series of hypostyle structures that underpin the Plaça Cívica, which rises above the watercourse and rests on the colonnade. On the western side, where the library stands, a retaining wall and a ditch channel movement between the Plaça Cívica and the splendid pine trees above. These various elements form a unique setting among Catalan universities as a whole, with buildings and nature existing side by side in exemplary harmony. The ground floor of the building occupies the same level as the Plaça Cívica. In addition to entrances, control, information and student services, it contains a multipurpose hall. The first level is given over to library management services, and the other three are occupied by the actual libraries. The upper floor, on the same level as the pine trees, is a construction that opens up to the woods, since the building inverts its façade depending on the level. The solid wall facing the openings serves to store books. The lower floors as far as the Plaça Cívica, conversely, overlook this plaza and use the blind wall to house all the book stacks. In terms of spatial layout, this façade faces north, the most suitable direction for a library. The building, then, is turned around to give meaning to its points of reference: The Plaça Cívica to one side, and the small wood and landscaped plaza to the other. (Espinet)

**La Biblioteca Pública Can Peixauet, Santa Coloma de Gramenet – Spain 2001**

### **Literature:**

"Biblioteca Can Peixauet: Santa Coloma de Gramenet, Barcelona 1998-2001". En: *Espinet/Ubach: treinta años = thirty years*.

Valencia: Pencil, DL 2009 (Monográficos Arquitectura ISBN 978-84-935145-9-4, p. 226-239

Obra realitzada per l'equip d'arquitectes Espinet/Ubach (format per Miquel Espinet i Mestre i Antoni Ubach i Nuet) entre 1998 i 2001, la Biblioteca de Can Peixauet està ubicada a l'antiga masia del mateix nom, situada a Santa Coloma de Gramenet. Està ja documentada el segle XII (l'estat actual, però, és fruit de les reformes efectuades durant el segle XVII i la primera dècada del XIX). El nou edifici està totalment reformat, tot i que s'hi han conservat alguns elements característics, com ara la torre central que corona l'edifici. La Biblioteca i el seu programa funcional, però, es desenvolupen en el subsòl, ocupant la plaça de nova construcció adjacent a la Biblioteca... mentre que l'edifici es configura com un accés a l'equipament. En aquest sentit, un dels elements més característics de la Biblioteca són les tres claraboies que sobresurten de l'estructura de la plaça, i que serveixen per a canalitzar i abocar la llum a l'interior de l'equipament. **Cultural Civic Center, Palencia – Spain 2011**

Rehabilitation of former prison of Palencia As Cultural Civic Center

The former Palencia Provincial Prison complex was created at the end of the XIX century, built with brick bearing walls following the "neomudéjar" style, and composed mainly of four two-storey wings and some other with one storey. On this building was planned a comprehensive refurbishment to transform the former use and convert it into a center that promotes the social and cultural activity in this part of the town.

Our proposal intends to convert the former prison into a meeting place, recovering some of the old spaces, and creating at the same time new structures that make possible the new planned activities. It is a project that respects the existing building, which is given a contemporary, lighter appearance, and where the natural light will play a key role.

With this aim the main two-storey wings have been refurbished, emptying their interior and placing a new independent structure to bear the new floors and roofs. Besides, between the main wings have been built new connecting pavilions, which form the new complex perimeter and give it a modern and friendly aspect.

To introduce the light in the building we had to remove the old covered with tiles which were in very poor condition, and have been replaced by others of zinc that open large skylights which introduce light into the open halls of the Center.

The entire building is organized around a great hall that connects the 4 pavilions of the former prison. It is a diaphanous space based only on a few mild cylindrical courtyards of glass that illuminate and provide the backbone of the stay. Due to its central location in relation to the pavilions, this space acts as a nerve center and distributor of users, across the Pavilion access and reception, directed towards the rest of the areas of the Centre.

The hall gives way to the lateral pavilions where the auditorium and various music and art classrooms are. On the upper floor, under a large glass skylights, are two multi-purpose areas dedicated to more numerous groups.

In the area where the cells of prisoners were, we placed the library. The reading rooms are articulated around a central space of high-rise under a lantern of octagonal shape that acts as a distributor for the different areas and that arrives vertical communication and control areas and offices.

Finally, access to the Centre are carried out through a very light and bright glazed perimeter that pretends to be a filter between the city and the activity of the interior. A structural steel beam travels abroad tying areas glazed with the former factory walls getting an alleged industrial air.

The use of metallic materials in all intervention, as the zinc in facades and roofs, glass and uglass in the lower bodies and skylights and the aluminium lattices as lightfilters also contributes to this.

[Biblioteca y Filmoteca de Navarra, Pamplona – Spain 2011](#)

### **Literature:**

ON Diseño 321/322: Libraries: Architecture and their types  
Ondisño.com

The new library is located on Paseo de Antonio Perez Goyena, No. 3, Mendabaldea (Pamplona), on a plot of 8450 meters square. The work has been executed by the joint venture Navarre Library, constitutive of "Fomento de Construcciones y Contratos, Construction, SA" and Navarra Construction Company, "SANCO", under the direction of architect Manuel Ferrer Sala. The new facilities are designed as a "general library" with superior bibliographic organ functions of the Autonomous Region. Also, additionally, act as the coordinating center for the Public Library System of Navarre, composed of 93 local (23 of them new or renovated in recent years), urban central public library Pamplona and its region, and public library Mendabaldea urban and environment. It features a center develop universal access to information and knowledge, information center, both on the library's own resources, external resources as other information of interest to society training center and self-learning; center to promote reading, to support education and research, entertainment and cultural meeting place, and Film of Navarre.

(<http://www.viaconstruction.com>)

La nueva biblioteca está emplazada en el paseo de Antonio Pérez Goyena, nº 3, de Mendabaldea (Pamplona), en una parcela de 8.450 metros cuadrados. Tiene planta baja, dos alturas y sótano, con una superficie construida de en torno a 19.000 metros cuadrados. La obra ha sido ejecutada por la UTE Biblioteca de Navarra, constituida por "Fomento de Construcciones y Contratos, Construcción, S.A." y la Sociedad Anónima Navarra de Construcción, "SANCO", bajo la dirección del arquitecto Manuel Ferrer Sala. Las nuevas instalaciones se conciben como una "biblioteca general", con funciones de órgano bibliográfico superior de la Comunidad Foral. Asimismo, de forma subsidiaria, desempeñará las funciones de centro coordinador del Sistema de Bibliotecas Públicas de Navarra, compuesto por 93 locales (23 de ellas nuevas o renovadas en los últimos años), biblioteca pública central urbana de Pamplona y su comarca, y biblioteca pública urbana de Mendabaldea y su entorno. En ella se desarrollarán las funciones de centro de acceso universal a la información y al conocimiento; centro de información, tanto sobre los recursos propios de la biblioteca, como sobre otros recursos externos de interés informativo para la sociedad; centro de formación permanente y autoaprendizaje; centro de promoción de la lectura; de apoyo a la educación y a la investigación; de ocio y de encuentro cultural; y Filmoteca de Navarra.

(<http://www.construirnavarra.com>)

La construcción de esta dotación cultural, promovida por el Gobierno de Navarra, correrá a cargo de FCC y Navarra SANCO. El proyecto, del arquitecto barcelonés Manel Ferrer Sala, estará distribuido en cuatro plantas, incluyendo el sótano. El propio arquitecto comenta que "se trata de un espacio proyectado hacia el exterior, sobre todo en su planta baja". Un juego de tonos y texturas caracteriza el exterior del edificio, "con una clara voluntad de transparencia y de integración en el territorio". De ahí que los materiales de la urbanización exterior sean los mismos que los del entorno. Asimismo, las fachadas son multicapas -con piedra natural- en granito azul oscuro y cristal, que proporciona buena protección térmica, no exige mantenimiento, permite una reposición fácil de las piezas y mejores niveles de acabado. El edificio, albergará la biblioteca de referencia de la Comunidad Foral y su patrimonio bibliográfico. Además ofrecerá otros servicios como el préstamo de documentos, hemeroteca y gestión del sistema de bibliotecas públicas de Navarra; por su parte, la Filmoteca custodiará y difundirá el patrimonio audiovisual.

### **Datos técnicos del proyecto**

Los planos horizontales son losas de hormigón que se soportan mediante jácenas de hormigón postensadas cuya utilización permite grandes luces y mayor flexibilidad de los espacios, lo que en una biblioteca significa una mayor amplitud en la percepción de los espacios y una mejor distribución del espacio interior que se confía a la ubicación del mobiliario. Las fachadas de la zona de lectura tienen, además de la protección solar, un doble acristalamiento que optimiza el rendimiento térmico. La cubierta está concebida en varios planos con revestimiento de piedra natural, que permiten recubrir las superficies inclinadas de los lucernarios y de las zonas más horizontales de la cubierta, donde se colocarán paneles de energía solar. Las divisiones interiores del espacio responden al mismo criterio de flexibilidad y optimización de los espacios y, excepto en los núcleos de comunicación y servicios, se realizan mediante bastidores de perfiles metálicos galvanizados y paneles de madera o de cartón yeso según las zonas. Los pavimentos de uso público y áreas de trabajo son de piedra natural; únicamente se emplean otros pavimentos en la zona de actos culturales, un pavimento de madera en la sala de exposiciones y moqueta en la sala de proyecciones del sótano. ### **Libraries :**

[San Giorgio Biblioteca, Pistoia – Italy 2007](#)

Il tema della memoria nella biblioteca di San Giorgio a Pistoia si presenta già nel nome: il progetto infatti recupera uno degli edifici delle officine San Giorgio nell'area ex-Breda dove, fino al 1973, venivano realizzati inizialmente carri a trazione tipica e poi carrozze per convogli ferroviari. L'intervento si colloca in una zona prossima al centro storico della città e risultava da esso separata proprio per la presenza dell'impianto industriale ormai dismesso: obiettivo primario del piano di recupero, quindi, è stato quello di restituire ai cittadini uno spazio pubblico in grado di porsi come generatore di identità urbana: la biblioteca, in quest'ottica, non si limita a soddisfare una richiesta funzionale ma diventa strumento di

riqualificazione e perno tra le diverse attività che l'area è in grado di ospitare. Punto cardine del progetto è, come si è detto, il senso della memoria che emerge grazie alla particolare attenzione con cui le trasformazioni vengono legate alla preesistenza, alla volontà di conservare tracce di un passato fortemente radicato in quest'area, ma anche al ruolo simbolicamente affidato alla biblioteca come "fabbrica della cultura". Le tre navate realizzate, che riprendono quelle esistenti utilizzandone le strutture verticali e sostituendone le volte con altre in legno lamellare, organizzano gli spazi interni improntandoli su una forte gerarchia: il corridoio centrale, l'unico a tutt'altezza, è l'elemento che regola l'intero impianto planimetrico dell'edificio. Permettendo l'accesso ai diversi servizi e ai diversi ambienti ponendosi come cuore dell'edificio. La scelta di uno spazio di questo tipo che si contrappone a zone laterali a più piani è sicuramente una scelta simbolica e di disposizione funzionale ma è anche legata al risparmio energetico. Sulla copertura infatti si aprono dei "camini di sole" che permettono di avere illuminazione naturale in gran parte dell'edificio e, tramite un sistema di rifrazione della luce ottenuto con lamelle esterne, garantiscono il confort illuminotecnico all'interno delle sale di lettura. Dal punto di vista della ventilazione i camini permettono l'estrazione dell'aria viziata per differenza di pressione e, in caso questa sia insufficiente, un sistema mette in funzione dei ventilatori posti nelle intercapedini dei camini, garantendo un continuo ricambio d'aria. Il controllo climatico è assicurato anche da una vasca posizionata all'esterno che garantisce un ulteriore raffrescamento naturale. Accanto all'utilizzo di materiali ecocompatibili come il laterizio usato come rivestimento esterno ma utilizzato anche all'interno, un altro elemento di attenzione alla sostenibilità è costituito dal trattamento delle acque piovane: il sistema antincendio e l'impianto di irrigazione utilizzano prevalentemente acqua proveniente dalla copertura e accumulata in appositi bacini. L'intero progetto pone il problema della relazione tra esistente e nuovo edificio, del dialogo tra progetto e condizioni al contorno e cerca di mediare tra questi due aspetti proponendo soluzioni spaziali e tecnologiche legate alla cultura della modernità che fossero però in grado di mantenere e valorizzare segni e valori di una tradizione passata per poterle dare un rinnovato ruolo all'interno della città contemporanea. #### **Biblioteca Facultad de Ciencias Emporejarias Universidad de Mondragón, Oñati - Spain 2011**

Architecture: Angel de la Hoz, Pablo de la Hoz, Cristina Fontán / Collaborators: Marta Porroy / Executive project and construction management: LKS, Hoz y Fontán Arquitectos

The university required a space in which to impart regulated and continuous education, lodge the administration's office, a library and the assembly room. The building meets all these requirements divided in four volumes. The first three volumes are destined to hold the educational and administration sections, and are formed with specific characteristics for the development of its activities; it is in contact with the ground and organized in such way that can function autonomously. Nevertheless, the fourth volume is the one that best represents the building's identity. The library, the assembly hall and the teaching staff's offices are arranged in a lifted volume that allows having view-points on the trees that surround the building, capturing a general view of Oñati. This lifting creates a great porch entry to the building and at the same time a generous hall, constituting both of them the building's main relational areas. Areas that, seen as public squares and watchtowers from which admire the scenery, will allow the connection between students and surrounding environment, acting the university not only as knowledge media, but also as a mediation support between local culture, natural landscape and university life. #### **Regional Library of Bizkaia - Biblioteca Foral de Vizcaya, Bilbao – Spain 2007**

Architects: Architects IMB / Gloria Iriarte, Eduardo Mugica, Agustín de la Brena

Client: Diputación Foral de Bizkaia, foru Bizkaiko Aldundia

The project, an open competition of ideas open, influenced an entire unit of the urban network of Bilbao. The area includes an existing building, which had to be remodeled, and an open space, allowing new construction in response to customer demand. The main argument of this project is the organization of the "old" and the "new" built in three volumes belonging to the three main functions, however, clearly separated. The current building has been renovated to achieve open and flexible interior spaces, which will be used as public rooms for reading and research. The new construction includes two new volumes built. The first, covered with stone, includes administration of the houses. The second is for storing books and is designed as a glass box that expresses and symbolizes the light of the new city library. The texture of the book is used as an excuse to establish a claim obvious cultural and dialogue between the building and public space outside. During the day the image of the silkscreen print, representing the written content of the books, are predominant. In contrast, at night, artificial lighting intensifies the domain of books stored on shelves. The storage building is spread over a moving sheet of water that represents the progress of knowledge in evolution. Materializes in the top of a glass surface that allows light to pass through an auditorium in the basement. The architectural complex is formed around the courtyards, which contribute to natural light living spaces.

#### **Centro de datos avanzados y biblioteca Carlos Santamaría, San Sebastián – Spain 2008 – 2010**

24.000m<sup>2</sup> · Costes · 21.500.000,00 €

El Centro Carlos Santamaría, ubicado en San Sebastián es un equipamiento universitario destinado a centro avanzado de documentación y biblioteca vinculado al Campus Universitario de Ibaeta y resultado de un concurso público promovido por la Universidad del País Vasco (UPV-EHU). JAAM Sociedad de Arquitectura, es el estudio finalista junto a otros dos equipos y, tras un procedimiento negociado, se les adjudica el proyecto. El resultado final es un edificio de trazo espontáneo, sencillo, ordenado y funcional. Con fecha diciembre de 2005, la Universidad del País Vasco (UPV- EHU) anuncia la convocatoria del concurso de ideas para la construcción del "Centro Avanzado de Documentación y Biblioteca" en el Campus de Guipuzcoa, como actuación dentro del

marco de colaboración suscrito por la UPV-EHU, el Ayuntamiento de Donostia-San Sebastián y el DEUI del Gobierno Vasco "Protocolo Interinstitucional para la ampliación del Campus Universitario de Ibaeta (Donostia)". En septiembre de 2008 se da comienzo a la construcción del edificio, a cargo de la empresa Construcciones Moyua. El edificio se configura a partir de un trazo espontáneo siguiendo la curvatura natural de la parcela. Este trazo queda interrumpido por un punto de inflexión, un vértice elevado en la entrada al edificio dirigido hacia el este, donde se encuentra la rotonda que articula la Avenida de Tolosa, hito urbano. Este vértice se abre como una gran boca, invitando a la entrada a un espacio protegido, cubierto y exterior, antesala del vestíbulo principal. La envolvente curva queda dividida en dos bloques separados por una calle que atraviesa el edificio de norte a sur. Esta gran hendidura baña de luz natural el edificio y permite la creación de un jardín privado interior como una prolongación de los espacios que vuelcan sobre él. Se trata de un espacio tranquilo, accesible para el paseo, la lectura y la reunión de grupos, iluminado siempre desde el sur y el norte, un contrapunto exterior al ruido urbano, en el interior del edificio. La posición de los huecos de fachada se determina desde el interior, colocándose siempre al final de los ejes de comunicación, en fachada se trabaja la proporción de estos huecos hasta obtener una composición satisfactoria. Puntualmente alguno de estos huecos se manifiesta volado al exterior, son prolongaciones del espacio interior, en lugares estratégicos, equipados con luz y bancadas, dispuestos para la lectura y el descanso. El edificio, que consta de planta sótano, planta baja y planta primera, se presenta amable al peatón, manteniéndose siempre por debajo de la altura de los edificios de su entorno.

#### Programa, volumetría y funcionamiento interno

El trazo espontáneo que configura el edificio es el cerramiento contenedor que ordena su programa de necesidades y estructura según el norte y el sur, acusando un vértice hacia el este, en el lugar que se considera más importante: la rotonda que articula la Avenida de Tolosa. En este vértice se ubica el acceso principal del edificio. Al oeste, aprovechando el vial perimetral se sitúa el acceso al garaje. Otras razones señalan el lugar adecuado para el acceso; en él coinciden los pasos de peatones más frecuentados para el acceso a la parcela: los dos de la avenida de Tolosa a cada lado de la rotonda y el proveniente del eje peatonal interno de las facultades. También, consecuencia de asomarse a la avenida de Tolosa, se aproxima a las paradas de autobús. Dentro de la parcela, el edificio se retranquea liberando al espacio de su entorno para permitir la perspectiva y alejarse de las referencias. Asimismo, las curvas de la parcela aportan al edificio un valor singular, no obstante sus cualidades no subordinan la función a la forma. Se plantea un edificio, con una ordenación del programa de necesidades en extensión horizontal y evitando la altura. Interiormente el edificio se estructura en dos partes, enfatizando la claridad de recorridos y la autonomía funcional. Las dos partes quedan separadas por el espacio exterior central, manifestándose en apariencia como dos bloques diferentes. El primero frente al acceso contiene en planta baja las áreas de acogida, las zonas de trabajo interno, las aulas, salas de reunión y el auditorio. En los niveles superiores se ordenan las sedes, institutos y cátedras. El segundo bloque contiene la Biblioteca con sus salas de lectura, de recursos informatizados y mediateca. Se plantea también la segregación de recorridos para facilitar la utilización de los diferentes usuarios sin cruce de flujos. A su vez se unen los bloques con comunicaciones verticales para reducir las distancias permitiendo la interacción de los usos especializados. El acceso se produce a través de un gran vestíbulo de doble altura organizador de las cuatro partes principales del programa: la biblioteca; las sedes de cátedras e institutos; las aulas, salas y auditorio y finalmente, la zona de trabajo interno, menos expuesta al visitante pero estratégicamente situada entre el resto de las áreas permitiendo operatividad al personal interno.

Al margen de este acceso principal el edificio dispone de otras dos entradas: un acceso para el personal del centro a través del patio situado al norte, y un acceso rodado al garaje ubicado en planta sótano. También, por razones normativas de evacuación, el edificio dispone de salidas de emergencia de planta, en algunos casos son coincidentes con las cuatro salidas del garaje a superficie que se reparten en el perímetro del edificio.

#### Construcción y materiales

Constructivamente, la fachada principal del edificio es una envolvente curva, autoportante, de hormigón autocompactable blanco de 25cm de espesor. Este cierre se apoya sobre el muro de sótano y es independiente de los forjados para permitir el paso del aislamiento térmico en toda su altura. Al interior el muro de hormigón se trasdosa con cartón yeso, dejando una cámara de aire en la que se coloca un aislamiento de lana de roca. En la calle que divide el edificio, tanto los pavimentos como las fachadas se realizan con madera. Al exterior lamas de madera de IPE, alternando zonas opacas con huecos de vidrio. Las lamas de madera, dispuestas tanto en vertical como en horizontal, se fijan sobre rastreles de madera de pino hidrofugada, que a su vez van fijadas a un panel OSB con impermeabilización exterior. La subestructura de este cerramiento está formada por una serie de montantes y travesaños de madera laminada entre los que se dispone aislamiento de lana de roca. En la cara interior se coloca una lámina paravapor, sobre otro panel OSB, trasdosándose el conjunto con contrachapado de eucalipto visto hacia el interior. En los fondos de esta calle y en la fachada principal, la fachada se resuelve con muros cortina con estructura autoportante de madera laminada. En el interior no existen pavimentos, el acabado de los suelos se resuelve con un pulido del hormigón para el que se ha buscado un equilibrio entre la resbaladidad permitida y el brillo deseado, dejando que el árido del hormigón quede a la vista. Al exterior los pavimentos son de madera, una tarima de ipe tratada para exteriores sobre enrastrelado de madera de pino hidrofugada. Es importante en el interior del edificio el tablero contrachapado de eucalipto. Utilizado como revestimiento interior en las fachadas de madera, se emplea también en el diseño de los mostradores de atención, mesas y otro mobiliario auxiliar, en revestimiento de lucernarios, taquillas o acabado de las paredes del auditorio. Finalmente el acero inoxidable, es el cuarto material del edificio, tras el hormigón, la madera y el vidrio. El acero inoxidable se emplea para las carpinterías, las barandillas, ascensores, letras del nombre del edificio y otros complementos puntuales.

#### Diseño sostenible

La principal característica a destacar es la forma curva de la envolvente. Gracias a esta curvatura se evita una exposición directa de las fachadas, con lo que se reducen las pérdidas térmicas a través de las mismas. Por otra parte, el vestíbulo principal se concibe como un gran invernadero. La fachada exterior está compuesta por un vidrio sencillo y el aislamiento se encuentra en la fachada interior, de manera que el vestíbulo es un espacio no calefactado con cubierta y fachada de vidrio. En invierno este espacio acumula el aporte energético solar, para distribuirlo después al resto del edificio. Esto permite la obtención de ganancias energéticas naturales, reduciendo el consumo en calefacción. En verano, las aperturas dispuestas en la parte superior del muro cortina y las puertas practicables de los extremos del vestíbulo permiten la salida del aire caliente, refrescando este espacio. En cuanto a las soluciones constructivas empleadas, la envolvente principal del edificio, un muro de hormigón armado autocompactable de 25cm de espesor, aislado al interior con lana de roca, confiere al edificio una gran inercia, de manera que se limitan las transmisiones térmicas entre el interior y el exterior. Además, el muro de fachada es exento, es decir, no está conectado directamente a los forjados, de manera que se evitan los puentes térmicos. El hormigón autocompactable, por otra parte, implica una más sencilla puesta en obra del hormigón y un menor gasto energético. El color blanco refleja la luz evitando el sobrecalentamiento del interior y por tanto el consumo para su enfriamiento. Destacar también el uso de la madera, material natural y renovable, en solución monolítica de fachadas resolviendo tanto los acabados como la estructura, en pavimentos exteriores, lucernarios, estructura de muros cortina y mobiliario permanente. **Biblioteca Montilivi de la Universidad Girona – Spain 1998 – 2007**

### **Literature :**

“Biblioteca universitària”. En: Guia d’arquitectura de Girona: àrea urbana. Girona: Col·legi d’Arquitectes de Catalunya, Demarcació de Girona, 2008. ISBN 978-84-96482-34-2, p. 137

Obra de l’arquitecte Javier San José, la Biblioteca Universitària de Girona està situada al Campus de Montilivi i es construí en dos fases (1998-2004, i 2004-2007). La Biblioteca es troba en la unió entre un fonadal i un petit bosc, frondós. El projecte es centre la idea de pont, de trànsit, entre el bosc i la resta de Campus. En efecte, el trànsit horitzontal entre dins-fora travessa tot l’edifici, generant un espai de 10 metres d’amplada (un carrer obert interior) que divideix i trenca tot l’edifici en dues parts. També en destacaria les dues grans façanes cegues, de dos colors diferents; i la coberta, oberta al nord per a captar la llum, però també per a absorbir el verd del bosc i tota la seua càrrega simbòlica, dins la Biblioteca. **Rehabilitación y Reforma de la Biblioteca Nacional Madrid – Spain 1987-2001**

El edificio concebido como “Palacio para Biblioteca Nacional y Museos Nacionales” fue proyectado por Francisco Jareño en 1.860. Modificado por Ruiz de Salces en 1.884 se inauguró en 1.892 para la conmemoración del IV Centenario del Descubrimiento de América.

Construido con grandes muros de carga y acero roblonado, tipológicamente era un edificio característico de su época: las salas perimetrales con circulación anular continua se destinaron a museo, y el núcleo central cruciforme a biblioteca, cada uno con accesos independiente. Esta distribución se repetía en las tres plantas originales del edificio, que carecía de electricidad, las salas se iluminaban cenitalmente y a través de los grandes huecos de fachadas y patios.

La separación de las instituciones: Museo Arqueológico y Biblioteca Nacional, y la consecuente partición física del edificio, cortó la circulación anular propiciando la descomposición tipológica y funcional del mismo, que se agravó en el tiempo por el crecimiento de las organismos y la falta de infraestructura tecnológica. **Biblioteca i Casal d’Avis a les Antigues Cotxeres de Borbó. Nou Barris, Barcelona – Spain 2009 – 2011**

2.716 m<sup>2</sup>, € 1.927.502

Primero fue un enclave donde guardar los tranvías de Barcelona. Con los años los autobuses los tomaron el lugar. Y con la llegada del siglo XXI, las Cocheras de Borbón se ha convertido en el nuevo eje de equipamientos cívicos del distrito de Nou Barris. Una transformación que comenzó en 2003 cuando la manzana comprendida entre las calles de Costa i Cuixart, Ramon Albó, Felipe II y la avenida de Borbón dejó de utilizarse como garaje para el transporte metropolitano. La zona recibe ahora el impulso definitivo con inauguración, en julio pasado, de un aparcamiento subterráneo y con la próxima apertura de una biblioteca y un casal para los mayores.

Vista del edificio principal de los nuevos equipamientos de las Cotxeres Borbó en los que se ubican el nuevo centro y la biblioteca. También incluye un aparcamiento. ÁLVARO MONGE Edición Impresa Versión en . PDF Información publicada en la página 36 de la sección de distritos de la edición impresa del día 24 de agosto de 2011 VER ARCHIVO (. PDF) PDF . PDF

La voluntad del proyecto es convertir las antiguas cocheras en un «área de nueva centralidad en la zona sur que dé respuesta a una serie de necesidades largamente reivindicadas por los vecinos», aseguran fuentes del distrito de Nou Barris. De hecho, desde que comenzó el proyecto el Ayuntamiento ha mantenido conversaciones con varias asociaciones del barrio para decidir qué equipamientos eran más necesarios para un distrito que cuenta con más de 168.000 habitantes.

PRIMERO CASAL PÚBLICO DE PERSONAS MAYORES / Es así como, en una primera fase, se creó el Centro Integral de Salud Cotxeres, que cuenta con un total de seis equipamientos sanitarios, entre los que destacan un hospital de día y un centro de atención primaria que ha servido para descongestionar los de Turó de la Peira, Río de Janeiro y Chafarinas y facilitar la vida a los vecinos. Es el caso de Nuria de la Arado, que vive en el barrio: «Antes tenía que coger el autobús para ir al médico y ahora puedo ir andando». Otras necesidades del barrio eran la creación de un centro para la tercera edad, ya que el barrio de Vilapiscina y la Torre Llobeta no tenía hasta ahora ninguna de titularidad pública. El centro, que tendrá unos 1.100 metros cuadrados y que estará situado en la planta baja del edificio que actualmente acoge el centro de salud, se abrirá durante el cuarto trimestre de este año. Una fecha que esperan muchos vecinos de la zona como Erminia Moreno, que cree que «era necesario un espacio para las más mayores del barrio». Este nuevo equipamiento contará con todas las particularidades de este tipo de centros. Así pues, los vecinos de más edad tendrán a su disposición salas polivalentes y aulas de talleres, además de un espacio con varios ordenadores para aprender a utilizar las nuevas tecnologías.

Como el resto de centros municipales de estas características, los mismos usuarios del centro serán los encargados de gestionar el centro bajo la tutela del Ayuntamiento.

DIEZ VECES MÁS ESPACIO // Al igual que la casa, la nueva biblioteca abrirá sus puertas durante los próximos meses. El nuevo espacio cultural sustituirá el histórico centro ubicado en la calle Santa Fe, que ya está cerrado. Con el cambio, el barrio pasará de tener una biblioteca de 108 metros cuadrados a otra con más de 1.100, y se equipará al resto de centros de este tipo que hay en el distrito, tanto en su volumen como a prestaciones.

Este aumento del espacio comportará un notable incremento del fondo bibliográfico, además de incorporar una zona de audiovisuales, un espacio para los más pequeños y varias salas de estudio y trabajo.

Biblioteca y hogar de ancianos compartirán un salón de actos totalmente equipado y adaptado para personas con movilidad reducida. La sala no sólo la utilizarán los usuarios de estos equipamientos, sino que estará abierta a todos los vecinos y asociaciones del distrito.

Para facilitar la movilidad de los vecinos y del resto de usuarios del nuevo eje cívico, el Ayuntamiento inauguró el 18 de julio pasado un aparcamiento subterráneo de 12.800 metros cuadrados. El garaje, que tiene la entrada situada en la confluencia entre las calles de Ramon Albó y Felipe II, está dividido en tres plantas y cuenta con capacidad para 467 vehículos. #### **MUCAB – Museo y Centro de Arte de Blanca, Blanca – Spain 2010**

MUCAB is a new cultural and services centre. It is located in front of the Segura river and will act like a urban core enhancing the riverside activities. The building has different uses: museum, nursery, music school, library and business centre for emerging local companies. The complex program is organized in three blocks connected by patios, so each of the blocks can be used independently. The first block houses the public social equipment; it is on the north side facing the urban centre. The second block houses the museum 'Pedro Cano Foundation', it is arranged in four stories; a staircase serves as a filter between the south façade and the exhibitions space. The third block, the nearest to the river, has one floor and houses the nursery and is wrapped with a metallic skin. (<http://mimoa.eu>)

El MUCAB es un nuevo centro cultural y de servicios para la localidad murciana de Blanca, diseñado por el estudio de Martín Lejarraga. Situado frente al río Segura, el MUCAB actuará como un nuevo núcleo urbano que potenciará la actividad en sus riberas. El edificio concentra usos muy diversos, por lo que el programa se agrupa en tres paquetes que configuran a su vez tres bloques diferentes conectados por patios (museo, equipamientos sociales públicos y guardería), de manera que sean independientes y permitan el solape de programas, la comunicación visual y su ocupación temporal. La planta sótano se extiende en toda la parcela con servicio de aparcamiento, mientras que el bloque de servicios públicos ocupa su frente urbano al norte, el museo se sitúa en el centro, y el bloque de la escuela infantil se desarrolla en planta baja, aprovechando la relación con el río. Arquitectura Viva 21.10.2010 (<http://www.arquitecturaviva.com>)

#### **Rehabilitación del Convento de San Joaquín y San Pascual como Biblioteca Pública Municipal, Cieza, – Spain 2006 – 2008**

Biblioteca Padre Salmerón

La primera vez que el Ayuntamiento intentó abordar, de una forma decidida, la instalación de una biblioteca en Cieza data de 1959. Con fecha 5 de enero de 1963, aparece publicado en el B.O.E. la Orden de 28 de noviembre de 1962 por la que se crea la Biblioteca Pública Municipal de Cieza y se aprueban sus reglamentos. La deseada primera biblioteca abrió sus puertas el 20 de octubre de 1963, y a partir esta fecha ha tenido cuatro ubicaciones. Desde el 26 de marzo de 2009, se encuentra en el rehabilitado Convento de San Joaquín y San Pascual.

La Biblioteca debe su nombre al fraile franciscano Pascual Salmerón Fernández, que nació en Cieza el día 1 de Enero de 1719 y murió a los 88 años, en el Convento de San Joaquín donde actualmente se ubica la biblioteca. Escribió varios libros entre los que destaca especialmente: La antigua Carteya, Carcesa, hoy Cieza, villa del Reino de Murcia..., publicada en 1777. El edificio, ex-Convento de San Joaquín y San Pascual (declarado Bien de Interés Cultural en el año 2000), es de finales del siglo XVII. La primera piedra se colocó en 1685 y la construcción se prolongó catorce años, inaugurándose oficialmente el 6 de noviembre de 1699. En 1988 hubo un litigio entre el Ayuntamiento y el Obispado por la propiedad del inmueble, llegándose al acuerdo salomónico de repartir el edificio entre ambas instituciones. El Ayuntamiento se quedó con las naves este y sur y el claustro. En el año 2008 concluyó, con el objetivo convertirlo en biblioteca, la rehabilitación la parte propiedad municipal del edificio. Esta fue llevada a cabo por el arquitecto Martín Lejarraga, y obtuvo la distinción de "mención" en la modalidad de "edificación" en los XV Premios de Arquitectura de la Región de Murcia. #### **Universidad de Valladolid en Segovia, Campus Maria Zambrano – Spain 2012**

Collaborating : Ricardo Sánchez, H. Sebastián de Erice

Una biblioteca de 4.000 metros cuadrados, que flota en el espacio central del edificio, determina la estructura del nuevo campus de la Universidad de Valladolid (UVA) en Segovia, que ya ha levantado su primera fase sobre los antiguos terrenos del regimiento y espera a la recepción de las obras que se producirá este mismo mes, según ha asegurado el delegado territorial de la Junta en Segovia, Javier López-Escobar. El delegado ha asistido este sábado a una de las primeras visitas al campus con los medios de comunicación, a la que también han acudido los arquitectos responsables del proyecto, José Ignacio Linazasoro y Ricardo Sánchez, y el vicerrector de la UVA en Segovia, José Vicente Álvarez. Las nuevas instalaciones, que se prevé empezar a utilizar en el primer semestre de 2012, tienen una superficie útil de 18.042 metros cuadrados y constan de 54 aulas, depósito, cuatro salas de informática, cafetería, gimnasio, espacios para delegación de alumnos y de trabajo, aparcamiento para más de 150 vehículos y almacenes. Abrazada por estas dependencias, la biblioteca se presenta como un llamativo núcleo de tres torres que 'vuela' por encima del atrio del inmueble, también de grandes dimensiones --2.000 metros cuadrados-- y concebido, según denotan los adoquines del suelo, como

una plaza cubierta. "Refleja la idea del saber y por eso ocupa ese lugar central", ha explicado Linazasoro. Recubierta por madera de iroko, de origen africano, presenta nueve salas de lectura repartidas en tres alturas y un gran espacio en la planta baja, construido a modo de hipogeo y destinado a control, préstamos y consulta rápida. Además, a ella están asociados varios puestos de investigación, una sala audiovisual, así como las salas de idiomas y multimedia. Una de sus ventajas es que cuenta con una entrada peatonal desde el exterior, que permite el acceso a los usuarios cuando la universidad esté cerrada. En su conjunto, el edificio del nuevo campus, que nace con el nombre de 'María Zambrana', destaca por su austeridad y por unos materiales resistentes --hormigón autocompactante de última tecnología, madera y acero-- que pretenden dar respuesta al uso "intenso y universitario" que se hará de las instalaciones. La entrada al mismo se produce por cuatro entradas, una en cada esquina si se entiende el espacio como un trapecio. Los arquitectos que le han dado forma, con experiencia en el diseño de otros espacios docentes como la Universidad de Salamanca en Ávila o la UNED en Madrid, han primado la materialidad, la luz natural y el espacio interior.

#### RECEPCIÓN Y EQUIPAMIENTO

La primera fase de construcción del campus, que comenzó en 2009, ha contado con una inversión de más de 16 millones y ha requerido 28 meses de ejecución, cuatro más de los previstos en un primer momento. Durante este mes, según ha señalado el delegado territorial de la Junta, se espera que las obras sean recepcionadas. A partir de ahí, falta por comenzar los trabajos de urbanización del entorno, para lo cual UVA y Ayuntamiento de Segovia deberán llegar a un acuerdo. Además, hay que empezar a equipar las instalaciones, que darán cabida a cerca de 3.000 alumnos. Para ello, la UVA cuenta con un presupuesto de 1,15 millones. El vicerrector ha indicado que ya se han sacado los concursos para equipar la biblioteca y las aulas y que con seguridad empezarán a correr los plazos la semana próxima, una vez los procesos se publiquen en el Boletín europeo. La UVA baraja el primer semestre de 2012 como fecha en que el nuevo edificio comience a funcionar, con el fin de que alumnos y profesores estén asentados en el próximo curso. Para entonces, empezarán a quedar inutilizadas las dependencias del Palacio de Mansilla y Mahonías, aunque seguirán operativas, por proximidad, las de la Facultad de Informática en Santa Eulalia.

#### SEGUNDA FASE

El proyecto del campus contempla una segunda fase, presupuestada en 14,6 millones, que prevé la creación de una superficie útil de 13.281 metros cuadrados, en la que se ubicará el vicerrectorado, las aulas específicas de las facultades de Ciencias Sociales y Jurídicas y de la Comunicación, la Escuela Universitaria de informática y la Escuela Universitaria de Magisterio. Aunque la Junta ha mantenido su compromiso, el inicio de las obras permanece paralizado por la crisis, una cuestión en la que hoy no ha querido entrar el delegado territorial en Segovia. (<http://www.que.es>)

It is a complex in the ancient poor quarter of Segovia which has been inhabited since the Middle Ages it replaces the ancient barracks of the 19<sup>th</sup> century and its structure is composed of classrooms, offices and common areas, including the library, which is in the centre of a sheltered space representing the core of the building. The construction is developed in two stages; the first stage is currently under construction. (Linazasoro)

#### Centro Cultural Escuelas Pías de Lavapiés, Madrid – Spain 1996 – 2004

##### Literature :

"Aulario y biblioteca en las Escuelas Pías de San Fernando, Lavapiés, Madrid". En:DAU, n. 29 (2007), p. 46-49.

"Biblioteca e Aulario nelle rovine de Las Escuelas Pías de Lavapiés: Madrid, 1996-2004". En: José Ignacio Linazasoro: progettare e costruire. A cura di Stefano Presi. Latina, Italia: Casa dell'Architettura Onlus, cop. 2007. ISBN 978-88-89002-03-2, p. 170-187.

"Biblioteca y Aulario en las antiguas Escuelas Pías: José Ignacio Linazasoro". En:Arquitectura COAM, n. 357, p. 8-15.

El edificio más emblemático del barrio son las Escuelas Pías, una mezcla de restauración, rehabilitación y nueva construcción situado frente a 'La Corrala'. Fundadas para la educación de niños pobres en 1729 (arquitecto de la orden Gabriel Escribano), Las Escuelas Pías fueron el primer colegio en Madrid de la orden de los Escolapios. El conjunto, realizado por el arquitecto José Ignacio Linazasoro (entre 1996 y 2004) pertenece a la UNED. El centro cultural consta de un aulario universitario, de nueva construcción y una biblioteca, que constituye la parte más emblemática del proyecto puesto que se sitúa en la antigua iglesia, construida entre 1763 y 1791, destruida durante la Guerra Civil. (19 Julio 1936). La rehabilitación se apoya en las ruinas de la iglesia que mantiene la tosquedad de sus materiales originales en contraste con el sutil uso de la madera y el mobiliario. La iluminación juega un papel clave en la biblioteca a través del inteligente uso de lucernarios. La iluminación artificial sorprende por la cantidad de bombillas que descienden del techo. (<http://www.otramiradaintomadrid.com>)

It constitutes a truly unique piece of work. An attempt of classification would be hard to accomplish, as it is a solid unit of restored, renovated and newly built parts. The ensemble is based on the church ruins of the ancient Piarist School of San Fernando. Although the church was destroyed during the Civil War, an adjoining piece of land was preserved furthermore, the ensemble is also part of a larger action plan that includes the Agustín Lara Square and an underground car park. The plan consists of a University Lecture Block and a Library. The first one is set on the empty plot of land and its newly built; whereas the library is located in the ruins area. Therefore, the latter became part of a new space. (Linazasoro)

#### Biblioteca de la U.N.E.D. (Universidad Nacional de Educación a Distancia), Madrid - Spain 1989 – 1994

Interior-exterior contrast: sharpness in contrast to the feel for comfort provided by a generous use of wood and the plaster ceilings. The readers are isolated from the motorway environment. An alternative to 19<sup>th</sup> century libraries: occupying the perimeter instead of the central area. The bookshelves close the façade and together with the coffered ceiling, let the light in. Within the project concept, light does not mean views. Instead, the latter are far-off, silhouetted over the shelves against the narrow strips of high windows; appearance reminiscent of the fresco paintings in Labrouste's libraries. The layout is reserved upstairs: The central part is solid and the areas designated as the café, meeting room and offices are actually bay windows facing the historical buildings of Madrid and the Casa de Campo urban park. The entire layout is based on the spacious main entrance hall, a hypostyle space where the outer small square – almost an atrium – is attached to the building. Outdoors the use of brick is evocative of the first City University of Madrid in the 1930s. (Linazasoro)

#### Josep Llinás Carmona, Barcelona – Spain

<http://www.epdlp.com>

##### Libraries:

#### Biblioteca Jaume Fuster, Barcelona – Spain 2001 - 2005

Designed by Josep Llinas and Joan Vera in Barcelona, the Jaume Fuster Library was awarded the 2006 FAD Architecture Prize, the most prestigious contemporary design prize to receive in Spain. The project was honoured for its delicate implantation in the urban context and the way it opens up new perspectives on the plaza on which it is situated. The expressive volume of the exterior and the abundance of its interiors is richly appreciated. It is one of the most modern and biggest public libraries of the city with an auditorium, amphitheatre, exposition room and special kids-spaces. According to the magazine Descobrir Catalunya the Jaume Fuster library, the Gas Natural headquarters, the Fòrum building and the Torre Agbar by Jean Nouvel are some of the new symbols

of Barcelona architecture. Even though this public project is highly praised, some critics do say that “the human scale of the irregularly faceted library seems out of step with its urban context”. (<http://www.mimoo.eu>)

### **Biblioteca Can Ginestar, Sant Just Desvern – Spain 2004**

#### **Literature:**

**El Croquis 128 (2006): Josep Linàs 2000-2005**

El edificio forma parte de un programa más amplio previsto por el ayuntamiento de Sant Just Desvern, sobre las colinas de Barcelona, que prevé destinar la vieja masía a espacios públicos y añadir un cuerpo principal, a construir partiendo desde cero, que albergará la biblioteca. El proyectista ha tenido que enfrentarse con tres vínculos principales: un terreno inclinado, un parque/jardín con esencias arbóreas prestigiosas y el mantenimiento, expresamente requerido por el cliente en la regulación, de un acceso común a los edificios nuevos y a los preexistentes. Josep Llinas decidió dejar intacta la zona sur de la manzana de edificios, que resulta ser la más valiosa en términos de árboles, pero al mismo tiempo la más impracticable y menos accesible, y decidió intervenir en la zona situada al norte. La entrada de todo el complejo permanece donde ya estaba, en la zona central y expuesta al este, en esa parte aparece el nuevo edificio, un cuerpo bajo, de dos plantas, de forma alargada. Casi constituyendo una pared de construcción, el proyecto se convierte en diseño a escala urbana y representa el límite este de la manzana. Una pared ondulada termina en cambio el lado norte y crea, de este modo, un tipo de gran patio interno lleno de árboles y soluciona de este modo el desnivel entre la parte este, a mayor altura y la oeste y se convierte en la protección de dos escalinatas que conducen al parque. No es la primera vez que Josep Llinas afronta el tema de la biblioteca, han pasado casi veinte años de la biblioteca de Tarragona (1985-1986) y de la de Barcelona (1987-1989). El arquitecto ha abandonado algunos elementos peculiares de su 'modus operandi', quizás precisamente su lado más 'moderno', su regionalismo hispánico, para abrazar una velada contemporaneidad. Se declara amante de los materiales naturales pero admite considerarlos poco 'contemporáneos'. Prefiere materiales naturales porque son capaces de desaparecer, de envejecer con el proyecto y de perderse en el paisaje, al contrario de los nuevos, como el cristal, porque son infinitos. Así, por tanto, en el proyecto de la biblioteca de Sant Just Desvern la elección de los materiales recae sobre el cemento armado y el cristal, el arquitecto español soluciona de este modo la dicotomía: cemento para la naturaleza y cristal para la contemporaneidad, resumiendo y sintetizando en su obra arquitectura global y arquitectura local. El resultado, visible, es un cuerpo oblongo y ligero de un color cálido cortado por grandes tiras de cristal, casi una galería acristalada, las cuales buscan un intenso contacto con el exterior, una tensión hacia los árboles seculares. Formalmente se trata de elementos ligeros que rehuyen la imagen maciza de la granja y que pueden ser interpretados como un contrapunto suyo formal. Lo que resulta es un edificio distinguible por su solidez y transparencia, por la sencillez de las líneas y la esencialidad de las formas presentes desde siempre en la obra de Josep Llinàs. Daria Ricchi (<http://www.floornature.es>)

### **Biblioteca Vila de Gracia, Barcelona – Spain 2002**

La Biblioteca Vila de Gràcia fue inaugurada el 12 de mayo de 2002. Ocupa un edificio de nueva planta obra del arquitecto Josep Llinàs, profesional con experiencia en la construcción de este tipo de equipamientos y que ha recibido numerosos premios FAD y premios Ciutat de Barcelona de arquitectura por sus edificios. Tiene una superficie total de 1.029 m2 distribuidos en seis plantas. Esta biblioteca pública de proximidad es un centro de información y cultura pensado para permitir un acceso a la información y el autoaprendizaje a todos los ciudadanos. Trabajamos en red con el resto de bibliotecas de la ciudad, programando actividades dedicadas al fomento de la lectura y colaboramos con las asociaciones y entidades del barrio.

### **Biblioteca Central de Terrassa, Terrassa – Spain 1998**

A Biblioteca Central de Terrassa se inauguró con una gran fiesta popular el día 10 de mayo de 1998 . El edificio está ubicado en los límites del barrio del centro. Es la biblioteca del distrito I y jefe de red de bibliotecas públicas de la ciudad (bet red). Es el resultado de la fusión de las dos bibliotecas que ya existían en el distrito (la Biblioteca Soler i Palet y la Biblioteca Salvador Cardús). No hace muchos años toda la zona donde está ubicada la bet era prácticamente una zona industrial, heredera de la gran explosión de la industria de finales del siglo XIX y principios del XX. El espacio donde está ubicada la bet era la sede de una importante fábrica de Terrassa, la fábrica Torredemer . Es uno de los motivos por los que el arquitecto y autor del proyecto, Josep Llinàs , dio a todo el conjunto arquitectónico un aire que recuerda a las edificaciones industriales más emblemáticas de Terrassa, construidas en pleno modernismo. Josep Llinàs ganó por este proyecto el premio Manuel de la Dehesa , de la V Bienal de Arquitectura, en el año 1999. El edificio de la bet tiene una superficie útil de 3.425 metros cuadrados , distribuidos en tres plantas. (<http://www.bauneblog.info>)

## **M57 Arquitectos, Granada – Spain**

<http://m57.es>

#### **Libraries:**

### **Public Library, Ogijares - Spain 2011**

Ideas Competition (1st Prize), Date: 2008 – 2011, Site: Ogijares (Granada), Area: 612,72 m2, Client: Citycouncil of Ogijares  
Architect: Rubens Cortés, Associate Architect: Raúl Melguizo, Team: Álvaro Castellano David Garzón Sergio Páez, Quantity  
Surveyor: Carlos Guerrero, Engineer: Juan Fernández, Construction: Urbana + B.Solís

María Lejárraga library is situated in the park of San Sebastián in Ogijares. In course of time a part of the park was occupied by fairs and partly the natural ground was converted into solid asphalt.

Children's playground and drying building are situated in the same area. The latter element was chosen for the ideas competition with a double purpose: recover its activity and convert it into a public library.

The project consists of two phases: restoration of the existing drying building and extension of new construction. The important thing about this project is to create perfect atmosphere for the reading leaving a footprint of the drying building. We reproduce the idea of the hanging peppers through the illumination system dropping to the reading desks.

The main reading room represents the space close to nature. It is built of wood elondo and trees of the park serve as curtain in the background. This ephemeral architecture that respects the green space gains numerous lights and shadows, which allows the reader to submerge into the world that reading offers. (M57)

## **Luis Machuca Asociados Arquitectos, Malaga - Spain**

<http://www.luismachuca.com>

#### **Libraries:**

### **Facultat de Ciències Socials (Faculty of Social Sciences), Malaga – Spain on design**

Contractor: UTE FCC- Construcciones VERA, Project area: 33.301,65 sqm

The place usually helps us facing the blank paper before starting a project once we got to know the program. In our case the territory, the place on which we had to act had been modified by the urban project of the UMA campus extension. Therefore, we had to get a more distant view. We considered the project and its place as a part of the whole landscape. Looking north we find the skyline of the Malaga Mountains while on the south side the most diffuse city areas and the seashore can be seen. As the program described a building- a complex for the Faculty of Economic and Social Sciences- that includes both the School of Business and the School of Social Science and Labour, became evident that we would have to deal with big proportions. In spite of all this we wanted to design a building that can be read as a part of the topography.

We treated the planning as an urban project, with the intention of creating a "place" within the university campus. The program suggested a small city in which the continuity of the public spaces remains permanent once we have entered the complex. Streets, different volumes and environment, mixture of uses ... we will find them all inside discovering the building.

The whole complex consists of three large rectangular blocks. This composition allows establishing pedestrian streets among them, which are parallel to the building and the campus roads as well. These interior streets have different roles, depending on the use of the blocks.

The main passage is covered by the computer classrooms. This space became a part of the entrance hall as well, as it includes all the modules that integrate general services: lecture hall, library, cafeteria, rooms for group work, direction, management, and classrooms at different heights.

The block of the departments enjoys the biggest independence; however, although the longitudinal way is the most prevailing, the block also helps the transversal communication by shortening the distance between the different special volumes.

The landscape, its topography with a north-to-south slope, and the inclined campus streets were determining from the beginning. On the other hand, this made possible that we can enter the building without having to pass the lower level. The result has a double advantage: from the main entrance the space dominates everything, furthermore allows the easy mobility of the users at this level of access where the activity of the complex is much higher. On the whole, three floors over the ground and one under it.

The exterior appearance of the complex consists of rectangular pieces in which the horizontal component dominates the vertical one. Each part expresses outwardly the function that fulfils inside. The light in our city is so intense that the architecture does not require colours to identify itself; on the contrary, its control has to be one of the most important objectives in any project.

It is the light that helps us discover architecture, both in the exterior and in the interior spaces that are set up as a result of the exterior volumes. The dominating colours of the project, gray and white, allow integrating the building into the landscape despite its huge dimensions. In the interior, the control of the light is just as important. This helps us creating comfortable spaces that fit to the designated use. The classrooms receive light from the north; meanwhile both the library and the computer classrooms have skylights. (<http://www.archdaily.com>)

### Centro Cultural en Ollerías, Biblioteca Ollerías - Spain 2000

La fachada del edificio correspondiente a la calle Ollerías se escalona y retranquea, para intentar la articulación de la guardería infantil colindante con la envejecida arquitectura doméstica del siglo XIX que forma la calle; apenas un gesto de un panel de fachada indica el acceso desde la calle. En la nueva plaza, el centro cultural se abre paso hasta la zona pública, con prudencia pero indicando su situación: una amplia escalinata es la primera aproximación, la única referencia en la plaza. En el juego de volúmenes encuentran su papel las medianerías colindantes, entre las que se encaja el nuevo edificio.

Málaga, die andalusische Großstadt an der spanischen Costa des Sol, ist nicht nur ein beliebtes Urlaubsziel, sondern auch eine Universitätsstadt. Für ihren „Campus de Teatinos“ wurde nun eine Erweiterung aus drei Gebäudeteilen fertig gestellt. Der Entwurf dafür stammt von Luis Machuca Arquitectos (Málaga). Das neue Ensemble am Tal des Flusses Guadalhorce besteht aus einem Gebäude für die Bibliothek, für den Veranstaltungssaal, die Verwaltung und ein Restaurant, ein weiteres beherbergt die Aulen und Seminarräume, und das dritte ist im Grunde der überdachte Bereich zwischen den beiden, der die Räume der Fachbereiche aufnimmt. Dieser Bau wird von der Straße aus erschlossen und verbindet die beiden anderen Gebäude über Brücken, Passarellen sowie eine äußere Straße miteinander. Dem Prinzip eines „Lernens im Freien“ (Architekten) folgend, durchdringen sich hier Innen- und Außenräume. Die halb offenen Treppen, Gänge, Höfe und Galerien werden dabei zu Aufenthaltsorten und bieten Platz für informelle Gespräche und Treffen. Die Fassade ist geprägt durch großformatige dunkle Platten mit bündig angeordneten, schmal profilierten Öffnungen. (<http://www.baunetz.de>)

#### **Libraries:**

### Biblioteca Regional de Madrid Joaquín Leguina, Madrid – Spain 2004

Authority and authority type: Autonomous Community of Madrid, Size of library: 10.000m<sup>2</sup>

The Regional Library Joaquín Leguina of Madrid is located in the south-east of the capital city.

Currently, the library is placed in a former brewery called El Águila. The library shares the building with the Regional Archive of the Autonomous Community of Madrid and with the Legal Deposit. The original building was built between 1912 and 1914 by Eugenio Jiménez Corera (\*1853 Madrid - +1910 Madrid) and later on was extended by Luis Sainz de los Terreros (\*1876 Santander - +1936 Madrid). The Autonomous Community of Madrid started the building works in 1994. The restoration project of the building was managed by the Spanish architects Emilio Tuñón Álvarez and Luis Moreno García-Mansilla and was executed between 1998-2001. The new library was opened in 2002 with the name of one of the first presidents of the Autonomous Community, Joaquín Leguina (1983-1995), who opened the bit to do the restoration. The library services are distributed in four stores: Ground level and first floor: Reference section with 72 reading places and 68 internet and Opac posts. Second floor: Periodicals and cartography sections: Equipped with: 60 reading places, 12 internet and Opac posts and 2 microfilms readers. Third floor: Multimedia section. It also house the local researchers space. Equipped with: 20 reading places and 14 internet and Opac posts. There are also, two basements where are placed the bibliographic store.

Architectural idea or principle:

Restoration project of a former brewery, built in the early 20th century in the neomudéjar style. Example of the industrial architecture of the time that abounds in Art Nouveau as well as historicist elements like red bricks and handmade tiles that has been preserved. Also, the architect aim was to create a functional and comfortable building especially designed for a library purpose.

Detailed description: The library has upkept particular elements of the brewery like carriages, beer cellars, silos and freezers that give to the current building a picturesque appearance. The architectural project has created a good combination between preservation of the historical building and all the implementation of all facilities needed to a functional and comfortable modern library. (<http://www.librarybuildings.info>)

## **José Antonio Martínez Lapeña, Elías Torres Architects, Barcelona – Spain**

<http://www.jamlet.net>

### **Libraries:**

**Biblioteca Universitaria Tarragona – Spain 2003**

### **Literature:**

Gallego, Moisés. “Biblioteca Rovira i Virgili a Tarragona: José Antonio Martínez Lapeña i Elías Torres, arquitectes”. En: *Quaderns d’Arquitectura i Urbanisme*, n. 251 (tardor 2006), p. 38-45

Jamlet. “Biblioteca, sales d’estudi i aules específiques, Universitat Rovira i Virgili, Sant Pere Sescelades, Tarragona”. En: *Quaderns d’Arquitectura i Urbanisme*, n. 251 (tardor 2006), p. 46-47

“Obra seleccionada: Biblioteca per a la Universitat Rovira i Virgili: Tarragona”. En: *IV Biennial d’Arquitectura Alejandro de la Sota*: 2005. Tarragona: Demarcació de Tarragona del COAC, 2005. ISBN 84-96185-59-1, p. 19

The project is a plaza with a public space, of relation between the library and the future service building, and a point of reference from the fluxes of the students that access the building from different directions. The library occupies most of the parcel with a compact building. The compact volume minimize the affects for the contextual surroundings of the future project. The access to the library is located either from the stairs or directly from Carrer del Mig. One of the intentions for the project is the presence of natural light and the disposition of the floor with a geometry that allows the possibility of maxim flexibility in the organization of the different areas. The enclosure of the building attends to the control of sun exposure without renouncing to the interior illumination. Only the northeast façade does not have solar protection. The principal hall of the library is organized as a free plan with windows to the exterior in three of the façades to obtain a good relation with the exterior and with a sky light that guarantees the natural illumination to the center of the building. (Martínez)

Posteriorment fa una petita descripció del Campus, amb edificis perimetrals resseguint els carrers perifèrics i amb tot l’espai lliure i de relax concentrat a l’interior d’aquestes grans illes, amb els edificis oberts a aquest espai. En aquest context tan negatiu, s’hi havia d’ubicar la Biblioteca del Campus. Els autors del projecte no van voler sotmetre’s a l’arquitectura imperant (tant del propi Campus com per l’urbanisme resultant), i van adoptar solucions subtils per a trencar aquests condicionants del lloc, i fer-ho sense stridències. Primer de tot cal destacar que la biblioteca es replega en si mateixa, en el seu propi edifici, intentant així- establir les mí-nimes relacions possibles amb el seu entorn, un entorn que no agrada. Així-, les façanes de l’edifici són neutres, llises, sense cap element que sobresurti ni que les identiqui ràpidament com a biblioteca. Per exemple, la interior, la sud, que dona al pati d’illa, es soluciona amb un seguit de finestres sense cap més significació. Així-, l’element extern més significatiu i identitari de la biblioteca seria el seu accés principal, en un dels laterals de l’edifici, a la façana sudoest. És un accés elevat, en què destaca una gran passarel·la, i un gran bloc unit a l’edifici, que serveix de “placeta” i d’element d’unió interior-exterior, i a on desemboca la passarel·la. A la façana externa d’aquest gran bloc hi podem trobar, en grans lletres, “Biblioteca”. Pel que fa al programa, descrit en l’article firmat per Jamlet, les sales d’estudi i d’informàtica es troben a la planta d’accés i a la inferior, mentre que la biblioteca s’expandeix entre la planta baixa i la superior. ## **Mateoarquitectura, Barcelona – Spain**

Josep Lluís Mateo

<http://www.mateo-mparchitect.com>

### **Libraries:**

**FilMOTECA de Catalunya (Film Library of Catalonia), Barcelona – Spain 2004 – 2010**

First Prize. Restricted competition 2004. Client: ICIC (Institut Català de les Indústries Culturals), External collaborators: Structural Engineering: OMA, Agustí Obiol. Installations Engineering: Grupo JG, Surface: 7.000 m2

### **PROCESS**

My initial interest was in understanding the brief and the place. We built a model with fragments of what was to go inside, with no specific attempt to give form or unity. We arranged this conglomerate at a tangent to one of the sides of the site, constructing a street and freeing up a plaza in front of it. The next phase obviously required precision. The cinemas, a very important part of the project, were put in the basement to reduce the volumetric impact of the building. The context then became stronger: the plaza became the entire ground floor, and the material for its construction had to be concrete, uniting structure and finish in a continuous mass which, to me, seemed to establish a relation with the shabby, dilapidated masses of its neighbours. I was particularly interested in the volumetric expressivity of the short sides of the parallelepiped, and its potential to define the corners of the existing streets.

### **EXECUTIVE PROJECT. 2005**

With our structural engineers we developed the previously defined concept, seeking to leave all the installations on show with no false ceilings. We also sought to make everything tectonic and slightly primitive. This involved continuing the previous arguments.

### **CONSTRUCTION. 2007-2010**

The construction process is extremely complex, having started with a long archaeological dig and continuing with all the excavation and work involved in undergrounding the cinemas, a difficult task because the site is set in a former medieval lagoon. A building is always the expression of intelligence and a sustained will, brought to bear on a specific place. We cannot abandon the project to its fate. We have to accompany it until the idea, converted into matter and space, starts living its life. Then, we disappear; the building no longer belongs to us. (<http://www.e-architect.co.uk>)

**Biblioteca Cañada Rosal, Sevilla – Spain 2011**

Programme: Municipal Library, Location: Plaza Sta. Ana, Cañada Rosal (Seville), Dates, phases: Competition: 2005, Project: 2006 Built/Completion: 2009, Awards: 1st Prize, Category: Library and Social Services, Area: 200 m2, Developer: Empresa Pública de Suelo de Andalucía (EPSA part of the Regional Government of Andalusia), Collaborators: F. Orizia, A. Pérez, P. Alvarez, DimArq SL

#### Project description

In 2005 Cañada Rosal Town Council (Seville) launched an architectural competition in collaboration with the Empresa Pública de Suelo de Andalucía (EPSA - part of the regional government of Andalusia) to design a public library. MEDIOMUNDO arquitectos was awarded first prize for their proposal and the construction of the public library was completed in 2009.

When designing the public library we proposed creating a meeting point for information and culture. Under a continuous roof, whose folds create a dialogue with neighbouring constructions, consecutive interior spaces are defined by light entering via skylights. The homogeneity of the materials used in the construction is diminished due to sequences of light and shadow that create an increasing degree of privacy as one moves from the entrance to the most intimate part of the library located near the patio and the children's area. In this way the library becomes a gradual extension of public space.

The project proposed a very simple layout for the optimal use of space. Visitors enter via a double-height lobby, a place of exchange with the public space outside. In it shelves and a bulletin board hide a staircase that leads to the reading room on the top floor. The elevator and ancillary services are located on the ground floor immediately after the lobby. This transitional area makes way to a reference section, audio books, computers and press. Next comes a children's area accentuated by an overhead laylight that leads into the rear courtyard. (MedioMundo)

The reading room is located on the top floor. To reach the administration area visitors must cross a bridge that overlooks the children's area below. The folds in the roof define the spatial sequence on this floor. Two skylights, the courtyard and the openings in the facade are the sources of natural light. Meanwhile, the walls themselves have been converted into built-in shelves and bookcases to ensure maximum fluidity and continuity of space.

"Choosing the place for the building was the first step of the project. Since the beginning the library was surrounded by gardens... in the middle of a parc, the Parc de les Esplanes. Some books and a dream ... We were fascinated by the idea of a half buried building, lost between the trees..." The building is a construction like any in a garden... It doesn't hold any memories of the institutional character of libraries... They are some walls which may have been in this place. We have tried in different ways to give the library an appearance of a labyrinth. A serie of rooms and gardens put together in a non-linear way. The building is an experiment, that shows every part of the development of the project... It's continuing changes and variations, as well as the authority of accepting the final result... The sportshall of Isozaki is our neighbour. Palafolls is building a city, as directed by the mayor Valentí Agustí, where he asks every architect to construct according to our dreams. (Miralles)

La volumetria mira de combinar el fet físic del front a la plaça Pere Torrent amb la cerca que cadascun dels edificis esdevinguin aparents i significats des de la percepció exterior. L'ordre i posició dels edificis aixecant-se cap el nord-oest respon per una banda al criteri d'orientació correcta com a principal estratègia de sostenibilitat i per altra fer explicatiu el final de l'edifici des de la plaça. La coberta més alta que recull la barra de l'escola de formació d'adults i la sala mirador cobreix el pati d'exposicions, posant en relació el conjunt amb les edificacions existents. El joc de nivells intenta allargar la plaça en el seu sentit longitudinal, fent reliscar el seu nivell actual fins a la sala polivalent, que esdevé un gran pati de llums cobert on s'hi aboquen tots els usos. Aquest gran buit permet al visitant identificar els diferents edificis que conformen el conjunt. El pati del fons connectat visualment amb la sala incorpora l'ús de pati d'exposicions i pati de lectura ocasional semicobert per la visera de l'edifici administratiu des d'on es percep al fons la plaça i el carrer lateral. Hem condicionat especialment l'edificació amb els següents criteris: Mirar, per una banda, d'interconnectar els nuclis d'escales; limitar el casal d'avis a planta baixa pensant en la comoditat dels usuaris; i prioritzar la relació en planta baixa amb el màxim de perímetre possible del Casal d'Avis amb la plaça i el carrer lateral, imaginant que durant el bon temps puguin gaudir de l'espai de la plaça més proper a la cafeteria del centre. (Mòdol)

#### **Biblioteca Universidad de Deusto, Bilbao – Spain 2008**

Floor area/size 22275 m2, Cost € 36.000.000,-

The new Library of the University of Deusto is open to students, researchers, institutions and companies worldwide. It seeks to pursue pedagogical innovation, while at the same time offering a dynamic and flexible architectural environment, in accordance with the new European Space for Higher Education. In this regard, the open access facilities have been conceived as a space where users may find the best conditions for learning and research. The development of the library must be seen in context of the wide range of actions carried out by Bilbao Town Council in the last few years, which seeks to consolidate Bilbao as a city of knowledge. The deep changes that this city has undergone have facilitated, among other things, the expansion of university campuses in the city centre, as in the case of the new library. The building is divided into five floors above ground and another five underground, all equipped with modern electronic resources. (<http://www.mimooa.eu>)

## Cultural Centre, Don Benito – Spain 1991 – 1997

### **Literature:**

Penny McGuire, in: *Architectural Review* 01.April 1999

Inner light - design of cultural center in Badajoz, Spain by Penny McGuire

Design of a cultural centre in a south-western province of Extremadura draws on memory and at the same time provides nurture for the future. Rafael Moneo's cultural centre in Don Benito, Badajoz, built on a conspicuous site within the town, is a rich contribution to the fabric and spirit of the place. Like previous works by this architect, the building asserts a very particular presence. Moneo's sensitive interpretation of the brief, his supple appreciation of history and place, characteristically produces complex responses - but couched in the language of restraint their complexity and sophistication tends to be masked. You can see it here. The exterior of this plainly detailed building may seem inscrutable at first glance, but a second one will reveal memories of local details, the aptness of scale and of the way it turns the corner, and so on. The poetry infusing design of the interior derives from Moneo's handling of light and materials. The site on the north-east corner of the Plaza de Espana was once that of the town hall and marks the intersection of Groisard and Villanueva streets. Moneo's centre which has an undeniably civic presence completes the square, addressing it (rather than the streets either side) with a corner tower under which is the main entrance. Across Villanueva street is the Colegiata church and like ships at sea these two buildings exchange signals. The restrained exterior of the old, the antique flourishes, the texture of old masonry, are answered by an equal restraint, roof lanterns and the fine etching over a white exterior of brick courses beneath. The white austerity of the centre's exterior gives little clue to the intricacy and richness within. Considering the brief which asked for a large lecture theatre, a library, museum, and a number of other provisions, the site was not particularly large and Moneo's dense compact architecture with its overlapping interior volumes fills it to the edges. Looked at on plan, the building clearly has a main core that is aligned with Villanueva street and contains the centre's main spaces. At its heart on the ground and first floors is the theatre seating 252 people; above it is the library and over that the museum. Around the core is arranged a series of ancillary rooms - galleries for exhibitions, archives, classrooms, offices and lavatories. Moneo's means of bringing light into the building centre is a source of enormous pleasure. Ten of the 18 glass lanterns which rise above the shallow roof illuminate the museum galleries. Light from the remaining ones is conducted down to the library and archives through big white tubes. Appearing as columns in the museum, they carry light into the archives, but in the library they terminate in the centre of false shallow vaults. The plywood from which these are formed gives these constructions a delicate aeronautical quality. Light diffused across their curving surfaces sheds a soft gold luminance over a wooden floor and handsome furniture, making the room the most agreeable of libraries. In the pleasingly proportioned theatre, the soft tones of the wood lining floors and walls are combined with rich red seating and ceiling. Elsewhere, for instance in the museum galleries, Moneo has simply allowed light to wash over white walls and accentuate volumetric modelling, and has used polished stone for the floors. ## Columbia University Northwest Corner Building, New York – USA 2011

With collaboration : Davis Brody Bond Aedas (<http://www.aedas.com>), and Moneo Brock

The design for the new science building at 120th St and Broadway has its origins in the historic Morningside Heights campus plan designed by McKim, Mead and White for Columbia University in 1897. The architects determined very early on that the new building should respect the McKim Meade & White plan; that it would measure just sixty-five feet in width, and would retain the same separation from its neighbors as indicated in that plan. Because of the construction of the Manhattanville Campus to the north, the new building was able to provide a much-needed gateway to the old campus for pedestrian traffic to and from the new campus to the north.

## Arenberg Campus Library, Catholic University of Leuven – Belgium 1997 – 2002

In 1997 the remains of the Celestine Convent were floating like a ship adrift between the roads and highways connecting the city of Leuven with its surroundings. The unmasted ship, once a living monastery, appeared to have lost its way, making it difficult to understand the meaning of the ruined cloister. With the disappearance of the church, three sides of the cloister remained. Brick prevailed, as did the pitched, slate roof. From the beginning the goal was to maintain the scale and the character of the place and make the tiny cloister the core of the new library. The design strategy relied on erecting a new building - not high, not mimetic - that would enclose the cloister. The organic geometry of this construction invigorates and animates the severe cloister and provides an unexpected space, a new courtyard, flanked by the restored dependencies of the monastery. The extension of the building mass containing the open stacks in the basement and the ground floor levels defines a new perimeter along the De Croylaan Road, anchoring the Celestine Convent once again to the road network. As a result of this strategy the existing volumes maintain their value and the rooftop of the old refectory continues to be the most striking element. The old monastery is a building rescued, one that has been newly integrated in the life of the city and of the University. The new Library reminds us that our present is written on the past, something always manifestly present in a city like Leuven and in a University that is one of the oldest in Europe.

### **20th Century Collection Library, Cadima - Portugal Construction Estimated 2011**

Client: Private, Budget: EUR 2,250,328.00, Area: 900 sqm, Architect: Mara Partida + Héctor Mendoza

This library will be specialized in art and literature of twentieth century authors. It will house the whole private clients' collection. It could be figured either as future cultural centre and emblematic referent to the zone. The Library is presented as an object clearly identified and inter-penetrated deeply into the landscape, in order to dialogue and be rooted to the site. Thus, the library is designed as a singular geometric container, focusing its interior towards a main open view: an interesting wooded garden where contemporary sculptures will be placed. The building is gently placed on ground through different platforms. Before entering, it raises an entry plaza where a reflecting pool is located. There is also a terrace extending to the impressive view. On the interior, the library creates its own atmosphere. It is made by concrete and, its geometry is responsive to the careful search of introducing light by lateral courtyards and skylights. The library is entered through filter funnel that prepares the visitor to the indoor environment, where a double height exhibition room appears. The main reading space is completely open, but offers some options of differentiated and intimate ambits of staying. The main space combines a double height surrounded by two stories thematic open rooms. These rooms are continuously turning towards the central space where the book collection is always the main protagonist. As a parallel requirement, clients will have the possibility to celebrate concerts for more than 80 people at the interior space. Concerts will take place in the main space and the upper rooms could be used as balconies to extend the audience. All materials chosen, mainly concrete, are direct consequence of integrating Structure, Geometry, Aesthetic Experimentation and Spatial Expression. (MX-SI)

### **Biblioteca Frederic Alfonso i Orfila, Setmenat – Spain 2011**

El passat 11 de febrer d'enguany va tenir lloc la inauguració de la nova sala polivalent de la Biblioteca Frederic Alfonso i Orfila de Setmenat (blog). Es tracta de la Sala Noble de la Rectoria Vella de la localitat, que s'ha rehabilitat i que a partir d'ara acollirà l'activitat de pròpia de la Biblioteca, a banda d'altres activitats de petit format que es fan a Setmenat. Aquesta restauració forma part d'un projecte més ampli i integral, consistent en l'adequació de tota la rectoria, del seu entorn i dels seus accessos. La Rectoria es va reformar l'any 1999 i des de llavors acull la Biblioteca. Conserva elements gòtics com les arcades del segle XIII al XIV, així com altres elements arquitectònics datats entre els segles XVI i XVII. Aquesta actuació ha tingut un cost total de 95.160 euros, i s'ha beneficiat dels ajuts del Programa Específic de Biblioteques del període 2004-2007. (<http://www.archiblog.info>)

Enrique Nieto, Fuensanta Sobejano

<http://www.nietosobejano.com>

### **Barceló, Madrid – Spain 2009 – 2011**

Client: Madrid city council

The new Barceló market and its surroundings area project is in fact the result of various other projects: An urban combination of different scale and programme elements that have come together to significantly transform a dense central area of Madrid. The idea originates from the definition of new areas that connect and link the different structures and foreseen functions of the market, shopping centre, sports centre, public library, car parks, temporary market and outdoor areas. The built-up complex is made up of three independent structures joined to a new public square. The Market – nucleus and heart of the whole operation – is conveyed as being an autonomous structure, which is located at the confluence point where its different façades open out onto the calle Mejía Lequerica and calle Beneficiencia. Its main attraction is an indoor shopping arcade with contrasting vertical symmetry inspired by large urban shopping centres from the past, that concentrate the complex's vertical and horizontal traffic. The sports pavilion rises up over the market. Its roof is actually a large elevated square from which the roof tops of Madrid can be made out. The new public library overlooks the school playground built right beside to become part of an urban complex. Its materials and structure are the same as those of the market and sports centre. The geometric and physical appearance of the different buildings and their façades confirm that – despite their different functions – the new buildings belong to the same time period and place. A façade made up of large pieces of moulded glass, -white and opaline- unifies the new public buildings style -market, sports centre, library- to illuminate and unify the whole complex. The style of the public areas in the plazas de Alonso Martínez and Barceló, as well as that of the neighbouring streets, their mutual paving and street furniture, transmit the feeling of the past radical subtle change that has taken place in the neighbourhood. Like an escalated version of civic life, where places to live, study, teach, go shopping, have fun, do sport, read, go for a walk or relax have a common setting, the new buildings and outdoor areas come together in an surprise puzzle in which every single different piece only makes sense when they are all put other in their exact precise place. The building of the temporary market that will be used when the construction work of the new buildings is in progress, is intended to be an urban facility which can be recycled and that conveys the inspired ability of a temporary operation to change with its environment. As it has to house the numerous outlets that have to be maintained, the building is divided up into six pentagonal shaped floor areas, that are set at different heights and have different lay outs, thus preventing it being out of proportion with regard to the surrounding buildings. A linear double height structure along la calle Beneficiencia will be used for the handling areas, warehouses, cold storage rooms and installations. One of this building's fundamental features is its exterior facade made of glazed polycarbonate that covers the polygonal cylinders to let natural light filter through during the day and which become huge lanterns lighting up the square in the evening. Once the construction work has been completed, these cylinders will be taken down and could be used somewhere else in the city, so that the new Barceló square, whose paving, landscaping and street furniture blends in with the surroundings, will round off the change made to this historical areas of Madrid. **Biblioteca Municipal, Villarreal (Castellón) – Spain 2011**

### **Literature:**

Image [Accessed: 30 September 2009]

Curro Crespo. " Carlos Ferrater Proyecta the new library Villarreal . " In: Scalae (29 September 2009)

"OAB (Ferrater Peñín, Gimeno): = City Library Municipal Library Villarreal." In: AV Projects , n. 34 (2009), p. 12-13

"Cortinaje ceramic Municipal Library in Villarreal (Castellón)." In: Living Architecture , n. 135 (2010), p. 40-43.

As we read in Scalae, architect Carlos Ferrater (with Alberto Peñín and J. Gimeno) has been awarded the construction of the future new library Villarreal. Located on a plot of 4.685m<sup>2</sup>, the "building is a long rectangle of 40 × 115 meters, two floors and located on a site in the underground car park which is a municipal library is located in one of the corners of the site, leaving most of the site as a new public space as a square, and very close to a school. The building would highlight the double façade : an outdoor, covered with ceramic materials with cracks ... and an inner glass. This enables to qualify the entry of sunlight inside the library, and thus improve their conditioning. Access to the Library will be using two ramps , also made of ceramic. It will have 275 points in reading, and has prepared a document repository for books and in the basement, parking. It is a building on, and strict functional lines simple but at the same time strong. Access and Circulation areas are located on a street inside the building that crosses across the board, without affecting areas of reading and study . Can accommodate up to 75,000 volumes. (<http://www.bauenblog.info>)

**EL NUEVO CENTRO BIBLIOTECARIO ABRIRÁ SUS PUERTAS A FINALES DE MARZO O INICIOS DE ABRIL DEL 2011**

*La fachada del edificio se forrará con canutillos cerámicos, en apoyo al sector*

La actual crisis económica, sumada a la difícil situación por la que atraviesan los ayuntamientos y las altas tasas de paro hacen necesario que las nuevas obras que se realicen sean adjudicadas a empresas locales o, de lo contrario, se subcontrate a estas, para dar trabajo a parados del municipio. Al menos, así lo defienden desde el Ayuntamiento de Vila-real. Y es que las autoridades locales ponen como ejemplo de esta apuesta las obras de construcción de la nueva Biblioteca Central que, aunque adjudicada a Beca --con sede social en Castellón--, da empleo a 55 vila-realenses, a la vez que también se han subcontratado diferentes trabajos a mercantiles ubicadas en la ciudad. A todo ello se suma el compromiso de la firma castellanense a hacer uso de materiales fabricados en la zona para levantar el edificio. Los trabajos de construcción de la futura Biblioteca Central comenzaron a principios del 2010 y, según los técnicos responsables de la obra, está previsto que concluyan a finales de año, por lo que el archivo podría abrirse al público sobre últimos de marzo o principios del mes de abril del próximo año, según confirma el edil del área, Ignasi Clausell. Diseñado por el reconocido arquitecto Carlos Ferrater, el proyecto tiene un presupuesto de cuatro millones de euros, de los que gracias a un convenio con la Conselleria de Cultura, el consistorio solo aporta 1,7 millones. Actualmente, la infraestructura cuenta con la estructura, por lo que los trabajos se centran en el suministro eléctrico y de aire acondicionado, así como en los sistemas de aislamiento térmico y sonoro. La próxima fase será la construcción de la fachada, tanto exterior como interior. A este respecto, y para respaldar al sector cerámico local, el cerramiento exterior se realizará con canutillos de este material, mientras que el interior se forrará con paneles de vidrio, que dotarán al edificio de un sistema de ventilación e iluminación sostenible. El nuevo centro bibliotecario tendrá capacidad para 75.000 libros y 275 puestos de lectura. (<http://www.vila-real.com>)

Angela García de Paredes, Ignacio Pedrosa

<http://www.paredespedrosa.com>

### **Libraries:**

**Biblioteca Ceuta – Spain 2007 competition 1<sup>st</sup> prize, 2012**

La nueva Biblioteca, obra del equipo Paredes Pedrosa Arquitectos -ganadores del concurso que se convocó a tal efecto-, estará ubicada en el PERI Recinto Sur, en una parcela de 5.280 metros cuadrados. El edificio tendrá una superficie total de unos 7.000 metros cuadrados en 4 plantas, e integrará en su subsuelo los restos medievales de Huerta Rufino, un yacimiento de época meriní (siglo XIV); éstos se mostrarán bajo una superficie acristalada situada en el vestíbulo de la Biblioteca. Esta nueva Biblioteca Pública del Estado se crea a partir de una orden ministerial publicada en el BOE en marzo de este mismo año, en la que se describe el organigrama funcional de la misma, así como las competencias de las diferentes administraciones. Así, la Consejería de Cultura de Ceuta gestionará el edificio y dotará de personal a la Biblioteca, mientras que la aportación de los fondos bibliográficos necesarios irá a cargo del Ministerio de Cultura. Según las previsiones del Ministerio, las obras comenzarán este mismo año, y se prevé que finalicen en 2011. Por el momento ya se conoce la empresa adjudicataria de las obras de la futura nueva Biblioteca Pública del Estado en Ceuta. En concreto, las obras irán a cargo de Acciona Infraestructuras, y tendrán presupuesto de 6,8 millones de euros. Éste supone una importante rebaja del presupuesto base de licitación, que estaba cifrado en 8,3 millones. (<http://www.scalae.net>)

**Biblioteca Pública, Cordoba – Spain 2007 competition 1<sup>st</sup> prize 2012**

Ayuntamiento de Cordoba

El proyecto de Paredes Pedrosa resultó ganador del concurso convocado en 2007. El inicio de la obra está previsto para verano de 2010 y su finalización para finales de 2012. El viernes 04 de diciembre fue presentado en Córdoba el diseño definitivo de la Biblioteca Pública del Estado a cargo de sus autores, el estudio Paredes Pedrosa arquitectos. El proyecto de la Biblioteca Pública fue resultado de un concurso convocado en 2007. Ahora, dos años más tarde, solventados los trámites administrativos relativos a la cesión del suelo para su construcción, el proyecto reanuda su marcha, fijando el inicio de sus obras para el verano de 2010. La duración de las obras se estiman en 24 meses, por lo que se espera a finales de 2012 para su apertura pública y puesta en funcionamiento. La nueva Biblioteca se ubica en un lugar privilegiado: en el borde de los Jardines de Agricultura, un jardín público deprimido respecto a la cota de la avenida a donde dará la Biblioteca su fachada norte, la avenida de América, en el lugar donde tradicionalmente ha existido una rosaleta. Si algo caracteriza precisamente el proyecto es la forma de atender de manera sencilla y serena a las circunstancias del contexto. El punto de partida del proyecto se fija en la comprensión del edificio como una arquitectura que necesita dialogar con la naturaleza. Por ello conceptualmente se plantea, tal y como recoge la memoria del proyecto, como la "puerta del jardín". Así, en todo el edificio, está presente la transparencia visual hacia el sur, hacia donde queda el jardín, para que su presencia acompañe al usuario en su recorrido y estancia en los distintos niveles del edificio. La Biblioteca es un volumen de planta trapezoidal que al norte, a la avenida de América, se muestra compacto y rotundo, respondiendo a la escala urbana que impone tan importante arteria de tráfico. En esa fachada se localizan fundamentalmente despachos y dependencias administrativas. Al sur, sin embargo, el edificio se aterriza

buscando las vistas hacia el jardín, protegiéndose del sol por medio de un mirador lineal. Pero es en sección en donde se explica la organización funcional del edificio. En el desnivel existente entre la cota de acceso desde la avenida y el jardín se dispone la biblioteca infantil, comunicada con el jardín y con la rosaleda, que se trasplanta delante suya, visible en doble altura desde el nivel de acceso. La planta primera será la planta principal de lectura y fondo bibliográfico y la segunda estará reservada para el archivo histórico y para investigadores. Unos grandes tragaluz abiertos al sur fragmentan el volumen por distintos niveles, inundando el interior de luz y enriqueciendo la experiencia de su espacialidad. Siguiendo este discurso de máximos con estrategias sencillas, pero resolutivas, la materialidad de la Biblioteca se confía a muy pocos materiales: muros estructurales de hormigón blanco in situ, vidrio y celosías tridimensionales de aluminio que permitirán dotar de una cierta vibración a la fachada norte. El proyecto de la Biblioteca cuenta con una superficie construida de más de 7.000 m<sup>2</sup>. Su presupuesto asciende a los 12,3 millones de euros. Cuando esté finalizada se espera que preste servicio a 1.000 usuarios aproximadamente al día. (<http://www.scalae.net>)

#### **Bibliometro, Madrid – Spain 2004**

Bibliometro this extended service is a library designed to promote reading through the free loan of books in the Madrid Metro. Passengers can take a book in any Bibliometro and leave them in another metro station. The small pavilion (7,8 \* 2,5m) has a sinuous shape, following the flow of travellers. Translucent illuminated glass walls permits books to be seen from the subway. Sponsored jointly by the City of Madrid and in collaboration with Madrid Metro, the service is the first project joining the two systems of the City Council Public Libraries and the Community of Madrid.

#### **Biblioteca Maria Moliner en Vellila de San Antonio, Madrid – Spain 2000 – 2003**

1.005 sqft., € 786.000, Promotor: Comunidad de Madrid. Consejería de las Artes.

#### **Awards:**

**Premio a la Estética Edificios no residenciales 2005**

Se trata de una biblioteca muy pequeña, situada en la zona Sur del casco urbano, un mar de adosados nuevos sin carácter ni vistas hacia las que asomarse entre los cuales el pequeño edificio debe significar su presencia pública. Un muro de hormigón visto coloreado de una planta de altura sin huecos en fachada, envuelve la biblioteca. Se ha encofrado con planchas de metal estirado que dejan su huella en la superficie como un vallado. Sobre el muro se levantan los dos grandes lucernarios que iluminan las salas de lectura sin sobrepasar la altura de los adosados. El interior continuo se estructura en torno a los dos patios abiertos en forma de gran artesa y se domina prácticamente desde la entrada. El nivel del pavimento es el de la solera de hormigón pulido y está ligeramente rehundido respecto a la acera. Una retícula de ligeros pilares metálicos soporta la cubierta interiormente revestida de viroterm pintado, obedeciendo al reducido presupuesto. A los patios es posible salir para pasear o leer. Las cubiertas inclinadas en forma de prisma de las salas se revisten interiormente con paneles de madera de okume para dar calidez a los paramentos blancos y son visibles asimismo desde el exterior sobre el cerramiento de hormigón. #### **Biblioteca Escuela Politécnica Superior de Gandía (Universidad Politécnica Universidad de Valencia) – Spain 2009**

Promotor: Universidad de Valencia, € 9.382.104, Superficies Cerrada: 8.589 m<sup>2</sup>, Superficies Abierta: 4.784 m<sup>2</sup>

The project deals with how to transform the building site, a wetland of Gandía Beach, at the entrance of the expansion of a campus building. A place of relationship and reflection. From the constant concern for scale, we find a succession of great public spaces – from the square, patio and access to others more private, refined and proper uses. The organization of a hybrid program means to establish a system of patios as an easy identification system. The project addresses the work of light as a conductor element of this equipment. A powerful concrete container is emptied by triple heights oriented from north to south to characterize the areas of reading and the main entrance. Under a strict control of sunlight and noise are opened and closed (computers) large glazed panels at north and smaller courtyards that run across the building. Small handlings of the traditional building permit certain structural achievements at a reasonable cost. (Penin)

#### **Biblioteca Pública en San Lázaro, Santiago de Compostela, La Coruña – Spain 2008**

For its construction we chose by a soft architecture or of difficult impact (physical, cultural and perceived), that bets by a nice constructive language and an argued innovating typology in the functional requirements and the evocation of open and transparent object. (Perea)

#### **Biblioteca Pública Rafael Alberti en Fuencarral, Madrid – Spain 1998**

In spite of the difficulties of the land's steep slope and its trapezoidal form, it has given rise to new, unusual and highly original architectural forms. Thus, the building was conceived as an inverted container, focused towards the exterior. This is manifest in the way all the ceilings of the library, except the second cellar floor, are slightly inclined. This reaches its maxim level, 36 degrees, with the roof of the Building. The access to the library is at the lowest point, through a little staircase. The distribution of the building is radial, without any right angles. The dependent spaces are located around an irregular central court and forma class "Box". (Perea)

#### **Biblioteca Pública del Estado en Granada – Spain 1995**

La biblioteca está ubicada en un edificio de nueva planta de 11.700 m<sup>2</sup> localizado en la calle Profesor Sainz Cantero, número 6. Inaugurada en 1994, ofrece todos los servicios requeridos por una biblioteca moderna. El edificio está considerado como uno de los diez más importantes de la ciudad. Obra de los arquitectos Andrés Perea, Cristóbal Vallhonrat y Carmen Mostaza, es una gran caja de cristal y cemento que, en su interior, quiere recordar a un palacio nazarí, con grandes patios interiores y vistas al cercano Monasterio de los Jerónimos. Con fecha 23 de mayo de 1994 (BOE 21-06-94) se firmó un Convenio con la Junta de Andalucía para la

instalación de la Biblioteca de Andalucía en la sede de la Biblioteca de titularidad estatal en Granada. La Biblioteca de Andalucía ocupa la planta baja y la Biblioteca Pública del Estado ocupa la planta primera. El edificio, con forma de ortoedro, es en su exterior de cemento y cristal, materiales que equilibran su aspecto contundente de fortaleza y ligero de los ventanales de las esquinas y muros laterales. En su interior se ha pretendido emular el estilo de arquitectura nazarí característico de Granada, disponiendo alrededor de un patio central alargado tres niveles principales y tres entreplantas (seis plantas en total) de salas abiertas y de comunicación directa en donde se ubican los diversos servicios de la biblioteca. Sólo el mobiliario, ligero y funcional, marca los límites entre cada espacio lo que le dota de una configuración muy flexible y adaptable a las necesidades de los usuarios y biblioteca. Espacios completamente abiertos con techos altos y finas columnas. La biblioteca busca la luz natural proveniente de los grandes ventanales y de un lucernario central situado sobre el patio. #### **Biblioteca Zona Nord, Torre Baró, Barcelona – Spain 2010**

Gründächer als Teil der Landschaft

Vorrangig Immigranten leben im Stadtviertel Torre Baró im nördlichen Teil von Barcelona. Hier wurde eine moderne Bücherei zum integralen Bestandteil der vorhandenen Topographie - einem Hanggrundstück an einer vielbefahrenen Schnellstraße nach Frankreich. Architekt Rafael Perera Leoz schuf ein Gebäude, das dem abfallenden Gelände angepasst und auf zwei Ebenen in den Hügel eingegraben ist. Die Geschosse sind untereinander versetzt und terrassieren den Hügel, flache Gründächer vollziehen einen sanften Übergang zur Landschaft. Auch der dynamisch gewundene Verlauf der Fassade orientiert sich an der Topographie. Ihre äußere Schicht besteht aus rhythmisch angeordneten, schmalen Elementen aus perforiertem, rostfreiem Stahl. Dazwischen entstehen vielfach Durchblicke auf die eigentliche Außenhaut der Bibliothek aus Glas und tragendem Beton. So fungiert die äußere Schicht als eine Art Sieb, im Tagesverlauf entstehen unterschiedliche Grade von Lichtdurchlässigkeit. Die Besucher gelangen über einen gläsernen Aufzug oder eine Stahltreppe direkt von der Straßen- zur weitläufigen Eingangsebene. Außerdem führen ein schmaler Fußweg zur einen und eine breite Zufahrt (entlang der Abfangmauern aus Beton) zur anderen Seite auf diese platzartige Erweiterung. Ein überraschend weiträumiges Foyer über zwei Geschosse eröffnet die Bücherei, eine Treppe ins Obergeschoss fungiert als Gelenk zwischen den Ebenen. Sie ermöglicht neben umfassenden Ausblicken zur Stadt den Überblick des gesamten Innenraums - vom Bereich für Kinder über den offenen Lesesaal im Erdgeschoss bis hin zur naturwissenschaftlichen Abteilung im Obergeschoss. Die Bereiche sind fließend gestaltet, so dass immer wieder neue interessante Blickbeziehungen entstehen. Vorherrschend sind die Farben Schwarz, Weiß und Grau, nur ein paar bunte Sitzpuffs in der Kinderabteilung setzen Akzente. Im übrigen entsteht Lebendigkeit durch die Bücher und nicht zuletzt die Besucher - viele Immigranten des Viertels, die in sehr beengten Verhältnissen leben, nutzen die Bücherei zum Lernen, Surfen und Chatten im Internet. Außer dem großen Lesesaal, einer Internetzone und dem Bereich für Kinder ist im Erdgeschoss ein multifunktionales Auditorium untergebracht, während im Obergeschoss die Sonderabteilung, Arbeitsräume und Büros liegen. Ein weiteres, schmales drittes Geschoss beherbergt hinten am Hang die Technik.

Flachdach

Die Bibliothek ist in einen Hang eingegraben, die Dächer sind als Gründächer ausgeführt und mit Gras bewachsen. Sie erstrecken sich auf zwei abgestuften Ebenen. Die obere Dachebene soll sich möglichst gut in die hügelige Umgebung einfügen und besteht aus einer großen zusammenhängenden Grünfläche mit variierendem Gefälle. Die 20 bis 30 cm dicke Substratschicht wird durch ein genähtes Netz aus hochdichter, perforierter Folie aus Polyethylen gehalten. Unterhalb dieser Folie liegt eine Geotextilmatte zur Absicherung gegen Erosion, es folgt eine Dämmung aus extrudiertem Polystyrol, eine weitere Geotextilmatte und schließlich eine wasserdichte Bitumenbahn, die direkt auf der Betonplatte verschweißt wurde. Die Bewässerung der Grünfläche erfolgt über eine Sprinkleranlage an den höchsten Punkten des Daches, um ein Abtropfen auf den Boden zu vermeiden. Das grasbewachsene Erdreich ist begrenzt durch einen 75 cm breiten Kiesstreifen, um eine Drainage zu gewährleisten. Überschüssiges Wasser wird über ein durchgehendes Gitter mit eingebauten Halterungen aus rostfreiem Stahl abgeleitet. Das Dach wird getragen durch eine Verbundplatte (aus bewehrtem Beton und vorgeformtem Stahl), die auf Stahlrahmen gelagert ist. Die Rahmen verteilen die Lasten einerseits auf eine Vielzahl schmaler Stahlstützen, die unauffällig in die Verglasungsebene der Fassade integriert sind und andererseits auf die bewehrten Betonstützen und -wände im Inneren des Gebäudes. Die untere Dachebene ist nur schwach geneigt, ein Erosionsschutz mit Geotextil ist nicht notwendig. Der übrige Aufbau entspricht der oberen Dachebene. –us (<http://www.baunetzwissen.de>)

#### **Biblioteca de Can Llaurador, Teià, Barcelona – Spain 2005 – 2009**

1.167 m<sup>2</sup>

0629TEIA imágenes del proyecto de la nueva biblioteca y del parque de Can Llaurador de Teià. Godia & Barrio [Sergi Gòdia Fran y Berta Barrio Uría] arquitectos 72dpi.net render, 3d, infografía | barcelona Teià resuelve una carencia histórica e inaugura la biblioteca El equipamiento, que ha costado 3,3 millones, será el nuevo centro cultural del municipio 14 / 06/09 02:00 - Teià - Gerard Ariño - El Punto Desde ayer, Teià ya tiene biblioteca. Por la mañana abrió por primera vez sus puertas tras que el viernes fuera inaugurada en un acto con cerca de 200 personas. Con la apertura de este nuevo centro, Teià resuelve una carencia histórica ya que era de los pocos municipios de 6.000 habitantes que no tenían biblioteca. El alcalde, Andreu Bosch (ERC), que a finales de mes deja la alcaldía, mostró su confianza en que el equipamiento se convertirá dentro de poco tiempo en un centro de dinamización social y cultural. La biblioteca será la primera del municipio. Ocupa una superficie de 1.167 m<sup>2</sup>, tiene 70 puntos de lectura, seis puntos de consulta de internet y un fondo bibliográfico de 15.000 libros y 1.300 documentos audiovisuales. Una de las principales peculiaridades es que se trata de un edificio semisubterráneo, que pasa totalmente inadvertido desde la calle que hay detrás del equipamiento. En cambio, desde el paseo de la Riera, hacia donde está situada la fachada, es totalmente visible. Los arquitectos encargados del diseño han sido Berta Barrio y Sergi Gòdia. La ejecución del proyecto y el ajardinamiento del perímetro han costado 3,3 millones, una buena parte de los cuales se han financiado con inversión municipal. La Generalitat aportó 400.000 euros a través del PUOSC, y la Diputación de Barcelona, que integra la biblioteca de Teià en su red, 300.000. El nuevo equipamiento se inauguró el viernes por la tarde con la presencia del conseller de Cultura, Joan Manuel Tresserras, el presidente de la Diputación de Barcelona, Antoni Fogué, y varias autoridades locales. El alcalde de Teià, Andreu Bosch (ERC), mostraba su satisfacción por la inauguración de lo que considera un «equipamiento indispensable» para el municipio. «Será un punto de referencia, de movimiento social y ligado a

la cultura», afirmó. Bosch, que deja el cargo a finales de mes, verá como su etapa como alcalde acaba con el estreno de tres de sus proyectos principales: la plaza de la Cooperativa (inaugurada en mayo), la biblioteca de Can Llaurador y la celda · la Viner, que se inaugura el día 20 próximo, junto con el centro de acogida turística. La finca de Can Llaurador, donde está situada la biblioteca, tiene una superficie total de 27.000 m<sup>2</sup>. En una segunda fase, que comenzará el próximo año, se acondicionará la casa antigua como archivo municipal. (<http://www.72dpinet.blogspot.com>)

### **Vienna University of Economics and Business, Wien – Austria on construction (2014)**

#### **La Biblioteca del Distrito 3, Terrassa – Spain 2005 - 2011**

Ya ha finalizado la construcción de la Biblioteca del Distrito 3 de Terrassa , obra del equipo de arquitectos Ravetllat y Ribas (2005-2011), con la colaboración de Manuel Ribas Piera, Carlos Casamor, Marta Gabàs y Anna Ribas. Este nuevo equipamiento está ubicado en el Parque de Vallparadis, en una zona con un fuerte desnivel. Tendrá una superficie total de unos 1.000m<sup>2</sup> y dispondrá de un fondo inicial de 18.500 volúmenes. Ha tenido un coste total de 2,4 millones de euros. Se prevé que la inauguración será alrededor de Sant Jordi, mientras que la puesta en marcha de la nueva Biblioteca será el próximo 2 de mayo. (<http://www.bauenblog.info>)

#### **Biblioteca Can Regàs Pont Major, Girona – Spain 2000 - 2003**

El equipo ganador del concurso para convertir la antigua fábrica textil la Marfà de Santa Eugenia en un centro cultural ha proyectado un edificio anexo a la actual estructura. El equipo, formado por Pere Joan Ravetllat Mira, Carme Ribas Seix y Olga Schmid, ha proyectado la sala polivalente en la planta baja y un bar-cafetería. La biblioteca estará dividida. Una parte en la planta baja y otra en el primer piso. En el piso superior habrá buques para los grupos de música (ocho para ensayos y dos para grabaciones) y una sala polivalente auxiliar. El gabinete de arquitectos ganador se ha impuesto a cuatro opciones más que se habían presentado. Inmediatamente se empezará a redactar el proyecto ejecutivo, que se prevé tener listo en tres meses. Después ya se licitarán y adjudicarán las obras. Se prevé que a mediados del próximo año empiecen unas obras que estarán terminadas a mitad del año 2010. En total, el coste de la rehabilitación será de 3.296.743 euros, que pagan a partes iguales la Generalitat de Catalunya y el Ayuntamiento de Girona, como proyecto incluido en el Plan de Barrios. El equipo ganador del concurso ha pensado en ubicar la sala polivalente en la planta baja del edificio a rehabilitar y el bar-cafetería en el anexo que se construirá junto a la antigua fábrica. Sin embargo, la alcaldesa, Anna Pagans, explicó ayer que estudiarán si se pueden intercambiar los usos de los dos espacios. De esta manera, el bar-cafetería quedaría dentro del edificio y la sala polivalente, por su carácter más independiente se ubicaría en el anexo exterior y no interferiría el funcionamiento de la biblioteca. La sala polivalente está pensada para poder hacer hay diferentes actividades: conferencias, teatro tradicional y contemporáneo, cine, exposiciones, baile, cenas y banquetes. La música, los periódicos y las revistas que se podrán leer en la biblioteca serán en la planta baja, así como la zona de trabajo y de reposo. En la primera planta estará el fondo general, el área infantil y los depósitos. En uno de los laterales de la antigua fábrica, junto a la acequia, se mantendrán varias turbinas del siglo XIX que hicieron funcionar la factoría hasta prácticamente los años cincuenta. El proyecto pensado para Ravetllat-Ribas-Schmid integra los dos edificios en un parque público y tiene en cuenta la vinculación de la Marfà con el centro cívico Can Pupils, que dejará de ser el escenario de algunas actividades ya que la antigua textil, una vez reformada, permitirá un mayor aforo. El equipo que redactará el proyecto ya fue el encargado de reconvertir Can Regàs en el centro cívico del Pont Major de Girona. Otras obras acabadas de su currículum reciente son una pasarela para peatones sobre el Segre en Lleida, la urbanización del Turó de la Peira de Barcelona, la comisaría de los Mossos en Cornellà de Llobregat y la rehabilitación como centro cívico de la antigua escuela Orlandai de Sarrià en Barcelona, entre otros. Poco proceso participativo Aunque se había anunciado un proceso participativo similar al que en su momento permitió definir los usos de la bisagra de Santa Eugenia, este último quedará restringido prácticamente sólo en las posibles alegaciones o sugerencias que se puedan presentar durante el periodo de exposición pública. El teniente de alcalde de Urbanisme, Joan Pluma, quiso señalar, eso sí, que en la definición de los usos han participado multitud de áreas del Ayuntamiento (Participación, Servicios Sociales, Cultura, Juventud y Patrimonio, por ejemplo). También se ha debatido con la comisión de vecinos del barrio y en la mesa territorial. (<http://www.diariodegirona.cat>)

#### **Biblioteca y Geriátrico, Barcelona – Spain 2009**

The mixed-use building, comprising a library, senior citizens' centre and childrens' playground, is situated within the interior space of an innercity block. Light filters through the facades of the Library into the reading rooms. The senior citizens' centre, in the form of a cul de sac, encloses the public spaces and encourages interaction between the children playing in the playground and the older people who are coming and going. Rafael Aranda (born 1961 in Vic, Spain), Ramon Vilalta (born 1962 in Olot, Spain) and Carme Pigem (born 1960 in Olot, Spain), established their studio RCR Aranda Pigem Vilalta Arquitectes in Olot in 1987. All three received

their diplomas from the Escola Tècnica Superior d'Arquitectura del Vallès (ETSAV), Barcelona. Among their most important works are: the Bell-Lloc Winery in Palamós, Spain; and the Tussols-Basil Athletic Stadium and Les Cols Restaurant, both in Olot. (<http://www.baunetz.de>)

When the AR last featured a library in Barcelona, it was an object building set within the medieval grain of Gracia. Situated on the north-west edge of the city, beyond the tyranny of Eixample - Ildefons Cerda's distinctive grid - the Jaume Fuster Library (AR June 2006) demonstrated Catalan architect Josep Llinas' masterful handling of a rotund form negotiating its place in response to distinct urban adjacencies and complex internal dynamics. By contrast, this library by RCR Arquitectes - a practice based in Olot, north of Barcelona - is anything but an object building, clinging to the edges of its context and lining the interior of one of the city's distinctive chamfered urban blocks in the south-westerly district of Sant Antoni. This building serves a new city-wide vision of Catalan urbanism, commissioned by ProEixample, a company formed in 1996 to acquire land in block interiors for public use. So strong is its motivation, the programme was not even the project's principal driving force. Instead, a break in the continuity of the street generated the project, providing a rare opportunity to fill the gap and give a new use to the courtyard beyond. The original design competition proposed a relatively generic administrative office. Once the spatial and social opportunities of RCR's winning composition were understood, however, the client agreed that a public amenity would be far better suited. Thus the library now occupies the gateway building, setting up complementary social dynamics with the senior citizens' centre, which was part of the initial proposal, at the rear of the courtyard. Before remodelling began, this block was typical of many in the city: inaccessible to the public and occupied by low-rise light industrial workshops, sheds and occasional chimneys. In her analysis, presented to the Mies van der Rohe Award jury in a public lecture (the project was one of five shortlisted schemes, AR June 2009), practice co-founder Carme Pigem named aspects of the city that had failed to come to fruition. 'The reality of Cerda's plan was different,' she conceded. Describing how the engineer's aim was to have a number of open blocks, not impenetrable monoliths, she underlined the need to reopen them for public use. When this project began, a single-storey unit plugged the gap in the street, perpetuating a false understanding of the Cerda grid as being more about blocks than buildings. A quiet anxiety was evident in Pigem's description, identifying the desire to create buildings that read more clearly than the blocks, which explains the bold shift in articulation of the new library against its context. Glazed facades veiled in perforated steel sit conspicuously against render and stone, exaggerating in material expression what the building concedes in form, as it's stealthy figure quietly finds its place in the city. In both plan and section, the black form negotiates itself into a very settled state, with a five-storey block sitting within the existing vertical gap and double-height/single-storey wing forming a cranked armature that steps in and around the west and north boundaries. While the wish to make a more identifiable building may have drawn some to use exuberant forms to create a dialogue between new and old, RCR's trademark sensitivity to landscapes has been reapplied with skill and restraint here. The plans are logical and clearly arranged, and the section breaks up to bring light into the covered passageway. In terms of material application, however, their restraint fails to add any subtlety to the grain of the townscape. While the ambition to unify street and courtyard is clearly conveyed, extending the application of minimal black surfaces to the library's interior was perhaps a move too far. Some may also agree that the armature in the courtyard should have had its own, more distinctive cladding and lining. Moving from street to courtyard and further still into the stacked reading rooms, the spatial shifts are insufficient in making this a truly urban experience. A return trip to Jaume Fuster, with its diversity of interiors and interrelations, underlines this point with potency as the most successful spaces in this new building are those that deal with specifics of context, placing lightwells along boundary walls in the senior citizens' building. It would seem that the library structure was unable to shake off the corporate undertones of the previously planned office building. The use of steel also has a problem, relating to the recent addition of a children's playground in the easternmost corner of the site, on land acquired since these photographs were taken. While providing shade, enclosure and shelter for the cloister, the buckled steel fins serve too well as solar collectors, absorbing the scorching heat of the Catalan sun, to the point where unsuspecting hands or backs get a nasty shock when they brush the surface - another unfortunate consequence of having to retrofit a brief into a predetermined architectural proposition. Despite this, the experience and amenity offered to local residents is an exemplary model for future ProEixample initiatives. Sitting in the stepped reading room the library certainly provides welcome respite from the hustle and bustle of this vibrant market district, and the building is extremely busy. Pignon describes Barcelona's new libraries as 'cultural supermarkets', forming an essential part of day to day community life. Here then, despite the slightly topsy-turvy process of retrofitting a function into a form, RCR has produced another fine library for Barcelona, making the city an exemplary destination for any would-be library architects and clients from around the world. Obra de l'equip d'arquitectes olotí RCR Arquitectes (2005-2007), la nova Biblioteca Sant Antoni-Joan Oliver es troba a l'interior d'un pati d'illa al barri de Sant Antoni de Barcelona, compartint espai amb un casal d'avis i el jardí interior, entre els carrers Manso, Ronda Sant Pau, Parlament i Comte Borrell. L'accés a l'interior, a través de la biblioteca, es fa per aquest últim carrer. És un edifici té 1.723 m2, distribuïts en 4 plantes més soterrani, que era antigament un fàbrica de caramels. La Biblioteca actúa com a element de sinergia, relació i transició entre el carrer, el casal d'avis (situat al final de l'interior d'illa), i el jardí urbà, amb els jocs per a nens. La Biblioteca destaca pels seus buits interiors, però l'element arquitectònic més destacat és, sens dubte, una grada interior ubicada a la segona planta, per a un lectura més informal i lúdica, en clara connexió amb l'exterior lúdic i juganer del parc urbà. (<http://www.bauenblog.info>)

La biblioteca Sant Antoni - Joan Oliver, situada en el interior de la manzana delimitada por la calle de Manso, la ronda de Sant Pau y las calles del Parlament y Borrell, constituye un equipamiento cultural y de proximidad para los vecinos del barrio y del Distrito del Eixample. Entre la calle y el jardín, la biblioteca es un mirador urbano en el Eixample. Desde el punto de vista social y arquitectónico, la biblioteca trabaja en sinergia con la residencia de ancianos y con los juegos para niños del patio de manzana. La biblioteca se encuentra junto al Mercado de Sant Antoni y lleva el nombre del escritor sabadellense que vivió en el barrio, Joan Oliver, conocido también por el nombre de Pere Quart. The Sagrada Familia Library was constructed by means of reforming an unused building in a public services complex formed by a market, a civic centre and a car park. The previous building, built in 1992 and intended to be a commercial centre, was never put to use. It was totally transformed by few though strong gestures: the reorganisation of the entrances to the complex, a profound modification in the building structure and the replacement of its envelope. In addition, these changes add new value to the block corner in the heart of Cerdà's 19th century Eixample district. A dim, shut-off construction has given way to a permeable building that is open to the light and to the city. Barcelona city council arranged a competition for the construction of the library, subject to the condition that it was not demolished, due to the manner in which the building is implanted within the complex. The competition proposal was based on two fundamental operations. The first was to flood the building with light by cutting open a large breach and transforming its shell. The second consisted of changing the existing system of scattered accesses that were lacking in hierarchy through a formula that would open up the building onto the street, by converting the main entrances into an extension of the public thoroughfare. In this way, the corner (which was formerly used as a residual space) is now highlighted and converted into an important feature. The shopping centre had been designed as a closed building, a compact block turning its back to the city. On the contrary, the concentration of the new library, the new entrance to the civic centre and the busy market form a unit that plays a principal role as a centre of activities for the district. Different complex programmes (the Library and Market – their services and supporting areas, the entrances to the Civil Centre and to the car park) are combined, thereby generating a structure that is open to the light. A vertical opening that emerges after the elimination of the central aisle gives shape to the building, dividing it up into two parallel bars, and inserting an area filled with light into the centre of the library; a courtyard flanked by two interior façades that opens up through a light shaft and is projected towards the exterior through a transparent wall. This new light-filled area is both the heart and the spinal column of the building. The need to provide natural light has also transformed the exterior facades. The blind wall gives way to a double skin that filters the light through. A perforated aluminium filter acts as an opaque surface that reflects the sun during the day and creates the illusion of the awakening of a lamp during the evening and at night. The building's appearance changes during the day according to the way in which the light falls on it. The system of screens, filters, transparencies and visuals contributes to creating a rich space that is forever changing. The central part of the building is extended towards the exterior, where diverse auxiliary components of the library and market come together to form a single iconic element, creating a new meaning for the block corner. Instead of being a problem element, the corner became the principal hinge that provides the building with its urban identity. That screen, covered by the metal veil, generates a vertical plane that recomposes the edges of the corner, acting as a backdrop and creating a public area, leading from the ramp to the rear of the hall. This element emerges to embrace the space and integrates into the façade. The corner of the block is converted into the main entrance to the library, to part of the civic centre and to the market, by means of two wide parallel ramps. From the interior, the space breathes before reaching the street. The access ramps, paved with material from the street itself, introduce the city into the building. The library entrance hall is a variation of the Barcelona mezzanine floor, with the only means of direct access being a slope, an extension of the public thoroughfare that runs underneath the building. The library is not oblivious to the public area of the exterior, but is joined to it. The stairs that sweep upwards from the entrance to the third floor form a combination of steps suspended in mid-air with the appearance of a reflection of the reversible perspective of Escher. The stairs and corridors cross the open space, generating a spiral path that passes through the whole building. The library areas can be discovered by walking through it. The pre-existing distance between the floors of the commercial building made it possible to leave generous heights for all the library rooms, thereby contributing to its condition of a "public building" in terms of space. The light filters through the space of the three floors in two colours: the white of the ceiling and central space and the black of the paving and outer part of the furnishings. Neutral colours were selected for most of the library to ensure that the necessary touch of colour would be added by the books themselves. The green of the children's library, different and bold, stains the light of the hall and consultation area. In the lay-out of the furnishings, the predominant features are experimentation and the idea that the interior space is like an urban maze: unique spaces can be identified, in which users are able to recognize places, streets, corners and squares; moments that conceal information: the library collections. The structure of the city and its spaces have changed in scale and been recreated inside through the system of shelves and tables. In the maze, two elements allow identification and orientation: the different colours used for the back of the shelves and a system of indicators inspired by urban signs and signposts. In addition, some of the furniture takes the form of a series of ribbons around the perimeter and, thanks to their location near the light, allow for the creation of reading, consultation and other areas. This ribbons system acts as an organizational element and colonizes the space. They move and all the furniture elements emerge from them. They change in shape and colour when they come into contact with the air and light. They are the ribbons of a gymnast which, when thrown into the air, take on different shapes and heights, depending on their functions. Light and emotion are scattered in space, opened by a breach that divides the building. There is no change, but a transformation in the environment already created in the new building: the library that is open to the light as it is to knowledge. (<http://www.arhitectura1906.ro>)

Obra del equipo de arquitectos Artigues & Sanabria (1997-2002), la Biblioteca Comarcal de Blanes está toda orientada con vistas al mar. Uno de los elementos más significativos del edificio es la gran plaza cubierta que se configura ante la fachada principal, una plaza cubierta por una gran visera que proporciona sombra al edificio y que sirve de punto de reunión y de encuentro, y que el mismo tiempo penetra dentro de la propia biblioteca, donde toma la forma de un vestíbulo de acceso de usos múltiples.

Obra del equipo de arquitectos Artigues y Sanabria (1995-1999), la Biblioteca Central Pare Miquel de Esplugues de Llobregat (Baix Llobregat) es fruto de una reforma y ampliación de una antigua escuela ya existente. Del proyecto destacaría dos aspectos: el primero, el aprovechamiento de los espacios que antiguamente ocupaban los patios de la escuela, reconvertidos en una amplia sala de lectura iluminada con claraboyas en el techo. Parece lógico. El espacio que con el antiguo uso escolar era el más diáfano y amplio ... con el cambio a usos bibliotecarios lo continúe siendo. Las características no cambian, pero si lo hacen los usos. Las salas de lectura necesitan grandes espacios y sobre todo, luz ... tal y como lo necesitan los patios escolares. El otro aspecto a destacar sería la gran pantalla frontal que remata la fachada principal, y en la que se han incrustado las enormes letras que anuncian el nombre de la biblioteca. Los que me conocéis sabéis que mantengo un lazos muy fuertes con la ciudad de Santa Coloma de Gramenet, así que era inevitable que tarde o temprano hablara de su Biblioteca Central. Obra del equipo de arquitectos Artigues y Sanabria (1992-1997), la biblioteca se encuentra en pleno centro de la ciudad, los Jardines de Can Sisteré, precedida de una de las pocas arboledas que aún quedan en el centro, ya escasos metros del Ayuntamiento. Tiene 2.000m2 y acoge un fondo de 70.000 volúmenes. Se trata de un edificio rectangular, de tres plantas, de color blanco, el elemento más significativo del que es, sin duda, su fachada curva, semielíptica. Fachada con una gran carga simbólica e intentificadora de todo el edificio. El hecho de que sea curva acentúa aún más su cierre y su integración sobre el su ubicación urbana. Sin embargo, la relación principal interior-exterior se efectúa sólo a nivel de la planta baja. Si bien el resto de la fachada resulta contundente, la planta baja resulta amable e invita a entrar. Esta interrelación se consigue con el uso intensivo del vidrio, en el que destaca la generosa entrada principal, una amplia puerta de cristal. Finalmente, esta diferenciación de usos de la fachada, se acentúa con el alerón que sobresale de la fachada principal y cubre la planta baja, creando así un espacio de transición exterior, un espacio de reunión y encuentro. (<http://www.bauenblog.info>)

Si en el artículo sobre la Biblioteca Rector Gabriel Ferraté vemos una separación de usos y funciones mediante una calle que cortaba el edificio, en la Biblioteca Central de Viladecans (Baix Llobregat) esta se lleva a cabo con la diferenciación volumétrica del edificio mismo, separado en dos partes bien diferenciadas. Obra del equipo de arquitectos Artigues & Sanabria (1995-1998), está situada en el Parque de Can Xic, en los terrenos de la antigua Masía del siglo XVIII del mismo, y tiene un total de 1.600m2. Se inauguró en enero de 1999, y es precisamente la diferenciación de usos uno de los dos aspectos más significativos del edificio. Por un lado encontramos un volumen en forma de prisma y de dos plantas de altura, en la planta baja se ubican la sala general de adultos, la hemeroteca, la música y el almacén, mientras que en la primera encontramos los despachos, el servicio de información y el área de referencia. Por otro lado, hay un conjunto de volúmenes dispuestos en semicírculo, sólo en planta baja, donde encontramos un salón de actos, la sala infantil y la zona de pequeños lectores. El otro aspecto a destacar es la zona de unión entre estas dos partes del edificio. En la intersección se ha creado un gran vestíbulo-distribuidor, a modo de acogida y de recepción, y que sirve de elemento canalizador de las diferentes circulaciones internas. De este vestíbulo también habría que destacar su función como elemento de transición entre el exterior y el interior (en este caso completamente dentro del edificio), ya que dispone de dos accesos, uno para cada fachada del edificio, lo que aumenta y facilita su relación con el entorno, e invita más aún a los usuarios a entrar. En cuanto al

entorno, el acceso norte del vestíbulo da a un jardín, con el que la biblioteca se relaciona intensamente, facilitando además su visión con una fachada de cristal. (<http://www.bauenblog.info>)

### **Biblioteca Rector Gabriel Ferraté, Universitat Politècnica Catalunya, Barcelona – Spain 1992 – 1997**

#### **Literature:**

“Biblioteca Universitat Politècnica de Catalunya: 1992/97”. En: Artigues & Sanabria. Lleida: COAC Lleida, 2006. (Inventaris d'arquitectura ; 13). ISBN 84-96185-88-5, p. 74-79.

Llorente Díaz, Marta. “Cinco bibliotecas de Artigues y Sanabria”. En: ON Diseño, n. 208 (1999), p. 210-241.

Obra del equipo de arquitectos Artigues & Sanabria (1992-1997), la **Biblioteca Rector Gabriel Ferraté** de la **Universidad Politècnica de Catalunya** se encuentra situada en una zona límite: entre la ciudad y el campus universitario. Esta especial condición de límite, de transición entre dos espacios, se tuvo mucho cuidado a la hora de diseñar el edificio. La biblioteca se ha concebido en forma de puerta: de puerta que invita a entrar en el edificio ... pero también de puerta, de entrada o de salida, entre el campus y la ciudad. Esta situación estratégica ha provocado que el edificio fuera capaz de generar actividad por sí mismo, como elemento vehiculador de relaciones, de múltiples relaciones. Muchas veces hemos hablado en el blog de la importancia que adquieren en los edificios de bibliotecas las zonas de relación entre el interior y el exterior. Hemos visto que adquirirían distintas formas (una pasarela elevada a la **biblioteca del Campus de Sescelades de Tarragona** , o **una plaza cubierta en la Biblioteca Nacional de Singapur** , entre muchos otros). En el caso de la BRGF, este espacio toma forma de calle, una calle de nueva creación, que actúa como elemento de encuentro, de reunión, y que canaliza todos los tráficos y toda la circulación por el edificio. Esta calle interior "corta" en dos partes todo el edificio, dividiéndolo claramente en dos zonas: las áreas servidas de las actividades, las funciones y los servicios que ofrece la biblioteca como servicio universitario, y las áreas servidas, las que reciben todas estas actividades, funciones y servicios. Hay, pues, una clara división funcional entre usuarios internos (los propios bibliotecarios) y usuarios externos (los estudiantes universitarios), que me ha parecido interesante remarcar. ### **Biblioteca can Baró en Corbera de Llobregat – Spain 2010**

Emplazamiento: Corbera de Llobregat, Barcelona, Promotor: Ayuntamiento de Corbera de Llobregat

Crear un lenguaje único a través de los materiales de construcción, fue la mejor vía para integrar arquitectónicamente un edificio existente – que se ha rehabilitado – y un equipamiento anexo – de nueva creación –. La carpintería de Technal se muestra en la Biblioteca Can Baró, obra de los arquitectos Sierra-Rozas, como una solución óptima y envolvente que dota de transparencia y modernidad a un equipamiento ubicado en un entorno topográfico complejo.

La Biblioteca Can Baró situada en el municipio barcelonés de Corbera de Llobregat, combina la rehabilitación de un edificio existente con la creación de una pieza arquitectónica hecha a medida para el espacio existente. Los arquitectos Sierra-Rozas establecieron que el edificio original sólo conservara los paramentos de fachada, mientras que la ampliación se definiera a partir de la topografía del lugar, aprovechando el desnivel existente.

El resultado es que la cubierta del edificio anexo se transforma en una alfombra horizontal como prolongación de un espacio de acera de la calle superior. Ésta va descendiendo sobre el propio terreno del lugar, dando lugar a un juego de cubiertas que suben, bajan y se rompen. Dentro del edificio, se acaban generando espacios a doble altura, con formas de filtrar la luz natural para conseguir iluminar las salas más interiores.

La piel del nuevo edificio, en la planta baja, la define un cerramiento vidriado para dar una total transparencia y, a modo de escaparate, contar lo que sucede en el interior. Más arriba, los espacios solamente se abren al exterior en puntos muy concretos y controlados, buscando de forma selectiva las mejores vistas.

La intención de los arquitectos era establecer un mismo lenguaje en la forma para mezclar e interrelacionar los dos edificios. Para conseguir este efecto, se ha optado por utilizar materiales comunes, tanto en el interior como en el exterior. En la ampliación se ha optado por perfilera de Muro Cortina MX de parrilla tradicional, tanto en aberturas verticales como en el lucernario. En el edificio existente las aberturas se resuelven con ventanas Unicity de hoja oculta y el lucernario con perfilera MX y vidrios fotovoltaicos. Las puertas de acceso son PH. (<http://www.technal.es>)

La biblioteca como continuidad de la topografía del lugar

La ampliación, proyectada por el estudio Sierra Rozas Arquitectes, nace de la topografía como continuidad de la misma, buscando una fusión entre el edificio y el espacio público.

El lugar destinado a la ampliación y todo el entorno de Can Baró, conservaba el encanto de aquellas zonas donde la diversidad y la falta de unidad hace necesaria una respuesta contundente, lógica y meditada. La ampliación, proyectada por Antonio Sierra y Ana Belén Rozas (Sierra Rozas Arquitectes), nace de la topografía, como continuidad de la misma, buscando una fusión entre el edificio y el espacio público, de manera que el espacio público no es tratado como aquello que encontramos entre los edificios, sino que queda integrado en la propia arquitectura, y el espacio arquitectónico es aquello que encontramos escondido o camuflado dentro la topografía.

El edificio responde al entorno que le rodea, con unos condicionantes de partida: el edificio existente y un gran vacío irregular de geometría compleja y con un considerable desnivel topográfico. El nuevo edificio, en su aparente complejidad formal, se puede resumir sencillamente como una pieza hecha a medida del lugar, construida o modelada con aquello que no podemos tocar, pero sí percibir: luz-sombra, vacío-lleño, abierto-cerrado, cálido-frío... La reforma de Can Baró se aborda de forma íntegra conservando, únicamente, los cerramientos de fachada.

Aprovechando el fuerte desnivel, la biblioteca se muestra como una continuidad de la topografía del lugar, parte de la cubierta se transforma en alfombra horizontal como prolongación del espacio de acera de la calle superior constituyéndose en plaza pública. Esta plaza, que sube en pendiente buscando las mejores vistas, culmina en el punto más alto como mirador en un lugar privilegiado. A partir de aquí, el edificio no se entiende como edificio, sino que se trata del propio terreno del lugar que desciende y se modela para acabar transformándose en un espacio donde albergar el programa de la biblioteca, las cubiertas comienzan a romperse bajando como topografía que desciende buscando el diálogo y relación con las edificaciones vecinas. El juego de cubiertas que suben, bajan, se quebrantan...es el mecanismo que permite, simultáneamente, ganar altura a los espacios interiores y, a la vez, filtrar y captar la luz natural para iluminar los espacios más interiores.

Dentro, los dobles espacios acabarán de llevar la luz a los espacios más inferiores. A nivel de piel, en planta baja se opta por un cerramiento el máximo vidriado con el fin de dar transparencia y anunciar lo que dentro se produce, como si fuese un escaparate, más arriba los espacios tan solo se abren en puntos muy concretos y controlados, buscando de forma selectiva las mejores vistas,

permitiendo espacios más tranquilos y aptos para la lectura, preservando tanto la propia intimidad como la de las edificaciones vecinas que le rodean. En el interior todo se articula en secuencias y espacios que cambian constantemente con simultaneidad de espacios diáfanos, dobles espacios, visiones diagonalizadas, vistas muy controladas y múltiples entradas de luz cenital.

El proyecto de mobiliario interior acaba de reforzar las trazas arquitectónicas.

Aquello nuevo y aquello existente se relacionan entre sí, con el máximo respeto, por analogía y contraste. El uso de materiales comunes, tanto en el interior como en el exterior, y el uso de un mismo lenguaje formal y espacial acaban de maclar e interrelacionar los dos edificios.

La intervención supone también la urbanización de todo el entorno de la biblioteca, con claras mejoras de conectividad peatonal. (<http://www.viaconstruction.com>)

### **Biblioteca de Sant Adria de la Mina, Barcelona – Spain 2005 - 2009**

Promotor: Consorci de la Mina, Sup. edif.: 4.200m<sup>2</sup>, Pressupost: 4.100.000 €

La Biblioteca de la Mina es un equipamiento público surgido en el corazón de uno de los barrios históricamente más conflictivos de Barcelona, por ser el lugar donde se reubicaron, en época franquista, muchas de las familias gitanas de la zona. En la última década el barrio ha sido objeto de una profunda transformación con el fin de romper definitivamente con su trayectoria de marginación social y urbana. La decisión de realizar aquí una gran biblioteca pública se inscribe en las políticas transformación social a partir de equipamientos públicos abiertos a la ciudad y capaces de desencadenar procesos de transformación urbana. Se plantea un edificio emblemático y representativo capaz de generar una imagen reconocible en el barrio y convertirse así en un lugar de encuentro y en una nueva centralidad para una zona que siempre había carecido de espacios públicos. La voluntad de ser un edificio receptivo y acogedor se traduce en una entrada urbana clara y amplia, con un gran voladizo que se extiende sobre la calle con el fin de atraer a las personas del barrio. Un primer proyecto, interrumpido, había sido diseñado en los años '90 por Enric Miralles y Carme Pinós. La presente propuesta recupera un fragmento de esta intervención, la sala polivalente, englobándolo en el nuevo edificio que actúa como contenedor. La sala se potencia mediante iluminación cenital, abriendo algunas de las paredes opacas perimetrales y facilitando su acceso para convertirla en el hall de entrada a la biblioteca y en un espacio para exposiciones temporales y acontecimientos singulares. La entrada de luz a través de las fachadas y de las claraboyas de cubierta proporciona un espacio interior diáfano y de gran calidad ambiental. Una segunda sala, paralela al hall, constituye la parte principal de la biblioteca. Esta zona también goza de iluminación cenital, tamizada con altillos y franjas de vegetación. Otros espacios menores están destinados a grupos de entidades, talleres, espacios de formación, oficina de ocupación, etc. by Karina Duque (<http://www.plataformaarquitectura.cl>)

### **Biblioteca les Roquetes a Via Favència, Barcelona – Spain 2005 - 2008**

Promotor: Pronoba. Diputació de Barcelona, Sup.: 1.430m<sup>2</sup>, Pressupost: 1.400.000 €

El primer objeto del encargo es la rehabilitación, ampliación y acondicionamiento para uso de biblioteca de un equipamiento existente, obra del arquitecto Marcia Codinach en vía Favència, en un tramo urbano habilitado sobre la cubierta de las “Rondas” (vías de circunvalación) de Barcelona. La segunda parte del proyecto consiste en la urbanización de los espacios adyacentes, en particular la zona entre los edificios existentes, donde se sitúa el acceso principal que convierte este espacio en un gran hall exterior abierto a la ciudad. Este equipamiento es una biblioteca de barrio que consta de una zona pública a nivel de la calle de acceso donde se ubican los espacios destinados a zona infantil, informática, prensa diaria, clases de formación y de estudio. El programa se organiza entre el edificio existente y un nuevo edificio anexo, adyacente al antiguo y conectado a este mediante un espacio de transición concebido como una sala de exposición: diáfano, con una gran rampa escalonada de conexión entre niveles. En planta baja, aprovechando la pendiente de las “Rondas”, se sitúan una sala de actos con acceso independiente y un área de trabajo interno. El planteamiento estructural, condicionado por la delicada situación del emplazamiento (encima de la cubierta de las vías de circunvalación), se resuelve con una estructura de acero a modo de puente, sobre tres bancadas corridas apoyadas sobre obra de fábrica existente, con luces de 15 mts aprox. Este principio estructural permite unos espacios diáfanos con iluminación natural que confieren al conjunto una gran calidad ambiental. En el edificio existente, unos lucernarios longitudinales corridos, orientados a Norte, proporcionan una luz homogénea constante y son a la vez el soporte de una instalación fotovoltaica. La imagen general del exterior pretende ser muy agresiva y monolítica, con geometrías contundentes y claras, en contraste con un ambiente cálido y de gran confort acústico y visual en el interior. Este efecto se consigue con el tratamiento de los materiales empleados, potenciando sus características y expresión propia: acero “corten” en el exterior i maderas claras (abedul) en el interior. El edificio anexo es un cuerpo rectangular de acero “corten” que queda suspendido y separado respecto al equipamiento existente. Este nuevo espacio se abre hacia el Este con un gran ventanal a doble altura y un cielo raso inclinado que acentúa el efecto de perspectiva y focaliza la visión hacia el panorama de la ciudad, mientras se cierra completamente al ruido de las calles laterales. La fachada principal, de chapa de “corten” perforada, permite jugar con unos gradientes de luz muy variables según las horas del día y de la noche, convirtiéndose en un filtro totalmente transparente o en una pantalla absolutamente opaca. La biblioteca se ha convertido en punto de reunión y referente en el barrio por las geometrías contundentes y de fácil lectura en el exterior y la organización muy clara de espacios y recorridos en el interior, donde los materiales empleados y la escala humana proporcionan un ambiente cálido e acogedor. by Karina Duque (<http://www.plataformaarquitectura.cl>)

### **Biblioteca Central Jordi Solé Tura, Mollet del Vallès – Spain (2009) on construction**

Client: Diputació de Barcelona (Barcelona Provincial Council), 4.500 m<sup>2</sup>

Construction of the Central Library of Mollet, as a result of a competition for the construction of the library and the police station on a parcel of municipal property. The library is part of an unitary project, that from the dialogue and the tension between the two buildings, articulates a new urban space, giving continuity to the parts around. (t9s)

El ayuntamiento de Mollet del Vallès proyecta su segunda biblioteca municipal en honor al político y académico Jordi Solé Tura, fallecido el pasado 4 de diciembre. La nueva biblioteca Jordi Solé Tura, que supondrá una inversión de 7,6 millones de euros, cuadruplicará la superficie útil de la actual, ubicada en la plaza Can Mulà de Mollet y su diseño permitirá ahorrar 136 toneladas de emisiones de CO2. La Diputación de Barcelona ha entregado hoy al Ayuntamiento de Mollet del Vallès el proyecto arquitectónico de la que será la nueva biblioteca central de la ciudad. El alcalde de Mollet del Vallès, Josep Monràs, ha destacado que la ciudad "pasará de tener una biblioteca de 900 metros cuadrados, a otra con más de 3.000 metros cuadrados". Monràs ha destacado la importancia del proyecto argumentado que "antes las bibliotecas eran sólo contenedores de libros, pero los centros bibliotecarios actuales se han convertido en el eje central de las políticas de cultura en la ciudad".

El nuevo edificio se ha diseñado de forma sostenible aplicando sistemas de captación de energías renovables, de aprovechamiento de la luz solar y medidas de eficiencia [...] <http://www.noticias.com>

### **Ludeca y C.R.E. (centro de recursos educativos deciuatat vella) en Edificio Existente, Barcelona – Spain 2008 - 2010**

Reciclar Ciudad. Reconversión de un 'rincón' del barrio gótico de Barcelona, transformando la edificación existente en desuso, cerrada y obsoleta, en un edificio público cualificado que aprovecha las potencialidades del lugar y genere urbanidad. Liberar la torre gótica. Con el escombros de parte de la edificación existente se recupera la torre gótica de Santa Maria del Pi, que se libera de las tensiones actuales, y se genera un patio a sus pies, futuro acceso en el interior de isla. Crujía vieja – Cuerpo nuevo. Se rehabilita la primera cruja del edificio existente para mantener el carácter histórico de la plaza. Y se construye un cuerpo nuevo detrás, de estructura metálica y piel de zinc, que dialoga con lo existente y deja libre la torre. La torre como telón de fondo. El nuevo contenedor metálico explosiona, gesticula y se desmaterializa al encontrar la torre. Los sillares de la torre devienen así el cuarto cierre del espacio en todas las plantas del edificio. Un espejo de fachadas. La fachada del nuevo cuerpo ante la torre, deviene una reinterpretación contemporánea del antiguo gótico. La materia pétreo, masiva, se transmuta en una piel de lamas semitransparente, las líneas de imposta son ahora UPE metálicas... Aire y luz como bisagras. Entre lo nuevo y lo viejo, una rendija de luz y aire relaciona visualmente todas las plantas y prolonga el exterior hacia dentro. En el cuerpo viejo la planta baja se aboca hacia la plaza favoreciendo la proximidad entre el espacio urbano cercano y los nuevos usos ciudadanos. Contenedor de usos sociales. Los espacios logísticos y la escalera se sitúan a la fachada de la Androna. El resto de espacio se libera posibilitando usos diversos. Así como en el cuerpo viejo los espacios se abocan hacia la plaza, en el cuerpo nuevo se encaran a la torre. Proceso constructivo innovador. El entramado estructural se montó previamente a la deconstrucción del edificio, para trabar los edificios adyacentes. A continuación, se trabajó simultáneamente en acabar las plantas superiores y en los trabajos de arqueología para rebajar el sótano, acortando el plazo de la obra 4 meses. Un lugar: una construcción. Estructura metálica, fachada ventilada, tabiques en seco, aplacados de resinas, pavimento de goma, estucado tradicional de cal... Los sistemas constructivos se diseñan para dar respuesta tanto a las dificultades del lugar como las demandas de minimización de residuos, eficiencia energética, durabilidad y fácil mantenimiento.

### **Biblioteca Salvador Cabre de Singuerlin, Santa Coloma de Gramenet – Spain 2005 – 2010**

Client: Ayuntamiento de Sancta Coloma de Gramenet (Diputación de Barcelona), 2.350 m<sup>2</sup>  
Ajuntament de Santa Coloma de Gramenet: 2.924.982,47 €, Diputació de Barcelona: 2.183.071,89 €

Renovation of the old market of Singuerlin into a main municipal library, integrating the building to the neighbourhood and giving to it the characters of representation that should have a public facility of its features. (t9s)

Inauguración de la Biblioteca Singuerlin - Salvador Cabré de Santa Coloma de Gramenet (Barcelonés)

Sábado, 15 de mayo de 2010, a las 13 horas. La biblioteca, de 1.748 m<sup>2</sup>, es la nueva sede de la Biblioteca Singuerlin, que ahora incorpora el nombre de Salvador Cabré, sacerdote de la parroquia del barrio del Singuerlin durante el franquismo e impulsor de la lengua y la cultura catalanas en la ciudad durante la década del setenta. El nuevo equipamiento es una biblioteca de proximidad, forma parte de la Red de Bibliotecas Municipales de la provincia de Barcelona y del Sistema de Lectura Pública de Cataluña. El proyecto, a cargo de Oriol Cusidó e Irene Marzo, ocupa una sola planta situada sobre el mercado municipal del barrio mencionado y destaca por su diseño de interiores diáfanos, con entradas de luz natural y con una fachada de gran personalidad formal. Se distribuye en cuatro zonas principales: área de acogida y promoción, zona de información y fondo bibliográfico general; biblioteca infantil y área de trabajo interno. La biblioteca cuenta con un fondo de 32.450 documentos y 166 suscripciones a diarios y revistas. Una de sus particularidades es el fondo especial de cine de autor y cine documental. Abrirá 40 horas, de lunes a sábado, y ofrecerá, entre otros, los servicios de información y préstamo, acceso a Internet, zona Wi - Fi, área de música, y sala polivalente que incluye una sala de cine con capacidad para 250 personas. El coste de la inversión inicial ha sido de 5.108.054,36 euros.

### **Biblioteca Roca Umbert en nave industrial, Granollers – Spain 2005 - 2010**

Coautoría con Agustí Mateos (<http://www.mateosarquitecto.com>), Client: Diputación de Barcelona, 1.809 m<sup>2</sup>

Renovation of an old factory of XIXth century sited in the industrial complex of Roca Umbert, to place a library adapted to the new technologies and to the different supports of knowledge. (t9s)

La Biblioteca està ubicada en una de les naus d'aquesta antiga fàbrica tèxtil reconvertida en centre cultural. Pel que fa a la seua arquitectura, com a element més significatiu destacaria el porxo cobert adossat a la façana principal. Aquest està dividit en dues parts longitudinals: la primera, és exterior; mentre que la segona està vidriada i representa una extensió de la Biblioteca cap a fora, un zona de relació dins-fora, fàbrica-cultura... d'invitació a entrar i mirar. En aquests espais s'hi han habilitat zones de lleure i lectura lúdica: la zona de còmics, premsa, etc. (<http://www.bauenblog.info>)

### **Biblioteca del Gótico, Barcelona – Spain 2006 – 2010**

Client: Foment de Ciutat Vella, 1.042 m<sup>2</sup>

El coste de la inversión inicial ha sido de 2.893.250,00 euros, con las siguientes aportaciones por administraciones:  
Ayuntamiento de Barcelona: 2.269.348,00 €, Consorcio de Bibliotecas de Barcelona: 43.112,86 €, Diputación de Barcelona: 326.088,89 €, Generalitat de Catalunya: 254.700,00 €

Renovation of the building, sited at Placeta del Pi in Barcelona, into the new library of the Gothic district. Part of the existing building is demolished to free the Gothic tower of the current tensions to open a patio at its feet. It's been built a new volume with metal skin and structure, which interacts with the part of the building that remains. (t9s)

Se inaugura la Biblioteca Gòtic – Andreu Nin de Barcelona (Barcelonés)

Domingo 2 de mayo de 2010, a las 11.00 horas

El nuevo equipamiento municipal, de 994 m2, dará servicio a los vecinos del barrio Gótico en un área de influencia de 34.000 habitantes. Constituye la cuarta biblioteca de Ciutat Vella, con lo cual se completa la estructura de este distrito de Barcelona de acuerdo con el Mapa de la Lectura Pública de Cataluña. Este nuevo equipamiento de Bibliotecas de Barcelona formará parte de la Xarxa de Biblioteques Municipals de la provincia de Barcelona y es la número 347 del Sistema de la Lectura Pública de Catalunya. La biblioteca se sitúa la antigua sede de la Universidad Pompeu Fabra (UPF), un edificio que durante la Guerra Civil acogió la sede del Partido Obrero de Unificación Marxista (POUM), del que fue secretario general el periodista y sindicalista Andreu Nin. El proyecto, a cargo de Ramon Farré - Escofet París y Massimo Preziosi, consiste en una reforma interior para adaptar los espacios de la antigua biblioteca universitaria a las exigencias de la nueva biblioteca municipal, cambiando, sin embargo, la ubicación del acceso que se sitúa de cara a la Rambla a través de un vestíbulo compartido con la Escuela Elisava que ocupa otra parte del edificio. La biblioteca cuenta con un fondo de 16.865 documentos, de los cuales 2.800 son fondos audiovisual y 65 suscripciones a diarios y revistas. Cabe destacar que dispone de un centro de interés sobre la Rambla; abrirá 38 horas y media, de lunes a sábado, y ofrecerá, entre otros, los servicios de información y asesoramiento, préstamo, apoyo a la formación y autoaprendizaje, formación en TIC, acceso a Internet, red Wi-Fi, apoyo a las escuelas, actividades culturales y difusión de la lectura. Edificio versátil, con plantas abiertas, sin espacios condicionales y totalmente preparado para adoptar las nuevas tecnologías, está construido sobre una superficie de 10.533 m2 distribuido en tres plantas idénticas y un sótano. Cada planta es una concentración de la anterior ya que repite, condensa y precisa, lo que la otra propone. En este proyecto el arquitecto vuelca un estilo programático sobre una concepción fluctuante y versátil de los espacios. La planta baja es completamente transparente ya que transmite la sensación de claridad gracias a los grandes ventanales en su fachada sur y posterior. La planta primera, más formalizada y silenciosa, tiene dieciocho puestos para visionado de DVD y VHS, catorce para DVD, catorce para portátiles WI-FI y diez puestos con acceso a Internet. La sala de consulta y referencia tiene una capacidad de doscientas noventa plazas. La segunda planta tiene un formalismo estético basado en lucernarios que iluminan la planta inferior y que aparecen como enormes ánforas conectando el suelo con el techo. Están distribuidas de forma que dividen el espacio en una serie de recovecos agradables que favorecen la lectura en ciento setenta y siete puestos. El edificio posee zonas de almacenamiento de fondos históricos y hemerográficos en la planta sótano y en las entreplantas. Cuenta con espacios para exposiciones, (290 m2) reuniones, conferencias y actos culturales (cien plazas), aparcamiento de cuatro bibliobuses así como espacios para servicios internos, trabajos técnicos y administrativos en la segunda planta. **Lomma Bibliotek, Lomma – Sweden 2009**

1.200 m<sup>2</sup>

Lomma new library, with its location on the border between the existing center and a new town district by the sea that suddenly emerge, is given a key position in the city with great symbolic value for the municipality. The Library building, situated close to the Høje river, is simple in its form, fully dressed with galvanized steel plates it relates to the port environment with boats and plate sheds. The building is located on an elevated granite plateau with an entrance ramp in all its width. Towards the water and the view is a less disconnected cafe building, as an architectural "little brother" to the library, from where it also can be reached.

Once in the building you meet a single large room into two floors height with a considerably raked roofs. A straight staircase, like a gangway leads up to an entresol, freely floating and completely fresh-cut from the outer contour. A core along the north facade contains administrative and personnel functions. The rest of the library is fully intended for the public. A unifying visual idea is the "Red wall" from floor to ceiling, as a cardiac wall decorated with the LIBRARY translated into 50 different languages by writing in silver. The wall is designed by graphic artist Gabor Palotai. The library is designed as a heavy house with concrete walls and ceilings. Floors are designed as 50 cm deep floor installation, which has the advantage that all electricity and plumbing installations are hidden. The only visible traces are three stainless steel chimneys at north facade. (Jais-Nielsen)

BTA 900 m<sup>2</sup> gross area building with orangery 270 m<sup>2</sup>, 300 m<sup>2</sup> renovation

When the town of Vaxholm decided to build a new arts center was the place given to the central park camp adjacent to the older existing cinema theater. Our aim and intention was to make the arts center to a part of the park and the park to some of the arts center. The solution was the orangery, which can be regarded both park and cultural center, a borderland between the two.

Orangery linking indoors and outdoors but also the site of different height levels and culture house various business areas. Certain activities may also be made directly in this room as author evenings, musical performances, exhibitions and children's play. In winter, the room is a warm extension of the park and water-laden summer days, it acts as a ceiling for café guests. Year round, it is an inviting place, with a low "threshold", the city and visitors. (Malmström)

**Universitetsbibliotek Växjö – Sweden 2006**

Client: Videum AB, Completed in 2006, Area: 11300m<sup>2</sup> Total BTA which 7200m<sup>2</sup> building BTA

Conversion and extension of existing university library. (Malmström)

Växjö university library is located on campus and consists of two buildings, an older brick building dating from 1995 and a newer annex building, which was finalized in 2006. If and to the building was designed by Malmström & Edström Architects. Rooms for studies The library contains different types of learning environments to choose from, here are 54 meeting rooms of varying size, three quiet reading rooms and over 900 study places. More than a library The library has Pedagogical University Centre, UPC their premises. The library is also ICT workshop for the training of university staff, a Multimediaal with equipment for showing films, video conferencing and distance learning. There are also language and mediolab and Text Workshop, which provides support in academic writing. (<http://194.47.65.210/bib/om/fakta/index/xml>)

**2004 Pristagare Kasper Salinpriset**

The building area is 10 800 sq-meters and the program organizer Including Areas library, restaurant, cafe and two large spaces for exam writing. The building is Tilted Slightly out of the General Of The grid area. Simplicity in plane (a Rectangle of 49x58 m) is contrasted in a more complex cross section. A study room Suspended enable visual contact diagonally Between the main levels of the library and Allows for daylight to reach the center of the building. No main-staircase Is to Be Found, Instead Vertical Communications are Organized by four Staircase Which "also work as fire-escape ways. The Demand for Flexibility resulted in a site-casted Concrete Construction regarding the large open spaces. Supplementary Structures, clad with industrially strongly Coloured panels or glass, are removable INSERTED AS VOLUME. A floor of massive wood (ash) Provides a silent and long-lasting Unifying horizontal surface in the library. The interior design was Developed Follo wing a special concept. Parts related to more permanent building-elements, Such as the Load-Bearing Structure and Staircase, were expressing Them Selves throughout Their on materiality (Concrete, steel, limestone ecc) While more temporary Instead element acted by means of the color. Less long-lasting elements were Defined as free-standing building VOLUME (Placed In The Open-Space Library), Book-Shelves, furniture's and even books. All of These were seen as "color", Which Implior that the character of The Library Will change over time. As Responsible Architect to the building we were also "Concerning collaborating's furniture and book-Shelves But the main Responsibility Were

Divided By; Bertil Harström / Furnishing Group (interior architect) in charge of all the furniture / Book Shelves, But For The "hanging" reading-room. (Malmström) (<http://sv.wikipedia.org>)

[Almedalsbiblioteket, Visby - Sweden 2001](#)

Client: Municipality of Gotland, Scope: 6900 m<sup>2</sup>

**Awards:**

**Nomination Mies van der Rohe Prize 2003**

Construction of integrated university and city library and the expansion of university entrance and restaurant. (Malmström)  
The architects Christer Malmström and Anders Grape wanted to build a building with modern design language and modern materials in harmony with the medieval world heritage city of Visby. The austere exterior form with its simple straight largely follows the Gotland building tradition, as well as the choice of materials and colors. By mixing concrete with cement and pigment has produced a color that is close to limestone. The whole color scheme of various shades of gray, white and gray / green is the color landscape of Gotland. In the large glass surfaces reflected the medieval city both from without and from within the building.  
Interior: Interior Architects Annika Tengstrand and Olle Salmonson has created a functional and beautiful interior that interact with the house and the architect's intentions. The library is decorated with compact shelving in straight lines to achieve a simplicity that matches the building. In the free and open areas are läseplatser, where you can fully enjoy the house's openness. The materials are oak, ash, gray homespun, black leather, black lacquer and a green shade that captures both the glass facade and the green Almedalen outside. The intention has been to shape an environment where architecture, interior and environment interact and create rooms that are both practical and beautiful restful. Environment and Technology: Almedal Library is an example of how architecture, technology and efficient use of the surrounding nature, can create an excellent environment, indoor climate and minimal burden on the environment. With the help of the Baltic Sea water and the sun keeps the library cool in summer and warm in winter. Facts: Facade Surfaces with a high degree of isolation. Glass Surfaces with optimized isolation. Systems for renewable energy sources. Cooling system with seawater as cooling source, the pump system powered by solar energy. Control systems with a high degree of individual control. Ventilation system with low flow rate. The transfer of heat to adjacent buildings. As a whole, the system is so energy efficient that the proportion of purchased electric energy for operating costs only amounts to approximately 10-12% of normal. Arts: Almedal Library foyer is in itself an aesthetic experience given the choice of building materials and the space that allows the glass room. The floor of limestone with a touch of marble were designed by Karin Fors Tyre. The fantastic view of Almedalen broken by a soft arches - a bridge between the inner and the outer room. "Crake" by Lars Vällinge, an expressive sculpture hanging in good agreement with the architecture and landscape. On Cramér Street hangs Korsman Marianne Ullmann-stained-glass window depicting the S: Nikolai church in Visby. The window to the Congress hall stands Pye Engström "sit", one of the works 'followed by' to Almedalen. The sculpture was bought for the inauguration of the library in Visby in 1960th. National Arts Council representative Kjell Strandqvist, which was responsible for the selection of newly acquired art to the library, the reasons for their choice this way: "A library fills that rule their walls with bookcases, therefore, is my choice of the so-called resolve art sculpture with one exception:" Echoes ", an acrylic painting on glass by Thomas Deyle. The painting hangs in the reading room on Level 2. In the fiction department are the major texting "We are on the wall", woven in the studio by Barbro Nilsson, Sven X: et Erixon model - a post in the neutrality debate 1942nd A key event in the history of Gotland linked this directly to the time when the current political situation. Here is also stone sculpture "Proceeds" of Lena Krister. The cheeky bunny by Amalia Årfelt visit the children's department. On the 3rd floor is Hans-Christer Ericson's "literally sculpture" in plastic, wood and paper - a choice that is based in the surrounding environment and in which language and the form may be concrete shape. Anders Thorlin is represented by two of its mighty stone, and books on Gotlandica department is Staffan Rosvall schooner "Hansina", Stina Lindholm's "Terra Gotlandica" and Pye Engström "gatepost Old Woman". In connection with Gotlandica archive is Bertil Nystrom's portrait busts in bronze by David Ahlqvist and Gustaf Larsson. (<http://mainweb.hgo.se>)

[Bibliotek Forum Nacka, Nacka – Sweden 2008](#)

1.220 m<sup>2</sup>

In early 2007, decided Nacka Municipality in order to thoroughly transform the old main library, in the center of the plant transformation. We have already tied up in programming and planning stage to develop a proposal for a new library with the overall profile information and meeting place. The library should integrate information Nacka (municipal equivalent of the civic offices) as well as new elements such as exhibition space, cafe and tourist information. The result is a library that will provide an alternative to commerce in the center and could attract a well filled with programs for residents and visitors Nacka. The content is easy to change, the various components to grow and shrink. Library media collections are organized around four themes, World, Pleasure Readers, Family and Leisure & Culture / Entertainment. Each theme is represented by a department and each department has a core that is the nature of the fully furnished with seats and läsbord, they provide orientation points to form rooms in the room. Centrally located is square, a smaller event and meeting place for politicians hits or visits by authors. Square wall backs up stage performances and allow the wall paintings or views in large format. Café with newspapers and TV monitors, display / exposure, sales and service functions simpler is positioned closer to entrance to attract and serve visitors. At the far end of the hall are offices and storage, visible from the public area. Local conditions offers a simple rectangular room with a large inlet of daylight from the side. Here's ambition was to create a general and flexible due to a strong character and changing decor. The floor, a rubber mat laid in an irregular grid of reinforcing the shelf direction. The roof, cassettes of networks with different hole patterns and transparency interacts with the floor and may also be a varied appearance with the help of lights. Integrated in the roof are great opportunities for fixed and mobile lighting and electricity. Bookshelves are oriented perpendicular to the window facing to the maximum benefit from daylight. From a steady mass of the shelves are then spot situations created and carved out to make room for departmental core, access data locations and the square. Furniture and furnishings to express modernity without being trendy. Bookshelves dominate with a cool and harmonious colors. Kernels and café contrasting with a temperature scale to be seen. [Kulturhus och Bibliotek, Vallentuna – Sweden 2012](#)

3086 m<sup>2</sup>

Five years have passed since the politicians decided to build a new cultural center and library in Vallentuna center. Now it's finished and Vallentuna has a new landmark.

- It is amazing to see how good it has become. By investing in culture, we are investing in the development of the municipality, said Orjan Lid (M), Mayor.

Architecturally, the house stands out. It is designed by Lars Gauffin on Nyréns Architects and building design plays with the boundary between indoors and outdoors. But the real heart of the house is the business. There is something for everyone whether you are looking for speed and excitement, or peace and quiet. There are five scenes in the house, including an outdoor scene. There are also showrooms, one konstklub and a creative workshop.

- It's Vall Tunas new living room. You should be able to discover new things and create yourself. Equally important is to just be. Reading a newspaper, have a cup of coffee or listen to music, says Pernilla Wolverine Roth, cultural section.

Culture and the library is an exciting venue for both young and old Vallentunabor. Moreover, it is a natural gathering place for many local associations.

- Vallentuna is one of Sweden's fastest growing municipalities. People want to move here because it's a great place to live. We have nature on their doorstep, and very close to the capital. With the new arts center, we also get an even richer cultural life, says Orjan Lid.

### **Stifts- och Landesbiblioteket, Linköping – Sweden 2000**

Biblioteket har en enkel uppbyggnad med två huvudelement i form av de låga längorna mot Hunnebergsgatan och den stora bokhallen mot entréplatsen och parken. Biblioteket är uppbyggt av slitstarka och vackra naturmaterial och byggnaden släpper in rikligt med dagsljus.

Vi specialritade alla diskar, bokhyllor, ställ och förvaringsmöbler samt tog fram en ny hyll- och bordsbelysning. Två stora armaturer håller ihop inredningen – en 72 meter lång armatur som leder in i bokhallen och en stor rund armatur som dels binder ihop rummet för tidningsläsning på hyllan, dels fungerar som lykta mot entrén om kvällarna.

Formgivaren Gunilla Allard fick rita nya stolar och fätöljer till biblioteket. Landskapsplanering, byggnad och inredning samspelar till en sammanhållande helhet

Landskapsprojektet består av ett nytt entrétorg samt delar av Kungsträdgården med sina rötter i tidig medeltid. Biblioteksplatsen med sin övergripande triangulära form följs upp i beläggningen av specialgjutna betongplattor och placeringen av askträäd, belysning med mera. Mot parken finns en parterr av bokstäver i klippt bok.

**Awards:**

SAR Middle Norrland award as the best building in 2001 and the Year Award Library.

**Literature:**

Architecture 6 / 2000 and the Architectural Review febr/2003.

Combined city and university libraries that connects the city center of campus. After the win in a general architectural competition with 63 proposals submitted for the project was the house of FFNS Architects in Umeå with His Tirzah with us as a project architect and Martin Hall, although he is now with us, as Managing Agents architect. Client was in Umeå Akademiska Hus AB.

Härnösands Sambibliotek - will be a meeting point for all Härnösand residents. Situated beside the city park, between the city centre and the high school grounds, the emphasis of the Sambiblioteket is as a place for meetings and discussion. " We wanted the glass wall to be as "immaterial" as possible," says Sambiblioteket architect, Hans Tirsén. "We wanted just a thin membrane between the book halls and the beautiful park outside, with as few skirting-boards and other intrusive trimmings as possible. The height of the glass wall made proper reinforcement against wind loads essential. The SGS system incorporating spar like frames and fish-shaped tie rods was exactly what we were looking for." "The high glass wall could have caused irritating draughts for people sitting close by. We solved this by using horizontal wooden wings to lead the cold air away from the façade. SGS made an excellent job of constructing these components. SGS were capable of providing all the elegant fitting solutions while taking responsibility for function at the same time, and we found this ability invaluable. It would hardly have been feasible for us to attain such high quality design and execution by ourselves." The glassed area covers over 1200 sq.m. and for the most part the SG Link system type, fitted to oak beams with horizontal fastenings, has been used. The steel frame is rod reinforced to facilitate the use of the ultra slim steel pillars. The pillars are fastened telescopically to the roof construction, complemented with bearing wires which carry the weight of

the facade to the top of the pillars. From here the load is carried down into the ground. " We look forward to working together again at some future and suitable time," says Hans Tirsén. "It's good to know such an advanced facade can be built on a limited project budget." (<http://www.skandglas.se>)

## **White, Göteborg – Sweden**

<http://www.white.se>

### **Libraries:**

#### **Karlstad University Library, Karlstad – Sweden 1997 – 2002**

Kund: Akademiska hus, Projektstart/slut: 1997 – 2002, Färdigställt: 2002, Storlek/yta: 13 450 m<sup>2</sup>, Kostnad: Ca 180 miljoner SEK

White planerade universitetets nya samlingspunkt och ansiktet utåt i nära samarbete med brukaren Akademiska Hus. Den gemensamma visionen var att skapa en tillgänglig, miljövänlig och flexibel byggnad med många kreativa mötesplatser och en tydlig, egen identitet.

Lösningen togs fram utifrån ett miljöprogram med höga krav på materialval, energieffektivitet och inomhusmiljö. Material som glas, sten, tegel och trä går igen i arkitekturen både in- och utvändigt.

I biblioteksbyggnaden, som bildar huvudentré i öppna våningsplan med stora partier av glas, har en administrativ byggnad kilats snett in. Entrén är utformad som ett infotorg, med cafédel samt läsplatser och grupprum i en inre del. Det stora biblioteksrummet har ymnigt dagsljusinsläpp till sina 1 200 läsplatser och många mötesplatser.

En stark signal om aktivitet skickar den runda aulan som skjuter upp genom taket, vars stora träklädda utsprång ger byggnaden karaktäristisk prägel. Aulan rymmer 600 gäster och används för föreläsningar, konferenser, högtider, musikevenemang etc.

Aulans och entréhallens armaturer är specialritade av White. Utanför biblioteket står en skulptur av Per Inge Bjørlo och verk av konstnärerna Helene Billgren och Petter Zennström finns inne i byggnaden. (White)

## **Wingårdh Arkitektkontor AB, Göteborg, Stockholm – Sweden**

<http://www.wingardhs.se>

### **Libraries:**

#### **Aranäs Senior High School, Kungsbacka – Sweden 2006**

### **Awards:**

**2006 Kasper Salin Prize for Aranäs Senior High School**

The Kasper Salin Prize is awarded by Sveriges Arkitekter (the Swedish Association of Architects) for the best building or built environment of the year. The award is named after the 19th century architect Kasper Salin, whose donation in 1962 was turned into Sweden's most prestigious architectural distinction. The Nyrén and Wingårdh practices are alone in having been four times selected for the award, added to which, Gert Wingårdh is the only individual architect to have been accoladed on all four occasions. Previous awards referred to the Öjared Country Club (1988), Astra Hässle (1993) and the Chalmers Student Union building (2001).

Aranäs Gymnasium – a school of many scales. The 1,500 students accommodated in the building have been divided into three teams of 500 each. Two large triangular rooms form nuclei for two of them, while the third has moved into the old, partly converted building. The teams have then been divided into smaller groups of about a hundred each. Size matters: this gives appropriately sized study groups, the conditioning governing the measurements of the triangles. The groups have a hypotenuse each, with the staff rooms directly adjacent. The indoor courts also serve as foyers for the school and for the theatre positioned nearest to the town.

Measurements and patterns take their cue from the neighbouring rectilinear townscape. By breaking the big school down into several smaller buildings, a large volume has been gathered into a compact volume, resulting in low costs, as has the use of prefabricated concrete elements for carcass and façades. The jury citation refers to an ambitious upgrade and enlargement of a high school, making it a cultural centre intended to link up with the urban centre in a rectilinear structure of precincts. The polished concrete units give the building a striking graphic acuity, at the same time as the material itself is plain and robust. The triangular light courts create a richly varied sequence of inner spaces lining a mall communicating with various entrance courts. The building was designed by Gert Wingårdh, Karin Wingårdh, Jonas Edblad and Johan Eklind. The landscaping is by Camilla Wenke, SCC.

(Wingårdhs)

#### **Mimers Hus. Cultural Centre and upper Secondary School, Kungälv – Sweden 2004**

This is a low-budget building. It called for a very plain scheme for the general layout with façades generally made of prefabricated concrete elements, but designed with great attention to the most visible parts. It houses a senior high school with technical education as well as a library and an auditorium serving the entire community. It is located on the edge of the centre of the small town of Kungälv, north of Gothenburg. Vertical and horizontal lamellas work as sunscreens and give the building a graphic pattern, endowing it with a distinct character towards the city, while birch panelling gives the interior a warm and sensitive atmosphere. Accessibility for the disabled has been another prime concern, especially in the theatre. (Wingårdhs)

#### **Ale. Cultural Centre and Secondary School, Nödinge – Sweden 1995**

Sitting at one of the coffee tables in the core of the building, you can see a rock band playing behind soundproofed glass walls, glance down at the sport hall, survey the entrance and library or pick up a magazine. This openness creates the security which a school needs. No dark corners here for bullying. Secretiveness and control are instead to be found in the classrooms, which are rooms for concentration. Claw-like, the school encircles a rock, with the entrance-side roof like a butterfly wing facing the newly formed piazza which replaces the conventional school yard. The building is robust and easily managed. Neither the brickwork nor the felt roofing have any openings, except for the lanterns, and the air moves through the building in easily cleaned ducts, unaided by fans. In addition to a healthy building, this meant low construction and running costs. Considerations of resilience have not precluded such brittle detailing as the glass walls of the library or the ceramic artistic embellishments. (Wingårdhs)

collaboration with: Gérard Chatelain, Gabriel Tournier

Année d'exécution : 1984, Montant : 200 mio CHF, Durée des travaux : 1984 – 1999, Maître de l'ouvrage DAEL - Direction des Bâtiments, Mandat architecte complet SIA 102

Le complexe Uni Mail réalisé entre 1986 et 1999, accueille les facultés de Droit, de Sciences économiques et sociales, de Psychologie et des Sciences de l'éducation, l'école de traduction et d'interprétation et différents instituts universitaires, soit au total 6'500 étudiants et 1'000 professeurs et assistants et personnel administratif. Il comprend des auditoriums et salles de séminaires et de travaux pratiques, des bibliothèques, des laboratoires et bureaux, une salle polyvalente, des cafétérias. Les divers équipements sont situés de part et d'autre d'une rue intérieure dans laquelle se retrouvent des étudiants de disciplines diverses. La rue centrale relie le parvis situé sur le boulevard du Pont d'Arve au jardin public réalisé à l'ouest d'Uni Mail par la Ville de Genève. (ACAU)

Mit einem „Dies academicus“ und einem dreitägigen Fest wird in Genf vom 12. bis 14. November der von den Architektengemeinschaft ACAU Chatelain und Tournier (Genf) geplante Universitätsneubau „Uni Mail“ feierlich eingeweiht. Der erste Teil des Universitätsneubaus, in dem die Fakultäten der Juristen, Wirtschaftswissenschaftler, Sozialwissenschaftler und der Übersetzer untergebracht sind, konnte bereits 1992 bezogen werden. Der jetzt fertiggestellte Bauteil nimmt die Studiengänge Psychologie, Erziehungswissenschaften und die fakultätsübergreifenden Bereiche auf. Insgesamt entstand mit der „Uni Mail“ Raum für 6.000 Studenten und 1.000 Professoren und Verwaltungsangestellte. Auf insgesamt ca. 30.000 Quadratmetern Fläche enthält der Gesamtkomplex Hörsäle, Bibliotheken, Labors, Büros, eine Cafeteria und eine Diskothek. Der große Baukörper auf fast quadratischer Grundfläche wird durch eine lange Fensterreihe geprägt. Um die Hochschule stärker in die Umgebung zu integrieren, führt ein Lichthof durch den gesamten Komplex. Diese „Innenstraße“ soll vor allem als Begegnungsort und als interne Erschließung der verschiedenen Bereiche dienen. In den oberen Etagen sind die Hörsäle, Seminarräume und die Bibliothek durch Stege miteinander verbunden. Neben der durch den zentralen Lichthof gebildeten Hauptachse gibt es noch vier kleinere Innenhöfe, die das Gebäude strukturieren und eine Belichtung der innenliegenden Räume ermöglichen. Die Baukosten für die zwei Phasen des Universitätsneubaus belaufen sich auf insgesamt rund 200 Millionen Schweizer Franken. (<http://www.baunetz.de>)

La bibliothèque: La bibliothèque constitue l'outil de travail indispensable pour les étudiants, c'est l'endroit où ils passent une grande partie de leur temps de travail; la bibliothèque est le véritable centre d'étude et de recherche des sciences humaines. La bibliothèque de la 2ème étape occupe les 1er et 2ème étages du quadrant sud-est du complexe; elle comprend les bibliothèques de la FAPSE, faculté de psychologie et des sciences de l'éducation, des centres interfacultaires, de l'ETI, école de traduction et d'interprétation, les archives Piaget et Rousseau et une médiathèque. La bibliothèque de la 2ème étape est accessible par une entrée séparée, depuis la place centrale; elle est liée au 2ème étage à la bibliothèque de la 1ère étape (Droit-SES) avec laquelle elle offre au total 1400 places de lecture, et plus de 10.000 ml de rayonnages en libre accès, des compactus, des bureaux de bibliothécaires, les comptoirs d'accès et de prêt. Les bibliothèques des 1ère et 2ème étapes s'organisent autour de trois patios, de part et d'autre de la rue centrale; long des façades (parvis, parc) et autour des patios; les rayonnages dans les parties centrales du bâtiment. Le projet a recherché la création d'espaces variés par leurs dimensions, leur échelle, leur caractère, leur éclairage, afin de créer des conditions propices à la concentration selon les goûts variés des utilisateurs. Salles de répétition de l'OSR et discothèque. Le programme des locaux universitaires a été complété par la réalisation au 2ème sous-sol, à la place du parking prévu initialement en 2ème étape, de salles de répétition pour l'Orchestre de la Suisse Romande (OSR) et d'une discothèque. Ces locaux sont accessibles depuis le parvis d'entrée par un large escalier, sans passer par l'Université, et depuis le boulevard Carl-Vogt (monte-charge pour le transport du matériel de l'OSR). La structure des salles du sous-sol est dissociée de la structure principale de l'Université afin d'assurer une bonne isolation phonique. #### **ZIS Upper School (Zürich International School) – Switzerland 2006 - 2008**

Elongated, stacked plateaus encompass the entire school's program. The different units – such as classrooms, gym, theater, library, laboratories and parking garage – are all connected, both spatially and functionally. The concept of a concentrated entity – with various uses, either next to one another or on top of each other – allow a flexible assemblage of modules, forming a spatially enticing learning and teaching environment. Schools are a significant part of society, the place where the proven, current, or impending is negotiated. They are the locus of innovation. We envision the school as a lively organism, encompassing a multitude of visual and spatial relations, an urban ensemble of manifold connections. Diverse forms of exchange are to be promoted – as pertaining to intellectual and emotional interaction: The school as a think tank and place of production – a campus or workshop at the service of future generations – the school as the place enticing social communication. The project is ultimately conceived as a multilayered text offering multiple interpretations; an identifiable entity suggesting further potential readings. (agps)

#### **Mediothek Kantonsschule Küsnacht – Switzerland 2000**

Auf dem Gelände der Kantonsschule Küsnacht wurde am 10. November 2000 eine neue Mediothek eröffnet. Der schlichte Kubus aus Holz und Glas wurde von der Schweizer Architektengemeinschaft Béatrix und Consolascio entworfen. Seit über 100 Jahren war auf dem parkartigen Gelände der Kantonsschule Küsnacht kein Neubau mehr entstanden. Insofern steht der klare, einfache Quader des Bibliotheksneubaus in spannendem Kontrast zur bestehenden Bebauung. Das Innere des Gebäudes besteht aus zwei grosszügigen, ineinandergreifenden Räumen. Der zweigeschossige Lesesaal ist ringsum von Regalen und Galerien umgeben. Architektur und Innenausbau gehen fließend ineinander über, denn der ganze Raum wird durch ein Raster aus länglichen Regalfächern organisiert. Die Regalkonstruktionen sind zugleich Stellfläche für Bücher als auch Tragkonstruktion, Trennwände und Brüstungen. Fußboden und Decke als größere Regalböden erscheinen als die logische Fortführung des Rasters. Neben der funktionalen Anforderung einer Bücherei bzw. Mediathek setzt sich der Entwurf mit dem Thema Bibliothek an sich auseinander. „Hier und dort, nah und fern, alles in einem Blick fassend (...) Der ganze Entwurf dreht sich um dieses Paradox“, heißt es in den Erläuterungen der Architekten. Im Gegensatz zur dunklen Studierstube von Klosterbibliotheken ist die Mediothek an den Längsseiten komplett verglast, von Licht durchflutet und wird so zu einer Art öffentlichen Raum. Die Regale sind direkt vor die Fensterscheiben gebaut, so dass die Glasscheiben die Regalrückwände bilden und die unzähligen Seiten der Bände nach aussen hin zeigen. Das Prinzip des verschlossenen Archivs wird, ähnlich wie bei Perraults Nationalbibliothek in Paris, durch Transparenz und Offenheit ins Gegenteil verkehrt. Von innen sollen die Fenster weniger zur Aussicht oder als Ausschnitt der Landschaft dienen, sondern als „Hintergrund zu den Büchern“ mit täglicher und saisonaler Wechselwirkung. #### **Biblioteca de la Libera Università di Bolzano – Bibliothek der Freien Universität Bozen – Italy 2002**

Bauherrschaft: Freie Universität Bozen, Gesamtbaukosten: ca. 100 Mio Fr.

Unmittelbar am Rande des historischen Stadtkerns soll aus einem bestehenden Ensemble durch Um- und Neubauten eine strukturelle Einheit entwickelt werden, ein modernes Hochschulgebäude, das den organisatorischen, funktionalen und repräsentativen Anforderungen einer Universität entspricht. Die innerstädtische, zentrale Lage in der Stadt mit den beschränkten Platzverhältnissen, das Verhältnis zu den bestehenden, z. T. schützenswerten Bauten, sowie das grosse Raumprogramm sind für die Aufgabe die wesentlichen Prämissen. Mit einer zusammenhängenden Grossform werden die bestehenden Gebäude in einen neuen Zusammenhang gestellt und das Universitätsgelände mit der vorhandenen urbanen Struktur verwoben. Das bestehende ehemalige Spital wird in diese Figur eingebunden und bildet zusammen mit dem an die Spitalgasse stossenden Kopfgebäude das Zentrum. Der ganze universitäre Komplex wurde als eine Komposition von verschiedenen "Einzelhäusern" konzipiert, die über ein Wegnetz miteinander verbunden sind. Die innere Struktur folgt diesem städtebaulichen Gedanken. Auf zwei Geschossen sind die Hauptbauten der Universität miteinander verbunden und beherbergen die öffentlichen Nutzungen. Das grosszügige und übersichtliche Zirkulationssystem erleichtert die Orientierung im komplexen Gebäude und schafft durch gezielte Ausblicke Bezüge zu den städtischen Aussenräumen. (Bischoff)

#### **Bibliothek Werner Oechslin, Einsiedeln – Switzerland 2006**

After a gestation period of many years, some of them difficult, the Library of ETH Professor Werner Oechslin was opened in Einsiedeln on 9th June 2006. Federal Council Member Pascal Couchepin also took part in the ceremony, together with ETH's Executive Board. The building, designed by Mario Botta, houses a unique collection of source material relating to the theory of architecture and the history of civilisation. The Foundation is linked to ETH by a permission for use contract.

Norbert Staub:

Umberto Eco would also have participated in the inauguration, had it not been for the current traffic problems in crossing the Alps. The celebrated linguist and novelist from Bologna erected a literary memorial to the library as an institution with his modern classic "The Name of the Rose". The fact that the opening of the Werner Oechslin Library in Einsiedeln was not an everyday event was also emphasised by the presence of other eminent personalities such as the Minister of the Interior and Minister for the Arts and Culture Pascal Couchepin, who was accompanied by the Head of the Cultural Affairs Office Jean-Frédéric Jauslin, and of course by the Library's architect, Mario Botta. A platform for interdisciplinary exchange. In his address, Pascal Couchepin said that the theory and practice of architecture had found a novel kind of unity in the personality of Werner Oechslin, ETH Professor for the History of Art and Architecture since 1985. In the first place, through his conscious decision to found the Library in Einsiedeln as a "Satellite in the Background", Oechslin set his work in the great intellectual tradition of the monastery village. In the second place, according to Couchepin, it voiced a strong counterpoint to the current opinion that books are fighting a losing battle in the digital age. He said that an important basis for the development was the link that had been forged between ETH Zurich and the Library. He now hoped that the building would become a platform for an exchange of ideas between the disciplines. ETH-President Ernst Hafen also regards this as an important task for the library, which was now complete and to which his spontaneous reaction had been one of fascination and admiration. "It will become increasingly important for the Natural Sciences and Technologies to be embedded in a cultural and social context, and for bridges to be built between the two spheres," explained Hafen. He said many institutions that facilitate and nourish this dialogue had come into being at ETH during its 150-year history: for example the Cabinet of Prints and Drawings, the Archives of Contemporary History and of course ETH's own library together with its archives and special collections. "An additional attractive venue for this exchange has now arrived in the shape of the Werner Oechslin Library." Dialogue competence as an advantage of the location. These special communication and dialogue competencies are, among other things, what make ETH Zurich stand out in the global competition among the best institutes. The ETH President said: "I am convinced that these special characteristics will develop into a decisive advantage for the location in a few years." Hafen added that

he himself regarded Werner Oechslin as an enormously inspiring scholar “From whose wide cultural horizon one can only profit.” This was why he was arguing in favour of making an introduction to the intellectual richness of this Library a constituent of every ETH course of study. The planning of the building intended to house the volumes, as numerous as they are valuable, and which Werner Oechslin has gathered together in the course of his years of research work, started 14 years ago (see box). Mario Botta committed his first sketches to paper in 1996. The transition to the “Werner Oechslin Library Foundation” then brought with it the hope that the realisation of the project would go ahead quickly. However, although as already mentioned it was possible to reach an agreement with ETH in 1999 that the Institute would contribute 400,000 Swiss francs per year to the project for ten years and in return ETH members would have the right to use the Library, unfortunately after a prompt start and with contributions from the political world, foundations and sponsors, financial worries forced repeated interruptions. Botta’s building began below ground, with a labyrinth-like rotunda in the basement. Today it stands complete, in spite of everything. A slim building of reddish Verona stone, ending in a convex curve facing the mountain and with straight lines towards the valley, and which incidentally stands exactly on the old pilgrim route to Santiago de Compostela. Oechslin designed the building to accommodate it with the same meticulous care with which he had gathered his collection. For example the presentation of the volumes shows a striking resemblance to a monastery library – not surprising on a site that is directly in line with the façade of the Einsiedeln monastery. In addition to the books, a multitude of allusions from the history of civilisation – images, busts and quotations – describe what the Library attempts to be: a place that aims to promote thought and discussion. Ideas: forgotten readings In his celebratory lecture, the Mainz philosopher Kurt Flasch shed light in an astute and amusing way on the fact that book-lovers were certainly never undisputed intellectuals. His panoramic view from Plato to Heidegger via Montaigne revealed that intellectual history had been a hard struggle between the advocates of thinking and those of reading. Nevertheless, Flasch’s synthesis yokes the intellect and books together in a mutually dependent team, and like Musil he concludes: “How does one reach one’s own ideas? By forgetting where one read them.”

An anticyclical vision

Werner Oechslin himself was visibly moved and grateful that it had now been possible to make his unorthodox vision a reality, i.e. to create an emphatically public place at a time when the trend towards privatisation is part of good taste. A place, moreover, that imposes on itself “economy of thought” with civilised moderation and orderliness while everywhere else strives towards the (virtual) accessibility of the “entire” totality of knowledge. Finally it is a place that portrays the book as an object to be understood with the senses, by creating through architecture a stage for the book. ( <http://www.ethlife.ethz.ch/news> )

### **Fondazione Martin Bodmer, Biblioteca e Museo, Coligny – Switzerland 1998 – 2003**

In these spaces, where the Swiss collector has accumulated hundreds of manuscripts, incunabula and precious bibliographic documents over a lifetime of collecting, visitors can now follow a path from the ancient origins of writing to the modern day, passing through Greek and Christian culture, the Middle Ages and the Renaissance. In Coligny, near Geneva, the collection was originally housed in two eclectically designed early twentieth century houses on land Bodmer owned. The need for a larger space inspired the Foundation to commission a new project by Ticino architect Mario Botta in 1998. His proposal, completed in 2003, consisted of a large underground museum on two levels located between the two existing houses. Visitors enter the museum through a lowered courtyard on the side facing the lake in the garden, adjacent to the wall separating it from the road into the village. The outside reveals nothing about the exhibition space, which is designed as an underground treasure chest, visually representing the need to protect these precious documents. The presence of the space is however signalled by 5 clear, almost dematerialised volumes: squares about 3.50 metres high whose position near the entrance creates reflections, shadows and perspective screens drawing visitors’ attention to the lake. But their presence is linked above all with the need to light up the underground spaces, acting as skylights and revealing the presence of the new exhibition spaces to the visitor. Their geometric form makes them a strong presence in the landscape capable of altering our perceptions with surprising results. The books are displayed in the museum open, resting on thin metal supports, illuminated from above. Their preciousness requires special care, and in fact the showcases are made of rough iron with reinforced glass, like so many little treasure chests. Handwritten pages, papyrus and precious incunabula are displayed like jewellery in a context abounding in symbolic references and a highly evocative atmosphere.

### **Stadtbibliothek Dortmund, Dortmund – Germany 1995 – 1999**

Site: 7.000 m<sup>2</sup>, Area: 14.130 m<sup>2</sup>, DM 66.000.000

Zur Realisierung einer architektonisch anspruchsvollen Lösung wurden in einem eingeschränkten Verfahren sechs Architekten mit Weltruf zur Beteiligung an einem Wettbewerb aufgefordert. Sieger war der Architekt Mario Botta aus Lugano (Tessin) in der Schweiz, der mit seiner Baulösung eines Riegels und einer gläsernen Rotunde die stadtplanerischen Vorgaben am vollkommensten erfüllte und gleichzeitig weitestgehend die Platzforderungen eines modernen Bibliotheksbetriebes garantieren konnte. Während das Haupthaus („Riegel“) die „Stadtkante“ symbolisiert und gleichzeitig die Struktur des Bahnhofsvorplatzes arrondiert, ist die dem Riegel nördlich vorgelagerte „Rotunde“ ein halbkreisförmiger Baukörper ausschließlich aus Glas formuliert. Mit diesem Baukörper wird der Bahnhofsvorplatz im Prinzip wieder eingeengt und reduziert, gleichzeitig jedoch löst der Baukörper durch seine ungewöhnliche Form Erstaunen aus und wirkt als Solitär in der Stadtmöblierung. Die Bauausführung in Glas symbolisiert weiterhin Durchsichtigkeit und Transparenz und kann quasi als „Gartenhaus“ auf der Rasenfläche des Bahnhofsvorplatzes gesehen werden. Diese Transparente Architektur kommt gleichzeitig dem Prinzip der Bibliothek als „durchschaubares Haus“ entgegen. Der Architekturplanung und den daraus resultierenden Ausführungsplanungen lagen seitens der Bibliothek folgende Grundbegriffe zugrunde: Kommunikation: Das Haus sollte mit einem extrem niedrigen Schwellenwert versehen sein und damit die Zugänglichkeit leicht gestalten. Im Hause selbst sollten sämtliche Flächen unproblematisch und direkt erreichbar sein. Dies wird unter anderem symbolisiert durch die Einfügung von Rolltreppen (Beispiele aus Den Haag und Rotterdam/Niederlande). Ferner sollte jede Fläche im Haus leicht erreichbar sein – und dies ohne große Orientierungsprobleme. Flexibilität: Gefordert waren große, durch möglichst wenige Installationen behinderte Flächen, die gemäß sich wandelnden Angebotsstrukturen der Bibliothek jederzeit ohne großen Aufwand umorganisierbar waren. Dies bedeutete für die Planung die Herstellung einer einheitlichen Tragfähigkeit an sämtlichen Stellen des Gebäudes, das Herrichten einer einheitlichen Beleuchtungsstärke, unabhängig von der Funktion einzelner Teilflächen, und die Herstellung einer gleichmäßigen Wärmelast in allen Teilen der öffentlichen Zugänglichkeit. Dies bedeutet außerdem die Einbringung flexibler Wände sowohl in abgeteilten Flächen der Benutzung (Artothek) als auch in den Arbeitsräumen der Mitarbeiterinnen und Mitarbeiter. Im Prinzip muss es möglich sein, jede Funktion der Bibliothek an jedem Ort unterbringen zu können. Innovation: Das Haus sollte „zukunftsgerichtet“ gestaltet sein. Dies bedeutete zum Zeitpunkt der Planung 1995/96 und zum Zeitpunkt der Einweihung im Mai 1999 die Herrichtung des Hauses für sämtliche zu diesem Zeitpunkt bekannten Zukunftstechnologien. Unmittelbares Ergebnis sind die das ganze Haus durchziehenden Doppelböden, die es möglich machen, an jeder Stelle des Hauses „mit einem Draht“ aus dem Boden zu kommen. Insofern stellte sich die Bau-Idee gegen jeden Versuch postmoderner Ausschmückung und unveränderbarer Einbauten. Dies bedeutete zum einen den Verzicht auf innenarchitektonisch spektakuläre Lösungen, andererseits jedoch die Freiheit der Installation neuer Angebote mit den optimalen Möglichkeiten zum Zeitpunkt der Idee. Besonderheiten und Unterschiede: Die Lage des Hauses unmittelbar am Hauptbahnhof in Dortmund unterstreicht die infrastrukturelle Bedeutung einer

öffentlichen Bibliothek in einer Großstadt. Die hohe „Technologiefähigkeit“ der Architektur hat die Bibliothek in die Lage versetzt, nach der Eröffnung im Jahre 1999 weiterhin konstruktiv und beispielhaft an der Installation neuer Technologien zu arbeiten. So wurden schon sehr bald 16 Internet-Leseplätze eingerichtet. Die technischen Möglichkeiten des Hauses waren Grundlage für die Durchführung des Projektes „Digitale Bibliothek in Öffentlichen Bibliotheken“, welches Anfang 2002 der Öffentlichkeit präsentiert wurde und mittlerweile in Deutschland an Aktualität gewinnt.

(<http://www.dortmund.de>)

Das Bibliotheksgebäude besteht aus einem lang gestreckten rosaroten Rechteckbau und einem halbrunden Glasbau (Rotunde), der wegen der zwischen den Doppelgläsern laufenden Jalousien schwarz, und nicht gläsern wirkt. Der Eingang befindet sich zwischen den beiden Gebäudeteilen, unscheinbar, eine normale Drehtür, durch die nur eine Person sich jeweils reindrehen kann. Die Bibliothek, umgeben von einer dreifachen Rasenfläche, leicht erhöht und mit einer Pflasterböschung abgegrenzt, steht kühl und für sich am Rande der Einkaufszone. Das Vorhaben der Stadtplanung, eine "Kulturmeile" am Rande der Innenstadt zu schaffen, ist durch den Standort erfüllt. Mario Botta hat das Gebäude nicht nur entworfen, er hat auch die Innenarchitektur für die Bibliothek gestaltet und damit seine Ideen ganzheitlich umgesetzt.

### Museo d'Arte moderna e Contemporanea di Trento e Rovereto, Biblioteca, Rovereto – Italy 2002

The Mart, Museum of Modern and Contemporary Art of Trento and Rovereto - was created in 1987 as an independent institution of the Autonomous Province of Trento, and today operates three venues: the headquarters of the Museum in Rovereto, the Renaissance Palazzo delle Albere in Trento and the currently closed for renovation Museum Fortunato Depero in Rovereto. The large, 15 Opened in December 2002 in Rovereto architectural complex, designed by Ticino architect Mario Botta in cooperation with the Rovereto engineer [Giulio Andreolli](#). The most important location of the Mart is located behind the museum building dell'Annona, today seat of the municipal library, as well as behind the Palazzo Alberti. The free space between the two buildings was converted into a long access to a circular, of a steel and glass dome-covered square, from which the visitors enter the museum. The museum has four floors. Beyond the entrance are the reception area of the Info Point, the bookshop, cafe, conference room and cloakroom. From the ground floor, visitors can also go into the basement, where the archives of the 20th Century and the library are housed. In the first . Floor are the rooms for temporary exhibitions, the Department of Education and the offices on the second floor introduces the Skywalk, a suspended glass and steel structure in the open, into a large 3,800 m2 area: here is the sprawling into two sections structured permanent collection shown in the museum.

le contraste \_ la ligne: La bibliothèque enjambe le couloir de liaison entre le premier bâtiment du Centre professionnel (Frédéric Brugger architecte, 1965-1967) et ses extensions. Structurellement, ce franchissement se traduit par une dalle suspendue et non posée. Le fait de rejeter les étagères de livres contre les façades permet de libérer la zone centrale. Celle-ci reçoit une «cabine» entièrement vitrée (contenant salles de réunion et services), dont la courbe – en contraste recherché avec le caractère anguleux du contexte – enrobe l'escalier d'accès éclairé par un lanterneau. Cette organisation spatiale et distributive permet d'obtenir un grand espace continu réservé aux places de lecture. (BW)

### Santiago Calatrava Vals, Zürich – Switzerland

<http://www.calatrava.com>

#### **Libraries:**

#### Universität Zürich, Rechtswissenschaftliche Fakultät, Bibliothek, Zürich – Switzerland 2004

Client: Universität Zürich, €3.900.000

Ende August 2004 wird die neue Institutsbibliothek im Universitätsgebäude in der Züricher Rämistrasse eröffnet. Santiago Calatrava hat hierfür im Innenhof des Altbaus einen spektakulären Baukörper implantiert. Auch bei diesem Umbau demonstriert Calatrava die Vielseitigkeit seiner organischen Formensprache und ingenieurstechnischen Genialität. Der Eingriff in den historischen Universitätsbau in der Rämistrasse (1905-09 von Hermann Fietz d. Ä., 1869 – 1931, Kantonsbaumeister Zürich) ist von außen praktisch nicht zu sehen. Calatrava hat den früher offenen Innenhof mit einer ovalen Glaskuppel überdeckt und eine sechsgeschossige Galeriekonstruktion darunter gebaut, die das Oval der Kuppel aufnimmt. Der neue Baukörper ist eine autonome Form – diesmal erinnert sie an die durchsichtigen Flügel eines Käfers, die in bewusstem Kontrast zum Altbau steht. Diese Lösung erinnert an die ING-Bank in Budapest (1992-94) von Mecanoo, die gleichfalls einen amorphen Fremdkörper einem historischen Gebäude einpflanzen. Calatrava hat seinen Baukörper förmlich in das Unigebäude eingesteckt, denn die Konstruktion liegt nur an acht Punkten auf. Der Altbau bleibt dadurch vollständig erhalten und die bauliche Intervention reversibel. Zwischen Altbau und Bibliothek entstand so ein vielgestaltiger Zwischenraum, der sich mal als Zwickel, mal als große Halle zeigt. Mit den ovalen Galerien schafft Calatrava einen ungewöhnlichen, fast dramatischen Innenraum, in dem die Ringe der abgeschrägten Balustraden zu schweben scheinen. (<http://www.baunetz.de>) 26.08.2004

Library for the law faculty of the university of Zurich. The old building from Hermann Fietz was built 1909. Calatrava received the assignment already in 1989 but it took another ten years until the construction started. The exterior stayed pretty much untouched.

The whole intervention is more of a giant piece of wooden furniture placed in the atrium of the existing building. The library has 5000 meters space for books and 500 working places. The oval skylight has an integrated mechanical sun shade. (<http://www.mimmoa.eu>)

Collaboration with: Franco Pessina (Lugano)

Seit den 1960er-Jahren wurden aus Platzmangel im Hochschulgebiet verschiedene Abteilungen auf den Sattel zwischen Hönggerberg und Käferberg verlegt. Der Landerwerb von 46 Hektaren wurde 1959 von National- und Ständerat aufgrund einer Bebauungsskizze von Professor Albert **Heinrich Steiner** beschlossen. Die erste Etappe nach dem Entwurf von Professor Steiner und Architekt **Gehrig** wurde Ende der 1970er-Jahre fertiggestellt. Die zweite Ausbaustufe erfolgte von 1972 bis 1976 nach den Plänen des Architekten **Max Ziegler und Eric Lanter**. Die dritte Ausbaustufe wurde 1988 mit der Ausschreibung des Ideenwettbewerbs für den Richtplan eingeleitet, welcher in der Weiterbearbeitung vom Team des Architekten Ben Huser-Serio gewonnen wurde. Den Wettbewerb für die dritte Etappe gewannen 1990 die Architekten Mario Campi und Franco Pessina. Nach einem Rekurs Steiners, der schlussendlich 1994 vom Bundesgericht abgewiesen wurde, fand der Ausbau des Hönggerbergs mit dem Bau der dritten Etappe von 1996 bis 2004 seinen vorläufigen Abschluss. (<http://www.stadt-zuerich.ch>)

Am 4. März 1999 konnte in Zürich die Fertigstellung des Rohbaus für die erste Phase der sogenannten „dritten Ausbaustufe“ der Eidgenössischen Technischen Hochschule (ETH) gefeiert werden. Mario Campi, der auch an der ETH unterrichtet (-2001), und Franco Pessina (Lugano / Zürich) errichten auf dem Hönggerberg ein Neubaukomplex mit insgesamt etwa 60.000 Quadratmetern Fläche. In den fünf „Fingern“ des kammartig organisierten Hauptgebäudes werden verschiedene Institutsbereiche und Labors der Fachbereiche Chemie und Werkstoffe untergebracht sein, außerdem entstehen, an den Kamm angelagert, acht neue Hörsäle, eine Mensa, eine **Bibliothek** sowie, in einem separaten Baukörper, ein Dienstleistungszentrum. Das Team Campi-Pessina-Piazzoli hatte mit seinem Entwurf (Arbeitstitel: „ELEMENTAR“) 1991 einen zweistufigen Wettbewerb gewonnen. Im Herbst 1996 wurde mit dem Bau begonnen, im November 1997 der Grundstein gelegt. Mit dem endgültigen Bezug aller Bereiche ist im Herbst des Jahres 2001 zu rechnen. (<http://www.baunetz.de>)

### **Libraries:**

**[Landesmuseum, Erweiterung, Bibliothek, Zürich – Switzerland 2016](#)**

Sanierung, Restaurierung des Hauptgebäudes 2002 - 2009

Der geplante Erweiterung von den Architekten Christ & Gantenbein ergänzt die von Gustav Gull erbaute Museumsanlage, so dass für die Besucherinnen und Besucher ein Rundgang durch Alt- und Neubau möglich wird. Zentrales Motiv des Neubaus ist die Brücke, welche eine räumliche und optische Beziehung zwischen Platzspitzareal und Museum aufbaut. Das Wettbewerbsprojekt aus dem Jahr 2002 wurde nach Gesprächen mit Gegnern und Personen aus Fachkreisen überarbeitet: Die Gesamtnutzfläche des Neubaus wurde um ein Drittel reduziert, die integrale Erhaltung des Altbaus inklusive Kunstgewerbeflügel garantiert und die Sichtverbindung resp. Erschliessung zwischen Platzspitzareal und Museumsinnenhof gewährleistet. Die Baubewilligung der Stadt Zürich vom Juni 2008 ist seit Anfang November 2010 definitiv rechtskräftig. Der Souverän der Stadt Zürich hat am 13. Juni 2010 und derjenige des Kantons Zürich am 13. Februar 2011 der entsprechenden Finanzierungsvorlage zugestimmt. Hierauf hinterlegten Kreise aus dem Referendumskomitee eine Stimmrechtsbeschwerde bei der Regierung des Kantons Zürich bzw. beim Bundesgericht. Im Juli 2011 hat das Bundesgericht die Stimmrechtsbeschwerde abgewiesen und damit den Weg frei gemacht für die Realisierung des Projektes. Mit dem Bau der Erweiterung soll 2013 begonnen werden, fertiggestellt wird er Ende 2016.

(<http://www.nationalmuseum.ch/d/Zuerich/erweiterungsbau7/index.php>)

Ein grosszügiges Auditorium für öffentliche Veranstaltungen sowie ein Studienzentrum für die Zusammenarbeit mit Schulen und Hochschulen sind Bestandteil der Erweiterung. Zur Limmat hin befindet sich die **Bibliothek**, die in Verbindung mit dem neuen Studienzentrum im Kunstgewerbeflügel steht. Der Neubau bietet zudem erstmals die erforderliche Gastronomieinfrastruktur für ein Museumsrestaurant. Auditorium und Museumsrestaurant können auch ausserhalb der Öffnungszeiten des Museums betrieben werden. Damit wird auch abends das Platzspitzareal belebt. (<http://www.nationalmuseum.ch>)

## **DEGELO Architekten (Heinrich Degelo), Basel – Switzerland**

<http://www.degelo.net>

### **Libraries:**

**[Universitätsbibliothek Freiburg – Germany 2008 – 2013/14](#)**

Bauherr: Land Baden-Württemberg, vertreten durch den Landesbetrieb Vermögen und Bau Baden-Württemberg, Universitätsbauamt Freiburg

The un-worked stone becomes the polished diamond. The task for the competition consisted of renovating an existing university library from the 70s. (**Bruno Krupp, Freiburg 1978**) Instead of only cutting the existing concrete elements off of the facade, the floors are also trimmed in such a way to create impetuously forward and backward tilting facades. With this simple intervention, the surface of the facade is unified over the entire building height while the inclined angles create strong relations with the surroundings that could not be more different: a small row house, a classicist university building, a city block and a representative theatre. Despite their differences, these elements are reflected on the surfaces of the facade making the building a part of the environment and likewise, the environment a part of the building. At the constrictions on the east and west side of the library, entrances find their place beneath the protective projections of the new façade. On the inside, one discovers the impressive dimension of the concrete structure that is contrasted by the delicate ornamental pattern of the mechanical systems. (Degelo)

#### **Högskolas Bibliotek (Orkanbiblioteket), Malmö - Sweden 2005**

Bauherr: DIL Nordic AB, Deutsche Bank, Stockholm mit Nutzer Malmö Högskola, Malmö

Im Zuge der Neunutzung des Hafens plante die Stadt Malmö die Neugründung der Universität (Universitetsholmen). Der städtebauliche Entwurf für die Umgestaltung des Hafengeländes von Diener & Diener erhält die bestehenden Hafenanlagen und Lagerhäuser weitgehend und bildet den Rahmen für das Gebäude der Lehrerbildung und Bibliothek, das nach dem schwedischen Namen für Sturm - Orkanen - benannt ist. Als zentraler Neubau entstand das rund 150 Meter lange und 50 Meter breite Gebäude direkt am Wasser. Die Großform des Hauses bezieht sich auf die teilweise für universitäre Zwecke ungenutzten Hafengebäude, während die Glashülle auf die strukturelle Erneuerung der Hafeninsel verweist. Fünf hell verputzte Höfe gliedern das sechsgeschossige Volumen. Im Erdgeschoss schaffen passagenartige Querverbindungen und Ausblicke von der Straße zum Hafenbecken. Der öffentliche Charakter des Gebäudes wird durch ein Café und einen Ausstellungsraum in der Eingangshalle betont. Zusätzlich befinden sich Studienräume, Auditorien und eine Sporthalle und in dem Neubau. Die Universität beherbergt für einen Zeitraum von 20 Jahren die Hauptbibliothek und das Lehrerbildungszentrum, das einen späteren Nutzungswechsel ohne große strukturelle Veränderung erlaubt. Fassaden und Glas: Die je nach Blickwinkel opak und olivgrün oder smaragdgrün und transluzent erscheinende Glasfassade wurde als Licht reflektierende Konstruktion aus Aluminium errichtet. Eine Besonderheit stellen Bereiche von hinterlüfteten Brüstungen und Wandteilen aus strukturiertem Gussglas dar. Die Scheibengrößen mit teilweise absturzsicherer Verglasung reichen bis zu 2,40 x 5,00 m mit eingesetzten Dreh- und Drehkippl-Flügeln. Zum Einsatz kam ein Sonnenschutz-Isolierglas mit einem Schallschutzwert von  $R_w = 41$  dB, einem Ug-Wert  $< 1,1$  W/m<sup>2</sup>K, einem Energiedurchlassgrad (g-Wert) von  $g = 27$  % und einer Lichtreflexion von LR 0 ~ 15 %. Die vorgehängte hinterlüftete Fassade im Brüstungsbereich besteht aus gekanteten pulverbeschichteten Aluminiumblechen, der Isolierung und dem speziell hergestellten thermisch vorgespanntem Gussglas in einer Stärke von 12 mm mit der Typenbezeichnung Raywall. Hinter dem Glas angeordnete Buchstaben werden je nach Blickwinkel des Betrachters sichtbar. Das liegt zum einen an der Brechung des Lichts durch das Profil des Glases, zum anderen an der besonderen Eigenschaft der aus gekantetem Aluminiumblech gestanzten und mit poliertem Edelstahl hinterlegten Buchstaben. Das Gussglas reflektiert das Licht unregelmäßig und verdeckt die dahinter liegende Schrift aus glänzendem Metall ebenfalls unregelmäßig. So lässt das Licht die Fassade immer wieder anders erscheinen. Um eine optische Verbindung zwischen der Pfosten-Riegel-Fassade und der Fassade im Brüstungsbereich herzustellen, wurden die Pfosten aus Sonderprofilen gefertigt, deren Struktur der Glasoptik ähnlich ist. Ebenso ist die Oberfläche der aus statischen Gründen erforderlichen Punkthalterungen des Gussglases vertikal geriffelt. Die Punkthalter sichern das Glas, wo die Angriffsflächen des Windes liegen, d.h. im Bereich des Vordachs und des oberen Gebäudeabschlusses. Durch Vorfertigung der Fassadenelemente wurde die Aufgabe fertigungstechnisch und ökonomisch optimiert.

Bautafel: Architekten: Diener & Diener Architekten, Basel/CH und Fojab arkitekter, Malmö/S, Projektbeteiligte: Fojab Architekten, Lund (Innenausbau); Per Friberg, Lund (Außenanlagen); Centerlöf & Holmberg, Lund (Tragwerksplanung); Feldhaus Fenster + Fassaden, Emsdetten, Flex Fassader, Örebro (Fassade), Bauherr: DIL Nordic AB, Deutsche Bank, Stockholm mit Nutzer Malmö Högskola, Malmö, Fertigstellung: Juni 2005. #### **Bibliothek Zollikon – Switzerland 2008**

The district Zollikonberg meeting was opened on 25.10.2008. Designed by Drexler Guinand Jauslin architects a greater leisure services and a new library is created, the Chramschof has been aligned with the Ensemble. The three public buildings grouped around a cozy place. A green area represents the connection to her Forchbahn. For decades, was scheduled to Geren's area. Geren, the area between Forchstrasse Binzstrasse and is now with the neighborhood meeting had another major center for the Zollikonberg. Direct from the station Zollikonberg is a hub of the far-flung residential areas. Between the restaurant and Chramschof Rose Garden is a spacious green room, which opens a wide view to the north. This wasteland has always aroused great plans, but never came to realization. They then received a targeted improvement as a meeting place for the residents of Zollikonberg - without excessive effort. Leisure services, library and the existing, with a new canopy provided Chramschof form an ensemble. Despite optimal interaction of all construction is in itself clear and unambiguous. They are based respectively on the emerging common outdoor area. Their facades are a good sized outdoor space, which corresponds to the adjacent uses. The site offers seating in front of the sunny facade of recreational services and library. The space is inviting furniture and have also homely. In markets or festivals, the district court to the important meeting. All exterior walls, roof, all items in the main building as well as load-bearing interior walls were made of wood elements as the new roof of the Chramschofes. For an efficient production and assembly of the wooden construction element and to avoid complicated connections, the dimensions of the elements were chosen as large as possible. Excess width wall elements were taken at night with a special transportation to the site. The entire shell of the wood element neighborhood meetings was set up in an assembly time of 3 days. The different geometries of the outer walls and the different roof slopes were using a full three-dimensional planning and a dimensionally accurate production of the wood element construction to give effect properly. For the formation of the roof buckling of column-free space, a library made to measure support was created from standard steel sections, so that the items could be stored optimally. Wood is also used in other parts of the neighborhood clubs use. The direction in space of the building projecting platform, which serves as a seat as well as access for the disabled, is made of untreated Douglas fir. Next, all doors and fittings, the library shelves of the library and other facilities in wood or wooden materials are produced. The library and recreational services are each housed in a separate wing of the L-shaped construction and are connected by the space-side entrance, or through the shared spaces. For both institutions, the reference to the outer space a central concern. The single-storey design of the buildings allowed by the direct connection to the common space and public space an inviting situation, a simple and clear organization and a direct communication between two public bodies. For the library, the situation on the ground floor is particularly important because they actively visited by parents with children. The opening up of areas of both buildings are arranged on the side of the square, classrooms, offices and other rooms are organized along the side facing away from the square. The facade with large windows and wood paneling to the bottom supports the relationship with the environment. The single-storey architecture allows a simple design with no stairs and elevators and elaborate means of escape. To minimize construction time and costs, were walls and roof of the new building as a large-format prefabricated wooden elements and a very

short time to put on the ground floor concrete slabs. The choice of simple construction techniques and materials, the sharing of building equipment and toilet facilities and the lack of basements lead to an optimal cost-benefit ratio. Ensuring the long-term use is secured by a flexible building structure which can be adapted to different users and uses. Structural requirements of which is accessibility for all, age-appropriate and wheelchair access to all rooms and the option to create a targeted individual walls in light construction. The building was a public procurement procedure created in the wood-very experienced Elementbau total contracting Erne AG timber. Despite high aesthetic and acoustic energy requirements and good suitability for use, the building could be planned cost. This is mainly due to the choice of a wood-Elementbau. With the choice of wood and other oak meet the new buildings to the highest energy standards and can be operated with an efficient heating of a borehole Ground Source heat pumps. Environment The hill between the Chramschof and the Rose Garden Restaurant was demolished and the established area, loosely planted with lime trees and various groups of pear trees and magnolias. It has created new walking paths from the Forchbahn and the Binzstrasse to their new location. At the same time fits the Rose Garden Restaurant enlarged its playground on the new routing. So that this meeting will be better integrated into the overall system. This meadow was a deliberate but not as a location for the upcoming new construction as it represents an important central reserve of a country's strategic importance for the further development of the center. #### **Auditorium und Bibliothek, Staefa – Switzerland 2010**

Competition 2005, 1<sup>st</sup> Prize, Project 2005-2007, Realization 2008-2010, Client: City of Staefa

The school facility "Obstgarten" is atypical ensemble from the 1970s and consists of raw concrete cubes that are integrated into the outside space on different levels. While the classroom tracts are to be renovated, and their interiors re-organised and partially supplemented, the environment is to be transformed into a lyrical antipole. The new auditorium replaces the former music hall and houses an auditorium and the public library. It forms the core of the school campus Obstgarten. Considering the size and the structural weight of the program, the music hall's base was no longer capable of bearing loads from the top to the underground plan, a few pillars, formed like abstract atlas figures, bear and lift the heavy volume of the auditorium. #### **Universität Luzern – Bibliothek, Luzern – Switzerland 2011**

Auftraggeber: Kanton Luzern

Universität und PHZ (Pädagogische Hochschule Luzern), Luzern, 2006 – 2011. Für den Umbau des Postbetriebsgebäudes zur neuen Universität Luzern wurden gezielte Massnahmen ergriffen. Um dem Gebäude einerseits eine neue Identität mit einem starken architektonischen Ausdruck zu geben und andererseits auf die engen Platzverhältnisse zu reagieren wird eine einheitliche Fassade aus spezifischen „Stadtfenstern“ vorgeschlagen. Das leichte, pro Geschoss alternierende Ausdehnen der Fenster bewirkt, dass von Innen ein stärkerer Bezug in die Diagonale der Strassenflucht erreicht wird. Die beiden längs und quer angeordneten Höfe tragen zur Orientierung bei und lassen unterschiedliche Raumtiefen entstehen. (Enzmann)

#### **Schweizerische Nationalbibliothek, Bern – Switzerland 1994 – 2009**

SFr. 35.000.000

Der weitgehend original erhaltene Zeuge der moderaten Moderne (1929 – 1931 Oeschger, Kaufmann, Hostetner) wurde restauriert und das alte Magazin im Bücherturm zu Freihandbibliothek und Lesesaal des Literaturarchivs umgenutzt. Die originalen Bauteile wurden mit zeitgenössischen Konstruktionen, die sich in Material und Farbe einordnen, ergänzt. (Furrer)

1927 wird ein gesamtschweizerischer Wettbewerb durchgeführt. Bekannte Architekten beteiligen sich: Salvisberg & Brechbühl, Hans Schmidt, Emil Roth, Max Bill. Den Wettbewerb gewinnen der junge unbekannte Zürcher Architekt Alfred Oeschger und sein Vater vor den Mitkonkurrenten Josef Kaufmann (Zürich) und Emil Hostettler (Bern). Keiner der Entwürfe vermag die Jury vollständig zu befriedigen. Sie erteilt deshalb den drei Erstprämiierten den Auftrag, gemeinsam ein endgültiges Projekt auszuarbeiten, das von 1929 bis 1931 im Stil des «Neuen Bauens» realisiert wird. Die klare funktionale Trennung zwischen Magazin und Verwaltungsteil und die Dominanz des achtstöckigen Büchermagazins sind deutliche Kennzeichen einer modernen Bibliotheksarchitektur. Akuter Platzmangel zu Beginn der neunziger Jahre, Erweiterung des gesetzlichen Sammlungsauftrages auf digitale Publikationen, Sanierungsbedarf des ganzen Hauses sowie neue Anforderungen im Publikumsbereich (Cafeteria, Vortragssaal, Ausstellungs-, Kurs- und Schulungsräume sind nur in unzulänglicher Form vorhanden, eine Vernetzung sämtlicher Arbeitsplätze fehlt) rechtfertigen die Erweiterung des Bauwerks zu einem aufgabengerechten Dienstleistungszentrum. Die Bauherrschaft (Eidgenössisches Departement des Innern, Bundesamt für Kultur und die Nationalbibliothek) entscheidet, am bisherigen Standort Kirchenfeld festzuhalten, den Altbau komplett zu sanieren, die neuen Magazine in den Untergrund zu verlegen und das alte Hochmagazin als multifunktionalen Publikumsbereich zu nutzen. Mit den beiden ersten Etappen Tiefmagazin Ost und Renovation/Erweiterung des Altbaus (1993 bis 2000) werden die Berner Architekten Furrer, Gossenreiter und Stuber beauftragt. Olivier Mosset, international bekannter Schweizer Künstler, realisiert die «Kunst am Bau». Bereits zu Beginn der Umbauarbeiten wird er in den Entscheidprozess mit einbezogen und konzentriert sich auf eine Neuinterpretation der ursprünglichen Farbgebung im Innern des Gebäudes. #### **Bibliothek am Guisanplatz BiG, Bern – Switzerland 2004 - 2005**

SFr. 18.000.000

Umbau des Zeughauses zu einer Freihandbibliothek unter Wahrung bzw. Ergänzung der vorhandenen statischen und räumlichen Strukturen. Abgeschlossene Raumeinheiten (Einzelbüros, Sitzungszimmer und dgl.) werden im Grossraum als Holz-/Glaskuben frei

angeordnet. Neubau eines unterirdischen Magazins vor dem Gebäude, Unterkellerung im Mittelteil des Gebäudes für die Zentralen der Haustechnik. (Furrer)

**Bibliothek am Guisanplatz (BiG):** Ein General als Gründungsvater Von Armee über Bevölkerungsschutz, Geopolitik, Katastrophenschutz bis zu Zivilschutz: Die Bibliothek am Guisanplatz – bis 2007 die Eidg. Militärbibliothek – ist ein Informationszentrum zu Fragen der Sicherheit – und ein Dokumentationszentrum zur Geschichte. Sie wurde 1848 auf Betreiben von General Henri Dufour gegründet. Und bereits 1975 war das Dokumentationssystem computergestützt. Zur Geschichte finden sich hier verschiedene Spezialsammlungen. So eine Sammlung mit 9000 digitalisierten Porträts, die Autografensammlung Heberlein, die Schauenburg-Sammlung mit Karten des 17. und 18. Jahrhunderts oder die Sammlung von Tschärner, die wie diejenige von Schafroth oder Keller Informationen über Schweizer in fremden Diensten bietet. Für diejenigen, die die politischen Veränderungen über die Jahrhunderte hinweg verfolgen wollen, finden sich Geschichtsatlantiken vom 16. bis ins 19. Jahrhundert.

#### **Schweizerisches Bundesgericht Lausanne, Bibliothek, Lausanne – Switzerland 2010**

**Restaurator:** Atelier Olivier Guyot, Romont, **Projektleitung Bauherrschaft:** Barbara Suter, BBL (Bundesamt für Bauten und Logistik), **Fachberatung historisches Innenmobiliar:** Monica Bilfinger, BBL

Das Bundesgericht im Parc Mon Repos in Lausanne, wurde 1922-1927 von der Architektengemeinschaft **Prince, Begin et Laverrière** aus Lausanne erbaut. Wie damals üblich, ist die gesamte Innenausstattung ebenfalls von den Architekten entworfen und unter deren Leitung ausgeführt worden. Selten genug: alle Pläne der Innenausstattung, auch des Mobiliars, sind noch vor Ort vorhanden. Bekannt ist ferner, dass Alphonse Laverrière eine enge Zusammenarbeit mit der Schreinerei Held in Montreux eingegangen ist. Die Menuiserie Held hat die meisten Teile der Innenausstattung des Bundesgerichtes hergestellt, so auch die Bibliothek.

#### **Die Bibliothek**

Der zweistöckige Raum liegt in der Mittelachse des Gebäudes im zweiten und dritten Stock gegen Süden hin über dem Haupteingang und der Salle Pleinière.

Die Bibliothek besteht aus einem Lesesaal mit eingebauten Büchergestellen auf drei Seiten, darüber ein Galerieumgang mit weiteren Büchergestellen. Licht kommt durch die hohen Fenster sowie durch ein gläsernes Oblicht.

#### **Die Renovation**

Die Renovation unter Betrieb umfasst eine Teilfreilegung des originalen Linolbodens. Eine totale Freilegung wäre nicht nur zu aufwändig gewesen, diese wurde auch aus akustischen Gründen nicht angestrebt. Mit einer Teilfreilegung entlang den Bücherregalen ist es jedoch gelungen optisch den originalen Boden wieder lesbar zu machen und mit der Wahl eines farblich angelegenen textilen Bodenbelages auch den Bedürfnissen der Nutzer zu entsprechen. Das Holzwerk, die Vertäfelung und die Büchergestelle, aus Wurzelholz der Ulme sowie aus Eiche, wurden vollständig aufgefrischt. Die Decke wurde nach Befund in einem Meergrünblau gestrichen was das Holzwerk besser in Erscheinung treten lässt. Die originalen Beleuchtungskörper sind nicht mehr vorhanden, hingegen eine ebenfalls bereits historische Version aus den 50er Jahren. Diese Leuchten wurden zum Teil neu verteilt und mit aktuellen Sparleuchten neu bestückt. In den Korridoren zu den neuen Bibliotheksräumen im Dachgeschoss wurden zeitgenössische Leuchten angebracht sowie eine feine LED Beleuchtung vor den Büchergestellen angebracht. Die zwei grossen bestehenden Tische wurden wieder in die Achse der Fenster gerückt und mit dem im unteren Geschoss befindlichen dritten Tisch ergänzt. Darauf wurde dem Wunsch der Nutzer entsprechend ein sog. „présentoir“ erstellt, das nun ermöglicht, alle Neuerwerbungen der Bibliothek zu präsentieren. Somit konnte auf die mobilen Büchergestelle vor den Fenstern verzichtet werden. Auch alle andern Tische wurden aufgefrischt. Es wurden ferner auf Wunsch des Betriebes zwei kleinere Tische, nach den alten Plänen neu angefertigt. Alle Stühle wurden neu aufgepolstert und mit einem neuen Leder bezogen. Neues Fenster Am 31. Januar 2011 fand in Anwesenheit aller beteiligten Handwerker sowie der Nutzer eine kleine Feier zum Abschluss der Arbeiten statt. Die hellere Erscheinung dieses wunderbaren Art Déco Saales überzeugt alle Beteiligten.

## **(Jacques) Herzog-(Pierre)de Meuron, Basel – Switzerland**

### **Libraries :**

#### **Tenerife Espacio de las Artes, Santa Cruz, Tenerife – Spain 2008**

With over 20,622 sqm, the building includes a public library, a contemporary art museum, the Photography Centre of the Tenerife Island, a store, a cafe/restaurant and several public use spaces for the community. The building is a long volume intersected by a ramp that generates a triangular plaza. Along the facade, over 1,200 openings in 720 different shapes filter the natural light to the inside, while generating an amazing view during night. During the opening, Jaques Herzog said that this building will change the image of Tenerife, and along with the Calatrava auditorium will turn the city into a cultural focus. (<http://www.archdaily.com>)

“The new Cultural Center is not only a place of encounter for people but also a place of intersection for the landscape of the contemporary city, the old city with its skyline along the barranco and the archaic topography of the barranco itself.”  
Herzog & de Meuron (1999-2008)

Located in Santa Cruz's restored old quarter the TEA is a multi functional exhibitions center, a lively place for people of all generations and with various interests, where the different activities and spaces of the Center are interfusing and interflowing. A public path cuts diagonally through the building complex connecting the top of the General Serrador Bridge with the shore of the Barranco de Santos. The path literally cuts through the large reading room of the Biblioteca Insular where large glass screens allow for views inside and outside the generously open space of the library. On its way down to the Barranco the path is widening, transforming itself into a triangular, semi-covered space in the heart of the Cultural Center. This triangular public Plaza, enlivened by the Museum Café and Restaurant, orients visitors towards the building complex and the Lobby; conceived as a spatial continuation of the Plaza. In the Lobby a large spiraling staircase, behind the Museum Shop and Ticket counters, connects to the upper and lower museum level. The upper level has skylit galleries in various sizes adapting to the requirements of the Oscar Dominguez Collection. The lower level, housing the Centro de Fotografia Isla de Tenerife, can be subdivided to match the needs of temporary exhibitions. Ceiling heights on both levels are close to 6 meters. The building's exteriors are finished in dark grey colored concrete, pierced by small pixel-like glass-filled openings, in random patterns, that filter the natural light to the interior. The perforations were created using a complex formwork system.

“The building typology of our design for the TEA is based on courtyards. The elongated courtyards are important in many ways, providing daylight, views and orientation for the visitors and users of the museum spaces and the library. One of them, between the office and museum wings of the building complex is planted with typical plants of the Island. From the very beginning of the design process we operated with courtyards, also because we wanted to connect the new Centro typologically with its existing neighbour building, the Antiguo Hospital Civil which has recently been transformed into the Museo de la Naturaleza y el Hombre. However it took a while before we understood that all different activities and functions of the Centro should be assembled under one continuous roof structure rather than break down into individual wings. This is also one of the reasons why the elongated courtyards do not appear like embraced exterior spaces but rather like interior spaces that are being left open. The spatial interplay between inside and outside integrates rather than separates the very diverse urban landscapes which are so fascinating in Santa Cruz.” Herzog & de Meuron (1999-2008)

(<http://www.arcspace.com>)

### **Informations-, Kommunikations- und Medienzentrum (IKMZ) Brandenburgische Technische Universität, Cottbus – Germany 2004**

Client: Bundesland Brandenburg, 7.630 m<sup>2</sup>, €28.500.000

An organic, amoeba-like form, it is not immediately obvious which is the front and which is the rear of the building. Inside, too, the seven upper and two basement levels of the library are all different in design: only their external form stays the same. But it is not only the design of the academic library - with its brightly coloured spiral staircase coiling upwards - which is unique; so too is its organisational form. The Information, Communication and Media Center (ICMC) at Brandenburg Technical University in Cottbus creates close proximity between areas which other universities have traditionally kept apart in both physical and institutional terms. Behind the milky glass façade, imprinted with letters from many alphabets, the library, multimedia centre, computer centre and data processing unit all work hand in hand. (text from the Goethe Institut website) (<http://www.mimoo.eu>)

Im Jahre 1993 wurde durch das Land Brandenburg ein Wettbewerb ausgelobt, der die Konzeption und Eingliederung eines Bibliotheksneubaus in den Flächen- und Gebäudebestand der jungen Universität beinhaltete. Dabei sollte die Universitätsbibliothek als Bestandteil eines architektonischen-repräsentativen und gleichzeitig funktionalen Zentralbereiches betrachtet werden.

Im Januar 1998 wurde durch das Finanzministerium der Planungsauftrag an das Schweizer Architektenbüro Herzog & de Meuron für den „Neubau Universitätsbibliothek“ erteilt. Die Entwurfsplanung wurde im April 1999 vorgelegt. Schon in dieser Planungsphase wurde die BTU Cottbus bzw. die Universitätsbibliothek als zukünftiger Nutzer zur Definition und Berücksichtigung spezifischer bibliothekarischer Anforderungen an das Gebäude hinzugezogen. Architektonische Kreativität und hohe nutzungsorientierte Flexibilität sollten in Übereinstimmung gebracht werden. Bereits im Juli des gleichen Jahres wurde die Haushaltsunterlage mit Gesamtkosten in Höhe von 21,3 Mio. € (41,62 Mio. DM) genehmigt und mit der Ausführungsplanung begonnen. Im Jahre 2000 wurde die Konzeption der neuen Bibliothek nochmals kritisch überarbeitet. Fragen zu Größe und Notwendigkeit des Bibliotheksneubaus unter dem Aspekt der immer größer werdenden Akzeptanz der „neuen Medien“ wurden betrachtet, Kosten und Wirtschaftlichkeit des Gebäudes erneut überprüft.

Im Ergebnis wurden einige Ziele neu definiert, die einer zukunftsorientierten, modernen Bibliothek gerecht werden. Das Bild vom „Bücherturm“ wurde erweitert. Die Bereitstellung unterschiedlicher, wissenschaftlicher und bewerteter Informationen, unabhängig vom Medium (digital oder gedruckt), bleibt Kernaufgabe der neuen Bibliothek. Die Anforderungen der Informations- und Wissensgesellschaft werden Maßstab für die Dienstleistungsangebote eines „Informations-, Kommunikations- und Medienzentrums (IKMZ)“, wie der Bibliotheksneubau jetzt genannt wird. An das Gebäude selbst werden höhere Ansprüche in Bezug auf seine Flexibilität gestellt. Es muss Veränderungen der Organisationsstruktur innerhalb seiner Struktur auch in Hinblick auf zukünftige Entwicklungen zulassen.

Der mit ca. 7700 m<sup>2</sup> Nutzfläche konzipierte Bau wird einmal 900 000 Medieneinheiten aufnehmen. Für Recherchen werden alle Benutzerarbeitsplätze vernetzt (davon 100 mit PC-Ausstattung) sein. Für spezielle Multimediaanwendungen werden 15 Arbeitsplätze in Carrels zu Verfügung stehen. In den Fachebenen werden außerdem 62 Katalogarbeitsplätze, insgesamt 60 Arbeitsplätze in 3 PC-Pools und ein Medienraum mit interaktivem Konferenzangebot nutzbar sein. Einer dieser Poolbereiche soll vorwiegend für Sprachlernprogramme genutzt werden. Organisatorisch untergliedert sich das Gebäude in: - die beiden Untergeschosse mit Technikzentrale (Gebäudeversorgung), Magazin, Technischer Sonderliteratur, Lehrbuchsammlung, - das Erdgeschoss mit Informations-, Anmeldungs- und Verbuchungsbereich sowie der Cafeteria, - das 1.-6. Obergeschoss mit den Freihandbereichen, welche die fünf Fachbereiche aufnehmen und - den Verwaltungs- und Bürobereich im 7. Obergeschoss. Das zu errichtende Gebäude soll das menschliche Bedürfnis nach Kommunikation, nach Räumlichkeit, nach Erlebarkeit von Information aber auch nach konzentriertem wissenschaftlichen Arbeiten ermöglichen...Der Baukörper, der all diesen Anforderungen genügen soll, charakterisiert sich durch seine gekrümmte, äußere Form. Diese bewirkt, dass keine Vorder- und Rückseiten zu erkennen sind. Der Betrachter soll dies einer gleichermaßen empfangenen Geste zur Universität nach Westen, zur Stadt im Südosten, zur Sielower Straße im Nordosten gleichsetzen. Mit einer Höhe von ca. 32 Metern ist das Gebäude Blickfang und Anziehungspunkt zugleich. Das Gebäude ist eine Stahlbetonkonstruktion, ummantelt von einer zweischaligen Glasfassade. Die Raumgestaltung ist großzügig, da auf Wandelemente weitestgehend verzichtet wird. Die Deckenscheiben werden hauptsächlich durch Stützen und zwei massive Kernelemente getragen. Die unterschiedlich großen Ebenen des Gebäudes lassen Galerien und große Lufträume entstehen, die die Transparenz der Fassade unterstützen. Das Magazin ist im unterirdischen, fensterlosen Bereich untergebracht, während in den lichtdurchfluteten oberen Ebenen die Lesebereiche und Arbeitsplätze angeordnet sind...([http://www.bibliothek-saur.de/2003\\_1/069-071.pdf](http://www.bibliothek-saur.de/2003_1/069-071.pdf))

Gestalt und Gestaltlosigkeit von Hubertus Adam

Am Angelpunkt zwischen Innenstadt und Universitätsgelände ist in Cottbus eine neue Bibliothek entstanden. Herzog & de Meuron, die hier – anders als vor einigen Jahren in Eberswalde – auch das Innere gestalten konnten, realisierten einen Baukörper, der mit seinem Oszillieren zwischen repräsentativer Geste und beiläufiger Gestalt auch für den heutigen Umgang mit der Organisation des Wissens steht. ...

1994 lobte das Land Brandenburg einen Wettbewerb aus, um mit einem zentralen Hörsaalgebäude und einer Bibliothek für die nunmehr gewachsene BTU jene zentralen Einrichtungen zu schaffen, an denen es bislang mangelte. Herzog & de Meuron erlangten in dieser Konkurrenz den zweiten Platz – mit einem Konzept, das auf dem östlich der Karl-Marx-Straße gelegenen Erweiterungsgelände zwei solitäre Baukörper zu errichten vorsah, deren orthogonale Gestalt durch den bestehenden Raster der gegenüberliegenden Universitätsbauten bestimmt war. Die Bibliothek sollte aus einem rechteckigen Volumen mit drei ebenfalls rechteckigen Lichthöfen bestehen. Als die Planung 1998 wieder aufgenommen wurde, war das Auditorium Maximum nach dem Entwurf des erstplatzierten Büros KSP an einer anderen Stelle errichtet worden, und zwar inmitten des bestehenden Campus. Weil nun nur noch ein einziges Gebäude auf der Erweiterungsfläche

visà-vis zu errichten war, unterzogen Herzog & de Meuron ihr Bibliotheksprojekt einer grundsätzlichen Neukonzeption. Aus dem strengen, orthogonalen Block wurde nach mehreren Stufen der Überarbeitung ein komplexes Volumen über einem amöbenförmigen Grundriss. Diese Form, die aus sich überlagernden Kreisen verschiedener Grössen entwickelt ist und zunächst eher beliebig erscheint, reagiert auf die städtebauliche Situation: Nach Westen hin, zur Karl-Marx-Strasse, öffnet sie sich in einer einladenden Geste Richtung Universität; nach Südosten hin, Richtung Innenstadt, empfängt sie die Besucher aus dem Cottbuser Zentrum. ....Fast wäre das Projekt aufgrund der Finanzknappheit im Jahr 2000 zum Erliegen gekommen. Herzog & de Meuron mussten ihren Entwurf noch einmal revidieren, und das hiess nun: dem reduzierten Budget anpassen. Ein runder Lichthof wurde gestrichen, die Ausstattung im Inneren musste sparsamer ausfallen. Vor allem aber war es angesichts der Grundwassersituation nicht möglich, zwei Untergeschosse unterhalb des Bodenniveaus zu realisieren. Um eine kostspielige und zeitverzögernde Neuplanung zu vermeiden, entschied man sich, das Gebäude gleichsam anzuheben und die Umgebung aufzuschütten, so dass die Bibliothek nun aus einem Hügel herauswächst. .... Der 32 Meter aufragende Baukörper, dessen doppelte Glasfassaden beidseitig mit einem Muster aus überdruckten Buchstaben verschiedener Sprachen versehen sind – Christine Binswanger sprach von einem «babylonischen Sprachengewirr» –, oszilliert zwischen Offenheit und Hermetik. Dadurch, dass das All-over der Fassaden die Geschosseinteilung überspielt, wirkt das Volumen kompakt, ja monumental, beinahe erhaben; es verändert ständig seine Gestalt, erscheint bald als Turm, bald als Festung – und ist doch anziehend und einladend. .... Keine der aus Beton gegossenen Geschossplatten füllt die gesamte Ebene aus; mehrfach wechselnd, bleiben in den Ausbauchungen Abschnitte frei, die zum Teil zwei, mal auch drei Geschosse überspannen. Das gesamte Bibliotheksinnere bildet also einen kontinuierlichen Raum, der sich durch sämtliche Stockwerke zieht; als vertikale Erschliessung dient eine expressiv ausgebildete Beton-Wendeltreppe im Norden, dazu treten zwei überdies der Aussteifung dienende Serviceund Liftkerne. Die lichten Bereiche in den Ausbauchungen dienen als Lesesäle – insgesamt bietet die Bibliothek ihren Nutzern rund 600 Arbeitsplätze für Nutzer; die Farbigekeit ist hier mit weissen, von Herzog & de Meuron entworfenen Kunststoffischen, grauen Bodenbelägen, weissen Eames- und Jacobsen-Stühlen sowie Stehleuchten von Arne Jacobsen und ebenfalls von den Architekten geplanten Spiral-Leuchtern reduziert gehalten und dient der Konzentration. Demgegenüber zeigen sich die niedrigeren Bereiche im Inneren des Gebäudes bunt: Die Kautschukböden, auf denen die Stahlregale der Freihandbereiche stehen, gliedern sich in jedem Geschoss in parallele farbige Streifen – und zwar in westöstlicher Richtung in der Abfolge gelb, grün, magenta, rot und blau. Die Sequenz ist in jedem Geschoss identisch; Farbe wird hier also nicht als Leitsystem eingesetzt und dient auch nicht der Markierung von bestimmten Sammlungsbereichen. In der Wendeltreppe, die sich auf der Grenze zwischen dem grünen und dem magentafarbenen Bereich befindet, verschlingen sich die beiden Farben zu einem furiosen Wirbel. Sie intensivieren sich durch die Spiegelungen in den Regalen und den Streckmetallverkleidungen unterhalb der Decke; Streckmetall wurde im Übrigen auch für die Kojen der Einzelarbeitsplätze, so genannte Carrels, und zur Trennung der öffentlichen Zonen von den Arbeitsbereichen der Mitarbeiter eingesetzt.....

(<http://www.nextroom.at>)

### **Hochschulbibliothek der Fachhochschule Eberswalde, Eberwalde – Germany 2000**

Client: Bundesland Brandenburg, 1.504 m<sup>2</sup>, €17.970.000

Am 7. April 1999 wurde auf dem Campus der Fachhochschule Eberswalde der Bibliotheksneubau der Schweizer Architekten Herzog & de Meuron eröffnet. Die Fassade des geschlossenen quaderförmigen Baukörpers besteht aus mehr als vorfabrizierten Glas- und Betonplatten, auf die mittels eines speziellen Siebdruckverfahrens fortlaufend Fotos gedruckt sind. Die Auswahl der Motive entstand in Zusammenarbeit mit dem Künstler Thomas Ruff, der aus seinem privaten Fotoarchiv unter anderem Bilder der Berliner Mauer zur Verfügung stellte. Breite, ringsum verlaufende Fenstererschlitze trennen die drei Geschosse horizontal voneinander und lassen viel Tageslicht in die Bibliotheksräume. Im Inneren sind die drei rechteckigen Geschosse nahezu identisch: An den Längsseiten sind Leseplätze und Buchbestände aufgereiht, in der Mitte befinden sich in einem langen Riegel Erschließung, Computerarbeitsplätze und weitere Buchregale. Der Neubau, der auf einer Nutzfläche von knapp 1.400 Quadratmetern einen Freihandbestand von 80.000 Bänden umfaßt, ist durch einen gläsernen Gang mit dem Altbau von 1911 verbunden, in dem sich das Magazin und Verwaltung befinden. Die Kosten für Sanierung und Neubau belaufen sich auf knapp neun Millionen Mark, davon entfallen fast sechs Millionen auf den Neubau. Die Fachhochschule erwartet sich von dem „weltweit ersten vollständig bedruckten Baukörper“ eine internationale Pilgerschar von Architekturfans auf den Campus von Eberswalde. Dazu Minister Steffen Reiche: „Im Land Brandenburg wird mit diesem spektakulären Gebäude eine Tradition wieder aufgenommen, die nach 1933 abgebrochen war und mit den Namen international bedeutender Architekten wie Mies van der Rohe, Bruno Taut und Erich Mendelsohn verbunden ist.“ (<http://www.baunetz.de>) 07.04.1999

### **Mediothek Pädagogische Hochschule Graubünden, Chur – Switzerland 2010**

Die Pädagogische Hochschule Graubünden mit Bauten aus der Zeit von 1981 bis 1994 wird mit einer Mediothek und zwei Hörsälen erweitert. Plastisch gestaltete Betonbauten in Kombination mit sägeroher Brettschalung sind das prägende Charakteristikum der Anlage. Ohne den Bestand zu konkurrenzieren übernimmt auch der Neubau diesen Ausdruck, dennoch wird das Ensemble durch ihn auf eigenständige und selbstverständliche Art erweitert. Zunächst klärt der Neubau den bislang undefinierten Abschluss des „Parkraums“ im Dreieck der Bestandsbauten und der Scalärastrasse. Die plastische Formung des Neubaus wird dazu benutzt, um von der parkseitig eingeschossigen, pavillonartigen Anmutung zu einem zwei- bzw. dreigeschossigen Körper gegenüber dem hoch aufragenden Schulgebäude überzuleiten und den bislang fehlenden Übergang der Massstäbe herzustellen. Zwischen den Häusern entsteht ein hofartiger Innenraum, der als Pausenterrasse dient und die Spannung zwischen diesen Massstäben erlebbar macht. Auf der Ebene von kleinen Rücksprüngen in der Fassade und der Ausgestaltung der Fenster wird die plastische Bearbeitung des Baukörpers zusätzlich weitergeführt. Der Verzicht auf einen umlaufenden Blechdachrand und die fugenlose Ausführung des Baus unterstreichen den Eindruck eines plastisch geformten Monoliths. Der grosse stützenfreie Raum der Mediothek, wird mittels einer Differenzierung der Raumhöhe, in einzelne Bereiche gegliedert: den hohen und von hochliegenden Fenstern indirekt ausgeleuchteten Arbeitsbereich für die Studenten, den niedriger gehaltenen Standort der Bücherregale und der Ausleihe mit direktem Landschaftsbezug. Die Fenster wirken von diesem Standpunkt als innenräumliches Ornament, das die naheliegende Churer Bergkette des Montalin zu einem Landschaftsfries zusammenfasst. Glatte weisse Wandoberflächen lassen im Innern die kubischen Raumformen hervortreten und reflektieren das Licht weit ins Innere. Diese weisse Auskleidung der Räume schafft hier wie auch im übrigen Gebäude eine lichtdurchflutete neutrale Atmosphäre für konzentriertes Arbeiten. Gleichzeitig finden in dieser weissen

Innenschale die den heutigen Ansprüchen genügende Dämmung sowie die Hausinstallationen Platz, wodurch die einfache Form der Räume unterstützt wird. (Horvath)

#### **Maison de la Paix, Genève – Switzerland 2013**

The "Maison de la paix", which means "house of peace" in French, will be built between Chemin Rigot and the SBB CFF FFS railway lines (see photos below). At its heart will be a library, numerous auditoriums and seminar rooms, and a cafeteria. The offices will be positioned in a manner which facilitates the interaction of people and ideas between all centres.

Photos of ongoing construction work are available on our Facebook page.

The "Maison de la Paix" as it will look in 2013.

### **Facts in brief**

The architects: IPAS Architects, Neuchâtel, winner of the International Architecture Competition, Owner and principal occupant: The Graduate Institute of International and Development Studies, Tenants: The Centre for the Democratic Control of Armed Forces (DCAF), The Geneva Centre for Security Policy (GCSP) and The Geneva International Centre for Humanitarian Demining (GICHD), Surface area: 22,000 m<sup>2</sup>, Date of inauguration: 2013

Cost of construction: CHF 137 million, Funding: CHF 34.5 million from the Swiss Confederation, CHF 43 million from the Canton of Geneva; the remaining balance will come from donations and a bank loan to be repaid from rental income. (<http://www.gcsp.ch>)

Geste architectural de grande qualité, la Maison de la paix est conçue pour servir l'Institut dans la durée. Le cœur du bâtiment est composé d'une aula de 600 places, de 15 salles de cours, de 10 salles de séminaire et de travail et d'une bibliothèque d'une surface de 4500 m<sup>2</sup> sur deux niveaux et, enfin, d'une cafétéria de 170 places et d'une terrasse de 80 places. #### **Bourbaki-Panorama/Stadtbibliothek Luzern – Switzerland 2000**

Sanierung des Bourbaki-Panoramas; Einplanung von Stadtbibliothek, Ausstellungsraum, Kinos, Restaurant, Läden fertiggestellt 2000

Die Rahmenbedingungen von Liegenschaft, Denkmalpflege und Bauprogramm ergaben ein zweiteiliges Projekt aus bestehendem Rundbau und neuem Mantelbau. Die historische Rotunde tritt - mit restaurierten Giebfeldern, Gesimsen und Laterne, Pilastern und dorischem Säulenkranz - den denkmalpflegerischen Vorgaben entsprechend, farbig und dekorativ in Erscheinung. Der Neubau erhält mit naturbelassenen Materialien - Sichtbeton, Glas, Stahl, Backstein und Holzpaneelen - eine eigene, schlichte Prägung. Die Glashaute belässt die Rotunde von aussen sichtbar, vor allem abends, als Grundfigur im leuchtenden Baukörper. Im Hauptraum der Bibliothek wird die Rotundenwand zur rückwärtigen Galerie- und Bücherwand. Der Raum öffnet sich nach aussen und lässt so die Präsenz des Rundbaus im gläsernen Geviert zum prägenden Charakteristikum des Hauses werden - als räumliche Umkehrung des klassischen Bibliotheksmodells: statt des introvertierten Leserraums der Studienbibliothek, eine grosse, der Stadt zugewandte Loggia. #### **Museum Haus Konstruktiv, Bibliothek, Zürich – Switzerland 2001**

Am 30. September 2001 wird in dem stillgelegten ewz-Unterwerk Selnau Zürich mit einer Ausstellung über James Turrell das „Museum Haus Konstruktiv“ eröffnet. Von der 1986 gegründeten „Stiftung für konstruktive und konkrete Kunst“ (KKK) initiiert, ist ein Ort entstanden, an dem sich die Besucher mit einer wichtigen Tradition Zürichs auseinandersetzen können: Bereits seit 1930 war die Stadt ein Zentrum für Neues Bauen, funktionales Design, Typografie, Grafik und Fotografie - in dem neuen Museum soll nun „die Geschichte befragt und die Gegenwart der konstruktiven Kunst gezeigt werden“. Ort und Programm des Museums gehen dabei eine stimmige Verbindung ein: Das Zürcher Architekturbüro Meier + Steinauer Partner AG hat ein ehemaliges Transformatorhaus der denkmalgeschützten Industrieanlage zu Ausstellungsflächen umgebaut. Bereits 1889 wurde in Selnau die erste „Powerstation“ für die Zürcher Straßenbahn errichtet. Der damaligen Stadtbaumeister **Hermann Herter** (Stadtbaumeister der Stadt Zürich, \*1877 - + 1945) fasste dann 1929/32 im Stil des Neuen Bauens die vorhandenen Gebäude mit schlichten Kuben zusammen. Mit Ausnahme der Gleichrichteranlage wurde die Anlage 1998 stillgelegt und schrittweise in ein Kulturzentrum umgewandelt. Auf fünf Geschossen ist nun ein modernes Museum mit rund 1200 Quadratmetern Ausstellungsfläche entstanden, erschlossen durch ein zentrales Treppenhaus. Das Foyer gibt den Blick frei auf eine Krananlage; unter dem **Dach mit offengelegtem Stahlfachwerk ist eine Bibliothek untergebracht**. Beraten wurde das Architektenteam von einem Freund der konstruktiven Kunst, Roger Diener von Diener & Diener (Basel).

Bauherrschaft: Stiftung Historisches Museum Bern, CH-Bern, I. Preis, 2001-2009, BGF 7.400 m2

Das Historische Museum liegt unmittelbar am Helvetiaplatz, am südlichen Ufer der Aare in Bern und wurde 1894 durch André Lambert (\*1851 La Chaux-de-Fondes - + 1929 Jávea Spanien) erbaut. Mit dem Neubau 'Titan/Kubus' erhält das Museum auf der Ostseite eine Erweiterung mit musealen und administrativen Nutzungen. Im Sockelgeschoss befinden sich neben dem als 'black box' konzipierten, 1000m2 grossen Wechselausstellungssaal 2000m2 Kulturgüterschutzräume. Im vertikalen Volumen der Erweiterung sind die Verwaltung des BHM sowie eine Bibliothek und das bernische Stadtarchiv untergebracht. Die Entwurfsidee besteht darin, den Erweiterungsbau als öffentlichen und begehbaren Sockel auszubilden, aus dem sich ein vertikales Volumen entwickelt. Letzteres kann in seiner Form und Höhe als logische Fortsetzung der bestehenden Flügelbauten des Museums gelesen werden. Über die Abfolge der drei unterschiedlichen Aussenräume 'Garten', 'Platz' und 'Treppenanlage' ist der Baukörper innerhalb des Ensembles verzahnt und stadträumlich angebunden. (mlzd)

Bauwelt 34 09-2003

Elemento unificatore del nuovo campus universitario di Lugano è il parco, in parte esistente, in parte da ridisegnare. Per contribuire alla realizzazione del campus, il progetto ribalta l'originario orientamento dell'edificio esistente mediante l'aggiunta, l'aggancio di un nuovo corpo verso est; che per dimensioni e forma conclude la volumetria incompiuta dell'antico stabile, ed esprime d'altro canto la sua nuova funzione di biblioteca. Oltre a completare i percorsi pedonali attorno al cortile interno, l'ampliamento contiene le circolazioni verticali "pubbliche" (scala principale, lift), così da liberare l'antica struttura e permetterle di accogliere grandi superfici non interrotte. Ma soprattutto, il nuovo corpo indica dall'esterno il carattere dell'edificio, attraverso il suo contenuto più rappresentativo: le sale di lettura. Disposte su tre livelli identici, affacciate sul parco, le sale si configurano come spazi ad un tempo unitari e suddivisi in entità individuali. La struttura stessa, a fitti ranghi di pilastri allungati, definisce nicchie dove trovano posto le zone di studio e di lettura per i singoli fruitori. In elevazione, il nuovo corpo sfrutta la grande altezza dei piani dello stabile esistente per creare livelli intermedi che contribuiscono all'intimità delle sale di lettura. Al piano terreno si trova l'entrata principale con il porticato d'accesso. Per quanto concerne il vecchio stabile, esso ha subito internamente una pulizia strutturale che ha permesso di ottenere ai due livelli ampi locali per i volumi in libera consultazione e per contenuti specifici (periodici, supporti multimediali). In un'ala del piano terreno si trovano la direzione e gli uffici di gestione e catalogazione. Attorno al cortile, concluso ora con il nuovo corpo, gli ampi corridoi anulari ospitano spazi di lavoro particolari, equipaggiati per la consultazione informatica, individuale o in rete. Per il nuovo corpo, struttura e tamponamenti sono pensati in materiali e con tecniche attuali: cemento armato per gli elementi portanti, vetro e metallo (con inserti in legno) per serramenti e "cellette" di lettura. L'edificio esistente mantiene esternamente il suo aspetto originario, con la sola sostituzione dei serramenti. Interventi radicali hanno subito invece le strutture orizzontali (per i nuovi e importanti carichi) e le installazioni. (Tognola)

#### **Vera Oeri-Bibliothek, Musikakademie der Stadt Basel – Switzerland 2006 – 2009**

The old library building of the Music Academy of Basel filled no longer the current needs - especially in relation to the space and infrastructure. Reflecting this, the building owner Visco AG Architects and planners with the planning and implementation of a new building. The "central services arm of the Eastern Mediterranean", the new library will be organized in a way inviting, transparent and audience-friendly. The implementation of the project took the form of a three-story, mostly underground and after Minergie created building, which was placed in the courtyard of the existing building on Leonhardsgraben 40th The property is owned by the municipality is located in Basel and the closed zone. Access is - infinitely and for disabled people - from the Leonhardsgraben by an existing open passage, via the main building of the Music Academy and on the grounds of the villa Moser. The buildings deinner is entered through a friendly, glass-enclosed pavilion on all sides. Cropping of the otherwise underground main volume on two sides of

the level -1 allows optimal natural lighting of the jobs in the reading room and office. Two Oblichtbänder illuminate the levels -2 and -3 with natural light. The first exposed an open staircase cascade, which shows the three-storey building volume of the space. The second, walk through and flush with the ground level -1 developed in parallel to the reading room. A two-storey angled wall brings the light through an air space up to the level -3. The flat roof of the new building has been extensively planted, so that it blends harmoniously with the park-like environment.

erfüllte längst nicht mehr die aktuellen Bedürfnisse - vor allem in bezug auf das Raumangebot und die Infrastruktur. Deshalb beauftragte die Bauherrin Vischer AG Architekten + Planer mit der Planung und Realisierung eines Neubaus. Als „zentrale Dienstleisterin der Gesamtkademie“ sollte die neue Bibliothek möglichst einladend, transparent und publikumsfreundlich gestaltet werden.

Die Umsetzung des Vorhabens erfolgte in Form eines dreigeschossigen, vorwiegend unterirdischen und nach Minergie-Standard erstellten Baukörpers, der im Innenhof des bestehenden Gebäudes am Leonhardsgraben 40 platziert wurde. Das Grundstück ist im Eigentum der Einwohnergemeinde Basel und liegt in der Schonzone. Die Erschliessung erfolgt - stufenlos und behindertengerecht - direkt vom Leonhardsgraben durch eine bestehende offene Passage, via Hauptgebäude der Musik-Akademie und über das Grundstück der Villa Moser. Das Gebäudeinnere betritt man durch einen freundlichen, allseitig verglasten Empfangspavillon. Das Freistellen des ansonsten unterirdischen Hauptvolumens auf zwei Seiten der Ebene -1 erlaubt eine optimale natürliche Belichtung der Arbeitsplätze in Lesesaal und Bürobereich. Zwei Oblichtbänder belichten die Ebenen -2 und -3 mit Tageslicht. Das erste belichtet eine offene Kaskadentreppe, die die Dreigeschossigkeit des Bauvolumens räumlich erkennen lässt. Das zweite, begehbar und bündig mit dem Boden der Ebene -1, entwickelt sich parallel zum Lesesaal. Eine zweigeschossige schräge Wand bringt das Licht durch einen Luftraum bis in die Ebene -3. Das Flachdach des Neubaus wurde intensiv begrünt, sodass es sich harmonisch in die parkähnliche Umgebung einfügt.

Umbau bestehendes Volkartgebäude, Erweiterungsbau für Hörsäle, Bibliothek, Cafeteria, Aula. Bauherrschaft: Baudirektion Kanton Zürich, Hochbauamt, Rauminhalt brutto 45.000 m<sup>2</sup>, Geschossflächen brutto 10.600 m<sup>2</sup>, Anlagekosten: CHF 39.000.000

1. Preis Projektwettbewerb 1991

Die Umnutzung des 1928 fertiggestellten Verwaltungsgebäudes der Firma Gebr. Volkart (Rittmeyer & Furrer/Robert Rittmeyer \*1968 - +1960, Walter Furrer \*1870 - +1949) erforderte grössere räumliche Eingriffe, insbesondere im schlecht belichteten Sockelgeschoss. Hier wurde die geschlossene Hoffassade aufgebrochen, zum Foyer umgenutzt und mit einer kreisrunden Aula ergänzt, die den Mittelpunkt der Anlage bildet. Riesige Schiebetore ermöglichen eine räumliche Einbindung des Foyers in das Aulageschehen. Im rechteckigen Neubauvolumen befinden sich Mensa, Hörsäle und im Dachgeschoss eine Bibliothek. Der den Räumen vorgelagerte ist Foyer und Erschliessung zugleich. Grossflächige Verglasungen gewähren und schaffen Transparenz. Die Nahtstelle von Alt- und Neubau bildet ein mit Glasbausteinen gedecktes, in der Höhe abgesetztes Treppenhaus, das zu einem wichtigen Raum der Begegnung in der neunten Hochschule wird. (Weber)

## Taiwan

### **Bio Architecture Formosano, Taipei – Taiwan**

<http://www.bioarch.com.tw>

#### **Libraries:**

#### **Beitou Branch Library, Taipei – Taiwan 2006**

In Taipei City's Beitou Park (台北市北投公園), there is a brand new public facility that is being hailed as Taiwan's greenest building. The Beitou Branch of Taipei Public Library (台北市立圖書館北投分館), which formally opened in November 2006, is the first building in Taiwan to qualify for a diamond rating—the highest possible—under the government's EEWB certification system (EEWB, 綠建築指標) for sustainable construction projects. Green buildings like the library aim to minimize harm to the environment through the use of recycled or renewable materials, and by being energy and water efficient. Taiwan's government was the first in Asia, and the fourth in the world, to adopt a set of sustainable building standards. The EEWB system—so called because it focuses on Ecology, Energy saving, Waste reduction and Health—is roughly equivalent to LEED (Leadership in Energy and Environmental Design Green Building Rating System) in the United States, and CASBEE (Comprehensive Assessment System for Building Environmental Efficiency) in Japan. The library's wooden walls hark back to Japan's occupation of Taiwan (1895-1945), during which period thousands of buildings were constructed of timber felled from the island's forests. Its shape, however, and the vast amount of window area for its size, make it very different in appearance to Beitou's few surviving Japanese-era bungalows. The use of wood is significant. If taken from managed forests rather than primary or rain forests, it is a far greener material than concrete. Cement takes a great deal of energy to extract, heat, mix and refine. Also, the extraction of gravel for use as a concrete aggregate has damaged many of Taiwan's rivers and hillsides. Ying-chao Kuo (郭英釗), one of the architects who worked on the project, explains that the timber for Beitou Library was sourced from North America. It could not be obtained from anywhere nearer because logging has been effectively banned in Taiwan, and forests in Southeast Asia are not managed in a sustainable manner. Taiwan's hot, humid climate and insect population can be brutal for wooden structures. But rather than treat the materials with strong chemicals that might later contaminate the environment, wood oils were used to protect the timber from rotting and infestation, says Kuo, one of the partners of the Taipei-based firm Bio Architecture Formosana (九典建築師事務所), the designers of the library. The library's large windows help cut electricity use in two ways. An abundance of natural light means less interior lighting is needed. Also, the windows can be opened to provide ventilation, so reducing the need for fans and air-conditioning. One part of the roof is covered by photovoltaic (PV) cells that are expected to convert sunlight into at least US\$1,000 worth of electricity per year. Another part is covered by a 20-centimeter-thick layer of soil that provides thermal insulation. During Taipei's chilly winters, the soil cuts heat loss through the ceiling and thereby makes the interior cozier. In the summertime, the foliage blocks some of the warmth of the sun. Some plants take root and thrive on the roof, improving air quality in the immediate area. However, says Kuo, it is not a rooftop garden, and so requires neither watering nor maintenance. The library conserves water by capturing rainfall. The sloping roof gathers rainwater, which is then stored and used to flush the library's toilets. Easy access to public transportation, which inevitably reduces car use and carbon dioxide emissions, is not part of the EEWB assessment system, though it may be added in the future. In any case, Beitou Library does superbly in this respect. It is six minutes' walk from Xinbeitou MRT Station, and at least 14 city bus routes stop within three minutes of the entrance. However, things are not made especially easy for cyclists. There are no racks for chaining or locking bikes. According to Kuo, this is because the library lies within a park, and Taipei City Government by-laws stipulate that bikes are not allowed inside parks. During the design phase, Bio Architecture Formosana did manage to obtain an exemption from another law, that requiring all public buildings to have car parking spaces. The Beitou building is not Taipei's only green library. The Shihpai Branch of Taipei Public Library (台北市立圖書館石牌分館), another Bio Architecture Formosana design, was opened to the public in late 2006. From within and without, Shihpai Library looks much more like a conventional building than its counterpart in Beitou. Kuo explains that this is because it was designed much earlier than the Beitou building, and also because it needed to have a lot more floor space—6,740 square meters (including a nursery), compared to 1,990 square meters—while occupying a much smaller plot of land. Nonetheless, the architects were able to incorporate several green features, including a roof shaped like a billowing sheet that captures rainwater; a corner cooled by winds from three directions; water-efficient bathrooms; a forecourt paved with water-permissible bricks; and a rooftop garden. Various government bodies are helping to promote sustainable building in Taiwan. Taipei City Government (台北市政府), which commissioned the Beitou and Shihpai libraries, was, Kuo says, "a very nice client." The Ministry of Economic Affairs' Water Resources Agency (經濟部水利署) encourages the capturing of rainwater. The state-run Taiwan Power Company (Taipower, 台電公司) is obliged to buy surplus electricity generated by PV systems. The Ministry of the Interior's Architecture and Building Research Institute (內政部建築研究所) is responsible for a six-year-long, NT\$1.8-billion Green Building Promotion Program (GBPP). "The program includes mandatory green building design for new governmental buildings, green remodeling and green HVAC [Heating, Ventilation, Air-Conditioning] projects for existing governmental buildings, research and development for recycling building materials, promotion of green building materials, training and education for architects and professionals, as well as other promotion activities for the public," says Chiung-yu Chiu (邱瓊玉), a research fellow at ABRI. The GBPP stipulates that government-backed projects worth NT\$50m or more, and projects receiving government subsidies that account for 50 percent or more of their total budget, need to pass four of the nine indicators that comprise the EEWB rating system. The nine indicators are: foliage; water soil content (infiltration and retention); energy savings (for lighting and HVAC); carbon dioxide emissions reduction; construction waste reduction; water conservation; garbage and sewage improvements; biodiversity; and indoor environmental quality. The not-for-profit Taiwan Green Building Council (TGBC) (台灣綠建築發展協會), established in January 2005, is also promoting EEWB. The TGBC brings together

building contractors, property developers, household appliance manufacturers, government bodies and academic institutions. It represents Taiwan on the World Green Building Council (WGBC). According to Chiu, by the end of July 2007 the total number of completed and EEWB certified green buildings in Taiwan was 195. This number may seem small, but by international standards Taiwan is making excellent progress. According to the WGBC's website, only 25 projects in Australia have been certified under that country's Green Star evaluation system. In Japan, just 16 buildings had satisfied CASBEE requirements by the end of 2006. Alex Hsu (徐鼎皓), one of Kuo's co-workers, says green buildings are typically 10 to 30 percent more costly than standard designs. Despite this, Taiwan's sustainable construction industry is growing. A total of 1,216 projects were being considered for EEWB certification at the end of July 2007, says Chiu. And as of August 2007, Bio Architecture Formosana was working on three more "green" projects—a hillside temple and nunnery on the outskirts of Taipei, a bank building in Yilan County (宜蘭縣) on the east coast, and a dormitory for the employees of a research institute in Tainan County (台南縣) in the south of Taiwan. Written by Steven Crook for culture.tw, (<http://www.culture.tw>)

## **MAYU Architects, Kaohsiung City – Taiwan**

MAYU architects+, founded in 1999 as Malone Chang Architects, later as Malone Chang and Yu-lin Chen Architects, is an interdisciplinary practice based in Kaohsiung, Taiwan.

<http://www.malonearch.com.tw>

### **Libraries:**

#### **Tainan Yu-Wen Library, Tainan City – Taiwan 2012**

Yuwen Library is a critical part of an ongoing municipal projects to expand the reading environment for the communities throughout Tainan City. The key design goals are to pull together surrounding public facilities by its unique facades, and expose its inner activities to the city by locating large concrete "windows" at building corners. We see this library as generator of civic programs, and the children's library, facing an elementary school across the street, plays an important role.

The Library is located in the East District, Tainan City. The site is bounded by streets ranging from 12m to 20m widthwise and also surrounded by public facilities: elementary school to the north, community center to the east, and the park to the south. The Yu-sin Boulevard to the west is the main south-north corridor in the area. The library is a 4-story concrete construction on a 2965 m2 site with 3144 m2 total floor area. The projected collection capacity is 110,000 books. The construction budget is around NY\$122,000,000. Library is a place of reading. However, in this information age, digital media and visual-audio resources have formed significant parts of any library collections. Therefore, in contemporary library, the visual acts of reading, browsing, and gazing create a web of inter-reference, resulting a fluid relationship of subjects and objects. In order to capture such contemporary phenomenon, the architectural interpretation of gaze and looking becomes guiding concepts of this project.

Gaze and looking: Concrete volume as visual vehicle

The site is adjacent to several urban programs with high public value; therefore, a concrete lower volume is proposed to negotiate those urban events on the one hand, and organize internal functions on the other. Large fenestrations articulated with concrete panels and canopies are located at dramatic moments: street corner facing elementary school (children's library), frontal view toward community center (young-adult area), gaze window viewable from the park (reading room), and finally the horizontal glazing along the boulevard (lobby and new arrival). These symbolic openings convey the public character of the library, allowing citizens' gaze penetrates the library boundaries from all angles. The coexistence of the expansive concrete walls and openings suggests enough aura that lures citizens to explore the knowledge inside.

Simultaneously Iconographic and transparent: Wood volume as symbol of books

The significant position of Library in the historical and social-cultural context always calls for symbolic formal language. A wood volume is half-lodged on top of the lower concrete volume: this volume contains collective human knowledge and clad in vertical wood louvers. It is the metaphor and representation of books. Characterized by four carved in curves, the form of the wood volume is distinct and iconographic. Internally, the combination of louvers and expansive glazing generates a transparent and universal space full of diffused sunlight. Here, the desire of gaze and looking is minimized; what is left is the very original act of reading. (MAYU Architects)

## **J.J. Pan Partners, Taipei – Taiwan**

<http://www.ijpan.com>

### **Libraries:**

#### **National Library of Public Information, Taichung –Taiwan 2007 - 2012**

Situated in the middle of the island of Taiwan, the National Library of Public Information occupies a site that is both geographically and metaphorically the confluence of information exploration and urban evolution. The striking form of the building features a "horizontal flow" theme recalling the early irrigation canals in the city's settlement since the 18th century, as well as symbolizing the fluid data interface in the internet age. Architecturally, the project is strongly rooted in the canons of modern architecture such as Le Corbusier's Five Points of Modern Architecture; but also addresses conceptual questions such as how the library is to survive or even thrive in the digital age. In fact, the genesis of the design is the decision to directly confront the challenges and opportunities presented by the dynamic nature of digital media. The resulting fluid building form and ever-changing spatial movement are manifested in the protruding volume of the conference center, the grand steps connecting the plaza and the L shaped buildings embracing a landscaped court. Akin to how the Five Points challenged the conventional design and construction practices of the time, the library tested the limits of design and construction in Taiwan. To achieve the building's free-formed skin with its curved planes and organic tree trunk-shaped columns, the latest 3D design software and quite a few on-site mock-ups were utilized. In the end, a composite wall system with integrated insulation molds the folding surfaces, which are clad with pearl-white round mosaic tiles of eight different sizes enabling the skin to achieve a monocoque appearance. In the interior, each floor from level one for five, takes its visual design cue from the corresponding outside view - people, trunk, canopy, the city skyline, and clouds respectively. The landscape design features a moon-gazing berm with a multitude of native plants and low-maintenance wind resistant shrubs.

Founded on the balance between cultural, technical and indigenous uniqueness, the design of the National Library of Public Information has established a new model for future civic projects in Taiwan. (<http://www.e-architect.co.uk>)

#### **Taichung Digital Library, Taichung – Taiwan 2011**

The challenge faces the design team is about "re-inventing" the library space and image to suit the changing ways people use the library in the contemporary digital age. The site of this new library lies on the strategic location of a park connected to one of the city's important linear green belt system. At the entrance plaza, the building recesses to form one gentle green curve on the lawn to express a welcoming gesture to the visitors. The volume of ground floor is "streamlined" to allow maximum transparency at the base. This fluent pattern also helps create a movement of people through the ground level of the library. With its linear window and curved exterior wall between floors, the facade of National Taichung Library is meant to echo the vibrant context. Visitors inside the

reading room will be able to enjoy the vast green treetop view through large glass taking advantage of horizontal openings facing the city's greenbelt. The folding facade reaches out for sunshine and creates shadows to enrich the building's elevations. Inspired by dotted light pattern of sunlight through tree leaves, the design proposes a series of round shaped openings spread out over the roof to allow for indirect sunlight and ventilation for energy saving. (Pan)

### **Founder's Memorial Library, Chinese Culture University, Taipei – Taiwan 1999**

#### **Awards:**

#### **1999 Quality Excellence Award, National Public Construction Annual Award**

The University wishes to erect a library in memory of its founder, Chang Chi-Yun, near the main entrance of its main Campus opposite the existing building, Ta-Cheng House. The site has a fine view of Sha-Mau Mountain to its north, and borders the Hwa-Kang residential community to its east. The land rises with a gentle slope from east to west resulting in over four meters of difference in height; the building was thus designed with dual level access. On the west, a main entrance plaza on the second floor level is enclosed by a U-shaped group of structures which protect the outdoor area from the strong winter wind, at the same time engaging Ta-Cheng House to form a central courtyard; on the east, a secondary landscaped plaza is provided on the ground level where town and gown may meet and mingle. An university bookstore and the service entrance for the library are both located here. The new group of buildings is 11 stories high with 2 basement levels. Building heights vary from north to south: the north wing is four stories, containing a 200-seat conference hall on the plaza level with auxiliary meeting rooms and reception space below and an art museum above; the L-shaped east and south wings contain the memorial library from 1st through 7th floors, housing a collection of 1,000,000 volumes and accommodating about 1,040 seats, while the south wing continues to rise to 11th floors for research and administration. Independent entries are provided for the different users. Parking for 168 cars and 832 motorcycles are provided underground. Steel structure precast panel exterior walls are the main systems. The pitched roofs harmonizes with existing buildings, but terminate in triangulated open lattice-work, partly to fulfill building code requirement for roof level exit, and to add a contemporary touch with a spirit of reform. Total floor area 36,680 sq.m., construction cost NT\$900,000,000. Completion date is May 1998. \* Joint Venture Architect: Chiu-Hwa Wang. (Pan)

## Turkey

### **Akant Tasarim & Restorasyon Mimarlik, Istanbul – Turkey**

<http://www.akanttasarim.com>

#### **Libraries:**

#### **Rami Eyup Istanbul Library, Istanbul – Turkey on design 2008 - 2011**

Total Area:78.000 sqm. A new library building is desired to be built in addition to Rami old Military Barracks. Restoration Project with a new City Museum function.

The Rami Library brings a new perspective to the understanding of librarianship in national cultural community and is also totally open to international.

#### **Library:**

The heart of the library is Lighthouse in the middle which is surrounded by two main reading halls and entrance hall in three different floors. A strong visual connection is created by a big gallery gap which also separates the library part from other functions in the building. Behind the reading halls 11 floors of bookstock is placed for more than 3 million of books. Beside three main reading halls, special reading areas and rooms for researchers, academicians are also planned and connected to the bookstock with bridges at some points.

#### **Foyer-Bridge:**

Foyer is thought as a small city square where public can navigate freely and enjoy the space. Foyer is at the height of +11.00 m and accessible with two different paths/stairs attached to the facade of building. These paths are becoming parts of the landscape which lead people inside the building. All the entrances of main functions are placed here. Under the Foyer part, Event Area takes place at +0.50m. Public is the keyword. Building with its surrounding would host as many events as possible which are related or non-related to the functions inside and bring people together and create a kind of Social Aura around. Event Area is mainly placed at +0.50m ground level, where the building is lifted up to create an extra volume. A café takes place here and services to this area. This space also connects the north-east border of the main project site with City Museum.

#### **Auditorium:**

Auditorium services to 1000 people. The whole system is designed suitable for theatre plays, concerts as well as conferences. Except auditorium function, another volume is attached to here which contains management department. Beside these main functions, underground parking, infrastructure spaces, vertical circulation elements, etc. have been solved coherently to design.

#### **Raif Dinckok Cultural Centre, Yalova – Turkey 2011**

It is possible to say that cities are made out of different contextual layers which time by time come near each other or on top of each other, even intertwine at times and ground their specific existing states. In the Yalova example peculiar to this city, oppositions between the main layers stand out.

One face of Yalova is its natural side. The endemic plants, areas where these plants are grown, exhibited and evaluated commercially, and even the most developed arboretums of the near geography are facts that determine the current existing state of the city. A colorful, joyful and vibrant world stands out. In this sense, it embodies an optimism, a feeling that the life is more joyous and trouble-free in this summer place.

Yalova is also an industrial city. Doubtless to say this face of Yalova's existing state is not as trouble-free. It is hard to say it would be joyous and vibrant. Instead, the harder parts of life, labor and sweat come out. Compared to the other one, this world is more challenging.

It would not be wrong to say, without even questioning which face is more veritable, these two existing states that are totally opposites of each other have intertwined in this city, have fed of each other and even have created the city's unique soul from the tension caused by the opposition. The relationship between the building which is a cultural center, the city and the people of the city is the primary vessel of the design. In this sense, it is aimed that the center mediates with the opposite layers of the city.

The building resigns to the west side of the site and leans to the edge in order to make space for the city garden that will be placed in front. The perception from the exterior does not give away to the shiny and dominant world of the recent cultural centers that want to monumentalize. Moreover, it holds off from this colorful, carefree yet imperious world. By doing this the 'designed' does not try to force an order, it does try to teach the 'user'. Instead, the design is mostly 'open-ended'.

At first glance, the building does not reference to any shape. This objectivity that the building's unlike to any shape mass creates, changes to the industrial character of the city as you get close to the building. Instead of the shiny and ostentations materials, the foraminous plates made out of resistant construction steel that was designed for facade sheating, was used to strengthen this feeling with their rusty surface. Citizens would recognize this texture easily as they have seen it in the production areas even though it had not been used on a building. The building now, has overgrown its new and stranger state and has started to intertwine with the citizens. The surface which is also suitable for recycling, acts as a natural palette, containing the changes it will go through like the color and tone changes caused by oxidation. This movement will make the relationship between the city and the building more interactive.

The fact that the facade is perforated provide the surface to dissolve at the night time like a tulle curtain and the inner would be perceived easily. The user enters the building from its mouth. There is not a door or a barrier. The metal tulle now transforms into a protector. It leaves the negative impacts of rain, sun and wind but it does not transform into an interior space because of its semi-transparent nature. The air ventilates freely in this area.

The masses in the building are shaped specifically to their different functions and necessary dimensions. Areas like 600 people capacity multi-purpose room, 150 people capacity workshop room, nuptial and exhibition rooms, library, office and cafeteria are related to each other from different elevations. These masses that are disconnected from the building facade and from each other, exist inside the building with their unique geometries. Their surfaces emphasize Yalova's colorful and overgrown natural texture. It is aimed that the joyful image that various plants generate will appear beneath the surface of the facade as a second layer of exterior perception of the building just like it is on digital publications in close perception.

The ramp that connects these masses to each other by creating a sheltered inner street, try to enrich the lives of the visitors. In the voids that are in between the masses are mostly recreational activity functions and service spaces.

To think about the predicted relationship between RDKM Cultural Center, which's project was acquired by a limited competition organized by the investor, its place and the owner of its place; the citizens, takes the building to a very specific position for the designer... (EEA)

### **Libraries:**

#### **Namik Kemal University Faculty of Medicine Morphology Building, Tekirdağ – Turkey 2012**

tekirdağ, design project and constructional drawings, 2009-2011

project team Pınar Gökbayrak, Ali Eray, Burçin Yıldırım, Burcu Yücetaş, Onur Yalınas, Özlem Yılmaz, Deniz Erdem assistants Erhan Sevinç, Eda Yeyman İTÜ-MARDİNT coordination Assist.Prof.Dr. Yüksel Demir, Zehra Zülfiye Rahmanalı

Morphology Building which will be used as the main building for Faculty of Medicine is within the campus of Namik Kemal University. The building consists of three blocks which includes offices for faculty members, laboratories, classrooms, and lecture rooms. The sunken courtyards, which enable maximum natural light and ventilation for basement floors, also complete the formal expression of the building since their footprints grow out of the volumetric layout of the blocks. Block A with the main entrance, consisting of lecture rooms, classrooms, cafeteria, reading room is allocated for students. Block C with the office spaces which are lined up around a gallery space is used by faculty members. Block B comprising of laboratories, seminar and meeting rooms is planned both for students' and faculty members' use. The courtyards at lower-levels maximize natural lighting and ventilation for interior spaces, while their footprints complete the volumetric expression of the building which has 12.000 m2 gross floor area. The building construction has finished in June 2012 and currently in use. (PAB)

## United Kingdom

### **3Dreid, Birmingham – UK**

#### **Libraries:**

#### **Heart of Slough, Slough – UK planning 2008**

Client: Slough Borough Council: A new library, museum, central Adult learning facility and Café. In addition, the development provides a valuable opportunity to regenerate the public realm of the area and a new garden square will form the focus of this. Internally, the scheme will provide a high quality environment using innovative design and materials creating a simple integrated structural solution promoting low energy consumption and carbon emissions. The building will be flexible, robust and adaptable providing a high degree of future proofing against changes in use and the external climate. (3dreid)

#### **Earlston High School, Earlston – UK 2009**

Client Bilfinger Berger BOT / John Graham (Dromore) Ltd, GIFA / Construction Cost 15,076sqm / £27.8m, No. of Pupils / £/sqm / £/Pupil 1000 / £1,844 / £27,800

One of three new build High Schools designed by 3DReid, as part of the public private partnership between Scottish Borders Council and Scottish Borders Education Partnership, in challenging locations, each with site specific issues including high marine exposure, breeding bird habitat and a flooding river. The schools provide high quality educational, social and sporting facilities within their respective communities. An integrated Public Library, Vocational Training Centres and a Horticultural Department further enhance these community facilities.

The location and topography of the site at Earlston has dictated the form of this rural High School which caters for 1000 pupils and community use. The school steps up the site; 3-storeys to the front – giving an impressive public façade – to 2-storey to the rear – giving a more appropriate human scale to the playgrounds behind. Retaining walls are used to hide the Plantrooms and also to create an upper viewing gallery to multi-use games area (MUGA) and a covered walkway links two external blocks.

#### **Innovations & added value**

Natural daylighting and ventilation was an integral part of the initial designs. The classrooms have higher than specified ceilings and this allows larger windows permitting light to penetrate deep into the spaces. The greater volume also allows air to circulate more freely and tempered natural ventilation is introduced into the classrooms from wall vents, as opposed to the windows.

The wide circulation routes are naturally lit from above and lightwells allow daylight to penetrate all levels – and allow a visual link between floor and departments within the school.

This fundamental environmentally sound design, and the inclusion of sustainable design features (Biomass Boilers, wind turbines, etc.) have enabled the schools to achieve an EPC Rating “A” and a “Excellent” BREEAM pre-construction rating. Note: We are still awaiting the post-construction rating from BRE. (3dreid)

### **Adjaye Associates, London – UK**

<http://www.adjaye.com>

#### **Libraries:**

#### **Rivington Place, Stuart Hill Library, London – UK 2007**

Rivington Place opened in October 2007, the first new-build public gallery in London since the Hayward Gallery opened in 1968. Designed by architect David Adjaye OBE, it won a RIBA award in 2008. This new and iconic cultural landmark celebrates the 20 year vision of two organisations: Iniva (the Institute of International Visual Arts) and Autograph ABP. It has established a permanent home for the profiling of international perspectives in contemporary visual arts and the diversity of visual culture. David Adjaye is one of Britain's leading contemporary architects, whose designs emphasise the experience as well as the function of architecture. Born in Tanzania, his influences range from African art and architecture to contemporary art and music. He has collaborated with numerous artists including Olafur Eliasson and Chris Ofili. The unusual lattice pattern of Rivington Place was influenced by a Sowe mask from Sierra Leone. This affects the internal space by creating windows at different heights; the lower ones giving views to the street, the upper ones giving views of the sky. In larger spaces, the windows produce an ambiguous sense of scale as their position and size contradict the effects of perspective. The two public façades are distinguished by a chequerboard grid of black pre-cast concrete panels. The eight rows of windows relate to five storeys of accommodation with the effect that the building appears taller than it actually is. Towards the top of the building the openings grow shorter, while along the length of the Rivington Place façade they widen. The building previously occupying the site had been demolished some years ago, the volume of the new building has similar proportions to some of the warehouses in the area. The materials and colours update the architectural language of the older buildings whilst responding to the use and purpose of the building. The 1,445 square metre building contains two project spaces for the presentation of exhibitions, film screenings and talks. It also houses the Stuart Hall Library; education space; photography archive; café; workspaces for local creative businesses and the offices of Iniva and Autograph ABP. The Stuart Hall Library on the 2nd floor focuses on contemporary art from Africa, Asia, Latin America and the work of British artists from different cultural backgrounds, many of the titles are not readily available in the UK. (<http://www.londonopenhouse.org>)

#### **Idea Store Whitechapel, London – UK 2005**

(restyling, see AEQUO)

Nominated for the Stirling Prize in 2006, the Idea Store Whitechapel is the flagship building programme based on a new type of information and learning provision being pioneered by the London Borough of Tower Hamlets (Adjaye)

Local people had become disengaged with Tower Hamlet's libraries, which were often in inconvenient locations, inaccessible for disabled people and in need of modernisation. Following a major public consultation, Tower Hamlets unveiled its plans to invest £30 million in a series of Idea Stores that would bring libraries up to date with modern lifestyles and community needs.

The first Idea Store opened in Bow in 2002. Over the next few years Idea Stores opened in Crisp Street, Whitechapel and Canary Wharf. Located at the heart of communities, amongst supermarkets and other shops, Idea Stores make library and learning facilities

available where people want to use them. They address the needs of diverse community groups, widening participation in lifelong learning and helping to strengthen community cohesion. Each one offers a convenient and accessible one-stop location for library, learning and information services.

Tower Hamlets had set out to double the use of library and adult education facilities across the borough within five years – and managed to exceed its own ambitious targets. Funding for the Idea Stores came from the London Borough of Tower Hamlets and a range of public and private sector organisations. The five-storey flagship Idea Store in Whitechapel was built by Verry Construction and designed by architects Adjaye Associates. (<http://www.homesandcommunities.co.uk>)

### **Idea Store Chrisp Street, London – UK 2004**

(restyling , see AEQUO)

Chrisp Street is one in a series of Idea Stores that are intended to encourage local people to make the widest possible use of the facilities provided; a person who starts off by browsing in the audio-visual section might decide to accompany their child to the teen library or perhaps sign up for a life-long learning class. The site for this Idea Store consisted of an existing retail unit, part of a 1950s shopping centre, and the larger deck which previously formed this roof (Adjaye)

### **Museum of African American History and Culture, Washington, DC – USA 2009**

#### **Competition – 2015**

(with Davis Brody Bond, SmithGroup, Freelon Group)

The museum is expected to open in 2015 and cost approximately \$500 million. Lead Designer: David Adjaye, Design Team: Freelon Adjaye Bond/Smith Group, Client: Smithsonian Institution, Structural Engineer: Guy Nordenson and Associates, Robert Silman Associates, Mechanical Engineer: WSP Flack + Kurtz

We have been covering the progress of the Smithsonian National Museum of African American History and Culture over the last several months, our most recent being President Obama's speech at the ceremony for the official ground breaking.

Adjaye Associates recently shared with us some insight into the inspiration for the design and its grounding principles. We also have several new perspective renders illustrating the internal experience. More details after the break.

Lead designer David Adjaye set out to establish a unique connection with both the site and its natural surroundings as well as create a compelling conceptual resonance within America's deep and longstanding African heritage. The basis of the design is firmly rooted in a trifacta that binds and informs the overall design; a "corona" shape that forms the solid portion of the building, a "porch" extension of the building that merges into the surrounding landscape, and a bronze filigree that wraps around the structure.

Adjaye Associates describes in detail the location and elements that begin to inform the overall experience; "Situated on the Washington Monument grounds the museum maintains a subtle profile in the landscape – more than half is below ground – with five stories above. The corona is based on elements of the Washington Monument, closely matching the 17-degree angle of the capstone and the panel size and pattern has been developed using the Monument stones as a reference. The entire building is wrapped in an ornamental bronze lattice that is a historical reference to African American craftsmanship. The density of the pattern can be modulated to control the amount of sunlight and transparency into the interior. The south entry is composed of the Porch and a central water feature. An extension of the building out into the landscape, the porch creates an outdoor room that bridges the gap between the interior and exterior."

"At 50m (49'-2") deep, the setback is similar to other buildings on the north side of the Mall. The underside of the porch roof is tilted upward allowing reflection of the moving water below. This covered area creates a microclimate where breezes combine with the cooling waters to generate a place of refuge from the hot summer sun. There is also an outdoor patio on the porch rooftop that is accessed from a mezzanine level within the building."

"Inside the building, visitors will be guided on a historical and emotional journey, characterized by vast, column free spaces, a dramatic infusion of natural light and a diverse material palette comprising pre-cast concrete, timber and a glazed skin that sits within the bronze lattice. Below ground, the ambience is contemplative and monumental, achieved by the triple height history gallery and symbolized by the memorial space – the "oculus" – that brings light diffused by a cascade of water into the contemplative space from the Monument grounds. Moving upwards, the views become pivotal, as one circulates along the corona with unrivalled panoramas of the Mall, Federal Triangle buildings and Monument Grounds."

(<http://www.archdaily.com>) 21.03.2012

### **Washington Libraries, Washington, DC – USA 2008 – 2012**

Adjaye Associates is designing for new public libraries to replace the existing Francis Gregory and Washington Highlands Facilities (Adjaye)

### **Francis Gregory Neighborhood Library, Washington, DC – USA 2012**

client: capital projects, total area: 22,500 sqf, contract value: 13 m USD

see also: Wienczek + Associates, Washington DC (USA)

### **William O. Lockridge/Bellevue Library, Washington, DC – USA 2012**

client: district of columbia public libraries, total area: 22,500 sqf, contract value: 13 m USD

see also: Wienczek + Associates, Washington DC (USA)

Both the 'francis gregory neighborhood library' and the 'william o. lockridge/bellevue library' by london-based adjaye associates have opened to the public in washington DC. the buildings open themselves to their residential contexts, generating welcoming centers which merge socially focused aspects with an urban and cultural program. within the wooded setting of fort davis park, the 'francis gregory neighborhood library' takes on the atmosphere of a pavilion. capped with a flat plane roof with deep eaves, the two-storey building is defined by an elevational composition of diamond panels. the motif is continued within the canopy, shading the interior from direct sunlight while introducing solar gain during winter.

an external glass enclosure of alternating transparent and opaque panes reflect the greenery within the facade. openings between the diagonal structural framework allow outward views into the trees.

the interior hosts programmatic areas for adults, teens and children along with public meeting and conference rooms.

the perimeter's windows integrate seating to encourage visitors to enjoy the landscape. a material palette of timber brings the outdoor environment inside. 'our mission, with the francis gregory library, has been to offer a new way to experience books, reading and story-telling. rather than a traditional closed building, this library is porous and open, with the canopy providing a welcoming entrance that invites people inside. conceived as an extension to the park, it is not only a place to gather, but also a place of contemplation and learning.' - david adjaye

integrating into the site's steep terrain, the 'william o. lockridge/bellevue library' is expressed with a cluster of volumes

which are lifted or set within the ground. an entry portico is placed beneath an elevated event and public gathering area while the stacks and reading areas are placed on the lower floors. a series of rectangular footprints arranged at angles to each other in plan form a linear progression starting with the circulation desk, and then following with the adult browsing and support offices. paralleling the rising street and topography, visitors ascend a concrete stairway to successive levels within separate structures, finding the teenage on a second floor and children's services on the third. although reaching three storeys in some parts, the collection of buildings still maintain the scale of the encompassing residential fabric. timber fins wrapping the concrete and glazed skin articulates the external presence amidst the sloping landscape, doubling as structural supports and filtering daylight inside. 'communities need empowering buildings – and this neighbourhood library is all about the creation of a strong beacon for its community. the primary act of public architecture is to create spaces that are socially edifying and socially liberating – using design excellence as a social force that makes good. this is at the heart of my work, so it is very exciting to see this building welcome its community through its doors.' – david adjaye. (<http://www.designboom.com>)

## **ADP Architects Ltd. (Architects Design Partnership), Birmingham – UK**

<http://www.adp-architects.co.uk>

### **Libraries:**

**Aston Library, Birmingham – UK 2010 –**

£ 6,000,000

ADP has recently completed the first phase of Aston University's library refurbishment, which involved a large extension to the existing listed building and the complete refurbishment of its ground floor. The refurbishment has transformed the facility into a new state-of-the-art learning resource centre (LRC) and social learning hub, with lively group learning areas, a café, and with internet access available throughout. The existing library, an imposing four-storey brick building in the Modernist style, was designed Sir Basil Spence, architect of Coventry Cathedral. The building is being sensitively updated in order to provide new and expanded facilities for the twenty first century. A large glass extension to the front of the building provides a dramatic new entrance, whilst revealing Spence's original structure. Inside, suspended ceilings have been removed to reveal the building's original frame and brickwork, whilst stylish furniture has been used to divide up the largely open plan space into zones which cater for different learning needs. (ADP)

**Canterbury Christ Church University, Library, Augustine House, Canterbury – UK 2009**

The new £ 35 million library at Canterbury Christ Church University has opened. The new library and central Learning resources centre Canterbury Christ Church University will be its premiere landmark. This interactive hub of the University includes cafes, drop-in internet access, and a range of student support services that will be readily accessible and available. With an atrium of grand proportions, this will be an inspiring focal point for the whole University community. The dynamic character of the building has been expressed by the angular assortment of bridges and galleries that intersect the atrium, linking the building's two sides of flexible floors. These diagonal elements were inspired by views of historic Canterbury seen from the building's glass façade, including an ancient burial mound, the City Walls, and the famous Cathedral itself. The building is on target for a BREEAM rating of 'Very Good', and is being used as the pilot scheme for the new BREEAM Higher Education assessment category. Some 20% of the energy consumed will be from renewable sources, primarily from ground-sourced heating and cooling systems. (adp-architects). The library complex at Augustine House has taken 20 months to complete and features built-in computer terminals, a roof terrace with views over the cathedral, a cafe, and vast glass and steel walls to reflect the flint of Canterbury's ancient city walls. Designed by ADP architects, the new building is set to "become a new benchmark in the design and provision of library and student support services in the Higher Education sector. It's a seamless, airy blend of technology, sustainability, contemporary learning and tradition: where a student can utilise the latest in digital learning; or take a quieter moment to study with a good old-fashioned book in a comfy chair, making the most of the stunning views over historic Canterbury." The library has 200 laptop computers which undergraduates can plug into sockets throughout the premises. It also has facilities for students with disabilities including adjustable height desks and signs in Braille for the blind. The project even has its own green policy, so there are only car parking spaces for contractors, everyone else has to use a bike or public transport. The building also utilises geothermal concrete "energy" piles which provide a quarter the building's heating. The aim was for the building to achieve a BREEAM rating of 'Very Good, and the project is being used as the pilot scheme for the new BREEAM Higher Education assessment category. Some 20% of the energy consumed will be from renewable sources, primarily from ground-sourced heating and cooling systems. (designinglibraries)

The new library and central learning resource centre for Canterbury Christ Church University is now its premiere landmark. This interactive hub of the University includes cafes, drop-in internet access, and a range of student support services that are readily accessible and available. With an atrium of grand proportions, it is an inspiring focal point for the whole University community. The dynamic character of the building has been expressed by the angular assortment of bridges and galleries that intersect the atrium, linking the building's two sides of flexible floors. These diagonal elements were inspired by views of historic Canterbury seen from the building's glass façade, including an ancient burial mound, the City Walls, and the famous Cathedral itself. The building has achieved a BREEAM rating of 'Very Good', and was used as the pilot scheme for the new BREEAM Higher Education assessment category. **University of Central Lancashire, Central Library, Preston – UK 2009**

£ 2,700,000

Appointed in 2008, ADP undertook a two-stage refurbishment of University of Central Lancashire's (UCLan) central library. Its transformation into a new state-of-the-art learning centre and library involved interior design services, signage, graphics and furniture. Phase 1 involved creating an open-plan learning space on the ground floor. This new centre is separated into key zones, housing: group learning; an information zone; an international lounge or 'culture' area; IT support; information retrieval; quiet study areas; book returns; café, and a separate, self-contained careers area, 'futures'. The distinction between zones was achieved by use of colour, signage and furniture. Phase 2 involved the wholesale refurbishment of the first and second floors, including a new mechanical and electrical servicing strategy. The first floor improves the location of book stock and houses flexible training rooms, ICT and media suites, and individual learning areas. The second floor provides more book stock space and group study rooms. (ADP)

## **Aedas Group, Birmingham -Hong Kong – UK**

<http://www.aedas.com>

Aedas was established in 2002 with the partnership of LPT Architects in Hong Kong and Abbey Holford Rowe in the UK to become Aedas LPT and Aedas AHR respectively. Following a merger with **TCN Architects of Birmingham in 2003**, the name Aedas was adopted for all areas of the practice with the LPT and AHR being dropped from the Hong Kong and UK practice names later in 2003. In 2006 Aedas partnered with **Davis Brody Bond**, an award-winning American architectural firm with headquarters in New York. In 2008, Aedas merged with **MEIS Architects of Los Angeles**, a world-class design practice. In 2009 Aedas set up offices in Karachi with **Aedas Ali Naqvi** and in Turin through a partnership with **Marco Visconti**, chief designer of a number of Fiat and Ferrari buildings in Italy. (Aedas)

### **Libraries:**

#### **Darwen Aldridge Community Academy (DACA), Darwen – UK 2010**

Darwen Academy represents an opportunity to provide a benchmark environment in the centre of Darwen, bringing together teaching and learning in new and interesting ways. An investment of £36m has made it possible to provide accommodations for 1,200 students between 11-16 years old and a further 400 post-16 places, offering both traditional and more vocational curriculum tailored to the needs of the pupils. Facilities include lecture theatres, open resource spaces, ICT areas and a **flagship Learning Resource Centre** that will enable pupils to focus on the development of their entrepreneurial skills. The facilities are also available to the local community. The design of the academy successfully responds to the unique nature of the site and offers a large slope in two directions as it is situated on the side of a hill. The number of storeys in the building vary in order to work with the levels and the landscape which is seamlessly integrated within the project. (Aedas)

The Darwen Aldridge Community Academy [DACA] is all about regeneration in its vision, location, design and use. Located in the heart of Darwen at the head of the main high street Darwen Aldridge Community Academy stands as a beacon of opportunity and hope, demonstrating what is possible when a vision for regeneration by a local authority is matched by a vision for education in an academy sponsor. Conceived as a simple triangular volume the building works with the steeply sloping 21m gradient of the site to open up access to the town on five levels providing stunning views and forming a central visual and physical connection with the town centre through innovative use of levels, materials and site topography. The building boasts one of the largest sedum roofs in the UK and roof fenestration aspects have been integrated as an innovative design feature allowing light to pour through into the atrium spaces. Opened in September 2010 the building has achieved its BREEAM 'Very Good' target. Unique to DACA, and in support of its specialism, is the provision of an 'entrepreneurship bridge' containing business incubator units available to anyone in the local community interested in starting their own business. This close contact between the business start-up community and the Academy is central to the vision of regeneration and a valuable curriculum resource, as it allows students to learn from shared experience. Brendan Loughran, Principal of DACA, said of the project: "The building is iconic and the strongest symbol of regeneration of Darwen. The impact on improving students' attitude and motivation has been incredible. We have an environment which marries the worlds of business and education." Rod Aldridge, Chairman of The Aldridge Foundation, added: "The joy and excitement about school life in the building is tangible and it is an uplifting place to visit and feel part of." (<http://www.worldarchitecturenews.com>)

#### **Hadley Learning Centre, Headley-Telford – UK 2006**

The Hadley Learning Centre brings together a 1200 place Secondary school, a 420 place Primary school, a 150 place SPLD/PMLD Special Needs school and Community facilities including sports and swimming facilities, theatre and a **library**. Conceived as a major community regeneration project, this multi-purpose learning centre focuses on the educational needs of all ages and abilities, also catering for PMLD and SPLD students. The award-winning Hadley Learning Centre provides a wide range of teaching, learning, community and performance facilities. A key feature of the design is the integration of all spaces in one building. Arranged around a central open space and connected by a communal street, the arrangement of spaces (Aedas)

#### **Columbia University Northwest Corner Building, New York – USA 2010**

see also: **Rafael Moneo, Davis Brody Bond Aedas (New York)**

Completed in December 2010, the innovative Northwest Corner Building houses 21 cutting-edge labs gathering together researchers in biology, chemistry, physics and engineering, as well as a **science library**, lecture hall and cafe completing the outlines of Columbia University's original Morningside Heights campus plan by McKim, Mead and White. Built as a bridge above the existing Levien Gym in the Dodge Physical Fitness Center and supported by a 129-foot long, three-dimensional truss, the 14-story facility accommodates seven double-height lab floors designed to mitigate vibration and allow for flexible layouts as new scientific research priorities evolve. Elevated, enclosed bridges to adjacent science facilities in Pupin Hall and Chandler Hall will encourage more interaction among faculty and students from the university's science and engineering departments. Interior lobbies flow from the sidewalk level at 120th Street and Broadway to a publicly accessible, 1,400 square foot cafe above, and are connected visually and spatially to the campus-level lobby. This adds a bright new public portal between the original, more cloistered campus design of the late 19th and early 20th century at a dark corner previously marked by an iron gate and the masonry wall of the gym. The facility also includes a 164-seat lecture hall and a **two-story integrated science library**. A new exterior stairway connects the sidewalk at 120th Street to Pupin Plaza, permitting direct access to campus. A unitized glass and aluminum panel curtain wall on the west, Broadway-facing facade, mirrors the building's structural steel system. The integrated design process and materials used for the building aim to achieve a LEED Silver rating, and design elements that meet Labs21 criteria, a voluntary partnership program dedicated to improving the environmental performance of U.S. laboratories. **London Planning Awards: Best New Public Space 2010**

Officially opened in September 2007, Phase I of the development included the creation of the new Barking Learning Centre with over 250 apartments above and a public square, located opposite the existing Town Hall. The key construction challenge was the retention of the original 1970s library building and the design of a new concrete frame and transfer structure built over library to support the new housing above. Phase I was delivered four months early and within budget. As with any large scale regeneration, the scheme faced challenges that were overcome with a positive attitude towards finding solutions and the successful working relationships with a complex client group including local authority, community organisations and developers. Despite the protracted programme and the difficult procurement process, high quality design remained central to the whole team's ambition of what could be achieved. The quality and innovation throughout the scheme prove that public/private investment can work with the right team in place. The new Barking Learning Centre offers a much wider range of public amenities with ICT suites, conference facilities, a one-stop-shop, cafe, art gallery, classrooms as well as library facilities. AHMM persuaded the client to allow them to retain control the FF&E contract for the library - raising the standard to include bespoke furniture and branding/wayfinding by leading contemporary designers, including long-term collaborator Studio Myerscough. Since opening in 2007, the library has seen a dramatic increase in users and is now open until 10pm, bringing new life into the centre of Barking. (Allford)

## **Barbican Arts Centre, London – UK 2006**

£ 126,000,000

### **Awards:**

**RIBA Award for Architecture 2007**

**Design Week Wayfinding & Environmental Graphics Award 2007**

The particular problems of the Barbican centred on visitors being unable to locate themselves and their destinations easily – a confusion made worse by visual clutter accumulated over the last two decades, by the lack of a distinctive street presence and by the centre's inherently compromised architectural arrangement with its 6 principal venues and main entrances spread above and below ground over seven levels. The whole building is listed Grade II but we were not disposed to radically change it, rather to work with it, recognising and celebrating the building's best qualities while dealing head-on with its deficiencies. Our strategy has been to clarify the Barbican's circulation by creating a single, wide, unambiguous and welcoming route which takes visitors from the de facto main street entrance on Silk Street right across the centre to its other most-used entrance off the Lakeside Terrace, which is at the heart of the whole development. This new grand route, actually a new bridge structure, has one major crossroads from which visitors can branch off to their chosen auditorium or restaurant or meeting room before it leads visitors directly to the central circulation core. These lifts and stairs, uniquely in the building, provide access to all of the centre's many venues including the Library and the Art Gallery (refurbished as an earlier phase of the works) on upper floors and the main Cinema and the Pit Theatre below. Where new architectural form has been called for such as the new entrances, the new bridge, interval bars and information points, we have developed a common language of form and materials for their 'portal' enclosures which clearly highlights their function and respectfully distinguishes the new from the old. All of these new architectural elements have been deliberately over-sealed to occupy their sites fully such that they sit within Chamberlin Powell and Bon's robust spaces with confidence and read as a necessary part of the architecture. Close collaboration has been a key feature of the project where lighting and graphic design has been carefully integrated with architectural form to ensure that all aspects of the design are supporting the principle aim – that of improving the legibility of the building and the visitor's experience of finding their way around. To reinforce the new simplified routing, a visitor way-finding strategy has been developed with the graphic designers which, in contrast to the previous attempts, sets out to reduce the amount of signage needed to the minimum required to function – and at a completely different set of scales. Floor-to-ceiling signage has been installed in the form of giant arrows and super-graphics spelling out the names of the two main venues, the hall and the theatre, using colours which match the predominant colours of the venues themselves. At each lift lobby, giant cut-out numerals wrap around the concrete denoting the relevant level while smaller scale directories give more detailed listings of venues and facilities. With the lighting consultants a bespoke light fitting has been designed which underlines the distinctive architectural character of the concrete structure and which subliminally reinforces visitors' routes through its layout. Needless to say the six year-long project has involved a continuing partnership between the design team, the contractors, the client, and, through three years of disruptive works, its loyal audiences. (Allford)

## **Ravensbourne College of Design and Communication, Library – Learning Resource Centre, London – UK 1999**

£ 5,000,000

The brief was to incorporate the college's existing library collection and provide an extensive new IT facility within the existing building on campus. The design, a simple plan arrangement, was developed to minimise intervention with the original building. This was achieved by stripping out all existing non-structural partitions to the ground and first floor, unifying the interior space. The plan kept the office administration and IT facilities to the back of the ground floor plan, allowing the reception and magazine display areas to take advantage of the south façade. An existing double height space was retained linking the now opened ground and first floor spaces. A new staircase was inserted into this space linking the reception to the main library area at first floor. The ground floor brick panels along the extent of the open library shelving area and those to the double height space were removed. These were replaced with glazed panels incorporating the college logo as graphics to the glass. Again, the insertion of the glazing formed a visual link between the ground floor and first floor library space. The simple move of opening and linking up the ground and first floor plans together has provided a flexible learning space which is used for many varying activities from quiet study to fashion crits, exhibitions and film sets. (Allford)

## **Alsop Partner Architects, London – UK**

<http://www.alsoparchitects.com>

### **Libraries:**

**THE PUBLIC, West Bromwich – UK 2005 – 2008**

£ 52,000,000, Total Area: 9,274 square meters

### **Awards:**

**MIPIM Future Project Prizes 2003**

### **Literature :**

**Powell, Kenneth, Mel Gooding, Will Alsop: 1990 – 2000: book 2**

**Laurence King Publishing 2002**

Contained within a simple rectilinear form, The Public was conceived as a "Box of Delights" offering a wide variety of spaces, forms, angles, curves, surfaces, vistas and atmospheres. Located at the heart of the new town center for West Bromwich the building, with its large doors and through-routes, is an extension of the public town square. The box envelope is punctured by a scattering of "jellybean" shaped windows that pierce the sides of the aluminium cladding. Inside, simplicity of form gives way to complexity, with rugged, multi-faceted or curved forms appearing to balloon into the space, sitting on, or suspended from a table structure, with lifts cutting past them and a wandering, large-scale ramp linking the spaces. These forms are containers for the many different functions in the building. There are, for example, "Pods" for displaying art, as well as a huge "Sock" containing two large galleries, an events space "Rock" and a "Pebble." At the top of the building, suspended from the roof, a series of "Lily-Pads" – dish-shaped floors with brightly coloured interiors – will house creative workspaces. In places, these structures break through the external shell of the building. The "Pebble" is clad externally in the same stainless steel cladding used internally. The Theater, contained within the "Rock," is designed to serve the local community by accommodating a wide variety of functions. Gallery visitors arrive at level 3 at the edge of an informal cluster of tubular steel trees which provide an introduction to the delights of the Galley experience. The trees, designed by Ben Kelly Design, incorporate a mass of displays, lights, projectors, input terminals and decorative panels. After passing through the trees visitors arrive at the "Sock," a black sculptural form rising through three stories and dominating the North East end of the building. This accommodates the two temporary exhibition galleries - a white single story room at Level 3 and black two story room at Level 1. The overall interior of The Public was designed as a bioclimatic space. The "Pod" structures make it possible to target energy into spaces where people gather, thus allowing a high degree of energy efficiency. Natural ventilation is used where possible.

**Peckham Library and Media Centre - London Borough of Southwark - UK 1999**

£ 4,500,000

### **Awards:**

**2001 AIA London Chapter Design Award for Best Building**

**2001 Civic Trust Award**

**2001 BCIA Award**

**2000 RIBA Stirling Prize – Building of the year**

The public library at Peckham, south London, completed late in 1999, is part of a concerted programme of regeneration and community growth for this part of the borough of Southwark and forms one element in a new public square. Alsop's architectural approach responds to, and interacts with, a client brief which seeks to redefine the role of the library in the local community. After the practice's appointment (through a process of competitive interview), Alsop launched an intense dialogue with the community to discover what sort of building Peckham's inhabitants wanted. Different groups who would eventually use the building; schools, disabled forums, inhabitants of Peckham, were consulted at design workshops. The result was a striking example of the new community architecture. Eschewing the idea of a library as a static and somewhat rarefied preserve of an accumulated knowledge, wisdom and information, the Peckham model proposes that the 21<sup>st</sup> century library should reach out to the community, encourage access to knowledge and embrace the diversity of the local population. Alsop's first major building in London, the Peckham Library brings together a number of themes and ideas which have long preoccupied the practice. Most obviously, there is the conviction that

the public domain is enriched by strong form and vivid colour. Traditionally, a library is conceived as a 'serious' building, but for Alsop seriousness of the conviction that the public domain is enriched by strong form and vivid colour. Traditionally, a library is conceived as a 'serious' building, but for Alsop seriousness of purpose does not preclude either high style or wit. The practice habitually elevates its buildings above ground level, so that users connect with sky and views and the building itself, whatever its function, gains in presence. A by-product of this strategy is that buildings gain a 'sixth facade' - an underbelly which can form the cover for a public space at ground level. The Peckham Library is supported on concrete-filled steel columns, angled to form an irregular arcade which encloses a covered space, an extension of the new square. External claddings are chosen for durability and for their expressive textures and colours - pre-patinated copper and steel mesh contrast with coloured glass (used on the north facade). The library itself is at fourth floor level, the short arm of an inverted 'L', with offices, meeting rooms and other ancillary facilities on the lower floors. (Alsop)

## **Archial Group Plc (formerly SMC Group), London – UK** <http://www.archialgroup.com>

### **Libraries:**

#### **South Thames College, London – UK 2009**

The campus will accommodate 5,000 students and 200 staff. The college has been designed to provide maximum openness for circulation spaces whilst recognising the issues of security in an inner city campus. New facilities for Music, Media and Performing Arts, Languages, Health and Social Sciences, 6th Form Centre, a Sports Hall (to Sport England standards), separate Multi Purpose Hall community, Fitness Gym and ancillary facilities, Learning Resource Centre and Cafe. (Archial)

#### **Hutchesons' Grammar Junior School, Library, Glasgow – UK 2008**

### **Awards:**

#### **Scottish Design Award Best Small Project**

Archial was asked to look at the reconfiguration of the grade 'C' listed junior school based around the requirement for a new library. We proposed to centre the new library at the heart of the school within 2 existing classrooms. Both classrooms were joined together and completely refurbished to contain an enclosed junior section, alcoves held within the existing door openings, a lowered curved ceiling which enhances the traditional windows whilst housing services and has IT and audio visual screens installed.

(Archial)

A £200,000 library designed by Archial Architects for Hutchesons' Grammar Junior School in Glasgow has been nominated in the Best Small Project category at the prestigious Scottish Design Awards 2009. Archial was originally approached by Hutcheson's Educational Trust to prepare a feasibility document to look at reconfiguring the existing Junior School plan to meet the current education criteria. The proposal centred around the requirement for a new library space which would form the hub of the school and a focal point for both parents and pupils. The Trust wished to create a space which underlined Hutcheson's traditional values, combined with a progressive and forward thinking ethos. Archial proposed that this would be best achieved by juxtaposing a modern state of the art frontage for the library against the dark timber panelling and decorative plaster work of the assembly room. The library now occupies the centre of the building adjacent to the main hall and directly opposite the main entrance. It was felt important to express the modern interior of the library space to the visiting public, however the grade C listing of the existing building prevented opening up of the shared wall. To overcome this, the design team proposed a glass wall/light box which acts as a facade or veneer to the new library behind. Both school pupils and staff chose 12 well known quotations from childrens' books which were arranged randomly across the glass panels in vinyl applied to the rear of the glass. A further layer of donors' names was sand blasted into the outer pane of glass and highlighted by the overhead lights. Russell Baxter of Archial Architects, said, "The final piece creates a focal point, an art installation that the pupils can enjoy and provides a mechanism to thank parents and friends that have been kind enough to help fund the project. "This bold and exciting piece offers ownership to the funders, fun to the children and creates a modern statement within a traditional school building, thereby reinforcing the schools' forward thinking approach." The Archial Group Plc employs around 200 staff in Scotland, operating from offices in Edinburgh, Glasgow, Aberdeen, Dundee and Inverness. (<http://www.glasgowarchitecture.co.uk>)

#### **University of Abertay Library, Dundee on Tees - 1998 UK**

Scale 5,250 m<sup>2</sup>, Value £8 million, Completed 1998

### **Awards:**

The library has won several awards including a RIBA Award 1998; Scottish Design Awards 'Best New Building' 1998; Regeneration of Scotland Award 1998 and the Sir Robert Grieve Awards 1998.

1998 RIBA Award

1998 Scottish Design Awards, 'Best New Building'

1998 Regeneration of Scotland Award

1998 Sir Robert Grieve Award

Following a limited design competition in 1995, Archial was commissioned to design a new library for The University of Abertay, Dundee, which has become the gateway to the University. Three distinctive building elements reflect the very different accommodation requirements: circular lecture spaces are contained within the tall drum form, open plan library decks with a curved glazed wall provide views westward to the Sheriff Court, and service areas are housed in a solid rectangular form. A roof canopy serves to mark the entrance and unite the three core parts of the design.

## **Architype, London – UK**

<http://www.architype.co.uk>

### **Libraries:**

#### **St. Katherine's Library, Hereford, Herefordshire - UK Competition First Prize. Start 2010**

Herefordshire Council today announced that sustainability architect Architype has won the competition to design the £2.9m St Katherine's Library in Ledbury, Herefordshire.

The competition attracted a large number of entries including designs by Feilden Clegg Bradley, Richard Murphy, Davies Sutton and Panter Hudspith. The project board scored the proposals based on their interpretation of the project brief and their understanding of the historical and conservation context. The final three were also displayed for public comment, and there was an overwhelming preference for the Architype scheme.

Located within a rare surviving example of a historic hospital complex founded in 1232, the winning proposal is for an overtly 21st century building with a strong connection to Ledbury's heritage. Designed as a modern re-interpretation of Ledbury's traditional

timber frame, the new building will be constructed from Herefordshire grown oak and Douglas fir timber. Architype's scheme is highly sustainable and is aiming to be Ledbury's first "Passivhaus" standard building with radically reduced energy consumption.

In addition to the new library, the project also includes the refurbishment of one of the UK's only surviving examples of a 15th century pre-Reformation hospital Master's House. Architype is working in partnership with mediaeval timber specialists Butler and Hegarty Architects and Amey Consulting is providing other consultancies.

Construction of the new library is due to start in 2010. (<http://www.worldarchitecturenews.com>) (12.05.2009)

### **ARUP , London – UK**

<http://www.arup.com>

#### **Libraries:**

##### **Alhóndiga Bilbao – Spain 2010**

El concepto actual de biblioteca debe responder a un nuevo modelo que trasciende las funciones tradicionales Asociadas a la difusión cultural, incorporando servicios de tipología diversa que refuerzan identificación con las necesidades hábitos y demandas de la ciudadanía y favorecen su implicación e en la dinámica social de la comunidad a la que atienden (RecBib – Recursos Bibliotecarios).

Transforming a former warehouse into a 68,000m<sup>2</sup> cultural and leisure centre. Retaining the original façade and strips of floor. Housing new facilities within the shell of the original building. The refurbishment of Alhóndiga Bilbao will transform a former warehouse into a cultural and leisure centre. Arup provided structural, mechanical and electrical engineering design for the project.

The facade of the historic building, which was formerly used to store local produce, will be preserved. Strips of floor 4m and 11m wide, adjacent to the facade, will also be retained. The interior has been demolished to create space for the new facilities to be housed within the shell of the original building. The new centre will include a swimming pool with a big terrace, library, cinemas, exhibition hall, retail, leisure space and an underground parking garage. The main challenge for the designers is to unite the existing façade and floor strips with three new inner buildings and two basements. (ARUP)

##### **Discovery College – Hong Kong 2008**

Discovery College is a private independent school, operated by English Schools Foundation (ESF) in Discovery Bay, Lantau Island. The new campus combines a primary school and a secondary school, which in Hong Kong is called a "through train" school. The Hong Kong government provided a capital grant for construction costs equivalent to the cost of a new local standard school. ESF added to the grant to provide a higher standard of accommodation and special facilities.

The school began full operation in August 2008, serving over 1,400 students. It has a gross floor area of 24,500m<sup>2</sup>, with a fully equipped indoor sports hall, a performing arts centre and plenty of high quality educational facilities and amenities, including laboratories, workshops, an information resource centre/library, gymnasium, swimming pool and cafeteria.

Arup's project management provided an end to end service for ESF, from the concept planning to detailed design, construction and finally, the handover stage. (ARUP)

##### **Amsterdam Public Library – The Netherlands 2007**

see: **Joe Coenen**

The lighting design creates a landscape with contrasting zones. A system for distributing fresh air is incorporated into the floors. The building makes use of free cooling from the cold air outside. Opened in 2007, Amsterdam's new library is designed to connect learning with participation and experience. One of the city's largest public projects, it attracts two million visitors every year. As well as borrowing books, Amsterdam Public Library offers people the chance to attend special events, presentations, exhibitions and cultural activities. It includes seven collection floors and provides a storage area for books, a theatre, a readers' cafe and a restaurant overlooking the city. The architect's vision was to create a building with light and space at its heart. Arup's lighting design creates a landscape with contrasting zones on the large collection floors. Luminous escalators guide visitors upstairs to terraces in the library's high atrium. To help achieve a sense of space, Arup's structural and building design specialists cleverly hid the building's equipment and services from view. A system for distributing fresh air is incorporated into the floors. This innovation also extended to ensuring the Amsterdam Public Library is as sustainable as possible. The building uses a ground source heat system together with very efficient boilers. It also makes use of free cooling from the cold air outside whenever possible. (ARUP)

##### **Seattle Central Library – USA 2004**

see: **OMA**

363,000 square foot library with 49,000 square feet underground parking garage. Capacity for 1.45 million books; four-storey "books spiral" displays collected volumes in continuous run. Received LEED® Silver rating from US Green Building Council. The Seattle Central Library opened in 2004 to great civic pride and universal critical acclaim. It has been described as the embodiment of new library forms for the 21st century. The design team's challenges included maximising public space without the use of visually impairing pillars, strengthening the external structure for seismic resistance and support, and doing both in a sustainable manner. For the exterior, designers developed a diagonal grid system of insulated glass on a steel structure that provides great stiffness to resist lateral forces. Approximately half of the panes are triple-layered glass with a metal mesh sandwiched between two outer glass layers. The mesh reduces both heat and glare. The library was designed to outperform Seattle's energy code by ten percent. To accomplish this, Arup used computer modelling and CFD analysis to investigate energy-efficient building systems. Among its additional sustainable features are water-efficient mechanical systems, including irrigation via rainwater collection tank, environmentally-minded ventilation and fire suppression systems and extensive use of recycled material for construction. The library received a Silver rating from the U.S. Green Building Council's Leadership in Energy and Environmental Design (LEED®) programme. (ARUP)

### **Associated Architects LLP, Birmingham, UK**

<http://www.associated-architects.co.uk>

#### **Libraries:**

**Birmingham City University, Library, City Centre Campus: Phase II –UK 2015**

Client: Birmingham City University

Phase Two of Birmingham City University's City Centre Campus extends its estate including BIAD and Millennium Point as a coherent development around the City Park. The building is designed to form a 'front door' for the university and a landmark at the eastern end of the park, designed to align with the Curzon District of Birmingham's 'Big City Plan'.

The building acts as a student hub for the campus to provide facilities including library, catering, student services and Student's Union incorporating the Grade II listed Eagle and Ball public house. The building also provides accommodation for the faculty of Education, Law and Social Sciences, Birmingham City Business School and the University Directorate. The building has two wings of accommodation following Cardigan and Curzon Streets, linked by an atrium. In compliance with the masterplan, the building has five occupied storeys in Cardigan Street and six in Curzon Street at the end of the park. A two storey element of larger footprint contains the student hub around a secondary atrium engaging the public house. External space to the east is accessible from within the building to extend use and enjoyment of the canal environment. Low energy targets are to be met by a high performance external envelope and by engaging the thermal mass of the structure. Mixed mode ventilation with opening windows will ensure excellent internal conditions with user control. A biomass boiler and adiabatic cooling are employed to achieve a BREEAM Excellent rating and Energy Performance Rating of A. (Associated)

#### **Library, University of Birmingham – UK 2015**

Client: University of Birmingham, Project Value: £37m, EPC: A, BREEAM: Excellent, Feasibility Study: 2009, Construction: 2013-2015

Associated Architects' 2009 feasibility study concluded that a new building rather than refurbishment would best meet this Russell Group University's needs. The demolition of the deficient 1950s library will create a 'green heart' to the campus, improving both site circulation and the setting of the historic buildings. The new Library has a colonnaded front to this open space at the natural centre of the University.

The plan is bisected by a central street running north-south. 16,000sq.m of floor space is arranged over six levels with a series of lightwells running through the building. A café and new exhibition/events space to showcase research at the University are located on the Ground floor. Energy use will be reduced by around 50% helping the University achieve its 20% CO2 reduction by 2020. The new building has a contextual modern aesthetic, a contemporary but respectful neighbour to the listed Aston Webb buildings. A high level of glazing maximises views in and out, achieving optimum day-lighting to quiet perimeter study areas. Windows are set within a regular framework of stone with brick infill. Glass louvres provide solar shading and add a layer of detail to the elevations. Other materials are aluminium and zinc cladding. The importance of the corner beside the University Centre is emphasised by angled stone columns with brick linings orientated to the landmark University clock tower. (Associated)

Community Hub

#### **Community Hub - Public Library, Telford – UK 2014**

Client: Telford & Wrekin Council, Project Value: TBC, EPC: B

The masterplan for the Southwater quarter of Telford seeks to provide the new town with a vibrant civic heart and a framework for future development that will transform the quarter and the wider town centre.

The Community Hub is a major component of the Southwater masterplan and is located at a key nodal point between the town centre and Town Park. The Hub will accommodate a new public library, the Council's First Point and customer contact centre, tourist information and a range of voluntary organisations. It also provides commercial space for bars, restaurants and a café. Located at the end of the new Southwater Square, the Hub will be a design quality benchmark for future Telford town centre developments.

The Hub is designed around a central stepped atrium which will focus views up through the building to Town Park beyond, as well as allowing daylight to penetrate deep into the plan. As a result, the design benefits from a series of dramatic single, double and triple height spaces that will provide interest and promote views between floors and functions, reflecting the Council's desire for an open and welcoming environment.

A triage zone at Ground floor will provide an introduction to all services within the building, whilst escalators will bring visitors up through the atrium to the First floor library or out to the park beyond. The levels above will accommodate First Point facilities including waiting areas, booths, meeting rooms and a telephone contact centre. (Associated)

#### **The Performance Hub, University of Wolverhampton – UK 2011**

Client: University of Wolverhampton, Project Value: £12.4m

The University of Wolverhampton's School of Sports, Performing Arts and Leisure operated from two campus locations in Wolverhampton and Walsall. Associated Architects was appointed to develop a new 'Performance Hub' building at the heart of the Walsall Campus to unite the School in one location.

Integrating the separate and distinct needs of the three Schools within one building needed careful consideration as the combined brief included a variety of noise intensive and quiet spaces. It was the resolution of these conflicting adjacencies that drove the internal and external organisation of the completed building.

A four storey linear block houses the majority of the teaching accommodation including a Learning and Resources Centre at the lowest two levels, and specialist dance, drama and music spaces on the upper floors. The main 'black box' theatre space and support spaces including dressing rooms, rehearsal spaces and set workshop areas are contained within a three storey performance block separated from the main accommodation block by a full height glazed atrium.

The external expression of the building reflects the internal organisation. The performance block, which houses the 'black box' theatre, is robustly expressed with green copper cladding with abstract punched window openings with coloured linings, set on a base of black metal panels containing get-in doors. The main teaching block is clad in a contrasting patinated copper cladding and has a dramatic sloping wall and roof profile and super graphic signage to form a new marker of the campus from The Broadway. (Associated)

#### **Muirhead Tower, University of Birmingham – UK 2009**

Client: University of Birmingham, Project Value: £25m

**Awards:**  
RICS 2010

Muirhead Tower was designed by Sir Philip Dowson of Arup Associates and was completed in 1969 as the Arts and Commerce Building. The iconic two tower building with its expressed concrete structure and podium had become beset with technical problems, resulting in it being shrouded in scaffolding for over 20 years.

Associated Architects was appointed to refurbish Muirhead Tower to accommodate the College of Social Sciences and the Cadbury Research Library, which houses the Special Collections and Archives of the University of Birmingham. The key challenge was how to how to do so, by being sensitive to the original concept whilst creating a new dynamic teaching and learning environment, that would re-vitalise the building in its location at the heart of the campus.

The University's aspiration, in a competing Higher Educational market place, was to provide staff and students with the best working environment, acknowledging the constraints of the existing building. The College of Social Sciences required the provision of academic offices, learning and meeting spaces. In addition there are a variety of undergraduate and postgraduate learning and teaching spaces contained within the two twelve-storey towers.

The building's podium was refurbished and extended to accommodate a 200 seat lecture theatre, new exhibition and display space, reception and a 120 seat café space. The two levels below the podium house the Cadbury Research Library including three BS5454 archive standard book repositories, search and seminar rooms, academic offices and conservation studio.

"This project was about restoring one of the University's most important buildings for the 21st century. The design keeps the concrete structure as designed by Sir Philip Dowson, but completely transforms the interior and exterior to create a space that is functional but also beautiful."

Ian Barker, Director of Estates, University of Birmingham (Associated)

#### **Awards:**

RIBA East Midland Award for Architecture 2008

ProCon Leicestershire Award. Building of the Year 2008

University expansion and functionality changes require the existing 1970's library to be completely refurbished, extended and fitted out. In addition to the upgrading of the internal environment, to meet the Universities aspirations, the project is required to be a thought provoking and complimentary addition to the existing high quality campus landscape. The current library facilities are to be maintained, throughout the project, with certain essential services requiring continuous provision. The planned growth of the University and the attraction of enhanced facilities will require the library to service over 22,000 students. A BREEAM rating of excellent is required. Solution: The project will provide a state of the art, flexible, aesthetically pleasing, light airy, library environment. To include book storage, lending facilities, quiet study areas, group study areas, ICT access areas, display areas for art work and special collections, bookshop, café, academic office and tutorial space. All contained within approximately 9,000m<sup>2</sup> of refurbished and 6,000m<sup>2</sup> of new space. Study spaces will be expanded to 1500 seats, with a dedicated 200 seat postgraduate area and 38km's of shelving housing 950,000 volumes. New RFID book tagging technology will be utilised. Planning permission was granted in eight weeks despite being a sensitive location adjacent to listed buildings. Client: University of Leicester, Project Value: £25 million, Completion Date: March 2008 (Associated)

### [The King's School Library, Worcester – UK 2007](#)

Client: The Kings School, Worcester, Project Value: £1.2 million

#### **Awards:**

RIBA Architecture Award 2007

City of Worcester Award 2006

Wood Awards 2007

Wood Innovation Award 2007

An existing Victorian structure with a tranquil outlook west over the River Severn forms the basis for this new school library, on two levels linked by a book-lined lightwell.

The plan is organised around a new Long Gallery running north-south to make a route through the centre of the school, with information, display and exhibition space. The upper reading room is reached across a new lightwell via a ramped glass bridge with lightbox balustrades.

All furniture, shelving and panelling is specially designed by Associated Architects in ice birch plywood with lightbox illumination and full IT integration. The same material has been used by the leading lettering artist, Gary Breeze, for the Greek inscription over the Long Gallery.

The free form librarian's desk forms a focal point with excellent visual surveillance.

Strong emphasis is placed on environmental responsibility and minimising CO<sub>2</sub> emissions. A sophisticated ventilation system, including motorised circular rooflights, obviates the need for air conditioning despite the high computer usage.

The library immediately established a new heart to the school, recording 17,000 visits during its first month of operation. The RIBA Awards Jury acclaimed "a highly imaginative and productive use of space skillfully and carefully carried through to the final detail". (Associated)

### [Kent Library and History Centre, Maidstone, Kent – UK 2012](#)

11,800 m<sup>2</sup>, £ 22,000,0000

The scheme is a mixed use development project, comprising of a History Centre including a historic archive, public library and support spaces. The project will be the new home of one of the biggest archives in the country and will offer a light, bright facility for visitors. The building's carbon footprint will be investigated with potential innovative solutions using ice storage for heat rejection and humidity control for the historic archive areas. The potential use of solar panels for domestic hot water and a shared energy centre will also help to reduce the energy footprint. The concept uses a residential development to create a backdrop for the new public facility. This emphasises the prominence and entrance to the building, an important site located at the gateway to Maidstone. The new public realm links up with the river walk and other local pathways. #### **British Library, New Archive Storage Facilities, Boston Spa – UK 2009**

The building at Boston Spa in West Yorkshire is needed because shelf space is being taken up at a rate of 12.5km a year, and available space at the existing facility in Boston Spa is being rapidly used up. The new building will have storage space for an extra 7 million items, which works out at an additional 262km of extra shelf space, enough to stretch from London to Manchester.

It features automated storage and retrieval systems and a low-oxygen system of fire prevention. This sees oxygen levels kept to just 14.8% — below the 17% at which fires can break out. The building is also one of the most air-tight in the UK.

In all, the building will hold patent specifications, books, serials and newspapers in 144,000 storage containers of three different sizes.

Project manager on the scheme was Capita Symonds. (<http://www.bdonline.co.uk>) 07.12.2009

#### **Northampton College, Lower Mounts Campus, Learning Centre, Northampton – UK 2006**

Northampton College's new Lower Mounts campus provides general and basic adult education. English tuition for speakers of other languages (ESOL), support for students with learning difficulties and disabilities, all in addition to mainstream GCSE's and A-Levels. Work with ethnic groups is a key part of the curriculum. The project requirement includes an CT Learning Centre as part of a vision for social inclusion. The new building is designed to provide a learning environment that will allow the users to grow and progress with confidence. The four-storey building located on a prominent site at the corner of Lower Mounts and St. Michael's Road, incorporates workshops, a dance studio, library and computer-learning centre together with a coffee shop and a crèche. Embedded in the St. Crispin and Castle wards of the town college offers programmes that focus on 'Skills for Life'. The Council for Ethnic Minorities (CEMC) is included in the move to the new city centre side. (Atkins)

#### **University of Dundee Library, Extension, Nethergate, Dundee, Scotland – UK 2007**

### **Awards:**

DIA Award for Best Commercial/Public Building

This state of the art extension to the University of Dundee Library provides an integrated Learning Centre to meet the needs of an ever-expanding campus. With a new entrance, café, teaching and meeting rooms, the new extension establishes itself firmly at the heart of university learning. We worked closely with the University Library staff and Project team to ensure that the scheme was developed in tandem and within the context of the University Campus Masterplan. The building's functions are clearly discernable in form, layout and materiality with glazed study areas, an enclosed rendered box of teaching spaces and curved timber clad staff offices. At the heart of the building a full height atrium acts as a lightwell and spatial focus for the library. The building provides 1,900m<sup>2</sup> of additional floorspace, creating a total library floor area of 8000m<sup>2</sup>. (Austin)

#### **Library & Learning Resource Centre, University of Edinburgh, Edinburgh – UK 1997**

A new 21st century library and learning hub for the College of Science and Engineering at the University of Edinburgh's King's Buildings campus has been given a planning green light to proceed. The new facility will provide a state of the art integrated library and learning hub which will offer a unique mix of attractive, flexible and stimulating study environments. The exciting proposals and resulting design concept by architects Austin-Smith:Lord will create a new social, learning and administrative focal point for the school. Learning, studying, discussing and interacting will take place in a lively, diverse and integrated centre.

Austin-Smith:Lord has developed a design which provides a two-storey 'Podium Hub' on the lower levels with a cafe and meeting area for discussion and debate, and, on the higher levels, a quieter and acoustically separated series of focussed study spaces. There also exists an opportunity to create an outdoor study environment in the shape of a dedicated roof terrace area. The shared vision of both the University and the architects is to create an exemplary building with a design informed and inspired by the best contemporary educational facilities. The centre is on target to achieve a BREEAM 'Excellent' rating, reflecting the University's high standards and aspirations for sustainable design. (<http://www.edinburgharchitecture.co.uk>)

Avril Roberts LRC

This award-winning computer, multi-media facility and library facility was the first of its kind in the UK. Located in the commercial heart of Liverpool, this second learning resource centre for the University serves the departments of Engineering, Science and Education, Health and Social Sciences. The design, an evolution on the original learning resource centre, offers a greater mix of open and quiet zones for both group and private study. It provides the focal point of the Mount Pleasant Campus and links to other parts of the university. This building, with a coffee shop and bookshop and adaptable spaces that are also used for meetings and exhibitions, has been designed with the flexibility to incorporate future change. (Austin)

**Glasgow Caledonian University, William Harley Library Extension, Glasgow – UK 1997**

3,600 m<sup>2</sup>. £ 4,550,000

Library & information centre, 200 seater group study room, electronic floor with 168 wired places range of small study rooms, seminar room, training room, vision impaired centre, bookshop. Entrance via 3 floor glass atrium with staircase rising through atrium, glass brick wall at back of foyer, curved counter, atrium (to be garden) between new and old buildings, variety of different sizes of student group study rooms. (<http://www.designinglibraries.org.uk>)

**John Moores University, Avril Roberts Learning Resource Centre, Liverpool – UK 1994**

**Awards:**

1994 RIBA Award for Architecture

1996 Civic Trust Award.

The brief for the first of the new LRCs – the Aldham Roberts Centre was led by the Head of Library Services, Don Revill, and a senior architecture tutor, Geoff Hackman. Both shared a rare mix of vision and pragmatism. Significantly, Don's approach was revolutionary, if not 'heretical' in library circles. At the time books were kept in libraries where silence reigned and computers were accessed at computing centres. The brief for the Aldham Roberts Centre was based on learning not reading; a place where books and computers were 'commingled', where group study was recognised and accommodated as part of project-based learning, where the librarian's first priority was coaching users, not keeping books. This enabled new technologies to be introduced and in a profession where silence in libraries was mandatory, re-focused on serious study. A decade and half later, such activity is considered normal but it was still revolutionary thinking at the time. Geoff Hackman was desperate for the new institution to commit to excellence in its architectural commissions, after some early forays into developer led sub PoMo projects. The fundamental learning which has secured the ultimate success of this building lies in the singular engagement between the client and the designers at the outset of the project. Unencumbered by conflicting management concerns and committed unswervingly to realise a vision, to satisfy a perceived need with excellence, the building which was both affordable on completion and in use transcends simple operational requirements by developing a facility which is in every sense sustainable. The Aldham Roberts Learning Resource Centre was adopted as an icon of contemporary architecture when Liverpool assembled its bid for 1999 City of Architecture status in the period 1993–94. (Austin)

**Libraries:**

**University and Public Library, -The Hive - Worcester – UK 2012**

Opening a new library in a year when more than 100 across the country have closed their doors due to public funding cuts has been both a challenging and heartening experience. When that library is jointly funded and run by a university and local authority, and is therefore designed to cater equally for the needs and expectations of students, academics and members of the general public, the stakes on getting it right are very high. But since the Hive was opened in Worcester by the Queen three months ago as Europe's first fully integrated university and local authority library, membership has grown, with just a few hundred joining between July and September 2011 to around 8,500 during the same period this year, and its gold roofs have already become an iconic sight in the city. It has taken eight years and £60m to reach this point. The project began in 2004 when the University of Worcester was planning a city centre campus and Worcestershire County Council was looking for more space for its public library. We discovered then that both shared a commitment to high quality education, social inclusion and cultural values, as well as to excellent customer service and information.

While university and public libraries may go about things in different ways, their visions and missions are quite similar. Public libraries started originally as a force for education and social good, as well as for community and social inclusion, while the earliest universities were groups of scholars congregating around libraries.

Now, students will often work in a library rather than isolated in their rooms because they want the shared experience and learning community a library offers, and when students move to a town or city to study they become part of that town community. At the University of Worcester about half of our students are mature students, who often have families and lives within the city and region, so we wanted to build a facility for every stage of their lives.

The idea of the university and local authority joining forces caught the imagination of Higher Education Funding Council for England (Hefce), which offered £5m in strategic development funding, and another £5m as an interest free repayable loan. The rest came from a joint private finance initiative bid between the council and university, with an additional £7m from the regional development agency, because the development was on a brownfield site and promised to deliver jobs and business support.

While at the beginning the focus was very much on what the university and local authority had in common, there were some challenges in developing services and policies that suited all library users. Students needed to feel it was their university library and that they could get the books they needed for their course, while the public needed spaces and services suitable for them.

As the Hive houses one of the largest children's libraries in the country, some university staff were worried about working with children around. Public library staff working meanwhile needed to know what specific needs students might have. Behaviour management was another issue, with rules introduced making sure all mobile phones stayed on silent.

To resolve these issues while retaining the advantages of a joint library, the Hive has been designed to include a mixture of public and private spaces with different functions. As well as communal browsing and reading areas, a cafe, and council customer services centre, there are meeting rooms and hundreds of private study areas.

Stock is integrated in a single sequence, not on separate floors, so books of interest to the public can occupy the same shelves as academic texts. To make sure students and academics could still access books they need, we have introduced three levels of borrowing: a university core selection, available for reference to everyone but only available for loan to students; around 45,000 titles that are on reading lists and are marked as 'high demand item for university', meaning the public can borrow only one at a time and may have further restrictions when assignments are coming up; and a third category available for anyone to borrow. There are many challenges involved in developing this kind of library but the advantages are huge. First, it is fantastically efficient to bring together two services in this way, not only financially but as a way of improving services. University researchers can not only consult books and journals but also the local authority record office and archaeology service. Students rub shoulders with potential future employers using the meeting rooms and business support services, while children borrow books next to the university students whose footsteps they may follow one day. At more than 90 hours a week, the opening hours, while normal at a university, are much longer than is usual for a public library.

A facility such as the Hive has the power to widen access to higher education and increase social mobility. We have already found that many people using the library are from low income families and did not use the old county council library. Many have not been to university. Our hope is that they or their children will be inspired to progress into higher education, as well as benefiting from the facilities of the Hive.

Is this a model for future library development? It would not work everywhere, but in many inner city locations it could provide a valuable solution. For a university that is prepared to invest in a community resource, and a local authority willing to collaborate, the challenges of creating a library like the Hive are well worth the lifelong learning opportunities it provides.

Anne Hannaford is director of information and learning services at the University of Worcester – follow @worcester\_uni and @TheHiveWorcs on Twitter (<http://www.guardian.co.uk>)

### **Bathgate Centre, Bathgate – UK 2011**

Construction is due to commence in early April on the new £7m Bathgate Partnership Centre, designed by BDP. The 2550sqm project for West Lothian Council is programmed for completion in summer 2011. Located on a prominent site in the West Lothian town, the proposals consolidate the currently dispersed council services under one roof. The partnership ethos for the new building is based on a concept of a shared working space strategy which will allow operational interfaces between the various stakeholders, providing users with a with a 'one stop shop'. The ground floor of the two storey building houses *a public library*, advice shop, community centre and café, grouped around a double height street. The upper floor accommodates open plan offices for the various council departments, and allows for flexible working patterns by providing the occupants with a variety of meeting spaces and quiet areas. A south facing enclosed garden and orchard to the rear of the building enables ground floor activities such as the library, café and crèche to spill out into a dynamic external space. The facades are clad in random cut Caithness flagstone and seamed brass to create a welcoming yet appropriately civic presence, and to set a benchmark for future urban realm improvements in the town. The building has a sedum roof and incorporates a small scale gas CHP system, natural ventilation including a solar flue to utilize the stack effect, a heat displacement and recovery system as well as a number of other energy reduction measures. It will have an EPC rating of B+. The new building will provide a feeling of belonging and pride by being clearly identifiable as an integral part of the local community, as well as being modern, attractive, spacious and practical to meet the challenges of the 21st Century. (BDP)

### **Cardiff Central Library, Cardiff – UK 2009**

Client: St David's Partnership (A partnership between Land Securities and Capital Shopping Centres), Cardiff County Council  
Construction cost: £15m, Completed: March 2009, Awards: 6.

#### **Awards:**

**RIBA Award 2010**

A modern 21st Century library as part of a city centre redevelopment. A state-of-the-art 6-storey library, which forms part of the St David's re-development scheme in Cardiff city. The internal space, full of colour and natural light, is designed to achieve an open and legible internal environment, creating an atmosphere in which all members of the community can enjoy learning, contemplation and relaxation. The building is designed to have a different look from the rest of the development - the cladding is inspired by the random appearance of books on shelves and it has an insulating sedum grass roof. At ground floor level are restaurants and internally all furniture was specially selected and the shelving is bespoke. Implementing sustainable design early on enabled the delivery a BREEAM Excellent 'rated' building for less than 0.5% of the construction cost. •provide an important modern civic and landmark building, •enhance the existing range of services on offer in Cardiff, •environmental impact and sustainable design of paramount importance. Results: •a successful modern cultural venue - the City's "public living room", •a BREEAM 'Excellent' rating. (BDP)

BDP has designed a state-of-the-art library that enhances the existing range of services on offer in Cardiff, and creates an atmosphere in which all members of the community can enjoy learning, contemplation and relaxation. The general components of the building consist of library and retail uses at the ground and mezzanine levels with four floors of dedicated library above finishing at the top with a partial plant floor.

This important modern civic building is a major element in the regeneration of Cardiff city centre and as such has achieved a high quality of design and finish to reflect its landmark status on its prominent site. The external metal cladding is inspired by the random appearance of books on shelves - the upper floors of the building also create a new window on the skyline with dramatic views over the city. The use of these modern materials and creation of a dramatic internal space have been developed to lift people's spirits as they enter this new facility which will adopt the role of the city's 'public living room'.

A major driver for this project was the Bespoke BREEAM Assessment. BDP's sustainability group guided the project team throughout the development of the design, working with them and providing recommendations for delivering a more efficient, sustainable building. By implementing the principles of sustainable design from the early stages of the project, the team was able to deliver an 'Excellent' rated building for less than 0.5% of the construction cost, and has achieved the highest score to date in a bespoke BREEAM post construction review. (<http://www.wordlarchitecturenews.com>)

### **Bridge Academy, Hackney, London – UK 2008**

#### **Awards:**

**ACE Engineering Excellence Award 2009**

Bridge Academy rethinks the idea of the school as a piece of urban design integrated into the city fabric. The design creates a unique vertical school in this dense urban brownfield site, formerly a gasworks, in the heart of its multi-ethnic community. Responding to the opportunities of this constrained water-side site, the innovative vertical Academy creates a compact school shaped around a multi-level 'heartspace', maximising social interaction and optimising passive surveillance. The design displaces ground upwards taking advantage of magnificent roofspaces for performance, learning and play.

Three building elements form the basis of the design: the 'sound shell', a performance hall and a sports hall. The sound shell wraps teaching spaces around the social heart of the school and terraces down to the canal, creating a sense of enclosure and protection, with the 'hoop' supporting the large ETFE wall unifying the academy spaces and bringing vast amounts of daylight right down into the lower ground floor. The north and south halves of the shell are arranged on half levels so that adjacent teaching spaces are reached by 10 steps in the staircase, providing stronger links across the different academic departments. A play deck and learning resource centre are suspended from the sound shell and are located above the central square, which opens out onto a café with views to the canal.

The 450-seat concert hall for use by the wider community outside of school hours was another opportunity for unique design. It is designed as a pavilion surrounded by nature, set among a hanging garden.

The sports hall has been sunk into the ground to reduce its height and with glazing at street level. Separate access is provided for off-hours use of the sports hall and a fitness room for local clubs. Terraces at each level of the building allow for a continuous stepped landscape from the top of the sports hall down to the canal.

A curved truss beam suspends the library above the central square, freeing up the ground floor for assembly and social interaction. The steel structure is intended to be visible so that, in keeping with the specialism of maths and music, the school becomes not just an environment to learn in, but an environment to learn from.

Construction was from February 2007 until June 2008. The school is 10,250 m<sup>2</sup> and it accommodates 1150 pupils. Bridge Academy won the Scala Award for Civic Building of the Year in 2009.

#### Social

Bridge Academy is part of the national government initiative to build state-of-the-art schools in the country's worst performing areas. It aims to improve the attendance and performance of students at the school, in turn reducing youth crime and improving the economic future of the area. Situated on the Regents Canal on an inner-city brownfield site, the design creates a focus for the regeneration of a neglected area. Predominantly reachable by foot for a local pupil base, this new school is also accessible for community use out of school hours. The scheme builds on BDP's successful schools without corridors, which maximise social cohesiveness and minimise opportunities for bullying. Care has been taken to create a fair and inclusive learning environment for all. These details are subtly integrated in to the overall design to ensure users do not feel different because of their disability. Control of noise levels in teaching spaces is important to optimise learning for students with hearing difficulties. Bridge Academy is a non-denominational school, which nonetheless attracts a diverse variety of faiths and ethnic and social backgrounds which need to be respected. The sports hall window on Laburnum Street can be screened off to provide privacy during PE lessons. Similarly the kitchen caters for Halal and Kosher meals. In response to the background poverty within the area, the provision of discounted nutritious meals was a key part of the brief set by the school's sponsor, as quite often the standard of cooking at home could be low. As such the kitchen is oversized by comparison to other schools to provide freshly cooked meals on site every day.

#### Technological

Innovative computer modelling software (BIM) was used in the design of Bridge Academy to coordinate structure and mechanical designs. This was subsequently transposed to the fabrication line, thus reducing wastage, streamlining the construction programme and increasing the efficiency of site delivery scheduling. A 3D animation, created by 3DW, was particularly useful in the early briefing stages of the project as the model was viewed around the world in various offices of client and sponsor organisations. It was also used as a tool for the local population of the London Borough of Hackney to see the building in context and take a virtual tour of the building's internal spaces. Through its application, the structural engineers took a leading role in defining the building form. The architecture and building services were wrapped around and through the model to ensure creative and practical integration. The use of BIM provided several benefits to the project including efficient drawing production (the model is sliced horizontally and vertically to create general arrangements and cross-sections) and the export of the model to structural analysis software packages. It enabled early detection of clashes with architecture and building services and enhanced communication of the construction methodology. It eased the transfer of information to the steel fabricator and the models enabled the client and other members of the design team to better understand the building form. The BIM work on this project has already been recognised with a Bentley Enterprise Award.

#### Economic

With floor space at a premium on such a confined site, flexible use of space helped meet demands of the brief. Retractable partition arrangements are used to allow spaces to be used in different configurations. A key example of this is the Performance Hall which creates a 450 person auditorium out of curriculum teaching space using a retractable acoustic 'Skyfold' wall and retractable seating units. Circulation space is appropriated for learning - for example the Central Square has multiple uses including assembly and the ICT balconies around the atrium. Out of school hours, the building is used in a number of novel ways. The lecture theatre is used as a cinema, and the sports hall will be a beach volleyball training facility during the Olympics. Wedding receptions, business fairs and private functions are held in the central and it has been used by local community groups for festivals and events. Recording suites, recital suites, music technology labs and the performance hall are made available for hire without disrupting the day-to-day operation of the school by means of a dedicated community entrance. This also ensures additional revenue for the school which can be put back into the running of the school. Designing future flexibility was necessary to meet changing educational and technological needs. Positioning the structure towards the perimeter of the slab enables the reconfiguration of partitions. Cellular beams and raised floors also offer flexibility for services. There is also future potential for the covered car park to be converted into usable space.

#### Environmental

In line with BDP's commitment to sustainable development, several basic principles were implemented from the early stages: sensible building orientation, natural ventilation, natural daylighting, enhanced insulation and solar shading. The form of the building has been designed as a single wrap of teaching spaces to minimise energy use by cross ventilation and maximising daylight from two sides. The use of ETFE ensures that the building is well lit, from the very top to the basement of the school, even on the duller days. Direct sunlight is controlled by high levels of insulation and solar shading to reduce the heat load. For the most part of the year the school is naturally ventilated, utilising the seven storey space on the canal side of the building to enable a stack effect in the building's central space. A ground remediation strategy was developed that minimises the extent of off-site disposal, whilst creating a safe environment for the academy and the community. Demolition material from the previous school building was used in the sub-structure. All timber used was sourced from sustainable sources. The school design makes use of the canal as a unique feature of the site to discharge rainwater overflow in to, hence reducing the size of the below ground rainwater attenuation tanks and minimising the extent of excavation and off-site disposal of material. A key principle of the design is that the school is set 700 metres from most of the pupils' homes in the catchment area, meaning that use of vehicular transport is largely unnecessary and therefore minimal carbon emissions result from journeys to and from school.

#### Productivity

The building creates a number of characterful places and makes circulation joyful, while its layout has an underlying clarity which makes orientation simple and easy to manage. The two main stairs and lift cores act as foci for movement and social interaction, and life's essentials such as the toilets can be found in similar locations across floors. The north and south half-levels of the building are

identified with different colours which progressively change as one moves up the building to ease wayfinding and help those with visual impairments or cognitive difficulties. The Bridge Academy attaches great importance to its partnerships with the local community and those with prestigious organisations such as Queen Mary University of London, the sponsor of the Academy, UBS Investment Bank and The London Symphony Orchestra. These links provide additional opportunities for students to have a rich educational experience. UBS's staff volunteer their time at the Academy and work with students and staff on a wide range of activities including Maths and English intervention and the Academy's Maths and Music specialisms. The feedback we have received from students and staff is that the building has been successful in providing an inspirational learning environment for all. This can be primarily put down to the open and social feel of the building and its distinct identity within the community. For the academic year 2009-10 the attendance figure was 95%, well above local and national averages. (<http://www.worldarchitecturenews.com>)

### **University of East London – Business School and Knowledge Dock Centre – London – UK 2008**

Staff and students at the University of East London (UEL) welcomed Her Majesty The Queen and His Royal Highness the Duke of Edinburgh for the official opening of UEL's new Royal Docks Business School and Knowledge Dock Centre in 2008. 350 guests including Rolf Harris, His Royal Highness Prince Turki of Saudi Arabia, Stephen Timms MP, UEL's Chancellor Lord Rix, and UEL staff and students applauded as Her Majesty unveiled a plaque to formally open the Business School and Library, located on the waterfront of the Royal Albert Dock. The ceremony began at midday at UEL's Docklands Campus. Her Majesty was welcomed by hundreds of UEL staff, students, supporters, and partners from local schools, colleges and community groups. UEL's new Business School, located on the waterfront of the Royal Albert Dock, features a vast 'trading floor' open-plan teaching space and computing hall, a 400-seat lecture theatre and an innovative library open 24 hours a day. The Business School provides undergraduate and MBA programmes in all aspects of business and management to 4,000 students on campus and world-wide. Damla Mehmet and Shoab Bakhat, both final-year students in UEL's Business School, were among a group of 24 students working on a water efficiency marketing project with representatives of Thames Water as Her Majesty toured the building. "It was so exciting", she said. "I can't believe I actually met the Queen. I'm really enjoying my degree here at UEL and this visit was a very special event for all of us!" The Knowledge Dock Centre is home to UEL's Knowledge Dock enterprise development and support service, which now works with over 1,000 businesses, mainly small and medium enterprises in Thames Gateway. Facilities include 42 business units, the HotHatch business generator, the Empower project for female entrepreneurs, Fabric Print & Design Bureau, the Product Design Lab, the SMARTlab Digital Media Institute, the Sustainability Research Institute and the engineering and laboratories of UEL's School of Computing & Technology. Awad Bhenick, President of the UEL Entrepreneurship Society, was one of 10 entrepreneurs working in HotHatch on Friday. Awad, a UEL Media and Advertising graduate who also directed a film of the occasion, said: "This is a wonderful event and I'm really excited to be so closely involved. Knowledge Dock has done so much to support me and countless other entrepreneurs and businesses in East London – this is fantastic recognition." Following a £110 million investment programme, the University of East London's new facilities include the vast open-plan Trading Floor with flexible teaching space and IT hubs, a 400-seat lecture theatre, an innovative Library and Learning Centre and the Petchey Centre for Entrepreneurship, established to promote innovation in business. Linked by high-level bridges, the Knowledge Dock Centre contains business units, incubator hot-desking facilities in the HotHatch, expert centres including SimLab, and Product Design Lab, flexible teaching and meeting space. (<http://www.associationofbusinessschool.org>)

### **Leigh Technology Academy, Dartford – UK 2008**

BDP's Leigh Technology Academy in Dartford was declared best outstanding new or refurbished secondary school in the country as the winners of the inaugural TES (Times Educational Supplement) Schools Awards were announced on 9 June at the London Hilton Hotel on Park Lane.

These awards celebrate and reward the professionalism and flair of those teams making an outstanding contribution to primary and secondary schools in the maintained and independent sectors. The awards encompass new facilities, innovation in teaching, leadership and community involvement.

Leigh Academy, which opened in 2008, is a groundbreaking 1,500 pupil school, specialising in technology and ICT. The school consists of four colleges, all under one roof. The school is brimming with innovation being highly sustainable and uses aspects such as orientation, passive cooling, earth tubes and passive ventilation to achieve 65% of the carbon emissions compared to DCSF benchmarks and a reduction of 30% against part L. The school has already been praised with accolades from the Civic Trust and RIBA, while Building Service Journal named it as its project of the year.

BDP architect director Keith Papa, who made the submission on behalf of the school said: "It is extremely rewarding to receive this accolade from the people who use our **buildings** and who know what it takes to make a great new school. We are delighted to have been part of the making of the new Leigh Technology Academy where such great teaching and learning takes place. It is a unique response to the design challenge to set open learning terraces and classrooms around a daylit wintergarden and our design approach is clearly paying dividends for the Leigh Technology Academy. The feedback we have received is that the architecture does a superb job of supporting the pedagogical and pastoral approach of the Academy. It is a brilliant example of a dynamic and passionate client and designer working together to create a delightful and inspiring place of learning." (<http://www.worldarchitecturenews.com>)

### **Marlowe Academy, Ramsgate – UK 2006**

#### **Awards:**

RIBA Sorrell Foundation Schools Award 2007

RIBA National Award 2007

RIBA Wood Award (Structural Category) 2007

Marlowe Academy, a new city academy, replaces the failing Ramsgate School. The architects were asked to come up with a building that was modern, functional and would improve exam marks too. They have responded with an indoor village, where the resident community can see itself in action, whether it be in the theatre, in the classrooms or in the dramatic assembly area.

The judging panel, including Paul Monaghan of Allford Hall Monaghan Morris, Frances Sorrell, co-founder of the Sorrell Foundation, and Anne Canning, Head Teacher of Camden School for Girls, said:

"The atrium is the heart of a truly public building: the school library is the local public library, the sports facilities are available to hire, and local groups use the theatre regularly. At a time when massive resources are being directed towards the rebuilding of Britain's educational infrastructure, Marlowe Academy offers an ambitious re-definition of what a large new school can look and feel like." (<http://www.architecture.com>)

### **Saltire Center – Caledonian University – Glasgow – UK 2006**

Construction Sum: £16,000,000 [2006]

#### **Awards:**

Civic Trust commendation 2008

Scottish Design Award 2007

Lightning Design Award 2007

## **RIBA Award 2006**

### **Overview**

The Saltire Centre forms the central hub of university life for many students in Glasgow. The building is a powerful image within the city and provides a beacon for learning. At the early briefing stages of the project the client team at the university set out to change learning and the notion of a library, turning it into a learning centre. The building has managed to create a social, as well as academic, focus which fosters and promotes team working and informal collaborations.

### **Themes**

#### **Integrated flexibility for space and learning**

A range of spaces to support different learning styles and working practises are available to students. From monastic cells to a vibrant cafe, students can utilise areas that are appropriate to them and their needs.

#### **Integrated social and physical context**

A number of external terraces have been created to form an urban square open to the public. This helps to reinforce the visual impact of the building. Inside the building, the use of large-scale art installations has played an important part in making the centre truly original. The pieces are integrated in the space and specially commissioned, contributing to Glasgow's rich history of public art.

#### **Innovative solutions to specific areas or smaller spaces**

The Learning Cafe was created in a previous building, but in the Saltire centre it has found its natural home as a location for interactive group working and collaboration centre. The furniture and zoned areas allow some enclosure from the large open space of the atrium. Student feedback for this space has been excellent and they obviously appreciate the flexibility and interactivity that the cafe offers.

#### **Responses to developing integrated ICT**

The building has been fully set-up for wireless working and contains over 200 laptops. The number of mobile devices is anticipated to rise and therefore the systems have been designed with an increase of demand in mind. (<http://www.imagineschooldesign.org>)

### **University of Cambridge, Faculty of Education, Cambridge – UK 2005**

Client University of Cambridge, £ 6.900.000

#### **Awards:**

**Cambridge 'most sustainable building Award 2006**

A convivial environment for the exchange of ideas.

The design concept creates a natural wrap of lawn and tree groupings to form a relaxed relationship of faculties, adjacent Georgian Villa and rekindled garden.

An interior social daylit street winds east to west through the garden from the entrance lawn. A library is placed alongside the lawn at the edge of the trees to receive glare free north light, while along the south side flexible teaching, seminar rooms and office space form a structured back-drop to the high side of neighbouring Homerton College. (BDP)

### **Bournemouth Central Library, Bournemouth – UK 2002**

#### **Awards:**

**Prime Minister's Award for Better Public Building 2003**

**Civic Trust Commendation 2003**

**Public Private Finance Award, Operational Local Government (runner up) 2005**

The library reinvented as stimulating public living room.

Four key aims drove our design: encourage the public into the library, inspire users, optimise working practices and create a vibrant economic hub.

We designed a mixed-use building, comprising 3,608 sq m (38,800 sq ft) of library space atop 3,572 sq m (38,450 sq ft) of street-level retail.

The library features a fully glazed north-facing elevation, allowing views to and from the street and a direct connection with the outside world.

Other features include an impressive triple-height foyer, an information/issue desk overlooking the entire library and a sweeping 'horseshoe' layout on the first floor housing a reference library, gallery, staff offices and more.

Brief create a welcoming information building on a former car park drive urban regeneration

#### **Results**

visitor numbers up three-fold since launch a reinstated historic line of the high street a PFI project where the local authority insisted on quality and got it. (BDP)

## **Bennetts Associates Architects, London-Edinburgh – UK**

<http://www.bennettsassociates.com>

### **Libraries:**

#### **Humanities Division and Library, University of Oxford – UK in construction 2012**

The architect will work with the University on the £180 million humanities development in the Radcliffe Observatory Quarter, a site at the heart of the city of Oxford bounded by the eighteenth-century Radcliffe Infirmary building and the adjacent Radcliffe Observatory. The development will be part of the masterplan designed for the site by architects Rafael Viñoly.

We are confident that Bennetts will develop a design which will give users of the humanities library a fantastic space to work in Professor Sally Shuttleworth

The new development will provide a home for most of the faculties in the Humanities, and will offer excellent teaching facilities, dedicated graduate space and academic offices, as well as space for visiting scholars and research projects. At the centre of the development will be a new humanities library, which will bring together holdings from faculty libraries, currently spread across the city. It will also include lecture theatres, and seminar and conference space, as well as cafes and space for art exhibitions, screenings of films and musical performances.

It is anticipated that the development will be delivered in two phases, with the first phase to be completed by mid 2012. The first phase will include the faculties of English, History, Philosophy and Theology.

Professor Sally Shuttleworth, Head of the Humanities Division at Oxford, said: 'Bennetts Associates were selected because they showed the best understanding of the challenges posed by the site and the complex requirements of the project brief. They combine a

strong analytical approach with sympathy for the historical context of the site. We are confident that they will develop a design which will give users of the humanities library a fantastic space to work in.'

Four practices were invited to participate in the competition, which was set up by Oxford University and PDCM, from an initial long list of twelve: Bennetts Associates Architects, David Chipperfield Architects, KPF and Wilkinson Eyre.

A spokesperson for the University of Oxford said: 'The University has been hugely impressed by the effort made by the architects and the quality of ideas from each practice. The architects went through a rigorous selection process over several months including visits to their offices by the Project Sponsor Group, building visits, user group workshops and finally interviews.'

The architect Rab Bennetts said: 'We are thrilled to have been given the opportunity to work with the Humanities Division and University to create a development of this significance on such an important site. Our competition proposals for open quads and gardens reinterpret the historic grain of Oxford and provide a strong identity for the library. We also explored space syntax, daylight, natural ventilation and good views to create the best possible educational environment.' (<http://www.ox.ac.uk>)

### **University of Stirling, Library Refurbishment – UK 2006**

Client University of Stirling, Area 7,000m<sup>2</sup>, Value £13 million, Completion 2006

The library was constructed as the centrepiece of an entire campus design on a lovely site at the foot of the Ochil Hills. Although a fine building it suffered from problems common to buildings of its time. Internal orientation is poor, study options are limited and the fabric was tired. The stage D report established a course of action and options for refurbishment. The library was built as part of the University of Stirling campus which opened in 1967. It sits in a prominent position at the centre of the grounds with views to the rest of the landscaped campus. Currently the library occupies two buildings: the original building and a low extension built later to the North. The building is placed in the landscape as a series of layered planes. Strips of external glazing allow fabulous views to the Ochils, the Wallace monument and other parts of the campus over Airthrey Loch. The design of the section is such that large areas of external glazing are shaded from high sun angles preventing excessive solar gain. Low sun angles are more problematic. Since the long sides of the building face East and West, glare from sun in the afternoon and in winter is controlled by internal blinds and curtains. Bennetts Associates reconfigured the existing ad-hoc layout of the library to create an efficient and legible layout that respected the original design intent of the building. Connections were improved to the University main concourse. The refurbished building will respond to new ways of learning by providing a menu of study options ranging from group to individual and informal to formal. (Bennetts)

### **Central Library and Jubilee Street Development, Brighton, Sussex – UK 1999 – 2005**

(see also: Lomax Cassidy Edwards – <http://www.lcearch.com>)

Shortlisted for the Stirling Prize and awarded Prime Minister's Public Building 2005, the Jubilee Library has also been a great success with the people of Brighton. Fronting onto the square at the heart of the masterplan, the building makes a welcoming expression of civic purpose and uses materials and roofscape inspired by the locality. The highly sustainable interior contains dramatic spaces infused with natural light. The project was built through PFI to a tight budget. (Bennetts)

## **Bisset Adams, Architecture, Interior, Design, Communications, London – UK**

### **Libraries:**

#### **Idea Store Watney Market, London – UK 2012**

Client: Tower Hamlets Council, Contract Value: £4.1 Million, Project duration: November 2009 - May 2012

Bisset Adams is currently architect and lead consultant on an ambitious, Big Lottery funded Idea Store on the Commercial Road at Watney Market, the first of a new generation of Tower Hamlets' library, learning and information centres, and dubbed 'a marketplace of information' with a range of community and civic partners aiming to provide benefits in health, employment and learning opportunities for local people. This will be a landmark building on a complex urban site, with a number of key constraints including the proximity of the East London line, existing adjacent residential flats, relocation of a bus stop and utilities running through the site. Planning permission has been granted and the project started on site in May 2011.

(<http://www.designinglibraries.org.uk>)

#### **Nothholt Library, West London – UK 2009 on design**

#### **Church Street Library, Westminster, London – UK 2009**

#### **Ealing Central Library, Ealing – UK 2008**

#### **High Wycombe Library, Buckinghamshire – UK 2008**

We were commissioned to produce interior designs and a branding approach for the new High Wycombe library, laid out over three floors as part of a major new shopping centre. The process involved consultation with the community, stakeholder groups and with librarians, to ensure the new library met the needs of its users. (Bisset)

#### **Ealing Nothfields Library, Ealing – UK 2007**

#### **Grays Library, Thameside, London – UK 2005**

#### **Idea Store, Bow, Tower Hamlets, London – UK 2002**

Idea Stores 10 years on: the next generation by Sarah Godowski, Director of Bisset Adams, and Sergio Dogliani, Deputy Head of Idea Store

#### **1. The Designers' view by Sarah Godowski**

It is now ten years since the first of Tower Hamlets' ground-breaking Idea Stores opened in Bow, and it's still seen as one of the best and most exciting library services in the country, referenced widely as an exemplar of innovative best practice. Bisset Adams has been involved in the Idea Store programme since 1998, working with Tower Hamlets council to devise a new model for customer engagement in learning, libraries and the community. The Idea Store programme has been a very different experience from the designers' viewpoint, owing largely to the innovative and forward-thinking character of Tower Hamlets council as a client, understanding the value of design and treating the designer and brand consultant as an integral part of the team. The success of the Idea Store programme has been largely due to a willingness to explore ideas, with radical results and successful engagement with the community; local people feel a real sense of ownership of the Idea Stores, and visits, membership and book issues continue to rise. After the largest-ever public consultation on the future of libraries, the team identified that local people wanted libraries to broaden their remit: offering better bookstock first and foremost, but also a range of other facilities from café to learning, and in more convenient locations alongside shopping or transport centres. We at Bisset Adams found early meetings memorable for the freedom of ideas: at a time when everyone was scratching their heads wondering how to save money on libraries, Tower Hamlets had recognised their potential and had fixed on the library service as a key partner in a broad learning offer to stimulate regeneration

and foster inclusion. They also realised the name 'library' meant little to many of the local community to whom the stock of old libraries in run-down buildings had little to engage or offer. Bisset Adams took a bold approach to designing the identity of the new service: the new brand was 'Idea', based on the concept that everyone has ideas, and believing in your ideas can change your life. The core values of 'Engage, Empower and Enrich; describe the customers' journey was engaging with the brand, being empowered, and enriching their lives through the books and services. The name 'library' appears in the strapline (Library, Learning and Information), but it was felt the new name would engage and appeal to local people to signal a much-needed innovation within the borough. Bisset Adams was the architect of the pilot Idea Store in Bow in 2002, and is now architect on the newbuild Idea Store at Watney Market, a landmark building currently in construction. The key to the success of Idea Stores has been to engage with previously excluded audiences, creating a genuinely vibrant community hub of learning, library, business, arts and community events. The café is used for business meetings; the learning labs for everything from language classes to baby massage. The latest Idea Store at Watney Market follows a new model as a 'marketplace of information' with the council's partners. The library space is spread over three floors with dedicated space for adults, children and young people, and 'learning clusters' provide a highly informal learning environment, part of a range of learning opportunities offered in the Idea Stores as well as in partnerships with local schools. In difficult financial times, it's exciting to be working with a local authority which recognises the value of libraries for local communities and for fostering regeneration and learning. Sarah Godowski

## 2. The Practitioners' view by [Sergio Dogliani](#)

They say that time flies when you have fun, and looking back over the last 10 years, since Tower Hamlets Council opened its first Idea Store in Bow, one can't deny that our journey that eventually turned around libraries in Tower Hamlets has been hard work, but fun too. We set out with the aim of transforming our libraries, and put them at the centre of people's lives, because that was our mandate from Tower Hamlets residents. How did we achieve that? First of all by working very closely with like-minded architects such as Bisset Adams, who very involved from day one in a new concept, not just a new building – we think it is this marriage of creative minds that resulted in such an innovative project. We then started by re-locating our buildings where people were, on the high streets, and by investing in books and IT. We then had to throw away the rule book (the one that still makes many libraries too daunting and austere, with silly signs on the doors telling you the 1,000 things you cannot do as you enter), and try to create a place where mutual respect is the norm. Our 'no rules' policy has brought in thousands of people who had never been to a library before, and as a result of our widening participation policies, social cohesion is now a reality, in a diverse borough like Tower Hamlets, not just a desirable outcome. We then had to learn a few tricks from the retail sector (because they know how to engage with ordinary people), to the dismay of traditionalists and lazy intellectuals, who immediately jumped to the conclusion that we were selling out - we are proud to remain a public service, we are efficient in our use of resources, but profit is definitely not on our agenda. So, longer opening hours (seven days a week), books attractively displayed (as in the best bookshops), customer focused layout design, and competent staff who care. Add to these art galleries and cafes, events for all ages (all year round), an ever-growing free reading festival with diverse audiences (Write Idea 2012), and you get the idea of a place that continues to be a choice destination for many: yearly visits of 2,100,000 (up from 550,000), and book lending up by 27% have put Tower Hamlets among the very top in London, after being at the bottom 10 years ago – this is remarkable, particularly considering the chronic decline in most library services in the UK. We continue to live by our values (engage, empower, enrich), so we still engage, and continue to seek novel ways of capturing the attention of users who are increasingly attracted by other offers in modern life; we continue to empower our people, by making things easier for them and by listening, taking on board their demands. And we continue to enrich the lives of those more in need, bringing an ever expanding range of services to an ever wider audience: we are now focusing on employability and health, the basis for improving the quality of life in Tower Hamlets, and use reading and learning opportunities to achieve this. So, we offer 800 courses yearly: literacy, yoga, complementary health, cookery, computing, numeracy, languages, fitness, design, sewing, dance, photography, accounting, music - the list goes on and on, and for each of these, we provide books and online learning materials, greatly enhancing the learning experience. We are now working on our fifth building, and it is interesting to note that at each stage the architects we've worked with - Bisset Adams at Bow and Watney Market, David Adjaye at Chrisp Street and Whitechapel, Dearle & Henderson at Canary Wharf - have contributed in different ways to the project, whether it was a refurbishment, new build or fit out, proving the strength of the concept. Many ask us: what is the key secret of your successful formula? If we were to single out a factor, we would say it is the attention we have always put on people (customers, staff), not just on things (buildings, books). Great buildings are certainly important, and you must have enough books to fill the shelves, but we think a truly great library service puts the customers first, and concentrates on removing all barriers to participation. Attitude is everything, no matter how wonderful a building, no matter how comprehensive the book stock, you need to have staff who are able to combine fantastic people's skills with the competencies required to deliver great reading, learning and information services. Too many times you see short term strategies (in the UK and abroad), where local authorities think you can remedy library usage decline by building a new library, and after the initial excitement, when the honeymoon period is over, the service continues to decline, because it was not supported by a solid concept, by a long term vision – in the Idea Store case, we went the whole way, people and things, seamlessly entwined, because you can't have one without the other. So, 10 years on, and we still continue to receive many foreign delegations who study our model, and are asked ourselves to travel to faraway places to talk about how we do things 'the Idea Store way'. The fact that most of the interest comes from Scandinavia, where you can arguably find the best libraries in the world, fills us with pride. But why are we so popular in Tromsø, Palafrugell and Seoul, and not so much in our own country? Why did cities in the United States, Holland and Italy based their library services on our model, and yet no one has given this serious consideration in the UK? For all the money we've invested in new books, we wish we could find one that answers that question. As dozens of libraries around the country close or severely reduce their services, can the UK library world outside Tower Hamlets really afford to ignore the future-proof Idea Store model for another 10 years? [Sergio Dogliani](#) (<http://www.designlibraries.org.uk>)

## **Bond Bryan Architects, Sheffield – UK**

<http://www.bondbryan.com>

### **Libraries:**

#### **Twelve Quays Campus, Wirral Metropolitan College, Birkenhead, Merseyside – UK 2008**

One of three sites owned by the College. The chosen development site occupies a narrow dockside frontage bisected by an historic tramway, still in use today. The proximity of the dock walls and complex geotechnical ground conditions introduced the design restrictions that eventually determined the linear form of the building. We took design references from the timber and red brick aesthetic of earlier dockside buildings and from the nautical history of a proud industrial port. This multi purpose learning and social space, whilst acknowledging its unique historical setting, is a truly contemporary education building accommodating science, engineering, art and performance spaces around the central enclosed street that creates the heart of the campus. With upper floor studio space designed to maximise the availability of natural north lighting and to create inspirational view as to the Liverpool waterfront, this 4 storey building makes a significant architectural contribution to the south bank of the Mersey. (Bond)  
This was a real challenge not just because of the restricted site space that we had to work with, but also the nature of that space.

The history of the place seemed at first restriction but eventually it became the inspiration for our design (Jonathan Herbert, director)

#### **Matthew Boulton College (Library), Birmingham – UK 2005**

Matthew Boulton College has been providing education to Birmingham and the Midlands region for over 100 years. Ms Christine Braddock, Principal and Chief Executive, had a vision of replacing the original College's facilities with a state of the Art College. In 2005, her vision was realised and the College moved to their new home which has some of the most advanced facilities that Birmingham has to offer. Ms Braddock was actively involved throughout the life of the project. A new £23 million College building in Birmingham's Eastside Learning Quarter providing a total of 18,500 m<sup>2</sup> of accommodation has replaced the College's original two buildings which had less than ideal facilities in a poor location. The College is one of the largest Further Education facilities in the region and has been constructed to "inspire learning and achieve excellence". The College comprises teacher's accommodation, a fitness suite, jobshop, library, IT suite and surgery. Results: During our 3 ½ year appointment, the completion of the new home for Matthew Boulton College represents a step change in bringing education to the city with 21st Century technology facilities. This building is deemed to be a flagship project for the Further Education Sector in the City of Birmingham and beyond. The College's commitment to excellence has been widely acknowledged including the awarding of 'The Queen's Anniversary Prize' for Further and Higher Education (the highest accolade given to an educational institution); 'The Beacon Award' for Healthcare programmes; and the granting of 'Centre of Vocational Excellence' (CoVE) status with specialised provision in the areas of Print Media & Graphics Vocational Medical Sciences Business and Professional Services. (<http://www.davislangdon.com>)

#### **University of Wolverhampton, Main Campus Learning Centre, Wolverhampton - UK 2002**

Opened in October 2002, the Harrison Learning Centre is the flagship Learning Centre at the University of Wolverhampton. The objectives of the £4.5m extension to the Centre were: To receive incoming work from School of Humanities Languages and Social Sciences, Create high quality space to pilot new types of teaching room, Create a new entrance and develop a shopping mall concept, Renew outdated infrastructure to bring the whole Learning Centre up to modern standards

#### **bpr architects Ltd., London – UK**

<http://www.bprarchitects.com>

##### **Libraries:**

#### **School of Arts, Education, Media Centre, Middlesex University, London-Hendon – UK 2011**

The Grove - which has been described as a "world class building" by the Greater London Authority - is an exciting new building – designed by BPR Architects who also designed Hendon campus's Sheppard Library, Hatchercroft Building and the magnificent glazed Quadrangle – provides teaching, learning and research facilities for some 1,600 art, design and media students as well as members of staff.

The new building varies in height between two and five storeys at different points, with an overall floor space of 15,460 square metres. Inside, students and academics work in specialist teaching facilities, including art and design studios, digital media labs, workshops, photographic studios and darkrooms and TV production studios as well as the more conventional seminar and teaching rooms, exhibition spaces, offices and cafeteria. Along with the new building, we are also funded major improvements to the open space and parkland in the immediate area leading to Hendon Grove including paths, terraces and landscaping. Overall we invested around £80 million on this project.

Another important aspect of the building's 'world class design' is the range of sustainable features intended to reduce the University's energy consumption and carbon footprint. These include an onsite combined heat and power system together with an absorption chiller, energy efficient air source heat pumps, solar panels on the sedum roofs, a mechanical ventilation system, and daylight and occupancy sensors for artificial lighting.

Our green travel culture, which is informed by one of the most advanced travel and transport strategies of any organisation in north London, will be enhanced with the addition of more facilities for cyclists and a policy that will continue to promote alternative forms of transport to the car. These features build on the impressive environmental credentials we achieved with Hatchercroft, which was awarded 'excellent' BREEAM status for its environmental sustainability. (<http://www.mdx.ac.uk>)

#### **Middlesex University, Sheppard Memorial Library, London-Hendon – UK 2004/re-designed 2012**

The new Sheppard Library redefines the term library, providing a flexible learning resources centre that encourages collaboration and excellence. Underlying principles for the new learning resource centre were functionality, integration and flexibility. Its design is informed by its function and environmental considerations and the building's 8,000 sqm footprint optimises use of the confined site. The new building provides services for 1,600 students utilising the latest information technology formed over a variety of study environments. The Sheppard Library provides facilities including dedicated research and postgraduate study rooms, digital language classrooms, video conferencing and an off-air recording base. Using a balance of passive design and renewable technology including rain water harvesting, solar panels and natural ventilation the design aims to minimise energy consumption. (bpr)

#### **Brisac Gonzales, London – UK**

<http://www.brisacgonzalez.com>

##### **Libraries :**

#### **Museum of World Culture, Göteborg – Sweden 2004**

£ 4 000 000 / 8 600m<sup>2</sup>

In many ways the building is akin to a geode. A simple and robust exterior encloses an interior that is characterised by surfaces of vibrant colours, reflective and perforated metals, rich and tactile in-situ concrete with different textures, and oak and pine flooring. The interior fitout for the Museum of World Culture has given us the opportunity to complete the building from a design point of view having executed the designs for the building as well. Statens Fastighetsverk (Swedish National property board - Ministry of Finance) (Brisac)

#### **Médiathèque Municipale Georges Perros, Douarnenez – France 2003**

Collaboration with David Cras

The site chosen for the location of the library, place of hell, can create a "cultural hub" in the heart of the city, in collaboration with the Port Museum, to rehabilitate a former industrial area while boosting Port-Rhu. About the architect: "The old building Quéré part of the history of Douarnenez. It is therefore to do with the existing, ie installed in a place once dedicated to the industrial production of new functions. The court has emerged as the core of the device. She brings light. You want to grant him the status of the court, in the manner of a preface which delays the time to enter in the text. For these reasons, the project preserves the maximum space of the court by entering the necessary extensions on one

side . So Initial sequencing ancient facades is rendered . The term of the project comes down to this simple page glass, bent at its ends to accommodate the access and through which the exchanges occur inside - outside. A recount in aesthetics , not to disguise as cultural space that was already there. The project cleared its way to the old cannery. It is public and passers by direct contact. It puts the user in contact with the sky and light . " Winner of numerous architectural awards in Britain , the firm has already made Cras David : The Library of Dinan, the Mediatheque Locminé , the cultural complex of Josselin , Library , Game Library - Media St. Luce sur Loire. (Brisac)

## **Broadway Malyan, London – UK**

We have over 450 staff working in 13 offices throughout the UK, Europe, the Middle East and Asia. We also have support offices in Buenos Aires and Belfast, and associated offices across Europe.

### **Libraries:**

#### **Bournville College, Longbridge (Birmingham) – UK 2011**

Architect Broadway Malyan has applied for planning approval for its detail design for a £84m new campus for Bournville College on the site of the former MG Rover works at Longbridge, Warwickshire. The scheme, which is part of developer St Mowden's £750m plans for the former car works site, will unite the college's three campuses in one site, serving 15,000 further and higher education students and adult learners. Leading the project from Broadway Malyan's Birmingham office, Salim Hussain said: "The new Bournville College marks one of the first phases of the biggest regeneration scheme in the region, so it is incredibly rewarding to have the opportunity to implement the concept design through the build stage." The six-storey building will be located on Longbridge North and is intended to create a new town centre at the heart of the regenerated 190ha site. The new Bournville College will be housed in one building, comprising multiple distinct blocks interlinked around the central spine structure with a double-height atrium. A glazed tower will overlook the nearby River Rea, running overground for the first time since early last century. The college will provide public access to a sports hall, restaurant and hair and beauty salons on site. It has been designed to achieve a BREEM 'Excellent' rating and sustainability features include rainwater harvesting, earth tubes and an exposed concrete frame for improved thermal mass. St Modwen's £750m Longbridge scheme is one of the largest regeneration projects in the West Midlands. The plan includes the creation of 10,000 new jobs and 1,980 new homes alongside public realm and access to transport links. Norman Cave, principal of Bournville College, believes the design of the building to be integral to the long-term success of the facility. He said: "The brief was to create a landmark building that represented the vision for Longbridge as well as providing an educational facility that could meet the needs of businesses, local community, adults and young learners.

"Fundamental to this was the creation of an effective working partnership where design ideas could meet the aspirations of the college. We believe that our partnership has done just that and we look forward to providing a 21st-century educational facility to an area of the city which has been severely affected by the demise of MG Rover." The MG Rover car works closed in 2005 with the loss over 6,000 jobs, although a Chinese firm, the Nanjing Automobile Corporation, maintains a small workforce on site to build MG sports cars. ( <http://www.building.co.uk> ) 23.400 m<sup>2</sup>

#### **Aquinas College (Learning Centre), Stockport – UK 2010**

Leading cladding supplier James & Taylor has used an award-winning concept to land the contract for a stunning aluminium façade at a Sixth Form College in Greater Manchester. The subtle, shimmering face on the £40m project at Aquinas College in Stockport is being created using four different anodized finishes that coat both mirror polished and highly etched Senses aluminium tiles. Architects Broadway Malyan worked with James & Taylor to develop a pattern to ensure the different finishes are distributed cohesively across the façade. James & Taylor are supplying 1,758m<sup>2</sup> of tiles. A similar façade on Manchester University's Michael Smith building won top honours for James & Taylor in the Power of Aluminium Awards 2008. The College was so impressed by the university design that it commissioned a similar one for its new building. Dr Ambrose Smith, Principal of the college said: "We have put students at the heart of our new building. Their energy and vitality are its inspiration. We think that it will be an inspirational building for its users and will enhance the neighbourhood too." Andrew Barstow, Northern Regional Manager of James & Taylor said: "It is very exciting to work with architects of the international reputation of Broadway Malyan on a project of this calibre. We are confident that the Senses Aluminium design will provide a fantastic finish for the building." Harry Hoodless of Broadway Malyan said: "We wanted a high-tech, façade that would appear animated as visitors and passers by view the long north elevation on their approach to the college. We chose a neutral colour with varying reflective qualities to respond to the surrounding context in this way. The façade will contrast but not compete with the existing street scene and the Senses tile provided us with the perfect product to achieve our goal." The 3-storey building will provide first-class, spacious facilities for students and staff, with sustainability a key element of the design. It has rainwater recycling, natural lighting, and a ventilation system that exchanges heat at high levels of the building, reducing the need for conventional space heating. It will have a wide main street with natural light flooding down through voids from the roof light above. Included are bright and airy classrooms and laboratories with improved IT provision, a new theatre, chapel, and canteen as well as new staff offices and study areas. Mr Hoodless added: "The Senses tiles create a visually stunning building that will help raise the college's profile in the surrounding area. This building is an important vehicle for educational and social inclusion and will increase self-esteem and confidence among staff and students alike."

#### **Stourbridge College, Stourbridge– UK 2010**

New Stourbridge College campus and Brierley Hill Library  
10,000 m<sup>2</sup>

Stourbridge College's plans for a £35M new campus in Brierley Hill have been approved unanimously by Dudley Council – with town planners hailing the project as 'brilliant' and 'exciting'. The new campus will be built in the heart of the Brierley Hill regeneration area and the state of the art education centre will offer a whole range of learning facilities for 16s and over including a theatre and the new public library funded by Dudley Council. The new facility will provide education and training for over 2,000 students studying creative arts and A Levels in the borough. Lynette Cutting, Principal at Stourbridge College, said: It's great news that we have received planning permission from Dudley Council for our new campus in Brierley Hill. The plans for the new education centre are ambitious but it's truly exciting to be able to offer local people a creative and inspirational learning environment which will be enhanced with improved cultural, community and social facilities through our partnership with Dudley Council." Councillor Michael Evans, Cabinet Member responsible for libraries at Dudley Council, said: "The move for Brierley Hill Library signals exciting times for borrowers in the area. It will offer state of the art facilities and will be open to all members of the public as usual. The new library forms part of the Council's library modernisation programme which aims to raise the standard of library services for everyone." (<http://www.stourbridge.ac.uk> )

### Stoke 6<sup>th</sup> Form College, Stoke-on-Trent - UK 2010

The City of Stoke on Trent is embarking on an exciting journey - a state of the art development which incorporates world class resources and design features to provide outstanding learning facilities for young people across the city and beyond. Innovative Design will encapsulate the essence of a dynamic learning environment which will capture the imagination of our young people and promote interactive learning. (<http://www.stokesfc.ac.uk>)

### University of Leeds, Law school Leeds, Leeds – UK 2009 – 2010

The University of Leeds School of Law has carved itself an enviable reputation for learning, teaching and research since its foundation in 1899. Unusually for a non-Oxbridge university, its alumni occupy some of the highest legal offices and presently include the Lord Chancellor and Minister for Justice and the Director of Public Prosecutions. But a new golden age for legal scholarship at Leeds is now beckoning. Work is due to start on a £12m purpose-built home for the school, which will cement its reputation by providing staff and students with world-class facilities. State-of-the-art teaching and research space, and a moot court incorporating the latest technology will sit alongside a law and community centre to support the school's pro-bono work. The building will bolster the school's already strong track record of recruiting and retaining the best staff, students and researchers and expand the work it does in the wider community. The new building will place the school at the heart of Leeds' legal community, and boost its reputation for excellence both nationally and internationally. The city of Leeds is synonymous with the legal sector. A large and diverse range of legal practises are based there, alongside major criminal justice courts, a cluster of financial services businesses and the renowned University of Leeds School of Law. Such a concentration of activity gives the School of Law a distinct advantage over many of its main competitors in the UK and its new home aims to capitalise upon this. The new building will have outstanding facilities - a moot court, which will be used for vocational learning and teaching and to test out the latest technology as part of the School's Court21 project looking at the impact of IT on the process of justice. A Law and Community Centre will support pro bono work with youth offenders, as asylum and with schools. It will also be used extensively for the Innocence project, which involves undergraduates carrying out investigative work into real cases where wrongful convictions are suspected. Dedicated study areas for researchers and visiting scholars, graduate students and undergraduates will provide work stations, document storage, a basic library and social space. State-of-the-art seminar rooms will also be used for CPD courses for lawyers and other professionals. The building will boost academic research as well as enhance learning and teaching. In 2008's Research Assessment Exercise - which measures the quality of research - the school was ranked amongst the top Law Schools in England in terms of the volume of outstanding research activity of international standard. New chairs in international fields and new postgraduate courses in international law are helping to develop a shared focus on global law and justice in the 21st century. The new building will further provide an environment for researchers from the School's four research centres - Business Law & Practice, Criminal Justice (including Cyberlaw), European Law & Legal Studies, and International Governance (including Human Rights) - to collaborate on research projects. (<http://www.leeds.ac.uk>)

Previously housed in scattered, outdated accommodation, the new School of Law will provide the faculty with state of the art working and learning facilities within an environmentally-responsive building. The new building will help to reinforce the School of Law's standing to the academic and professional communities, as well as to prospective students. It will furthermore strengthen linkages with other faculties as a key part of the University's professional campus. The building's design has been generated from the environmental issues unique to its site. We have explored several measures that would put the building at the forefront of energy efficient design including using passive solar gain to reduce heating energy, biomass power generation, facade and window design to maximize natural daylight and minimize glare, stack system natural ventilation and strategies to minimize heat loss through the building fabric. (Broadway)  
£ 14,000,000, 3,000 m<sup>2</sup>

### University of Salford, Law Faculty, Salford, Manchester – UK 2008

A new £6.8m law faculty building extension opened in February, as part of a £150m upgrade to the University of Salford. The opening ceremony was attended by Shami Chakrabarti CBE, director of human rights group Liberty, and Lady Brenda Hale, the UK's first and only female law lord, whom the new Salford Law School's purpose-built Lady Hale Building is named after. Sustainable both during construction and for the lifetime of the building Buro Happold carried out the structural engineering design for this elegant building, and every effort was made to ensure sustainability, both during construction and for the lifetime of the building. Crucially, it uses a Trespa cladding system - a by-product of the timber industry, 70 percent of whose mass comes from cellulose sourced from managed forests. For lifelong sustainability, Deltabeams were used on the first and second floors, maximising the benefits of the TermoDeck heating, cooling and ventilating system by allowing air to circulate through the floor planks and the beams. This maximises use of the natural heat storage capacity of the hollow core slabs, minimising energy consumption. The cantilevered area of the second floor is interesting from both a structural and an aesthetic point of view too, as it is supported by the roof beams: deep, cellular beams which support the cantilever floor through perimeter-hung columns. Tripping the light fantastic - inflatable bubbles create a colourful light display One of the most notable aesthetic features of the faculty is a colourful ETFE system surrounding the lecture theatre. "The building is clad with inflatable bubbles of ETFE (ethyl-tetrafluorethylene)," said Andrea Manenti, Buro Happold's job leader on the scheme. "Coloured lights shine through it from an LED lighting system housed between the wall and the bubbles, to spectacular effect." ETFE is highly sustainable too: compared to glass, ETFE films are 1% of the weight, transmit more light and cost 24% to 70% less to install. ETFE is also resilient (able to bear 400 times its own weight), self-cleaning - thanks to its nonstick surface - and totally recyclable. "We are very proud of our involvement in this landmark building," said Manenti, "and the ETFE pillows make a pleasing architectural contrast with the panels of the Trespa cladding system on the main building." Project team: Client: University of Salford, Architect: Broadway Malyan, Buro Happold services: Structural Engineering, Main contractor: Bardsley Construction (<http://www.burohappold.com>)  
Bold use of form and colour has given the new Salford School of Law at the University of Salford an iconic new look. The 2,500m<sup>2</sup> scheme features a new library which projects over two lower floors of faculty teaching and social space, office space for lecturers and administrative staff and a moot court. A distinctive ETFE clad lecture theatre adjoins the main building providing additional flexible space for the University, and acting as a beacon on the highly visible corner site. Responding to the client's brief, the design aims to minimise the use of energy during the life of the building, to maximise the use of natural ventilation and lighting and to optimise zone control and sub-metering to enhance long term performance monitoring. A Termodeck system has been used, utilising the concrete hollow floor decks of the building to distribute air to each zone. Using night operation of the ventilation system these slabs are cooled or heated as required, thus minimizing the need for mechanical plant and associated energy use. In order for this system to operate effectively the building envelope has been carefully designed, detailed and insulated to a high degree, exceeding current Part L requirements. The ETFE cladding of the lecture theatre is continuously inflated by a small pump that maintains the air pressure. Thirty LED lights are evenly distributed and concealed behind the cladding and shine upwards at a tilted, reflectively painted board to create the even light treatment to the ETFE. They are computer programmed from inside the building, and the bulbs can change to any colour across a spectrum, either as a still colour or a rippling effect. Phased construction works enabled minimum disruption, and off site construction techniques helped to fast track the programme enabling completion to be achieved on

time and within budget. The end result is a sustainable and flexible building, meeting the needs of a 21st century teaching environment. (Broadway)

### **Phoenix Community Center, London Borough of Sutton – UK 2004**

#### **Awards:**

**Finalist in the The Municipal Journal Regeneration Awards 2005**

**Special Recognition Award The Deputy Prime Minister's Award for Sustainable Communities 2005**

**Shortlisted for Best Housing-led Regeneration Project at the Regeneration Awards 2005**

An eye-catching yet highly functional timber Brise Soleil system, that provides effective control of solar heat gain, light and glare, has helped to integrate the bold architectural concept of a diverse multi-functional, sustainable landmark community building. Designed by architects Broadway Malyan and funded by the London Borough of Sutton and Sport England, the Phoenix Centre is a 3,200m<sup>2</sup> complex that integrates a unique combination of 15 different community uses in a safe and accessible environment. As part of the brief to create a sustainable centre, Broadway Malyan designed substantial areas of glazing along the south and west sides of the building enabling large amounts of daylight to spill into the building, providing natural rather than artificial lighting. This also helped to create a feeling of openness, whilst illustrating some of the facilities available to the community as they walk past. However, with the extensive use of glass came the problem of controlling solar heat gain, light and glare. Levolux demonstrated they had the ability to design a solution that would provide the control needed whilst integrating the bold aesthetics of the exterior timber beams and the straight, clean lines of the exterior glazing and cladding. Levolux designed, manufactured and installed their timber Brise Soleil fin system, manufactured in western red cedar. The system provides the ideal solution giving optimum protection against the elements whilst ensuring that views both in and out of the centre are not hindered. The system also helps to enhance the exterior look, with the curved timber fins providing an organic feel, that echoes the building's sustainable ethos. Optimum protection from the elements "The Levolux Brise Soleil system has enabled us to create a modern and sustainable building that has a comfortable interior environment," said Broadway Malyan. "In addition, whilst giving optimum protection from the elements the system also adds to overall look and feel of the building." Virtually maintenance free, the system can be used on both new and existing developments, adding a fresh dimension to existing buildings or distinguishing new buildings with its unique features. Available as either single piece fins or multiple parts, they can be mounted at a fixed angle, adjustable by means of motors or be fully automated with solar controls. Like all systems from Levolux, the timber Brise Soleil is virtually maintenance free and are backed with the company's design, manufacture and installation package. The centre provides a range of facilities including a sports hall, gym, dance studio, library, youth centre, recording studio, IT suites, community police office, café and a community hall all under one roof, providing a unique blend of services that cannot be found anywhere else in the borough. The centre will provide a safe, fun, family environment and offer courses and activities for all ages and interests. (<http://www.levolux.com>)

Forming part of Broadway Malyan's Roundshaw Neighbourhood Renewal scheme, this combined community and sports centre is situated at the heart of the estate adjoining other community facilities including the church, shops and doctors surgery. Together with the Roundshaw Park playing fields, the centre provides the neighbourhood's residents with much needed access to facilities that promote healthy living. The architectural concept for the building set out to integrate a broad range of diverse but complementary functions within a single, economic but distinctive building. All major spaces are accessed via a welcoming multi-purpose double-height foyer entered from a landscaped square. The eye-catching feature of the foyer is a two-storey central timber 'beehive'. The ground floor of this structure encloses a café to tempt new visitors into the building. The architecture is a modern, efficient and economic expression of the building's organisation and structure. A single sweeping roof, supported by laminated timber beams on steel columns, covers a simple rectangular, two-storey white rendered enclosure. Large areas of glazing on the south-west corner give a feeling of openness, inviting potential users to visit the facilities that are on view, in particular the foyer, library and fitness suite. Roof overhangs and timber louvres shade the glazing to prevent overheating and glare. Internally, to complement the laminated timber roof beams, the windows, doors, screens and the central feature in the foyer are all made of timber. Sustainable features include a connection to a mini district combined heat and power system (CHP), and the maximum use of natural daylight through the incorporation of rooflights, lightwells and sun tubes. The 'beehive' was furthermore designed to provide stack effect ventilation. The building is fully accessible to people of all disabilities and contains a full range of sports and recreational facilities including a sports hall, recording studios, library and community police office. The centre also hosts a weekly market.

### **Nicolas Burwell architects, London – UK**

#### **Libraries:**

### **University of Plymouth, Library Extension, Plymouth – UK 2004**

Project value £5.0m, Gross floor area 2,950sq.m, Completed 2004

Modern learning takes many forms. Responding to this diversity the library creates a hierarchy of spaces graded away, both vertically and horizontally, from a central open reading room. Oak-finished acoustic panelling envelops areas suited to the sharing of knowledge, ideas and information. These give way to a range of more intimate spaces for smaller working groups. The gradation culminates in quiet study carrels around the perimeter, with lowered ceilings and angled windows for glare-free natural light. (Burwell)

#### **Libraries :**

### **Kultur- und Kongresszentrum Würth (Bibliothek), Künzelsau-Gaisbach – Germany 2015**

Künzelsau. Der Gewinner des internationalen Architektenwettbewerbs für das geplante Kultur- und Kongresszentrum Würth in Künzelsau-Gaisbach steht fest: Die Jury unter dem Vorsitz von Prof. Stephan Braunfels (Berlin) wählte am gestrigen Donnerstag den Entwurf von David Chipperfield Architects (Berlin) aus insgesamt 13 eingereichten Arbeiten aus. Den zweiten Platz erlangten Lundgaard & Tranberg Architekten (Kopenhagen), der dritte Platz ging an Henning Larsen Tegnesteue (Kopenhagen). Die Architektengruppe Hohenlohe (Büros ARS und Kalis aus Künzelsau, Büros Knorr & Thiele und Steinbach & Bortt aus Öhringen) wurde mit Platz vier ausgezeichnet. „Der anspruchsvolle und aufwendige Entwurf ist von wohlthuender Eleganz, Ruhe und Würde und korrespondiert trotz seiner erkennbaren Wertigkeit wie selbstverständlich mit dem Werksareal am Horizont. Innen- und Außenräume sind von höchster Qualität und Zeitlosigkeit“, heißt es in der

Begründung des Preisgerichtes. Im Sommer 2006 hatte die Adolf Würth GmbH & Co. KG einen eingeladenen Wettbewerb für ein Kultur- und Kongresszentrum ausgelobt. 13 Architekturbüros aus dem In- und Ausland hatten sich an diesem Einladungswettbewerb beteiligt. Das künftige Kultur- und Kongresszentrum Würth wird aus einer Veranstaltungshalle als Kernelement, einem Kammer- und Konzertsaal sowie einem Kongress- und Seminarzentrum bestehen. Zusätzlich sind ein Museum mit angegliedertem Skulpturengarten und eine Bibliothek geplant. Das neue Zentrum wird nicht nur dem Künzelsauer Unternehmen für interne Veranstaltungen dienen, sondern auch der Stadt Künzelsau und ihrer Bevölkerung für Veranstaltungen sowie kulturelle und gesellschaftliche Events offen stehen. „Als überregionale Einrichtung soll das Kultur- und Kongresszentrum Würth die Bedeutung der Region Künzelsau und des Hohenloher Raumes als Veranstaltungsort stärken“, so Prof. Dr. h. c. Reinhold Würth, Vorsitzender des Stiftungsaufsichtsrates der Würth-Gruppe und Mitglied des Preisgerichtes. (<http://www.wuerth.de>).

### Museum Folkwang, Bibliothek, Essen – Germany 2010

170 m<sup>2</sup> Lesesaal, Studienraum / 210 m<sup>2</sup> Depot-Kompaktusanlage Kosten Bestandteil Neubau Museum Folkwang

#### **Literature:**

Langshausen, Birgit, Eine Bereicherung für die Kulturhauptstadt. Die neue Bibliothek des Museums Folkwang in Essen / 50.000 Medien zu Kunst, Fotografie und Plakat, in: BuB, Forum Bibliothek und Information, Jg. 62,2010,9, pp. 633-635

### Des Moines Public Library, Des Moines, Iowa – USA 2001 - 2006

Location: Des Moines, Iowa, USA, Completion Date: 2006, Client: Des Moines Public Library, Gross Floor Area: 145,528 sqft (13,520 m<sup>2</sup>)

The library forms an integral part of the new Des Moines 'Western Gateway Park'. This area of the city is currently undergoing extensive redevelopment and the new library and park will become a centrepiece for the urban renewal of Des Moines.

Located at the east end of the park, the new library acts as a link between downtown Des Moines and the park. On the one hand, it responds to the city block, but at the same time it stretches out into the parkland, floating in the surrounding landscape, thus creating outside spaces of different character while conveying to the visitor the feeling of sitting in the park while reading a book.

The 'Gateway Gallery', a flexible activity space, forms part of a public route through the building, reinforcing its bridging character between the park and the city and blending the threshold between library and park. Administration and back of house services are housed in the east wing. The stacks are arranged in such a way that one will always be able to see into the park, creating a sense of openness and transparency. In addition to book stacks, the library also accommodates education facilities, children's play areas and a conference wing with a cafe, reinforcing the public nature of the building and providing a platform for public life.

The two storey concrete structure sits above an underground car park and is entirely wrapped in a composite energy efficient glass-metal skin. Laminated between two glass surfaces, a layer of expanded copper mesh reduces glare and solar gain, thus greatly reducing long-term energy costs. The mesh is the only sun-shading device necessary, ensuring that the view from the inside into the park is maintained at all times. Slight variations in the make up of the panels provide the library with a differentiated yet uniform skin, emphasizing the organic shape of the building.

Tangible Measures for a Sustainable Design:

Glass façade with integrated metal mesh

The façade consists of triple glazing units with an integrated metal mesh. The three-dimensional quality of the mesh allows for good views out of the building but reduces the solar gain through the façade by 80%, thus significantly reducing the building's cooling load.

Green Roof

The green roof both improves the visual and the physical environmental impact of the building.

- For views from the surrounding buildings it gives a sense of a visual continuation of the surrounding park
- The roof helps retain rainwater and thus minimises the impact of the large roof on the sewer system.
- The green roof increases the building's mass and therefore mitigates peaks in temperature resulting in a reduced heating and cooling load.

Exposed Concrete Soffits

All suspended ceilings have been omitted exposing the concrete soffit of the floor slabs. As the slabs are exposed, their building mass can be activated to reduce the building's cooling load.

Daylight

The elaborate building shape helps connecting the inside and outside and maximises the use of natural daylight. Integrating mesh in the full-height glazing furthered the effectiveness of the daylight. The mesh mitigates the sometimes harsh qualities of daylight thus minimising the use of artificial light to avoid contrast and helping to illuminate the depth of the space.

The cumulative effect of these measures have lead to an excellent energy rating with the local energy supplier and given the library a significant cost rebate in addition to annual savings on their energy bill. (<http://www.archinnovations.com>)

## **Jonathan Clark Architects, London – UK**

<http://www.jonathanclark.co.uk>

### Longford School 2, Feltham, London – UK 2009

#### **Awards:**

RIBA London Awards 2010 Winner

WAN Education Awards 2010 Finalist

“I've worked with many architects over the years but Jonathan's ability to listen to our needs and turn them into crazy yet buildable designs is fantastic. He has created buildings and environments which captivate the minds of our staff and students. The vision lead by our Head Teacher of delivering 21st century teaching environments has been turned into reality by Jonathan's designs. It is a pleasure working with him.” Robert Glass, Projects Director, Longford Community School

This is a two storey extension and partial conversion of an existing two-storey 1960s constructed building at Longford Community School. A total area of 750sq.m (a 200 sq.m extension and 550sq.m conversion of existing) houses two new classrooms and a Fitness Centre at ground level with a new Library/learning Centre at first floor. The challenge here was how to successfully extend a nasty looking teaching block. We chose to build a vibrant colourful structure that straddles the end of the block almost as a kind of

articulated bookend. The two storey extension element uses bespoke designed colour-stained Finnish softwood laminated 'fins' that support both the first floor structure and the roof. Unusually for this material, the structure is completely external and exposed to the elements and after much research was pressure impregnated in order that it could perform to these conditions. In between each fin are aluminium grating panels that provide solar control as well as structural stiffening to the external structure. Behind the structure is a two storey panel of glazed curtain walling. The roof is clad with silver 'Trespa' panels and is designed to give the impression of floating/sliding across the exposed roof beams. Internally, the library has been designed as an adaptable open plan area that can be used for different ways of teaching – there is raised area of carpet clad cubed modules for seating, bespoke designed tables and benches and an enclosed curved 'arena' space. (Clark)

The project designed by London-based practice JCA involved a two-story extension and partial conversion of an existing 1960-built two-story building at Longford Community School in Feltham near Heathrow. The architects have created a 200 square meter structurally-expressed timber supported extension and 550 square meter of existing space to house two new classrooms and a fitness center at ground level with a new library/learning center at first floor. This project involved the fit out of an empty shell and core space situated on an upper mezzanine of the canteen block. The ceiling height was generous but not enough for two proper internal levels. In order to solve this structural challenge, JCA has designed a multi-colored Formica clad plywood structure that houses individual study booths over two levels by arranging the cross section. This has helped the lower booths to sit directly below without requiring full headroom while sitting. The colored-timber structure spans the end of the block representing an articulated three dimensionally layered book-end. This colorful structure offers a vibrant extension to a dull and lifeless brick-built teaching block. Bespoke-designed color-stained Finnish softwood laminated fins are used to support both the first floor structure and the roof. Aluminum grating panels are inserted between each fin to provide more solar control as well as some structural stiffening to the external structure. The roof is timber structure clad with silver Trespa panels. The panels are designed to give the impression of floating/sliding across the exposed timber roof beams. A solid block-work wall separated the new sixth form from the canteen below. A number of different sized portholes are inserted into this wall to allow the students to look straight into the canteen below and feel more connected with the rest of the school. A new staircase and disabled lift platform are inserted, adjacent to a new office for the head of sixth form. The sustainable timber has been used in order to fulfill the client's wish to use materials that are procured in an environmentally responsible way. ( <http://www.worldinteriordesignnetwork.com> )

## **Coltart Earley Architecture, Glasgow – UK**

<http://www.coltart-earley.co.uk>

**Libraries:**

**Hamilton Central Library Regeneration, Hamilton – UK 2000 – 2004**

Client: South Lanarkshire Council, Total Project Value: £9m

Hamilton Carnegie Library is a Category A Listed Building built in 1908 as the first of three buildings forming the Townhouse Complex.

The concept behind the renovation of the library at Hamilton Town House is exposure, the ability to create a facility where visitors encounter and discover new influences and opportunities to learn, develop and grow in a welcoming environment. The discovery of the original Carnegie Lecture Theatre presented us with the opportunity to recreate one of the original spaces within the library utilising reproduction plasterwork taken from the remaining damaged ornate plasterwork and columns.

with the location, it was important that the design gave the entrance to the town an impression of style and confidence...this is a huge project for the area and will create a facility that the whole community can be proud and enjoy ( South Lanarkshire Council)

**Libraries:**

**Bond University's Soheil Abedian School of Architecture, Robina –Australia 2013**

client: Bond University, location: Queensland, Australia, budget: \$ 14,000,000 AUD, dimension: 2.500 m2

primary team: Sir Peter Cook and Gavin Robotham, Mark Bagguley, Jenna Al-Ali, Ting-Na Chen, Lorene Faure, Yang Yu, Nuria Blanco, Javier Ruiz, general contractor and project management: ADCO, Gold Coast, structural and environmental engineers: Arup Brisbane, status: Under construction, Year commenced: 2011, Year completed: 2013

The Soheil Abedian School of Architecture is under construction and is scheduled for completion in April 2013. The design is a result of an international competition which was won by Cook Robotham Architectural Bureau (CRAB), London in association with Populous and Brit Andresen. The 4000m2 building will provide a public forum space for 120 people, studios for undergraduate and masters' students, as well as post-graduate spaces, in a generally open-plan arrangement. Staff accommodation, resource room, reading room, atelier and coffee shop as well as environmental science laboratories constitute the other major functions within the building. The building is complemented by a 330 m2 workshop building and an existing 220m2 Architecture Fabrication Research Laboratory. In all, the workshop facilities will provide 550m2 of space for traditional workshop equipment as well as dedicated digital design and fabrication equipment and materials library. Key elements of the main academic building include a 70metre long street of varying width and height adjacent to which are 4 "scoops" which bring light and air into the building. The scoops provide an important "eddy" space for informal gatherings, critiques and self-directed student activity. The inclined street and the eddy spaces will be key to the successful social interaction between students and also engagement with the broader community. The combined facilities, internal and external space, workshops and public spaces combine to fulfill the schools pedagogy of a strong theoretical foundation underpinned by "learning by making." (<http://www.crab-studio.com>)

The Soheil Abedian School of Architecture is located on the campus designed in the 1980s by Arata Isozaki. It forms part of the Faculty of Architecture and Sustainable Design. Winning the competition in January 2011, CRAB was awarded the contract and the building is on Fast Track.

Again, Cook and Robotham's long experience as teachers of architecture and their regular working knowledge of several including the Bartlett, AA, Harvard, SCI-ARC, Columbia, Frankfurt and UCLA enables them to incorporate a response to many anecdotal criteria as well as constructional and climatic objectives.

The building is a long, airy loft on two to three levels articulated by a series of 'scoops': defining structure-enclosures that can be used for casual meetings and 'crit' sessions. These line the central street that gently rises up the hilltop site. Advantage is taken of the east-west axis to clarify a very climate-controlled development of the north and south skins of the building.

The Soheil Abedian School of Architecture is CRAB'S second University building, and it is rising up fast. Its character is very much developed out of the experiences of Peter Cook and Gavin Robotham as teachers and users of many architecture schools. As with their other work, the sociology of small, intimate groups within institutions, the value of casual overlay, the

importance of the non-curricula moments – as well as a 'sense of theatre' runs through the project. The central 'street' is flanked by irregular 'scoops' – coves of structure that give character to the unfolding of the studios and study rooms. As befits a hot and sometimes sticky climate, the building is airy and folds over upon itself in a series of fan-like roofs and slits.

<http://www.archdaily.com>

Sir Peter Cook and Gavin Robotham (CRAB Studio) won a 2010 international competition to design Bond University's Soheil Abedian School of Architecture. With construction underway, Cook and Robotham visited the Gold Coast in October 2012 to review the progress. Cameron Bruhn joined them on site.

Circulating the corridors of the University of Queensland's architecture school (my alma mater) is a story about Sir Peter Cook's visit in the mid 1980s. The tale's not so much about him being there as a visiting professor – although that should surely rate a mention – rather, it's about a vigorous stoush with another visiting Brit, Alison Smithson, during a student critique. There isn't a lot more to the story and I guess that explains its longevity.

Cook was recently in Australia to preview a project of his Cook Robotham Architectural Bureau (CRAB) currently under construction on the Gold Coast. Cook and Gavin Robotham (his partner in CRAB) have both taught in architecture schools across the world, and together bring a wealth of experience and anecdotal observations to the task of designing Australia's newest architecture school, Bond University's Soheil Abedian School of Architecture.

The school accepted its first student enrolments in January 2011, with the former Queensland government architect, Professor Philip Follent, appointed founding head. CRAB, in association with Populous and Brit Andresen, won the international design competition for the new school's building in 2010. The latest of Cook's architectural formations, CRAB was established in 2006, Cook and Robotham having already worked on a number of competitions together. Since forming, the studio has won competitions for the Verbania Theatre in Piedmont, Italy, and the law faculty and administration buildings of the new Vienna Economics University in Austria, the latter currently also under construction.

Bond's School of Architecture takes the name of Soheil Abedian, a longstanding supporter of the university and the founder and chairman of Gold Coast-based property development company the Sunland Group. The building is due for completion in May 2013, and its sculptural concrete scoops are already emerging from the ground. These four concrete blades are structural, environmental and experiential elements. They create un-programmable spaces for critiques, group work and exhibition (and of course alumni gossip).

The diagram of the building is straightforward enough – a gently ramping internal street runs the length and height of the envelope, with studio spaces over two levels on one side and three levels of offices and service functions on the other. This space undulates in section, with bridges crossing overhead and stairs connecting up and around. The roof is a flat, lily-pad-like structure that rests on an array of slender columns, creating a colonnade around the perimeter. At the entrance, the form cantilevers forward like a protruding nose – a classic Cook motif – to welcome us.

For those old enough to remember Monty Python, Sir Peter (and the Archigram group) are the architectural manifestation of an English naughtiness that made an inane exchange about a dead parrot pure comic genius. Fart jokes are still part of Sir Peter's repartee. In conversation with him during his visit to Bond University I asked him about that legendary student critique in Brisbane almost thirty years ago.

The story survives amid the anecdotes from a distinguished, yet irreverent, career in architectural practice, teaching and discourse. As it turns out the disagreement was about a "rationalist" project that was being presented. Cook: for, Smithson: against. Smithson was intractable. Having made their respective points with some force, they decamped to the staff club for lunch, happily gossiping about this and that. As Cook would say, there are too many architects wandering around "pofaced." (<http://www.architectureau.com>)

### **Vienna Economics University, Law School, Library, Vienna – Austria 2013**

Budget : € 40,000,000 Dimension : 26,000 m<sup>2</sup> CLIENT : PROJECTGESELLSCHAFT WIRTSCHAFTSUNIVERSITAT WIEN IMMOBILIENGESELLSCHAFT m.b.h GENERAL CONTRACTOR : VASKO + PARTNER INGENIEURE, WIEN PROJECT MANAGEMENT : TECHNISCHE GESCHAFTSFUHRUNG DER ARGE PS : DREES & SOMMER WIEN GmbH

Located in the Prater Park of Vienna's 2nd District a completely new campus will open in 2013 for this long-established University. A series of parallel 3-stage competitions led to CRAB being awarded the contact for the interlocking buildings that have a 270 m. face to the woods of the Prater. A strong feature of the buildings is CRAB's attitude to providing casual meeting spaces and outside shelter – largely based upon their long experience of University life. The building rises in a series of snake-like tiers : running from 'earth' colour to 'light' as you go up the building. A connecting roof garden runs from the Prater park into the University's courts : over the top of the Law Library. From within, the entrance is flanked by two 'gleaming' glass corners : on one side the coffee shop and on the other the students' common room. The present stage of construction is illustrated. (Cook)

Der aus einem Verwaltungsgebäude und dem Departmentgebäude D3 bestehende bunte Gebäudekomplex im Westen wurde von Sir Peter Cook und seinem CRABstudio geplant. Er beinhaltet die juristischen Departments, Forschungsinstitute und die Spezialbibliothek Wirtschaftsrecht ebenso wie das Rektorat, weitere universitäre Verwaltungseinheiten und einen Bäcker. (<http://blog.wu.ac.at>)

Weiter im Inneren des Campus findet sich das zweiteilige Departmentgebäude D4des spanischen Büros Estudio Carme Pinós. Die dynamische Fensteranordnung prägt die Fassade des Gebäudes. Eine Spezialbibliothek (Sozialwissenschaften)

und das Lifestyle Café „Nykke“ sind über einen eigenen Eingang erreichbar. Der Teil des Gebäudes mit den Seminarräumen ist erhöht. Folgende Departments werden hier beheimatet sein: Finance, Accounting und Statistics, Volkswirtschaft und Sozioökonomie.

### **Libraries:**

#### **Gorbals Library, Gorbals – Glasgow – UK 2004**

There was an age when the trams and books were inextricably entwined such as when the Glasgow Corporation (Tramways, Libraries) Act, 1899 gave the city powers to provide a public library service supported from the rates. Initial plans were to build eight libraries at a cost of £100,000 but following a gift of that amount from Andrew Carnegie a further seven were immediately planned. Carnegie had left the Broomielaw in Glasgow with his family 52 years earlier and in that time he had amassed enormous wealth. Gorbals Library was the first public lending library to be opened in Glasgow on November 11, 1901. However, it soon outgrew its accommodation and it was replaced by a new library in Norfolk Street in 1933. Last June saw yet another chapter materialise in this area with the opening of a library and learning centre by First Minister Jack McConnell. For CRGP it marked the end of an interesting project in which they worked alongside Curious Oranj who had been commissioned to create a design for the 21st century. Tom Crombie, a director of CRGP and architect in charge of the project, faced an unconventional design strategy. "The interior was not what you would imagine a library to be. It is modern, hi-tech and is more about computers than books. Its purpose is all about being a learning centre than a library and it educates people in the use of IT," he said. The library certainly aims to help people access the internet and become computer literate so that they may become more employable as well as being able to participate in the pleasures of surfing the net. Essential to the plans for the building and its adaptability for future use was the need to create a flexible interior that could be changed to suit whatever configuration might be required. This flexibility had to be built in to how the facility was serviced particularly in terms of lighting and the IT infrastructure. CRGP showed its expertise in management by being in attendance as practical people with a client who was trying to push the boundaries forward in terms of libraries and an interior designer who was trying to push the boundaries forward in terms of how the space was going to be distributed and how it was going to be used. "It was necessary to keep people's feet on the ground in some respects. And to try to keep the job within budget and ensure that what was proposed was practical and achievable and more important, useable," said Tom. The job has now been completed and the library and learning centre is functional. In its first month of opening, the centre attracted 30,000 visitors and loaned 13,000 books. At the opening ceremony, the First Minister said: "Learning is not just about sitting in a classroom or lecture theatre. It is about seeking out opportunities to better yourself, to learn new skills and to reach your true potential. This is something that everyone deserves the opportunity to do - and bringing learning into the heart of communities breaks down many of the barriers that prevent people from doing so." The new centre is supported by the Scottish Executive, Scottish Enterprise and Glasgow City Council, Gorbals Social Inclusion Partnership, Glasgow College of Nautical Studies, Gorbals Initiative and Gorbals Community Forum. (CRGP)

#### **Fitzwilliam College, University of Cambridge, Cambridge – UK 2010**

The new Library and IT Centre that extends the east wing of the 1959 Denys Lasdun College masterplan. When complete it will provide a variety of study spaces, all with flexibility for IT network connections via an accessible raised floor. Reader spaces are located around the perimeter of the main library, maximising the use of daylight and views over the college gardens. The concertina of the west facing timber elevation affords workstations with natural side-light for short-term computer use. (Cullinan)

#### **New Herbarium and Library Wing, Royal Botanic Gardens, London-Kew – UK 2007 – 2009**

### **Awards:**

AIS Constructors Award. Silver Award

The building achieves a BREEAM 'Excellent' rating

Founded in 1853, the Herbarium is the world's leading centre for the study of plant diversity. The new Herbarium building provides long awaited additional archive space for Kew's priceless collection of dried plant specimens, botanic books and illustrations.

The concept for the building is generated by juxtaposing the vault-like, climate-controlled archive (that keeps the specimens at a constant 15°) with airy, day-lit research spaces. These glass and timber research areas undulate around the 3 storey, brick-clad archive enabling scientists to work in close proximity to the collection. The new wing is linked to the existing herbarium by a timber and glass drum. This houses a circular reading room and ground floor reception that opens onto a newly created south facing courtyard. (Cullinan)

#### **Centre for Mathematical Sciences, University of Cambridge, Cambridge – UK 1996 – 2003**

### **Awards:**

AIS Constructor Award. Silver Award 2009

David Urwin Award 2003

Royal Fine Art Commission. University Building of the Year Award 2003

British Construction Industry. Major Projects Award 2003

Royal Institute of British Architects Award 2003

This complex brings together the Pure and Applied Maths departments into seven 40-office pavilions grouped around a grass roofed central core building containing lecture theatres and a dining hall, and an external contemporary Cambridge courtyard. A circular library and a gatehouse complete the masterplan. The low energy buildings have exposed thermal mass, natural ventilation, night cooling, solar shading and a Building Management System to regulate the internal environment. The post-occupancy Probe Report commissioned by the University confirms the achievements of this sustainable design, assisting staff and student recruitment, and initiating new research groups and funding. (Cullinan)

### **Betty and Gordon Moore Library, University of Cambridge, Cambridge – UK 2001**

Established as a new branch of the main University library covering the Physical Sciences and Technology, the library is central to the vision of bringing together two mathematical departments, the Isaac Newton Institute and the national research centre for mathematical sciences and their applications at the Centre for Mathematical Sciences. Circular in plan, with three floors above ground and one below, it features advanced natural ventilation and cooling managed via the integrated building management system for the upper two floors whilst the lower levels are cooled by chilled beams. The library accommodates around 7000m of open access books and periodicals in addition to the 2,730m of closed access stacks. The library provides secure 24 hour access to its collection and workstations. (Cullinan)

### **Faculty of Divinity Library, University of Cambridge, Cambridge – UK 2000**

Located on the top floor and mezzanine of the Faculty of Divinity the north facing double-height library has views over the mature college gardens, and is filled with light provided by the large central roof-light and vertical glazing. The library's radial plan makes it easy for the user to navigate and easy for the librarian to supervise. This layout enables the 60,000 books and journals to be shelved in a simple linear sequence. There are 49 reading spaces in the library; some tucked away quietly at the edge of the building beside a window, or more ostentatiously in the centre of the space under the clerestory. (Cullinan)

### **St. John's College Library, University of Cambridge, Cambridge – UK 1990 – 1993**

In 1990, we won a competition to build a new library for the College which had a magnificent collection of old books and manuscripts housed in a chapel-like room built in 1624, but its modern collection had long outgrown its cramped conditions. Our design kept the old collection intact by retaining the shell of the existing 1885 Penrose building, and transforming it with a new extension at right angles to create a technologically modern, naturally ventilated library with 120 reading spaces. The resulting cruciform building also makes a new entrance to the library facing the mighty tower of Gilbert Scott's chapel across Chapel Court. The building was completed on time to a tight timetable within the confines of a busy working college. (Cullinan)

### **Li Ka Shing Library, Singapore Management University – Singapore 2006**

ECA worked closely with the National Library Board of Singapore (NLB) to develop and implement the brief for this academic hybrid library. The design aimed to acknowledge the importance of the library as a collection of physical spaces providing access to both printed texts and the ever expanding quantity of digital information. Within the SMU masterplan the library forms one of the key focuses of the campus. The £13M (approx.) library has capacity for 140,000 volumes, 900 work/study spaces and 166 dedicated computer terminals, providing a rich variety of working environments whilst maintaining maximum flexibility to allow the library to adapt to the changing needs of library users. #### **Libraries:**

### **Sutton Life Centre, Borough of Sutton, London – UK 2011**

Applied technology blurs the boundaries between private and public learning

Curl La Tourelle Architects and Land Design Studio are working together on an unprecedented new building typology that blurs the boundaries between an immersive learning environment and community library. A series of physical, digitally generated and sensory environments communicate critical life skills and citizenship issues that are faced everyday by people in Great Britain. These experiences are centred on the lives of nine and ten year old children, but can be extended to engage all, investigating drug culture, dangers of alcohol, life threatening hazards involving transport and it can promote an intelligent response to global climate change, waste and recycling, a citizens role in the community and our influence in a political world. A Media Lab links the new media technology allowing visitors the ability to create their own digitally generated environments. Thus, emphasising the importance of communal and collective engagement, re-defining the concept of a community centre and district library. Cutting edge sustainable technology provides 50% renewables. Assisted natural ventilation utilises underground temperatures via earth tubes cooling or heating the air. A Biomass Boiler provides all the buildings heating requirements. Rainwater is harvested for use throughout the building. An eco/habitat garden provides a green buffer to the local residents.

### **Canada Water Library, London – UK 2011**

Local Authority London Borough of Southwark, Content New Library building including a café, learning facilities and a performance space, Completion Date November 2011, Value £14 million, Size 2,900 m2

The idea of a free standing object in space is quite appropriate for a library, since it is a portal to the discovery of other worlds. As a piece of sculpture it binds together a tube station, a stretch of open water and a plaza and makes the precursor landmark of a substantial new development on London's Canada Water. The inverted pyramid form contains a readily accessible café, performance space, internet points and popular books within a small footprint at ground level, whilst the expanding shape above enables the containment of the main library within a single, galleried, skylit double volume. The whole is clad in aluminium sheets, anodised a light bronze with sequined perforations. (CZWG)

17 December 2009

By John Morgan

UCU voices concern at the loss when the university is trying to make 6% savings. John Morgan writes  
University College London has lost £6 million on plans for a cultural institute after financial worries forced it to abandon the project. UCL's accounts for the year ended 31 July 2009 reveal a loss of £5.95 million on its Institute for Cultural Heritage project, which was to occupy a purpose-built "landmark" building at its Bloomsbury campus.

In a statement, UCL says that it had "reluctantly concluded that, in the present economic climate, it should not press ahead with its proposed new building for an Institute for Cultural Heritage in its original form".

Half the losses came from clearing the site, while "some of the remaining costs on project management and design fees have had to be written off", it says.

The University and College Union, which is opposing possible job cuts at UCL, said the university cannot afford such a loss when it is pushing for 6 per cent savings.

Sean Wallis, branch secretary, said: "When UCL is asking staff to count every penny, it is rather distressing to see it has spent £6 million on moving gravel."

The university secured a £1 million gift from the MBI Al Jaber Foundation for the proposed institute and would have won £5 million from the Heritage Lottery Fund had the scheme gone ahead.

But the university decided it could not provide sufficient funds to match the lottery grant.

Had it been built, the institute would have created a new home for four of UCL's most important collections, including the Petrie Museum of Egyptian Archaeology and library archives that feature George Orwell's manuscripts.

When the plans were announced in 2007, the university said the venture would widen public access to the collections, bringing a fourfold increase in visitor numbers.

A UCL spokesman said the university was "going through a master-planning exercise for viable alternative approaches, to see if we can create some of the facilities originally planned for the institute by remodelling existing buildings and spaces". He added that some supporters of the project were willing to transfer their investment to the revised proposals.

The spokesman described the site, which is in Gordon Street, as "UCL's last remaining development site on our Bloomsbury campus", adding that the work carried out was necessary "for any future building on the site".

He also said that much of the planning and design work "will be essential to inform future developments", meaning that it was not possible to determine the sum that will be written off entirely.

Elizabeth Clear, UCU branch president, said: "Because of the job cuts, we feel it's an enormous amount of money to have lost."

She added that the collections were "amazing" and deserved wider public access, but that UCL "did not consider the full implications" of its expensive plans.

## **Awards:**

RIBA Award 1994

The site, a long narrow rectangle, lies between the curve of Silver Street and the Cam millpool. On the street side, the building is low and appears to emerge from the existing curved boundary wall. The interior of the building is like one large piece of furniture are all made of oak. The structure uses sections of a size that were only available "green" (i.e. unseasoned). The timber was cut and dried for the project, but moisture contents remain in the range of 25 to 60%, and the structure will continue to dry for several years. The timber joints which transfer load use a system of stainless steel fixings to allow the joints to be tightened as the timber dries. The dominant aspect of the interior space comes from the geometry of the roof. The straight line in the plan generated by the waterside and echoed by the clerestory is set against the curved wall to Silver Street. The inside of the curved wall is lined with books, while the rafters forming the roof reconcile the straight line to the curve and generate a gentle three dimensional curved plane when seen in perspective. The main reading room is a space that extends from ground floor to the first floor, and overlooks the river. (Dixon Jones)

1st Prize in International Competition, Client: Bodø Kommune, Area: 6,300m<sup>2</sup>, Construction Cost: £25 million, Design Period: 2009 – 2011, Completion Date: 2014

### **Awards:**

Highly Commended, AR MIPIM 2010 Future Projects Awards

DRDH was awarded the design of a new Library for the city of Bodø in northern Norway. The invitation followed on from a previous open competition for the masterplan of the city's Cultural Quarter in 2008, which the practice won. The City Library is one of two principal buildings within the Cultural Quarter, alongside a Concert Hall and Theatre also being designed by DRDH. Both buildings respond to the particularities of their context, situated between city and landscape, whilst maintaining a familial relationship that creates an urban ensemble. Externally, both façades display a trabeated construction of pre-cast concrete, with an aggregate of local white stone. Forms rhyme between them. Roofs and towers speak to one another and the library establishes a horizon, across which the Concert Hall surveys the dramatic landscape of sea and mountains. Internally however the buildings offer quite different characters. The principal spaces of the Library describe an open internal landscape, which focuses upon the main reading space with its glazed elevation to the harbour. The building includes a number of other community functions including a flexible performance space, a gallery, a multifunction room and a café. These are defined as a series of rooms that face the city streets. The building is open to both the city and the harbour, with entrances connected by an internal street. The childrens library, at the top of the building, is more intimate, nestled beneath an inverted roof form and focused around an external play court. Throughout the detailed design stages, the project has been coordinated through extensive use of Building Information Modelling (BIM). The proposal is currently at construction stage and is due to be completed in 2014. (drdh)

## **Dyer Associates, London – Edinburgh – UK**

<http://www.groupdyer.com>

The learning landscape is changing. We understand that good design can motivate, attract and retain Both learners and staff. #### **Walsall College, Business & Learning Campus – UK 2009**

Client Walsall College, Size 24,000m<sup>2</sup> / 258,000sqft, Location Walsall, West Midlands, UK, Value £35m, Procurement Design & Build with Novation, Complete May 2009

This is the flagship project of a major regeneration programme to establish Walsall as a hub for business, learning and enterprise. Built near the college's existing town centre site, it plays an important role in creating a new urban image for the Midlands town. The development comprises an extensive new landmark building integrating learning facilities with the essential infrastructure of a thriving modern campus. With input from multiple stakeholders (public and private), it is a model for partnership working, promoting engagement with employers and the wider community. We are aiming for a BREEAM rating of 'excellent'. The campus is located on the axis of a new public thoroughfare, set back from the streetline on a landscaped plaza. It is organised over five levels into two main wings: vocational (west); general learning (east). The floorplates provide optimum efficiency, accessibility and flexibility. The wings feed off a central hub arranged around a five storey atrium and new public plaza. Its network of shared facilities includes offices, retail, catering and leisure units and a large learning resource centre. It is also a 'shop window' for the college's professional academies, which are equipped to the highest industry standards. (Dyer)

#### **Queen Margaret University College, Edinburgh – UK 2008**

Dyer Associates is recognised as one of the of the UK's leading design practices with experience in the education sector. The winning proposals for the new Craighall site focus on the Learning Resource Centre as a vibrant and dynamic space at the heart of the campus. An internal atrium and open-plan street with views out to other buildings and to the landscaped parkland will become the QMUC social hub, promoting a sense of shared learning and collective endeavour. Philip Ball, a design director at Dyer Associates, said: "Dyer Associates is extremely excited to have been selected for this prestigious project. We believe it represents a fantastic opportunity to create a landmark development for QMUC, which will capitalise upon its unique setting and provide a people-focused learning environment for the 21<sup>st</sup> century". ### **Clapham One, London – UK 2011**

The £80 million landmark Clapham One PPP (Public Private Partnership) Project for the London Borough of Lambeth encompasses two sites in Clapham. United House has secured a £29 million contract to design and build a new community library, primary care medical centre and 136 private sale apartments as joint developer and investor with Cathedral Group plc on the site of Mary Seacole House. The nearby Clapham Manor Street site will be home to a new leisure centre and 63 homes, 44 of which will be social (note: this part of the project does not form part of the United House contract). The project has two sectional completion dates for the early handover of residential units and the public spaces. 12 storey concrete frame building with single storey basement comprising:

• Community library - this is a spiral 'drum' shape over three floors from basement to first, with an open centre and ramp to outside edge where the books will be displayed.

• Primary care medical centre - to the remainder of the ground floor providing consultation rooms, minor operating rooms, training and management, etc.

• 136 residential apartments for private sale – one and two bed apartments designed and built to a high quality specification.

• Basement - car parking and building operational plant.

The external facade is of Forticrete split blocks with stainless steel colour windows and Juliet balconies. The building has been designed with curved ends to each of the cores to reduce the impact of the volume of the building. (<http://www.unitedhouse.net>)

#### **University of York Campus, National Science Learning Centre, York – UK 2006**

The New National Science Learning Centre is located on the University of York campus. The Centre will provide innovative, experimental, continuing development courses for science teachers and technicians, and is the hub of a new national network of Science Learning Centres. The building comprises 2 main elements; a 3 storey block at 90 o to the existing Medical School (also designed by Farrell & Clark), and a 2 storey quadrant block which contains the Centre's major functions. The building design utilises rainscreen curtain walling and cladding enhanced by planar glazing and coloured render to the sculptural form of the main entrance, which is located at first floor level and accessed by a bridge spanning over an external courtyard area. The main block contains the teaching areas and offices. A restaurant and bar, with appropriate kitchen support facilities, is located at ground floor. The accommodation contained within the quadrant shape includes 2 lecture theatres (with the ability to combine and provide a 300 seat facility), a resource centre, and the main entrance and exhibition area of the building. The form of the quadrant has been developed to accommodate the requirements of the lecture theatres. The central exhibition hall has been designed to be the fulcrum of the development, providing a dramatic, exciting and flexible core to the building. Open galleries within a 'drum shaped' hall contribute to providing a setting appropriate for exhibitions, science demonstrations, meetings, conferences and the stimulation of delegates undertaking Science Learning courses. A unique aspect of the project is that the building itself has been designed as a 'learning tool'. This will be achieved by structural clarity, transparent sections of walls, floors, special fittings and building services. The building also utilises and demonstrates a number of energy efficient and sustainable features including geo-thermal heating and cooling, a 'green roof', grey water retention and 'green' pipework distribution systems. Display panels inform building users how services systems are operating, together with information from a weather station, cameras on to bat and bird boxes and links to other science facilities. External facilities will eventually include trial growing areas, a greenhouse and a nature study pond. (Farrell) Total Project Value £10m

#### **University of Hull, Business School, Kingston upon Hull – UK 2005**

The New National Science Learning Centre is located on the University of York campus. The Centre will provide innovative, experimental, continuing development courses for science teachers and technicians, and is the hub of a new national network of Science Learning Centres. The building comprises 2 main elements; a 3 storey block at 90 o to the existing Medical School (also designed by Farrell & Clark), and a 2 storey quadrant block which contains the Centre's major functions. The building design utilises rainscreen curtain walling and cladding enhanced by planar glazing and coloured render to the sculptural form of the main entrance, which is located at first floor level and accessed by a bridge spanning over an external courtyard area. The main block contains the teaching areas and offices. A restaurant and bar, with appropriate kitchen support facilities, is located at ground floor. The accommodation contained within the quadrant shape includes 2 lecture theatres (with the ability to combine and provide a 300 seat facility), a resource centre, and the main entrance and exhibition area of the building. The form of the quadrant has been developed to accommodate the requirements of the lecture theatres. The central exhibition hall has been designed to be the fulcrum of the development, providing a dramatic, exciting and flexible core to the building. Open galleries within a 'drum shaped' hall contribute to providing a setting appropriate for exhibitions, science demonstrations, meetings, conferences and the stimulation of delegates undertaking Science Learning courses. A unique aspect of the project is that the building itself has been designed as a 'learning tool'. This will be achieved by structural clarity, transparent sections of walls, floors, special fittings and building services. The building also utilises and demonstrates a number of energy efficient and sustainable features including geo-thermal heating and cooling, a 'green roof', grey water retention and 'green' pipework distribution systems. Display panels inform building users how services systems are operating, together with information from a weather station, cameras on to bat and bird boxes and links to other science facilities. External facilities will eventually include trial growing areas, a greenhouse and a nature study pond. Total Project Value £10m

Significant investment in state-of-the-art facilities on the University's west campus created a first-class facility for the Business School to accommodate our continued growth in size and status. In 2005, we moved in to our new home, described by Sir Digby Jones, former Director General of the CBI, as a 'world class learning and teaching facility'. Designed by esteemed architects Farrell and Clark, the school is a mix of new build and redevelopment. Contemporary links connect four Grade II listed buildings to create an inspirational yet practical space, equipped with the latest technology.

#### **British Library Strategic Vision Masterplan – UK 2009**

Following a rigorous selection process, the British Library has appointed Farrells to lead a strategic master planning team for its 9 acre site at St Pancras, London. Consultant teams were asked to submit proposals to work with the Library on a Master Plan for the future development of the entire site to support the Library's future strategy and plans in a changing, and increasingly digital, world.

Farrells commenced working on the Master Plan in April 2009 and with a framework vision for the site presented to the British Library Board in October 2009.

Sir Terry Farrell said: "It is a privilege to have been appointed as strategic master planner to the British Library. The British Library is one of this country's greatest institutions and I am delighted to work with the Library to ensure it makes the most of the changing cultural and academic environment." (Farrells)

### **Libraries:**

#### **Bentley Library, Walsall – UK in design**

FAT beat off competition from over 70 submissions to win this RIBA competition in March 2008. We are now working closely with Walsall Council, the stakeholders and user groups to develop our proposals for the new community library and nursery in Bentley. Hopefully the planning application will be submitted in the summer of this year. The 630sqm single storey building sits on a brown field site, the site of the former library, in the heart of suburban Bentley. There are two vertical elements that express the dual functions of the building. These also relate to the tower of the nearby community Church and frame views of the local landmark, the Cairn, which sits atop the adjacent hillock. The library and proposed study centre are arranged around a plinth accessible from the main street. The idea is that the combination of the area? principle community buildings will provide a new civic focus for Bentley. The masterplan for the site also includes: car parking, the nursery? outside play area and a new playground.

#### **Thornton Heath Library, Borough of Croydon, London – UK 2009**

Gross external floor area 875m<sup>2</sup>, Total cost £1.5 million, Cost per m<sup>2</sup> £1,714, Client London Borough of Croydon

Architects Journal, 16 September, 2010 | By Rory Olcayto :

'Thornton Heath has a desperate kind of mid-19th-century artisan character,' states Pevsner's Buildings of England series, adding that there is little to enjoy in this 'relentless suburban sprawl'. Walking along the shambolic, piecemeal Brigstock Road, past the 'Best Hand Car Wash in the UK', the Cheap and Cheerful furniture store and the Braids 'R' Us beauty salon, you can see why Pevsner finds this Croydon suburb so hard to like. Despite a solid Victorian and 1920s townscape, which mixes terraces with commercial yards and semi-detached villas, it's a crazy jumble: road signs, shopfronts, street lamps and cars - hundreds and hundreds of cars. A few minutes' walk westwards from the railway station, the road widens, and there is a clear view of something at odds with Pevsner's observations: a striking, graphic, gleaming white pavilion, fixed to the front of a Edwardian block and set alongside a very busy bus stop. Its function is spelled out in large freestanding three-dimensional letters, in case you're not sure what lies inside. Welcome to FAT's £1.5 million revamp of the local Carnegie library. London-based practice FAT makes provocative architecture that invites you to think about what you're looking at. Its buildings have a dreamy, prosaic quality that offends or delights depending on your taste. In the 2002 book Fame and Architecture, founding director Sean Griffiths says FAT's work 'makes references to "high" architecture but it also has readings accessible to others'. That might explain why director and co-founder Sam Jacob described the practice's magnificent Heerlijkheid Hoogvliet community building in the Netherlands (AJ 06.11.08) as 'not Arcadia, but an imaginary Arcadia', when much of it resembles the landscape of a Nintendo videogame. Thornton Heath Library, too, has two (and perhaps more) personalities. The cast concrete letters have a cartoonish feel, as if the whole building is a blown-up board-game piece, but, explains Charles Holland, the director who led the project, they also reference the sculptural grandeur of neo-classical civic facades. FAT's intervention here is really quite rude: it nearly swallows the Edwardian facade, including the heraldic stone frieze around an old doorway it's supposed to be nodding and winking at. It's odd, then, that the result is a massive improvement, although the confident proportions and materiality of FAT's new-build are very clear to see. Given the complexity and craft FAT invests in its projects, Croydon Council should be applauded for granting the firm, funded by a £1.37 million Big Lottery grant, its first civic project in Britain. The brief was to expand the existing facility to offer a lending library, a reading area and café, a homework space, computers, a children's library and community meeting rooms. A three-month public consultation gathered over 1,000 local comments, and included a display in a nearby Tesco, drop-in sessions, talks and school visits. This led to further demands: better usability, a wider community role, access to the garden and a contemporary entrance pavilion of 'outstanding architectural quality'. In October 2007, the Big Lottery grant was awarded. Construction began in June last year and the building was completed this July. Much of the refurbished library's success is due to how it works with the neighbourhood. The street pattern in the immediate vicinity is weak. The building is located on a section of Brigstock Road that is largely lined with low-rise residential properties, many of which, like the library, are set back from the pavement, with some behind planted lawns. FAT's solution comes courtesy of CABE: imagine the library as the 'living room of the city'. The entrance pavilion, with its stepped foundation, café and pushed-forward footprint, is a clear embodiment of this idea. It looks especially good when a double-decker bus pulls up alongside it, something FAT clearly thought about (its design and access statement includes a render of this very scene). But there is considerably more to this project than the pavilion's imaginative urbanism. The library is now fully accessible and a number of fine original architectural features, including timber mouldings around the octagon at the plan's centre, have been rescued from burial under previous alterations. All furniture is designed by FAT and a pair of additional two-storey wings increase floor space and improve circulation. A stair tower and lift in the north-east corner of the plan provide public access to a back garden. New doors, fitted in extended window openings, lead out to a terrace adjoining the refurbished children's library. To the front of the lower-ground floor, uninhabitable storage space has been remodelled to create meeting and activity rooms, and staff accommodation with an IT area above occupies the south-east extension. These towers have a utilitarian aesthetic. They are clad in cement fibre panels - a surprise given the luxurious frontage of polished white concrete and its mix of dolomite fines. Nevertheless, the right choices have been made about where to spend money. Outside, the access ramp, like all access ramps, is the one sure point. FAT was right to spend money here, making it both sculptural and integral, but the polished concrete deck and toughened glass balustrade has a commercial aesthetic that feels misplaced. This is one architectural element that is crying out for a fresh perspective. And yet, standing beneath the octagon and looking south-west into the pavilion café, you sense that one room is part

sphere, the other a cube, and you realise how well FAT has emphasised the spatial qualities inherent to the building's upper-ground floor. The original building would not have felt this big before. Thornton Heath Library could be FAT's most successful building in terms of interior space. I wonder, what would Pevsner have to say? Regardless, a new edition of his Surrey guide beckons. (<http://www.architectsjournal.co.uk>)

## **Feilden Clegg Bradley Studios LLP, Bath, London – UK**

<http://www.fcbstudios.com>

### **Libraries:**

#### **The Hive, Worcester – UK 2012**

£ 50,000,000

Feilden Clegg Bradley are appointed by Galliford Try to develop a bid proposal to RIBA stage D for this new facility for the University of Worcestershire and Worcester County Council. On a riverside site in Worcester city centre, this will be a highly sustainable 11,000m<sup>2</sup> building with a unique three dimensional form. It provides an integrated academic and public library, the first purpose designed joint-use facility in the UK, which will serve both the University of Worcester and the general public. It also includes a county archive and local history centre and a local authority 'Hub' providing frontline services for local residents. The development also provides retail space and high quality public realm connecting key levels in the city centre. The gold shingled form draws inspiration from both the historic kilns of the Royal Worcester works and the undulating ridgeline of the Malvern Hills. The structure incorporates solid laminated timber roof cones, the forms of which have been generated to optimise day lighting and natural ventilation throughout the building. Water from the nearby River Severn is used to provide cooling. (Feilden)

Worcestershire County Council and the University of Worcester worked together to create a new multi-million pound city centre library, history and customer centre for students and the public. The two organisations, along with the support of Worcester City Council and Advantage West Midlands, realised the opportunity of creating a combined facility for the whole community to use, and the project has developed into one of the most exciting new libraries in Europe.

In October 2004 the County Council and the University met to discuss the merits of a joint library. This model is unique and has never been undertaken before in this Country. This meeting marked the start of a new thriving Partnership between the University and the County Council.

Galliford Try were announced in 2009 as the preferred contractor to design, build, finance and operate the building, following approval by the University Board of Governors and the County Council Cabinet.

Bath-based architects Feilden Clegg Bradley Studios designed The Hive. The innovative design won the international Bentley Be Inspired Innovation in Generative Design and was shortlisted for Best Designed Project and for Best Local Government Project Team in the Public-Private Finance awards.

Building work began on a derelict site in the city centre in 2010 and the doors opened to the public for the first time on 2 July 2012. The Hive was officially opened on 11 July 2012 by Her Majesty the Queen.

In 2004, the public library service had identified that the original Worcester City library building was no longer fit for purpose and needed to modernise to raise the level of service required by library users of the future. At the same time, the University was exploring the development of a new City Campus and was actively seeking to improve its learning resources. The Council and the University therefore came together and forged a partnership that led to the creation of The Hive.

By bringing services and facilities together under one roof and with the investment and support of the government, The Hive aims to encourage even more people to join the public library and explore what it has to offer, which is so much more than just a library. We hope that what we will do is help people see the connection between the university and the city. It is now possible to walk on a pedestrian route from the cathedral through the city centre and into the library, then on to the city campus.

Anne Hannaford

University of Worcester Director of Information and Learning Services

The Hive is an extension of the city and will provide a tangible link to the university – the city centre is on one side of The Hive and the university's new city centre campus is on the other. Bringing the two together will cement the already strong working relationship between Council and University.

The name 'The Hive' was chosen to represent the purposeful activity, and sense of community which the development will help to create. It is also a reflection of the building's appearance, with its bold, distinctive golden 'honeycomb' cladding, which will mark it out as a physical as well as a cultural landmark for Worcester. (<http://www.thehiveworcester.org>)

#### **Clore Learning Centre, Hampton Court Palace, Borough of Richmond upon Thames, London - UK 2006**

The Clore Learning Centre is a new resource for Hampton Court Palace, comprising a single storey reception building and the refurbishment of the 17<sup>th</sup> century Barrack Block to provide education facilities for visitors to the Palace. This is the most significant building to be built at Hampton Court for more than 150 years and presented a rare opportunity to integrate a new building within such a significant historic landscape. Hampton Court Palace is a Scheduled Ancient Monument and development of this scheme required continuous and careful dialogue with English Heritage. The project demanded a thorough understanding of the historic site with a particularly sensitive approach to the design of this major new building which was funded by the Clore Duffield Foundation. The new single-storey steel-framed building provides teaching and exhibition facilities to help visitor groups interpret the history of Hampton Court Palace. As a key centre for learning, Hampton Court attracts over 50,000 school and adult learner visitors a year, and the aim is to double this to 100,000. The Learning Centre is oriented to create a new external courtyard and includes multi-functional teaching and exhibition spaces configured under a pitched tile roof. Two tall roof ventilation stacks provide contemporary references to the many famous chimneys that adorn Hampton Court Palace itself. Use of traditional handmade bricks and roof tiles further place the building within its context. The significance of the Barrack Block is respected through the setting of the Reception Building and a more dynamic entrance to the Palace is created between the new and existing built forms and landscape elements. A new planting scheme takes inspiration from the site's former use as a kitchen garden and the new building serves as a backdrop

for a number of commissioned artistic installations. The sustainable design achieves low energy consumption through the combined use of high insulation, natural ventilation and daylighting, assisted by harnessing the structure itself to create a zero U-Value wall. (Feilden)

### **Oxstalls Campus, University of Gloucestershire, Gloucester – UK 2002**

#### **Awards:**

**RIBA Award 2003**

**Civic Trust Award – National Award for Sustainability 2003**

We began work with the University of Gloucestershire in 1998 with a commission to produce a masterplan for a new campus on a 15 acre brownfield site on the edge of the city centre. Its educational hub comprises a Learning Centre and Sports Science Faculty and student housing for 175 is provided by a series of four storey linked villas. The Learning Centre provides space for 300 computer workstations, a series of flexible teaching spaces and a lecture theatre for 200 people. The Sports Science Building contains laboratories and teaching spaces and a large sports hall for teaching, training and competitive events. Issues of sustainability were prioritised in the design of the new buildings. The 'waveform' roof of the Sports Science Building admits north light to reduce artificial lighting loads and its south-facing roof slopes are clad with photovoltaic cells. The energy-efficient systems were part-funded by the EUBART programme and the DTI's research-focussed ETSU programme. The scheme also utilises a ground source heat pump, termodeck ventilation and high levels of daylighting, unusual in most sports facilities. The next phase was student accommodation, arranged as flats over four storeys, providing 175 student rooms in a series of 'villas'. In 2005 we were appointed to design a new teaching centre alongside the learning centre, providing additional space for teaching and offices and large, open-plan spaces for informal group learning. The third phase of expansion was also begun in 2005; this was an extension of the Sports Science Building to provide a dedicated space suitable for national level badminton, along with a fitness suite arranged over two linked storeys. A ground source heat pump provides for space heating within this part of the campus. In 2003 the scheme won an RIBA Award and the Civic Trust's Sustainability Award in recognition of its strong environmental agenda. "Higher Education buildings are tight budgets as we all know. Here 'the money' has been expertly designed with, giving the right emphasis in the right place." (Feilden)

### **Foster + Partners, London – United Kingdom**

**<http://www.fosterandpartners.com>**

#### **Libraries:**

### **Imperial College, Sir Alexander Flemming Building, London - UK 1994 – 1998**

Client: Imperial College and South Kensington Millennium, Consultants: Waterman Partnership, Davis Langdon & Everest, Claude Engle, Per Arnoldi, Research Facilities Design, Sandy Brown and Associates

The forum widens as it rises, forming open-plan terraces for research students on the second and fourth floors, where the perimeter is lined with study carrels. Sculpted rooflights introduce a combination of north light for optimum working conditions and controlled sunlight to bring sparkle into the building. Fully glazed at its northern end - the site's only open aspect - the forum looks onto the Queen's Lawn and Queen's Tower, the last fragment of the 1890s campus.

Modular laboratories are designed to be used by any microbiologist and are flexible enough to allow changes in use or to adapt to new techniques. Alongside these are specialist facilities, which need to be close to the building's service risers. These risers are configured at the edges of the site, leaving the central space free and flexible. This is essential to allow for the rapid pace of change in the research world. Even as the building was being constructed, the requirements of its users were changing and the design was able to adapt to their evolving needs.

The practice has also completed the Flowers Building, which provides bioscience laboratories for interdisciplinary research at postgraduate level. (Foster)

### **Faculty of Law, University of Cambridge, Cambridge - UK 1990 – 1995**

Client: University of Cambridge, Consultants: Anthony Hunt Associates, Davis Langdon and Everest, YRM Engineers, Cambridge Landscape Architects, Arup, Emmer Pfenninger Partner AG, Halcrow Fox, Sandy Brown Associates, University of Cambridge Estates Management and Building

Cambridge University has the largest law school in Britain, with 800 undergraduates and 200 postgraduate students. The Law Faculty is a place with traditions, but it is also forward-looking. The Faculty building provides state-of-the-art facilities for teaching and research, comprising the Squire Law Library, five auditoria, seminar rooms, common rooms and administrative offices. The building sits at the heart of the Sidgwick site, the focus of humanities education at Cambridge, close to the Institute of Criminology and University Library. Its neighbours include James Stirling's History Faculty and it is surrounded by lawns and mature trees. This low, green garden context is the essence of Cambridge. The challenge, therefore, was to preserve the natural setting and to minimise the building's apparent size. The rectangular plan is cut on the diagonal in response to the geometry of the History Faculty and pedestrian routes across the site. It has a relatively small footprint, yet provides 8,500 square metres of accommodation without exceeding four storeys. This was achieved by burying the auditoria below ground, while the curving glass of the north facade helps the building to recede visually.

A full-height atrium forms the focus of the building. It links the different levels visually, creating a feeling of spaciousness, and draws daylight into the lower floors. Natural lighting is used to dramatic effect, especially in the Library, which occupies the upper three terraced floors and enjoys uninterrupted views of the gardens. The curving north facade is entirely glazed; the south, west and east facades are part glazed and incorporate devices to exclude solar gain and glare.

The building is highly energy-efficient. Its partially buried structure and exposed concrete frame combine to give it high thermal mass, making it slow to respond to outside temperature changes. Together with high insulation values, this allows the use of mechanically assisted natural ventilation throughout - only the lecture theatres require seasonal cooling. A lighting management system reduces energy consumption, while heat recovery coils, linked to the air extract, reclaim waste heat.

Interestingly, the building's environmental performance was put to the test during its first summer, one of the hottest on record. Happily, it performed extremely well. (Foster)

### **Cranfield University Library, Cranfield - UK 1989 – 1992**

Client: University of Cranfield, Consultants: Arup, Davis Langdon & Everest, Roger Preston and Partners, George Sexton Associates

Cranfield University was founded in 1946 as a school for aeronautical engineers. Today it is one of Britain's leading technical education and research establishments, incorporating a wide range of postgraduate studies, and is a major foreign currency earner for research contracts.

The new Library provides a much-needed focus for the campus. Built on a square plan, it consists of four barrel-vaulted, steel-framed bays, one of which forms a broad central atrium - the hub of the Library - linking all three floors. The overhanging roof provides sheltered walkways along the sides of the building, while at the front it extends to create a vaulted entrance canopy. The building reformulates the concept of the library in the information age: it is the reverse of the closed book stacks and forbidding screens and security barriers of traditional libraries. Seven kilometres of open bookshelves are located on the upper levels, freeing the ground-floor entrance area for social uses, focused around a coffee bar.

Library systems are designed to adapt easily to information technology advances, and a perimeter desking system allows students to plug in their own computers or laptops and have instant access to the University's computer networks and electronic databases. Maximum use is made of glare-free natural light and views. Rooflights at the apex of each vault bring natural light to the atrium and upper floors. Daylight is evenly distributed across the ceiling by gull-wing deflectors and can be supplemented by indirect lighting from continuous fluorescent bulbs. External shading to the glass facades minimises heat gain during the summer months and allows comfortable conditions to be maintained through a ventilation-only system. The complete range of building services is controlled through a comprehensive building and energy management system. Using a restrained palette of high-quality materials, the Library was built within costs no greater than those of a traditional brick building. Commentators have noted its evocation of a classical temple complete with peristyle and portico, which is perhaps appropriate given the symbolic role it plays at the heart of the campus. (Foster)

### [New York Public Library, New York, NY – USA Renovation – 2018](#)

250 Mill S

News: UK firm Foster + Partners has unveiled plans to overhaul New York Public Library's flagship branch on Fifth Avenue by inserting a contemporary lending library into unused reading rooms and stacks at the back of the building. At present only a third of the the Stephen A Schwarzman Building is accessible to the public, but Foster + Partners plans to insert a new corridor that will connect the main entrance with a new four-level atrium at the rear, where visitors can browse collections whilst enjoying a view of Bryant Park through the existing tall windows.

"We are reasserting the Library's main axis and its very special sequence of spaces, from the main Fifth Avenue entrance and the Astor Hall, through the Gottesman Hall, into the dramatic volume of the new circulating library, with views through to the park," said Norman Foster.

Located beneath the Rose Reading Room, the new section will replace seven relocated floors of closed stacks, while a 300-person workspace for students and researchers will take the place of several offices and storage areas.

Floorplates will be pulled back from the exterior wall to create a series of tiered balconies and visitors will enter the space via a grand staircase that descends from above.

Proposed materials include bronze, wood and stone, which the architects claims will age gracefully and fit in with the existing beaux-arts building designed by Carrère and Hastings in the early twentieth century.

The New York Public Library launched its £185 million renovation strategy earlier this year, but faced criticism as scholars and writers claimed the plans would comprise the library's existing facilities.

Foster commented: "Our design does not seek to alter the character of the building, which will remain unmistakably a library in its feel, in its details, materials, and lighting. It will remain a wonderful place to study. The parts that are currently inaccessible will be opened up, inviting the whole of the community - it is a strategy that reflects the principles of a free institution upon which the library was first founded."

Construction is scheduled to commence in the summer and is expected to complete in 2018.

Foster + Partners has been working on a number of projects in New York in recent months, including a vision for the future of Grand Central Terminal and a competition-winning design for a Park Avenue skyscraper.

The New York Public Library today unveiled proposals for the integration of the Circulating Library into its flagship Stephen A. Schwarzman Building on 42nd Street – Lord Foster presented the plans at the launch of the public exhibition.

The project aims to safeguard the building's legacy and precious books for future generations. The existing research library will be retained as it is today, with more space for researchers, as will many of the public spaces – the project will open twice as much of the building to the public and will restore the logic of the Neo-Classical design to improve the experience of the library's historic halls. The two circulating collections will be housed in a spectacular new space previously occupied by book stacks.

The centrepiece of the 5th Avenue and 42nd Street building is the magnificent Rose Reading Room, below which are seven storeys of book stacks. However, these stacks are inaccessible to the public and no longer meet the needs of the books they contain, in terms of capacity, fire safety or preservation. The books will be moved to a large humidity-controlled chamber under Bryant Park, which was created in 1989 as part of the Bryant Park project, and provides the ideal environment for their conservation. Thus the stack space is freed to create a new 'library within a library' comprised of the Mid-Manhattan collections and the Science, Industry and Business Library – reinstating a circulating library to the NYPL main building, as had originally existed until the 1980s.

The 13,000 structural points of the existing stacks will be replaced with an innovative new vaulted stone and steel cradle. This move will free the floors from the west façade, allowing them to be peeled back to form a series of balconies – in the process revealing the full height of the slender windows internally for the first time. New study areas will line the perimeter of the balconies and new reading platforms will sit beneath the vaulted ceilings, which are carefully attuned to ensure excellent acoustic performance. The materials palette and design of the interiors will evolve with further development. The current combination shows bronze, wood and stone, which will age gracefully with the passage of time and use. A new internal atrium runs the full length of the base of the circulation library, connecting the visitor facilities to the building's accessible entrance on 42nd Street.

Just 30 percent of the library is currently accessible to the public – the project will more than double this, opening 66 percent of the building by utilising unused reading rooms, back of house spaces, offices and book stacks. The design aims to make the building more inviting, more permeable and to bring the books to the fore rather than hide them away. Starting with the circulation strategy, the central axis through the Neo-Classical building will be reasserted. Visitors will be able to walk in a straight line through the grand Fifth Avenue portico and the majestic Astor Hall into Gottesman Hall, where a permanent treasures gallery will display some of the most important pieces from the collection. For the first time, the westerly doors of the Gottesman Hall will be opened up, restoring a sense of symmetry and intuitive circulation across the building. Visitors will enter the new circulation library on a balcony in the centre of the former book stack space, where they will face elevated views of Bryant Park. From here, a grand staircase will sweep down to the main level, aligned with the park, and further to the state-of-the-art education and business library below. Dezeen 19.12.12 (<http://www.dezeen.com>)

## [John Spoor Broome Library, California State University Channel Islands, Camarillo, CA - USA 2008](#)

Client: California State University, Consultants: Arup , Davis Langdon & Everest , Arup , Calvin R Abe Associates Inc, Claude R Engle, Boyle Engineering

The focus of the reinvented Camarillo State Hospital into the 23rd California State University campus, the new library serves as the intellectual and architectural centerpiece, establishing the character and quality of future projects. The brief called for a building that “would become a dynamic crossroads for students, faculty and community members who seek to research, study and explore the vastness of knowledge that a library provides. It stands as a source of university and community pride.” The campus masterplan acknowledged the balance between preserving the existing historical buildings while providing the functional needs of a contemporary academic library.

Noted for its collection of Spanish Colonial structures built between the 1930s and 1950s, the former hospital consists of two and three storey structures, organised around a series of eight outdoor courtyards. The selective removal of the central hospital wings has fused four of the courtyards into a single site for the new library, which abuts an existing 1950s Spanish style building. The transparency of the building showcases the book stacks, while deeper inside, the former exterior wall of the old structure becomes visible as a backdrop for the new library stacks. Reading rooms, classrooms, and offices are located beyond within the renovated existing building.

Characterised by a sense of light and transparency, there is a dynamic play of natural light throughout the two-storey library. The prominent roof canopy responds to both functional as well as symbolic requirements. It is the primary element in linking the library to the rest of the campus and provides a unifying architectural statement. Engineered as a lightweight trussed steel structure supported on circular hollow steel columns it is critical as an environmental device to provide effective sun control to the surrounding accommodation and the louvered canopy casts shadows across the entry plaza that change throughout the day. Glazed roof panels and elevated windows flood the interior with natural light and a central double-height space provides a dramatic social focus. (Foster)

## [Free University, Berlin - Germany 1997 – 2005](#)

Client: Senatsverwaltung für Stadtentwicklung, User - Freie Universität Berlin, Consultants: Pichler Ingenieure, Höhler und Partner, Schmidt Reuter Partners / PIN Ingenieure, Büro Langkau Arnsberg, Büro Moll, Büro Noack, Kappes Scholz, Büro Peters, Hosser Hass und Partner, IFFT Karlotto Schott

### **Literature:**

**Rostende Ikone, Spiegel 12/1977, 14.03.1977 (<http://www.spiegel.de/spiegel/print/d-40941892.html>)**

Since the end of World War II the Free University has occupied a central role in the intellectual life of Berlin. As one of the city's most symbolically important institutions, its foundation marked the rebirth of liberal education there after the war. Today, with more than 39,000 students, it is the largest of Berlin's three universities. This redevelopment scheme includes the restoration of its Modernist buildings and the design of a new library on the campus.

The University's matlike campus was designed by Candilis Josic Woods Schiedhelm, and when the first phase was completed in 1973 it was hailed as a milestone in university design. The facade was designed in collaboration with Jean Prouvé, following Le Corbusier's Modulor proportional system. It was fabricated from Corten steel, which when used in appropriate thicknesses, has self-protecting corrosive characteristics. The rusty appearance of these buildings led to the affectionate nickname of die Rostlaube - the rustbucket. However, in the slender sections used by Prouvé the steel was prone to decay, which by the late 1990s had become extensive. As part of a comprehensive process of renewal the old cladding has been replaced with a new system detailed in bronze, which as it patinates with age emulates the details and colour tones of the original.

The new library for the Faculty of Philology occupies a site created by uniting six of the University's courtyards. Its four floors are contained within a naturally ventilated, bubble-like enclosure, which is clad in aluminium and glazed panels and supported on steel frames with a radial geometry. An inner membrane of translucent glass fibre filters the daylight and creates an atmosphere of concentration, while scattered transparent openings allow momentary views of the sky and glimpses of sunlight. The bookstacks are located at the centre of each floor, with reading desks arranged around the perimeter. The serpentine profile of the floors creates an edge pattern in which each floor swells or recedes with respect to the one above or below it, generating a sequence of generous, light-filled spaces in which to work. Amusingly, the library's cranial form has already earned it a nickname of its own The Berlin Brain. (Foster)

## [Médiathèque Nîmes – Carré d'Art, Nîmes – France 1993](#)

Client: Ville de Nîmes, Consultants: Ove Arup and Partners / OTH Méditerranée, Thorne Wheatley Associates, OTH Mechanical, Claude R Engle, Daniel Commins, Jolyon Drury Consultancy

Mediathèques exist in most French towns and cities. Typically they embrace magazines, newspapers and books as well as music, video and cinema. Less common is the inclusion of a gallery for painting and sculpture. In Nîmes, the interaction within the same building of these two cultures - the visual arts and the world of information technology held the promise of a richer totality. The urban context of Nîmes also acted as a powerful influence. The site faces the Maison Carré, a perfectly preserved Roman temple. The challenge was to relate new to the old, but at the same time to create a building that represented its own age with integrity.

A singular modern building, yet one that references the courtyard and terraced vernacular of the region, the Carré d'Art is articulated as a nine-storey structure, half of which is sunk deep into the ground, keeping the buildings profile low in sympathy to the scale of the surrounding buildings. The lower levels house archive storage and a cinema, while above a roofed courtyard forms the heart of the building, exploiting the transparency and lightness of modern materials to allow natural light to permeate all floors. These upper levels are connected by a cascading staircase, linking the top lit galleries to the shaded roof-terrace café overlooking a new public square.

The creation of this urban space was an integral part of the project. Railings, advertising boards and parking spaces were removed and the square in front of the building was extended as a pedestrianised realm. The geometry of this piazza follows Nîmes Roman grid in recreating tree-lined streets alongside the building and providing a new setting for the Maison Carré. Lined with café tables and thronged with people, the new square has reinvigorated the social and cultural life of Nîmes. Together with these urban interventions, the Carré d'Art shows how a building project, backed by an enlightened political initiative, can not only encourage a dialogue between ancient and modern architectures but can also provide a powerful catalyst for reinvigorating the social and physical fabric of a city. (Foster)

## **Gareth Hoskins Architects, Glasgow – UK**

<http://www.garethhoskinsarchitects.co.uk>

### **Libraries:**

#### **The Bridge Arts Centre, Easterhouse, Glasgow – UK**

Client: Glasgow City Council. Value: £ 10m.

### **Awards:**

2007 RIBA National Awards Winner

2007 RIBA Regional Awards Winner

2007 BCI Regeneration Awards Winner

In 2007 Gareth Hoskins Architects won an open competition to design a new arts venue in Easterhouse for Glasgow City Council. The Bridge Arts Centre nestles between the existing community swimming pool and the John Wheatly College, to form Easterhouse Cultural Campus, and provides a naturally ventilated auditorium space, rehearsal workshops, recording suites, education and gallery spaces, café and community library. Funded by a range of sources including local government, Scottish Arts Council Lottery Fund and European Regional Development Fund, the project challenges the notion of a traditional “arts” building. It aims to create a new focus for people within one of Glasgow’s peripheral housing estates, to engage with and take part in the arts, and also endeavours to stimulate regeneration of the surrounding area. The building form, dictated by the site, is that of a simple rectangular timber box, housing the auditorium, adjacent to a double height triangular volume containing the library and learning spaces. (Gareth)

#### **Library St. Aubyn, Plymouth – UK 2011**

The city council is hoping to double the number of books available for readers in Devonport under plans for a new library in St Aubyn’s Church. They promise that the new-look library, which will replace the current one housed in the Guildhall basement, will boost interest in reading. Devonport Regeneration Community Partnership and Plymouth City Council have come up with an imaginative solution that will give the community a new library as well as help protect the grade II listed Georgian church. Cabinet member for leisure, Cllr Glenn Jordan, said: "It is early days, but we are looking at between 15,000 to 18,000 books for this new library – more than double the amount of books we currently have for Devonport. "We will also have DVDs and CDs on offer. We recognise that people use the Internet as a key source of information, which is why we plan to have 14 computers. We think this gives us the best of both worlds – preserving an old building by giving it a new lease of life." As part of a wider study of some of Devonport's key heritage buildings, the council and the DRCP commissioned a feasibility study for the long-term use of the church, which has experienced falling congregation numbers, but is a listed building and a fine and rare example of its type. The study revealed that given the church's wishes to keep a space for worship alongside any alternative uses, a potential dual use could be a library. Devonport Regeneration Community Partnership has signalled its intentions by allocating £1.125 million to the project. Plymouth architects Gilmore Hankey Kirke have begun consulting on proposals which include creating spaces for meetings and exhibitions within the church. The Rev David Nixon, parish priest of St Aubyn, said: "The church should be part of the regeneration of the community around it, and I hope it will signal the beginning of more engagement with the community and rebirth of the church." Building work could start early next year, and preparation would include applying for listed building consent as well as finalising designs. (<http://www.thisisplymouth.co.uk>)

## **Zaha Hadid Architects, London – UK**

<http://www.zaha-hadid.com>

### **Libraries:**

#### **Middle East Centre, St. Antony’s College, Oxford – UK 2006 – 2014**

Client: St. Antony’s College, University of Oxford, 1,200 m<sup>2</sup>. New library, research centre, archive

The Middle East Centre at St. Antony’s College, University, Oxford serves as a centre for the entire University. At its core is a specialized library and extensive archive. We were commissioned to design a scheme to expand the centre by using a garden plot that links existing premises – complying with the college’s clearly defined vision for future growth and adding formal coherence to the existing quad.

Our intention was to create a less restrictive research environment and improve links between the centre’s academic and social functions. The strong physical constraints imposed by the scale and position of the site demanded a bold and distinctive solution.

In response, we conceived the new connecting building as a series of plateaus and territories, in which different academic, research and social functions are ‘signposted’ by the character of the interior space. Form is driven by a series of tensions points spread on a synthetic landscape that blends built and natural elements. The new structure deforms and to this environment, revealing paths and flows. The new ‘bridge’ connects existing elements at different levels – its suspension allowing more public aspects to infiltrate the building.

Bridge form and public spaces are linked by a central staircase, connecting to the centre’s main academic components – with contrasts in scale and depth highlighted by the convex or concave form of the reading spaces. Elevating the bridge allows for a more diverse and complex articulation between interior and exterior.

The sweeping form of the bridge is mirrored in the forecourt area where a curved frameless glass façade reveals the public plateau, frames the main access point and cuts across a sunken area, suitable for private reflection. (Hadid)

#### **General Library and Resource Center University of Seville – Spain in design**

Groundbreaking 2009, Height 25.0 meter / 82 feet, Value 22.0 million euros

The General Library and the Investigative Resources Centre of the University of Seville is conceived as a continuous volume which emerges from the extension of the park. The project expands itself longitudinally to the given site, and progressively rises from a soft material into a stretched sculptural object. Located on the edge of ‘el Prado de San Sebastián’ park, the 160m long floating library is lifted off the ground on top of three structures which extends to a very shallow plinth; allowing the introduction of landscape at the entrance level, and producing terraces that in turn define the public spaces. This strategy of having a transitory area that attracts and invites the users is mainly to promote cultural, educational and entertaining

activities for the students of the University. Therefore, the Library performs as an attractor, not only for the users of the park, but also for the 3,300 researchers; becoming a new Centre for the University and the City of Seville. Has been paralyzed due to bureaucratic problems after several months of construction.

#### **Heydar Aliyev Centre, Baku – Azerbaijan 2012**

101.801 m<sup>2</sup>, Building 52.417 m<sup>2</sup>, Site 111.292 m<sup>2</sup>

Emerging from the surrounding landscape, this most fluid of structures provides a major new venue, landmark and source of regeneration for the city of Baku – admitting visitors to a library, museum and conference centre through folds in its continuous outer skin, the interior spaces flooded with natural light via a glass façade. (Hadid)

#### **Wirtschaftsuniversität – Library and Learning Center, Wien – Austria 2012**

Currently under construction, Zaha Hadid's dramatic design for a new Library and Learning Centre rises as a polygonal block from the centre of a new campus (masterplan by BUSarchitecture) at the University of Economic & Business, Vienna. Employing both inclined and straight edges, the structure takes the form of a cube whose sweeping lines separate as they move inwards. These edges become curvilinear and fluid to create a free-formed internal public plaza at the centre of the complex. Additional facilities are contained within a single volume which divides and then intertwines to enclose this glazed gathering space. At 28,000 sq m the new centre is generous in size and will comprise of a 'Learning Centre' with workplaces, lounges and cloakrooms, library, a language laboratory, training classrooms, administration offices, study services and central supporting services, copy shop, book shop, data center, cafeteria, event area, clubroom and auditorium. Initiated through a two-phase competition in 2008 the project is slated for completion in 2012. Zaha Hadid commented: "I am delighted to be working in Vienna as I have a close affiliation with the city. As a centre of research, the Library and Learning Centre is forum for the exchange of ideas. It is very exciting for us to be part of the University's expansion." (<http://www.wordlarchitecturenews.com>)

### **Hampshire County Council Architects, Winchester, Hampshire – UK**

<http://www3.hants.gov.uk> search: selected projects

#### **Libraries:**

#### **Basingstoke Discovery Center – UK 2010**

Client: Hampshire County Council, Basingstoke & Deane Borough Council and Citizens Advice Bureau, Value: £ 805,000  
Completed: November 2010, Specialist teams: Accessibility Design, Basingstoke

Basingstoke library is one of Hampshire's busiest libraries and is situated on the first floor of the Festival Place shopping complex in the centre of Basingstoke. In 2010 the main library was transformed into Hampshire's third Discovery Centre. The completed project has been well received and supported by the local community. The vibrancy of the design with its new colour schemes and attractive, functional signage has improved surface contrast and way-finding for visitors. Accessibility has been improved by remodelling the ground floor entrance and creating a new staircase route to first floor. The lift car has been replaced and can now accommodate larger wheelchairs and be used for evacuating disabled persons in the event of a fire. Key items of fixed furniture and IT equipment have been replaced e.g.: the help desk and self service check in/out system, making these wheelchair accessible. Induction loop systems have been installed to the reception desk and meeting rooms and a new accessible toilet has been installed where there was previously none. Most exciting has been the inclusion of including Hampshire's first Changing Place, a specialised facility for people with profound and multiple learning and physical difficulties. As a consequence, users can now prolong their visitor experience to both the Discovery Centre and Festival Place as they no longer have to cut short their trip to town if they are inconvenienced. These access improvements have enabled a number of services to be delivered, including sensory clinics for people with sight or hearing impairment, tailored learning programmes for adults with learning difficulties and a base for adult services to run support groups from. (Hampshire)

#### **Winchester Discovery Center, Winchester – UK 2007**

Client: Hampshire County Council, Value: £7.25 million, Completed: November 2007, Specialist teams: Architects and QS: HCC Property Services, Structural & Civil Engineer: Gifford, Mechanical & Electrical Engineers: White Young Green  
Lighting Designer: DPA Lighting, Textile Artist: Alice Kettle, Graphic Artist: Peagreen, Contractor: Mansell Construction Services Ltd.

#### **Awards:**

**RIBA Award**

Winchester Discovery Centre is the flagship project for Hampshire County Council's library rejuvenation scheme. The project restored and extended a Grade II\* Corn Exchange to provide a library, gallery, performance hall and café. The design needed to widen the appeal of a library, encouraging members of the community who would not normally visit and enabling a range of cultural activities and performances to suit all tastes. This forward-looking vision needed to be accommodated without diminishing the listed building's heritage. The original layout was incorporated into the new design but with contemporary elements. For example, a new mezzanine floor follows the line of the original circular courtyard centrepiece. The new performance hall and art gallery are to the rear of the development, so they do not dominate the listed building. A new stone and glass wing containing library space and a café forms one side of the building. The rear wall of the new wing, covered by a vast embroidery by Alice Kettle, is top lit to help increase the transparency of the front façade. The Discovery Centre is now used by a much more diverse cross-section of the local population as it plays host to exhibitions, dance classes, comedy nights, conferences as well as the traditional uses of a library. The café offers a relaxed and informal atmosphere for the building users and the new glass fronted extension gives an open and inviting view of the Discovery Centre to passers by – it has become a new public place for Winchester. (Hampshire)

#### **Alton Discovery Centre, Alton – UK 2004**

Client: Hampshire County Council, Value: £1.3 million, Completed: September 2004, Specialist teams: Architect and Interior Design: HCC Property Services, QS: Grant Associates, Structural: RJ Watkinson Associates, M&E: HCC Property Services  
Acoustician: Arup Acoustics, Contractor: Richardsons (Nyewood)Ltd.

#### **Awards:**

**RIBA Awards 2005**

The new Discovery Centre in Alton serves a population of more than 40,000 people. The previous library was run from a redundant civil defence building on a large site in the town centre. The site was divided, with half earmarked for housing, and the remaining half for the new library. This was a strategy that enabled the proceeds of the land sale to part finance the new library, which was to become a Discovery Centre with a wide range of cultural facilities. Given the limited size of the site, a steel frame was considered the

most favourable method of construction. Handmade bricks, plain tiles, Western Red Cedar and aluminium curtain walling completed the fabric of the building. Light and ventilation have been maximised throughout, but glare and solar gain on the south façade are controlled with a series of retractable awnings and fixed timber louvres. The building and interior were consciously designed to provide a clear and logical layout to the circulation routes. Even though the building was on three floors, all areas are accessible by either a lift or one of two stair cases. The main entrance is approached from an open paved public area, and leads into the main lending and reference library. This in turn is complimented by a small café, exhibition and gallery space. (Hampshire)

<http://www.nicholashare.co.uk>

**Libraries:**

**Blackburn Central High School – UK 2012**

**Blackburn with Darwen and Bolton BSF**

The Blackburn Central High School with Crosshill is a newly-created entity involving the amalgamation of three existing schools: Blakewater College, Beardwood School and Crosshill Special Needs School. The combined student population of the new school is 960, including 60 special needs places.

Nicholas Hare Architects designed the building which sits in a prominent location on a steep incline above the town and takes advantage of the magnificent views towards the hills beyond. The school is arranged around a multi-purpose central 'heart' space combining dining, assembly, library and social areas, while the teaching spaces run in a 'ribbon', wrapping around the building and creating identifiable and discrete homebase areas where the students spend 80% of their time. It is intended that the School will become an important facility for the various local communities, which have very significant levels of social deprivation. The selection of a new, greenfield site with no relationship with any existing school provides an equal opportunity for all local people to embrace this new community building. "Nicholas Hare Architects have designed an excellent building in which to educate young people. The imaginative use of natural light and a simple but striking colour palate help to create an open and positive working environment in which staff and students can thrive" Alan Chambers, Head - Blackburn Central High School. (Hare)

### **Joseph Chamberlain Sixth Form College, Birmingham – UK 2008**

Joseph Chamberlain Sixth Form College in Birmingham has won this year's Prime Minister's Better Public Building Award. (2009) The Prime Minister, the Rt Hon Gordon Brown MP, congratulating all those involved, said: 'This award is all about how creative design and high-quality construction lead to better public services. Joseph Chamberlain College is an excellent example of this. Students, teachers and all those working and living around the college can take great pride in this first-class building. I am sure it will inspire all who use it and make a real difference to the community.' The beautiful, protected and calm environment created by Nicholas Hare Architects belies its tough inner-city surroundings. The college opened in September 2008 and now has 1,600 students. It has inspired more young people, coming from a range of backgrounds, to study post-16. The college is heavily over-subscribed and the number of girls opting to study has increased. AS level results for the first-year intake have seen an improvement over previous years. The college also offers the local community a library, adult learning and sports facilities, and has already triggered improvements to what was a very inhospitable area. The college exterior is imposing, with a continuous curved façade towards a busy roundabout, and welcoming, with a tree-lined entrance leading from the road. A sequence of inner spaces, including a leafy courtyard and semi-circular garden, leaves traffic and noise behind. Natural light predominates, with glazed walls to the courtyards, double-height spaces and atrium light wells. Elly Tobin, the college's principal, said: 'Never in their wildest dreams would these young people have expected such a wonderful building. It makes them feel proud and good about themselves. It gives them a sense of their place in the community and a sense of responsibility. They have been given something special and they want to do well and give something back.' Richard Simmons, CABE chief executive, added: 'Some say that, with tightened budgets, good design is a luxury we can't afford. Exactly the opposite is true. In straitened economic times, investing in high quality is the best use of public money. That's the lesson we should take from Joseph Chamberlain College.' The Prime Minister's Award recognises effective delivery and value for money as well as high-quality design. The success of Joseph Chamberlain College is due to the highly collaborative approach adopted by the college, the designers and the supply team led by BAM Construction. Together they have achieved a flexible and sustainable building, with energy use minimised by passive means. The award is part of the British Construction Industry Awards. It is sponsored jointly by CABE, the Office of Government Commerce and the Department for Business, Innovation and Skills. (<http://www.betterpublicbuilding.org.uk>)

### **Chafford Hundred Learning Campus, Thurrock - UK 2002**

**Thurrock Council**

The pioneering brief for the campus included playgroup and nursery facilities as well as a primary and secondary school and a branch library. The school dining space opens at 8:30am and is designed as an internet cafe, and facilities that can be shared by the community are open during school hours. The campus layout was carefully developed to balance the needs of adult learners with pupil security. In 2003 the campus received the Civic Trust Centre Vision Award for the project which contributed most to the revitalization of a community.

Since then the Campus has been extended twice to increase the capacity of both the secondary and primary schools. Both extensions have followed the site strategy set out in the original masterplan for the project. Additional work is now planned to extend the primary school further and to design a sixth form centre.

"The building is brilliant - I can't fault it"

Alison Banks, Head Teacher, Chafford Hundred Campus (Hare)

## [Kempe Centre, Wye College Imperial College of London, Wye – UK 1996](#)

### **Awards:**

The building received an RIBA design award.

The Learning Resources Centre united the College Library with the Department of Computing in a new building looking out on the Kent countryside. Green values were fundamental to the design, combined with the underlying purpose of responding to technological developments in library management. The building was constructed with its long east and west faces between two existing rows of pleached trees. The trees help to protect the building from low sunshine in the summer months. The main library hall is naturally lit, with clerestory lighting falling between the bookstacks. The site was a very sensitive one, on the edge of a traditional Kent village. (Hare)

Shortlist (for Corby Parkland Gateway - including Corby Civic Hub, Corby International Pool & Corby Interchange) Share

The Corby Cube is truly a new paradigm for civic buildings in an age of austerity. The pressure to reduce expenditure has pushed Authorities to examine how they can rationalise their estates and deliver services more efficiently and effectively. The Corby Cube does just this.

We have worked on this ground-breaking project since 2004, having won in competition against Richard Rogers Partnership, Rafael Vinoly and Fielden Clegg Bradley. The Cube combines the functions of two buildings, an arts and civic centre, into one, providing a diverse range of services under one roof. This approach is sustainable in the holistic sense as Council services are consolidated to make the most of their reduced resources whilst redundant brownfield sites can be regenerated to create future development opportunities. The project was the first theatre to gain a BREEAM Excellent rating.

Our innovative approach has led to a building that everyone in Corby can be proud of. It demonstrates that world class public facilities can be sustainable and at the very heart of a community's proactive regeneration, putting the 'Cor' back into Corby. (Hawkins)

Located in central Corby, the Corby Hub is a 'pure' building, the exterior completely unblemished by service entrances, bin stores and plant equipment (all of which are contained in an undercroft).

The highly reflective surfaces are symbolic of the reinvention of Corby, and refer to the town's historic role as a leading player in UK steel production.

Reinforcing this marriage of the old with the new, many of the internal surfaces will include steel finishes.

### **CONTEMPORARY DESIGN**

A series of components spiral around the exterior characterising each elevation; the north elevation is animated by a transparent glazed entrance foyer, the east elevation by display vitrines and window into the council chamber. A cantilevered reading room projects out of the first floor of the south elevation and the west elevation features transparent glazing into the elevated library ramp and a café and hair salon at ground floor level.

Irregularly spaced apertures appear on the upper levels framing views into a planted terrace and providing views out to the historic woodlands beyond. The roof is treated as a fifth elevation continuing the patterning of the façades with bandings of sedum roof and brown roof.

Integrated within the facade will be work by artist Nayan Kulkarni utilising retro-reflective 3M tape, using golden section geometry. This 3M tape is arranged across all four facades of the building and illuminated using a series of external light sources to create a vibrant 'blink' effect.

### **Facilities include:**

A modern, flexible 445-seat theatre and arts space, and additional studio space

A well-equipped library

A ground floor café and hair salon

A rooftop restaurant with views over Hazel Wood

Corby Borough Council One-Stop-Shop and offices

Council Chamber and a marriage room for civil ceremonies

Terraced roof garden

"A series of components spiral around the Corby Hub exterior, characterising each elevation."

Facilities are arranged around a spiralling circulation system composed of ramps, which rise from the foyer through the building and a linear 'lazy stair' spanning 15m and culminating in a helical stair leading to the rooftop restaurant. The ramp predominantly provides space for the library, but is also a device to enable multiple facilities to be located on what is perceived as the ground floor and provides the central promenade through the building.

### **CORBY HUB THEATRE**

To reduce its impact on the overall building, the theatre is a walnut-clad casket submerged in the south east corner of the cube; the interior features balconies influenced by Victorian playhouses. The theatre has a flexible flat floor auditorium with a curved retractable seating system, the first of its kind in the UK.

The building is predominantly naturally ventilated using exposed thermal mass for night-time cooling and aims to meet a BREEAM rating of excellent. (<http://www.designbuild-network.com>)

### **Boscombe Housing and Library, Bournemouth – UK 2007**

Client East Dorset Housing Association (part of Synergy Housing Group Ltd), Value £2.8m, Location Boscombe

#### **Awards:**

East Dorset Awards

RICS SW Community Benefit Award 2008

This new public library is the result of an imaginative public/ private partnership. As part of a programme for new libraries, that included the award winning Bournemouth Library (a controversial PFI scheme), the local authority teamed up with a local housing association to run a CABE sponsored design competition. The brief was to replace the outdated library in Boscombe. The flats above the library 'cross-funded' the scheme and established a much needed 24/7 presence on the site. We won the competition in 2002 and worked with the East Dorset Housing Association (part of Synergy Housing Group) to design and oversee the construction of a social housing scheme above an independent library space. The library has recently won a series of awards for its involvement with Public Art and has become a very popular destination for wider community events. As a parallel study, we were commissioned by Bournemouth Council to develop a masterplan for the area to reduce the impact of car parking behind the High Street and introduce new pedestrian routes, creating planning guidance for a series of development sites around the new library. #### **Libraries:**

### **London Library Phase 2 Westminster – UK – 2010**

Client: The London Library, Construction Cost: £6.9M

The largest independent subscription library in the world. Founded 1841 by, Thomas Carlyle. One of the first steel-frame buildings in London (1896-98). The London Library, founded by Thomas Carlyle in 1841, is the world's largest independent lending library, and is located in the north west corner of St James Square in buildings dating back to the 1890s. Behind its discrete, formal facade onto St James Square, the original Library was added to and extended on a number of occasions in the course of the 20th century to accommodate its ever growing collection of books.

“The Library is proof positive that the best contemporary architects are capable of reproducing the complex and refined atmospheres of our best-loved institutions. The London Library has a new layer of History that ranks with the original and will surely be loved by its members.” Kieran Long, Evening Standard

Haworth Tompkins were appointed to oversee the latest expansion of the Library's facilities. Through an analysis of the Library, its identity, its capacity and future needs, a master plan was developed to extend the Library's facilities whilst upgrading the existing accommodation and improving the circulation and accessibility to all parts of the Library. The first phase of work, completed in 2007 involved extending the Library into TS Elliot House (see separate Project Page). The second phase completed in 2010 provides 42 new reader spaces, 1.25km of new shelving, new designated rooms for the Art Book Collection, Times Collection and Periodicals and Societies Collection, improved circulation, remodelling of the main Issue Hall and the creation of a new members entrance from Mason's Yard. The design develops a contemporary architectural language that responds to the authentic idiosyncrasies of an historic institution. As in Phase One, new toilets were designed in collaboration with Turner Prize-winning artist Martin Creed. This created a conceptual dialogue to think specifically about the way in which the atmosphere of the building might be amplified and articulated by the new proposals. (Haworth)

The London Library in St James Square with a million books is the largest lending library in the world. The core of 1841 originally and later extended several times since 2004 building has been remodeled and renovated in two phases. The first phase, consisting of the renovation of the Eliot House, was completed in 2007. The second phase has just been completed in July 2010. The plans for the 18 million British pound measures taken by the London office of Haworth Tompkins, who won in 2004 is adequate competition (see also BauNetz message of 16 June 2006). The second phase of renovation has created 42 new places for reading and 1.25 kilometers of

shelving space for books, a new workshop for book repairs and new spaces for art-book and journal collections. Even were the transport system with new stairs and lifts as well as the redesigned main entrance hall and the members. (<http://www.baunetz.de>)  
**[The London Library, T.S. Eliot House, London Library Phase 1, London –UK 2007](#)**  
Client: The London Library, Construction Cost: £3.1M

T S Eliot House is the first phase of a masterplan to refurbish and develop the London Library in St James's Square. The purchase of an adjacent 1970s office block - despite its lack of architectural quality - offered an opportunity to expand without moving services off site. Its refurbishment provides a conservation studio, staff areas and additional bookstacks, so freeing up space for future redevelopment in the main building. The design challenge has been to find a strong contemporary language which works alongside the quirky and characterful architecture of the London Library itself. "The whole team have worked tirelessly to create and deliver a thoughtful and sustainable solution to the Library's perennial need for space, whilst taking care to ensure that this new wing merges seamlessly into the much loved existing London Library labyrinth." Inez Lynn, Chief Executive, The London Library Internally, it was stripped back to its concrete shell, and internal finishes have a raw quality to reflect this. New toilets were designed in collaboration with Turner Prize-winning artist Martin Creed. This created a conceptual dialogue to think specifically about the way in which the atmosphere of the building might be amplified and articulated by the new proposals. Meanwhile, significant changes were achieved to the nondescript brick elevation facing Mason's Yard by remodelling the nondescript 1970s elevation with distinctive projecting windows, flush pointed brickwork, and a black render and lush glass ground floor base. (Haworth)

### **Libraries:**

#### **Brent Civic Center, Wembley, London – UK 2009 – 2013**

Plans for the greenest civic centre in the country have received unanimous approval from Brent Council's planning committee. The new centre will be a landmark building designed by award-winning Hopkins Architects Town planning. Environmental, structural design and sustainable technology advice was provided by specialist consultants Scott Wilson. The new Civic Centre – the first ever civic building to be built by Brent Council – has been designed to be the greenest civic building in the country. It is set to be situated in the heart of the Wembley regeneration area opposite Wembley Stadium and Wembley Arena. The nine-storey building will accommodate around 2,000 Brent Council staff and for the first time ever, all Brent Council services will be delivered from one building. Half the building will provide a range of new facilities for the local community to use. These include a multi-purpose foyer with grand civic steps, a flexible community hall for up to 1,000 people, *a new library and learning centre*, a winter garden and a smaller Civic Hall with an external terrace and a café. There will also be an expanded Registrar's service with a wedding suite and wedding garden. The building aims to achieve BREEAM 'Outstanding' through a combination of solar shading, natural ventilation, façade performance and combined cooling, heating and power utilizing waste vegetable oil. It also intends to use the new development to encourage greener habits locally and set new standards of sustainability for other developers to follow. The building is due to be completed in mid 2013 with building work planned to start on site in late 2010. (<http://www.worldarchitecturenews.com>)

#### **The Forum, Norwich – UK 2001**

After a fire destroyed the Norwich Library in 1994, a Millenium Project was initiated to re-house it, together local visitor and business centres, a 'Heritage' exhibition and shop, bar and restaurant and the local BBC station - 'Look East'. The old library site was combined with the adjacent car park to form a complete city block, surrounded by civic buildings. The Forum is conceived as a courtyard surrounded by a three storey, horseshoe-shaped enclosure of loadbearing brickwork, which accommodates the various activities on a series of balconies. The courtyard roof is supported by bow-string steel trusses forming leaf shaped panels, infilled with acoustically absorbent material or glazing. Light enters into the heart of the building, creating a dynamic public atrium. (Hopkins)

#### **Djanogly Learning Resource Centre, Jubilee Campus University of Nottingham, Nottingham – UK 1999**

The Sir Harry and Lady Djanogly Learning Resource Centre (or the Djanogly LRC) is a library on the Jubilee Campus of the University of Nottingham, England. The library houses books and resources relating to education and computer science. It also housed books relating to the Business School, prior to their move to a specific Business library in 2004. The library is an unusual circular building situated on an island platform in the middle of the campus lake. It was designed by the architect Sir Michael Hopkins, with the striking feature of having only a single floor, which spirals its way up and around the circumference of the building. It was initially rumoured to be sinking because the architects had forgotten to account for the weight of its books, but whatever the truth of this rumour, any problem has now been fixed. The library was named after the philanthropists Sir Harry and Lady Djanogly who gave a significant contribution towards the cost of its construction. Sir Harry is the father of Jonathan Djanogly the MP for Huntingdon. (<http://en.academic.ru>)

#### **Kroon Building, School of Forestry and Environmental Studies, Yale University, New Haven, CT – USA 2009**

The Kroon Building — future home of the Yale School of Forestry and Environmental Studies — will set a new standard for sustainable architecture when it breaks ground this winter. Professor Stephen Kellert of the environmental school met with members of the Yale community at Sage Hall yesterday to present plans for the \$40 million project. The project will bring 50,000 square feet of environmental sustainability to a site currently occupied by the Pierson-Sage Power Plant on Science Hill. [environment.yale.edu](http://environment.yale.edu)

A simulation of the colonnade in the proposed Kroon building showcases its extensively "green" architecture. The building will house the School of Forestry & Environmental Studies. Kellert, who recently won the "Outstanding Contributions to Research" award from the North American Association for Environmental Education, said the building will serve as an example for the community. "We preach the gospel of sustainability, and we don't practice it very well," Kellert said. "This building teaches what it aspires to accomplish. ... We hope we can catalyze the movement of Yale toward a more sustainable institution." Environment school professor Marian Chertow FES '00 said she is enthusiastic about the way the Kroon building is paving the way for green building and energy conservation. The environment school is striving to be a leader in sustainable architecture both for the University, which has many large, inefficient buildings, and in the discipline more widely, Chertow said. "We're trying to get the university aware, and in our own field we're trying to do some experimental things ... [to push] the envelope of what hasn't been done before," she said. The Kroon building plans meet the platinum rating for the Green Building Rating System of Leadership in Energy and Environmental Design. Kellert said Hopkins Architects, the London firm in charge of the project, designed the structure with strict environmental objectives in mind, especially climate neutrality, energy efficiency, renewable energy production and minimal pollution. The architecture will do much of the work in terms of lighting, heating and cooling, he said. "It will provide a

living learning opportunity,” said Julie Newman, director of the Office of Sustainability. “It lets us creatively tap into innovative technologies.” Named for philanthropist Richard Kroon ’64, the building will provide office space for about 75 faculty and staff. It will also feature classrooms, a 175-seat auditorium, an environmental center and a cafe, among other facilities. Kellert explained to his audience yesterday that there were difficulties in initially securing the site for project development. “The University resisted tooth and nail decommissioning this power plant,” he said. In addition, fundraising has not been as successful as planners hoped, as the project is still \$10 million short of reaching its goal even after projected costs were cut down. But the University now supports the project, he said, and is working with the environmental school to make the vision a reality. “Any building is only a shadow of its aspirations,” Kellert said. “You have these high ideals but ... translated to brick and mortar it’s an entirely different thing.”

#### **Tomas Bata University, Library Building, Zlin – Czech Republic 2008**

This recently completed scheme is very much a signature project for Eva since it is in her birthplace and also the site of an extraordinary architectural and social concept realised by the shoe manufacturer and altruist, Thomas Bata, between the two World Wars. The Library, until now situated in old warehouse, forms part of a new development plan, together with a multi-purpose auditorium financed by the City of Zlin. The two buildings share a somewhat symbiotic relationship, education and culture going hand in hand, uniting once more the joint activities which suffered an unfortunate decline during the Communist era. The Library building consists of two distinct volumes with 500 study spaces for students, and offices for the Rector and University administration, these being connected by a relaxation area as a meeting place. The building was built on a relatively low budget and uses an energy system complemented by efficient shading and is clad in ceramic tiles. (Jiricna)

## **KSS Group, London – UK**

<http://www.kssgroup.com>

### **Libraries:**

#### **Luton Six Form College (Library), Luton – on construction - 2011**

£ 34.000.000, 16.870 m<sup>2</sup>

GDM Partnership Ltd are undertaking the building services design of a new 17,000m<sup>2</sup> academic building for Luton Sixth Form College, which opened in 1966 as the first sixth form college in the country. GDM have been appointed alongside architects KSS Design Group on the project, supported by the Learning Skills Council. The 22-acre College site, a mile to the north of Luton town centre, will be comprehensively redeveloped, and all of the existing buildings will be replaced. The development will be of a low-rise nature, to respect the surrounding residential area. General teaching areas will be in four separate wings. The wings are designed as cul-de-sacs, creating quiet learning environments for distinct learning communities. A further two wings will provide academic accommodation for the performing arts and sports departments, with a 180-person lecture theatre/performance hall and 6-court sports hall. An atrium will wrap around a central three-storey hub, which will provide all of the College’s administrative and student support functions. At the first floor level, the wings and hub will be accessed by bridges across the atrium. The atrium will be covered with an ETFE inflated pillow roof, with ‘fritting’ screen-printing to mitigate extremes of solar gain whilst ensuring a light and airy environment. A main refectory area, with 700 covers for staff and student use, will provide dining and recreational space. This will open onto an outside terrace and external amphitheatre, which will offer further seating and gathering options. A large learning resource centre, with a double height glazed wall, will overlook extensive, high quality sports pitches, including one with an all-weather surface. The building will adopt a low energy ‘TermoDeck’ thermal mass ventilation system and heat exchange recovery system, with a high performance envelope. The development will incorporate a ground source heat pump system as an on-site renewable energy source, fed via bore holes beneath the sports playing fields. The college will also implement a rainwater harvesting system, including a surface water retention area imaginatively designed to incorporate attractive water features at the front of the new building. The development will be procured under a two-stage Design and Construct contract. Construction will commence on site later this year and will be completed in time for the opening at the start of the 2010/2011 academic year.

#### **North West Kent College, Gravesend – UK 2009**

£ 19.300.000, 9.500 m<sup>2</sup>

At Gravesend, our proposal replaces some of the existing campus adjacent to the main entrance with 6.000 m<sup>2</sup> mixed use teaching accommodation, with learning resources unit and information technology suite, linked to a new 3.500 m<sup>2</sup> reception also housing a new refectory, gymnasium and administration offices. (KSSGroup)

#### **South East Essex College, Southend-On-Sea – UK 2005**

£ 83.200.000, 26.125 m<sup>2</sup>

The newly opened 26,100 m<sup>2</sup> campus for South East Essex College features inspirational teaching spaces, a soaring ETFE-clad atrium, a distinctive red pod and organic-shaped dining decks. And for the first time, the Learning and Skills Council increased funding for a building based on estimated in-use energy savings. The state-of-the-art Southend Campus replaces two former sites for the college. The overall form of the building was inspired by the human body. The Pod performance space, with its dramatic red exterior, is envisaged as the lungs of the building, while the learning spaces and escape stairs resemble a spinal column in plan - the services run through this spinal column literally like a nervous system. <http://www.longkentish.com>

### **Libraries:**

#### **Oxford Brookes University, New Library and teaching building, Oxford-Headington Hill – UK 1997 – 2013**

£ 14.000.000 8.500 sqm

The 8,500sqm project includes reading and bookstacks for the Headington Hill campus of the University. The site is adjacent to a listed manor house surrounded by mature landscaping and commands spectacular views over the dreaming spires of Oxford. The design of the project has been progressed to a feasibility stage for fundraising and to obtain the support of the local planning authority. (Long)

#### **The British Library, Centre for Conservation, London St. Pancras – UK 2003 – 2007**

£ 13.500.000 2.600 sqm

This project was won as a result of an European design competition during 2003. The British Library's brief was to build a world-class Centre for Conservation on a site immediately north of their existing building at St Pancras. The centre houses book and paper conservation facilities and the British Library Sound Archive. It also has a mission to convey and teach the special techniques of conservation. Each of these require very particular conditions like good working north light and acoustic isolation. At the north end of the existing building, the lowest two floors are occupied by back-of-house functions and a large loading bay. Publicly accessible space in the existing library starts at first floor level, with an extended outside terrace facing the new building. This terrace also covers the service yard and creates a new focus for any future Library expansion on adjacent sites. (Long)

#### **University of Brighton, Falmer Centre for Learning and Teaching, Brighton – UK 2001**

£ 3.500.000 3.150 sqm

Following the success of The Aldrich Library, Long & Kentish was asked to look at the University's Falmer campus which was originally built in the 1960's, and is coming to the end of its life. We did the first two replacement buildings which established some principles for building on the steep north facing slope, and suggested a palette of materials. The new learning resource centre on the University of Brighton's Falmer campus includes a library. The building is designed to make best use of the sloping site and the dramatic views to the northwest. (Long)

#### **The British Library, London St. Pancras – UK 1975 – 1997**

£ 500.000.000 120.000 sqm

The British Library was voted one of the six most popular buildings of the millennium in a popular poll, and it was short listed for the Stirling Prize. Included in the accommodation are extensive exhibition galleries (fitted out by the architects), two restaurants, a café, a catering kitchen, and education rooms. The building is remarkable for its attention to detail. People who use it comment on the pleasure it gives to the sense of touch with its carefully shaped natural materials: wood, stone, brass, and leather. It has been called the last 'handmade' public building in Britain. It is also unusual for the ease with which its geography can be comprehended by the visitor. In spite of its size, most of the building's public destinations are visible from its point of entry, and little use has to be made of orientation plans. The routes through the building are natural and inviting. M.J. Long was a partner of Colin St. John Wilson & Partners, and was the co-designer of the building. She was the author of the overall building plan, and took particular responsibility for the client's brief and the natural and artificial light which are so important to the character of the building interiors. Rolfe Kentish was the associate responsible for organizing the design team to produce the entire set of construction documents for the final stage of construction. (Long)

#### **University of Brighton, Aldrich Library, Brighton – UK 1996**

£ 4.000.000 4.853 sqm

This commission was won in a design competition. The Aldrich Library is now seen as the flagship building of the Mousecombe campus (it can be seen on the front page of the University website). The form of the building responds equally to the pressures of the site and the organisation of the library. It acts as a 'marker', to highlight the corner of the campus, and achieves its architectural significance not through its size (because it is less overbearing than its 1960 's neighbour) but through the animation of its form. Inside, the readers are located next to north and east facing windows, while the southern and western sun is excluded by the masonry walls that enclose the book stacks. The building is ventilated naturally as air comes in through a purpose designed light shelf which also sound-attenuates traffic noise from adjacent roads. Variations in the visual environment are created with a carefully designed system of artificial lighting, and natural materials are used as much as possible. The result is an economical building which reproduces the feel of a large-budget commission. The project also involved a partial renovation the 60 's building to which the library is attached, and includes a bookshop, refectory and cafe. (Long)

#### **Harold Washington Center, Chicago, IL – USA 1988 – 1992**

\$ 144.000.000 75.000 sqm

### **Literature:**

Chicago Tribune, 15 September 1991 'Chicago to build nation's largest municipal library'  
AIA Journal, July-August 1988

The new 75,000sqm public library houses 2 million books, 8,600 current periodicals and a winter garden on the top floor. The fixed elements of the building are confined to the perimeter, creating a flexible 'loft' in the tradition of the commercial buildings of the Chicago loop around the turn of the century. MJ Long and Colin St John Wilson worked as design consultants to Hammond Beeby and Babka LC (Long)

The scheme, commissioned by Land Securities, incorporates a mix of retail and office space, affordable housing and a new library on Victoria Street in central London, and has been developed as part of a masterplan for the Victoria Transport Interchange. The city block which contains the Victoria Palace Theatre and the Duke of York public house will now also house a public library, affordable housing and a small office building. This site and our previous proposals for it are entering into oral history, and the site is already becoming known as 'Old Victoria'. In our designs over the past four years we have sought to consolidate the setting of the listed buildings as a recognizable part of the city; as a city block unified by scale, materials and colour and by a coherent if varied way of making openings and creating recognisably similar architectural details. Crucial to this has been the figurative aspects of the design; the repetition of a simple colonnade type at ground floor and the emphasis upon windows and niches in the facades generally. These niches will sometimes house people on balconies or in deep window reveals. They will also add another layer of imagined inhabitation, acting as settings for a series of sculptures. The site can be said to house almost all of the activities associated with a good bit of city; places to work, live, enjoy culture and to learn, as well as places to eat and drink. It is a microcosm of a city. The site is home to a listed building, the Victoria Palace Theatre, and is opposite the Westminster Cathedral Conservation Area. It sits above Transport for London's proposed Victoria Station Upgrade (VSU) and the Kings Scholars' Pond Sewer. The resultant restrictions on loading have necessitated the use of a lightweight engineered timber structure throughout our scheme. Initially we were attracted to the fact that the white faience South facade of the theatre hosts a number of sculptural stone figures, as does the stone facade of the train station opposite. Our design responds to these cues creating a 'stone room' out of this end of Victoria Street. Just as Parliament Square defines the Eastern end of Victoria Street with a variety of public uses unified by the singular materiality of stone, our proposal aims to intensify your experience of a recognisable place made up of different building types and uses designed to complement their urban setting. The library, which sits on Victoria Street, is conceived of as a modern palazzo. Its primary, glazed façade is shaded by a travertine screen, which incorporates solar chimneys that will allow the reading rooms to be naturally ventilated as well as protecting users from the hot South sun. This façade steps back in plan giving a view of the fine signage on the Eastern facade of the Victoria Palace Theatre, which is currently occluded by the existing building. Our new 'Palace of Books' can also be used for evening events due to the provision of a cafe and public meeting room. It is a state-of-the-art 'green' building that responds to nature (solar orientation, geo-technics) and technology (subterranean water and rail lines), and to its cultural and architectural context also. The scheme also includes 35 units of affordable housing with a mix of tenures, located to the East of the site on Bressenden Place. Dwelling in the modern city involves a careful balance between privacy on the one hand and the opportunity to engage in the life of the city on the other. Affordable housing poses particular design problems, not least the difficult task of creating opportunities for individual inhabitation within a rigorous approach to domestic urbanism. Large parts of London and especially Westminster are planned by blocks of housing, and, in these locations, the mixture of dwelling types is successfully assimilated into a clear urban grain. Georgian housing appears at first glance regular and uniform, but subtle differences in size signal that the architecture is a backdrop for life. The discrete character of urban housing enables idiosyncrasies to be placed into an architectural frame; from animated pot plants to snazzy curtains. Intermediate housing sits above the library. The social needs rented accommodation is separated from the library by vertical vents that serve the tube station below ground. The external brise soleil protects the flats from solar gain and provides privacy for inhabitants' bedrooms and will also act as supports for planting. Behind this deep threshold a Jura limestone wall is cast with shadows. Private parts of the flats are withdrawn from the street whilst the living rooms project as bay windows. Each flat has a balcony and is accessed by a bridge, which themselves are part of the private domain. Internally, the engineered timber construction will be partly exposed. A series of layers builds up the façade so that it will appear as a relative of the library, establishing continuity between these interconnected parts of the project. The office building, located to the North of the site, also incorporates the listed façade and shop interior of TM Sutton, a local pawnbrokers. It is designed to have retail at ground floor and office on all floors above. Owing to its location, the office is not exposed to solar gain or to high noise levels, therefore a facade treatment that differs from those of the library and housing is appropriate. The timber columns and end of floor plate are to be clad in Jura limestone which will give the facade solidity and depth. The timber beams are visible within. On the North facade, parallel opening windows are proposed, while on the East and West facades, and on the whole of the top floor, juliet balconies will enable inhabitants to take advantage of views and abundant fresh air to their offices. These balconies will greatly enrich the appearance of the building from street level by allowing human inhabitation of the facade. The windows pop forwards to open and thus the façade becomes animated, and each floor plate can be naturally ventilated. In massing terms, the design acknowledges the shift in scale upwards from the Georgian block, housing the Duke of York public house and the Victorian theatre, to the taller 1960s commercial buildings and those permitted in the masterplan that form the immediate hinterland of Victoria Street. We aim to create a fine setting for the listed buildings, unifying them as part of a cohesive city block with a common architectural language. (Lynch)

## **John McAslan + Partners, Manchester.Edinburgh.London – UK**

<http://www.mcaslan.co.uk>

### **Libraries:**

#### **SOAS (School of Oriental and African Studies) Library Terraces – UK 2011**

The SOAS library, cited as the jewel in the School's crown, has been lauded as the leading national library for Asian, African and Middle Eastern studies, comparable only to the British Library. It houses more than 1.5 million volumes and extensive electronic resources for the study of Africa, Asia and the Middle East, and attracts scholars from all over the world. The library is also one of the UK's five National Research Libraries. The library is currently undergoing a £12 million modernisation and enlargement programme (known as 'the Library Transformation Project') that aims to increase capacity and create new student study spaces. The library is housed in the Philips Building on the Russell Square campus and was built in 1973. It was designed by architect Sir Denys Lasdun (\*08.09.1914 London - + 11.01.2001 London) who also designed some of Britain's most famous brutalist buildings such as the National Theatre and the Institute of Education.

As a constituent college of the University of London, students at SOAS also have access to Senate House Library, shared by other colleges such as London School of Economics and University College London, which is located just a short walk from the Russell Square campus. (Wikipedia)

John McAslan + Partners was appointed under a Consultant Framework to complete the transformation of the much loved Denys Lasdun Philips Library in 2008.

The main objectives of the transformation project were to improve the clarity of the existing design, enhance and increase research facilities, reader seats, study rooms, provide flexible learning environments (with a strong focus on IT) and facilitate future growth. Due to funding requirements the project was split into phases.

Read less >

Phase 1 entails the full refurbishment of the Ground and Lower Ground floors with a new reception, glazed study rooms, media labs and a new archive facility to meet a number of rigorous BS standards. The ground floor book stacks are completely reconfigured to allow the spaces to once more 'breathe', puncturing the envelope to allow controlled natural light and ventilation deep into the library space.

Phase 2 involves a similar approach to all 4 remaining levels and the refurbishment of the incredible atrium space and original Lasdun diagrid roof. Phase 1 completed in 2011. (McAslan)

#### **Nightingale Building, Learning Resource Center, Kingston University, Kingston upon Thames – UK 2007** £ 2.900.000, 1.600 sqm

JMP was appointed as masterplanner and architect, with Arup, for Kingston University's five-year multi-building capital programme.

At the Kingston Hill campus, the Nightingale Centre is a linear learning resource – in effect, an enclosure grafted onto the front of two existing library buildings that has delivered significantly more reading space, student study areas, a reception, group study rooms, an IT-supported Learning Café, and a socially valuable open space, with a landscaped area to the north of the new building which has become a focal point. (McAslan)

#### **Imperial College Library, Sherfield Building, London – UK 1997**

In April 1995 John McAslan + Partners was commissioned to design two low-energy independent projects comprising the 4,000 sqm refurbishment and extension of the Libraries Building, including a music facility, and the 12,000 sqm refurbishment of the Sherfield Building, at the heart of Imperial College's campus in South Kensington. Phase 1 of the proposals, the Library, commenced on site in 1996, and was completed within twelve months in the summer of 1997.

The Library consists of extensive alterations and additions to the existing 1960's building while maintaining the existing library's operational continuity, rationalising the building use, improving building services and providing upgraded and environmentally responsive interiors.

Completed subsequently the Music and Arts Centre has provided high quality rehearsal spaces of varying capacity together with a new gallery space and associated office accommodation, serving a 250 seat music hall. (McAslan)

#### **Swiss Cottage Library, Borough of Camden, London – UK 2003**

Client LB Camden, Size 5,000 sqm, Cost £5m, Team John McAslan + Partners, Architect, Whity Bird & Partners, Structural Engineer, Gifford & Partners, Building Services Engineer EC Harris, Cost Consultant

### **Awards:**

Winner, RIBA Awards 2004, Conservation

Winner, Camden Council Design Awards 2004

In 2003, JMP completed the remodelling of the Grade II listed Swiss Cottage Library, designed by Sir Basil Spence (\*13.08.1902 Bombay, India - + 19.11.1976 Yaxley, Suffolk, Coventry Cathedral 1962) in 1962-64.

The practice was appointed following a two-stage selection procedure and developed the proposals in partnership with Camden Council and a multi-disciplinary design team.

The Library is at the heart of the Swiss Cottage site's long term redevelopment, a major project which embraces new residential, leisure and cultural facilities. The practice's approach has been to expand the Library's key community assets and creative possibilities while protecting the building's landmark status.

The project won acclaim from English Heritage, with Philip Davies, the London Region Director commenting: "It is clear that the project is a success in architectural and heritage terms, and provides Camden with an excellent 21st century library facility. It demonstrates how change can be successfully achieved in listed buildings. Through careful analysis and a sensitive design approach, the Council's needs have been accommodated by means of a scheme that has also consolidated and clarified the building's essential qualities. John McAslan + Partners has been exemplary in its approach to the project, and much credit for the success of the scheme is due to their involvement." (McAslan)

Prospect “Top 100 modern (post 1945) Scots Buildings”, Nr. 9 2005

Edinburgh Architectural Association Best Building of The Year 2000

Regeneration of Scotland: High Commendation 2000

Royal Institute of British Architects (RIBA) Award 2000

Royal Scottish Academy Gold Medal 1997

The Library is built to express joy and optimism in the future of poetry within our culture: an engine for cultural renewal rather than a dry container for historical documents. This is made manifest in a building which engages with history, both literally (the historic walls to the north and east) and metaphorically (the rich resource of Scottish poetry) while opening up towards the west-facing clare and courtyard reading area, and Salisbury Crags to the south. The building itself is framed with glass and oak infill panels and sliding shutters to close it up at night – making it characteristically Scottish in its juxtaposition of mass and delicacy. Internally the plan is a simple double square with divisions suggested by the freestanding stair and lifts, lined by a continuous wooden bookcase, with intimate study carrels. A simple monopitch roof with big circular skylights slopes up from the horizontal datum struck by the high level windows above the masonry wall, towards the sun and the view. This allows a mezzanine to serve as a member's reading room, periodicals area and children's reading area, with the stacks sliding aside to form an internal performance space. The library is conceived as an “Elysian” grove, a happy place where enlightenment is achieved by bringing the books out from their snug timber shelves to open them up in the light. (Malcolm)

## **Rick Mather Architects, London – UK**

### **Libraries:**

#### **Christ's College Cambridge New Library, Cambridge – UK on design**

1.400 m<sup>2</sup> new building, 520 m<sup>2</sup> existing building

Rick Mather Architects have been commissioned by Christ's College Cambridge to design a new college library One of Cambridge's oldest colleges, the brief calls for the creation of an inspiring new library which will serve the whole College community, allowing connections to the historic First Court and the existing 1897 Bodley Library.

The Design for Christ's College Cambridge creates a glass covered court between the South Range and the Bodley Library to create a new study centre and library at the heart of the College. For the first time this will give the library a clear presence on the College's imposing First Court. The new four storey plus basement library proposes 200 reader spaces, four supervision rooms, a rare book reading room, manuscript store, 1,875 m of open access shelving, 625 m of closed access shelving and doubles the amount of existing staff accommodation. The College's desire to place the New Library at the heart of its academic community has led to the choice of this central site over others. Its position will allow the library to have a First Court presence along with other key College functions such as the Chapel and Hall. The college brief highlights the need for library accommodation, but also the addition for a space where students can meet for informal study. Its will also allow a direct connection with the Old Library. Additional benefits are that disabled access to Charles Darwin's room and the Fellow's Parlor via a new bridge. (Mather)

#### **The Queen's College, University of Oxford, Oxford – UK 2006 – 2012**

Rick Mather Architects won the competition to design a new library and archive building for The Queen's College in 2006. The college was founded in 1341 and the Upper Library dates from 1692-1695, originally believed to be from designs by Christopher Wren (\*30.10.1632 East Knoyle, Wiltshire – + 03.03.1723 Hampton Court). The Lower Library was created by Charles Robert Cockerell (\*27.04.1788 London – +17.09.1863 London) in 1843. The New Library's sloping rooflight above the reading room will give magnificent views up to the west elevation of the old library. The building will provide an additional 7000 ft<sup>2</sup> (650m<sup>2</sup>) and will be almost invisible below the library terrace. The new library is partially sunk into the Provost's garden and is linked to the old library.

#### **Royal Horticultural Society, Library, London, Westminster – UK 1997 – 2001**

4.250 m<sup>2</sup>, £ 7.000.000

This extensive redevelopment of the Royal Horticultural Society (RHS) headquarters building in Vincent Square provides a new home for the Lindley Library, offices and an entirely remodelled conference hall facility. Listed and dating back to the 1900s, the existing building has been extended into hitherto unexploited basement areas and comprehensively refurbished to house the society's growth over the next 25 years. The Lindley Library is one of the most important botanical reference libraries in the world and consists of over 50.000 volumes covering a wide range of subjects, including garden history, botany, flower arrangement, and botanical art. It is used by scholars from all over the world. It is also much used as a resource by the RHS's own garden writers,

authors and members of the general public to whom it is open free. The RHS thought that was not room to house the Lindley Library in their existing building and it would have to be moved out of London to the RHS gardens at Wisley in Surrey.

#### **The Learning Grid, University of Warwick, Coventry – UK 2004**

MJP worked closely with the University's Library Service to create an innovative Student Resource Centre for independent learning within an existing building. The design had to be modern and inspiring as well as functional to attract students. The facility is designed to provide a relaxed environment that encourages students to work in whatever way suits them best - alone or in groups; at any time of the day; at desks or on sofas. There are also facilities for students with specific needs. A wide range of electronic equipment is provided to support new approaches to learning, with areas for brainstorming, presentation practice and multimedia video editing, as well as pc terminals and access to books and printed material. MJP used a range of screens and furniture to create a materials are used to create a lively environment - and as a reaction against other facilities which provide dreary rows of computer desks. A new perforated steel staircase was inserted into the building to form a physical and visual link between the two floors of the Learning Grid. It forms a contemporary feature which deliberately contrasts with the institutional character of the existing building. The facility is open to an atrium which incorporates new catering facilities and is used for social events by staff and students. MJP are currently involved in the installation of a new work by the artist David Batchelor in the atrium. (MJP)

#### **Wolfson Building, The Science Museum, London – UK 2003**

€ 5,580,000

The Wellcome Wolfson Building forms part of the second phase of our competition winning scheme for the Wellcome Wing extension to the Science Museum. Set behind Grade 1 listed railings, facing on to Queen's Gate and within the Queen's Gate conservation area, the building bridges the divide between the institutional museum buildings at one end of the site and the redbrick and stucco residential Victorian terraces of Queen's Gate at the other. The building houses the Dana Centre, a new public facility for the presentation and discussion of topical scientific issues using traditional and new media. A double height café, 150-seat flexible auditorium, 50-seat seminar room and exhibition area are distributed over the first three floors. These are connected by a dramatic triple height space which faces over a new landscaped courtyard. Above this is low-energy office space, with a two-bedroom penthouse flat and private office for the Centre's director. The building's projecting precast concrete features echo the stone bays and porticos of the terrace to its north, while the red stock brick used on the Queen's Gate façade is a perfect match with the existing terrace. The south elevation forms a new gable to end the terrace and formally addresses the courtyard to the south. Viewed from the courtyard, the building takes on a very different character as it responds to the institutional context of this end of the site. The glass, aluminium and concrete of the Dana Centre predominate over brick, and the auditorium, expressed as a suspended concrete box, is set below a four-storey aluminium brise soleil bookended by two brightly coloured and glazed stairways. The interior features exposed concrete columns and ceiling. This is combined with an air displacement system, effective reduction of solar gain and good natural lighting to reduce energy use and carbon emissions by 20%. Provision is also made for grey water recycling. 'Cool, elegant, stylish . . . the Wellcome Wolfson Building, offers a much needed break with the past and injects vibrancy and contemporary style into an area dominated by the ideals of the 19th century. Buildings don't come much cleverer than that.' Building, October 2004 (MJP)

#### **Millennium Place, Durham – UK 2001**

€ 19,000,000

Our project for Durham Council transforms a derelict site on the Durham peninsula, a historic area of the city surrounded on three sides by the River Wear. Our project acted as a catalyst for the regeneration of this area and was the starting point for the council's Lottery funded Durham Millennium City Project. It is a good example of Lottery-assisted urban regeneration as it provides much needed community facilities on a brownfield site. Our urban design concept was for a new civic terrace riding the ridge that leads up to the UNESCO World Heritage Site containing Durham Castle and Durham Cathedral. This elevated terrace has views over the Wear valley and links to the riverside walk around the wooded site. Our new Clayport Library and council offices re-complete the existing building frontages, severed by the 1960's road cutting. At the heart of our new development is the new Gala theatre, cinema and conference complex which sits in pride of place, visible from the main vehicle approaches into the city. The building's have become Durham's new principal cultural venue. To meet the city's business plan and its community brief, the building has air palletted seating allowing the auditorium to switch quickly between theatre, cabaret, exhibition and banquet modes. The building is also fully equipped to broadcasting standards. The rooftop function rooms and foyer bars have spectacular views over the Wear valley. The 150 seat IMAX-style cinema is buried beneath Millennium Place, taking advantage of the dramatic change in level across the site. The cinema shows widescreen tourist oriented films for the tourist information centre by day and commercial films in the evening. Our development also provides a new pedestrian route between the new riverside hotel and car parks on the opposite bank of the River Wear and the peninsula. Once the adjoining commercial development is complete, Millennium Place will link to the river walk and footbridge to complete the vision for the area. 'The spectacular and contemporary treatment of the Claypath site forms a dramatic and complementary foil to the historic fabric of the old city, symbolising its cultural regeneration.' Durham City Council. (MJP)

#### **Ruskin Library, Lancaster University, Lancaster – UK 1997**

Our building for Lancaster University houses the Whitehouse Collection of works of art and writings by John Ruskin. Set at the entrance to the University campus, the library is a symbolic gateway to the University. It forms an escarpment at the west boundary of the University, and offers a dramatic view towards the sea. The building accommodates archive storage (known as the treasury), together with a reading room, curatorial offices and public gallery spaces. A double height entrance gives access to the gallery spaces, which are connected through the treasury by a glass bridge. Metaphor and allusion were used in the planning and detail design, with the sequence of spaces being deliberately church-like; the entrance, treasury and reading room respectively represent the narthex, choir and sanctuary of a church. The linear arrangement of the building meets the need for security, with the reading room remote from the entrance and only accessible through secure doors controlled by the curatorial staff. The construction of the treasury as a 'building within a building' physically isolates the collection, creating the stable atmosphere and environment necessary for conservation of the archive without the need for air conditioning. The library's massive construction and the inclusion of a basement provide security and environmental inertia to the reading room, the foyer and public galleries above. (MJP)

## Lancaster University Library, Lancaster – UK 1996

€ 4.000.000

The first phase of a major expansion of the existing library, accommodating a new user services department, book-stack area and a fully integrated IT department, comprising seminar/ lecture and group reading suites, open learning areas, alternative learning technology centre and facilities for multi-media reading. The building also accommodates a new archive storage area (to BS.5454) with a dedicated reading room and exhibition area. In the uncertain future of libraries and the nature of information retrieval and use, the library provides deep plan, flexible space to accommodate a wide spectrum of library uses – from high density PC use, IT teaching technology development and staff areas, to traditional book storage and reading areas. The raised floor contains all telecommunications and data cabling and acts as the air distribution plenum. The building is planned around a top-lit atrium – the location for noisier activities of the library. This concentration of noisy uses frees the perimeter for quiet study. The atrium is closed by the archive area and the double height Reading Room, which provides half the total number of new reader spaces. The Reading Room is a special place, opening out towards the horizon, with its completely glazed western wall and brise soleil screen overlooking the entrance to the University and Morecambe Bay, it acts as a symbol for the library and the University the “locus of learning”.

(MJP)

## The Cable and Wireless College, Coventry – UK 1993

€ 24.000.000

### **Awards:**

**The RFAC / Sunday Times Buildin of the Year 1994**

Cable and Wireless acquired a ten acre site overlooking Warwickshire green belt for their new telecommunications training college. MJP developed and wrote a very detailed brief with the client, including environmental objectives for the project. Teaching space is located at the front of the site. An ocular court forms the social hub of the complex, linking residential, administration, catering and teaching facilities. A separate leisure pavilion lies to the east. Teaching rooms are highly flexible, north lit and naturally ventilated; the wings are linked at first floor by a library and telecommunications exhibition space. MJP also managed the fit out of the college. 'What makes the building satisfactory in the end is the way in which each move has been thought through at so many different levels.' Peter Davey - Architectural Review The masterplan and innovative design approach has produced '... one of the best buildings in Europe' Jonathan Glancey Independent. (MJP)

## **Richard Murphy Architects, Edinburgh – UK**

### **Libraries:**

## University of East London, Computer Library and Lecture Theatre, London – UK 2009

Construction Cost £5.5m

### **Literature:**

Stratford Campus, University Of East London, By Richard Murphy Architects Architects' Journal 03 Jun 2010

Top 50 Clients - Education Riba Journal November 2006

Our third commission from the University of East London, this building accommodates 400 computers organised in approximately groups of 30 for both teaching and open access, a 400 seat lecture theatre, seminar rooms and a University entrance foyer. The 'L' shape plan forms two sides of the proposed central college green at the heart of the reorganised campus in Stratford (the other two sides formed by the rear of the existing University house and our recently completed Department of Podiatry and Physiotherapy). The building also acts as a block to the currently dominant Arthur Edwards building and forms a gateway to a second University quadrangle. Internally, the foyer doubles as a gathering space for the 400 seat lecture theatre immediately above and is also freely connected to the computer facility. This is organised as a two storey galleried space and allows students to look out onto the college green. It is hoped with the eventual construction of a new University learning resource centre that the Computer and Conference Centre will also be linked to this facility. (Murphy)

## Kirkintilloch Adult Learning Centre – UK 2009

Phase 1 Architects Richard Murphy, Bill Black, David Stronge, Phase 2 Architects Richard Murphy, Bill Black, David McPeak, David Stronge, Construction Cost £5.35m, Client East Dumbartonshire Council and Strathkelvin Development Company

### **Awards**

**2003 Civic Trust Award Commendation**

The aim of the project was to provide an open learning environment which draws in potential students from all sectors of society and also provides a new home for the classes already located within Kirkintilloch by Strathkelvin Further Education Centre. The building houses an open learning "resource" centre, as well as more traditional teaching rooms, giving learning opportunities and vocational courses for people who missed out on further education or who want to return to it later in life. A major emphasis within this idea is the use of computers as an electronic library as well as for teaching basic computer skills.

The site forms part of the narrow strip of ground between the Forth-Clyde Canal and Southbank Road in the centre of Kirkintilloch. The canal bank itself slopes steeply into the water and was previously covered in trees and scrub vegetation.

The building is laid out as a linear plan with a two storey block to the south side housing classrooms and offices. Against this sits a lean-to structure which houses the open learning facilities and projects out onto the canal bank.

The entrance to Phase 1 (previously to one end of the linear plan) is now positioned in the centre of the completed building. The reception orientates the visitor and first time student within the main double-height space, allowing a clear reading of the building to be made with the majority of the classrooms and computer resource space to the left and the café and other administration offices to the right. A void behind the reception, through which the stair descends past a seated area, which protrudes out over the canal, makes connection to the lowest level which houses the open resource areas.

The main open learning space looks over the canal with a series of triangular bays forming workspaces almost among the trees retained on the canal bank. Access to the classrooms and other facilities is from an open gallery on each floor, the aim being that all activities take place in the open learning area except individual classes. The classrooms then face out to Southbank Road with the upper level rooms sitting beneath a light weight roof edge and clerestory windows. The lean-to roof and the classroom roof are separated by a continuous roof light which allows sunlight into the main space, controlled by moveable shading systems.

The roofs are intended to form a simple datum below which the planes and levels within the building are arranged to give a dynamic composition to section and facades. The canal bank will be replanted so that the building is amongst trees. This should maintain the wildlife corridor of the canal as it comes into the semi-urban town centre.

The building as a whole was completed in February 2009. (Murphy)

### **Computer Center, Merchiston Campus, Napier University, Edinburgh – UK 2001**

#### **Awards:**

RIBA Award 2003

Scottish Design Award 2003

The University wished to enhance its present computer teaching facilities with the provision of a new 24 hour-access 'computer centre' within its existing campus buildings at Merchiston. It centralises 500 workstations and provides support space for technicians and computer servers together with ancillary accommodation. The new centre is intrinsically linked to the existing university buildings which surround it (there are no elevations), although a separate entrance will however give both open access to students 24 hours a day and provide it with a separate visually identifiable presence. The brief was very simple and yet a room of 500 terminals with no clear subdivision or defined circulation could have been a daunting prospect. We elected to immediately subdivide into a matrix of 5 x 4 bays defined laterally by five parallel barrel vaults and longitudinally by a stepped hillside of four terraces. A tartan grid of circulation weaves its way between, under valley gutters in one direction and vaults of light in the other. The whole is supported on clusters of columns and the entire composition is surrounded by light from hidden perimeter roof lights where there are also ramped access routes. The vaults themselves are lit from the sides by sunlight reflected upwards so that sunlight doesn't fall onto computer screens. Placed centrally within the matrix is the main support desk, providing them with both a commanding overall view of the facility and also of the main entrances. (Murphy)

### **Eric Parry Architects, London – UK**

<http://www.ericparryarchitects.co.uk>

#### **Libraries:**

### **Bedford School Library, Bedford – UK 2003**

£ 1.200.000

#### **Awards:**

National Design Award Civic Trust 2005

In October 2000 Eric Parry Architects were invited to take part in a RIBA competition to design a new library building for Bedford School. We won the competition and were appointed in January 2001. The site for the new library is on the staff car park to the west of the existing school library. The library addresses the range of main school buildings, establishing a front elevation that works around the existing library rather than behind it. A sequence of spaces within the library progress from the informal lobby housing the newspapers and journals, through to the quieter study areas facing the garden. From a single front elevation the building splits into two wings. To the south is the quiet study area with a seminar room above. To the north is the two storey library with a mezzanine accessed by stair or lift. The library was officially opened in January 2004 by Poet Laureate Andrew Motion. (Parry)

### **John Pawson Ltd., London – UK**

<http://www.johnpawson.com>

#### **Libraries:**

### **Design Museum, London – UK 2014**

....Due to open to the public in 2014, the £80 million plans include galleries for permanent and temporary exhibition spaces, an auditorium and a library, which will accompany a separate housing development by Dutch firm OMA.

The former Commonwealth Institute, which was completed in the 1960s, hasn't been used for over ten years but will retain its hyperbolic paraboloid roof structure in the refurbishment.

New glazed entrances will lead in towards the galleries located on the ground floor, basement and second floor, giving the museum three times the exhibition space of its current home at Shad Thames on the Southbank....

<http://www.penoyre-prasad.net>

#### **Libraries:**

### **Templeman Library at Kent University Extension, Canterbury – UK 2014**

Client University of Kent, Value £12m extension / £10.5m refurbishment, Completed 2014

Our competition-winning design for the new £12m extension to Templeman Library at Kent University, Canterbury, will provide a 5,200m<sup>2</sup> extension to the existing library, and refurbishment of the original building designed by Lord Holford (\*22.03.1907

Johannesburg/South Africa - + 17.10.1975 London) and constructed in three phases between 1965 and 1990.

The existing building has been frequently adjusted in its lifetime. Our approach is to reveal its hidden strengths by:

—Removing sections of floor structure at each level in the central core of the building to let in daylight and create views through the building.

—Replacing the glazing with curtain walling to weave the new extension and the existing building into one volume.

—Design fitted furniture pieces to punctuate the existing space and combine with flexible mobile furniture to enable easy access to power and data.

The proposals will create a vibrant contemporary building for study, interaction and exploration, bringing together a variety of reader spaces, versatile collection and exhibition space, and a distinctive resin clad 250 seat lecture theatre. The treatment of the extension façade inverts the balance of the original brutalist architecture of the building to create a strong and holistic architectural identity.

This long-term, easily-phased solution will create a step change in quality across the whole library development to re-emphasise its enduring and pivotal role within the campus. The newly enhanced 'lawn entrance' to the south is combined with improvements made to the north of the building which will create a cultural avenue, linking the existing theatre and architecture school.

The project aims to achieve BREEAM Excellent.

Construction of the extension and first phase of the refurbishment is due for completion in September 2014. (Penoyre)

## **Jubilee Gardens Primary Care Centre and Library, London-Ealing – UK 2010**

Client Building Better Health Limited, Value £5.4 m

The new Jubilee Gardens Primary Care Centre and Library replaces two existing buildings on adjacent sites and creates a unique combination of healthcare and a local community facility. The building occupies the former branch Library site next to Jubilee Gardens and is situated in a quiet suburban cul-de-sac, forming the park approach.
