A spacious, two-storey, glazed entrance hall gives access to the library, a seminar room for community use and internet point. The entrance hall also contains the main waiting area for the health centre and its main reception. There are a range of bookable consulting rooms, group room and audiology suite at ground floor. At first floor there are consulting and treatment rooms for 3 GP practices and District Nurses, arranged around a sub-waiting area overlooking the main entrance hall. The upper floor level is dedicated to staff areas and offices for administration and outreach staff. A staff terrace overlooks the park to the east.

The elevations and materials are sympathetic to the local surroundings and the brick and copper coloured cladding echo the materials of the former library building. (Penoyre)

## **Crawley Library, Crawley, West Sussex – UK 2008**

Client West Sussex County Council, Value £12.5 m, Completed 2008

### **Awards:**

**RIBA Award, South/South East**

**West Sussex Design and Sustainability Awards**

Crawley Library creates a new major civic building and destination for the community comprising 2850sqm public library, 450sqm Register Office, together with 1170sqm Social Services facilities. Our brief was to develop these areas in an accessible and welcoming integrated development forming part of a long term masterplan for the wider area around a new public open space, bringing together the various stakeholder in a timeless yet contemporary civic building. Consultation and community participation formed an important part of the client's requirements and detailed aspects of the brief was developed through extensive liaison with library and registration service staff and end users. The consultation drew on workshops with artists Gordon Young and Anna Sandberg which clarified library end user priorities and informed an art commission for a series of engraved oak columns carrying quotations of favourite books etched into the stripped oak trees. Sustainability was a high priority for the client and this is reflected in the sustainable low energy design which achieves a BREEAM rating of very good and extremely low carbon emissions: 11.94 kgCO<sub>2</sub>/sqm p.a. compared with 30.31 kg CO<sub>2</sub>/sqm p.a. permitted under Building Regulations. Planning and Social Constraints - The Library forms a first phase of an extension to Crawley town centre. We worked with the county council, planning authority, English Partnerships (HCA), and developers to coordinate a masterplan for the phased long term development of the area. The Library's new public square forms the focus of this masterplan and will allow the diversion of Telford Place to create a vehicle-free heart to the neighbourhood in the next phase. The site acts as an important Gateway site into the town centre and early consultations with the planning authority highlighted concerns that a standalone library would not provide appropriate civic presence and massing. Our initial feasibility study informed an expansion of the client brief to include other local public services and an upper storey of administrative accommodation. This mix of uses allows the building mass to step down from four storeys facing the town centre to two storeys more in keeping with surrounding streetscape. Materials and Method of Construction - The brief and prominent town centre location called for a building which expresses civic qualities suitable for public services in the 21st century. This was achieved through playful elevations exploring variations of rhythm between stone and glazed panels addressing the need for transparency to showcase facilities and provide good levels of daylight. The width of the panels is based on the width of a standard shelving unit, allowing a unique relationship between the exterior and interior whereby the books are actually embodied in the thickness of the building envelope. Subsequently freed-up floor space contributes to a light, airy and accessible interior. Designed as an exemplar for sustainable construction with Green Guide to Specification Class A building materials, the building form was developed to minimise energy consumption through a sophisticated mixed mode heating and ventilation strategy which informs the choice of materials throughout. Ventilation is regulated through BMS controlled actuators. In wintertime, tempered fresh air enters via raised floors across underfloor heating coils, and is extracted via a central heat recovery system at a wind trough at the top of the atrium. Renewable energy technologies used include central biomass and solar thermal hot water. A sedum roof contributes to biodiversity and rainwater attenuation. A lifecycle cost plan informed key specification choices to minimise whole life costs. Exposed roof finishes were replaced by ballasted systems. Hard wearing cladding materials such as Jura limestone, engineering brick and curtain walling were specified for accessible or vulnerable areas. Internal finishes in public library area are specified for durability. Programme and budget constraints - From early design stages onwards a life cycle cost plan was developed which informs key aspects of the design to achieve long term economies in operation, for example through low energy design, the use of robust long-life materials, and the integration of the library with other county council facilities for building management efficiencies. Design development was managed to achieve best value with costs regularly evaluated against design objectives to ensure decisions add real value. Spending was focused on obtaining high quality design and durability for public areas – for example focusing natural stone on principle elevations, and provision of metal rather than timber shelving, solid core laminate table tops, and chairs with robust stainless steel frames. The main contractor was selected through a two-stage IESE Framework process allowing costs and specification choices to be checked in relation to supply chain information immediately following completion of RIBA Stage D to achieve competitive pricing.

## **University of Portsmouth, University Library, Portsmouth – UK 2004 – 2007**

### **Awards:**

**Civic Trust Awards Commendation 2008**

**Portsmouth Society Awards 2008**

The 3.600 m<sup>2</sup> extension to the existing university library establishes a clear and attractive entrance plaza and gateway to the park. In the 30 years since the first stage of the Frewen Library was built, demand on the library has dramatically increased. The extension provides a new triple height entrance, and IT facility, a cafe and a series of seminar rooms around a planted courtyard. The two new upper floors contain the library stack areas and reading carrels overlooking the park and also connecting back to the existing building. Built as part of the original masterplan the Frewen Library has served the needs of the growing University of Portsmouth since 1977. The new extension, with its strong entrance, has dramatically improved the experience of arrival and circulation of the library. It is approached from the Library Plaza, a new public space created on the axis of Cambridge Road. Welcoming students into the library is a triple height, light filled hall, orienting them in a dynamic space interconnecting with the existing and new parts of the library. We have designed a flexible building to allow variable use patterns of controlled opening including 24 hour access to IT areas. The new extension will be a recognisable and active heart for the facility bringing identity and importance to the Frewen Library as a central element of the university. (Penoyre)

## **Pringle Richards Sharratt Architects, London – UK**

<http://www.prsarchitects.com>

### **Libraries:**

#### **Black Cultural Archives, Brixton, London – UK 2010**

737 sqm, £3.5 million

### **Awards:**

**BD Architect of the Year Award (2011)**

**BD Architect of the Year Award (2010)**

Pringle Richards Sharratt was appointed to design the new Black Cultural Archive in Brixton, London, following a competitive interview.

The project is a joint venture between Lambeth Council and the Black Cultural Archive to provide new accommodation for black cultural artefacts and archives in a controlled environment within the UK for the first time. The building will be opposite Lambeth Town Hall and form part of the challenging redevelopment of Brixton Town Centre. A substantial part of the project will be the refurbishment of Raleigh Hall, a listed building owned by Lambeth Council and made available by them for the sole use of the BCA. The new BCA will provide a much needed new focus within both Brixton and the UK for the black community. The building will provide flexible space for external events and the presentation of temporary exhibitions like 'Black Gold' which was carried out recently by the BCA as a joint venture with the V&A. The scheme will involve the complete refurbishment of the listed buildings to create new exhibition space, visitor centre, interactive orientation area, library and conservation spaces, as well as creating a new extension providing integrated storage for the collection to BS 5454.

The project is funded by the Heritage Lottery Fund, London Development Agency and London Borough of Lambeth. (Pringle)

#### **Hull Historic Centre, Hull – UK 2010**

### **Awards:**

**Civic Trust Award 2011**

**Wood Award 2010**

Hull History Centre is a new two-storey building containing the archives of the City of Hull. The archives are stored on the first floor, and the ground floor provides public spaces – reading rooms, exhibition spaces, and lecture theatres. The entrance is through a public arcade and winter garden, which runs the full length of the building. Structurally the building consists of two very different forms – a plane two-storey concrete frame, and a two-storey high atrium formed of ETFE panels supported on curved Glulam ribs. The concrete frame has to support the heavy weight of the archives in rolling stacks, so the columns supporting the flat slabs are relatively closely spaced to control the deflections. The soffits of the slabs are exposed to provide their part of the thermal flywheel, and are meticulously detailed with shutter panels organised and joints exposed. The entrance arcade is a series of ETFE cushions supported on two-storey high curved Glulam ribs, elegantly fixed to steel shoes at top and bottom and laterally restrained by a small steel purlin at mid height. Glulam ribs at the eaves take the tension forces from the cushions. These ribs are singly curved, and set at about normal to the roof slope, creating a continuous ripple of the eaves in plan and elevation, which nicely relates to the soft curves of the cushions. This is a very carefully considered and well detailed example of exposed structure, expressing the different functions of the parts of the building. The result has delighted the people of Hull, who have visited in large numbers.

#### **Radcliffe Science Library, Oxford University, Oxford – UK 2004 - 2007**

£ 2.400.000

### **Awards:**

**Oxford Preservation Trust Award 2009**

Oxford University has recognised, for a number of years, the benefits that could be achieved from the development of a more unified and rationally organized library system involving the many libraries funded by the University. This project is part of the Oxford University Library Service's strategy for a more integrated, more efficient and more user-friendly library service. The proposals allow the Radcliffe Science/ Hooke Lending Library to play an important part in the OULS strategy to create "A University Library for the 21st Century". The proposals are linked to the creation of a new Depository as this would allow the further expansion of book storage and provide the future space to complete the reorganization of the RSL to take on its role as a "Science Hub". Over time it will also allow the incorporation of those departmental collections that wish to become integrated in the RSL-Hooke. The scheme equips the RSL to act as the principal 'hub' for science and medicine reference and lending books at Oxford University. This is achieved by:

- Enhancing integration between the two main above-ground components of the existing RSL/Hooke complex, the Worthington and Jackson Wings.
  - Providing a newly-designed entrance hall which will enable the combined RSL/Hooke to function as a lending library.
  - Providing more coherently arranged staff working areas.
  - Providing facilities which will allow the RSL/Hooke to comply with current building legislation for disabled access plus fire safety.
- The scheme provides a replacement for the existing link between the Worthington and Jackson buildings and the creation of a more visibly logical entrance from the museum forecourt. (Pringle)

#### **Pitt Rivers Research Center & Balfour Library, Oxford University, Oxford – UK 2004-2006**

2,100 sqm, £ 5.000.000

The clients brief was for a new building to contain public facilities for Museum visitors, lavatories, lecture and seminar rooms and a special exhibition gallery, a library for students, research areas for staff and visiting academics, conditioned storage for museum objects, conservation and collections management facilities, and offices for academic and administrative staff. Planning Constraints: The site for the building was an area of lean-to buildings and turn of the century corrugated iron huts, built against the walls of the Pitt Rivers Museum, and the Oxford University Museum of Natural History. The site was in the curtilage of a Listed Building, and Listed Building consent was required both to demolish the lean-to buildings and corrugated sheds, (which were not listed but of historic interest) and also to demolish the existing staircase of the Pitt Rivers Museum, to allow the new building to adjoin the Pitt Rivers Museum at that point. The Research Centre contains a new staircase, and a lift, which the public can now use to circulate to the upper galleries in the Museum. There was also a small stone gabled addition (originally built onto the Oxford University Museum) but in use by the Pitt Rivers Museum, which was demolished to allow the new building to take a regular form. The challenge was to build a modern building, amongst the existing Victorian museums. The mass of the building, a large volume with a steep roof, was taken from the forms of the adjoining buildings. The long vertical window was designed to make a "break" between the new buildings and the existing stone facade of the Oxford University Museum.

Materials and Method of Construction

The building has a load bearing Hornton stone façade, with timber sliding windows by Rationel. Access to the windows is via a galvanised metal balcony which has also been designed as a sun-shade to the south façade. The structure is steelwork, (which in most areas is exposed) with Omnia concrete planks. The roof is supported on a vast glue-lam beam, and comprises solid timber panels, lined with birch. At the top of the roof is a large rooflight, allowing ventilation and daylight to the large central workspaces. Two voids in the second floor allow daylight to penetrate to the first floor workspace.

Summary of Timetable and Programme.

Before our involvement, the feasibility study proposed a two phased building, over several years, to quite a high budget. We were taken on board and had two weeks to convince the client to do a single building, from the start, and contain the phasing within the finishes inside the building. This approach produced enormous cost and time savings. We were appointed in February 2004. We were out to tender by October 2004 (single stage design and build) having obtained planning and listed building consent, including demolition of the lean-to buildings, and were on site by April 2005, with completion in November 2006. The programme was influenced by the expenditure of SRIF funding which had already been obtained for the project.

Budget Constraints

The project was designed to a very tight budget. The project was Design and Build, and we were novated to the Contractor, but also kept a watching brief for the Client. We have tried very hard to make the building appear good quality, and have had to constantly change materials internally and come up with new, cheaper suggestions. We have used simple materials, and clung onto one or two very strong ideas, somewhat may – imaginative lighting, the big timber roof, carefully sourced and researched stone. The windows are timber instead of steel, as a result of value engineering, but they are very good quality. The landscape is minimalist as there was a minimal budget. It is a very good value building. (Pringle)

**[Oldham Library and Lifelong Learning Centre, Manchester - UK 2004-2005](#)**

6,300 sqm, £ 12,000,000

**Literature:**

Oldham Library - High-density race warning: *Building Design* 03/11/2006

Oldham Library - Oldham's Double Bill: *Building Design* 09/06/2006

The Library and Lifelong Learning Centre is the second phase of the new Cultural Quarter in Oldham, and is situated adjacent to the first phase – Gallery Oldham. The approach to the Learning Centre is through the double height entrance foyer of the Gallery. Increased in size the foyer forms an access hub for the Gallery, Library and Lifelong Learning Centre at the very heart of the Quarter. The building form peels away from the linear gallery orientating it towards the broad expanse of distant moorlands to the South and East. Views from the second floor Galleries toward the South are maintained and enhanced by a sedum roof to the library and a ‘blade of light’ – a north-light that reflects the sky and extends along the length of the new building. Public areas are located across two open floors, with exposed concrete soffits articulated by linear slots cut through the floor and roof slabs, allowing the stairs, lifts and daylight to penetrate through and link the floors together. Terracotta panels, exposed concrete and cast glass – the palette of materials used on Gallery Oldham – has been used again to present an articulated single building. A performance space enclosed within an oval form and clad in copper, is dramatically expressed against the regular texture of the southern elevation, providing a strong image when viewed from the by-pass and the southern wards of Oldham. As with Gallery Oldham the use of free energy has been maximised where possible – daylight, thermal mass, natural ventilation, and solar shading are all employed to minimise running costs while at the same time introducing a feeling of wellbeing. The building was procured via a Private Finance Initiative with Kier and Barclays Bank forming the SPV. (Pringle)

**[Graves Art Gallery and Central Library, Sheffield – UK 2001](#)**

4,000 sqm, £ 11,500,000

The practice carried out a masterplan for the redevelopment of the Graves Art Gallery and Central Library in the centre of Sheffield. The aim was to reconfigure the building to enlarge the gallery accommodation and make it more accessible to the public, as well as redeveloping the library and the community theatre, to suit modern requirements. The challenge was to make the building accessible, as it is located on a sloping site with very little space in front of the entrances, all of which are addressed by a steep flight of steps. The building is close to the Millennium Galleries and Winter Garden, and one of the objectives was to provide a common identity for both the Millennium Galleries and The Graves Art Gallery, to create an identifiable arts quarter in the city centre, linked to nearby theatres and the Winter Garden. The masterplan was explored through a series of option studies, which covered all possible approaches from a relatively simple refurbishment to large-scale redevelopment and extension. (Pringle)

**<http://www.qftarchitects.com>**

**Libraries:**

**[Downing College, Maitland Robinson Library, Cambridge – UK 1990 – 1992](#)**

This new library is built on the principle that the books are stacked in the centre of the plan with the carrels arranged under the windows. Thus a square building is formed with a central octagonal staircase providing access between the basement, ground and first floors. With the college's commitment to classicism from Wilkins onwards and the strong emphasis on the Greek Revival, it was felt appropriate that this building should form a 'capriccio' of the outstanding monuments of the Acropolis. For that reason the Portico of Augustus forms the main entrance and south portico of the building; the Choragic monument of Thrasylus forms the East Portico; and the Tower of the Winds forms the octagonal cupola, which has a Greek Corinthian capital at the apex with a weathervane. The Greek names for the eight winds are inscribed on each of the eight faces of the octagon.

The whole building is made in natural Ketton stone in loadbearing construction. Each of the metopae has been carved to symbolise tripos subjects that are taught in the college.

The entrance doorcase is a combination of Greek work with splayed architraves combined with Michelangelo's doorcase at the Medici Chapel, Florence where the reduction in width of the architrave and fine detail foreshadow the change in taste from the Roman to Greek detail. (Qinlan)

To the southerner Stromness is located in the far north, a place more Scandinavian than Scots. To the Orcadian, Stromness lies on the threshold of a more imaginative North, where thoughts of Thule begin.

We view our work through the mirror of a northern modernism. We continue to be interested in the simple resolution of an architectural proposition. We search for stillness, lightness and clarity. A poet friend, Thomas A Clark, wrote that "reticence is a kind of shade." As fair-skinned northerners it is wise to seek out the shadows.

Stromness has a unique foreshore of stone piers that span the high and low watermarks along the northern shore of the Hamnavoe. The PAC occupies a strategic position within this stone fringe, adjacent to the point of arrival for Stromness and at the entry to an extraordinary stone city.

The PAC is home to an internationally acclaimed collection of contemporary art. The PAC is a collaboration of permanent collection and temporary galleries. The project involved the refurbishment of historic pier buildings, along with the creation of a new gallery building.

The building consists of three distinct elements: a building that is part of Victoria Street and two parallel buildings that extend from the street towards the sea. The street building contains entry, administration and library along with an artist's studio. The original pier building contains the collection while the new building contains temporary gallery space along with service areas and in its attic, the collection archive.

The new building adopts a simple pitched roof recalling a traditional waterfront warehouse. The building is clad in the black vestment of a dignified and valued elder. This signifies its cultural significance yet it also has a quality that is ambivalent and melancholic. Its familiarity however is transformed and undermined through a façade that shifts from solid to void; black zinc ribs alternate with translucent glass infills.

Ragna Robertsdottir, an Icelandic artist who creates veils of volcanic particles, clarified the idea for a façade that shifts as the viewer moves. The glazed façade describes the linear circulation that connects all three buildings. The spacing of the ribs echoes the original gallery's rafters. When seen gable-on the new building appears solid but dissolves as the viewer moves, allowing the original pier building to gain prominence. The building is grounded in its location yet through a lightness of touch escapes the Medusa effect of the prevalent stone culture.

The Victoria Street building is seen as the antithesis of the black house, all is white. Again this expression is familiar yet it has an uncanny air about it. The townscape of Stromness is dun coloured while the whiteness of the Pier Arts Centre hints at the spectre. Internally the spaces are a backdrop to the art. Their surfaces are bleached or translucent. Within these muted spaces moments of clarity connect the viewer back to the northern landscape.

Beyond the technical the PAC is sustained by a fragile community and in turn sustains the culture of that community.

#### **Ebbisham Library and Lifestyle Centre (Epsom Library), Epsom, Surrey – UK 2001**

Library: 1.392 m<sup>2</sup>, £ 3.300.000

The Ebbisham Centre is a combination of public and private facilities made possible by collaboration between Epsom and Ewell Borough Council and Surrey County Council. The Centre aims to foster the general health and well-being of the local community through offering a wide variety of social, recreational and leisure activities. The Ebbisham Centre accommodates Epsom Library, The Derby Medical Practice, Chapters Café and a Lifestyle Pilates Studio, whilst offering a variety of bars and restaurants within the two squares. For meetings and conferences there are six especially designated rooms for business use and local groups. The Centre incorporates modern, meeting rooms and exhibition space including [The Zone](#), a large separate area for presentations, exhibitions and sports activities, and [The Spa Lounge](#), an area where community groups can meet and enjoy social activities. The Ebbisham Centre aims to provide a wide range of community facilities in order to encourage individuals and families to participate in new interests, whilst focusing on a holistic approach to health and well-being. The whole development has been designed to be user friendly and provide easy access for all ages and abilities. To complete a visit to The Ebbisham Centre, users can enjoy a wide range of refreshments and delicious food at [Chapters Café](#) conveniently situated next to the Library.

#### **Information Commons, Sheffield University Library – UK 2007**

RMJM was appointed by the University of Sheffield in November 2003 as architect and lead consultant for the £ 23 million Information Commons project. This 11.500 m<sup>2</sup> building provides a 24/7 integrated learning environment for undergraduate and post graduate students. It provides 1.350 new study spaces where students can study individually or in groups, using print and electronic materials. It has been designed to accommodate current and future learning methods and technologies. The Information Commons building is situated in the heart of the Sheffield's urban campus, which was the subject of a development framework study by RMJM.

#### **University Town Library, University Shenzhen – China 2007**

### **Awards:**

2007: AIA Hong Kong Chapter Merit Award

2008: The Chicago Athenaeum Museum of Architecture and Design, International Architecture

2008: Hong Kong Design Centre - Design for Asia Merit Award

The Building was completed in December 2006 and opened to the public early 2007 and provides a new perspective on sharing resources while acting as a gateway icon. The Library designed by RMJM serves four university campuses spread on either side of a canal. The building itself acts as a bridge linking these previously disconnected facilities. Students, staff and the wider community are free to pass through and over the building to make this connection. Its 480m long undulating form mirrors the topography of the landscape while its dragon-like shape, contemporary materials and function aim to reflect the erudite language of education. Glazed façades encourage views out to the surroundings, while providing layers of sun-shading to reduce heat gain on library spaces within. The Library was designed to hold 1.5 million books, 3000 seats, 1700 data ports and 8000 visitors daily and sits on a 51,600m<sup>2</sup> site area in the suburb of Shenzhen.

(<http://www.detail.de>)

The scheme is a new 'gateway icon' for the campus shared by the graduate schools of Peking University, Tsinghua University, Harbin Institute of Technology and Nankai University.

The University Town Library provides a new perspective on sharing resources: the library serves three university campuses spread on either side of a canal. The building itself acts as a bridge linking these previously disconnected facilities.

Students, staff and the wider community are free to pass through and over the building to make this connection. Its 480m long undulating form mirrors the topography of the landscape while its dragon-like shape, contemporary materials and function aim to reflect the erudite language of education.

Glazed façades encourage views out to the surroundings, while providing layers of sun-shading to reduce heat gain on library spaces within. The library was designed to hold 1.5 million books, 3,000 seats, 1,700 data ports and 8,000 visitors daily and sits on a 51,600 sqm site in the city of Shenzhen. (RMJM)

## **Rogers Stirk Harbour + Partners, London – UK**

<http://www.rsh-p.com>

### **Libraries:**

#### **Library Thames Valley University (TVU), Slough – UK 1993 – 1996**

### **Awards:**

Civic Trust Award 1997

RIBA Architecture in Education Award 1997

RIBA Award 1997

Structural Steel Design Award 1997

Thames Valley University (TVU) is one of a number of new British universities developed from former further education institutions in the 1990s. The existing campus at Slough, developed from the 1950s on, was undistinguished, with poor public spaces and indistinct circulation routes, and isolated from the town centre by a main highway and railway line. The practice was asked to carry out a masterplan for the future development of the campus and to identify a site for the proposed learning resource centre, essentially a library but with provision for the use of computers, videos and other new information technology as well as books. The university wanted a clearly accessible building which could be built to a tight budget and a fast construction programme. The completed building is both straightforward (in terms of its simple diagram, balancing a "warehouse" storage area with an open reading and reception space) and highly memorable. The linear, three-storey bookstack block is contained within a fair-faced in situ

concrete frame. The reception and reading area is covered by a curved steel roof structure, fully glazed at each end and with a 40m long window opening extending the length of the reading room and providing views of a new external pond. Solar control is provided by internal motorised fabric blinds. Ventilation is primarily non-mechanical. The tough finishes and strong colours of this striking building, which cost just £3.6 million including new landscaping, recalls Rogers' work of the Sixties and early Seventies, not least in its references to the metallic aesthetic of the Case Study houses programme. (Rogers)

### Law Court, Antwerp – Belgium 2006

Antwerp's New Law Courts will be a catalyst for RRP's long-term masterplan for the new 'Zuid'.

The site for the Law Courts is the Bolivarplaats, on the southern edge of Antwerp's central area, where the urban fabric is broken by a massive motorway interchange, cutting off the boulevard that leads into the city. The building, designed in conjunction with VK Studios, was conceived both as a gateway to the city and as a link across the motorway between the city centre and the Schelde River. It houses eight distinct civil and criminal courts and includes 36 courtrooms plus offices, chambers for judges and lawyers, library and cafeteria, with a great public hall (the space traditionally known as the "Salle des Pas Perdus") linking six radiating wings of accommodation. This space is capped by a striking roof structure, crystalline in form, linking the paraboloid roofs that cover the courtrooms.

Unlike traditional Law Courts, the new scheme creates courts, hearing rooms and public space, all filled with natural light, as well as providing spectacular views across the city. Highly transparent clear-glazed atria, lifts and stairwells provide instant legibility and respond to the initial brief to make the workings of justice more transparent.

Coloured steel work also acts as an orientating device that is legible both in the broader context of the city and from within the building. The building, straddling a major highway, looks out to a large area of open land. The design creates 'fingers' of landscaped parkland which extend right into the heart of the building.

When designing the new Law Courts building, RRP also focused a great deal of attention on the environmental aspects of this project and on the effective use of energy. Natural light is used to optimum effect, natural ventilation is supplemented by low-velocity ventilation for the hearing rooms and rainwater is recycled. The environmental strategy is based on utilising the thermal mass of the pre-cast concrete frame, the reduction of solar gain by high performance glazing and the use of external glazed louvres. The new Law Courts for the City of Antwerp were formally opened on 28 March 2006 by King Albert II of Belgium. (Rogers)

#### **Manchester Town Hall (City Council) Redevelopment + Central Library, Manchester – UK 2013/14**

collaboration with Jan Simpson Architects, Manchester <http://www.jansimpsonarchitects.com>

David Green, project architect at Ian Simpson Architects:

A key idea has been opening up the courtyard to create connections between different levels and taking natural light through the building. We are also bringing back some spectacular internal spaces, including the grand, curved, stone-lined Payments (Rates) Hall. The main challenge has been balancing this transformation vision against the historic fabric. However, in many ways, E Vincent Harris' neo-Gothic design for the Town Hall Extension helps the low-carbon strategy – the high ceilings, large windows, narrow floorplates and heavy masonry and exposed concrete soffits all support natural ventilation. The extension and central library projects have progressed simultaneously, to similar deadlines, and we have enjoyed the collaborative approach to the project and the opportunity to work closely with another architect. It has been interesting, and often enlightening, to see how another designer approaches a similar problem.

Lee Taylor, project architect at Ryder Architecture:

The main project drivers are to provide an environment in which visitor numbers can be increased from one to two million per annum and allow greater public access to historic and archive material. We want the refurbished central library to be a place where people want to be. It will appeal to new and existing users alike and provide increased access to a wider range of material and activities. It will support transformation in the delivery of library and archive services. Through a new, linked, city lending library located within town hall extension and containing modern content and a children's library, central library will have clarity of purpose as the regional hub for historic and archive material. The building is an intriguing hybrid of 1930s technology and classical architecture, a hallmark of E Vincent Harris' work. Nothing is quite as it appears; a concealed steel frame is clad internally in Manu marble tile and render giving the appearance of stone, and apparently solid perimeter walls contain air plenums and routing for integrated services distribution. (<http://www.architectsjournal.co.uk>)

The Central Library is a part of the wide refurbishment of Manchester's Town Hall complex. The magnificent Grade II\* listed library was built in 1934 (1930-1934: Emanuel Vincent Harris 1876 (Devenport, Devon – 1971 Bath). It occupies a stunning location in St. Peter's Square at the head of the civic complex and Oxford Road Knowledge Corridor. The vision for the redevelopment is that knowledge and learning will be shared amongst customers through a new use of space. The client brief is to create:

- a place of unique and memorable experiences
- a place that stimulates individual creativity and thinking
- an environment that induces relaxation and new thinking
- a place of openness, warmth and life
- a space that entices and inspires
- a place that pulls you back
- a place that reflects the role of Manchester as the original modern city

(Ryder)

Manchester Central Library is part of the wider refurbishment of Manchester's town hall complex. The grade II\* listed library, built in 1934, occupies a stunning location in St Peter's Square at the head of the civic complex and Oxford Road Knowledge Corridor. The ultra modern flagship library in its day had become tired, cluttered and no longer viable for the current role and content of libraries. The existing symmetrical circular structure was disorientating with too few points of reference as the visitor moves round its circumference. Stairs were enclosed and uninviting. It was designed as a civic statement and not as a visitor experience. The main driver was to increase visitor numbers from one to two million per annum, to create a regional hub for film, photographic and paper based archive with repository storage, to allow greater public access to archive and historic material and to bring back the original clarity and architectural intent of key heritage spaces.

Ryder has transformed the previously rather forbidding and confusing building into a welcoming series of interconnected spaces. The existing book stacks were removed, which in turn meant taking out all the floors, and the insertion of new vertical circulation linking all levels. Clear, contemporary staircases and scenic lifts span the newly created floor apertures at each level. The generous new sweeping stair and glazed lifts take the visitor on a journey through the building. (Ryder)

### City Library, Newcastle upon Tyne – UK 2009

8.300 m<sup>2</sup>

The City Library is part of the £ 40.2 M Newcastle Libraries PFI which also includes a new community library for the Newcastle district of High Heaton. The City Library opened in June 2009 and is both a civic landmark and a meeting place. It is a highly transparent building encouraging people to visit and enjoy. The brief was to create a building to delight and inspire as well as a model for C21 library facilities. It is a destination venue with spaces for reading, learning, research, relaxing, meeting and working, inspiring local, civic and regional pride. As well as accommodating the historic Newcastle Collection, music area and reference browsing, the library provides exhibition and performance space. One of the main design features is the steel frame grid which forms the John Dobson Street elevation. Artist Kathryn Hodgkinson has created the screen printed design which runs across the glazing on the grid elevation, inspired by interviews with 1,000 Newcastle residents about their fears, hopes and dreams for the city. (Ryder)

### High Heaton Community Library, Newcastle upon Tyne – UK 2008

The new High Heaton Community Library, alongside the new City Library, is part of the Newcastle Libraries PFI project. High Heaton is a single storey pavilion. The building comprises two organic forms – the library and community room – linked together by common services and staff accommodation. Although irregular in shape on plan the entrance facade and roof line present an even curve facing out to the community. The glazed entrance wall guides visitors through the lobby into the main library space. The enquiry desk and issue counter is next to the lobby, to supervise the community room and public toilets. A curved roof light sits above the enquiry desk, accentuating its location and allowing good natural daylight deep into the floor space. The children's and young adults' area is positioned to allow easy supervision from the enquiry desk. The adult lending and customer service centre occupy the rest of the space. Full height slot windows provide glimpses into and out of the library. The library has a single ply membrane roof, rendered blockwork walls and aluminium double glazed windows and doors. (Ryder)

### Saunders Architects LLP, Southampton – UK

<http://www.saundersarchitects.co.uk>

#### **Libraries:**

#### Sir Michael Cobham Library, Bournemouth University, Bournemouth – UK 2003

Further education has become an increasingly major source of work for Saunders Architects. Our most significant experience was our collaboration with Bournemouth University on a whole range of projects under a framework agreement. The flagship project was the award winning major 4million extension and refurbishment of the library and multi-media resource centre on the Talbot Campus, opened by HRH The Duke of Kent. As well as new education buildings we have been associated with the provision of student accommodation on a large scale. (Saunders)

### Shepherd Epstein Hunter, London – UK

<http://www.seh.co.uk>

#### **Libraries:**

#### Enfield Town Library, London, Borough of Enfield – UK 2010

Work started on site in 2009 for the extension, refurbishment and remodelling of the existing listed Edwardian Library building in Enfield Town Centre. The original part of the 1912 Carnegie Library is to be refurbished whilst later additions are to be demolished with a new extension of glass, concrete and stone proposed in their place. The proposals include relocating the main public entrance from Cecil Road to the adjoining Library Green which will be landscaped. The proposed extension respects the mass and scale of the existing building and its prominence on the streetscape of Cecil Road. It will combine bookstacks with state of the art library facilities, including enhanced IT provision, a café and a dedicated children's library. The old and new will be linked with a two storey top-lit atrium that provides natural light into the centre of the plan and helps visitors to orientate themselves. The structural frame of the new extension is to be formed of exposed concrete and an array of boreholes sunk below the Green will ensure that a large portion of the heating and cooling requirements of the building are provided from a renewable source. (Shepherd)

#### Clapton Library, London Borough of Hackney – UK 2010

Clapton Library is currently closed for restoration and expansion. When the library reopens in Spring 2010, the building will be approximately one third bigger than at present and will include dedicated study and IT areas, a space for teenagers and a meeting room available for hire. The library will be fully accessible, and toilets and baby working with Shepherd Epstein Hunter, a large architectural practice with extensive experience of library design, Hackney council will be restoring the grade II listed building to reveal many historical features which have been hidden for over thirty years, whilst offering 21st century facilities. A single storey structure to the east of the existing library, formerly used as a battery room in the days when Hackney Council generated its own power, will be incorporated into the library. A sensitively designed extension will be constructed above the battery room, and the whole site will when the library reopens, it will incorporate an improved range of books, CD and DVDs. Customers will have the choice of issuing and returning stock themselves, rather than queuing for the counter, and there will be an exciting range of events and exhibitions. Watch this space for further updates! (Clapton Library)

Clapton Library in the London Borough of Hackney, originally designed by Edwin Cooper, was one of three branch libraries built in Hackney just before the First World War, financed partly by the borough and partly by the millionaire philanthropist Andrew Carnegie. Each was a product of the Free Library Movement which sought to improve adult literacy in Britain in the late nineteenth and early twentieth centuries. Opened in 1914, it is now a grade II listed building. (Shepherd)

#### University of Liverpool Library – UK 2008

Shepherd Epstein Hunter (SEH) has won planning permission for a major new library at the University of Liverpool. The £20 million project will link Basil Spence's Sydney Jones Library, built in 1974, and the late 1960s Senate House, designed by Tom Mellor. Both buildings will be adapted and refurbished as part of a larger scheme to create a combined central library facility for the university. SEH's new link building will provide space for helpdesks and information points and will enable access to both buildings across all three storeys. Once complete the three buildings will enclose a new urban space - dubbed the 'library plaza'. This square will boast a new café terrace and will replace the existing, steeply sloped forecourt to the Sydney Jones Building. The project is scheduled to start on site in spring 2006.

### London Borough Enfield, Fore Street Library – UK 2008

The primary objective of this library is to create a relaxed, friendly atmosphere by coming away from traditional library design. A single storey shop unit – a former “Blockbusters” video store – has been converted into the Fore Street Public Library, designed to maximize the exposure of the Borough’s Library service by locating it at the heart of a busy shopping street in Edmonton, London for the London Borough of Enfield.

### University of Kent Library, Canterbury – UK 2008

(<http://www.kent.ac.uk/is/projects/review/pdf/TemplemanLibraryOptionsAppraisalFINALSept08.pdf>)

This project allows the University to take the first steps towards remodelling the University’s Templeman Library facility and analyses a number of options for development so that the University can understand their implications and integrate them within the Estates Strategy and masterplan. The appraisal identified options with estimated costs; examined how the physical work required for each option could be carried out; reported on the condition of the existing fabric, finishes and services of the building that will address the need for essential repair or work to comply with any regulatory failures; and provided a whole life cost study to establish the energy efficiency of the building and proposals for reducing energy consumption. (Shepherd)

### University of Liverpool Library – UK 2008

Project team Architect: Shephard Epstein Hunter; project team: Andrew Long, Nick Hufton, Jason Rivers, Renato Pimenta, Steven Pidwill, Nawed Khan, Michael Fortune, Emily Hall, Emily Barnes, Vivian Varvara Pashiali, Sapna Shah; structure: Gifford; qs: EC Harris; CDM co-ordinator: AA Projects; acoustics: Azymuth Acoustics; landscape: Shephard Epstein Hunter with Annabel Downs; clerk of works: Steve Smith; project manager: Mace; main contractor: Wates; client: University of Liverpool/Sydney Jones Library. Photos: Peter Durant.

Shephard Epstein Hunter (SEH) has won planning permission for a major new library at the University of Liverpool. The £20 million project will link Basil Spence’s Sydney Jones Library, built in 1974, and the late 1960s Senate House, designed by Tom Mellor. Both buildings will be adapted and refurbished as part of a larger scheme to create a combined central library facility for the university. SEH’s new link building will provide space for helpdesks and information points and will enable access to both buildings across all three storeys. Once complete the three buildings will enclose a new urban space – dubbed the ‘library plaza’. This square will boast a new café terrace and will replace the existing, steeply sloped forecourt to the Sydney Jones Building. The project is scheduled to start on site in spring 2006.

Shephard Epstein Hunter has recently completed a £17m scheme that connects two noteworthy twentieth century buildings at the heart of the University of Liverpool campus. A new link building, situated between the Sydney Jones Library by Basil Spence (1974) and Senate House by Tom Mellor (1968), enables the university to double the size of its library and provide a facility befitting its status as a leading centre for research, writes Shephard Epstein Hunter. The three buildings form a square or ‘library plaza’ in place of the unsatisfactory and rather drab forecourt that previously fronted the Spence building. Senate House (renamed the Abercromby Wing) has been completely remodelled and refurbished, and now forms the university library entrance. It comprises a main reception, issue desk, short-loan collection, law library, postgraduate study facilities, a dedicated IT suite and staff office facilities.

The building was vacated in spring 2006, prior to a complete strip-out, demolition works and extensive asbestos removal. The floors were strengthened to allow bookstack loading and the construction of a new plant room. Structural defects to the existing cantilevers were repaired and a high aluminium cement survey was undertaken with remedial action.

Originally accessed from the north facade, the entrance is now situated to the south off the new library plaza. This creates a presence for the library on the new square, providing access for all. Adjacent to the entrance is a new cafe and terrace, which creates a social focus for students, staff and visitors. The ground floor, formally a fully-enclosed gallery space, has been opened up, allowing the reception area and casual reading space to flow into the atrium and link building. This also creates views from the existing atrium to the landscaped gardens of Abercromby Square.

The character of the two central atria has been maintained and enhanced, while the floor plates have been completely reconfigured. Cellular offices and corridor walls on all floor levels were removed, creating large open-plan spaces for book-stacks and study areas. Where new offices or group study rooms were required, glazed partitions have been installed to allow natural light and views to the outside. The original timber cladding to the second floor of the atria has been retained and refurbished, with new openings providing views into the atria. These also improve user orientation and increase daylighting. Timber veneer doors enhance and complement the use of wood by the original architect.

The atria ceiling slats, which were removed due to asbestos contamination, were replaced with visually alike items. Solar film was added to the atria glazing to reduce the risk of glare in the newly created IT area in the north atrium. The first floor balcony is enclosed with a glazed screen for sound segregation and to improve safety.

The west facade of the building provides the connection point for the new link building. The integrity of the facade is largely retained, with existing brickwork and window openings still visible from the link building and the new atrium that separates the two structures. Structural glazing creates a clear visual separation and accommodates building movement. Additional loading on Senate House is minimised by suspending the new stair from the link building on cables. Compressible bearings are also used where the stair flights come into contact with the existing structure.

The link building completes the new square, reconciling the different levels between the two existing buildings, and providing easy single-point access to the enlarged library facility. It houses the reference collection and academic liaison help desks, as well as places for meeting and casual reading.

The Sydney Jones Building (renamed the Grove Wing), which contains the main arts and humanities book collection, has been refurbished on a floor-by-floor basis. The upper floors have new single person and group study rooms, as well as traditional reading spaces and casual meeting areas. The special collections and archives area has been transformed with an environmentally controlled reading room with display cases, a seminar/teaching room and reception area on the ground floor. This provides a much needed presence and prominence within the facility.

This project links and upgrades two noteworthy twentieth century buildings in the heart of the campus to double the size of the library facility. The remodelling of the Sydney Jones Library (Basil Spence, 1974) and the former Senate House (Tom Mellor, 1968) includes the construction of a new link building that reconciles the different levels and provides easy access to the enlarged library. The relationship of the buildings forms a new urban square or Library Plaza.

The brief from university librarian Phil Sykes was ‘to design a building that reflects the status of Liverpool as a leading research university with a proud history and a great future’. The new facility had to provide an inspiring entrance, cafe, main reception, issue desk, dedicated short-loan collection, law library, postgraduate study facilities, a dedicated IT suite, teaching rooms, a variety of study spaces to meet the needs of varied students, additional book stack space, a new special collections and archives reading room and reception, plus all associated staff office facilities.

Construction of the link building is steel frame on piled foundations and in-situ concrete floors with underfloor heating. Blockwork walls support concrete rainscreen cladding with Kingspan insulation. Curtain walling is an aluminium utilised system with high specification solar glazing. Structural glazing connects to the existing buildings, creating a visual separation while accommodating building movement. Additional loading on the Senate House is minimised by supporting the new stair from the link building on suspension cables. Stair flights rest on the existing building on compressible bearings.

Extensive structural floor strengthening to the former Senate House has enabled book stack floor loading and construction of a new plant room. Structural repairs were carried out to cantilevers, a high aluminous cement survey was followed by remedial action and an enabling works contract undertook demolitions and asbestos removal. The character of the atrium was maintained, with ceiling slats replaced to match those existing and new glazed openings installed on the second floor. Corridor walls on all floors were removed and replaced with glazed partitions to admit natural light and a glazed screen encloses the first-floor balcony for sound segregation. New toilets and lift were fitted.

In the Sydney Jones Building the existing 'temporary' rear wall was removed and a new cavity wall constructed to match the building. Windows to new study rooms were introduced and corner bay windows formed. All lighting, electrics, ceilings and floor finishes were replaced and the toilets were refurbished.

As the library is open 24 hours and remained operational throughout, the build programme had to be carefully tailored, with university exam periods a key consideration. Nine sectional completion dates ensured full operation. The Sydney Jones refurbishment is phased on a floor-by-floor basis to mitigate disruption to users. Construction work began in August 2006, with phase 1 – the link building and Senate House – completed on time in August 2007. Phase 2 – the Sydney Jones refurbishment – is due for completion in September 2008.

### **University of East Anglia Library, Norwich – UK 2004 – 2006**

The original six-storey Central Library at the University of East Anglia was built in 1968 to designs by Denys Lasdun and Partners and extended by Feilden and Mawson in 1974. We were appointed in 2002 to design a new extension of some 7500 m<sup>2</sup>, to be built in phases. As part of the design process we tested a number of options which would create new space at the heart of the campus, and researched the original 1968 Lasdun masterplan in order to understand the pattern of growth which he and his colleagues envisaged. We consulted with the 20th Century Society, English Heritage and the planning authority from the early stages of the project in order to arrive at the preferred solution. A close working relationship with the Librarian and her technical user group was central to the design process in order to achieve a high quality cost-effective building providing a well-lit, glare free and comfortable environment requiring minimal energy. Both the new UEA Library extension and the phased refurbishment of the existing Grade II-listed library were completed on time and on budget, and officially opened by novelist Rose Tremain on Wednesday 8th March 2006. "...it is a tribute to the design team that the plans were approved. The design provides a building of real quality and one which complements the original Lasdun architecture. We are delighted with the internal space it provides, which is light and airy and should provide an ideal setting for study and our collections." Jean Steward, Director of Information Services at UEA, UEA newsletter November, 2004 "a fresh twist on a modern classic" Martin Spring, Building Magazine, on UEA Library, Nov 2005 (Shepherd)

SCONUL Library Design Award 2007

WORSHIPFUL COMPANY OF TYLERS & BRICKLAYERS Triennial Award for Excellence in Brick, Commendation. 2008

Europe wide competition win in February 2002 to design a new consolidated home for the School of Slavonic and East European Studies, (SSEES). The school was housed in various buildings within the University of London and became part of University College in 1999. It is the first passive draught cooled public building in a city centre in the world. It is an extremely energy efficient way of maintaining comfort within the urban heat island. The new building is located on the UCL main site in Bloomsbury, with a street frontage on Taviton Street, and accommodates the SSEES Library, academic and research facilities for the four departments that make up the School. The site is extremely complicated; the last vacant site within the UCL campus, and in the Bloomsbury Conservation Area. Taviton Street contains several listed Georgian terraces, a distinctive urban form that has been eroded somewhat by subsequent layers of development. An existing electrical sub-station, fuel and district heating line connected to the Chemistry Building passed through the site, and delivery access and escape routes had to be maintained to adjoining buildings. Planning Consent was gained in 13 weeks from submission after full consultation with English Heritage, the Bloomsbury Society, the Victorian Society and numerous other interested parties. The building has a hybrid environmental strategy, naturally ventilated all year and passively cooled through the summer months but engaging draught cooling via a central lightwell through periods of summer peak temperatures. The London 'heat island effect' shows the city centre to be warming but the SSEES project demonstrates that it is possible to configure a low energy strategy in a city centre at these latitudes. This is the first known application of this low energy environmental strategy in a city centre in the world. The strategy has been exhaustively modelled and tested at the Institute of Energy and Sustainable Development at De Montfort University, Leicester, and the BP Institute for Multiphase Flow at Cambridge University. Fresh air, tempered in winter or pre-cooled in mid summer, flows from the atrium across the floorplates to the exterior exhausts. We have devised acoustically treated narrow section transfer ducts within partitions to allow air to pass across enclosed spaces such as the first floor computer rooms without unwelcome sound transfer. The entrance to SSEES, a stone sculpture by Frantisek Bilek in the foreground. Spatial legibility was an important client priority, on entering visitors look across the atrium to the library entrance and front desk. The terrazzo floor adopts the geometry of Borromini's marble floor in the University Church in Rome, Sant Ivo della Sapienza. In SSEES it mediates an essentially triangular geometry into the hemicycle of the perimeter envelope. Simulation of the likely airflow within the passively draught cooled SSEES building. The research employs a physical modelling technique originally devised by Paul Lyndon at the Department of Applied Mathematics and Theoretical Physics at Cambridge and now being developed by Andrew Woods at the University's BP Institute for Multiphase Fluid Flow. The

simulations revealed a potential problem of stalling in very warm conditions when departing air is cooler than ambient. The design was modified accordingly. The model tank is immersed in a large water tank filled with saline fluid as the background environment; a source of fresh water is added to the base of the building to mimic the heating in the lower floors of the building. This drives the upward flow in the stacks and draws in additional fluid through the stack. Pre-cooling in the stack is modelled by adding dense saline fluid (blue) to the stack. This mixes down into the ground floor, and then mixes with the fresh water producing a relatively low density fluid which rises through the stack, as long as the analogue pre-cooling is not too intense. Results from the experimental modelling help establish flow regimes and guide the control strategy for the building. The project was on exhibition in the Wellcome Wing of the Science Museum September 2005 until March 2006. (Short)

#### **Lancaster Library, Coventry University, Coventry – UK 1998 – 2000**

Total Project Cost: Contract sum of £18 million sterling / \$28.26 million plus fit out  
Final Account £17 million sterling.  
Gross Floor Area: 110,000 ft<sup>2</sup>, Construction Period: November 1998 - August 2000

#### **Awards:**

SCONUL Award 2002 “Best Library Since 1995”  
Brick Development Association & Building Magazine “Best Public Building Award” 2000,  
and overall “Building of the Year” 2000  
UKCSA Award for Excellence “Best New Commercial Project” 2002

Coventry’s Library was won in full European competition in 1995, in collaboration with the Institute of Energy and Sustainable Development at De Montfort University. It is the world’s first deep-plan, multistorey, naturally conditioned building on anything like this scale. The library staff wanted large open square floor plans. In fact the building could be used for any kind of corporate activity, it is a kind of universal diagram. Its plan form was distilled from a series of feasibility studies involving iterative intensive brain-storming and testing of a series of type forms. It develops a small campus plan with a mall/gallery, a bookshop and café and extensive landscaping leading to a lake stocked with fish, and a mediaeval Friary. It makes a new public park and garden for the city. It is highly replicable as a form. It has been thoroughly engineered and features customised leak proof dampers by the Swiss manufacturer Landis-Stauffer, and our own ventilation terminal design featuring double banks of split aluminium tubes like an array of organ pipes. The principles are simple but the physics is complicated: air is introduced into a plenum below the upper ground floor and fed upwards through four atria. It is extracted via perimeter stacks and a large central atrium. The motive power is entirely provided by the natural buoyancy effect of warming air. Sophisticated wind tunnel and computational fluid dynamics analysis informed the design, right through to the production of construction details. The building is characterised by simple but finely crafted brick patterning which embeds it culturally into the West Midlands region. The Library is a key element in the revivification of the region through widening access to higher education. Building Magazine and the Brick Development Association awarded this building their ‘Public Building of the Year’ and overall ‘Building of the Year’ prizes in December 2000. Five and a half thousand visits a day are being logged at the library entrance, nearly three times that anticipated. It seems to have changed the whole geography of learning at the University. (Short)

#### **Harm A. Weber Library and Academic Centre, Judson College, Elgin, IL – USA 2005 – 2007**

Total Project Cost: \$25.0 million, Gross Floor Area: 85,000 ft<sup>2</sup>, Construction Period: May 2005 to April 2007

#### **Awards:**

**Certified as a Gold level LEED Building by the United States Green Building Council**

Total Project Costs: \$ 25 Mil. International Competition win 2001 \$7.5 million U.S. Federal Government grant for “Eart Stewardship”, administered through the Dept of Energy \$110,000 grant from the Illinois Clean Energy Community Foundation to fund environmental design research. In April 2001 we won the College’s worldwide competition for a new Academic Centre to house their University Library and the Division of Architecture, Art and Design. We were fascinated at the prospect of juxtaposing a new library with a Faculty of Art and Design and a School of Architecture on a beautiful campus alongside the Fox River, 40 miles west of downtown Chicago. The scheme puts classrooms and academic offices in a wing fronting a landscaped quad at the heart of the College, and the library in a square, deep plan building with a huge open attic studio above. The floor plates are interconnected and punctuated by atria which supply air and admit light. Mechanical cooling and dehumidification is installed because of the Continental climate, but the building will optimise its natural conditioning potential in the mid-season period - its energy consumption should achieve US record lows for this climatic zone. The environmental strategy has been developed with the Institute of Energy and Sustainable Development at De Montfort University, Leicester, and the BP Institute for Multiphase Flow at Cambridge University. #### **Libraries:**

#### **Bill Bryson University Library, Durham University – UK 2012**

A major new extension, the East Wing of the Bill Bryson Library creates much needed graduate study and postgraduate research space for the growing student cohort at Durham University. Book collections have been rationalised and printed material consolidated in to controlled access loans with addressable compact mobile shelving for swift retrieval. Modern wireless enabled reader spaces are clustered around the perimeter taking advantage of long views. Group rooms, study booths, carrels and eddy spaces provide a variety of student study experiences. An exiting four storey atrium, grand sweeping stair and link bridges connect the levels. Daylight, natural materials and neutral colours create an atmosphere of calm and studious activity. (Space)  
New East Wing is part of £22m investment in Durham University’s modern and historic libraries

Bill Bryson returned to Durham University on Tuesday November 27, to rename the main library and open its new wing. The opening of the £11m East Wing at the Bill Bryson library makes the main library building 42 per cent bigger and provides 500 new study spaces across four floors.

The development is part of Gateway, Durham University’s major £60m estates project which incorporates a new Law School and a dedicated building for student support services, The Palatine Centre.

Dr Bryson, who served as the University’s Chancellor from April 2005 to December 2011, is making his first visit back to the University since he bid farewell last year.

He said: "As somebody who has been privileged enough to have books at the centre of my life, I can't think of any greater honour than to give my name to Durham University's library and the pursuit of learning for generations to come.

"I once wrote that of all the things I am not very good at, living in the real world is perhaps the most outstanding.

"Libraries and books are a doorway to a whole new world – democratic access to a galaxy of infinite possibilities beyond the routine and the mundane that really make life worth living."

The Bill Bryson Library, which is built on a former colliery, houses the majority of Durham University's modern printed book and journal collections. Access is primarily for staff and students but librarians also work with local schools on specially designed research skills sessions, amongst other outreach projects.

The new East Wing has been designed to produce a light and spacious study environment, including 21 individual and six group study rooms.

It has enabled the library to rearrange its collection of 1.5m books into one sequence and to make 120,000 books previously in storage available in open access shelving for the first time.

Jon Purcell, University Librarian, said: "Feedback from the National Student Survey, social media and our Student Users Forum told us that our students needed a bigger and better library. Student representatives were consulted throughout the design and development of the East Wing. Maximising study space and providing a range of facilities was a priority for us."

Mr Purcell added: "The renaming of the Bill Bryson Library, which never had a site specific name before, recognises Bill's time as the University's 11th Chancellor, his ongoing links with the library, and the continuing development of the site.

"Bill was a frequent user of the library during his time as Chancellor, and made full use of the study facilities and resources in the course of his research.

"Library staff were often surprised to come across Bill using the photocopiers and reading on Level one amongst the students!"

The Bill Bryson library is the largest of five libraries which make up the Durham University Library Service, which is receiving a £22m investment.

The other four libraries are: Palace Green library (exhibitions, special and local collections); The Queen's Campus library; the Leazes Road library (additional educational materials); The Business School library (additional business school materials).

The library service can trace its roots back to 1669, when John Cosin, Bishop of Durham, paid for a library to be constructed on Palace Green close to his residence, Durham Castle, which contained his extensive collection of books. This became the library for the newly-founded Durham University in 1833. (<http://www.dur.ac.uk>)

### **Libraries:**

#### **Learning Resource Centre, University of Ulster, Magee Campus– Ireland 2002**

Client: University of Ulster, Magee College, Location: Londonderry, Role: Lead Consultant & Architects, Nature of Project: Provision of new Learning Resource Centre, containing networked reader spaces, bookstacks, group study rooms, electronic classrooms and associated support facilities, Contract Value: £ 4.500.000 / € 6.900.000, Date of Commission: November 1999, Stage Complete: September 2002

The project was awarded within a winning UK-wide restricted design competition. Our response incorporates over 600 networked reader spaces and 700 linear metres of bookstacks over three levels, arranged around a central open atrium. Noisier café, group study and ancillary spaces are isolated from these main reading rooms, in a block above the main issue desk area. Panoramic views over the River Foyle are through a highly glazed east façade which has been 'engineered', with a bespoke designed solar shading system as part of a passive ventilation philosophy – a first within a major building in Northern Ireland. (TODD)

#### **Kingston University Learning Resource Centre, Kingston upon Thames – UK 1998**

Client: Kingston University, Location: Kingston-upon-Thames, Role: Architects & Lead Consultants, Nature of Project: The design & supervision of construction of a new learning resource centre & restructuring of associated existing library. Contract Value: £2m, Date of Commission: June 1995, Stage Complete: Completed: February 1998

The new Learning Resource Centre (LRC) was the amalgamation and enhancement of two on-campus existing library facilities. The brief was to provide a centralised location for 8000 linear metres of book storage and create a variety of study areas (650 individual spaces) including soft seating, individual carrels and a number of rooms for group study and teaching. A strong emphasis on electronic based self learning was also provided through the creation of a 24 hour access to the Information Technology Open Access Centre.

As part of a new campus redevelopment this part of the commission involved the restructuring of the existing 2,000m<sup>2</sup> library and the attachment of two new inter-linked wings to provide 4,000m<sup>2</sup> of learning resource facilities. Development restrictions, imposed by outline planning consent, and dictated by the demands of the campus masterplan and the functional requirements of the subject building, resulted in a deep floor plan solution. A flexible, environmentally sensitive, climatic control and glazing system enables a solar controlled employment of maximum natural light and comfortable working conditions (TODD)

### **Libraries:**

#### **Withington Library, Manchester – UK 2008 Renovation**

External items included a complete re-roof of the building (including renewal of the lantern lights and re-pointing and localised repair of parapet walling). Internally localised plaster repairs to walls and ceilings were made, as was; a full renewal of heating boiler plant, radiators and associated pipework. The library was recarpeted and redecorated throughout. Work was completed by mid April 2008. Total cost was £197,700 funded by Manchester City Council. (<http://www.manchester.gov.uk>)

#### **East City Library, Manchester – UK 2007**

East City Library is housed in Whitworth House, at The Manchester College's flagship Openshaw campus. The City Council operates the library for students and the public under an innovative management arrangement. The College was keen to open the campus up to the public and raise awareness of its student offer, while library customers can now take advantage of services previously only available to students. The library is situated in a large modern foyer under a circular wooden canopy. It is clearly zoned with a well-defined children's area and an enclosed homework centre in an adjacent former classroom. There is specialist, course-related stock for students and a quiet study area for both student and community use in the neighbouring Media

Hall. Installation costs were shared between the City Council and the College. A Service Level Agreement covers all operational arrangements including opening hours and access. The financial benefits of working in partnership have enabled a doubling of opening hours. (<http://www.manchester.gov.uk>)

### **North city library & 6<sup>th</sup> form, Harpurhey, Manchester – UK 2006**

5077 m<sup>2</sup>, £ 7.100.000

#### **Awards:**

**Silver for Best Public Building Roses Design Awards 2006**

The facility was intended to provide appropriate and qualitative accommodation to enable delivery of key public services within an areas scheduled for regeneration. A dramatic four-storey atrium at the entrance provides an immediate visual link to all areas of the building with clear views out of the community garden and urban streetscape. There has been a threefold increase library visits in the community along with the exceeded expectation of enrollment figures.(Walker)

The project aimed to deliver a landmark building to challenge engrained negative perceptions of the area: a new Sixth Form College and Public Library, located on the site of a Victorian Grade 2 Listed former Public Baths in Harpurhey, two miles from central Manchester, in the second most deprived ward in the country, scheduled for regeneration.

The building offers education and community facilities for the 21st century, providing both dedicated learning zones and shared public spaces. The building layout is open, simple and designed to allow passive supervision where education and social engagement can take place in an attractive, safe and accessible place.

The four storey building, with dramatic atrium at the entrance providing an immediate visual link to all areas of the building and with clear views outside, uses a flat slab concrete frame structure which allows great versatility to room layouts and building services, with the ability to easily reconfigure spaces in response to changing curriculum uses and learning styles. The physical quality of the learning environment uses a robust and high quality palette of materials with low maintenance requirements.

The design is pioneering in its use of integrated sustainable features aimed to reduce CO<sub>2</sub> emissions. These include photovoltaic panels, both roof mounted and as south facing cladding, roof mounted active/solar arrays, rainwater harvesting, thermal mass from the exposed concrete frame which, together with natural ventilation and bms control, enables night time cooling for summer months and a heat store during winter. The buildings external fabric is highly insulated.

Awards: BREEAM, RIBA Building Feature, MCC Libraries Renewal Flagship, International Green Apple Award, Design Benchmark for £1b + BSF schemes.

RIBA LSC National Design Excellence Award. Judges' comment extract: 'The key strategic decision to combine the college with the public library ..... has effectively created a new building type' (<http://www.bestbuildings.co.uk>)

### **Forum Library, Wythenhawe, Manchester – UK 1999 – 2002**

The original Forum Library opened in 1971 as part of the Forum complex featuring a leisure centre, theatre, main hall and meeting rooms. By the mid-1990s, however, it needed substantial refurbishment. Following a major refurbishment the new Forum is now well regarded and well used by local people, boasting adult education and Learndirect, gym and swimming pool, health centre, public hall, nursery and cafe, as well as one of the city's largest and busiest libraries. The Forum Library was completely upgraded with a new layout, new stock and comfortable areas for customers to relax. The library was the city's first Access Point, enabling online or freephone access to council services. There is a large music and film library, meeting rooms, plus long and short stay computers for public use. The first floor is intended for learning, both students and the wider public. It features a Learndirect centre and a wide range of reference and information resources. The library also features some specialisms, supporting local economic and healthrelated priorities for Wythenshawe. These include a Health Information Point and a Macmillan Cancer Support Service and Information Points for businesses and inventors. (<http://www.manchester.gov.uk>)

General Contractor: Linbeck Construction Corporation, Houston

Located at the centre of Rice University's historic campus, the new Central Campus Library seeks to respond to both the sensitive nature of the site and the programmatic demands of a teaching and research facility for the 21st Century. The proposal makes reference to the original Cram masterplan for the campus conceived in 1910 and reinstates the avenues of live oak trees. An elliptical form identifies the axial heart of the campus and mediates between the formal Academic Court and the informal wooded Great Court. This form houses an "immersion concourse" where the public aspects of the library are located. From here academics and public can gather and orientate themselves. Above, two linear bars, typical of the campus's building massing, sit and house the book stacks, providing readers with daylight study space within the tree canopy.

### **Libraries:**

#### **New Bodleian Library, University of Oxford, Oxford – UK 2006 –**

Date:Appointed November 2006, Location:Oxford, UKClient:University of OxfordValue:£50 million

At the heart of Oxford's historic core, Gilbert Scott's 1940 New Bodleian Library is a vital resource for academic research. Wilkinson Eyre Architects has recently been appointed to refurbish the library as a new cultural and intellectual landmark. The essence of our concept is an inversion of the traditional Oxford quadrangle, playing with contrasts of lightness and darkness, void and volume. The bookstack itself becomes a simple yet dramatic box, poised mysteriously above a generous public area which permeates the building. The design works with, rather than against, Scott's robust design, reinvigorating the space with an improved circulation diagram and creating a number of contemporary interventions including a spectacular reading room at roof level, reinforcing the library as a major new research resource for special collections. (Wilkinson)

Oxford University's world-famous Bodleian Library is today embarking on a new scheme to overhaul its facilities and services in order to meet the challenges of the 21st century.

The plans, announced today, include the purchase of a site to construct a new book storage facility in which to house low-demand items and the timescale for the refurbishment of the New Bodleian. With the purchase of this land, based just outside of Swindon town centre, the Library can now progress with its extensive plans to provide innovative services for readers and better preserve its heritage collections.

As part of the plans for the future of the Bodleian, the University announced on Saturday that the New Bodleian will be renamed the Weston Library in honour of the £25 million donation given in March 2008 by the Garfield Weston Foundation. The name change will come into effect following the refurbishment of the Library.

Sarah Thomas, Bodley's Librarian and Director, Oxford University Library Services, said: "With the purchase of this site, we anticipate that the new storage facility will become operational in 2010. This will enable the renovation of the New Bodleian as a special collections library and the union of a number of faculty libraries into the Humanities Library on the Radcliffe Observatory Quarter."

The Bodleian Library pledges to improve the overall speed of access to information by providing direct access to high-demand print collections, more online access to materials, electronic document delivery, and expanded inter-library loans.

This summer, most of the special collections will move out of the New Bodleian to the Radcliffe Science Library – ensuring that these key works are still accessible during the refurbishment. Preparation for the refurbishment will start in 2010 and the work will take approximately four years to complete.

The New Bodleian houses many of the University's most important treasures. To emphasise this, the University is transforming it into a modern special collections library and research centre so its unique collections can be seen to their best advantage and its great collections of manuscripts and archives be best protected. In addition to improving its services as a major research library, the ground floor of the New Bodleian will be opened up to the public with the creation of exhibition galleries and learning space, allowing the Library to build on its successful relationship with the community.

The central stack will be replaced, three floors of secure storage developed below ground level, additional reading rooms provided, and dedicated floors for curation and conservation created. The new public access to the ground floor will mean Oxford residents and visitors can view some of the University's greatest treasures and gain insights into research activities at Oxford.

"This is exciting progress in the rollout of the Libraries' strategy to improve services for its readers," said Sarah Thomas. "The academic strategy includes a combination of direct access to books on the shelves of Oxford's libraries, online access to the largest number of digital titles in the UK, and state-of-the-art storage for paper collections."

As part of its plans to improve reader services and provide better storage for paper collections, the University this week purchased a 15-acre site close to Swindon for the construction of a high-density book storage facility for the Bodleian Library.

The new book storage facility will house predominantly low-demand items from the Library's collections, many of which have electronic copies available. As a result, the facility is expected to fulfill approximately 200,000 requests per year, which is a reduction of more than 50 per cent over its previously anticipated use. Located in South Marston, the facility is 28 miles from Oxford, on a direct route to the city.

In addition to providing greater access to its print volumes and the New Bodleian refurbishment, the Bodleian is investing heavily in increased digital access to its collections. Half a million pounds has been spent this year on improving access to retrospective journal holdings in electronic form, and a further £500,000 has recently been approved.

Finally, the development of the Radcliffe Observatory Quarter is a key part of plans for the Library's future. The first phase of this new development in central Oxford will see the creation of an interdisciplinary humanities library, located on the lower floors of the new Humanities centre. The new library will house up to one million volumes of printed material, eventually consolidating the holdings of up to 15 separate collections and related collections and integrating them with stock from the main Bodleian. It will be a state-of-the-art facility, offering the very latest developments in information technology, dedicated study space for graduate students, and longer opening hours for readers. ([http://www.bodleian.ox.ac.uk/news/2009\\_mar\\_17](http://www.bodleian.ox.ac.uk/news/2009_mar_17))

he redeveloped New Bodleian library building will be renamed the Weston Library in honour of the £25 million donation given in March 2008 by the Garfield Weston Foundation toward its transformation into an advanced special collections library and cultural centre.

Dr Sarah Thomas, Bodley's Librarian, will make the announcement on 14 March during the Founder's Luncheon held by the Bodleian Library, an annual event commemorating the birth of its founder, Sir Thomas Bodley in March 1545, and his legacy of philanthropy. The formal renaming will occur in 2014 following a major refurbishment of the New Bodleian building.

The gift, the largest ever made by the Foundation, was announced at the launch of Oxford Thinking: The Campaign for the University of Oxford last May. It is also the largest donation received to date in the Library's history, and is one of the leading gifts to the University's campaign which aims to raise a minimum of £1.25bn.

Coupled with matching funds from Oxford University Press, the Garfield Weston Foundation grant will transform the accommodation for the Bodleian's priceless collections and will open up its treasures to the public. The redevelopment will revitalise the 1930s Giles Gilbert Scott facility, constructed essentially as a book store and known simply as the 'New Bodleian', in contrast to the 'Old Bodleian' library, into a major research centre. Scholars worldwide, citizens of Oxford and visitors to the city will be able view some of the University's greatest treasures and gain insights into the research activities of the University. With spaces for exhibition galleries, lectures, and seminars, the aim is for the Weston Library to become an even more active partner in the intellectual life of the local and international community.

Dr Sarah Thomas, Bodley's Librarian and Director of Oxford University Library Services, said: 'The Garfield Weston Foundation has time and again shown its generosity to Oxford. Their commitment to help make the extraordinary collections of the Bodleian accessible to a wide audience and to create the conditions which ensure the security, preservation, and scholarly use of our collections is marked not only by their philanthropy, but by their passion for excellence.'

The redevelopment project of the New Bodleian building will involve the rebuilding of the central book stack, the installation of three floors of secure storage below ground level, the provision of additional reading rooms, and the creation of dedicated floors for curation and conservation. The refurbishment will also see the ground floor of the library opened up to the public, with the creation of exhibition galleries and learning space, allowing Oxford residents and visitors to view some of the University's greatest treasures and to gain insights into our research activities.

The refurbishment of the New Bodleian building is part of a larger scheme to revitalize Oxford's historic Broad Street by creating a new public square. The plans are supported by both the local authorities and the Oxford Preservation Trust.

### **University of Oxford: Department of Earth Sciences, Oxford – UK 2010**

Date:Completed October 2010, Location:Oxford, UKClient:University of Oxford, Value:£28 million

This new building for the University of Oxford's Department of Earth Sciences has not only been designed to meet the academic requirements of the department, but also to signal to the wider public the interests and concerns of the users. The most striking element of the building is a 'narrative wall', which acts as a shop front for the activities and ideas of the department. The building is structured around a simple relationship diagram which summarises the organisation of the spaces within. The ground floor space is focussed on outreach, with the more public areas of the building such as the library, foyer and display spaces close by. Write-up spaces are separated from the main laboratory areas, while generous circulation provides for interaction as users move around the building. (Wilkinson)

#### **Libraries:**

#### **Centro Culturale, Torino – Italy on design**

€ 107.000.000, 40.000 sqm.

Keith Williams' premiated project for a major arts complex in the Italian city of Torino, was the only one from a UK architect selected into the final round of this major international competition. The 40,000sqm project housed the new city library and a 1200 seat concert hall. The Centro Culturale project was located in the former industrial quarter on the site of the defunct Nebiolo Company fabrication plant. The project was developed not as a single building but as a new united complex, with the library and concert hall at its heart. The internal planning and interconnections allow the grouping to function as if contained within a single building envelope, yet distinguish between the identity of each separate part. (Williams)

#### **Clones Library & County HQ, Clones –Ireland 2008**

Clones town, the location of Monaghan County Council's new Library Headquarters and Branch library, is the entry point to the county for visitors travelling from the West of Ireland

Since the 1960's however, the town has suffered from the cut-off of its hinterland in Northern Ireland and the decline of traditional industry in the area (agriculture, textiles, engineering). However in 1999, Monaghan County Council and Clones Town Council, together with all the local community and the development groups initiated the Clones Regeneration Strategy, a blue print for the development of the town.

The development of derelict properties between Fermanagh Street (the main retail street) and '98 Avenue (the main link to Enniskillen, Donegal and the north-west) was identified as key to the regeneration of the town. Monaghan County Council acquired 1 ha of lands from four property holders between both streets. These lands formed the site for the new Library Headquarters and Branch library, along with a new public square and car-parking.

The new building replaces the antiquated facilities of the old Library Headquarters, which was housed in the 19th century Market House since its inception in 1928. The old Headquarters is distinguished architecturally, but in very poor repair. It has limited access and with a total floor space of 365sqm for the headquarters and branch, including both lending floor and all staff areas, is inadequate for a contemporary library services needs.

The Library HQ and Clones Library now occupies an area in the town centrally located and earmarked for extensive redevelopment. It is envisaged that the new library building is at the heart of this redevelopment acting as a civic and cultural centre for the community. The new building is 1450m<sup>2</sup> in area, is a landmark building, consistent with the high quality of new library buildings designed and constructed in recent years throughout the country. Architecturally the building is contemporary and forward looking, whilst acknowledging the historic context of Clones town.

The building is set in a high quality public square with extensive seating and landscaping, providing an external public focus and an appropriate and attractive setting. Car parking is available directly in front of the building, with wheelchair access car parking available immediately in front of the main entrance.

It has been conceived as a very open and accessible building in which the local community can engage, whilst encouraging the strongest possible links to the new town square. The branch library has been allocated the most prominent, accessible and visually apparent location within the building, ensuring that it plays to the widest possible audience. The branch includes a designated Exhibition area, which will play host to a range of activities such as lectures, recitals, workshops, demonstrations and exhibitions which the library service could not provide before in Clones. There is now a very spacious Local Studies Research Area, where a researcher has access to the County Library's extensive local collections and use of microfilm reader-printers and computers. The inclusion of an Outreach/Activities Room on the ground has already accommodated a vast programme of summer events for the whole community. Public toilet facilities are provided, including one fully accessible disabled toilet and baby changing facilities.

Clones library has always been very much part of the local community & a supporter of life long learning but our involvement was limited due to lack of space and resources. The new library has seen an increase of almost 100% in stock for borrowing i.e books, music CD's, DVD's, CD:Roms, magazines, large print, audio books. The Internet access points, so vital in a modern library service and indeed in a rural community, increased from 4 to 14 with broadband. The new library now has a separate Young Adult area, with a wider range of materials available for them to borrow.

The Library HQ key function is the administration of the Library Service for the whole county of Monaghan. It is housed on the 1st and 2nd floors, where all stock for the county is purchased, processed & dispatched from here, approximately 14,000 items each year. The Schools Library Service and Rural Mobile Library Service are administered from here. The HQ acts as the centre for a comprehensive annual Outreach plan of events and activities. The County Reserve Stock is housed here, which consists mainly of books and materials developed over the past 80 years of Monaghan County Library Service's existence and includes books no longer available to purchase.

The new library HQ and Clones Library is fully accessible to mobility impaired users, and lift access is available.

The new library is already making a big impact on the local environment, the local economy and the cultural and social fabric of Clones. The town has a strong sense of community and now the Library can play a bigger part in community developments. The plaza outside is a new focal point for the people of the town and the area. It is a new, green, meeting place for the community. As the Roman Statesman and Philosopher Cicero once said 'If you have a garden and a library, you have everything you need'.

The ground floor also comprises an exhibition area and an activities room. Library headquarters is housed on the first and second floors, incorporating staff offices, a meeting room, a book preparation area & the County backstock room.

A local history area is separated from the main branch and houses an extensive local history collection along with 3 microfilm readers. (<http://www.librarybuildings.ie>)

#### **Library, Civic Offices and Public Square, Athlone – Ireland 2004**

Athlone's multi-award winning 4,200 sqm new Civic Centre, which the office won in an European wide competition, opened to the public to great acclaim in October 2004.

The Aidan Heavey Library is located in the Athlone Civic Centre building. The 4,200m<sup>2</sup> Civic Centre forms the focal point of the regeneration of Athlone town centre. The library itself is 1050m<sup>2</sup>

The main library is located on the ground floor to the south, off the main foyer, in the left wing. Due to the sloping nature of the site, the children's library is located on the lower ground floor to the north. The main library space is double-height volume. A top-lit public entrance foyer provides access to library (and all other elements of the building). The building has a roof terrace.

The building displays an integrated approach to energy efficiency and sustainability. Natural ventilation and daylighting are provided through lightwells and rooflights. Stone louvres to the south provide solar shading during summer.

The building faces the 19th century St Mary's church and associated Jacobean stone tower, situated across the square.

Remnants of the 17th century town wall have been incorporated into the adjacent public square. The area in front of the building is landscaped in white concrete paving slabs dressed in local sandstone, with teak-topped concrete benching.

##### **King Edward VI School, Stratford-on-Avon - UK in design**

King Edward VI School in Stratford-on-Avon is a boy's secondary grammar school. Shakespeare was a former pupil and boy's are still taught in his classroom within the 15<sup>th</sup> century Guildhall. The Commission followed a competition to prepare a masterplan of the school site and design a new library. This is to be a landmark building on the edge of the school site overlooking the gardens opposite. It is the school's intention, subject to receiving HLF funding, to restore the school's historic buildings, and open the Guildhall to the public part-time. The school was recently designated a Humanities Special Status School, and as a design a new drama studio, for the next generation of Stratford-on-Avon's playwrights and actors. (Whright)

##### **Magdalen College, Library, Oxford – UK under construction 2013**

Wright & Wright Architects is adding to the historic estate of Oxford University's Magdalen College with an extension and reworking of the grade II\* listed New Library.

The library was originally a single hall school designed by JC Buckler in 1851, and was extensively redesigned in 1930 by Giles Gilbert Scott, who converted it into a library with space for 12 readers and a librarian.

The college now requires room for 120 readers in various study settings plus additional meeting, storage and staff facilities. Wright & Wright's task was to meet these needs with a clearly contemporary intervention while respecting the existing architecture. While the library requires 3,000 linear metres of book space, half of this will be on mobile oak storage in preparation for a less book-based future.

Scott's alterations inserted new levels into the hall, breaking up the single grand space, and providing Wright & Wright with a useful precedent for change. Its design solution proposes both a bold reworking of the Buckler interior plus a new L-shaped extension, which will stretch along the rear and continue at right angles to the original along the Longwall boundary, where the edge of the college grounds are marked by a high 15th-century wall. New landscaping adjacent to the extension will create additional external seating in the quad within a scented garden.

In the Buckler building, Wright & Wright is planning to dig down deeper than Scott's basement extension to provide space for servers, book storage and toilets.

In the original main space, the architects will take out Scott's new levels to reveal the full height of the hall and its windows, and then add a freestanding, oak-clad intervention rising high into the space like a giant piece of furniture.

This removable steel-framed structure houses three levels of study areas and a new staircase and glass lift. Students can also sit at tables within the cathedral-like void. All furniture is oak and bespoke.

The practice hopes this structure will give users a greater appreciation of the original building by taking them closer to the splendid timber-trussed roof and the long windows, which before the Scott alterations were high above the readers' heads.

"A clear architectural language will be established, distinguishing between old and new, set in a meaningful relationship that will create spatial tension," says partner Clare Wright.

At the lower level, the Buckler building will be extended forward within the footprint of a terrace created by Scott to form a new plinth to the original. This carries on around the Longwall to create a contemporary building in its own right.

Wright&Wright's intervention uses the whole height of the hall.

The fully accessible entrance will be on the corner, with the existing building to the left and the new reading room opening to the right. New accommodation will be clad in Clipsham stone, with York paving used for the new stepped landscaping and continuing inside through the new spaces. It will incorporate two new modest courtyards, positioned in front of gates within the wall. These will neatly bookend the development.

Views through the new accommodation are important, along with the creation of different types of study space — some secluded, others open. In the extension, for example, students can either sit at group tables near the garden, or in cosy, top-lit secluded spaces on the other side of the central book stacks. These have views through to the courtyards.

Alternatively, they can use the separate, square room at the far end with more relaxed seating, or study externally on the wi-fi-enabled terraces. The bold new plans are entirely appropriate for the evolving nature of historic Oxford estates, says Wright.

"The college has always changed. They take extraordinary care of historic buildings, but also strive for what's best now by adding to the portfolio that's been built up over five centuries in a sensitive but contemporary manner," she says.

An archaeological dig has started on the site ahead of the building work. This will be followed by underpinning work to the estate wall in preparation for construction next year. 20.09.2012 by Pamela Buxton (<http://www.bdonline.co.uk>)

### [Corpus Christi College, Cambridge – UK 2008](#)

#### **Awards:**

**RIBA Award 2009**

**Natural Stone Award 2009**

**Wood Award 2009**

Corpus Christ College is one of the oldest colleges in Cambridge. Centrally located and occupying in an entire block of the historic city, our task was to transform a former bank hall into a modern library. A new new court was created alongside the library and now provides offices, accommodation, a bar and brand nw JCR. Listed buildings were carefully restored and new ones finely detailed. The use of high quality long life materials will help ensure the new buildings last as long as their historic predecessors. (Whright)

When Cambridge University's Corpus Christi College ran out of undergraduate library space, it engaged Wright & Wright to remodel a former bank it owns on one of the city's main streets as the Taylor Library, reports Ellis Woodman. Photos by Peter Cook and Dennis Gilbert

Founded in 1352 — just a couple of years after a third of the population of Europe had succumbed to the Black Death — Corpus Christi is one of Cambridge University's oldest colleges. It is also one of its smallest, a product of the fact that its city centre site has stubbornly constrained all ambitions towards expansion. In the 20th century, the college established a satellite presence on the far side of the River Cam, but its principal address remains essentially the product of just two phases of development.

Constructed in uncoursed rubble and still boasting an otherworldly disregard for basic plumbing, the 14th century Old Court is indeed the oldest court in the city. Alongside it stands the 1823-27 New Court, designed by William Wilkins. Its footprint isn't so very much larger than that of the original quad but it is a grander and considerably stiffer proposition.

Representing one of its architect's rare excursions into gothicism, the scheme draws its detailing from early Tudor sources, but in the doggedly symmetrical composition of its facades, it betrays Wilkins' fundamentally classical sensibilities. It is through New Court that the college is now entered. The chapel lies on axis with the gate house, while the northern and southern flanking ranges are occupied by the dining hall and library respectively. In fact Wilkins designed two libraries — the Parker Library, which constitutes one of the world's most important archives of medieval texts, and the less rarefied undergraduate library on the floor below.

By the late nineties, both had outgrown their existing premises. Studies to test the feasibility of an expansion were undertaken separately by 5th Studio and by Colin St John Wilson. Both concluded that the best solution would be to fit a new wing within the garden of the Master's Lodge. However, the college was resistant to the idea of encroaching on this space, leaving only one option, one that would prove considerably more involved — and expensive — than constructing a new building.

In the mid-19th century, the college had undertaken a commercial development comprising a Wilkins designed terrace of houses and an adjoining gothic bank building by Horace Francis, which enjoy a very prominent urban position. The terrace masks the college's relationship to Trumpington Street — the road along which most of Cambridge's oldest colleges are distributed — while the bank turns the corner into Benet Street, where it looks out to another work by Wilkins, the magnificent screen and gate house of King's College.

In the early 20th century, Corpus reclaimed the houses as student accommodation but Francis's building remained in commercial use until 2005, when its lease came up for renewal. With this opportunity in sight, the college decided to build a new undergraduate library within the bank. Expected to provide shelf space for 45,000 books, the new facility would offer more than double the college's book-holding capacity. It would also free up the site of the existing undergraduate library, enabling the Parker to be provided with additional reading rooms and a new secure vault.

While the dividends were clear, the complexity was daunting.

While the dividends were clear, the complexity of what was being proposed was daunting. Not only would the building's interior have to be comprehensively remodelled, its orientation would also have to be reversed — the entrance to the city would be closed and a new one opened onto what at the time was a small service yard, which the bank had shared with the Wilkins terrace and Old Court.

A 2002 competition for the project was won by Wright & Wright, a practice that had established a strong track record in library design, having completed both the Women's Library at London Metropolitan University and the library at the Royal College of Art. Funded in large part by a donation from John Taylor, a Corpus alumnus who made a fortune by inventing the cordless kettle, the Taylor Library finally opened its doors in February.

Wright & Wright's scheme involved gutting the existing building, removing the floor of the banking hall at street level, and dropping the basement floor by a metre. Into the shell, the practice introduced a structure to support bookshelves and reading desks.

The new structure reads as a building within a building, and is held apart from the original walls by a full height-void. This move has enabled the new floor plates to be positioned freely — there are now three where there were previously two — without crashing into the inherited window openings. It also allows the intervention to follow an orthogonal plan without becoming embroiled in the site's wayward boundary line.

The choice of materials also proves a significant distinguishing factor. Where the internal faces of the original walls are plastered, the bookshelves and reading desks of the new fabric are meticulously detailed in oak-veneered joinery. That same material is used for the balustrades and as a lining for the steel structure, with the effect that the whole takes on a decidedly monumental presence. For all the lightness of its construction, the new work feels every bit as substantial as the old.

Alongside the banking hall, Francis' building incorporated a house for the bank manager, which has also been transformed to provide a media studies centre at basement level and a designated law library above. The range of study spaces provided is therefore really quite extensive, particularly when one compares the project with a traditional, single-volume collegiate library such as the Parker or Wren's wonderful library for Trinity. The more domestic arrangement established here cannot compete with the grandeur of those examples, but one suspects it represents a model that many contemporary undergraduates would prefer.

Bookshelves and reading desks are meticulously detailed in oak-veneered joinery.

Given the nature of the new use, the fact that the building presents a run of large windows to a busily trafficked junction was a potential problem. However, the introduction of new glazing resolved the sound issues, while the void around the plan's perimeter deftly ensures that students can work without being observed by passers-by.

Initially, the architect envisaged the introduction of an additional window. This would have been located at the building's corner, taking the place of the now redundant front door. Instead, the college has decided to install a clock within the door surround, requiring the introduction of a blank panel to transform the opening into an aedicule. I have not seen any design for the proposed clock but it will have to be good if it is going to compensate for the loss of the fantastic view from the library back to the entrance of King's College.

The narrow yard via which the building is now accessed was conceived as a service space and offers neither the scale or formality of the college's two courts. In plan, it forms a parallelogram, which narrows towards the library at its north end. The practice's work also included an extensive remodelling of the other buildings on the yard to provide office space, washrooms, fellows' sets, and a basement-level junior common room. While modest in architectural scope, these changes have proved crucial in elevating the yard's status within the network of college spaces. With this ambition in mind, the idea of completely refacing the back of the Wilkins terrace in stone was also mooted, but English Heritage preferred to see it retain its existing character. The only significant adjustment that has been made, therefore, is the introduction of a series of stone door surrounds, which subtly aggrandise the openings conceived by Wilkins as back doors, but which now serve as the front entrances.

The library registers in this rag-bag setting by way of an L-shaped extension that wraps around the yard's north end. It accommodates the sequence of entrance spaces and, just as crucially, allows the building to advertise the public role it now plays in college life. That function is signalled by the choice of material — stone — and by the presence of a double-height window that commands the principal elevation.

Approaching it, we discover that a deep recess has been cut into the adjacent facade — a low, wide space lined in stone with a beautiful oak soffit above and an oak door at the back. Passing through, we enter a compact reception area before pinballing back to the library.

Presented with the full-height void that extends up the back of the tall window, we are granted both a sense of spatial release and an immediate understanding of the scope of the room that we have entered. While expectations of "accessibility" are increasingly interpreted as reason to make the entrances to our public buildings as negligible as possible, Wright & Wright has set itself in clear opposition to that tendency.

Wright & Wright has sensitively extended six centuries of architectural development.

Rather than being faced with the ubiquitous sliding glass door in an all-glass facade, we find the practice has sought to attenuate the space between the library and the outside world as far as it possibly can. It offers an infinitely richer experience — a sequence that has been precisely considered both in plan and section. It impresses enormously for the measured way that it reveals information to the visitor.

If I have one caveat, it is about the handling of the tall window. Given its exceptionally dominant role within the composition, one expects this element to be the most elaborately developed. Indeed, an artwork, engraved on the glass by artist Lida Kindersley makes a gesture in that direction, but one is left wanting rather more from the architect. Save for its increased scale, does the window really have any more presence than if it had been designed at a quarter of the size? Faced with this opportunity, Horace Francis would surely have offered us a splendid oriel, wreathed in gothic tracery.

Perhaps of more relevance to the question of what Wright & Wright might have done with it is to imagine the response of a figure like Mackintosh, whose work clearly remains a central reference for the practice.

This quibble aside, Wright & Wright has done a fantastic job in the most constrained of circumstances, producing a building that sensitively extends six centuries of architectural development. Doubtless, its additions will eventually undergo changes, just as it has adjusted the work of earlier centuries.

However, the practice cites Ruskin's edict, "when we build, let us think that we build forever", as a sentiment close to its heart. That attachment is borne out by the building that it has delivered — a thing of considerable substance which stands apart from the more modish concerns of current architectural production.

One suspects that in another six centuries, students at Corpus will still be able to enjoy much of the practice's work.

### **The RCA (Royal College of Art) Library, London – UK 2008/2009**

Situated adjacent to the Royal Albert Hall, the library at the Royal College of Art is a sensitive response to the brief and the context. Readers are seated at the windows with books located in the plan's depths behind, housed in dense oak bookcases. The exterior is clad in lead for reasons of style and substance; we were delighted when the celebrated sculptor, Eduardo Paolozzi, was moved to note "It looks just like a casting". A restricted site dictated unconventional and innovative construction techniques: the steel frame was lifted into place, followed by smaller lighter elements, which could be assembled on site. (Wright)

**Wood Award 2002: Shortlisted for Best Public Building**

A former laundry serves to house an archive of women's history

This library has its roots in the Suffrage movement and houses the largest collection of books and objects related to women's history in England. The new building is on the site of a derelict Victorian washhouse and laundry in Old Castle Street. The resulting building makes a positive and sensitive contribution to its urban context, is intellectually accessible, provides secure and environmentally appropriate stores for the collection, is physically accessible and utilizes sustainable elements in the design. It consists of an exhibition hall, seminar room, educational facilities, reading room, archives, café, offices, friends' room, and garden. The library is surrounded by a disparate group of buildings. In response it steps back horizontally and vertically, behind the retained façade as it rises on the east, with a copper clad link between the wash house wall and the main body of the building. To the north a small garden has been created. The west façade will front a courtyard linking the building to the university's new law building, being designed by the same architect.

The structure is reinforced concrete frame clad internally and externally in brick. The very stringent environmental conditions required in a museum and archive have been met using passive means rather than air conditioning. The estimated energy costs for the archives are 20 percent of those for a conventional system. The palette of materials is restricted to brick, stone, oak, steel, and glass. ## [Bookless Library, San Antonio, TX – USA 2013](#)

San Antonio plans one of the nation's first bookless libraries

The \$1.5-million San Antonio library – which will have computers, tablets, and e-readers, but no paper books – will be like 'an Apple store.'

By Husna Haq / January 21, 2013

A rendering of the BiblioTech, one of the nation's first bookless libraries to open in San Antonio, Texas in the Fall of 2013.

Courtesy of Bexar County Government

That's right, BiblioTech, a \$1.5 million Bexar County paperless library will have scores of computer terminals, laptops, tablets, and e-readers – but not a dog-eared classic or dusty reference book in sight.

“Think of an Apple store,” Bexar County Judge Nelson Wolff, who led his county’s bookless library project, told NPR when describing the planned library.

Are you as well-read as a 10th grader? Take our quiz

The 4,989-square-foot, digital-only library, one of the first of its kind, will feature 100 e-readers available for circulation, 50 e-readers for children, 50 computer stations, 25 laptops, and 25 tablets for on-site use. Patrons can check out e-readers for two weeks or load books onto their own devices.

“A technological evolution is taking place,” Wolff says. “And I think we’re stepping in at the right time.”

It’s a trend that appears to be catching on. As we reported on in a July 2012 post, “Bookless Libraries – has it really come to this?,” a number of libraries, academic and public, have joined the paperless bandwagon. It began with academic libraries, including Kansas State University’s engineering school, the University of Texas at San Antonio, Stanford University’s engineering school, Drexel University, and Cornell. From there it spread to public libraries, including the Balboa Branch library in Newport Beach, California and even the New York Public Library, which doesn’t plan a bookless future but “a future with far fewer books.”

That’s a vision that makes many bibliophiles – us included – shudder.

In an interview with NPR, Sarah Houghton, director of the San Rafael Public Library in California and a proponent of digital media, called the bookless library “premature.”

Most communities, she says, simply aren’t ready for a digital-only library. For starters, some people simply prefer reading physical books. What’s more, not everyone is technologically literate and may need considerable help – help that would require training staff and swelling the library budget, unlikely in today’s budget-starved environment. Finally, she adds, a lot of content simply isn’t available for digital licensing and purchase.

“So your selection of bestsellers and popular media just went down the toilet because 99 percent of that is not available to libraries digitally,” she says, adding that many publishers either won’t license to libraries or offer expensive or unrealistic terms.

Perhaps most importantly, as we wrote in a previous blog post on the topic, “the shrinking library deprives us of a critical ingredient in the exploration and discovery of books: the ability to wander, browse, and stumble upon new treasures at random.”

And as bestselling author Michael Connelly told Time last year, libraries are also community gathering spaces. “The library is a societal tent pole. There are a lot of ideas under it. Knock out the pole and the tent comes down,” he said.

Houghton’s thoughts on the future of the bookless library? “I think it’ll be a good 100 to 150 years from now until all libraries are completely digital,” she told NPR.

We don’t know about you, but we’re breathing a collective sigh of relief.

Husna Haq is a Monitor correspondent.

Bexar set to turn the page on idea of books in libraries

By John W. Gonzalez

Updated 1:55 am, Friday, January 11, 2013

Bexar County Judge Nelson Wolff is an unabashed book lover with 1,000 first editions in his private collection, but even he sees the writing on the wall.

Paper books have lost their allure, and future generations may have little use for them, Wolff contends.

So when he embarked on a mission to create a countywide library system, he decided it should be bookless from the start.

Today, after months of planning, Wolff and other county leaders will announce plans to launch the nation's first bookless public library system, BiblioTech, with a prototype location on the South Side opening in the fall.

“If you want to get an idea what it looks like, go into an Apple store,” Wolff said.

Inspired while reading Apple founder Steve Jobs' biography, Wolff said he envisions several bookless libraries around the county, including in far-flung suburbs.

“It's not a replacement for the (city) library system, it's an enhancement,” Wolff said.

“People are always going to want books, but we won't be doing that in ours,” Wolff said.

The University of Texas at San Antonio is a pioneer among academic institutions with bookless collections and technical libraries.

Many cities, including San Antonio, offer downloadable books and other digitized information along with their paper volumes.

But no entire public library system is bookless, and unlike others, Bexar County's BiblioTech library system won't have a legacy of paper. It'll be designed for, not adapted to, the digital age, Wolff said.

“We've called everywhere and I don't believe anybody's done this before,” he said.

Not that it hasn't been contemplated.

San Antonio is considering a bookless library for the far North Side, using funds set aside for District 9 in the 2012 bond issue.

Newport Beach, Calif., decided in 2011 to make its original library bookless, but withdrew the plans amid public outcry.

Tucson-Pima Public Library System in Arizona opened a small bookless branch in 2002 in a neighborhood where residents were largely without computer access. But about five years ago, the system added books at the community's request, spokeswoman Kenya Johnson said.

“They told us they wanted their own collection there, so we shifted the format and now it's a full-access library. It still has the computers,” she said.

At UTSA, which opened one of the nation's first bookless academic libraries in 2010, officials are pleased with the outcome and confident the concept will spread.

“The students love it. It's full all the time,” UTSA library dean Krisellen Maloney said. UTSA students use the facility in person, at home, in classrooms and via mobile devices, she said. Despite conveniences, bookless libraries often confront copyright issues. Even so, the county has “the right idea,” Maloney said, because it's planning to have personnel available to help library users with homework or other research. People visit libraries for various services, “not just for the books,” she said. “They (Bexar County) are probably coming up to this at just the right time,” Maloney added.

Wolff on Tuesday will ask Commissioners Court to approve several measures to launch BiblioTech, a play on the Spanish word for library — biblioteca.

Commissioners will decide whether to seek a contractor to complete the design of the library and another to provide e-book titles; hire staff; and create a seven-member advisory board.

At least \$250,000 will be needed to gain access to the first 10,000 book titles, Wolff said. Costs for design and construction aren't set, but the county will save by using a county-owned building.

“We wanted to find a low-cost, effective way to bring reading and learning to the county and also focus on the change in the world of technology,” Wolff said. “It will help people learn,” he said.

Still, the South Side location — in a remodeled building that houses offices for tax assessor, justice of the peace and constable — is considered a test.

“We want to make sure it works before we have an obligation to do anything else,” Wolff said. Other sites likely would be in shopping centers or spaces provided by partnering suburbs, he said.

With rampant growth in unincorporated areas, and with San Antonio's policy of not annexing more territory, Bexar County needs its own countywide system, Wolff asserted. Harris County operates a system with 29 branches, including two technology labs, he noted.

“People in those outlying areas have no library services, so this would be a relatively inexpensive way to bring those services to them,” Wolff said.

The county pays San Antonio \$3.7 million a year so county residents can take advantage of the San Antonio Public Library System, particularly its suburban branches, Wolff said.

But “they want \$6.7 million now ... we're the only county that gives this much money to a city system,” he said.

The judge is aware that opposition may arise over cost and need, but he's got his arguments ready. For one thing, the project starts on the South Side — where a decade ago citizens protested over lack of any bookstores there.

“We know they have less access to technology and less economic buying power than other regions of the city,” Wolff said. “Now we'll be providing them a service that anybody else that has money would have,” he said.

The first site, open till 8 p.m. on weeknights, will allow plenty of opportunities for after-school study, said Wolff, a native South Sider.

The countywide aspect of the system still is being planned. Officials envision a system offering any county resident who registers in the system to have easy access to the county's titles.

At the first library, residents will be able to check out one of 100 e-readers available for home use.

Wolff said there may be some losses of the \$100 devices, but “we do have your name, we do have your address. You check it out for two weeks, just like a library book. In two weeks, your e-book goes dead, so you won't have anything worth keeping.”

\$ 13.000.000

“We believe that library and information service is essential to a learning society because information and knowledge are indispensable to the development of human potential, the advancement of civilization, and the continuance of enlightened self-government”. (Queens Borough Public Library)

The future of the modern library depends on its design. Increasingly, as information is digized and entertainment caters to short attention spans, perceptions of the library veer towards obsolescence. Without compromising its integrity as a locus of knowledge, cross-cultural exchange, and community ( 1100 )

**New York Public Library, Battery Park, City Branch, New York – USA 2010**

This 10.500 sqf. Library, which occupies the bottom two floors of a residential highrise development in Battery Park City, was commissioned to meet the needs of a new and rapidly growing community. As a new branch without an ingrained pattern of community use, it was critical for the design to establish a presence that would attract visitors. Open, bright spaces create a welcoming environment for the public, while the design of book and periodical displays, information desks, and furniture facilitates the most efficient circulation. The folded planes of the ceiling guide the visitor's eye through the library and acts as a physical and visual unifier for the entire space. The most eco-friendly of the New York Public Library branches, the project utilizes numerous sustainable design strategies and is LEED Gold certified. (1100)

**Robin Hood Library Project PS 16: Brooklyn, Queens and Staten Island, New York (PS 81, 46, 147, 201,274 ) – USA 2009**

An alarming 60 percent of New York City's public school students in grades 3 through 8 are reading below grade level. Their inability to read and understand limits their opportunities for success in school and in life. To make matters worse, often these students come from homes and attend schools that lack the capacity and resources to help them develop their ability to read, to comprehend, and to explore the world.

The Library Initiative, a partnership of the Robin Hood Foundation and the New York City Department of Education, with support from the Mayor, corporate donors, and a team of architects, seeks to reverse these patterns of low literacy skills and underachievement by working with community school districts and public elementary schools to design, build, equip, and staff new elementary school libraries. Working with schools in high poverty neighborhoods that have low academic achievement, the partners

are committed to fundamentally transforming school libraries into vital resources for the whole school community — students, teachers, and parents — that will impact and contribute to improved student performance.

Robin Hood sought and received major funding and support for the Initiative from two major children's book publishers, Scholastic and HarperCollins, each donating one million books. The Initiative also attracted cash as well as in-kind donations to cover everything from architectural services to computers for a total of \$40 million for the project. Major donors include Credit Suisse, Apple, USA Networks, Pentagram, Sciam Construction, and HMG Architects, along with nine other top architectural firms. Additionally, Robin Hood and the New York City Department of Education partnered with Syracuse University's Masters of Library Science Program to train New York City elementary school librarians. Tuition for the program will be underwritten by Syracuse University and the Department of Education. Robin Hood is also providing professional development for a core group of teachers and every principal involved in the Initiative, as well as developing innovative educational programs that extend the reach of the project, such as creating a learning garden for a school in a neighborhood with little outdoor space and a summer reading program called Camp Bookweek.

Since 2002, 62 libraries were reinvented in an unprecedented effort to improve the educational opportunities of New York's neediest children. (<http://www.robinhood.org/initiatives/library>)

### The Robin Hood Foundation prompts architects to re-envision the public school library

By Jane Kolleeny

"I had a dream of reinventing the library for elementary students," says Lonni Tanner, who headed special projects at the Robin Hood Foundation for 11 years. In 1998, she and Henry Myerberg, AIA, a partner at Rockwell Group in New York, visited a school in Brooklyn and saw what passed for a library: a room with a few dusty books and out-of-date computers. Soon they discovered that many of the public schools in New York City had similarly dispirited spaces posing as libraries. The kids deserved better, Tanner felt. Essential to their thinking is that libraries—at the heart of learning and education—can have a lasting effect on poverty. "You can't change all the classrooms in a school, but you can make a library—which takes only 5 percent of the physical space of a school, but has a 100 percent influence," says Myerberg. "That's a great rate of return."

So began the Robin Hood Foundation's library initiative, which has evolved into a unique collaboration with New York City's Board of Education to create, fund, and maintain school libraries in some of the most impoverished areas of the city's five boroughs.

Myerberg worked closely with Tanner to jump-start the project, asking other architects to volunteer their services. He was amazed at how easy it was to get help; it took 10 phone calls to get nine New York architects (plus himself) to design the initial 10 projects, which were completed in 2002. Since then, on the second round, he designed seven of the next 21 libraries, which opened in 2004. For the third round, he will undertake about five of a total of 25 libraries, which will be also be designed by seven other local architects, four of whom created prior libraries for the project.

The goal of the first round was to create a model that might be applicable to other school districts in the U.S. "It's not about creating a box or a room or putting books on the shelf," says Tanner. "I wanted the library to do its duty with the rest of the building and the school's program."

The library initiative fits perfectly into the mission of the Robin Hood Foundation, a nonprofit organization founded in 1988 by commodities broker Paul Tudor Jones and two friends in an effort to give something back to the less fortunate in a society that made them wealthy. The foundation has become a favorite of New York's high-flying hedge-fund managers, many of whom have given to it generously in recent years as their own fortunes soared. The group funds soup kitchens, education, job training, and programs for the homeless, supporting about 140 organizations in the greater New York City area. Executive director David Saltzman says, "The library initiative is a model of what public/private partnerships can and should be. Generations of poor children in New York City will benefit."

#### The inspiration becomes reality

The architects involved in the library initiative knew they needed to understand the students before they could design for them.

Calvin Tsao, AIA, a partner at Tsao and McKown Architects, who has completed five libraries to date, says: "We examined what the word 'library' means today, technologically and sociologically, and then sought to define the word for this particular group of people. We deconstructed and reevaluated the purpose of the library specifically for the students, to reinsert learning into there in a way that would be relevant to them."

From the beginning, a stream of donations—elicited by Tanner—sprang forth, including one million books each from Scholastic and HarperCollins, paint from Benjamin Moore, computers from Apple, advanced education (Master of Library Science degree programs) for the librarians from Syracuse University, graphics from Pentagram, and other gifts in kind. Even with donations and modest spending, the budget for the design of each library typically runs \$400,000 to \$500,000, a hefty commitment for schools with limited resources. But the Board of Education has committed its ongoing support—essentially in the form of a two-to-one matching grant—putting in two dollars for every dollar contributed by Robin Hood.

The architects learned that the old-fashioned definition of libraries as quiet, private places to read has morphed over time into a notion of settings for collaborative learning. They serve as gathering spots, where kids can work together on computers and watch or deliver presentations. Libraries have become media centers where technology and the Internet provides access to the world at large. Public performance and interactive learning appear to help the kids develop confidence. For that reason, the libraries feature theater areas or town halls, as Tsao refers to them, a deliberate attempt to center the space in a traditional way and use design as a learning device.

The team of architects from the first round of libraries established parameters to guide later designs. They agreed on the need to accommodate librarians/teachers leading an active class, students giving performances, and individuals studying alone. Since each space comprises no more than 2,000 square feet, flexibility became a key design component. Many areas have multiple uses facilitated by custom-made movable furniture and shelving. Each library required a minimum of four computer stations, wireless access, and storage for 10,000 books. While the design in each instance is unique, the aim has been to standardize the program and develop an economy of means.

#### The designs themselves

Architect Richard Lewis has designed five of these projects to date and is slated to do five more. He has enjoyed the sense of common purpose that Robin Hood encourages among the architects. "It is so satisfying to see the positive effect of these libraries. That's why the issue of professional fees has been so unimportant," he comments. The architects speak glowingly of their experience with Robin Hood, despite modest fees, which offset a portion of their direct costs. Michael Beirut, a partner at Pentagram who serves as graphic designer for the libraries, reiterated this experience. He described this work as the most fulfilling of his career. Perhaps the look on the kids' faces as they use the places explains the motivation of everybody involved in the initiative.

Looking at tight budgets and existing spaces, the architects found that some of their best tools for enlivening the libraries included customizing portable furniture, applying bright colors, and bringing in lots of daylight, original graphics, and whimsical light fixtures. While the libraries are ambitious for this context, they are often conservative for the architects themselves, many of whom have established reputations for innovative design. Marion Weiss, a partner at Weiss/Manfredi Architects, who designed a library at P.S. 42 in the first round, made a big impact simply by changing the library's location. Moving it from the fourth floor—where, in

isolation from the center, it seemed to imply that reading belongs at the periphery of education—she placed it on the first floor, where it is visible from the street and makes clear the school's commitment to books and learning. One of the challenges the architects faced was combining public and private areas in limited space. Some designs use bookcases, often on wheels, to define zones. Multifunctional furniture such as “flip-flop” desks and stools also help, along with curtains that can be drawn or opened as needed, and areas that can morph into proscenium seating, a stage, or work area. Tod Williams Billie Tsien Architects completed one library in the first round and three more in the second. Partner Billie Tsien, AIA, said they learned that a great cabinetmaker is not only your friend but potentially the primary builder of the library, since he/she can produce the space-defining bookcases that can “make a room feel good.” Beirut unified the projects with an identity built around the word library, with an exclamation point in place of the i. Throughout the interiors, this iconic branding crops up in a variety of materials and forms—in signage, carpets, flooring, and the glazing of doors. Since the kids typically can only reach 5 to 6 feet up to the top shelf, most architects kept the shelves low but took advantage of generous ceiling heights by putting murals on the walls above the shelving. So far, the libraries have been big hits—not just with the design community, but more important, with the administrators, teachers, principals, and children who use them. Principal Robert Flores of P.S. 106 in Brooklyn says, “You can't fathom what this library has done for this community and the 650 students served by the school.” When the program began, few of the teachers believed they would see much outcome from the initiative; they had long become accustomed to unfulfilled promises and cuts in school funding. Yet after the completion of the third cycle, there will be more than 55 new libraries built with 595 more to go, to fulfill the Robin Hood Foundation's goal of completing a school library for each of the 650 public schools in New York City. The projects have won eight AIA awards for excellence in design, and this year, Tanner received a special citation by the New York City AIA for the work, along with Christo and Jean-Claude for their Gates in Central Park—the only recipients of this award in 2005. The good will, strong design, and civil virtue of these projects are hard to quantify. And now the initiative is having an impact beyond New York. Baltimore launched a similar program in its public schools in 2001. The first library, Southeast Middle School, should open this fall. Designed by Alexander Design Studio, it won a Baltimore Chapter AIA award as an unbuilt project. With funding from grants raised by Baltimore's Board of Education, the city is preparing to expand the program. “We enlisted the help of 12 architects to do 12 more libraries for the schools,” says Alexander. While Robin Hood's library initiative is 100 percent in New York City, the idea of public/private partnerships to effect change in student performance and schools nationwide is both its promise and example. This remarkable project has drawn people together in creative and meaningful ways, bringing attention to communities that sorely need it. While the Robin Hood Foundation makes libraries happen, Common Ground creates housing and community development projects for New York's homeless and underprivileged. Read about its most recent undertaking—restoration of the Prince George Ballroom, a unique public/private endeavor here.

<http://archrecord.construction.com/people/profiles/archives/0509RobinHoodFoundation-1.asp>

In 2004, 1100 partnered with the Robin Hood Foundation on their library initiative, to provide under served New York City public schools with quality libraries. The first project 1100 designed for 16 PS, serves as a template for our five additional public school libraries. The curvilinear ‘bookworm concept’, established for PS16, was further refined to make the system truly modular and interchangeable to adapt to the range of layouts and conditions of each of the 5 schools. In each school, the design uses custom-designed bookcases as the visual focal point of the space, to divide the library into separate and versatile areas. The bookshelf is permeable, promoting discovery and imagination. (1100)

A dynamic urban library should expand and evolve with the community, operating as container and distributor. For young people it acts as a point of departure where the world beyond can be revealed. <this children's reading room is designed to stimulate its users' imaginations, encouraging them to learn through form, color and layout. Bold and graphic elements with a bright palette of greens, and blues are offset by glossy white. A reflective fabric undulates to form a playful ceiling, at parts folding away to reveal greater height and contrasting concrete. This reading room will inspire curiosity within and promote discovery even outside its walls. (1100)

#### [The Robin Hood Library Initiative: PS 16, Staten Island, New York NY – USA 2004](#)

60 percent of New York City public school students in grades 3 through 8 read below grade level. In 2004, 1100 partnered with the Robin Hood Foundation on their library initiative taking steps to help ameliorate this statistic. This first project, PS 16; is serving as a template for current and future projects in underserved neighborhoods in all five boroughs. The architectural component of this creates environments that attract children's attention and engage their participation in reading. Departing from the conventional library typology – a room lined with linear shelving – a custom designed serpentine bookcase form the visual focal point of the space and divides the library into three separate and versatile areas. The bookshelf is perceived as a permeable presenting opportunity for discovering rather than stifling imagination. (1100)

##### **Libraries:**

#### [Tidewater Community College, Learning Resource Center, Virginia Beach, VA – USA 2013](#)

120,000 sqf. , \$ 47,000,000

Scheduled to open fall 2012, the Tidewater Community College (TCC) Learning Resource Center is a \$ 36 million joint-use collaboration of the college and the City of Virginia Beach, Virginia's public library. In 2005, the City of Virginia Beach engaged Anderson Brulé Architects to create a Feasibility Analysis to explore the viability of a joint-use facility with the college. Following the analysis, ABA began work on the Strategic Operational Plan, creating a holistic understanding of library, service needs through research and data analysis, as well as an inclusive staff, stakeholder and community outreach process that reflects the diversity of the partner organizations and the communities they serve. With funding in place, Anderson Brulé Architects facilitated TCC and the City through the pre-planning work necessary to provide the appropriate decisions and information, including the conceptual space program, essential to inform the subsequent architectural design and construction documentaztion. (ABA)

## Redwood Shores Library, Redwood City, CA – USA 2008

22,500 sqf.

### Needs + Vision

Environmental appreciation is fundamental to the small community of Redwood Shore, located next to the waterfront along the Belmont Slough of the San Francisco Bay. Lacking a library and community meeting space, and with a delicate wetlands site in mind, the City select ABA to lead their effort of obtaining state funding. ABA's strategies and solutions created a fit of library, community space and an educational center that teaches about the balance between community needs and environmental sensitivity. State, City and Site Process. A Community in Transition

ABA was able to obtain two-thirds of the library development cost, a \$ 10.1 million State Bond Act Grant, through a highly collaborative Needs Assessment process co-created with the Core Team, Community Advisory Committee, City Staff and the Community-at-large. By using surveys, focus groups, interviews, and even a creative workshop with school-age children, the Needs Assessment engaged a wide range of people and convincingly made the case that Redwood Shores was underserved in library services, winning competitive State funding. ABA also facilitated the community through a complex and successful entitlements permit through the rigorous San Francisco Bay Conservation Development Commission (BCDC).

Sculpted to Meet the Water's Edge ...

Rethinking the fundamental purpose and functions of the library, the design addressed the assessed needs and included resource areas, a teen area, five community meeting rooms, technology center, and bookstore. Sculpted to meet the water edge, each room opens to large windows that maximize views. Interior furniture and finishes play on a nautical theme, using a marine-inspired color palette. A café that spills out onto a deck becomes the boardwalk access to the nature trail along the water. An Environmental Interpretive Center transforms book learning into observation and interaction with the natural habitat of the wetlands, the bay and slough wildlife.

Green Systems. Protecting and Learning About the Delicate Bay Ecosystem.

In the vein of slough preservation and conservation, the project was designed to exceed even the community's desires for sustainable design. Honoring the biodiversity of the bay wetlands, the Library sits on piers that minimize its impact to the delicate surroundings. From the under floor air distribution and natural daylight, to the specialized water treatment, water efficient fixtures, widely incorporated recycled and healthy building materials, and native landscaping, the Library incorporates multiple strategies of environmentally sustainable design. Although not submitted to the US Green Building Council rating system (USGBC), the City is publicizing the Library as its case study for development of citywide green design guidelines. (ABA)

## Cambrian Branch Library, Son José Public Library, San José, CA – USA 2006

27,800 sqf.

The new 28,000 sqf. Library provides three times the space of the outdated original and features many neighborhood amenities: a living room with fireplace, internet café, tech center, and a community room accommodating 100 persons. The design evokes movement and discovery, the proportions based on the mathematical "Fibonacci" sequence represented literally by a red spiral in the children's area, and permeating conceptually throughout the project. Public art is also incorporated in the 2-story interior, drawing from the natural and social histories of the area. The building's sustainable features include shading elements, storm water retention, and a high-efficiency mechanical system, lowering life-cycle energy costs. (ABA)

## Tully Community Branch Library, San José, CA – USA 2005

ABA worked with the City of San José to appropriately locate a new branch library, ball fields and parking within a master plan of approximately 19 acres in central San José. The library anchors the corner of the overall site with a barn-shaped form that reflects the agrarian past. The tall windows of the children's area act as retail beacons to the facing busy road. The project incorporates an under floor air distribution system so that, despite its lofty volume, energy consumption is vastly decreased from standard practices. The sustainably designed project received a Water Quality Award for exemplary water efficiency and water treatment strategies. (ABA)

## Martin Luther King Jr. Library, City of San José, San José State University, Joint Library – USA 2003

Executive Architect - Carrier Johnson, San Diego, CA, •Design Associate Architect - Gunnar Birkerts Architects, Bloomfield, MI  
Local Associate Architect - Anderson Brulé Architects, San José, CA

The Dr. Martin Luther King, Jr. Library is a 136 foot (41 m) tall public library in Downtown San Jose, California, United States that opened on August 1, 2003. As of 2007, it is the largest library building in the western United States built in a single construction project with over 475,000 square feet (44,000 m<sup>2</sup>) of space on eight floors and approximately 1.6 million volumes. The King Library is the main library for both San José State University and the San José Public Library.

This is the largest library to be built at one time west of the Mississippi - Eight floors plus a mezzanine and lower level •475,000+ square feet •11 acres of space •The building has a capacity of 2 million volumes •5 public elevators, escalators to the 4th •3,600 seats (more than double the combined seating of previous library facilities) •over 1 million visitors served per year •The Library is free and open to all - no identification or proof of residency is needed to use or enjoy materials within the Library.

## Acocck Associates Architects, Columbus, OH – USA

<http://www.acocck.com>

## Ohio State University (OSU) Thompson Library, Columbus, OH – USA 2009

The Thompson Library is a corner stone to The Ohio State University; it was built in three phases: the original, a Second Italian Renaissance Revival Style Structure opened in 1913; a 14 level stacks tower with wings and pavilions completed in 1951; and a modernist addition to the west, completed in 1977. The mission of the Thompson Library project is to produce a newly renovated structure that successfully meets the master plan and program objectives of the Thompson Library, through thoughtful management and the deployment of resources. The Thompson Library, as the Main Library of OSU, serves both as a general library for undergraduates and a research library for graduate students. Faculty in humanities and social sciences also share this building. While the library services and its collections receive high praise from the campus community, the physical environment falls short of its expectations. The renovated Library will house print-based collections, special collections, reading rooms, study areas, staff services and work areas. Public areas will include a café, exhibit spaces, and a major pedestrian access through the main level of the building. With this renovation the library will also include, the EHS library collection/staff/services, currently located in Sullivant Hall. The vacated space by EHS at Sullivant Hall will be renovated/ modified to create what will be called the Library Technical Center. (Acocck)

#### Project description

The \$108.7 million renovation of the Thompson Library lasted from 2006 to 2009, though planning the renovation took eleven years. Many changes were made to the original building in the renovation. The changes were meant to bring light to the library, harmonize the various additions into one building, and to update the various technological and mechanical systems of the building.

Two glass atria with skylights were constructed to allow natural light to enter the building; the west atrium is five floors, the east atrium is four floors. The east atrium contains a 'flying' staircase, unattached from walls, that allows for greater movement within the library (the previous staircases had been on the edge of the library). The walls of the tower facing the atriums were replaced with suspended structural glazing, a technique used to give the appearance of a wall of glass. This opens the stacks to the atriums and allows for more daylight to

View of the tower from the east atrium of Thompson Library. Obtained from Wikimedia Commons. Author: Ibagli  
enter the building. An additional floor was added to the ten-story tower; the eleventh floor is an open study space with comfy chairs for reading and large windows, providing library users with a picturesque view of the campus. The Reference Reading Room was remodeled back to its original design of 1913; to do this, the floor that had been constructed in 1966.

The renovated library has seating for 1,800 individuals, as well as 200 computers, and wireless internet. More group study space, a terrace garden, and a café were also added in the renovation. Motorized window shades that are automatically timed to move depending on the time of day and position of the sun were included to reduce energy consumption. Additional green facets were added during the renovation, including the use of recycled material, energy efficient lighting and HVAC system.

#### Architect

Graham Gund, of Gund Partnership, was the design architect for the Thompson Library renovation. Acock Associates is the Architect of Record. Acock Associates is based out of Columbus, Ohio. Construction managers Turner Construction and Smoot Construction teamed together to coordinate construction. MSI Design was hired as landscape architect. Heapy Mechanical-Electrical Design Services was also contracted and either replaced or upgraded the mechanical and electrical systems for the library's renovation.

#### Funding

Fundraising for the renovation lasted multiple years. The cost of the renovation was \$108.7 million. The majority of the funding came through the state (\$70 million). \$30 million was raised through donations, \$9 million of that was from the OSU Athletic department. The remainder (\$8.7 million) was contributed from funds the university had set aside for projects.

#### **Libraries:**

**William H. Hannon Library, Loyola Marymount University (LMU), Los Angeles, CA - USA 2009**

Located on a bluff overlooking the Pacific Ocean, and occupying a site between the old and new campuses of Loyola Marymount University, the William H. Hannon Library has become a new landmark for LMU and a central gathering place for students. The 120,000 square foot, three-story building (with full basement) was designed to tie together the campus and provide visual order to the disparate elements of the nearby buildings. The William H. Hannon Library represents a new paradigm in the delivery of information services to students, offering the most advanced technologies of today's digital libraries, combined with the materials and services of traditional libraries. The basement is designed to support high density storage that allows the accommodation of over one million volumes. This efficient use of space allows for 580 individual reading stations and over 30 collaborative study rooms in the floors above, as well as a computer lab, café and other special spaces designated for music and video materials. (AECOM)

#### **Sharjah Library, Sharjah – Emirate of Sharjah on design**

On the same site as the prestigious Sharjah Archives a central library is currently being designed and will be built under AECOM supervision. The architecture is inspired by the magnificent reading dome of the British Museum. The total building area is approximately 20,000 m2 and construction was completed on budget at US\$ 20 million. (AECOM)

### **Aedas Group, Aedis Architecture & Planning, San José, CA – USA**

<http://www.aedisgroup.com>

#### **Libraries:**

**Hillview Branch Library, San José, CA – USA 2007**

#### **Awards:**

**AIA Santa Clara Valley Design Awards, Award of Honor 2008**

Since its opening, the new Hillview Branch Library has become an instant neighborhood landmark as well as an important asset to this area of San Jose, a highly diverse community in multiple aspects: culture, ethnicity and age groups. The project replaces a much smaller, aging and functionally obsolete facility located a few blocks away. A unique partnership between two public agencies, the city and the school district, allows the new structure to be built on a portion of an existing public school. The library provides greatly enriched resources to the students of its host school as well as to help steer these youths toward productive after-school activities. As part of a citywide library improvement program, the library shares the common goal of being friendly to its surroundings, yet commanding a strong civic presence. An additional goal for this project is to distinguish the structure visually from its host school. The exterior of the building is animated by highly varied massing and a rich palette of colors. Flanking stone walls supporting a curved canopy announce the library's main entrance, while a cylindrical rotunda in the background signals the building's focal point on the inside. Interior activities are visible through the glazed entrance wall, providing for a connection between the inside and outside. To the right of the entrance, the separate community room is identified by a curving glass block wall with a barrel metal roof above. The building's interiors aim to create a very comfortable atmosphere, not unlike that of large, trendy, commercial

bookstores. This is no longer your grandparent's library, where quietness reigns as patrons concentrate on their tomes! Instead, we have a "market place" under the rotunda featuring the latest releases, a children's area where toddlers are encouraged to roam and explore, a teen center for those aspiring adults and finally, a true symbol of the 21st century: an internet café! Vibrant colors and richly textured materials abound to delineate each area and to create a friendly and accessible environment. Since many community members worked in the region's historic agricultural industry, celebrating this farming heritage became a key design element. In collaboration with Bay Area-based artist Amy Trachtenberg, interior details of the rotunda borrow from local agriculture: rising from a base of tractor tires, columns are clad with old growth redwood milled from harvest vessels, stainless steel and madrone branches; above, a series of paintings echoing the patterns and hues of the labored earth encircle the upper rotunda. Sustainable design elements include: bio-swales, storm water detention pond, reduced heat island effect, zero light pollution, low irrigation water usage, superior thermal envelope, superior HVAC performance (30% above ASHRAE), non-HCFC refrigeration system, construction waste recycling, recycled content building materials, local material sources, indoor air quality control both during and after construction, and day-lighting. (Aedis)

## **Alexander Design Studio, Ellicott City, MD – USA**

<http://www.brokenboxes.com>

### **Libraries:**

#### **Roland Park Library, Addition, Baltimore, MD – USA 2007**

Owner: City of Baltimore, Size: 9,400 SF, Cost: \$3,500,000, Completion Date: 2007

The Roland Park Library is an historic stone building located within a close-knit Baltimore neighborhood. Given a spatially limited site, the program called for an addition that not only maintains the historic nature of the building, but also meets the library's expanding programmatic needs. The project increases the Library's square footage and wraps the existing symmetrical building, preserving its lines and inherent character. Working directly with the local neighborhood and the City of Baltimore, the entire design process was an open, interactive exchange of ideas. Publicly well received, the Roland Park Library Expansion is reflective of a historically sensitive yet programmatically functional design. (Alexander)

#### **Southeast Middle School Library, Baltimore, MD – USA 2005**

Owner: Baltimore City School System, Size: 3086 sqf., Cost: \$151,800, Completion Date: 2005

This pro bono design for one of Baltimore City's poorest school districts is a pilot project for bringing innovative thinking to the design and renovation of the school's libraries. Replacing two interior rooms that made up the existing library, the new library is a unified space animated by a continuous piece of interior furniture that accommodates instruction/learning spaces. This continuous, but transforming system holds shelving, supports desk areas, houses computer terminals, defines an amphitheater, and supports specialty lighting. Conceived as a Mobius strip of learning, it criss-crosses the space as it accommodates the library's program needs, ultimately tying back into itself after making its circuit around the room. The circulation desk is defined by the one instance where the system crosses back over itself. The end result is a place where students are both energized by their built environment and made aware of the infinite yet connected nature of human knowledge. (Alexander)

### **Libraries:**

#### **Oley E. Rooker Library, Little Rocks, AR – USA 2010**

Winner of a Members' Choice Award from the Arkansas Chapter of the American Institute of Architects, the new Oley E. Rooker Library, Little Rock, AR, has walls of windows that overlook a plaza and an infinity-edge reflecting pool.

(<http://lj.libraryjournal.com/2011/12/buildings/library-building-2011/year-in-architecture-2011-fantastic-facades/>)

Each branch library in Central Arkansas Library System is uniquely designed for its neighbourhood, and the Oley E. Rooker Branch reflects its location, culture, and the community's interest in sustainability. Sited along Stagecoach Road near the main entrance to Otter Creek, the new library will provide a memorable landmark for the community and will be the first LEED certified facility for CALS. The design incorporates many sustainable strategies, including a geothermal heating and cooling system that takes advantage of energy naturally found on-site; efficient landscaping practices, such as catch basins to clean and infiltrate water on-site; and specification of both regional and rapidly renewable materials. Local building materials include stone, copper, wood, and glass. Lamiated wood beams form a large sheltering roof while transparent glass walls and large windows not only welcome passersby by allowing them to see activity within, but also provide a connection between interior spaces and the outdoors. The indoor environment is enhanced through views to the outside and abundant natural light. Cork and stone floors, wood, warm colors, and oversized hanging "lamps" along the perimeter add to the warm, inviting interior. (Allison)

## **ALSC Architects, Spokane, WA – USA**

### **Libraries:**

#### **John F. Kennedy Library, Easter Washington University, Cheney, WA – USA 1999**

expansion and remodel of an earlier library building (1968)

153,000 sqf., € 22,000,000

### **Awards:**

**Honorable Mention Excellence in Masonry Award Masonry Contractors Association of America (National Award)**

The primary goal for this project was to transform the existing dark and uninviting library into a student centered facility that would become the center of the University community. Creating a high-tech library that enables students to take advantage of distance learning opportunities was another important goal. To address these goals, the existing library was nearly doubled in size and completely remodeled. In addition to the library, ALSC was also responsible for redevelopment of EWU's pedestrian circulation system. The central mall area with its fountain and stream has become a favorite campus gathering space.

## **Alspector Architecture, LLC - USA**

<http://www.alspectorarchitecture.com>

### **Libraries:**

#### **John Cotton Dana Library, Rutgers University, Newark, NY – USA on design**

Multi-Scheme Master Planning and Conceptual Design Studies to transform, restore and upgrade the Newark campus' existing main library (build: 1967/1977). Interactive workshop design process facilitated determining the building program and evolving the final scheme. Elements recasting the library into a renewed campus center of study and learning are a state of the art Learning Commons, a Jazz Café, expanded Institute for Jazz Studies archives, and a variety of individual collaborative learning and study spaces including group studies, instructional computer labs, seminar rooms and new public assembly rooms. (Alspector)

#### **Mid-Mannhattan Library, New York Public Library, New York, NY – USA on design**

Renovations and expansion of the main circulating library. Winner of invited design competition.

Jacob Alspector served as Associate Partner in charge while at Gwathmey Siegel & Associates.

#### **Elmer Holmes Bobst Library New York University (Reconstruction of the Philip Johnson Building – 1972), New York, NY – USA Phase I : 2009, Phase II: i.constr.**

Philip Johnson (1906 – 2005) / Richard T. Foster (1919 – 2002 ) 1968-1971

One of four buildings executed for the university by Philip Johnson, Bobst Library was part of the unrealized NYU Campus Master Plan by Johnson and Foster. Although its red sandstone facade reveals the architects' attempt to work within the context of Washington Square, the large-scale building towers over the surrounding buildings. Its lack of applied ornament and formal expression of the steel frame are features of modern architecture. At the same time, its fluted masonry cladding, enormous Palladian atrium and elaborate first floor pattern are historic references that characterize postmodern buildings.

See also: Philip Johnson Alan Ritchie Architects, New York, NY – USA <http://www.pjar.com>

As the start of an ongoing multi-year renovation of NYU's iconic 490,000 square foot main library on Washington Square, Alspector Architecture re-evaluated the library's master plan and developed a detailed library program. The completed design includes a careful renewal of the first two above grade floors of Philip Johnson's 1972 building and the comprehensive transformation of the buildings two below-grade levels. The program required support for learner-centered and collaborative teaching, research and study methods. Alspector Architecture developed a rich variety of spaces, including circulation and reference centers; technology, reserves and microforms help desks; computer classrooms; refreshment lounge; and a variety of individual and collaborative study spaces.

New York University, Phase II

Following the successful Phase I Renewal and Renovations of NYU's iconic 490,000 square foot main library on Washington Square, Alspector Architecture undertook the comprehensive planning of a multi-year renovation of the balance of library public service space. Phase II will encompass phased departmental and collection relocations, new and refurbished Furniture, Fixtures & Equipment and complete information technologies, lighting, and mechanical infrastructure upgrades for Philip Johnson's 1972 building along with enhancements to the atrium such as skylights and new safety barriers. Phase II Planning Study completed April 2007.

#### **Allen County Public Library, Fort Wayne, IN – USA 2006**

Main Library Expansion & Renovation

Two story 127,000 square foot addition to existing 240,000 square foot library. Community-use facilities include: flexible meeting-rooms, "Access Fort Wayne Television" program, community computing and training, exhibition gallery, cafe, and library store. New below-grade garage and auditorium with separate entrance for off-hour use. Design phase included workshop interactions with private and public entities to meet goals of library and community. Completed 2006.

\*Jacob Alspector served as Associate Partner in charge while at Gwathmey Siegel & Associates

#### **Utah Valley University Library (Digital Learning Center), Utah Valley State College, Orem, UT – USA 2008**

Alspector Architecture acted as the concept and library design consultants for the programming phase for a new 180,000 square foot Digital Learning Center. The subsequent Concept Design effort included the creation of a new north campus quad for the 25,000 student state college growing into university status. Following concept design Alspector Architecture was the Design-Build Competition winner in 2006; expected completion is set for June 2008. (Alspector)

#### **Science, Industry & Business Library, New York Public Library, New York, NY - USA 1996**

### **Awards:**

AIA NYC Merit Award, 2001

National AIA/ALA Buildings Award, 1997

Architectural Record Interiors Award, 1997

ull-service public circulating and research library in landmarked building. Storage for collection of over 1.5 million books, open-shelf reference, 50,000 sq. ft. library-administration offices, 125-seat conference center and 60 seat electronic training center.

Multiple phase, fast-track design and construction. Flexible design to accommodate emerging technologies. Multiple public-agency approval, including DASNY and NYC, NYS, and US governments. Private and public funding. (Alspector)

\*Jacob Alspector served as Senior Associate in charge while at Gwathmey Siegel & Associates

## **Samuel Anderson Architects, New York – USA**

<http://www.samuelanderson.com>

### **Libraries:**

#### **HUL Administration, OIS & Weissman Preservation Center, Harvard University Library, Cambridge, MA – USA 2006**

24,000 sqf.

The architects created a finely scaled building. The open workspaces on the North side take advantage of abundant natural illumination while mechanical equipment is clustered in dropped ceiling surrounding the core. Up-lights in custom workstations illuminate the resulting uncluttered slabs, enhancing the building's transparency.

Each floor's circulation is organized by a gently folded wall of bookcases punctuated by portals into private offices. Custom furniture throughout is moveable, including the specialized equipment of the Special Collections Conservation Laboratory- a state-of-the-art facility for treatment of rare books, manuscripts, and maps.

Renewable and recycled materials including FSC-certified wood for finished and custom furniture were used throughout. Innovative lighting, air quality, geothermal heating and cooling systems, and storm water management, earned USGBC's prestigious LEED GOLD certification.

Executed in collaboration with LWA of Boston. (Anderson)

### **Thaw Conservation Center, The Morgan Center, New York, NY – USA 2002**

The Thaw Conservation Center is a world-class laboratory for conservation of works on paper as well as a magnet for conservation studies and training. It has enabled the Morgan Library to significantly expand its capabilities and activities in the field of conservation.

The Center sits on the top floor of the only freestanding brownstone extant in New York City - a four-story structure originated in 1855 and expanded around 1900. The original servant and nursery quarters had been modified many times, so the interior included nothing of architectural or historical value to preserve. Wherever possible, we exposed, restored and cleaned existing brick walls while installing few new partitions. The layout achieves appropriate arrangements for wet and dry treatments, examinations, documentation, teaching, and research, while allowing considerable flexibility for evolving conservation practice.

The Library requested that the existing shallow roof line be maintained, but the conservators required ample northern light. We conserved as much as the existing roof structure as possible with additions of discrete steel and wooden elements, transforming the original framing into a series of elegant shed trusses. The continuous air-vapor barrier was installed just above the original sheathing, but below the insulation, so the original roof construction is revealed and appreciated. (Anderson)

### **Straus Center for Conservation, Cambridge, MA – USA 1996**

11.000 sqf.

Harvard's Conservation Department is the oldest fine arts conservation treatment, research, and training facility in the United States. Renovation was imperative for the safety of the staff and collections; expansion was necessary to allow the conservators' advances in research and teaching to be realized

The challenge of accommodating the specialized needs of each conservation specialty while maintaining interdisciplinary exchange was addressed by a free plan where architectonic elements define distinct areas without separating them. A rhythmic sequence of skylights floods and unifies the Center with north light.

The dedicated mechanical system (discreetly located in a penthouse) maintains steady temperature and humidity despite intermittent use of spray booths, fume hoods, and fume extractors. A continuous air/vapor barrier and specially designed windows and skylights successfully prohibit the formation of dangerous condensation even on the most frigid nights.

The materials and equipment are integrated with the processes and functions of the treatment and research work. Each element is assessed in terms of its special use, relation to the human body and to the room, to ensure fluid, safe motion. (Anderson)

## **Architectural Resources Group, Inc., San Francisco CA – USA**

<http://www.argsf.com>

### **Libraries:**

#### **North Branch, Berkeley Public Library, Berkeley, CA – USA 2012**

Northern California The Berkeley North Branch Library, a Berkeley City Landmark, was designed by local architect James Plachek in the California Spanish style. Constructed in 1936, the building maintains the majority of its historic features.

ARG, in association with Tom Eliot Fisch, was architect for the rehabilitation and expansion, which was funded as part of a 2008 Library Bond measure. The historic one-story building was expanded with a two-story 4,200 square foot addition. The project restores the historic central rotunda and reading rooms, including decorative finishes and original furnishings, and adds staff work areas, a teen library, a community room, and support spaces, including accessible restrooms. Inappropriate modifications (e.g., ramps, awnings, lighting) made over the years were removed and replaced with new, historically appropriate finishes and fixtures. (Architectural)

## **Architecture For Humanity, San Francisco, CA – USA**

<http://architectureforhumanity.org>

### **Libraries:**

#### **Francisco Perez Anampa School, Ica – Perú 2010**

Design Fellow: Diego Collazos, Colaborator: Arturo Novelli – Edificaciones America, Project Coordinator: Ofelia Harten Area: 557 sqm, Year: 2010, Cost: \$193,000 USD (Final), Construction: Edificaciones America, Funding: Integra ING – Peru, Happy Hearts Fund, Beneficiaries: Primary beneficiaries: 160 Primary school children. Secondary beneficiaries: 3,105 Community of Tate. Courtesy of Architecture For Humanity

The Francisco Perez Anampa School is part of the: Happy Hearts Fund – ING school reconstruction program. The school is the first project in which Architecture for Humanity took part in by providing design services and construction administration.

The Francisco Perez Anampa school is located in the community of Tate, a small town in the Ica Region 300 kms south of Lima, Peru. The geographical context is very arid and dry within the southern Peruvian desert, the weather conditions are not extreme, still the comfort of the school children can be addressed with a proper building.

The school building attended by approximately 160 primary school students was heavily damaged by the 7.9 earthquake in 2007 that affected the Ica region in Peru. The entity assessing the quality of the buildings after the earthquake, Defensa Civil, confirmed that the building cannot be used any more, as a safety precaution. The school had to be moved to a temporary location for more than 3 years, into improvised temporary school structures. Those times are remembered as very harsh as there was a lot of dust, limited water accessibility, no electricity, and the classrooms proved to be very cold in winter and extremely hot in summer.

Happy Hearts & ING decided to rebuild the school as the pro-activeness of the community and the big necessity to provide an effective educational environment was essential. The new facility will include six brand new classrooms, one library, a state-of-the-art computer lab, two administrative offices, a meeting room, upgrade of the toilets, a courtyard, and playing area for the children.

## **ATA / Beilharz Architects, Cincinnati, OH – USA**

<http://www.ata-b.com>

### **Libraries:**

#### **Clermont County Public Library – Bethel Branch, Bethel, OH – USA 2005**

10,000 sqf.

Built to replace a cramped storefront library in rural Bethel, Ohio, this building was designed to meet the needs of the surrounding county. The open style design supports individual program areas in a large public space allowing flexibility for changing programs. The building accommodates drive-up service for the convenience of the rural customers. Internet browsing of the Library's collection and either phone or on-line reservation permits county residents access to a truly twenty-first century public institution. (ATA)

## **Atlanta-Fulton-Public Library System, Atlanta Georgia**

<http://afplweb.com/building-for-the-future>

Building for the Future

Atlanta-Fulton Public Library System's Building Program Update

January 2013

The Library System is engaged in a \$275 million building program, funded by a library bond referendum approved by Fulton County voters in 2008. The project is divided into two phases.

Phase I of the Library Building Program consists of 10 projects, 8 new libraries – Alpharetta, East Roswell, Milton, Northwest Atlanta, Palmetto, Southeast Atlanta, Stewart-Lakewood and Wolf Creek – and 2 expanded libraries – Auburn Avenue Research Library on African American Culture and History and South Fulton – with a total budget of \$167 million; these dollars include everything from design and construction to funding for collections.

### **Follow Our Progress:**

Below are the architectural and engineering teams as well as the sites that have been selected to date:

**Alpharetta Branch:** Cooper Carry, in association with Vines Architecture; Alpharetta City Center project in the heart of downtown Alpharetta.

**Auburn Avenue Research Library:** JWRA/Freelon, a joint venture comprised of J. W. Robinson & Associates and Freelon Group, Inc.

**East Roswell Branch:** KHA FRA Engineering Consultants, in association with Holzheimer Bolek Meehan Architects; corner of Holcomb Bridge Road and Fouts Road. Click here to check out the design of the new East Roswell Library.

**Milton Branch:** Stevens & Wilkinson, in association with 720 Design; corner of Mayfield Road and Charlotte Drive.

**Northwest Atlanta Branch:** Collins Cooper Carusi Architects, in association with The Freelon Group Architects.

**Palmetto Branch:** Houser Walker Architecture; on the west side of Palmetto Cascade Highway just north of Carlton Road. Click here to check out the design of the new Palmetto Library.

**South Fulton Branch:** McAfee3 Architects, in association with Craig Gaulden Davis.

**Southeast Atlanta Branch:** Stanley, Love-Stanley, P.C., in association with Craig Gaulden Davis; 1463 Pryor Road, Atlanta.

**Stewart-Lakewood Branch:** Smith Dalia Architects in association with Craig Gaulden Davis and Ai3; 1332 Metropolitan Parkway, Atlanta

**Wolf Creek Branch:** Leo A. Daly Co.; county-owned property in unincorporated South Fulton on east side of Enon Road.

Click here to check out the design of the new Wolf Creek Library.

- The program management team Heery/Russell is coordinating this significant building effort.
- Community input will continue to be an integral part of these projects.
- Green building design and sustainability are priorities for these projects; the Library System expects to achieve LEED Silver on all of the Phase I projects.

### **Timeline**

Design has begun on several of the projects, with construction beginning in early 2013, and openings in 2014 and continuing into 2015. Phase II consists of 23 renovated libraries and will begin upon the completion of Phase I.

Individuals and businesses interested in opportunities available with the library projects and other county procurements should contact the Fulton County Department of Purchasing & Contract Compliance at 404-612-5800 or visit <http://www.fultoncountytga.gov/atlanta-fulton-public-library-system-capital-improvement-program>.

## **Ayers Saint Gross Architects, Baltimore – USA**

<http://www.asg-architects.com>

### **Libraries:**

#### **MD (Maryland) State Library for the Blind and Physically Handicapped, Baltimore MD – USA 1992**

Over nearly two decades, Ayers/Saint/Gross has been involved in renovation, restoration, and reorganization of the downtown Baltimore branch of the city-owned Pratt Library that opened in 1931. The Maryland State Library for the Blind and Physically Handicapped occupies an adjacent site and provides books for the blind and physically handicapped. Ayers/Saint/Gross designed a building for this program, which primarily involves shipping and receiving, supported by a large area of closed book stacks. The program includes small reading rooms for the public and a browsing collection. The design provides the prominence appropriate to an institution of civic significance, within the bounds of an essentially utilitarian program. The public portion is in a limestone-faced building topped with atrium-like windows. Large areas for the closed stacks, storage, and mechanical space are below grade. Shipping and receiving occupy a one-story wing, above which the 45,000-gross-square-foot State Library Resource Center eventually was built. Completion: 1992, Size: 47,000 gsf, Cost: \$5.5 million

## **BBG-BBGM, New York – USA**

<http://www.bbg-bbgm.com>

### **Libraries:**

**Pentagon Library and Conference Centre, Washington, DC – USA 2006**

### **Awards:**

Excellence in Construction Award, ABC Chesapeake Chapter 2007  
Project of the Year Award, ABC Chesapeake Chapter 2007

BBG-BBGM designed the new Pentagon Library and Conference Center to not only meet the needs of the Department of Defense staff working within the facility but to satisfy rigorous environmental and energy efficiency standards as well. The DC-based firm's design was honored recently with one of the 2007 White House Closing the Circle Awards. These annual awards recognize efforts by federal employees and agencies to enhance and preserve the environment. Located under the existing River Terrace Parade Ground, the new conference center occupies the shell of what had previously been the Pentagon Officers Athletic Club. The new facility includes a large multi-purpose room seating 250 and fifteen smaller meeting rooms of varying sizes, as well as administrative offices and a permanent home for the Pentagon Library. A new entry pavilion, faced with limestone and bronze, was created specifically for the conference center. There are a variety of environmentally sustainable elements within the design of the conference center: multiple finishes and materials containing high levels of post-consumer recycled materials (i.e. acoustical tile), certified recycled wood, 'earth friendly' materials (such as linoleum), and high efficiency energy and water fixtures; skylights that bring natural daylight deep into the subterranean facility; and more than 50% of building materials were sourced locally, reducing CO2 emitted during transit. In addition, demolished portions of the existing structure were re-used in the new construction, rather than being hauled away to a dump. Energy usage is over 20% less than a typical facility of this size and function. The Pentagon Library and Conference Center has been submitted for a LEED "Gold" rating and will be the first Pentagon project to receive anything higher than the minimum LEED rating of "Certified." (<http://www.worldarchitecturenews.com>)

## **Beatty Harvey Coco (BHC) Architects, New York, NY – USA**

<http://www.bhc-architects.com>

We recently completed one of the first LEED certified libraries in the State of New York, the Ossining Public Library, as well as the LEED Gold rated Westhampton Beach Village Hall. We handled the LEED coordination for the first LEED school in NY State, the LEED Silver rated Hampton Bays Middle School. In East Hampton we are under construction on the first school in NY State to be submitted using standards of the Collaborative for High Performance Schools (CHPS), a program that tracks sustainable design in education. (BHC)

### **Libraries:**

**Farmingdale Public Library, Farmingdale, NY – USA – 2010**

### **Awards:**

AIA Masonry Award

**Greenburgh Public Library, Greenburgh, NY – USA 2009**

### **Awards:**

AIA Archi Honor Award

Located on the side of a steep hill in the Westchester town of Greenburgh, the two-story, 23,000 sqf. addition to the existing 22,000 sqf. library built in 1968, was designed to bring the facility up-to-date in serving its 300,000 annual visitors. Designed with a large amount of glass, the building uses natural light to illuminate a majority of the interior spaces. This, along with other energy efficient features and sustainable design concepts will qualify the project for LEED certification. (BHC)

**Ossining Public Library, Ossining, NY – USA 2007**

### **Awards:**

AIA Archi Commendation Award

The new 48,000 sqf. Ossining Library was constructed on a steep hill, on a site directly adjacent to the existing library, which was demolished and replaced with parking. Focusing on a contextual style, the project team developed a contemporary design with features that allude to the historic architecture of the Village of Ossining and used materials indigenous to the Hudson Valley, including natural stone and brick. (BHC)

**Cold Spring Harbor Library & Environmental Center, Cold Spring Harbor, NY – USA 2006**

To take full advantage of the waterfront, hillside property, the new library

**Brentwood Public Library, Brentwood, NY – USA 2004**

The renovation and upgrade of the 68,000 sqf. Public Library, one of the largest libraries on Long Island, was intended to accommodate the growing needs of the multicultural community. (BHC)

**South Huntington Public Library, South Huntington, NY – USA 2004**

### **Awards:**

Society for American Registered Architects. Design Award of Excellence

This 46,000 sqf. New building replaces the existing main library that had served the community of South Huntington for the past 30 years. The new building consists of a main collection of 160,000 volumes and a children's library with a collection of 50,000 volumes. The building is two stories with a mezzanine. The building is a state of the art in terms of technology, energy efficiency and environmental concerns, and is designed to be adaptable to address an uncertain future. (BHC)

**Cherry Hill Township, Cherry Hill, NJ – USA 2004**

### **Awards:**

AIA Masonry Award

Located in the Center of the Township of Cherry Hill, New Jersey this new 72,000 sqf. library replaces the original library constructed back in the early 1970's. (BHC)

**Haverstraw Public Library, Haverstraw, NY – USA 2003**

### **Awards:**

AIA Masonry Award

The Town Board approved the library subdivision on May 9, 2001. We selected Beatty, Harvey & Associates as architects, and Paceline Construction Corporation as our construction management firm to work on the plans and eventual construction. Sunday, October 21 marked the official groundbreaking ceremony of the new 36,000 square foot Haverstraw King's Daughters Library. Friends, staff and community enjoyed the beautiful weather and eagerly listened to speeches of hope and the reality of the new undertaking. The grand opening of HKDPL's new branch at the Rosman Center at Garnerville was held on May 18, 2003. This new library became the Haverstraw King's Daughters Public Library's new main branch featuring state-of-the-art check-in and check-out equipment, countless public computers, rooms for programs, tutors, quiet study, gallery, and more space to house the growing needs of our community. (<http://www.hkdpl.org>)

#### **Friends Academy Kumar-Wang Library, Locust Valley, NY – USA 2000**

##### **Awards:**

**AIA Archi Commendation Award**

Located at a private school on Long Island's north shore this new building is a state of the art facility housing Friends Academy's main library as well as serving as a technology center for research and education. Incorporating 24,000 sqf. of space, the new building is three stories (plus a mezzanine) and was designed to a compliment to the traditional architecture of the campus. In addition to planning and designing the new building BHC designed the interiors, including all furniture and casework. (BHC)

#### **Rogers Memorial Library, Southampton, NY – USA 2000**

##### **Awards:**

**AIA Archi Commendation Award**

The skillful design of this 22,000 sqf. building, which blends the needs of the library with the concerns of the community, was able to overcome community opposition that had led to the failure of a previous design. The new facility replaced an older building that the library had outgrown. (BHC)

#### **Suffern Free Library, Suffern, NY – USA 1999**

##### **Awards:**

**AIA Archi Award**

Using salvaged historic stone walls and stained glass from the previous building on the site, the design of the 38,000 sqf. Suffern Free Library harmoniously incorporates the historic architecture of the town and the style of the neighboring Tagaste Monastery with newer features and technology. (BHC)

#### **Beck Associates Architects, Oklahoma City, Ok – Tulsa, OK – USA**

<http://www.beckdesign.com>

##### **Libraries:**

#### **Downtown Oklahoma City College Consortium, Ronald J. Norick Library / Learning Center, Oklahoma City, OK – USA 2004**

114,000 sqf., \$ 18,000,000

The new Ronald J. Norick Library/Learning Center serves the downtown Oklahoma City workforce as a business information center and the inner-city neighborhoods as a community library. Visitors stepping into the first floor arrive in the four-story atrium, which is a primary focal point for the interior and fills the space with natural daylight. The first and second house the library collections, along with a special Oklahoma History Collection; the Children's Library, created from a children's design charette; and a cantilevered reading room with views to city hall and the new downtown art museum. The first-floor atrium has open seating for the "mini" cyber cafe. Rotating art exhibits can be displayed in the glass-enclosed art gallery on the first floor. The 114,000-square-foot facility houses the library administration staff, the Downtown College Consortium and public multiuse space. The fourth-floor learning center, the Downtown College Consortium, serves students at four universities. It also houses the Forum Room, which can be used for theatrical performances and seminars. Classroom space for the Downtown College Consortium, and other area colleges and universities offering MBA or other college courses, also is on this floor. (<http://schooldesigns.com>)

##### **Libraries:**

#### **Syosset Public Library, Syosset, NY – USA 2007**

\$ 13,000,000

##### **Awards:**

**2007 AIA Westchester / Mid-Hutson Chapter Design Awards: First Honor Award for Recognition of Architecture Excellence – The Syosset Public Library Expansion**

**2007 AIA Long Island Chapter Design Awards: First Honor "Archi" Award for Recognition of Architectural Excellence - The Syosset Public Library Expansion**

Space for the addition for this Long Island library was limited by a tight site and the need to retain as much existing parking as possible. The addition extends behind, as well as up and over the top of the existing one-and-a-half story structure. The expansion houses a 150-seat tiered auditorium, a cozy reading area with fireplace, quiet study rooms, public-access computers, new stack/seating areas, and a double-height gallery space connecting new and old. The architects specified materials that complement the existing 1960s structure: brick, metal panels, and a glazed curtain wall. The jury commended the planning for the addition and extensive alteration, in which all of the mechanical equipment is hidden in an interstitial space between the new and existing structures, as well as the nicely resolved detailing of the exterior. Jury members also praised the reuse and transformation of an existing modern structure to create a unified whole. (<http://info.aia.org>)

## **The Huntington Library, Art Collections and Botanical Gardens, San Marino, CA – USA**

### **Master Plan – Completed 2010**

The Huntington, located on 220 acres outside Los Angeles, welcomes 600,000 visitors a year to its outstanding library, art, and botanical collections. Ann Beha Architects created a Master Plan for The Huntington which serves as a blueprint for its future preservation and development, for buildings and landscape. The Master Plan sets strategic objectives to guide long term planning, expansion, and increased public access and services for scholars and the community.

## **Cambridge Public Library, Cambridge, MA – USA 2009**

The Cambridge Public Library, designed in 1887 by Van Brunt & Howe in the H.H. Richardson inspired Romanesque style, is listed on the National Register of Historic Places. ABA partnered with William Rawn Associates to complete the renovation, restoration and major expansion of the Landmark Library. The historic building has been restored and energized and includes a 70,000 sf addition that maximizes views of the historic building while minimizing impact on the neighborhood park. A 1957 addition to the Library’s west elevation resulted in the original granite and intricately carved brownstone details being covered or destroyed. In an effort to restore the building’s unique details, ABA performed extensive research and conducted testing to identify original materials. The entire historic building has been restored and includes the information commons in the original delivery room and Young Adults in a reconfigured stack space. **This project is designed to achieve LEED Certification. This project received a 2010 Massachusetts Historical Commission Preservation Award; a 2010 Integrated Design / Integrated Development (IDID) Excellence in Sustainable Design Award; a 2010 Interior Design / Interior Architecture Award from the Boston Society of Architects; and a 2010 Aon Build America Award from the Associated General Contractors of America.** (Beha)

## **Massachusetts Historical Society, Boston, MA – USA 2009**

The Massachusetts Historical Society encompasses millions of rare and unique documents and artifacts vital to the study of American History. The four-phase renovation of this distinguished library and landmark accommodates new seminar, reference, and exhibition spaces, expanded publication offices and collections storage. ABA’s design work has increased public programming, improved protection for collections, and refreshed the interiors which expand the Society’s programs and introduce new technology. (Beha)

## **Crandall Public Library, Glen Falls, NY – USA 2008**

ABA designed the renovation and expansion of the Crandall Public Library, a 1930’s Charles Platt building listed on the National Register of Historic Places. The \$18M project expands the existing landmark building and creates a social and interactive facility serving three communities as the Central Reference Library for the Southern Adirondack Library System. Located on the City’s main street, with one side facing a city park, the design creates an inviting and open entrance on the street side, and outdoor seating and recreational space on the park side. The new 52,000sf library includes a large multi-purpose community room, café-style browsing area, Center for Folklife, a new children’s space triple the former size, and state-of-the-art technology throughout. **This project received a 2008 Outstanding Building Award from the New York Library Association.** (Beha)

## **Needham Public Library, Needham, MA – USA 2006**

ABA designed a contemporary 40,000 SF addition to the Needham Public Library’s existing 8,000 SF Georgian Revival style building, originally constructed in 1915. To minimize the difference in scale, the addition was divided into components that match the scale and proportions of the existing building. The new wing is clad in marble, slate, and brick like the historic building, while introducing large areas of glass that provide greater views, openness, visibility and natural lighting. The interior design was inspired by the scenes of the Library’s unique collection of fourteen N.C. Wyeth paintings. This continuity of forms makes clear the transition within the library from past to present and future, and acts to bind both tradition and vision within the same structure. The Needham Public Library building is LEED Certified. (Beha)

## **University of Pennsylvania, David B. Weigle Information Commons at the van Pelt-Dietrich Library, Philadelphia, PA – USA 2006**

Project Size: 7,000 sf

A joint undertaking of the School of Arts and Sciences, the Office of the Provost, the Penn Library, and ABA, the Weigle Information Commons offers students an innovative, technology-rich venue for collaborative study and learning. With seating for close to two hundred students, the 7,000 square foot Commons offers a choice of group study settings ranging from private study rooms, to café-like booths, to flexible open spaces. A digital media lab provides training and equipment for video, audio, imaging, and web publishing design, while a 25-seat seminar room is a setting for students to practice their presentation skills. (Beha)

An innovative, technology-rich venue for collaborative study and learning, the Weigle Information Commons is located on the first floor of the University’s Van Pelt-Dietrich Library. The Commons provides seating for 200 students and offers a variety of group study spaces, a digital media lab, and a seminar room for students to practice presentation skills. This flexible venue is also used by students seeking faculty advice on writing skills and for tutoring sessions. ABA worked with the existing modernist aesthetic of the Library, transforming a dark and uninviting space into what is now one of the most popular student destinations on campus.

"Their (Ann Beha Architects') advice was thoughtful and concrete; the final design owes a great deal to their insights."

- H. Carton Rogers, Director of Libraries, University of Pennsylvania. (Beha)

### [David Bishop Skillman Library, Easton, PA – USA 2005](#)

#### **Awards:**

**Library Building Award AIA/ALA 2007**

**Institute Honor Award for Interior Architecture 2006**

The David Bishop Skillman Library, constructed in 1963, has been expanded and redesigned as a vibrant center of social and intellectual life at Lafayette College. ABA designed a 35,000 SF addition, creating an innovative model for information services at the core of the campus. The library integrates information technology and expands collections and library programs. As a newly important center for campus life, the Library offers facilities for group studies, a café, gallery, a special events room, and informal meeting spaces. (Beha)

### [Providence Public Libraries, Providence, RI – USA 2003](#)

As the Architect for the Providence Public Library System, ABA completed a Master Plan for renovations and additions to the central library, seven existing branch libraries and two new branches. This urban Library system, which won a 2001 award from the Institute of Museum and Library Services, serves a wide variety of neighborhoods, through in-depth, general and specialized collections and award winning public programs. The project included schematic designs and budgets for the renovation and expansion of all seven existing buildings and a concept study for the central library, enabling the system to develop an overall capital campaign. Completed projects include the expansion of the Rochambeau and South Providence Branches. The projects reconsider the ways in which library services are delivered throughout the city, offering architectural expression to support the library's mission of providing access and invitation to new facilities for a diverse urban community. (Beha)

### [Mary Baker Eddy Library for the Betterment of Humanity, Boston, MA – USA 2002](#)

80,000 sqf., € 25,000,000

#### **Awards:**

**Boston Preservation Alliance Achievement Award 2002**

A modern library within a neoclassical building respects the old by making clear what's new, by Nancy Levinson

As conceived by the client, the program for the Mary Baker Eddy Library for the Betterment of Humanity mixes the practical and idealistic, the private and public. Located within an existing building—the 11-story Neoclassical mid-rise once occupied by the Christian Science Publishing Society—the 81,000-square-foot facility includes a technologically up-to-date research library and a small conference center for both institutional and public use. In addition to these specialized spaces, the library features a sequence of public galleries, all of which have a marked spiritual and pedagogical bent, and whose presence addresses the client's ambitious goal of making the library a forum for the public. These galleries include the Hall of Ideas, located in the double-height space that was once the building's entrance lobby and for which the MIT Media Lab has created "Word Physics," a computer-generated flow of great quotations; the Quest Gallery, which documents Mary Baker Eddy's life and work; the Monitor Gallery, an interactive display that uses the resources of The Christian Science Monitor to explore world events, past and present; and the renovated Mapparium, a three-story, spherical, stained-glass simulation of the globe, constructed in 1935 and long one of the city's singular attractions. Throughout, the architects have followed the sensible and sensitive course of refurbishing, wherever possible, existing features and finishes, and of using a contemporary vocabulary for all that is added, thus articulating old and new. The result is a lively blending of elements, including chestnut wall paneling, travertine and terrazzo floors, wrought-iron grillwork, and mosaic-tile ceilings, all retained from the original building, and new features such as a lobby staircase with a stainless-steel stringer and glass balustrade, sleek new birch furniture, and a glass curtain wall. The library occupies only four floors of the old building, with research and archival spaces on the top two floors and public galleries on the lower levels. These public spaces posed a particular challenge. If the library were truly to be a civic meeting place, it would need to establish a strong presence on its street, which happens to be Massachusetts Avenue, one of the city's main thoroughfares. But the old Publishing Society was not at all a presence on the street. It was literally walled off, separated from the surrounding city by a 14-foot-high limestone wall that sheltered what had been a private garden; the building was entered from the Christian Science Plaza (part of the church headquarters designed in the early 1970s by I.M. Pei and Araldo Cossuta). The architects met this challenge with a skillful and bold gesture: move the entrance from the plaza to the main avenue, tear down the high wall, and extend the lobby toward the street, enclosing the new entry space with a gracefully curved, 16-foot-high glass wall, transparent by day, aglow by night. And from this generous architectural move there followed an equally good landscape strategy, which was to create a garden between the lobby pavilion and the street. Designed by Reed Hilderbrand Associates, the garden, like the architecture, elegantly intermingles old and new. By removing only portions of the Neoclassical wall, the designers created a landscape in which new features, such as a stainless-steel waterwall, work in crisp counterpoint to the imposing heft of the Baroque-style gate. See the February 2003 issue of *Architectural Record* for full coverage of this project.

### [Bowdoin College, Hawthorne Longfellow Library, Brunswick, MD – USA 2001](#)

The Hawthorne-Longfellow Library is known for its special collections and breadth of services to the Bowdoin community. ABA's design for the Library reinforces Bowdoin's commitment to providing a dynamic, technologically advanced, and welcoming library environment for the college. The original library building, designed in 1964, presented many design and technical challenges. The renovation provided new reading, study and reference rooms, an electronic classroom, a special collections/archives center, new stack areas for reference materials, and new compact storage. (Beha)

### [Nantucket Atheneum, Nantucket, MA – USA 1997](#)

#### **Awards:**

**1997 Massachusetts Historical Commission Preservation Award**

ABA renovated and expanded the Nantucket Atheneum, the town's historic library and cultural center. The scope included modernization of library facilities, new building systems, and a 4,000 SF addition, which included a new Children's Wing. Located in a new public park, the expansion complements the historic structure, and provides a lecture hall as well as areas for study, story hour, browsing and computer technology. The project received a Preservation Award from the Massachusetts Historical Commission. (Beha)

### **Libraries:**

**Hennepin County, Eden Prairie Library, Eden Prairie, MN – USA 2004**

Eden Prairie Library started its life as a "big box" super market. Hennepin County purchased the building intent on converting it into a new state-of-the-art library facility. BTR was enlisted to combine our library expertise with our design focus to aid in this effort. (Bentz)

Eden Prairie Library is believed to be the first library in the US to use a natural gas fuel cell to create power and heat on-site. The fuel cell generates 5 kilowatts of electricity which is enough power to operate a typical home and has an annual utility savings of \$82,000. The Minnesota Sustainable Design Guide was used in the design of the building. Some of the sustainable components incorporated into the Library include: the reuse of an existing building (the building was formerly a grocery store); low emitting VOC materials; recycled content carpet tiles; efficient lighting controls; sustainable landscaping incorporating native plants; and on-site rain water management. Building information: <http://www.hclib.org/News.cfm?ID=970> (<http://www.greenlibraries.org>)

**Clare Boothe Luce Library, Monks Corner, Mepkin Abbey, SC – USA 2001**

The state-of-the-art monastic library sits in a prominent location on the cloister of the monastery, forming a link to the Luce Gardens to the west, a separation of pathways between the monks and visitors, and a dramatic bridge-like appearance the reinforces the northwest edges of the cloister. The library features a significant collection of print and non-print media in both open and compact shelving areas. Specially designed rooms are set aside for rare books and archival collections. While following tenets of monastic building design, including clarity of structure and austerity of design, the library is modern in both its building technology and its electronic information infrastructure. (Bentz)

**Winona State University, Darell W. Krueger Library, Winona, MN – USA 1999**

The new 108,000 square foot "Library of the Future" at Winona State University was designed to accommodate the new and changing technologies of the information age, enabling students to access information in all available formats and media. As patterns of study shift to more group collaboration and cross-disciplinary research, the library will be flexible and adaptive to the unknowns of the future. (Bentz)

### **Libraries:**

**Ridgewood Library Renovation, New York, Queens, NY – USA 2008**

The main reading room of this 1929 Neo-Tudor style building by the architect Henry Brucker will be restored. The original radiating book stacks from the central reference area, interior surfaces and trim will be restored, while providing the 21st century state-of-the-arts technology to the patrons of this small neighborhood library. (Beyhan)

**Cornell University Mann Library, Public Computer Classroom Auditorium, Ithaca, NY – USA 2007**

Albert R. Mann Library was originally housed in a 5-story, 143,000 sf, Art Deco building designed by the architect Cornelius J. White in the late 30's and built in 1947. In 1993, an addition designed by the architect Edward Larrabee Barnes was completed, extending the existing building towards the Bebee Lake and adding approximately 106,000sf of stack space.

The renovation project by BKAA started after the completion of the addition with the demolition of existing self-supporting book stacks in the center of the building. In place of the book stacks, new central atrium was designed. Distinguished Art-Deco reading rooms, lobby and the building exterior were restored.

The top two floors of the existing building went through an extensive effort of adaptive re-use. Seven state-of-the art teaching laboratory and support spaces, a Hortorium for the 100 year old Liberty H. Bailey herbarium collection, several classrooms and faculty offices for the Plant Science Department were inserted in a thoughtful arrangement of proximities to meet the 21st century standards of academic research environment. (Beyhan)

## **Gunnar Birkerts (& Association), Wellesley, MA – USA**

### **Libraries:**

#### **University of Utah, Marriott Library, Addition, Salt Lake City, Utah – USA 1997**

This expansion preserves the original library's architectural integrity while optimizing its location at the heart of an evolving campus. The two-level subterranean addition wraps around the existing structure on the north, east and south sides. Between 1968 and 1998, the student population at the University of Utah doubled and the number of volumes in the library. Renovation from 1,800,000 to 2,750,000. The programming challenges of this project involved accommodating this substantial growth and also planning for the next 20 years. The expansion provides 4,000 book stacks, 1,400 reader stations, audiovisual facilities, 250 computer stations, multimedia classrooms, a reserve reading area, a 200-seat auditorium and an extended-hours study area. Extensive incorporation of daylighted courts and skylights reduces eyestrain and minimizes fatigue for users. The design also features: HVAC/humidity control system to keep users comfortable and the library's collection secure; indirect lighting system and data/power raceway system to facilitate computer-technology integration; underground air-duct system that takes advantage of "passive ground cooling;" electrical and mechanical services wrapped around the original building's basement core, allowing for a thin sandwich between floors and ceiling heights of 10 feet. (<http://schooldesign.com>)

#### **University of California, Geisel Library, San Diego – USA 1993**

The Central Library was designed by **William L. Pereira Associates** with project architect **Robert A. Throburn**. It opened in 1970 and is an icon of the Brutalist style. The structure is all poured in placed architectural concrete (no wimping out on precast here). An addition, designed by **Gunnar Birkerts**, was added in the early 1990s and sits below grade of the main tower with skylights that pop above the plaza level. The library was renamed the Geisel Library in 1995 for Audrey and Theodor Geisel. (<http://www.flickr.com>) On December 1, 1995 The University Library Building was renamed Geisel Library in honor of Audrey and Theodor Geisel (Dr. Seuss) for the generous contributions they have made to the library and their devotion to improving literacy.

In the tower, Floors 4 through 8 house much of the Library's collection and study space, while Floors 1 and 2 house service desks and staff work areas. Some of the austerity of the original building has been lessened by the addition of the coved ceilings, painted walls, and carpeting throughout levels 1 and 2. The new color scheme complements the color scheme in the addition.

The library addition, designed by Gunnar Birkerts, was deliberately designed to be subordinated to the strong, geometrical form of the existing library. The library, designed in the late 1960's by William Pereira (original report), is an eight story, concrete structure sited at the head of a canyon near the center of the campus. The lower two stories form a pedestal for the six story, stepped tower that has become a visual symbol for Geisel Library. Whatever its metaphorical connotation, its image is preserved and enhanced by the concept for the addition. (<http://libraries.ucsd.edu>)

#### **Latvia National Library, Riga – Latvia 2012**

By David Cohn

The Latvian National Library was conceived in 1991, the same year Latvia gained independence from the Soviet Union. Gunnar Birkerts, FAIA, a Latvia native now based in Massachusetts, won the commission to design the Latvian National Library in 1991—the same year the country gained independence from the Soviet Union. But the high-profile project never got off the ground due to funding woes. Now, nearly two decades later, construction of the library is finally under way in the capital city of Riga. Given that Latvia has been hit hard by the economic crisis, "it's really amazing that the project is still moving forward," Birkerts says. Equally amazing is the fact that Birkerts's original design has been maintained. "There has been enormous change within the building," Birkerts says, "but the shell has not changed. The architect conceived an asymmetrical "glass mountain" inspired by a Latvian folktale about three men scaling a glass mountain on horseback to rescue an imprisoned princess. The story, and his design, are related to Latvia's quest for independence. "It's a fable that absolutely everybody knows. And it was expressive of the political situation at the time, breaking away from the Soviets to strike out on our own as a nation." Large expanses of glass on the facades will be combined with stainless-steel walls and roofs. Inside, the 13-story library will contain six million books overlooking an atrium. Completion is slated for 2012. The \$300 million building, designed in collaboration with local architect Modris Gelzis, is rising on the banks of the Daugava River, facing Riga's historic center. It will anchor a new development that includes a government center, university buildings, and a concert hall. The location is part of an effort "to keep developers out of the Old Town," says Birkerts. "We are doing this with the help of UNESCO, which has declared Old Riga a protected area." Birkerts turned 85 this year, and this project caps a long career commemorated in the new monograph, *Gunnar Birkerts: Metaphoric Modernist*, published by Axel Menges. After studying in Stuttgart, Birkerts worked in the offices of Eero Saarinen and Minoru Yamasaki before establishing his own practice outside of Detroit in 1962. Among his best-known works are the Federal Reserve Bank of Minneapolis (1973), the Kemper Museum of Contemporary Art in Kansas City (1994), and the Corning Museum of Glass (1980), in Corning, New York. Currently, he is working on the renovation and enlargement of the Museum of the Occupation of Latvia in Riga. (<http://archrecord.construction.com>)

## **BKSK Architects, New York, NY – USA**

Stephen Byrns, Harry Kendall, George Schieferdecker, Joan Krevlin

<http://www.bkskarch.com>

### **Libraries:**

#### **Mamaroneck Public Library, N.Y. – USA 2010**

A substantial renovation and addition to the historic Mamaroneck Library is currently under way. The original structure was built in 1927 with two subsequent additions in 1960 and 1970. BKSK will be adding a contemporary 13,000 square foot addition, and modernizing the existing 21,000 square feet of the building. The new facility demonstrates its commitment to environmental leadership by incorporating energy efficient building systems, a green roof, sustainable materials and abundant natural light — all elements that will enable the Library to qualify for a silver LEED® rating. The marrying of old and new in the design is achieved through complementary façade materials and a replication of the sense of columns and box patterns. A highlight of the new design is the restoration of the Library's original reading room in the 1927 section. In addition, a new children's wing, dedicated teen area, expanded public computer space, enlarged community meeting facilities and a coffee bar and outdoor terrace will meet current and anticipated future needs of the Library patrons. The flexibility of the design allows for future changes in library services and product delivery. The anticipated completion date is spring 2010. (BKSK)

#### **Plainsboro Public Library, Plainsboro, N.J. – USA 2010**

Client: Plainsboro Public Library and Township of Plainsboro, 45,000 sqf., \$ 12,000,000

The new Plainsboro Public Library building anchors a newly created Town Green. It shapes, and is shaped by, this pedestrian-friendly public space, created as part of a new mixed-use Town Center for an ethnically diverse and rapidly growing community. Working in concert, the public space and the public library are an affirmation of the civic realm. Plainsboro's first library was inaugurated in 1993, and the Library (as a de facto community center) has played a key role in the town's self definition as it grew. The new 45,000 square foot/\$12.4 million facility celebrates that fact, as a home for their increasingly ambitious program of services. In addition to its sizable collection of books and periodicals, their expanded program includes an internet café, a children's science museum, classrooms, an arts resource center and a community meeting space/auditorium. The architecture literally showcases these community resources. Simple, geometric brick wings bracket an articulated glass & steel center entrance and main reading room. This material contrast emphasizes the Reading Room's openness and transparency, and a lacy colonnade engages the plaza and square as a front lawn/outdoor reading room. Once inside, another outdoor room is revealed—a directly accessible contemplative library Reading Garden. Progressing up to the third floor Children's Floor, two corresponding outdoor terraces—one active and one passive—echo the overall connection between indoor and outdoor functions. The Children's Floor also includes a tower element, from which a commissioned video artwork, projected onto the outwardly sloping ceiling will be a quietly intriguing landmark visible from afar. All of these asymmetrically arranged exterior architectural elements, evocative but not imitative of the area's traditional brick and white trim buildings, combine to express the contemporary mission of this 21st century library. Plainsboro's town center is a new creation, based on a time-honored model. The residential and commercial structures that complete it, along with the street furniture and lighting, strike a comfortably nostalgic note. The Library offers a bridge to the present, and has quickly become a source of civic pride and an emblem of community aspirations. The interior architecture is expressive, as well, of the library as a vital part of contemporary life. The double-height, expansive main Reading Room, as described above, is conceived as an indoor equivalent of the Town Green and opens directly to it. Key program elements (Gallery, Café, Community Room) are visually accessible from the entrance, and carefully zoned from more active and public to less active and quiet. A broad open stair leads to the circulation desks of each floor that introduces a language of modern craft and artful simplicity. Throughout, the millwork and furniture evince a welcoming spirit of quiet whimsy and an embrace of multi-cultural influences. (BKSK)

#### **New York Law School, New York, N.Y. – USA 2009**

Primary Client: VVA Project Managers, Building Owner: New York Law School

BKSK partnered with Washington, D.C.-based SmithGroup to complete the first of a two-phased project that comprises 200,000 sf of new construction and 150,000 sf of renovations that results in a highly functional complex and an attractive new physical identity for New York Law School right in the urban heart of New York City. Our design approach emphasized the principles of clarity and visibility. The new wing contains classrooms, offices for faculty, student spaces, and the law library, organized by a generous lounge/circulation space that runs along a 5-level, 200-foot glass façade. This transparent envelope displays a high degree of activity well into the evening, transforming the impression of the School "inside-out." The Phase I new addition with five stories above- and four levels below-grade opened in September 2009. Phase II includes renovations that will create innovative facilities for faculty and students, supporting the School's new centers for advanced scholarship and research. (BKSK)

Gentry Public Library

Fayetteville, Arkansas (2008)

A new modern public library and community room are surgically placed in the 100 year-old brick shell of a former hardware store on Main Street in a small Arkansas town. The existing brick structure, though of little architectural value, was desired by the community to remain visually intact at the exterior. The scarred and patched building is thus conceived as an historical artifact; its ruined state transformed by the addition of steel and glass volumes that encase existing window openings and brick ornament, infill existing openings, and selected walls.

These transparent volumes act as display cases oriented from the interior towards the city, presenting the building and its artifacts to the public, extending the gritty expressive character of the library with another layer of time and modernity, in effect, a new civic presence for the town of Gentry. The Ballard Library and Neighborhood Service Center draws on this established Seattle neighborhood's Scandinavian and maritime roots, while focusing on its future as a popular community composed of a younger, more diverse population. The building presents a powerful civic face along a pedestrian corridor. Its main entry is pulled back from the street to make a deep front porch, where exterior site furnishings are grouped to encourage human interaction and reinforce the civic nature of this sheltered space. Individually metered, photovoltaic glass panels shade the Neighborhood Service Center lobby, demonstrating the effectiveness of photovoltaic technology in a Pacific Northwest environment. The project effectively illustrates that green building is feasible within a modest budget, and offers the Ballard community an ideal example of the benefits to be realized when sustainable design and extraordinary architecture come together. (Bohlin)

#### **Issaquah Public Library, King County Library System, Issaquah, WA – USA 2001**

##### **Awards:**

**2005 Design Award. AIA/ALA**

The Issaquah Public Library is a 15,000 sq. ft. branch library that represents an expansion and modernization of library services for Issaquah in a more prominent and centralized location. It is located in the heart of the historic downtown core, on the corner of Front and Sunset streets. While future downtown planning calls for multi-story urban structures, the library use dictated a single story. The cedar-sided structure resolved this apparent conflict through the use of an exaggerated building height coupled with the use of a trellis and canopies to maintain a humane scale at the street level. These scale elements relate to the cornice height of the neighboring buildings and visually secure the building in its context. Patrons approach the entry from the new parking structure, passing screens of greenery and artwork, and from Front Street past large multi-paned windows. This rhythm echoes the pattern of shop windows and offers protection through a large overhang and canopies. On the corner is a large covered area, or agora, which serves as a sheltered gathering space and marks the entrance to the building. Activity in the multi-purpose room, adjacent to the agora, is visible from the streetscape. Doors open to the area outside to accommodate special events. Entering from the agora, patrons pass through a wood-lined lobby and under a pair of tilted columns into the main space. Additional round columns gently taper, accentuating their height, as they rise to meet the wood-lined ceiling. Light filters through clerestory windows to highlight a delicate metal truss at the building's spine while bathing the space in natural light. Maple desks and bookcase ends carry the warmth of wood throughout the space. Trellises at the children's area and circulation desks mimic the exterior trellis. Stone petroglyphs in the floor, benches and a series of bronze ravens line the entrance sequence while echoing the sense of discovery inherent in the building's design. The library does not plagiarize historical details, but rather appears as a comfortable cousin to its historic neighbors. The new Issaquah Library creates a fresh identity that is both timeless and welcoming. The Issaquah Library received a 2005 award for design in the joint American Institute of Architects/American Library Association awards program. (Bohlin)

#### **Rakow Research Library, Corning Museum of Glass, Corning, NY – USA 2000**

The Rakow Library is the world's pre-eminent repository on the history and technology of glass. The Library's facility was designed in response to a number of demanding criteria: the need to provide a secure environment for the library's irreplaceable collection, the need to carefully control environmental conditions, and the need to protect the collection from the risks associated with the museum's location in a flood plain.

Originally housed within the Museum of Glass building, continual expansion of the collection necessitated its relocation. After various locations on the campus were evaluated, the Library was located within the shell of a vacant 1966 office building. This renovation choice was dictated less by economy than by the advantages of its location and the expansion opportunities available within the building's shell.

The renovation took the form of a radical reconstruction, including significant reinforcement of the steel structure to permit future installation of compact shelving. This restructuring process afforded several design opportunities, including openings in the second floor linking upper and lower levels.

Mechanical, electrical and finish systems were entirely replaced. Their design was heavily influenced by conservation requirements. In addition to very narrow temperature and humidity tolerances, the building systems feature advanced air filtration, a fire suppression system designed to minimize potential water damage, and careful segregation of heating and plumbing piping to avoid the risk of leaks in collection areas. Finishes were chosen to minimize the introduction of air-borne contaminants.

The new library's architecture celebrates glass, thematically relating the building to its library subject and to the Museum's nearby Glass Center. Extraordinary glass detailing characterizes the "building within a building" which houses the collection, as well as special features such as glass-floored stairs and bridges. The south-facing reading areas enjoy a river view through a glass sunscreen. This screen serves as a large "environmental sculpture," transforming the character of the former office building. Its metallic and etched linear patterns interact with seasonal sun angles to maximize visual transparency while excluding direct sunlight from the library's interior. (Bohlin)

#### **Boora Architects, Portland, OR – USA**

**<http://www.boora.com>**

##### **Libraries:**

#### **Vernonia K 12 School, Vernonia, OR – USA 2012**

This new educational campus is a ground-up replacement of Vernonia's K-12 facilities after a devastating flood in 2007 severely damaged or destroyed all of the small town's schools.

The new building also functions as a community hub and civic center for activities and meetings with over 50,000 square feet available for community use.

In the summer of 2012, Boora closed our office for a day of volunteering at the nearly completed school

Located on higher ground, the school is divided into four pods: lower elementary, upper elementary, middle school and high school.

Thirty-two classrooms are augmented by two gyms, a music/choir room, drama space, a media center and a commons/cafeteria.

Parking, natural wetlands and sports fields surround the school.

Since the community has always had a strong connection to the natural environment, a high priority was placed on sustainable design. Directed to achieve LEED Platinum certification, the team incorporated daylight; radiant in-floor heating and cooling; bio-mass boilers; photo-voltaics; rainwater collection; local materials and labor; and wetland education features.

On track to be one of the first consolidated LEED Platinum school buildings in the country, Vernonia K-12 faculty and staff will monitor building energy use as part of a new curriculum focused on natural resources.

To inform the design with as much information about the particular needs and aspirations of Vernonia, Boora held multiple discovery sessions, design charrettes and town hall meetings with community members and students. These meetings also kept the community of Vernonia apprised of progress and broadened the sense of ownership of the new school. (Boora)

#### **UC (University of California) Santa Cruz, McHenry Library Renovation and Addition – USA 2010**

To accommodate growth in response to expanding student population and increasing degree offerings, the University of California, Santa Cruz commissioned Boora to renovate the McHenry Library, designed over 40 years ago by John Carl Warnecke, and add over 116,000 square feet of space to the building.

Boora's collaboration with UCSC on the McHenry Library Renovation & Expansion began in 1993 with a full programming study. Funding was secured in 2003, allowing Boora to move forward with design, documentation and construction. The first phase of the project was the addition, completed in 2008. The renovation of the 160,000-square-foot existing library will be complete in the summer of 2010, 17 years after the project was initiated.

Located on a forested site at the center of campus along a main circulation corridor, the enhanced McHenry Library strengthens the geographic and intellectual core of campus, improves environmental conditions within the building, preserves the library's collections, enhances the student experience and encourages a broad range of library events. It provides the campus with a state-of-the-art academic resource housing offices for faculty and staff, group meeting rooms, individual study rooms and research space, which supplement traditional book stacks and reading areas.

The original building was designed as an object in a landscape, with a cast-in-place concrete structure, steel, glass, and pre-cast panels with exposed river rock aggregate. The building's slender columns reference the site's dense redwood forest.

The lines, proportions, and materials of the existing building are reinterpreted in the addition, creating continuity between old and new. The addition features an exposed cast-in-place concrete structure with concrete panels and the pattern of its glazing is a modified version of the original.

An information commons sits at the heart of the addition, accommodating computer stations organized for easy interaction between computer terminal users, information desks offering access to library staff and research assistants, a lounge space for group work, and both wireless and fiber optics for high-speed connectivity. A cafe is nearby

On the west elevation, a main reading room occupies a double-height space behind a two-story curtain wall with black frame. Scrim on the exterior of the reading room control solar gain and diffuse direct light. The main reading room overlooks a new outdoor plaza south of the entrance to the existing building will link to the campus's primary pedestrian route and accommodate outdoor lectures, readings and other library events. A public lawn will enhance the pedestrian route and extend library functions into the adjacent environment through outdoor lectures, readings, and other library events.

At the perimeter of the addition, a series of outdoor reading porches, screened from the elements, provide additional user spaces attached to the building for use during warmer months of the year. Placing these spaces at the perimeter allows visitors to experience the landscape, buffered by exterior sun-shading scrims that protect occupants from direct light.

A study bar is located along the southern edge of the building for quiet study adjacent to the stacks. The northern edge of the building is occupied by library staff and administration. Stacks are sheltered at the center of each floor plate. (Boora)

#### **Bowen Williamson Zimmerman Inc., Middleton, WI – USA**

<http://www.bwzarchitects.com>

##### **Libraries:**

**University of Wisconsin-Madison, Law School Addition, Madison, WI – USA 1996**

##### **Awards:**

**AIA Design Honor Award 1997**

The purpose of this project was to add library, classroom, and office space to the University of Wisconsin - Madison Law School. The challenge in the program was to develop a unified facility that created a holistic solution from a variety of multilevel additions developed over time while, at the same time, respecting the historic campus district context.

Addition and Remodel: \$15,000,000, 54,000 gsf (Bowen)

Society places in 21st century cities, in: Industria delle costruzioni – Social issue.

Biblioteche e mediateche 2, vol40,387,2006,Jan/Feb,pp.20-29

The design of this 25,000 square foot branch library for the City of Phoenix addresses issues of excellence and affordability in sustainable design. Impacted within a Planned Shopping Center in north Phoenix behind a gas station, car wash, fast food restaurant, and supermarket, the Library's construction and material palette quietly draws from, and (re)presents, the language of its retail neighbors. Stacked bond concrete masonry units, lock seam galvanized steel, and glass enclose the simple rectangular volume, while an exposed concrete floor with carpeted 'area rugs', exposed cmu walls, exposed gang-nail trusses, glu-lam beams, steel pipe columns, and sparingly used painted gyp-board interior partitions. In the tradition of banks, post offices, courthouses, and city halls of fledgling western frontier towns, whose dignified, yet paper-thin street facades belie their utilitarian construction behind, the Library's 'false front' mediates between its two realities: one of a limited budget, the other of the civic presence expected in a public institution. With its torquing false metal scrim curving along the site's eastern edge of 36th avenue, the Library's 'cowboy front' gives scale, presence, and distinction commensurate with its position in the community. (Will Bruder)

## [Phoenix Central Library – Phoenix, Arizona - USA 1989-2004](#)

in association with Wendell Burnette and the Phoenix firm of DWL Architects

It has quickly become a point of community pride. Largest reading room in North America. Library is often cited as an example of green architecture.

The Burton Barr Central Library in Phoenix has quickly become a landmark building on the city skyline. Completed in 2004, it's situated directly above the main freeway artery into downtown. The five story structure appears much more massive due to the voluminous open space on the 5th floor, which houses the largest reading room in the country. Also unique to this level, is the roof structure, which does not touch the columns that reach towards it, but rather floats in tension above them. The overall building is orientated along the north-south axis. Huge thermal walls on the east and west sides combined with highly efficient mechanical ventilation reduces energy consumption to one third of its expected amount. (<http://www.mimoo.eu>)

The Phoenix Central Library has become a landmark on the Phoenix skyline and an icon of late 20th century modern architecture. It has quickly become a point of community pride while serving the region's library and information needs. The library houses a 1,000,000 volume collection within its 280,000 square feet. The great reading room on the fifth floor, housing the nonfiction collection, is the largest reading room in North America. Using a single, central open core, the 'crystal canyon' provides vertical circulation with three high-speed elevators and the grand staircase, a plan arrangement that renders all collections accessible and easy to find. The combination of innovative computer cabling, lighting, furniture design, and layout strategies with the library's digital and real information has given the library a unique flexibility to meet changes in operation gracefully and economically. The library is often cited as an example of green architecture, addressing many issues of environmentally sustainable design. The thermal mass of the walls and a highly efficient mechanical system cut energy usage to one-third the amount initially projected by city planners and utility experts. The Phoenix Central Library was completed in 2004 at a cost of \$28,000,000, \$98.00 per square foot. (<http://www.archiplanet.org>)

## [Hercules Public Library, Hercules, California - USA 2004 – 2007](#)

see: HGA Architects and Engineers

20,000 sf.

Sited on a raised plinth, the Library is a beacon from the freeway as its long butterfly rake emerges from the hillside. Organized around a white elliptical 'sky garden' containing a single magnolia tree, the library's programs emerge; a café and reading areas, a high-energy space for teens. The Children's Library is separated from other collections as well, with the deep blue 'story cone' transporting kids to a magical world of words and imagination. Completed as will bruder architects ltd. with HGA Architects and Engineers. (Worksbureau)

<http://www.brunercott.com>

### **Libraries:**

## [Dean College, Library Learning Commons, Franklin, MA – USA 2008](#)

33.000 sqf., € 5.000.000

The new Library Learning Commons at Dean College creates a re-energized identity for this campus. The original library, built in 1960, has been transformed into a new brand of library for the college and will encourage new ways to think about learning. The program includes the redesigned library, offices, classrooms, lounge spaces, and a café. The Library Learning Commons is sited as the anchor of a main academic quad and creates a series of new outdoor gathering spaces. (Bruner)

## [BSA \( Bull Stockwell Allen \) Architects, San Francisco, CA – USA](#)

<http://www.bsaarchitects.com>

### **Libraries:**

## [Folsom Library, CA – USA 2007](#)

Folsom's new 24,000 sf main library is located within the existing Civic Center and City park. Continuing on the park-land theme, users enter through an interioring that links the library functions with community meeting rooms and a café. Features include an indoor/outdoor reading terrace, an adult wing with a technology center and a children's wing with a storytelling room. (BSA)

## [Diablo Valley Community College, Pleasant Hill, Bookstore, CA – USA 2006](#)

Diablo Valley Community College's new 15,000 sf student bookstore creates a landmark focal point for the main campus quad and incorporates all the latest trends in bookstore design. The program includes a full service café, convenience store, daylit sales floor, administrative offices and covered queuing to protect students from the elements during peak "buy back" season. (BSA)

### **Dublin Civic Center Library, CA – USA 2005**

Dublin's new 38,000 sf library's design, with its signature rotunda, complements the circular forms of the adjacent City Hall. With its iconic form and articulated use of civic materials, the facility captures and reinforces the identity of this growing community. The plan is very open with the adult and children's wings separated by a large daylit area housing computer terminals, reading alcoves and periodicals collections. (BSA)

### **Mission College Student Center, Santa Clara, CA – USA 2003**

The 45,000 sf Mission College High Tech Student Center is a mixed use facility that combines the college's Technology Center, academic and administrative offices, bookstore, cafeteria, conference center and multi-media facilities. With its immediate success the project began the desired reinvigoration of the Mission College campus. (BSA)

### **Natomas Community Center, Library and Park Sacramento, CA – USA 2001**

This project for the City of Sacramento encompasses a 31,000 sf community center, a 14,000 sf library and a phased 25-acre park that recalls the Natomas district's recent agricultural past. Received the American Public Works Association Project of the Year Award for 2002. (BSA)

### **Belvedere-Tiburon Library, CA – USA 1997**

Belvedere-Tiburon's 10,000 sf library houses adult, young adult and reference collections in a main gallery space, surrounded by light-filled alcoves framing the views of the surrounding hills. The design builds on the Bay Area's arts and crafts tradition with its shingled exterior, dominant roof forms and pergola at the entry. (BSA)

### **Danville Library and Community Center, Danville, CA – USA 1994 - 1995**

The 18,000 sf Danville Library and 7,000 sf Community Center were designed in tandem as a civic complex surrounding a one-acre town green. The library itself houses adult and children's services in large open rooms filled with daylight. In addition to the comfortable reading rooms, the library provides 50 on-line workstations for children and adults. (BSA)

### **Libraries:**

#### **Springfield Literacy Center, Springfield, PA – USA 2010**

50,000 sqf.

**Project:** When it opens in April of 2010, the Springfield Literacy Center will house kindergarten and first graders from the Springfield (Pennsylvania) School District. The building is designed to provide and foster a strong connection between the students and nature, merging the natural environment with the built environment. The facility is positioned on a wooded hillside, with two wings that wrap around a mature grove of oak trees. A single-story wing will house the kindergarten classrooms and art center, and a three-story wing will include classrooms for the first graders, as well as a library, offices, and spaces for special education and multipurpose activities. As a public school building, the project had demanding budget and schedule constraints, as well as the requirement for achieving LEED “Certified” certification level. The project’s sustainable design goals will not only reduce the facility’s impact on the environment, but also help provide a basis on which to educate students on green practices. Elements of geothermal heating, daylighting, recycling, and green roof systems are all “on display” for the students to see in action, providing hands-on opportunities for learning and helping to nurture environmental stewardship.

**BIM Experience:** The tight integration between Revit and IES was also used to good advantage on this project, allowing Burt Hill to perform building analysis with IES tools directly from their Revit model—even during very early stages of schematic design—to better understand how to balance the goals of energy performance against daylighting and other requirements necessary for LEED certification. For example, the building model was used to analyze and iterate on the optimal size, orientation, location, and glazing of the windows to provide effective daylight levels for the young students, cut down on glare, produce comfortable temperatures in the classrooms—and still achieve the desired goals for energy efficiency. While this project was notable for its high degree of building analysis, the Revit building model was also essential for design visualization, design coordination, and the efficient production of construction documentation. The Burt Hill designers participated in many informal design charrettes with community representatives and school officials, during which the Revit model was used to explore “on-the-fly” design alternatives and capture agreed-upon design directions and changes—which in turn resulted in the automatic update of any related building documentation. To coordinate the building and the sloping site necessitated the creation of numerous exterior elevations and sections, which were produced effortlessly with the Revit software. The structural engineers used Revit Structure, enabling the design teams to share their architectural and structural models—facilitating inter-discipline clash detection as well as the coordination and the production of construction documentation. (<http://www.autodesk.de>)

To improve literacy rates, the school district implemented a curriculum that identifies individual educational needs and applies a unique literacy education plan based on those needs. The new literacy center is the built response to educating students based on individual learning style and achievement. Merging the natural environment with the built environment, the design features learning centers dispersed throughout the site, ranging from science and sculpture gardens, to alphabet walks and exterior classrooms. Sustainable design practices will not only reduce the facility's impact on the environment, but also provide a basis on which to educate students on sustainable technology. Elements of geothermal heating, recycling, and green roof systems are on display for the students to see, providing hands-on opportunities for learning and helping to nurture environmental stewardship. The site in turn has become a significant force in influencing the curriculum and architecture. A education plan based on those needs. The new literacy center is the built response to educating students based on individual learning style and achievement. Merging the natural environment with the built environment, the design features learning centers dispersed throughout the site, ranging from science and sculpture gardens, to alphabet walks and exterior classrooms. Sustainable design practices will not only reduce the facility's impact on the environment, but also provide a basis on which to educate students on sustainable technology. Elements of geothermal heating, recycling, and green roof systems are on display for the students to see, providing hands-on opportunities for learning and helping to nurture. (Burt.Hill)

#### **Learning Commons, Harrisburg University of Science and Technology, Harrisburg, PA - USA 2009**

\$ 73,000,000, 373,173 sqf.

As the initial building of a planned multi-year development program, the Academic Center encompasses classrooms, an auditorium, laboratories, student team meeting areas, a library and reading room, a conference center, parking, administrative offices, and a full floor of breakout space. The primary academic spaces are on levels 10 through 14. Immediately below are seven levels of parking. Design was propelled by a massing strategy. Unlike conventional high rises, the building features a split elevator core. Large, precast monoliths contain the elevator towers, opening up the center of the academic floor plates both horizontally and vertically. Extrapolating from the original master plan’s learning pods and their central “learning commons,” we stacked the pods vertically and linked them floor-to-floor by interconnected two-story atria. Doubling as lobbies, learning environments, and programmed public spaces, the atria form an urban stand-in for a more traditional campus. A return air intake at the top of the stacked atria

draws air from the open floors below into the air handlers on the penthouse floor, minimizing return-air ductwork. Studio-based learning environments and a mix of classrooms open onto the atria with these multi-function areas. Intercommunicating stairs alternate across the interlocked atria. Two-story elevator lobbies alternate through the academic floors, encouraging pedestrian activity and providing opportunities for formal and informal encounters among students and faculty – a crucial element in establishing a campus-like feel. The large expanses of glass on the east and west sides of the spaces flood them with daylight, provide great views of the city, and energize an environment that is well connected to its surroundings. The first floor of the Academic Center houses the main public lobby, Admissions Center, and Reading Room. The double height of the Reading Room firmly claims the corner of 4th and Market for the University, declaring it as a special place of scholarly pursuits and setting the stage for the neighborhood's potential future as Harrisburg's intellectual center. It's also an area for public receptions and events. Outside the Reading Room, the second floor study and stack areas overlook the first floor's public areas, extending the dialogue between private University and the public still further. The design of the lower floors incorporates public access to the neighboring Strawberry Square galleria. The connection enables the University to leverage existing galleria functions such as a food court, credit union, performance spaces, and other businesses for students and faculty, while drawing the galleria into the heart of the University. This is also where the public is given convenient access to the parking garage. And it's here, in this most publicly shared campus area, that Burt Hill developed an environmental graphics and signage program to both direct and instruct students and the public, alike, in the University's presence and its purpose. (Burt.Hill)

#### [Carnegie Library of Pittsburg, Downtown Branch, Pittsburgh, PA – USA 2004 – 2005](#)

12.000 sqf.

The state-of-the-art, public library facility provides a vibrant, comfortable, accessible, and organized atmosphere for patrons. A bi-level space includes the library's business collection, fiction and non-fiction volumes, public internet stations, study seating areas, and a meeting room. The Foundation Center, which provides resources for grant research, is located on the lower level. The design concept focuses on the users' tasks, with a dynamic spine of resources including study areas, internet stations, a reference desk, and electronic self-checkout. The facade is designed to act as a billboard for oversized "super graphic" signage, in addition to creating a cohesive connection with the existing metal panel facade. (Burt.Hill)

#### [Advanced Technology and Learning Center, Cincinnati State Technical and Community College, Cincinnati, OH – USA 2004](#)

216.000 sqf., € 55.000.000

Cincinnati State Technical and Community College was seeking a new center to focus on information technology and culinary arts, as well as provide a student life hub. Burt Hill, in association with SFA Architects, designed a sustainable Advanced Technology and Learning Center that spans over 215,000 square feet. The center houses student lounges, offices, classrooms, audio/visual production facilities, a presentation center, and culinary arts facilities. Additionally, a 747-car parking structure is attached to the building. The sustainable design includes heat recovery, heat-efficiency lighting, and daylighting. The creative design of the Advanced Technology and Learning Center helped to create a unique identity for the campus. Through innovative design and sustainable elements, the Cincinnati State Technical and Community College will continue to develop and appeal to students. (Burt.Hill)

### **[bws \(Burns Wald-Hopkins Shambach\) Architects, Tucson, AZ – USA](#)**

<http://www.bwsarchitects.com>

The Tucson firm of BWS Architects has been ranked one of the top 10 firms in the U.S. by Architect magazine, a national publication that serves the architectural design community. At number seven in the ARCHITECT 50, BWS Architects is grouped with some of the best known firms in the country – Skidmore, Owings and Merrill (2), Perkins & Will (5), NBBJ (19) and Zimmer Gunsul Frasca (45).

Reporter Amanda Kolson Hurley wrote: "Under-the-radar BWS has extensive experience in library and school Design, Its Applied Research and Development Building at Northern Arizona University received LEED Platinum certification."

In creating this new ranking, the magazine looked beyond firm size as a measure of success, because "size is just one, not-terribly-revealing measure of an architecture firm. "Hurley goes on "We designed the ARCHITECT 50 quite simply to promote a more well-rounded definition of success. The criteria for inclusion comprise a trifecta of critical goals for every practice: profitability, sustainability, and design quality."

#### **Libraries:**

#### [Flowing Wells Library, Flowing Wells, AZ – USA 2008](#)

Located near the new Flowing Wells Community Center, this new library completes the master plan for cultural and recreational facilities in this historically underserved neighborhood on the northwest side of Tucson. This small branch library is designed to triple in size as funds become available, so a major challenge on this project was to establish a functional facility, easily expanded, on a very limited budget. We explored numerous options for building systems and emerged with a simple and contemporary expression in metal panels, creating a strong architectural presence in a small package. (BWS)

#### [Martha Cooper Branch Library and Learning Center, Tucson, AZ – 2006](#)

The Martha Cooper Branch Library and Learning Center, located on Midtown Tucson, is an new prototype for small neighborhood-centered libraries. Smaller than a typical branch library for the Tucson-Pima Public Library system, this non-traditional 7,700 square foot facility is designed to provide meeting spaces, computers, and library materials that are heavily focused on the needs of children. Although the site is only 1,5 acres on size, the design concept allows for future expansion that will almost double the building in size. (BWS)

#### [Oro Valley Public Library, Town of Oro Valley, AZ – 2002](#)

Responding to the Town's design guidelines, the library incorporates stone, stucco, copper and glass in a contemporary expression that fits comfortably into the fabric of the community. The 25,000 square foot library provides magnificent mountain views, and enjoys natural daylighting with clerestories throughout the stacks and reading areas. The Friends of the Library operate a book sales area where they provide comfortable seating and sell coffee. The library also features a children's library and a well equipped teen zone. (BWS)

#### [Sierra Vista Public Library, Sierra Vista, AZ – 1999](#)

The mountainous geology of Cochise County inspired the steeply sloped copper roofs and striated concrete walls of the Sierra Vista Public Library. The projecting walls and roofs protect the south and southwest facing windows from direct sun, and yet allow the building to open up to the beautiful gardens and mountain views. With a mechanical system that employs evaporative cooling and

air conditioning as the environmental conditions dictate, this building is remarkably energy efficient, and won the Governor's Energy Award in 2000. Replacing an old library which we in-turn remodeled into a senior center, we applied a highly collaborative and interactive design process on this project. We developed nine alternative designs for the library that we explored with the community in public meetings. The options ranged from fairly traditional architecture that reflected the existing facilities to more contemporary approaches that responded to the site, the region and the climate. There was strong support for a bold, innovative approach that responded directly to the environment and the mountains. (BWS)

## **Cannon Design, Buffalo NY– USA**

<http://www.cannondesign.com>

No longer simply repositories of text collections, academic libraries are becoming vibrant partners in learning. The movement toward informal, active, and group study is affecting the design of library environments as students and faculty increasingly use these spaces to engage as collaborators and to seek guidance through the ever-expanding resources and technologies accessible to today's learning communities. As both pedagogy and technology continue to evolve, academic libraries must be designed as responsive and flexible buildings to ensure that they remain relevant and vital contributors to campus life.

### **Libraries:**

#### **Central Library Restauration, St. Louis, MO – USA 2012**

St. Louis, MO... The St. Louis Public Library will close its downtown Central Library, 1301 Olive Street, on Monday, June 14, 2010, so that it can commence the eagerly anticipated restoration and renovation of the St. Louis landmark. Central Library will remain closed throughout the project, which is expected to last about two years. Library officials' goal is to reopen Central in time for its centennial year of 2012. The \$79 million project will be paid for through the Library's own funding from St. Louis taxpayers, state and federal funding, and a major philanthropic campaign by the St. Louis Public Library Foundation. Designed by famed architect Cass Gilbert and funded by Andrew Carnegie, Central Library is one of America's great public buildings and an architectural masterpiece. In 1901, Andrew Carnegie made a large donation which was used for expansion, including building the current central library. By 1938 the collection included 900,000 items, and by 2011, 4,600,000 items. The Central Library building at 13th and Olive was built in 1912 on a location formerly occupied by the St. Louis Exposition and Music Hall and was designed by Cass Gilbert (\* 1859 Zanesville, OH – 1934 Brokenhurst, England). The main library for the city's public library system has an oval central pavilion surrounded by four light courts. The outer facades of the free-standing building are of lightly rusticated Maine granite. The Olive Street front is disposed like a colossal arcade, with contrasting marble bas-relief panels. A projecting three-bay central block, like a pared-down triumphal arch, provides a monumental entrance. At the rear, the Central Library faces a sunken garden. The interiors feature some light-transmitting glass floors. The ceiling of the Periodicals Room is modified from Michelangelo's ceiling in the Laurentian Library. Designed by famed architect Cass Gilbert and funded by Andrew Carnegie, Central Library is one of America's great public buildings and an architectural masterpiece. In 1901, Andrew Carnegie made a large donation which was used for expansion, including building the current central library. By 1938 the collection included 900,000 items, and by 2011, 4,600,000 items

The restoration and renovation, designed by the St. Louis architectural office of Cannon Design, will carefully restore and repair the building's beautiful façades and stunning main public rooms. New services and wonderful spaces to house them will be created in the renovated building. By remodeling former offices and service spaces, 30,000 square feet of additional space will be opened to the public. For example, a beautiful 250-seat auditorium/theater will occupy a space originally used for coal storage. Other exciting features that the renewed Central Library will offer include:

- \* The Center for the Reader: An enormous new space dedicated to new books and popular reading.
- \* A greatly enlarged children's library, including new craft and story areas, study and reading areas, and a teen center.
- \* The Creative Experience: A dedicated room that will showcase new, state-of-the-art technology and software.
- \* New rooms dedicated to patrons who use Central Library's unique genealogy, St. Louis history, and rare books collections.
- \* New generation technology including a computer classroom for technology education, new computer study areas as well as workstations distributed throughout; wireless technology access, and laptop computers.
- \* A new, accessible entrance facing Lucas Park opening Central to the growing downtown residential district, offering a mirror to the great restored Olive entrance. The new entrance will feature the falling waters of a new reflecting pool, signaling that patrons are entering into a special experience. A few steps will take patrons into the new atrium, a beautiful new multi-story space leading into the heart of Central and an array of new features.
- \* In addition to the new auditorium, a variety of new meeting spaces will be available for Library programs.
- \* Entirely reworked electrical, mechanical, and environmental systems engineered for energy conservation. New elevators and restrooms will be distributed throughout the building. (<http://www.spl.org>)

#### **Ave Maria University, Canizaro Library, Ave Maria, FL – USA 2007**

Ave Maria University, the first all-new Catholic university to be established in the United States in half a century, is set on 750 acres of a 4,000-acre town development near Naples, Florida. The 5,000-student residential university was developed simultaneously with the town of Ave Maria, whose projected long-range population is 40,000. The campus consists of 12 individual buildings, totaling more than one million sf, which includes undergraduate housing, a science/class building, library and a student union. A 1,100-seat Oratory is both the spiritual and physical center of the community. (Cannon)

The cornerstone of Ave Maria University's campus is the new \$18 million Canizaro Library, a state-of-the-art facility capable of serving the University well into the future through both sophisticated technology and physical expansion. Inspired by Frank Lloyd Wright's principles of organic design and architecture, along with a natural environment and open floor plans, outside and inside elements are blended seamlessly. Exterior horizontal lines from the structure form connections to interior walls and beams. Programmatically, the building seats over 400 with quiet and group study rooms, audio and video workstations, and wireless internet access throughout 98,000 sf of space. The 200,000-volume library opened in July 2007 and houses major media, special and rare book collections as well as the Wright archives donated by the founder and principal benefactor, an advocate for Wright principles. (Cannon)

#### **Duane G. Meyer Library & Campus Information Center, Missouri Sate University, Springfield, MO – USA 2002**

The Duane G. Meyer Library underwent a renovation/expansion project beginning in fall 1999, which doubled library space by the time of its completion in fall 2002. New facilities include a significant area for Special Collections and Archives, electronic classrooms and media labs for student and faculty use. The addition also includes 12 large group study rooms, 11 small group study rooms, 8 faculty studies, 10 multimedia workrooms for teams of students, and multimedia workstations for individual use.

The Duane G. Meyer Library, named in honor of former president Dr. Duane G. Meyer, has been Missouri State's main library since 1980. It is located at 850 S. John Q. Hammons Parkway. Among the resources and services offered by the Duane G. Meyer Library are over 877,000 books, subscriptions to over 3,500 periodicals and newspapers with back issues on microfilm, microfiche, and microcard, and full text electronic access to over 20,000 periodicals. In addition, the library contains over 934,000 state, federal and United Nations government documents. A central feature of the Library and of the campus is the Jane A. Meyer Carillon with its complement of 48 bronze bells. (<http://www.missouristate.edu>)

## [Mills Memorial Library, McMaster University, Hamilton, ON – Canada 1994](#)

### **Awards:**

**Ontario Library Association 1996 Building Award for Best Academic Library Award**

Libraries today are at the heart of a major transformation in teaching, learning and research on university campuses. Fuelled by emerging technologies, changing student and faculty expectations and use patterns, changing teaching strategies and evolving digital scholarship, libraries have changed dramatically as well. No longer ‘book warehouses’, libraries have become centres for teaching, learning and research. While these changes have had a profound impact, our traditional library strength of connecting people to information is still relevant today. In fact, it can be said that ‘twenty-first-century fluencies’ (information fluency, numeracy, visual fluency, media fluency, scientific fluency and geospatial fluency) are essential elements of a quality education in our flattened world. In order to be successful post-graduation, our students must possess the skills necessary to access and use information – regardless of format – efficiently, effectively, legally and ethically. Over the past two years the McMaster University libraries have undertaken a dramatic transformation from very traditional academic library to innovative, user-centred partner in teaching, learning and research. It is an evolution that most recently culminated in the receipt of the 2008 Association of College and Research Libraries (ACRL) Excellence in Academic Libraries award, which we received in recognition of ‘a successful transformation from a traditional research library to an innovative, user-centered library using technological advances to accomplish its goals’.<sup>1</sup> Successful organisations are measured today, in part, by their ability to adapt to the changing needs and expectations of their users. Adaptation requires a culture of risk-taking and innovation that encourages and rewards the radical rethinking of library resources and services. The McMaster University community is recognised for its ability to lead by reinterpreting/reinventing itself. The recent hiring of a new University Librarian and the hiring of eight new librarians provided us with an opportunity to make some significant organisational changes to meet the needs of the twenty-first-century academic library user.

## **Carde Ten Architects, Santa Monica, CA – USA**

<http://www.cardeten.com>

### **La Crescenta Montrose Library, CA, County of Los Angeles Public Library System - USA 2010**

After years in the planning and building, the Crescenta Valley boasts a library that establishes a true town center.

By Mary O’Keefe

With a crowd of community members and public officials and the cutting of a ribbon, the La Crescenta Library was officially opened last Friday, Jan. 29. “It is our hope that this library becomes the heart of this community,” said Margaret Donnellan Todd, Los Angeles County Librarian. Although the community has been enjoying and using the library for the past few weeks, Friday’s ceremony was a chance to thank those who had been supportive throughout the long process of designing and building the facility. Todd thanked the many volunteers and the Friends of the La Crescenta Library and the La Crescenta Elementary Korean Parent Club for their donations. “Libraries really do represent faith in the future,” Todd said. But faith is not enough; the effort required funds, \$14.5 million in fact, to complete. Todd thanked Supervisor Michael Antonovich for his leadership, the faith he had in the project and finding the funding. The county stepped in with \$13 million, Congressman David Dreier brought in \$1.5 million and \$350,000 was found through the sale of surplus library property. Together the effort allowed the La Crescenta Library to grow from 4,300 square feet to 15,000 square feet. The facility was a community effort with community input, Antonovich said. He formed a committee that oversaw the design, building and completion of the library. “The library is the crown jewel of [the committee’s] hard work,” he said. “There were many meetings that took place.” He had praise for his staff for monitoring the funding that was set aside for the building. “They made certain that the funds were not siphoned off like [what happens] to other funds in Sacramento,” Antonovich said. The library’s design was the result of many, many discussions. “We had a lot of meetings with community and library departments. We used local material and gave it a local ambience,” said Scott Carde, lead architect from Carde Ten Architects. During the ribbon cutting ceremony Carde told the story how his mother made him read three books a week. At first this was not something he enjoyed but soon came to love the assignment. He spent a lot of time at his local library. “Libraries are in fact a magical place. They influence us. They animate us. They add to our lives in ways that are mysterious. Sometimes in a conscious way, sometimes not,” he said. As visitors enter the library they will first notice the stained glass artwork that borders the front door. Within the glass are hand drawn portraits of significant historical buildings in Crescenta Valley. The old school bell at La Crescenta Elementary and St. Luke’s Episcopal Church are just some of the local landmarks represented. The artist, Timothy Gibbs of RD Gibbs & Co. in the Glendale/Montrose area, grew up in the community. It was his task to bring the feel of La Crescenta to the stained glass medium. “This is the old La Crescenta Woman’s Club,” he said as he pointed to a stained glass drawing. Gibbs has been working with glass for about 30 years. He said he liked the colors that play with the light as it streams through the doors. From design to completion, though, takes a long time. “It is time consuming. We have to carefully plan and do a lot of research,” he said. “But I am pleased with the results.” Murals adorn the walls of the library. Artist Evan Wilson was chosen by the committee to paint the murals in both the adult and the children sections of the library. “I wanted to give a feeling of history,” Wilson said as he stood in front of the murals of a woman with her hand reaching to the sky and another of a man resting in the foothills. “The original plan was not to have any people [depicted in the mural] but at some point that changed,” he said. The man and woman are symbolic of people who contribute to knowledge, he said. Symbols that border the top edges of the walls represent free flowing knowledge. Evans said the process of creating this type of work is difficult in the beginning because he was looking at black and white technical drawings. “It is hard to get the feel of the building [at first],” he said. But he worked closely with the architect and incorporated the Craftsman style of the building into this artwork. Artists Geri and William Gould were responsible for creating the bronze plaque installed in the foyer floor of the building. William was raised in La Crescenta and Geri is a descendant of the local Indians, the Tongvas. Their artwork has been displayed in the Smithsonian and the Vatican. The library’s medallion is a star-compose overlaying a circle with symbols of the three ages in the center. The Historical Society of the Crescenta Valley commissioned it. The piece depicts the history of Crescenta Valley by highlighting three ages of human habitation set with the background of the San Gabriel Mountains. Toypurina, shaman of the local tribes, represents the Native American period. Don Jose Verdugo represents the Spanish period and the father of modern La Crescenta, Dr. Benjamin Briggs, represents the American era. In a ceremony that followed the ribbon cutting, descendants of each of the three ages were honored. (<http://www.crescentavalleyweekly.com>)

### **Sorensen Library, Sorensen Park, CA, County of Los Angeles Public Library – USA 2010**

Los Angeles County Supervisor Gloria Molina today announced the Sorensen Library, 11405 E. Rose Hedge Dr., Whittier will be closed from November 27, 2008 to summer 2010 for construction of a new, larger facility. “The new facility will be the County’s newest eco-friendly ‘green’ library,” said Molina. The community and the Friends of Sorensen Library were a part of the planning of the new library and we look forward to celebrating its reopening with a bigger and nicer facility in the summer of 2010.” The new 10,655 square foot library will replace the existing 1,048 square - foot facility. It will be part of the County’s Sustainable Design Implementation Program, which uses the LEED-New Construction rating system developed by the U.S. Green Building

Council (USGBC). The USGBC has four certification levels (Certified, Silver, Gold, Platinum) awarded according to achievement as evaluated by points using the LEED scorecard. The new Sorensen Library will meet the LEED Silver standard.

(<http://www.colapublib.org>)

### **Canoga Park Library, CA, County of Los Angeles Public Library – USA 2004**

14,500 sqf., € 4,443,000

Located amid strip malls and fast food joints on a busy thoroughfare in the San Fernando Valley, the Canoga Park Branch Library is one of the only civic buildings in this Los Angeles neighborhood. Boldly defined by a round auditorium at one end, the library provides a welcome contrast to the surrounding exurban architectural banality. Carde • Ten Architects located it directly on the street, confining parking to the rear of the property: another welcome departure in this automobile-centric city. Adhering strictly to the client's program, the architects placed all of the library's functions in one room that a small staff of librarians can easily monitor from a central reference desk. Only a single row of columns, running down the building's center, interrupts this open space. Each column, which contains conduits for pipes, supports four steel girders that extend outward to the building's walls. At the walls, the girders are bound together by stainless-steel cables that span the roof and then are anchored to the ground with steel rods and concrete. This support system, developed by Carde • Ten's Erik Mar for his thesis project at MIT, carries all vertical loads: freeing the walls from this burden and allowing for an uninterrupted band of windows around the building. The generous band of fenestration, which floods interior spaces with daylight, is one of the library's many eco-friendly features. Roof girders are tapered at an angle that optimizes solar exposure for a series of photovoltaic panels. Solar cells on the south-facing roof eave do double duty, generating electricity and helping to reduce the solar load. The entire photovoltaic system generates roughly 35,700 kilowatt hours of electricity per year. Inside the library, the architects were also mindful of sustainability concerns when they located program elements. The main reading area, for instance, occupies the north side of the building, where glazing admits soft northern light that requires less filtering. Elsewhere in the library, the architects added adjustable louvers along the windows to protect the book stacks from overexposure to light. Other ecofriendly features include bamboo flooring, chosen because it is a renewable low-impact resource, and drought-tolerant landscaping. ( <http://archrecord.construcion.com> )

### **Chinatown Library, CA, County of Los Angeles Public Library – USA 2003**

12,500 sqf., € 3,762,000

This is the third most active of the City's 75 branches. It serves as one of the gateways to the Chinatown community. The design blends ancient Chinese building traditions with a forward-looking style. (Carde)

## **Cardwell Architects, Seattle, WA – USA**

<http://www.cardwellarchitects.com>

### **Libraries:**

#### **Corvallis Public Library, OR – USA 2009**

The City of Corvallis selected Cardwell Architects to design its new main branch library. The project involved the restoration and addition to the historic 1931 library building, designed by Pietro Belluschi. Additions were made to the original library in 1965, wrapping the north and east elevations of the original building. The program called for the expansion of the library to 57,000 square feet. The goal was to design a library that was inviting, easily understood by the library patron, efficiently staffed, and accommodating future growth and technology. (Cardwell)

#### **Suzzallo and Allen Libraries, University of Washington, WA – USA 2002**

The University of Washington selected Cardwell Architects in association with Mahlum Architects to renovate and restore the 325,000 square foot main campus library for the University of Washington. The architects worked with the university to prepare a predesign study, which developed the project scope and budget. Cardwell Architects worked with the library staff and the university to write the building program and to develop a strategy for phasing the project. The work involved the restoration and renovation of the three oldest parts of the library including the historic library and reading room. (Cardwell)

( see also: Mahlum Architects )

#### **Anacortes Public Library, WA – USA 2003**

The new 28,000 square foot library is built on the site of the former library in downtown Anacortes. The two-story building emphasizes openness and flexibility and features high, indirect clerestory windows that bathe the interior with diffused natural light. The siting of the library and juxtaposition of building forms define the program elements and give clarity to the building plan. (Cardwell)

#### **Carlsbad City Library, CA – USA 1999**

The City of Carlsbad selected Cardwell Architects to design its new 64,000 square foot library, which features a 200-seat auditorium and a community art gallery, organized by a colonnaded entry courtyard. The two-story library features a main hall that focuses public services, gives clarity to circulation and organizes the collections. From this central space, a sequence of spaces transition from public gathering areas to smaller spaces for group and individual study. (Cardwell)

#### **Holman Library Green River Community College, WA – USA 1997**

Holman Library at Green River Community College is a new 60,000 square foot information technology center, incorporating the campus library, media production and distribution facilities, and computer instruction labs. Library services are focused on the second floor information Commons, an electronic reference and a curriculum resource center with more than 120 networked workstations. The facility represents the college's first phase of implementation of the Washington State Communications Technology Center master plan for fiber-optic intercampus and remote-site educational information distribution. (Cardwell)

#### **Everett Public Library, WA – USA 1991**

Everett Public Library selected Cardwell Architects to restore and design a major addition to its historic downtown library. The design includes historic restoration of the existing building and an addition that is both sensitive and complementary to the architectural character of the original building, while expanding the library to 52,000 square feet. The new design removed the bulk of an addition done in 1965. The original entrance and historic lobby have been restored and are the focal point of the library. The new addition builds upon the diagram of the original library, giving clarity to circulation and the organization of the collections. (Cardwell)

## **Carrier Johnson, San Diego CA – USA**

<http://www.carrierjohnson.com>

### **Libraries :**

#### **City of Goodyear, Community Center and Library, City of Goodyear, AZ – USA 2011 / 2012**

Goodyear conducted a worldwide competition to find the right private company to partner with the City to develop its future focal point. The winning proposal was submitted by the team of Lankford & Associates, Inc. of San Diego, Carrier Johnson, Phelps

Development and JMI Sports, and contracts were approved in October 2008. As of February 2010, the City Hall building is at 82% complete construction documents, and the library/infrastructure are at 95% complete. As these documents neared completion, the economic decline began. Staff conducted a financial analysis of Assessed Valuation and projected revenues available to repay the bonds that would be sold for the project. This analysis concluded that the City would not receive sufficient secondary property tax revenue to pay for the annual debt service. Therefore, in May 2010, completion of the construction documents, as well as proceeding with construction of the Phase I project elements, were placed on hold. At this time, it is unknown when the projects will resume. (<http://www.ci.goodyear.az.us/index.aspx?NID=2297>)

**Tidewater City College Library Learning Resource Center, City of Virginia Beach, VA – USA 2011-2013**  
Scheduled to open fall 2012, the Tidewater Community College (TCC) Learning Resource Center is a \$36 million joint-use collaboration of the college and the City of Virginia Beach, Virginia's public library.

In 2005, the City of Virginia Beach engaged Anderson Brulé Architects to create a Feasibility Analysis to explore the viability of a joint-use facility with the college. Following the analysis, ABA began work on the Strategic Operational Plan, creating a holistic understanding of library service needs through research and data analysis, as well as an inclusive staff, stakeholder and community outreach process that reflects the diversity of the partner organizations and the communities they serve.

With funding in place, Anderson Brulé Architects facilitated TCC and the City through the pre-planning work necessary to provide the appropriate decisions and information, including the conceptual space program, essential to inform the subsequent architectural design and construction documentation. (<http://www.aba-arch.com>)

**CSU Dominguez Hills University Library – Leo F. Cain education resource center – California State University, Carson, CA – USA 2007 – 2010**

With panoramic views spanning Catalina to downtown Los Angeles, as well as expansive views of the CSU Dominguez Hills campus, the new south wing library addition is a stunning state-of-the-art facility posed to serve the educational and cultural needs of a growing university and the surrounding community. Doubling the university's existing library space, the 140,000-square-foot, five-story, energy-efficient extension provides ample space to access the university's entire collection of books and research materials, more places to study, as well as a technologically advanced archival storage and research area, an events center, and an art gallery that will accent the multi-cultural population of the South Bay. ADesigned to bring the outdoors in, the new structure is dominated on its north side by windows providing indirect lighting for reader stations. The feeling of openness begins at the glass bridge that connects to the existing library to the new south wing. The open-air top of the bridge supplies students with an expanded balcony lounge with outdoor seating. Additionally, a large courtyard between the new and the old buildings provides a relaxed outdoor learning environment. The library addition creates an optimal environment in which to study, perform library research, and assimilate the knowledge necessary to succeed in today's job marketplace Study areas consist of several carrels, lounge seating and study booths, and tables inlaid with art. There are also eight group study rooms and a multicultural reading room. Two additional computer learning labs and a less formal computer lounge, as well as about 250 computer workstations in a variety of settings throughout the building increase the library's electronic offerings. Combining both electronic resources with traditional library materials in a space that is both beautiful and functional, the new library addition greatly enhances the library staff's ability to improve the learning and research capabilities of CSU Dominguez Hills students and faculty, as well as those of the community. (<http://library.csudh.edu>)

**Murrieta Main Branch Library, Murrieta, CA – USA 2008**

In the eyes of American astronomer and science popularizer Carl Sagan, the heartbeat of a community can be best measured by how well it takes care of its library. "I think the health of our civilization – and our concern for the future – can all be tested by how well we support our libraries," he wrote. Based on that yardstick, Murrieta is alive and very well, indeed. Over the past year, countless individuals, companies, and organizations have stepped up with generous donations to make the new Murrieta Public Library a true source of collective community pride. "This is a very supportive city," said Loretta McKinney, director of library services. "Everyone has been wonderful." Major donors alone contributed more than \$550,000 toward the 25,000-square-foot library, which will celebrate a grand opening Saturday, March 17, along with Town Square Park. The \$11.4 million library would not have been possible without the support of the people listed and the friends of the library. Early next month the contractor, Jaynes Construction of San Diego, will turn the new library building over to the city. To prepare for its opening, new shelving will be installed and places found for 45,000 new books and other media that are part of the opening day collection that will bring the total to approximately 75,000 volumes. An expanded library staff of 21 will also be trained and new audio visual, computers, and communications equipment have been tested as part of the pre-opening preparations. The new library also will include a completed Heritage Room, a repository of Murrieta's historical archives, featuring a collection of photos, artifacts, and records from the time of its first settlement to cityhood and beyond. With its craftsman style fireplace, it will be set apart from its modern surroundings as a place to ponder the past. The Heritage Room will also be available to school-age children for classroom projects and class field trips. The room will be a resource for older students as well, who need to research historical documents, photos, and other memorabilia that make up Murrieta's past.

Major Library Supporters: Won and Insook Yoo \$250,000, Fred and Shirley Grimes Foundation \$107,700, Davcon Development \$65,000, Pechanga Resort & Casino \$65,000, Riverside County \$50,000, Near Cal Corporation \$32,700, Friends of the Murrieta Library \$25,000, Daniel Stephenson \$10,000, Altura Credit Union \$5,100, Ewles Materials \$5,000, Judy Rosen Enterprises \$5,000, Arizona Tile \$5,000, Numerous other donors \$50,000. (<http://www.murietta.org>)

**Cal poly pomona libray – California State Polytechnic University, Pomona , CA – USA 2008**

The new California State Polytechnic University Library Addition included a 103,926 gross-square-foot, four-story addition built adjacent to the existing university library, a remodel of the existing 23,830 square-foot ground floor, a renovation of the second and third floors, and improvement of site and landscape areas. The addition provided needed lecture, instructional and office space, plus a 120-seat amphitheater. All classrooms included the integration of new data and telecommunication infrastructure to support future information technology systems. The library was designed to meet the needs of Cal Poly Pomona's expanding enrollment. It contains state-of-the-art information stations, library instruction spaces, enhanced reading areas, and academic lecture spaces. Key features include: a research commons, a two-story grand reading room, 23 group study rooms, five group-listening rooms, and a twenty-four hour research lab. The library addition is flooded with natural day-lighting in most areas allowing for comfort and increase productivity. The openness that the windows allow created a feeling of oneness with the environment surrounding the campus. Completed on schedule in 22 months, the project expanded and rearranged functional areas, including the library's entry floor, increased operational efficiency, added compact storage areas and provided students and faculty with better working environments for study and research. The library addition corrected structural, mechanical, hazardous material; ADA accessibility and code related deficiencies; and provided necessary improvements to the existing building's mechanical and electrical systems to provide a fully operational and safe facility. A new centralized security system was installed that monitors virtually the entire building including all elevators, entry/exit doors, group study rooms and general open study areas with keycard and pass-code protected access for facilities and library personnel. Rudolph and Sletten self-performed its own concrete work requiring over 140 concrete-driven foundation piles to support the new steel structure. (<http://www.rscostruction.com>)

### National City Public Library, National City, CA – USA 2005

National City's two-story library is located in Kimball Park, a 30-acre green space in the heart of the city. The architectural composition of the library is two stone veneer masses that respect the street grid and are intersected by an elliptical-shaped main reading room. Clad in glass, this element is protected on its south and west edges by the masonry elements and opens onto the park, illuminated with northern light. (Carrier)

### Dr. Martin Luther King Jr. Library, San José, CA – USA 2003

see: ABA Anderson Brulé Architects

The Dr. Martin Luther King, Jr. Library is a joint-use facility for the City of San Jose and San Jose State University, pooling the resources and staff of both library systems. Located on a prominent corner site between the campus and city, the library's main entry lobby physically connects the two user groups at the street. The articulated form of the building comes from this diagonal "street" merging with the city's orthogonal grid. (Carrier)

### Cartaya & Associates Architects, Fort Lauderdale, FL – USA

<http://www.cartayaandassociates.com>

#### **Libraries:**

#### Miramar Branch Library, Broward College & Nova Southeastern University Educational Center,

#### Miramar, FL – USA 2008

\$ 15,000,000

The New 72,000 square foot Miramar Branch Library, Broward College & Nova Southeastern University Educational Center is located at a site in the heart of the City of Miramar. It is designed to be the northern gateway to the new Miramar Town Center and complement the civic and governmental components of the complex. The building includes a 32,000 square foot Broward County Branch Library, a 20,000 square foot Broward College Miramar Classroom Center and 20,000 square feet of classrooms for Nova Southeastern University. The County Library included over one hundred thousand books, cd's and dvd's, as well as a Community Hall and Electronic Laboratory. (Cartaya)

#### Weston Branch Library & Broward College Combination Building, Weston, FL – USA 2006

\$ 7,500,000

Completed in 2006, this new two story, fifty thousand square foot, building includes a thirty thousand square foot Broward County Branch Library and a twenty thousand square foot Broward College classroom facility. The County Library includes seventy computers and over one hundred thousand books, CD's and DVD's, as well as a Community Hall and an Electronic Laboratory. The Broward College Facility includes ten classrooms, a bookstore, and student academic service offices. (Cartaya)

#### Tamarac Branc Library, Tamarac, FL – USA 2004

\$ 5,000,000

This new 30,000 S.F. Community Library, located in Tamarac, Florida, was completed in 2004. The design allows for the entry of natural light through walls of glass with sun-shading devices. This County Library includes over one hundred thousand books, CD's and DVD's, as well as a Community Hall and Electronic Laboratory. An open interior design was created for ease of monitoring the interior public spaces. The overall ambience of the Library is friendly, open, and accessible within a human scale. (Cartaya)

### CBT Architects – Childs Bertman Tseckares, Boston, MA – USA

<http://www.cbtarchitects.com>

#### **Libraries:**

#### The Learning Center for the Deaf — Early Childhood Education Center and Campus Library,

#### Framingham, MA – USA 2010

20,000 sqf.

Classrooms, meeting room, library

CBT's design for the Early Childhood Education Center and Campus Library at The Learning Center for the Deaf will feature a multipurpose meeting room, flexible classrooms equipped with state-of-the-art technology, spaces for health and physical therapy services, and a spacious new library. The abundant use of glass within the interior spaces helps encourage visual and social connectivity between students and staff, while learning spaces are acoustically engineered to block out sound for students learning to hear with cochlear implants. Flexible classrooms utilize full-height demountable walls as divisions between the classrooms, allowing for rooms to be adjusted depending on the size of the class. The building's exterior aesthetics takes cues from the existing New England vernacular buildings, while the interior is contemporary and playful. A playground on the upper level is directly accessible from classrooms and an outdoor terrace on the lower level knits the building into the campus' fabric. The project is slated for LEED Gold certification and features high performance attributes. The building strategically takes advantage of unobstructed southern daylight through its east-west orientation. Clerestories draw light deep into the classrooms while minimizing glare. A rooftop photovoltaic array will absorb daylight and help moderate the building's temperature and will provide 1/3 of the building's annual energy. The design will also implement a geoechange system to help heat and cool the building efficiently. Water-efficient plumbing fixtures and non-toxic finishes will also be implemented. (CBT)

#### Middlebury College — Starr-Axinn Center, Middlebury, VT – 2008

82,400 SF

#### **Awards:**

2009 Sustainable Design Award from the Boston Society of Architects (BSA)

2009 Society for College and University Planning (SCUP) Excellence in Architecture Award.

Classrooms, social spaces, faculty offices, winter garden

The design for Middlebury College's Axinn Center at Starr Library reinvents a beloved campus landmark, meets the need for additional classrooms and faculty offices, brings disparate departments together for increased interdisciplinary collaboration, and redefines the Center of an expanding campus. Located on the historic Old Stone Row quad, the project preserved the original 1927 neoclassical Starr Library, the 1957 Shepley Pavilion Reading Room, and added 50,000 SF of new space. Previous additions, which engulfed the original library, were deconstructed and reclaimed elements of the additions were used in the construction of the new project. The program called for the historic reading rooms in the library to be restored and other existing spaces to be adapted as

classrooms and a 65-seat screening room. Two new symmetrical wings, designed to reference the style and character of the college's original Old Stone Row buildings, provide offices for the History, Film and Media Culture, and the English and American Literatures departments. The new space accommodates faculty offices, technologically "smart" classrooms, a 45-seat tiered classroom, 2-story film production and editing studios. A light-filled winter garden which overlooks a sustainable landscaped, south-facing courtyard, connects all of these dynamic program elements and is the major horizontal circulation for the project. (CBT) Renovations on the original 1927 Neoclassical Starr Library, at the heart of the Middlebury College campus, included the preservation of historic details and the addition of two new wings. (<http://www.windowsmasternh.com>)

#### **Harvard Public Library, Harvard, MA - USA 2007**

Addition: 11,500 sqf., Renovation: 8,000 sqf.

##### **Awards:**

AIA New England Design Award

Massachusetts Historical Commission Historic Preservation Award

Building Design and Construction Annual Reconstruction Award

Renovation, preservation and new construction

Located at the heart of the Town Center in Harvard, Massachusetts, the building known as Old Bromfield started life in 1877 as a public school house. The building was originally designed by Peabody (1845-1917) and Stearns (1843-1917) and constructed with a grant from Margaret Bromfield Blanchard. Generations of the town's children passed through its doors until it closed in 2003 due to the structure's inability to serve as a modern academic building. By 2003, Harvard's existing library had also become outdated, with little room to grow on its present site to accommodate the ever-growing needs of the town, and the town saw the opportunity to save the opportunity to save Old Bromfield by reusing it as a site for a replacement library. In 2007 the original building, with an 11,500-square-foot addition, reopened as the town's new public library. The renovation preserves the building into its next century, and the addition perpetuates and expands the educational, civic and recreational qualities of the library. The building's Queen Anne-style architectural and ornamental details were restored both inside and out. The woodwork of the floors and book cases was refinished and repaired, and original lighting fixtures were replicated and augmented to achieve similar quality of light. Acoustical ceiling tile was removed from the second floor to reveal the splendor of grand wooden trusses and the newly created room was renamed Volunteers Hall. The design of the addition is scaled and detailed to complement the original building. The space houses the library's reference resources, main stacks, reading rooms, and study areas. Its additional workspaces have allowed the library to expand its inner-library loan program, and to develop additional book groups and more creative programs for children and teenagers. (CBT)

#### **John Adams Courthouse and Social Law Library, Boston, MA – USA 2004**

430,000 sqf., Renovation and restoration

Designed in 1894 by George A. Clough (George Albert Clough 1843-1910, Snell & Gregerson, Boston), Boston's first city architect, the courthouse was originally built for the Supreme Judicial Court (SJC) and the Social Law Library, the country's oldest subscription law library. Four additional floors were added in 1909 and 1914. Today, the 430,000-square-foot courthouse is listed on both the State and National Historic Registers and is a Boston Landmark. CBT completely reorganized the interior to accommodate the needs of a 21st century appellate court while restoring the building's architectural features to their original grandeur. CBT's renovation provided clarity to the plan and improved vertical movement. Major court functions were moved to the second and third floors, and the ground floor was remodeled to accommodate public functions. The original entry was reconfigured to allow direct views into the central atrium, a soaring four-story space that serves as an important pedestrian link between adjacent neighborhoods. Notable features were cleaned and refurbished, including coffered vaults, sculptured corbels, frescoes, and justice-inspired allegorical statues. Five of the building's wood-paneled courtrooms were returned to their original opulence, including a 1890s courtroom that was formerly used by the SJC and noted jurist Oliver Wendell Holmes. The Social Law Library was completely renovated and expanded to house the Commonwealth's historic law collection, including reading rooms with skylights and large stack space. Additional new program elements include a social science library, a courtroom, judges' chambers, conference rooms, and offices. Along with restoration of the historic interior, new technology was integrated without disturbing the building's architectural intent. Lighting, HVAC, telecommunications, and security systems were concealed, while allowing a contemporary infrastructure necessary to administer justice in the Commonwealth. (CBT)

#### **Thomas Crane Public Library, Quincy, MA – USA 2001**

56,000 sqf.

Renovation, restoration, addition, exhibition space, cafe, performance area

Listed on the National Register of Historic Places, the landmark 1882 (Coletti Building 1939) Thomas Crane Public Library is regarded as one of the finest works of noted architect Henry Hobson Richardson (1838-1886). CBT worked closely with civic leaders and state agencies to preserve this historic asset while upgrading the library to accommodate modern services and demand for space. The 56,000-square-foot addition blends with the existing structure, creating a cohesive, visually appealing composition. The original building plan was extended with major program functions concentrated around a new light-filled, three-story atrium. This central gathering place welcomes and orients visitors with exhibit space for artwork and doubles as a performance area and seating for the adjacent cafe. Central organization occurs on each level, allowing broad, general visibility from circulation and reference desks. The children's library is housed on the ground level. A broadcast facility for the local cable station was blended into the complex with a separate entrance and its own architectural identity. The historic reading room in the 1882 building was restored with the help of original photographs. Period light fixtures were reconstructed, the original Richardson-designed tables and chairs were returned to use, and new mechanical and fire protection systems were installed. (CBT)

#### **Lucius Beebe Memorial Library, Wakefield, MA – USA 1998**

(1923 by Ralph Adams Cram 1863-1942 > Cram & Ferguson > HDB/Cram and Ferguson, Boston) CBT designed this new structure to meet the Wakefield community's need for a local arts center. The 500-seat theater will be used as an educational and municipal assembly space for both local and visiting performance groups. The center is also expected to accommodate business conferences by way of the spacious auditorium and state-of-the-art audio/visual facilities.

#### **The Butterfly Library, Taipei - Taiwan on design**

6,000 sqf.

The new Butterfly Library in Taipei is a living symbol of sustainability, designed to serve the community, tenants in two adjacent residential towers, and the Taiwan Butterfly Association. The new library is sited at the transition of a steep slope facing a temple and will be a gateway to the green trail network of Jian Nan Mountain. This 6,000 square-foot four-story structure is composed of an elongated glass box that appears to float above the ground floor. Sustainable design features include a double skin façade composed of an artfully etched high performance glass wall that maximizes natural daylight and a secondary louver system to provide shade, moderating the subtropical temperatures and minimizing energy use from the grid. The project will also promote the use of renewable energy through photovoltaics, wind turbines and geo-thermal. (CBT)

## **CDFL – Cooke Douglass Farr Lemons, Architects and Engineers PA – Jackson, Mississippi – USA**

<http://www.cdf.com>

### **Libraries:**

#### **Thad Cochran National Center for Natural Products Research, University of Mississippi, Oxford – USA 2008**

A center for primary research in the utilization of natural products, the Cochran Center for Natural Products Research totals 115,000-square feet developed in nine separate design/construction packages over a ten-year period. As a primary discovery unit, the center is designed to address completely unknown chemical and biological elements and to contain all potential hazardous elements as investigations proceed. Safety and research integrity, critical to the center's success, had a major influence on the design of the facility. The laboratory component contains bio-safety work areas, entomology and environmental chambers, synthetic chemistry sections, cold labs, a scientific library, plus centers for agronomy and microbiology. An animal center houses twenty-five principal investigation suites with complete support operation, including surgical, necropsy and care centers. The facility also includes a material intake suite to categorize collected specimens, and a full conference center. Joint Venture with Laboratory Research Group. (CDFL)

#### **Willie Morris Library, Jackson, Mississippi – USA 2004 – 2006**

The Willie Morris Library in Jackson, Mississippi is located on land donated to the City of Jackson by the Entergy Corporation for the sole purpose of providing a permanent building for the city's most utilized library branch. The narrow, wooded site is situated next to an ox-bow pond that is recharged by nearby Hanging Moss Creek. The architectural design draws inspiration from the trees and vegetation that are common to the site as well as the region. Architectural standing seam roofing, mixed shades of jumbo brick, and details of cypress wood on the siding and exterior soffit fuse modern elements with the regional vernacular. Unique design features ensure an informative and enjoyable experience for library patrons. Oversized glazing allows a visual melding of the wooded area surrounding the building with the interior of the library. Clerestories protected by overhangs provide copious southern light to the reading area. Patrons are offered a variety of seating options from comfortable sofas to more traditional tables and chairs as well as computer alcoves for word processing and Internet access. The children's collection area plays on the outdoor, woodland vocabulary incorporating forest creature footprints in the design of the carpet, tree-shaped cutouts in the furniture and a "cloud" canopy to foster imagination and curiosity. A "flying gutter" feature collects and transports approximately thirty percent of roof water to the ox-bow pond next to the building creating an uncommon waterfall on rainy days. Circulations have increased by approximately 30% and the building is poised for more volume and service expansion. (<http://www.dcd.com>)

#### **Galtney Center for Academic Computing, University of Mississippi, Oxford, Mississippi – USA 2002**

The Galtney Center for Academic Computing is the end result of a complete interior and exterior renovation of the two-level reinforced concrete structure formally called Weir Hall. The project also includes new classroom additions and landscaped plazas linking the facility to adjacent student activities. The first floor houses the core components for the building, including seminar rooms, administrative offices, student and professor help desks, a 24-hour coffee café, and the student computing center or "virtual library". The second floor contains additional administrative offices and classrooms. Upon its completion in 2003, this project was awarded an American Institute of Architects/Mississippi Chapter Honor Citation for design excellence. (CDFL)

## **Centerbrook, Centerbrook, CT , Architects and Planners – USA**

<http://www.centerbrook.com>

### **Libraries:**

#### **Yale University, School of Forestry and Environmental Studies, Kroon Hall, New Haven, CT – USA 2009**

Kroon Hall is a landmark in sustainable green design (Yale University)

"We love our new Kroon Hall. It is not only a feast for the eyes but a joy in which to work. Thank you for your inspired vision and execution." James Gustave Speth, Former Dean, School of Forestry & Environmental Studies, Yale University  
Kroon Hall is Yale's greenest building, LEED Platinum certified, and a flagship for the university's commitment to sustainable ideals. It is designed to use 50 percent of the energy of a comparably sized, efficient modern building. The new home for the School of Forestry & Environmental Studies joins with two adjacent buildings to create a new unified campus within a campus, establishing a highly visible center for the study of the environment at Yale. Kroon Hall received extensive media attention in 2009, its first year of operation, and seven design awards, including an AIA New England Honor Award and a prestigious national green building award that will be announced officially later in 2010. Constructed of stone, concrete, steel, and glass, it is sited between two neo-Gothic buildings on Yale's Science Hill. It forms two new courtyards, reintroducing the collegiate urban fabric of Yale's core campus to Science Hill. The gabled roof recalls its neighbors while integrating photovoltaic solar collectors and skylights. The end walls are glass with wooden screens that offer sheltered views in both directions. The top floor is a cathedral space housing a conference center with large lecture hall, classrooms, and a cafe. The middle floors accommodate faculty offices, while the bottom floor has more classrooms and a library that lead out to the lower courtyard. The Platinum Rating from the U. S. Green Building Council is the highest attainable. Sustainable features include solar photovoltaic panels, ground source heat pumps, displacement air systems, high thermal retention, daylight harvesting, energy recovering ventilation, a rainwater collection and cleansing pond, a green roof, and recycled, local, and sustainable building materials. Centerbrook as Executive Architect collaborated on the project with the Design Architects, Hopkins Architects of London and an all-star team of consultants including ARUP engineers, atelier 10, Nitsch engineering, Kalin Associates, and Olin Partnership. (<http://www.centerbrook.com>)

#### **Yale University, Lewis Walpole Library, New Haven, CT – USA 2007**

The Lewis Walpole Library, a department of Yale University Library, is an internationally recognized research institute for eighteenth-century studies and the primary center for the study of Horace Walpole, the English man of letters. Wilmarth Sheldon "Lefty" Lewis, a pre-eminent scholar of Walpole, gave the collection along with his eighteenth-century Farmington, Connecticut estate to Yale University. This posed a quandary for Yale since the historic house would be difficult to preserve if modified to accommodate the larger spaces and the controlled environment that the collection required. Centerbrook's solution was to create an attached 'barn' with state-of-the-art systems. The 13,000 square foot addition includes a spacious reading room, modern collection storage, and innovative staff and conservation workspaces. The addition is in the tradition of connected Connecticut farm buildings, and fits a large building into an historic neighborhood. It preserves the existing historic frame house, retaining its residential image and scale. The library and other twentieth-century additions to the original building were restored and renovated to accommodate exhibits, classes, and social events. (Centerbrook)

### [University of Colorado, Anschutz Medical Campus, Health Sciences Library, Denver, CO – USA 2007](#)

As a joint venture with Davis Partnership Architects of Denver, Centerbrook designed this 116,000-square-foot medical library, which is located along the center quadrangle of the new University of Colorado Health Science Center campus. The library serves the medical school, four hospitals, and numerous biomedical research facilities. Designed as a social bridge between all campus disciplines, the library's prominent location near public transportation creates a gateway welcoming community use, as well. The library provides public access at the first floor and becomes increasingly private and quiet on upper floors. The facility includes collection storage with a reading room as well as indoor and outdoor private and team study spaces. It also includes administrative offices, reference services, classrooms, a conference center, a learning resource center, systems-database support, education and health informatics support, and storage of and access to a History of Medicine rare book collection. (Centerbrook)

### [University of Colorado, Wolf Law School, Boulder, CO – USA 2007](#)

Centerbrook is the Design Architect. Davis Partnership Architects of Denver is the Architect of Record.

The Wolf Law School is prominently sited at the south entrance of the University of Colorado in Boulder and acts as a gateway to the campus. The building was designed to recall and reinforce the distinctive character of the historic Boulder campus. The campus was originally characterized by low-scale, sandstone buildings with tile roofs. Much of this quality was missing in recent campus architecture and the University wanted it restored. The Law School is constructed of local red sandstone with limestone details and a red tile roof. It is five stories tall and steps back at its upper floors to maintain the scale of the historic campus. It is "L" shaped and orientated around a large courtyard opening to the southwest, providing views of the Flatiron Mountains throughout the building. Benches and shade trees fill the courtyard, making it an informal social space and community center for the School. The building has courtrooms, classrooms, seminar rooms, faculty offices, a law clinic, a student center, and a law library. Classrooms have wireless networking and video conferencing capabilities for distance-learning. There are internet-based video recording stations and interview rooms as well as digital information kiosks on all floors. The law library is an integral part of the Law School, easily accessible from classrooms and faculty offices. It is the regional archive for the United States government, making it the most complete law library in Colorado. The Law School has received a LEED Gold Rating from the U. S. Green Building Council. (<http://www.centerbrook.com>)

### [Manchester Community College, Library, Manchester, CT – USA 2003](#)

This 35,000-square-foot library is the lynchpin of a 250,000 square foot expansion of Manchester Community College. The library was envisioned as a learning resource center where students could retrieve information from books, periodicals, and other written documents as well as from electronic sources such as CD ROMs, the Internet, DVDs, and videos. The library is a largely open, one-floor space arrayed around a central circulation desk. The ceiling pops up into raised areas with clerestory windows in several important places, including the circulation desk, a large reading lounge with a fireplace, and a study area. Breakout rooms and lounge spaces invite students to gather and work in groups. Lighting for study areas and stacks are custom-designed uplights, which produce comfortable, non-glare illumination and afford flexibility in adjusting stack locations in the future. Sculpture and art is brought into the building and integrated into lounge areas for the enjoyment of patrons. The goal is to create a bright, friendly, and sociable environment where the college's students feel welcome and at home. (<http://www.centerbrook.com>)

### [Mark Twain Library, Redding, CT – USA 2000](#)

The Mark Twain Library was established in 1910 through the efforts of Samuel Clemens' daughter, Jean Clemens, to create and endow a library in memory of her father (Mark Twain) who spent his last years in Redding under her care. Many of the original books were from Mark Twain's personal library. The original building was built with help from the local townspeople and friends of Mark Twain. Slow but steady population growth in the 1970s resulted in an addition built of exposed concrete. In keeping with the philosophy of central library "control," then popular, the addition was round with a central circulation desk. This allowed a small staff to survey the entire facility from a single vantage point. Further community growth in the 1980s and 1990s and rapid changes in information technology created the need for renovations and expansion. The Library Board worked with Centerbrook to shape a facility that would respond to present and future community needs. The new addition screens the view of the 1970s concrete structure and serves as the entrance to the library. The choice of shapes and materials is intended to complement the surrounding New England community. The addition contains the children's functions, separating the noise associated with children's activities from the main library. The center of the existing round building was reshaped as a display area, (vaguely reminiscent of a river boat paddle wheel). The display cases can be moved to allow larger public functions. At the far end of the central axis sits a restored sculpture of Mark Twain surrounded by characters from many of his stories. The architectural frieze around the entire facility is composed of quotes from Mark Twain's lectures and novels. The original Mark Twain Library building has been renovated for special collections and is available for public functions, meetings, and musical performances. (Centerbrook)

### [Quinnipiac University, Arnold Bernhard Library, Hamden, CT – USA 2000](#)

This project undertook the renovation and expansion of a thoroughly inadequate library built in 1969 for a then young New England college. The front of the old building was remodeled to make its spire a beacon of radiating light and to provide a stepped proscenium at the spire's base for socializing and frequent ceremonies and concerts. The rear of the building was largely demolished and replaced with a larger addition now open to a wooded glade and the panorama of stream and mountain beyond. Inside, the old structure was reduced from three floors to two, merged via a skylit rotunda and open balconies. There is a variety of ambiances ranging from the lively cyber café to the secluded team study rooms cantilevered out into the treetops. The library includes the Lender Family Special Collections Room housing a unique American exhibit on An Gorta Mor, the Great Hunger in Ireland during the late-nineteenth century. The exhibit features paintings, sculptures, an illustrated history, and a comprehensive collection of published materials. In addition to answering current functional and technical demands, Centerbrook saw the building as having the power, through its unique language of procession, emotion, and symbolism, to be an alternative to, or a sanctuary from the more troubling aspects of the cultural environment students must contend with today. Its design was to be informed by the core philosophical concerns of humankind: knowledge, individual conduct, and governance. First, Centerbrook sought to make it a place that celebrates the life of the mind. Computer access to knowledge is not relegated to enclosed rooms but is instead integrated into the building along with over a hundred artworks spanning centuries. Second, the more admirable traits of individual conduct were considered and the organization of the building was made rational, structured, and processional. An important goal was to achieve the attributes of craft and care and a balance between rationality and emotion; a balance between exuberance and serenity. Perhaps most importantly, Centerbrook strove to make a place of harmony and beauty that would nurture contemplation. Third, both within the library and at its front door, settings for social interaction and forums for a public life were created, both essential constructs of a sense of community and the polis. Out of these three aspects of knowledge, conduct, and community, Centerbrook attempted to make of the building a symbol of humankind's highest aspirations, and, like Ariadne's gift of the golden cord to Theseus, help students to more easily find their way out of the labyrinth. (Centerbrook)

### [University of Connecticut, Homer D. Babbidge Library Information Cafes, Storrs, CT – USA 1998](#)

#### **Awards:**

AIA Connecticut Design Award

The Information Cafés are the centerpiece of the University Electronic Information Center, inserted into the Homer D. Babbidge Library. Each is laid out in an open plan cluster of several hexagonal workstations. The effect of the clusters is of a sociable café, a

far cry from the typical academic reading room where quiet reigns. The intent of the Cafés is to encourage students to be at ease in the library and to interact freely in small learning groups. Designed according to black box theater principles, the Cafés are wired flexibly from below by means of raised floors and lit from above by track lighting. Integrated up-lighting under each umbrella provides non-glare illumination for computer screens. The co-mingling of technology, theater, and retail paradigms puts the Cafés at the forefront of library innovation. (Centerbrook)

#### **East Hampton Library, East Hampton, CT – USA 1997**

This building houses a library, community center, day care, and a senior center. Local citizens were an important part of the design process. A committee of 35 diverse residents collaborated in a series of workshops which initially focused on the site and user needs. Further work included "dream drawings" to supply architectural imagery. The complex site affected the design. Watercourse setbacks, solar orientation, parking, adjacent residential and industrial neighborhoods, access and identity considerations were all heeded. Laid out on an east-west axis, the building opens to south light and averts the cold with long roofs. The smallest component, the Senior Center, is closest to the road and sized to match residential neighbors. The day care center follows, and the large library is at the rear. This stepped plan gives all three parts equal recognition from the street. The building was designed like a steel framed pole barn with space under the sloping roof used for several mechanical attics (the water table prohibited a basement). Ceilings also rise and fall as needed, making space grand where appropriate - at the library entry and reading room, at the seniors main hall, and at the shared meeting room. Other places are cozy - a senior fireplace niche and drop-in center, a day care aedicula, and the children's library. Here two sets of "Three Bears" easy chairs preside. The smallest is child sized, the middle is a normal chair, and the largest makes even adults look childlike. The building is designed to harmonize with its small village surroundings and still evoke pride in the citizenry. Bell patterns were stenciled at entries and in the library, reminding of the town's heritage as "Belltown" (it is the original home of our nation's bell manufacturing). The family of chimney, ventilator and bell towers spire high as civic markers, while windows and dormers give a friendly cadence to the building's substantial mass. The long porch, anchored at the street by the bell tower entry, ties the complex together. Overall, this building has the stature of an important public structure, its varying functions drawing community members together. (Centerbrook)

#### **Quinnipac University, School of Law Center, Hamden, CT – USA 1995**

The 130,000 square foot law school center and library forms the west terminus of the university's "village street" established under Centerbrook's 1979 campus master plan. This large complex is brought into scale with the rest of the campus by its division into four wings and an overall height of two stories above grade, achieved by placing the third level library below grade. Daylight is brought into this level by a ten-foot-wide, glass roof that extends the entire perimeter of the library wing. The library encloses 50,000 square feet in the building, accommodating 552,000 volumes and a seating capacity of 400. The four wings form a courtyard that is the complex's central organizing feature. The main interior hallway of the building encircles the courtyard, giving the building a clear and memorable organization. On an emotional level, the south-facing courtyard collects the ambiance of the morning sun and a sense of community. Café tables, chairs, benches, and blossoming shade trees adorn the courtyard's lawn and add to the attraction of this enclave. On both a symbolic and functional level, the courtyard provides a forum for public life, a yard for the court, in effect. Twin spires and a clock tower further distinguish the courtyard. The east spire serves as a landmark identifying the main entrance from both the courtyard to the south and the driveway to the north. The complex's overall sociability, its places to sit on the edges of paths, its enclaves for gatherings, its small cafés within and without, all speak to the central purpose of the practice of law and the school itself, that of bringing people together. To enhance a sense of place, a wide array of furniture and light fixtures were designed for the building. (Centerbrook)

#### **East Lyme Library and Community Center, East Lyme, CT – USA 1990**

This 35,000 square foot building combines a public town library with senior and youth centers, offices for the Visiting Nurse Association and the Town Parks and Recreation Department, and a multipurpose meeting room. The town requested that each of these maintain a separate identity and visibility while being housed in a one-story building of New England character with sloping roofs. The site complicated the requirements. It borders residences, wetlands, and the Smith Harris House, an historic Greek Revival farmstead on the National Register. Early studies revealed just enough room to fit the building and required parking on the narrow site. The building was set on the north half to leave the south end as an entry and parking "orchard," sunny in winter and shaded in summer. The tripartite building faces the parking with three open pavilion entries. The longest of these, in the middle, leads to a high lobby in which all departments have indoor entries. The youth and senior centers claim the two other pavilions as their own outdoor entries. The sloping roofs required by the town were massive. To break down their scale, entry pavilions and dormers, which are Greek Revival, reflecting the Smith Harris House were added. A gallery pavilion, tall with glass and almost the same size as the house, juts out the back of the lobby to face it. The trim and fenestration throughout the building, though newly invented, also recall the house's style along with the stretched columnar brick piers and pediments of the three building wings. Since Greek Revival was prevalent at the town's founding, this all helped celebrate the town's 150th anniversary. Inside, off the lobby, each facility opens through a procession of regular spaces in irregular patterns. Especially in the library, large spaces lead to small which lead in turn to large again to dramatize the pleasures and uses of each. In addition to administrative and technical services offices, the 18,000 square foot library includes a grand reading room. It is preceded by a checkout desk off a tapered entry hall and is surrounded by stacks, special pods for media, new books, periodicals, a children's library, and the "East Lyme Room" with mahogany cabinets displaying town memorabilia. Between the Senior Center and the large subdivided multi-purpose room is a full kitchen capable of serving 400 meals. The Senior Center also offers its own meal site room, a day room, and crafts studio. The Youth Center separates into counseling offices and a recreation hall where a snack bar and DJ booth/TV "tower of power" in the middle are surrounded by game tables and seating. (Centerbrook)

### **Cherry Huffman Architects, Raleigh, NC – USA**

<http://www.cherryhuffman.com>

#### **Libraries:**

#### **Chatham Community Library (Central Carolina Community College), Pittsboro, NC – USA 2010**

The Chatham County Library is located on the campus of Central Carolina Community College in Pittsboro. The library will serve as the library for the community college as well as the regional public library. The Chatham County community is committed to being leaders in sustainable design and the library design incorporates many highly innovative features. The project is on track to receive a LEED Gold certification. The library is designed to use natural light for almost all of the functional light during daytime. Extensive on-site daylight modeling was completed with Dr. Wayne Place. Electric lights automatically turn off when sufficient daylight is present. The design was extensively tested through prototype models and physical analysis. As one of the ways of meaningfully engaging the community, several artists are incorporated into the design. A mural artist is painting the children's program area. A metal worker is designing custom fences and bicycle racks and a ceramic artist is designing tiles for two "hearth" features. These and several other inclusions of local artisans serve to reinforce the library as a community anchor. (Cherry)

#### **Cameron Village Regional Library, Raleigh, NC – USA 2006**

The library is located in the oldest shopping center of its kind in the southeast. The design created a window into the community, expressing the library's individual function while maintaining continuity with its surroundings. The library's updated interior and

exterior has added light, energy and transparency to the building—an integral part of the library’s new identity. It now welcomes 3,500 visitors a day. The open plan combines the two sides of the building into one library. An addition to the second floor provides more floor space with the ability to separate quiet and public study zones. The relocated entry opens into an atrium connecting the first and second floors. The southern exposure of the primary facade offers an opportunity to take advantage of an ideal day lighting circumstance. Through the use of carefully designed shading structures the design responds to environmental concerns, maximizing daylight and views inside and out while avoiding direct light and undesirable heat gain. The primary view from the street is the activities occurring within the library—connecting the inside and outside. The library received a Merit Award from the American Institute of Architects, North Carolina Chapter in 2006. (Cherry)

University of Maryland at Baltimore, Architect: The Design Collective

The second largest medical library on the East Coast provides the highest level of library and computing services available. The state-of-the-art information services building serves over 900 libraries in 10 states as part of the biomedical network of the National Library of Medicine. Many highgrade finishes are incorporated into the six-level building, including maple and cherry-wood paneling and black granite counter tops. Telecommunications cabling, fiber-optics, and 1500 computer data connections were installed throughout the facility. The Information Access and Management Center, located on the building’s main floor, allows users to access database and networked information. Three Technology-Assisted Learning Classrooms are used for training, advanced applications, file management, and design of expert systems.

#### **Libraries:**

### **Patricia W. & J. Douglas Perry Library, Student Success Center, Old Dominion University, Norfolk, VA – USA 2011**

The Patricia W. and J. Douglas Perry Library is home to most of the Old Dominion University Libraries’ collections and services. The University Library was opened in its present location off 43rd street in 1976, with a major addition and renovation completed in February 1998. It was renamed the Patricia W. and J. Douglas Perry Library on December 10, 1998 and was dedicated on April 15, 1999.

Completed in: 2011, Project size: 76,316 SF; Construction cost: \$9,700,000

To create an interactive “Learning Commons” and accommodate the University College, which helps students transition to college life, the library at Old Dominion University underwent both a renovation to some of its existing spaces, as well as an addition of 30,000 SF.

Approximately 20,000 SF on the first floor of the existing Perry Library was captured to create the “Learning Commons”, which includes multi-task open work areas, enclosed meeting rooms and project rooms, social gathering spaces, and a small cafe.

Additionally, approximately 30,000 SF were added to accommodate University College and its support services to students.

The Center serves as a central hub for 24,000 students and operates 24 hours. Our design direction was for an atmosphere of exploration, collaboration, and social activity. The Center is a destination, a place to see and be seen, and a home base for commuting students.

A single inversion arc draws students to the main entry addition. The arc curves through the iconic Perry Library to form a strong geometry unifying the 1973 vernacular with the new. The design incorporates ODU “blue” paired with a warm “gold”. Overall tones borrow from the existing library neutrals and feature exposed concrete, reinforcing the overall technology theme. Glass partitions expand the spaces one into the next for a dramatic layering effect. The University embraced a “for students/by students” philosophy and a student advisory committee participated in the design process. Furniture selections support technology-driven requirements. Mock-ups were installed for onsite testing for a semester. Overall comfort, performance, and ease of power and data integration Civil engineering design for this project included site layout and grading for a series of ramps and curved steps to integrate with the campus overall master landscape plan. Stormwater design, which included a new bioretention facility and compliance with the campus stormwater master plan, and site utility design, including the design of a 12-inch City-owned water main for future use. Extensive coordination was involved with DCR for stormwater approval, Hampton Roads Sanitation District (HRSD) for sanitary sewer coordination, and the City of Norfolk Utilities Department for design and approval of the 12-inch water main. drove product selection. Practicality meets imagination in this community and technology-driven center. (Clark)

SMC LIBRARY, SCIENCE COMPLEX WIN

STATE ARCHITECTURAL AWARDS

Santa Monica College’s Library Expansion & Modernization Project and its Science Complex have both won prestigious statewide awards from the Community College Facility Coalition. Both projects were designed by CO Architects of Los Angeles, formerly Anshen + Allen.

The Library project won the Award of Honor in the Modernization Project category and the Science Complex won the Award of Honor in the Growth Project category.

The coalition is made up of representatives of California community colleges, architects, engineers and contractors. The 2005 awards were presented for the best in design for California community college projects.

The \$23.6 million Library Modernization and Expansion project – which was completed in August 2003 – nearly doubled the size of the facility to 96,500-square feet and provided widespread Internet access. In addition, the project included seismic retrofitting and a redesign of the exterior, with landscaping, benches, lighting and more.

With three stories divided into five levels, the Library features plentiful skylights and atriums, giving the structure an open and airy feel. The centerpiece is an elliptical wood-paneled “building-within-a-building,” flanked at the north end by a dramatic three-story glass elevator tower.

The \$30 million state-of-the art Science Complex – which opened in August 1999 – is a 98,000-square-foot facility made up of two buildings separated by a courtyard but connected at the second floor. The gray-green-white building has many environmentally sensitive features, as well as modern labs and classrooms.

The complex includes two 100-seat lecture halls, including built-ins such as infrared assisted-listening devices and computerized control modules for the professor to display DVDs, CDs, and other media; labs ranging from plant propagation to instrument labs and a Nuclear Magnetic Resonance Spectrometer, one of only two at a community college. (<http://www2.smc.edu>)

## **Cogdell & Mendrala Architects, Savannah, Georgia - USA**

<http://www.cogdellmendrala.com>

### **Libraries:**

#### **Zach S. Henderson Library, Georgia Southern University, Statesboro, Georgia – USA 2008**

- The expansion/renovation project began in summer 2004 and was completed in August 2008.
- The completed building is as large as a city block. The total square footage of the library is 235,000. A helpful feature is the color coding of the carpet by floor: Green – first, Blue – second, Red – third, and Purple - fourth.
- The \$22.75 million project added 101,000-square foot to the original building.
- The expanded building was designed more for people than for books.
- Floor to ceiling windows are featured throughout with seating at all the outer edges and the collections nearer the center.
- By the end of 2008, there will be more than 1900 seats and twenty-nine group study rooms available.
- The new Learning Commons (second floor) offers bright, flexible seating for group collaboration, faculty – student collaboration and research, and multimedia creation and projection.
- The Automated Retrieval Collection (ARC) is currently capable of storing 800,000 items in 5,848 separate bins that are stacked 45 feet high is one of the most exciting features of the building.
- When the ARC is expanded to its full capacity the building will be large enough to house a collection of more than two million items.
- There will be more than 300 hard wired computers and wireless is available throughout the building.
- A welcome addition to the original building is the rear entrance that allows access from the parking lot.
- The library is open almost 24 x 7. During regular terms, it's only closed from ten pm on Friday until 9:00 am on Saturday and from 10:00 pm on Saturday until noon on Sunday. See schedule.
- The striking three-story glass atrium with its virtual waterfall is a highlight of the eastern addition.
- The L shaped western addition features a cathedral ceiling on the third floor with impressive views from both the third and fourth floors. (<http://library.georgiasouthern.edu/building>)

#### **Ina Dillard Russell Library & Information Technology Center, Georgia College & State University, Milledgeville, Georgia – USA 2005**

see Holzman Moss

The existing facility consisted of an original building constructed in 1926 and expanded in 1965, which together totaled approximately 45,000 sf.

The new two phase \$15,000,000 project added a 100,000 sf addition and completely renovated the existing facility following the Design-Bid-Build delivery method. The first phase consisted of a new three story addition. When the addition was completed, the Library was able to relocate all of its staff, materials, and student functions from the existing facility into the new addition. The move was coordinated with the semester break which created minimal disturbance to the University's Library services. Once relocation was complete in the new addition, the second phase involving the renovation of the existing facility began. When completed, a partial move of certain temporary departments, went back into the existing building.

Features include a 24-hour student gathering/study zone with a cyber-cafe, graduate study lounge, group study rooms, electronic classrooms, and additional reference areas. Complete access to the library's computer labs are now available anywhere within the complex. State-of-the-art technologies and high-density shelving contribute to the doubled capacity for collections and reader seats. The Flannery O'Connor Memorial Room, a museum and archive dedicated to the author and Georgia College alumnus, is joined by additional gallery spaces and an adjoining Education Room for museum-quality exhibitions and special campus events. (Cogdell)

#### **Live Oak Public Library, Bull Street Branch, Savannah, Georgia – USA 2000**

On 2002 Bull Street is, arguably, the oldest library within the Savannah city limits. The history of the entire Live Oak Libraries system is closely linked with this particular branch. It was opened in November 1916, costing \$104,041.78 to construct, the money mostly coming from a Carnegie grant. Its 23, 000 item collection was brought from East Henry Street's Carnegie Library, which had previously served the local African-American community. For more information on the Carnegie

Library:[www.liveoakpl.org/upload/LibraryHistoryLeMays.pdf](http://www.liveoakpl.org/upload/LibraryHistoryLeMays.pdf)

Designed by H. W. Witcover, the Bull Street library is a beautiful example of neoclassical architecture. In the following decades the building went under several renovations. The first came in 1936 when the WPA (Works Progress Administration) added a small wing for more book stacks and painted a Robin Hood mural in the Children's Section.

In 1956, while there was no change to the building it self, it was renamed the Chatham-Effingham-Liberty Library. It served as the single library building for all three counties, only aided by book mobiles that had routes through Effingham and Liberty Counties. This service was discontinued December 31, 1944 due to a lack of funding.

Ten years later in 1966, a whole new addition, in the form of a nearby residence, was annexed to the building that doubled its size, making it better able to handle the increased traffic after segregation had ended. A reading lounge and more room for the staff were specifically designed, as well as more stack space.

In 1999, the building went through an overhaul. Restored to its prime, the building's size was again doubled to almost 66,000 sq. ft. It was painted in the very recognizable neoclassical style of Robert Adams, a famous Scottish architect, interior designer and furniture designer. He was considered the leader of the first phase classical revival in 1790 in the United Kingdom, specifically

Scotland and England. Some of his most notable works are Derby House, the front screen in Whitehall, in London, Kedleston Hall, and Pulteney Bridge, in Bath. For more information on Robert Adams : [en.wikipedia.org/wiki/Robert\\_Adam](http://en.wikipedia.org/wiki/Robert_Adam)  
The Bull Street Library's split-block addition from 1966 was replaced with white Grecian marble, vivid colors in the rest of the décor, and beautiful window walls that gave a lovely view of the live oaks that line Bull Street. In honor of these trees, the entire library system was renamed Live Oak Libraries in 2002. (<http://www.examiner.com>)

### **Libraries:**

**[John & Christine Warner Library & Student Center \(Central Ohio Technical College – Ohio State University\), Newark, OH – USA 2008](#)**

### **Awards:**

ACUI ( Association of College Unions International ) Design Award 2009

AS & U ( American School & University ) Educational Interiors Showcase Bronze Citation 2009

Central Ohio Technical College (COTC) is forging ahead and looking forward to a future of growth. The vision for of The John L. and Christine Warner Library and Student Center is now a reality, as the structure of this state-of-the-art facility nears completion. Construction began in the spring of 2007, and now the campus is preparing for the move of the various services and resources over the summer months. When the doors to the new building open, it is anticipated that not only will the face of the campus change but so will its feel. Structurally and symbolically this nearly 84,000 square foot building will be the union of information access and the information generation. The facility will feature 25,000 square feet of library space; nearly double the space of the current library. The new library will house an ever-changing array of research tools for teaching, learning and research. The new student center features a modern dining area, student organizational space, a learning commons, various activity areas and a new bookstore. Through volunteerism and student employment, the center will offer first-hand experiences in citizenship and educate students in leadership development, social responsibility, multiculturalism and values. Spaces that will be available to community, non-profit organizations at no charge include: the library, dining hall, bookstore, public lounge areas, and the Sleight Community Room. Brian Boehmer, Architect and Project Director, stated: "The concept of having an open facility that houses a library, dining, bookstore and student spaces is very unique. The notion that there are no physical barriers between the food service operations and the library and the fact that food and/or books can literally go anywhere in the building strengthens this concept." Additionally, the Warner Center features three working fireplaces for those cold Ohio days. Like other spaces on campus, the building provides complete wireless internet access. All classrooms and most of the learning labs will have full multi-media components. Students will be able to sign out laptops at multiple locations throughout the building. Dr. Bonnie L. Coe, President of COTC, stated, "It is our hope that the center will foster a sense of community that will cultivate enduring loyalty to both COTC and Ohio State Newark. The building was made possible through the foresight and generosity of its namesakes – John L. and Christine Warner, who are credited with the unique concept of combining the library and student center into one facility. The Warners' generous donation consists of a \$4.5 million lead gift, followed by the establishment of three charitable remainder trusts of varying amounts and years. (<http://www.newarkcolleges.com>)

## **[Adrian College, Shipman Library Addition & Renovation, Adrian, MI – USA 2000](#)**

22,000 sqf. Addition, 29,000 sqf. Renovation, 4,752,000 €

The expansion and renovation of Shipman Library on the campus of Adrian College transformed a 40-year-old functional, but nondescript library. The project is the first step in a campus renaissance, the college's first major building project in more than a decade. It symbolizes a commitment to academic excellence. Renovation 51,000 square feet of virtually new space. It establishes a new benchmark of quality for future campus projects. The existing building and new addition are linked dramatically with a vaulted connector that functionally and visually unifies the entire building, while creating a major organizational space similar in character to traditional collegiate reading rooms. The new addition is shaped to respect and enhance the pedestrian scale of the campus. It incorporates an exterior palette of limestone and masonry, which harmonizes with the two existing distinct campus-building styles. The library has become an academic and social center, and also houses the campus' technology center. The new Shipman Library combines the historical tradition of libraries with 21st-century technology. (<http://schooldesigns.com>)

**[Washington, DC, Public Library Branches, Rosedale Community Center and Library, Renovation, Modernization – USA 2012](#)**

New Building Multi-Purpose Recreation / Community Center / 26,200 SF / Washington, DC

The new Rosedale Community Center and Library will replace the current dilapidated building, rejuvenating this neighborhood with improved community amenities. The community center will have a gymnasium, meeting rooms for general purposes as well as for the teen and senior age groups, a community kitchen, and fitness room. Outside of the building users will find a new swimming pool, new artificial turf field, basketball court and playground. The design is straightforward and is comprised of three rectangular buildings, a gymnasium wing, community center wing, and a library wing with a central entry point. The community center wing will be housed under a green roof and provide storm water retention and filtration, the 9,000 sf green roof will help reduce the heat island effect providing points for LEED certification. The new building, designed to LEED Gold standards, is intended to provide a modern facility to foster activities such as continuing education, arts and crafts, indoor sports as well as neighborhood meetings and events. **[Washington, DC, Public Library Branches, Mt. Pleasant Branch Public Library, Washington, DC – USA 2012](#)**

CORE, along with HMA2, was hired in 2008 to renovate, redesign, and restore the Mt Pleasant Library at 16th and Lamont Streets, NW. The overarching project goal is to improve the functionality of the library. To do this, CORE will increase usable space, add a new wing for community gathering space, improve circulation, design for all ages, and preserve the historic structure and spirit of the neighborhood. Throughout 2009, CORE has worked diligently to develop a design that meets the needs and interests of local community group, historic preservation groups, and design review boards. CORE has created a design that blends the new wing with the historic structure in a subtle yet provocative way. The project is scheduled to begin construction the first quarter of 2010. (CORE)

**Libraries:**

**[South Carolina State College, Miller F. Whittaker Library, Orangeburg, SC – USA on construction](#)**

**ABOUT THE LIBRARY**

The Miller F. Whittaker Library was constructed in 1969 with the mezzanine addition in 1979. Various print and electronic collections are housed in more than 47,500 square feet of space. The library provides resources to meet the instructional and research needs of students and faculty.

**THE MILLER F. WHITTAKER LIBRARY RENOVATION**

The new library will be located in the approximate same location as the present facility, and will include approximately 74,500 square feet. In the first phase, a wing of the library will be built in the existing adjacent south parking lot. The second phase will consist of relocating the contents of the present library into the new wing and then demolish the existing library to make room for the new construction. The three-story steel framed brick and glass structure will feature natural lighting from windows and an integrated skylight system. The majority of the print collection will be housed on compact shelving, which requires less square footage than conventional shelving. The new facility will house several state-of-the-art amenities, including a WiFi system allowing students the use of laptops throughout the facility. Some additional features include lounge and conventional seating for more than nine hundred fifty; classrooms for bibliographic instruction and lectures; a fifty seat computer commons area; meeting rooms, study rooms, and conference rooms of various sizes; a children's room and curriculum lab; multimedia lab; and a café. The facility has been carefully designed to meet newly adopted SCSU architectural design criteria, academic needs and fit the learning style of South Carolina State University students. Once complete, the facility will be a positive statement to the continued commitment and progress which will be synonymous with South Carolina State University well into the 21st century.

**<http://library.scu.edu/MFWLibraryFriends.pdf>**

The Z. Smith Reynolds Library is defined by its: Friendliness and Caring. We value being friendly and strive to be the embodiment of approachability for the Wake Forest community. We value and care about our colleagues in the library and about each individual at Wake Forest University.

Collaborative Spirit

We value collegiality and working together as a team. Our collaborations within the library, the larger Wake Forest community, and the field of librarianship help us reach higher levels of service, innovation, and impact on the campus and the profession.

#### Welcoming and Inclusive Place

We value the library as a place where everyone is welcome. We provide places where students, faculty and staff can gather and meet across disciplines. We provide spaces for the WFU community to host events and programs that engage and enrich the intellectual and cultural lives of the community.

The Z. Smith Reynolds Library values: A Mission Focused on Success

We value progress and achievement in the Wake Forest community, and pledge to do all that we can to help our students, faculty and staff succeed. We celebrate success as a way to recognize quality work and to showcase and demonstrate the highest levels to which we all aspire.

#### Unparalleled Service

We value our community and seek to continually improve upon our role as information experts.

We value partnerships with faculty and staff across campus to enhance the University's effectiveness. We continually strive to innovate and build new models of service to best meet the needs of our users.

#### The Quest for Knowledge

We value the quest for human knowledge in all its forms. We value the teaching and learning process by which knowledge is disseminated and acquired, and we value the creative process required to produce new thought.

The Z. Smith Reynolds Library aspires to live by these guiding principles:

**Diversity and Inclusion.** We value and appreciate differences: of opinion, perspective, culture, race, socioeconomic status, color, sex, national origin, religion, age, sexual orientation, gender expression, and physical ability.

#### Innovation and Creativity

We value a culture of innovation and pledge to build a creative environment that allows us to explore new ideas, learn from failure, and continually re-envision what libraries can be.

#### Love of Learning

We are intellectually curious and expect to continue to learn, grow, and develop throughout our lives. We do this by reading, through engagement in professional development, by learning from each other, and through access to cultural activities. We seek to instill the appreciation for lifelong learning in all of our library users. (<http://zsr.wfu.edu/about/library-values>)

### **[Nancy Guinn Memorial Library, Conveo, Rockdale, GA – USA 2010](#)**

Architect: Craig Gauden Davis in association with Studio 3 Design Group

\$ 5,500,000

**Enhanced Functionality:** The expansion and renovation of the Nancy Guinn Memorial Library addressed a number of shortcomings with the existing building: leaks and water damage caused by measures taken to support the rooftop mechanical units, improperly functioning mechanical units, and an inefficient circular-oriented floor plan. A 9,000-square-foot addition brought the library's total size to 47,000 square feet and offers views of a wooded public park and amphitheater. A 200-seat meeting room was relocated to the upper floor and given a separate entrance so it can be used after hours. Other amenities include three small-group study rooms, a 12-seat conference room, a children's story hour room, and a computer training lab.

### **[Etowah Branch Library, Etowah, Henderson County, NC – USA 2008](#)**

Area: 8,000 sqf., Cost: \$ 1,300,000

#### **Awards:**

**Best New Library Under 10,000 SF, 2008 North Carolina Public Library Directors Association**

Located near Hendersonville, NC in a community with a population of approximately 2,700 people, this new library overlooks the Etowah Valley and Blue Ridge Mountains. Nestled on a gently sloping site, the library is the center of this small community. The project came in under budget, has many sustainable features and is designed to accommodate future expansion. • Building facade faces due south to maximize daylighting opportunities and capture views towards the Blue Ridge Mountains. Fritted, high performance glass to reduce heat gain. Large 6' overhang protects façade from summer sun but allows warmth in the winter, Exterior uses indigenous materials and colors, Interior floor features renewable cork flooring, Multi-purpose room with after-hour entrance, Children's area is enclosed from rest of the public area for security and acoustical isolation. (Craig)

### **[Pendleton Branch Library, Pendleton, Anderson County, SC – USA 2007](#)**

Area: 12,000 SF, Completion: 2007, Cost: \$1.9 Million

Situated on virgin forest donated by a Clemson entomology professor for the preservation of an environmental sanctuary, the library is built next to the ruins of an 1860 southern plantation home known as Tanglewood. Proportioned after the original home, the exterior is classical in its articulation while the interior focuses views into the lush surrounding forest. The Children's program room and reading areas provide views into the archeological ruin which CGD's design reclaimed from decades of overgrowth and converted into an exterior reading garden and history lesson for the community. Plentiful natural daylight, Seating along the exterior to capture views, Central circulation/help desk for visual control, Public meeting room, Children's program room Lobby star-burst relates back to terrazzo floor pattern in the main library (also designed by CGD). (Craig)

### **[Horry County Library, Conway, SC – USA 2006](#)**

Area: 20,000 sqf., Cost: \$ 4,300,000

Associate Architect: Moseley, Wilkins and Wood

#### **Awards:**

**C. P. Quattlebaum Design Award, 2006 City of Conway, South Carolina, Presented for an outstanding contribution to quality development in the restoration, landscape or design category**

Public meeting room with after hour entrance, Two-story lobby organizing public space, All shelving 66" high or less to create a sense of openness, Plentiful windows to provide daylight, Designed to receive a 20,000 sf addition, Indirect lighting throughout, CGD designed FF&E

This library is located on the same site, adjacent to the historic Burroughs School and Auditorium on Main Street in Conway, SC. With plans to convert the school and auditorium into a museum and theater, the library was sited to frame an entry drive and help organize the site into a "cultural campus" while maintaining several large live oak trees original to the school. The two story façade of the library balances the scale and style of the auditorium façade and provides this small library with a strong civic presence visible from Main Street. (Craig)

### **[Drs. Bruce and Lee Library, Florence, Florence County, SC – USA 2004](#)**

Building Area: 83,000 gross square feet on a 5 Acre site, Cost: \$ 17,000,000

When a new foundation dedicated to advancing the greater good of the community wanted to make a monumental statement, it chose Craig Gaulden Davis to create the city's first civic structure in more than thirty years: a public library, classically designed, that would serve as a catalyst for future growth and progress. To quantify the importance they placed upon this vision, the foundation insisted that the library be made 8,000 square feet larger than the State Library's formula's recommendations, which are based on population size. The Drs. Bruce and Lee Foundation Library in Florence, South Carolina, has lived up to – and exceeded – its mandate. This strong, timeless edifice has engaged the existing community, spurred revitalization of the downtown business district, and boosted commercial investment, economic development, professional recruitment and educational achievement throughout the Pee Dee region. Massive but exceptionally well-sited and proportioned, the library is clad in limestone, its grand walkway leading to a portico with elegant hand-carved Corinthian and Ionic capitals. Lush grounds include a landscaped public plaza and a great lawn, ideal for hosting concerts and other civic events. Organized around a central two-story atrium, the facility features a bright, colorful children's library that overlooks the great lawn, a bank of Internet-equipped public computers that are in near-constant demand; a 48-computer classroom/training suite; a large South Carolina History Room with separate climate control systems and a fireproof vault; and a variety of meeting rooms for individual study or research, team projects and training sessions. To accommodate after-hours events, the Founder's Room is equipped with a separate entrance that allows admittance from the building's exterior while also providing easy access to service facilities. With a functional fireplace, conference table, comfortable seating areas and traditional furnishings, the Founders Room is the perfect setting for special events such as meetings, catered affairs and book signings. To allow convenient access while preserving the structure's dramatic street appeal, public parking is located on either side of the facility rather than in front. An elevated plinth suits the building's classical design while also concealing a secret: a self-draining mechanical room that distributes air quietly and evenly without creating typical aesthetic issues associated with air-handling equipment. Craig Gaulden Davis is passionate about creating libraries that showcase community ideals. Like the Pee Dee region it serves, the Drs. Bruce and Lee Library has its own character and context, making it a treasured resource for all generations. Program: Central Atrium/Circulation Area, Children's Area, Internet Area, Periodicals & New Book Collection, Adult Fiction Collection, Adult Non Fiction Collection, Reference Collection, Reference Offices, South Carolina History Collection, Private Study Rooms, Public Training Classroom, Administrative Offices & Work Areas, Public Meeting Room, and Founder's Room Conference Suite (Craig)

### **Hughes Main Library, Greenville County Library, Greenville, SC – USA 2002**

Area: 120,000 SF, Completion: Fall 2002, Cost: \$17.8 Million, Associate Architect: MGA Partners, Client Website: <http://www.greenvillelibrary.org>

#### **Awards:**

**First Place Hospitality/Public Space Category 2006, StarNet Merit Award 2004, AIA South Carolina Honor Award 2004, Brick Association of the Carolinas Honor Award 2003, AIA South Carolina Honor Award 2003, AIA Greenville**

When architect David Moore needed inspiration for the design of the Hughes Library, he needed only to look to the past. Recalling the rich textile industry on which Greenville was founded, Moore, partner of Craig Gaulden & Davis, Inc (CGD) and project architect designed a building that marries traditional architecture with modern design. To further evoke the past, Moore brought in large oak trees around the exterior of the building. And the building was completed in 20 months, just in time to move the 440,000 items from the old Main Library to the new location. Utilizing a fast track, design build approach to accommodate Greenville County's 20-month turnkey schedule, CGD in association with MGA partners out of Philadelphia, PA created a design that accommodates the needs of the library system and the patrons. Craig, Gaulden & Davis are no strangers to library design, having designed nearly 1.3 million square feet of library space throughout the Southeast including new main libraries for Anderson, Lexington, Charleston and Florence counties in South Carolina. However, The Hughes Library is the first in the state to utilize a design/build approach. This method teams the architect and contractor together to provide the owner a single source of responsibility for the design and construction of the project. Greenville County Library System executive director, Beverly James notes, "Because of our time constraints and the complexity of the project, it was essential to have experts in library design as well as in construction leading our efforts." The library's exterior. Moore saw the new library as the main vehicle to extend the existing Heritage Green campus. Greenville's downtown cultural arts campus, Heritage Green is also home to The Greenville Art Museum, a 600-seat community theater and the future site of a Children's Museum. The new library rests on an adjacent block—formerly the site of a Coca-Cola bottling plant—that is surrounded by traditional red brick structures. "By utilizing colors from all the buildings on the campus, the library becomes a transitional element that ties the entire campus together," says Moore. Founded in 1921, the Greenville County Library has been a part of the Greenville Community for 81 years. Named the Hughes Library, through a generous gift from Phil and Bob Hughes in honor of their parents, R.F. and Mary Hughes, the new facility has been described as a "piece of fine art." Creating "this piece of fine art" was surely a collaborative effort. Moore called on the help of Brian Melson of Buford Goff, Inc. and Carrie Welker of the Thompson Company in Atlanta when he began designing the lighting for the library. Moore's goal was to incorporate as much natural daylight as possible. He also wanted the space to be well illuminated at night to show the activity that occurs in the library—people talking, people reading books, people studying at the tables. Further, Moore used linear, indirect fixtures in the library stacks to provide even lighting over the shelves. He also used lighting as a sculptural element in the building. The children's wing is the focal point of the library and this area created a unique lighting design challenge. Since the new addition was created to encourage children to read and to inspire their imaginations while encouraging family visits, Moore and Melson used an innovative lighting design. The solution was both playful and functional. They selected a low-voltage, cable lighting system manufactured by Translite-Sonoma. Brian Melson and David Jordan of The Schneider Company designed the system utilizing crisp halogen accent lights. Animal-like spotlights, called "Byrdys" appear to walk across the horizontally suspended cables. An assortment of five different colored; hand-blown glass downlights were also suspended from the cable system to further inspire young imaginations. Undulating colored nylon ribbons were also suspended from the ceiling. Hughes Library has been described as "a great vessel of learning and leisure opportunities awaiting the citizens of Greenville County." Architect David Moore looked to the past and saw the future. (<http://www.theschneidercompany.com>) CGD's 3rd contribution to Heritage Green, Greenville's downtown cultural campus, the 120,000 SF Hughes Main Library serves to expand Heritage Green and promote further downtown development. Utilizing a design-build delivery system, Greenville County required that the library be programmed, designed, constructed, and opened to the public in 20 months or less. As the lead architect of the selected design-build team, CGD was responsible for programming, architectural design, interior design and coordination of all architectural and engineering disciplines, including specialty lighting, library technology and building security design. In order to meet this aggressive schedule, the Team utilized a "fast track" approach that required the early release of construction packages during the design process to allow construction to commence before the entire library was designed and documented. (Graig)

### **Anderson County Main Library, Anderson, SC – USA 2000**

Client: Anderson County Library System, Location: Anderson, South Carolina, Cost (2000): \$10,100,000, Area: 96,000 square feet on a 5-acre site, Program: Public meeting rooms, cafe, store, local history help desk and collection .

[In the early 1900s, Andrew Carnegie donated \$50,000 to build Anderson Public Library at the corner of Tenth and Jackson streets. The city's only Neo-classical structure (completed in 1905) includes extraordinary craftsmanship such as oak fireplaces, a stained glass rotunda, classic columns, marble stairway, and special lighting.]

The Anderson County Main Library is more than a book depository; it is the center of discovery, discourse, research, and gatherings for the community. Craig Gauden Davis' design combined traditional library functions with those of a convention center, bookstore, cafe, copy shop, print center, video store, computer school and living room. During its first year, library usage more than doubled, attracting over 400 outside organizations. As expected, the boom in activity has brought new life to surrounding commercial neighborhoods. Located at the highest point in the city, the library is a beacon to its role as the intellectual and community center of the county. A sloping site features a public green with ancient trees and extensive landscaping. A contemporary arrangement of Jeffersonian columns, porticos and pediments, crowned by a copper dome, declares the building's civic role, while the interior reflects the information age it serves. Floor plans bear out the library's role as community center. Circulation, Audio/Visual, and Children's help desks are placed near an internal "Main Street". Meeting rooms, cafe, store, new materials, current periodicals, adult fiction, audio/visual, and the children's collection are on the Main Level; Reference, Periodical, and Local History are on the Upper Level. A single entry, and clear visual control of the public space from service desks, help address security concerns. Efficient workflow design, durable materials, and creative use of daylighting minimize operating costs. The technology infrastructure and options for building expansion offer flexibility over the long haul. (Craig)

### **Libraries:**

**Utah Valley University Library, Orem, Utah – USA 2008**

196,000 sqf.

Collaboration with: Alspector Architects

The Digital Learning Center (DLC) features cutting-edge technology and plenty of room for growth. Governor Huntsman said Utah Valley University's library, as the first building completed under Utah's High Performance Building program, was the "greenest" state-funded building in Utah. The library also received two merit awards for green construction by Intermountain Construction in 2008.

Included in the building are group study rooms, a commons area with more than 90 computers with access to the latest in computer software packages and expanded collections. Other facts about the DLC include:

190,000 square feet, Over 200,000 books, Access to over 10,000 journals, More than 100 public computers, Mac and PC computer labs, Double the size of current collections, 31 group study rooms, Extended hours area, Café, Media viewing rooms, Writing Center (<http://www.utahvalley.com>)

## **Cutler Anderson Architects, Bainbridge Islands, WA – USA**

<http://www.cutleranderson.com>

### **Libraries:**

**Capitol Hill Library, Capitol Hill, Seattle, WA – USA 2004**

11,200 sqf., \$ 5,200,000

This 11,200 sqf. Library is located in the most densely populated and actively urban neighborhood in Seattle, Washington. The architect's intention was to create a quiet refuge in the intense neighborhood, while designing a building that could hold its own in the visually active context of Capitol Hill. To achieve this end, the community and the architects also wanted the building to respond to the site's natural and manmade context. In response, the architects looked the winter solstice to determine the shape of the central reading room. A triangular pitched roof whose rainwater runoff is expressed in a central open downspout reinforces this shape. To foster life, the exterior and interior of the brick portions of the building were wrapped with a veil of stainless steel mesh, upon which 16 varieties of climbing plants have been trained. When the planting matures, lighting that has been placed between the pant-supporting wire and the brick will be turned on and the building will glow green with life. (Cutler)

**Maple Valley Library, Maple Valley, WA – USA 2001**

### **Awards:**

Award of Excellence Building with Trees Awards 2003

AIA National Honor Award 2001

AIA Honor Award, Seattler Chapter 2001

Honor Award The Wood Design Awards 2001

### **Literature:**

Holtzman, Anna, Book leaves in a Library in Maple Valley, Washington. Nature in heard above readers's whispers, in: Architecture, Vol. 92,2003,3,pp. 90-93

In awarding Johnston Architects and James Cutler Architects an Honor Award for the design of a new public library for the town of Maple Valley, Washington, jurors emphasized the building's importance as a demonstration that a modest budget need not limit a public building's quality. Built in a small, 1-3/4-acre (0.7-hectare) forest in the midst of a rapidly developing suburban area, the new library is designed to connect library patrons with the living world around them. Transparent walls of wood-framed glazing invite the forest into library spaces. A U-shaped shed roof minimizes the visual impact of the building on its forest side while presenting a "crown" of wooden eaves to a busy arterial road on its urban side. But the library's connection to the forest is not simply visual. The roof's configuration allows it to collect all of the rain it receives to one central open downspout that will release up to 300 gallons (1100 liters) of water per minute into a central gravel pool. Serrated edges of the pool catch organic debris which will serve as nutrients for a moss pool. This vivid expression of the water displaced by the building and the life that water can foster invites patrons to enjoy and ponder their own place in the relationship between built and natural environments.

(<http://www.architectureweek.com>)

Built in the midst of a rapidly developing suburban area, this 12,000 sqf library is designed to serve the long term needs of the community while attempting to preserve the small 1-3/4 acre forest in which it is placed. The book collection, lounges, children's areas, offices and study areas are designed for maximum flexibility while attempting to visually connect the occupants with the living world around them. The "U" shape shed roof was designed to minimize the visual impact of the building/forest side of the building while presenting a "crown" of wooden shed eaves to the busy arterial road to the south. This roof configuration also serves to gather all of

the water to one central gravel pool. The edges of the pool are serrated in order to catch arganic debris that will serve as nutrients for a “moss pool”. By visually displaying the amount of water displaced by the building and the life that it can foster, it is hoped that this wooden building will further connect its users to the place. (Cutler)

## **CWZ Charles Walton Associates, Glendale, CA – USA**

<http://www.charleswaltonassoc.com>

CWA AIA, Inc. is a leader of innovation in library architecture. Since their inception in 1949, CWA architects have designed over 30 libraries in southern California and surrounding areas. They are pioneers in design, transforming a library into a center for educating and enriching the community. CWA was started when Charles Walton was given the project of remodeling the Brand Library and Art Gallery for the City of Glendale in 1949. Through years of prominent civic projects, CWA architects have become experts in architecture, urban planning, and interior design. CWA architects integrate theme or “experience” into library architecture. Their first themed library to be recognized is the Cerritos Millennium Library for the City of Cerritos. The exterior of the building is clad in titanium sheets that reflect the present modern time of the millennium. The interior is divided into multiple sections. Each section boasts a fantastic theme while still fitting together. CWA’s incorporation of themes creates an encouraging environment for local residents to explore. (CWZ)

### **Libraries:**

[Walnut Hill Branch Public Library, Dallas, TX – USA on design](#)

Size 19,700 sqf.

The City of Dallas is pursuing a goal of Silver LEED® Certification for the new library. The sustainable design will incorporate significant energyefficient design components, as well as WI-FI technology for the staff and community. Additionally, because the location is adjacent to an airport, the design team is defining solutions for the acoustical challenges the facility must address. The city would like a notable design. Consequently, LEO A DALY is working with local artist Linnea Glatt to incorporate public art into the design of the building. It will be designed to showcase the art, as well as present the architecture as a work of art itself. This library is located in a diverse area of Dallas. In order to reach out to the community, the client wants the exterior architecture to be recognizable as a library. The facility will be a place for learning, gathering, research, and the arts. The library will be designed as a functional building that is user-friendly and provides a welcoming atmosphere for this diverse group of people. The library will contain a black box theatre that will double as a multipurpose room. Dallas’ Department of Cultural Affairs will work with the library to schedule theatrical events three months out of the year. The library staff will utilize the theatre as a flexible space, auditorium, or multipurpose room the remaining nine months. (Daly)

[Georgia Gwinnett College Library, Lawrenceville GA – USA 2010](#)

(ATLANTA – Feb. 23, 2011) The U.S. Green Building Council awarded the Leadership in Energy and Environmental Design (LEED)® Gold certification to the recently completed Georgia Gwinnett College (GGC) Library and Learning Center in Lawrenceville, Ga. Designed by international architecture, planning, engineering, interior design and program management firm LEO A DALY, GGC’s facility is the first academic library in Georgia to achieve this status and one of only seven Gold-certified academic libraries in the U.S.

“Georgia Gwinnett College is visionary in its approach to education,” said Jerry Voith, vice president and managing principal of LEO A DALY Atlanta. “Both the college and our project team wanted to build a library that not only had world-class facilities but also was committed to its sustainability responsibilities. Achieving the LEED® Gold certification, which exceeded the mandated LEED® Silver goal, is proof of that commitment.”

The new 90,883 square-foot, four-story library was conceived, designed and built as a “Knowledge Center” with public areas on floors two, three and four. In addition to book shelving spaces that can store up to 300,000 volumes, the facility includes an Academic Enhancement Center, a Center for Teaching Excellence, a large multi-purpose lecture room, a quiet reading room, an archives area, 37 study rooms and a café.

The building’s centerpiece is a three-story atrium that houses the Information Commons, an open study area providing a variety of furnishings for individual or group study. The atrium’s curtain wall provides impressive views to and from the central campus. Balconies and windows overlook the expansive atrium area from upper level floors.

“From the start, our students made it very clear that they wanted their college to uphold the highest standards of environmental responsibility and stewardship,” said GGC President Daniel J. Kaufman. “Earning a LEED® Gold certification is a testament to our students’ collective vision, our staff’s dedication to that vision, and the insightful skills of the building’s designers.”

Designing and constructing the facility to LEED specifications proved a challenge as libraries traditionally use large amounts of energy for lighting and for climate control systems to preserve printed materials. Using an integrated design approach and strategy that included high-efficiency lighting fixtures, windows that saturated 75 percent of the interior spaces with natural daylight as well as efficient insulation, the team achieved a 32 percent reduction in energy use.

“LEO A DALY’s team designed a building that is not only beautiful, but functional and efficient,” Kaufman said. “The features that contributed to earning the LEED® Gold certification are impressive. We are very proud of the entire project team’s work.”

As the library is located on a previously undeveloped site, the project team took several measures to minimize the clearance of the site. Pre-construction discussions ensured that the disturbance limits were reduced. Utilizing four stories reduced the building footprint and maximized the conservation of existing natural terrain around the building. This enabled preserving twice the outdoor space to promote biodiversity and provided a high ratio of open space to development footprint.

Recycling and reusing materials during construction was another area of emphasis. More than 95 percent of the construction waste was diverted from landfills to local recycling facilities. Almost 95 percent of the reinforced steel used was recycled from scrap cars. The drywall used on the project is made of 95 percent recycled content and is a by-product of industrial waste material. All the wood ceilings in the building are fabricated from 97 percent recycled materials. Additionally, more than 30 percent of the recycled content was used within a 500-mile radius of the site.

Other sustainable elements included reducing the water use by 40 percent over the typical library through features such as high-efficiency restroom fixtures and occupant sensors; designing drought-tolerant landscaping for more efficient use of exterior water; high indoor air quality; use of natural materials and finishes and using 2.5 percent environmentally-focused products as well as products with low off-gassing.

#### **[Georgia State University, Library Transformation, Atlanta, Georgia – USA 2007](#)**

The design transformation for the library updates, unites, expands, and makes more user-friendly two buildings. The five- and eight-story buildings were built over the last 40 years on the urban campus. The end result, which allows increased reader and collection spaces (using compact shelving), reaches slightly over 300,000 SF. Grouped around a new 150-seat “Learning Commons,” users have access to a great variety of study space options. Exciting glass-enclosed bridges, connecting the buildings at five levels (across a city street), are filled with collaborative and interactive study stations and natural daylight. (Daly)

#### **[Roberts Wesleyan College, Golsisano Library, Rochester, NY – USA 2007](#)**

\$ 10,000,000

Passero Associates was part of the design team preparing documents for this LEED certified building, serving as the civil and site engineering subconsultant to the design architect and Roberts Wesleyan College for the \$10 million Library project. The design of the new Library on an existing parking lot required relocation of the displaced vehicles to an appropriate location with pedestrian access to the campus. The new Library site was selected to become the focal point for the campus with views from multiple locations. Pre-design services included a due diligence study, review of local zoning codes and a utility conditions report.

Complement and elevate the architectural language of the campus; provide robust, invigoration, friendly, and collaborative study environments; and illustrate the educational value and benefits of a sustainably designed library. (<http://www.passero.com>)

According to Roberts Wesleyan College, its \$11 million B. Thomas Golsisano Library has received a silver LEED rating from the U.S. Green Building Council (USGBC). LEED is a third-party certification program and the nationally accepted benchmark for the design, construction and operation of high performance green buildings. The new library is one of the first colleges or universities to receive silver LEED certification in the area. LEED certification was obtained after submitting an application documenting compliance with the requirements of the rating system as well as paying registration and certification fees. "Receiving silver LEED certification is a great honor," said Richard Greer, facilities director at Roberts Wesleyan College. "It reaffirms that we achieved everything we set out to do. We have created a comfortable workspace that is both user-friendly and efficient, all while adhering to the highest environmental standards. The LEED process is rigorous, but worthwhile and we hope that the success of this project will serve as an example to the community." Funding for the library was made possible through a \$5 million contribution from Golsisano. An additional \$7 million was raised from other sources and allocated to both the B. Thomas Golsisano Library and to the original library, which is being renovated, renamed and transformed into the Robert and Mary Hastings Academic Center. The lead architectural firm, Leo A Daly with SWBR Architects, designed the two-story, 43,000 s/f library that incorporates unique design elements, and was built with the environment top-of-mind. The library features an Information Commons comprised of a 1,600 s/f café, a computer lab, group study rooms, large meeting rooms, and wireless capability throughout the facility. It also includes a graduate study room, a reading room, and an upgraded archives and special collections area. LEED promotes a holistic approach to sustainable design by recognizing performance in five key areas of human and environmental health: sustainable site development, water savings, energy efficiency, materials selection and indoor environmental quality. The library incorporates the following aspects: \* Renewable materials such as cork flooring and carpet squares made of highly recycled content and sunflower board cabinetry. \* T-5 fluorescent lighting. \* Geothermal heating and cooling systems (pumps draw water from beneath the earth's surface instead of from outside air to provide heating and air conditioning). \* 100% "green E" power - energy derived from wind or bio fuels. \* Natural light leveraged throughout the building to extend energy efficiency, including white paint and solar shades that are used to reflect the direct rays of the sun and bounce light to specific areas. The combined use of the employed energy-savings systems account for the library being 40% more energy-efficient than what the NYS Energy Code recommends, according to NYSERDA.

(<http://nyrej.com>)

#### **[Palm Beach Atlantic University, Warren Library, West Palm Beach, FL – USA 2007](#)**

Collaborative. Comfortable. Conversational. Casual. These are words that describe the atmosphere of PBA's Warren Library. While there are places for solitary study, the overall atmosphere of the Warren Library encourages conversation and collaboration. The Warren Library is an elegant architectural expression of how we see our University. It is a wonderful space filled with Florida sunshine that draws students to the books, publications, technology and one another. Opened in 2007, the first month use of the library increased 800 percent. It is now the place for students to be at Palm Beach Atlantic University and has transformed our campus forever. (<http://www.pba.eu>)

#### **[Southern Methodist University \(SMU\), Fondren Library Addition, Dallas, TX – 2006](#)**

#### **[Incline Village Library, Incline Village, NV – USA 2005](#)**

#### **Awards :**

AIA Northern Nevada, Award of Citation 2007

ALA / IIDA ( International Interior Design Association), Inaugural Library Design Competition, Honor Award 2006

#### Statement of Design Approach:

The new Incline Village Library is designed to settle into the context of the existing site, respecting the vernacular of the area while incorporating a fresh contemporary attitude into the "Tahoe Style." All roof slopes, color, and building height as well as exterior wall materials are in accordance with the Tahoe Regional Planning Agency (TRPA) Code of Ordinances. The TRPA helps define the requirements for all of the projects in the Lake Tahoe basin.

With a sloped roof silhouette that commands attention from the nearby highway, the new facility incorporates ample amounts of glass to take advantage of the tremendous views in all directions. Exterior wall materials consist of a combination of split-face concrete block at all bearing walls, and cementitious lap siding at the wood framed exterior walls.

The construction cost for the 11,045 square foot facility totaled \$3,600,000.00 for a cost per square foot of \$325.93.

#### Sustainable description

The Incline Village Library incorporates many sustainable aspects.

##### Daylight Harvesting

The library's design focuses on providing excellent daylighting. A ridge skylights that spans the length of the open library space provides much, if not all, of the lighting required for the space during daylight hours. Glazing solutions for the building were well researched resulting in different high performance glazing selected for each orientation.

##### Computer Controlled Systems

Direct Digital Control of the HVAC systems reduces operating cost. The Plumbing system uses the latest in low flow technology.

##### Community Gathering Spot

From the beginning of the design process, one of the original goals of the building was to support the community and become a gathering spot for Incline Village residents. In addition to its repository of books and journals, the facility also offers a classroom, a number of public computer stations, as well as place to relax and socialize, with a café, and numerous "nooks" that form quiet reading and meeting areas. (<http://www.library.unlv.edu/arch/aia/awa2008/b08019.html>)

#### Largo Public Library, Largo, FL – USA 2005

Leo A Daly planned and designed a new public library that would serve the community for the next 30 or more years. Since 1976, the library's collections, departments and programs had grown with the community, but the facility remained the same. Together with Collman & Karsky Architects and Biltmore Construction, we worked with city officials, library staff, and the public to meet the community's needs and provide an architectural statement that reflects its surroundings.

The design of library provides natural light, landscaped reader courtyards, and updated technology. It utilizes sustainable concepts, saving resources for the future. Since opening, public use has increased by 150 percent.

"My sincere appreciation for the quality of the working relationship between the staff of Leo A Daly, the local architectural firm, and the City. Your willingness to listen and be flexible to input helped to create a team whose combined efforts have resulted in a building which is derivative of community input, and integral to its park setting. This library is uniquely Largo."

Barbara Murphey, Library Director Largo Public Library (Daly)

#### Peachtree City Library Renovation and Expansion, Peachtree City, Georgia – USA 2005

34,636 sqf.

Originally built in 1987, the Peachtree City Library had outgrown its 20,000-SF facility. LEO A DALY, through a series of user-interactive work sessions, prepared a "Vision-Study for the Future," including a multidisciplinary facility condition update analysis, space needs analysis, proposed master plan for total renovation, and a 12,000-SF addition, three-dimensional image study sketches of optional solutions, and cost estimates. The challenge was to not only add space and update the facility, but also to create a dramatic and inspirational new sense of place for the public library. The chosen design concept added an expanded children's area in a soft, curved form at the front of the library, with a translucent conical dome, bringing in natural light through the top and simulating a sunlit clearing in a forest. The raised roof canopy that invites and welcomes library patrons not only boldly marks the library entry, but also highlights the coffee shop bistro that beckons the Peachtree City residents to stop and meet their friends for morning coffee or afternoon tea. At night, it glows like a lantern in the park. The library, which is designed to be a highly appealing, stimulating, and unforgettable place for all ages, includes projecting reading bay windows facing the heavily vegetated park, a cozy fireplace reading nook, and a brightly colored teen zone. (Daly)

"I don't think they (the residents) know how beautiful it is...the children' section...is perhaps the library's crown jewel. LEO A DALY designed a plan that meets the 20-year old Peachtree City Library's present needs, while allowing room for future growth. We've come up with a really good building that will stand the test of time." Jill Prouty, Library Administrator, Peachtree City Library

#### Lamar State College Master Plan and Ron E. Lewis Library, Orange, TX – USA 2002

Owner Texas State University System, Size 47,000 SF, Scope Architecture, Engineering, Structural, Engineering, MEP Engineering, Interior Design, Programming

#### **Awards:**

**Award ABC Excellence in Construction Award**

The Lamar State College-Orange campus developed over time through sporadic acquisitions of multiple downtown Orange, Texas properties.

The College challenged the LEO A DALY team with developing a new image and master plan to consolidate its disjointed collection into a fourblock pedestrian campus plan to support its academic mission. To achieve the consolidation, the design team creating a system of pedestrian-friendly walkways and landscaped open spaces to form a unified

campus. Covered arcades border the campus green and provide pedestrian connections to key buildings. During the master plan's development, it became obvious that the multi-property campus also needed a significant building to serve as a central uniting focus as well as an anchor for future

downtown development. The three-story, 43,000- SF Ron E. Lewis Library and Administration building now serves that need. More importantly, it provides the needed new academic campus image while maintaining compatibility with the existing context.

LEO A DALY, along with its subsidiary Lockwood, Andrews, & Newam, Inc. (LAN), provided full A/E services in the implementation of the master plan, as well as Program Management, MEP engineering and structural engineering for the new library, and a new central energy plant. Satisfied with the team's solutions for meeting the university's needs, the client retained the LEO A DALY/ LAN team to complete subsequent Orange projects including Phase II of the master plan improvements. These include redevelopment of the

old library into an office and classroom building, the Green Avenue Plaza renovation and redevelopment, a student center, and an academic

building together with landscaping and parking improvements. (Daly)

## University of Las Vegas, Lied Library, Las Vegas, Nevada – USA 2001

302,000 sqf.

### **Awards:**

2001 Youth Design Jury Award American Institute of Architects, Nebraska

2001 Louis I. Kahn Award for Best Post-Secondary Education Facility American School and University

2001 Best of the Southwest - Outstanding Architectural Project Southwest Contractor

1997 Award for Unbuilt Projects American Institute of Architects, Nevada

A primary objective of the University of Nevada, Las Vegas library was to become a life-enhancing space and act as a central campus meeting venue. As lead designer and engineer, LEO A DALY planned a landmark structure to add definition and clarity to its highly visible position on the master plan and serve as the southwest cornerstone of a proposed academic loop. Using a series of interactive meetings with university leaders and community members, our team, with local firm Welles Pugsley, designed the 302,000 SF library so all four sides would be clearly seen. The design placed importance on library activity and visibility, creating an added layer of campus connectivity and energy. The building is a blend of technology and sustainability, housing 2.3 million volumes. It uses an automated storage and retrieval system that saves nearly 100,000 SF, reducing construction and operational costs. The library harmonizes with its desert environment by harvesting natural daylight to deflect heat, offsetting energy costs. Computerized simulations of daylight conditions were used to maximize natural light. The exterior skin includes low-e insulated glass with perforated aluminum sun louvers and deflectors. Zinc-alloy cladding on “floating” vertical walls and its barrel-vaulted roof deflect heat and contribute to its landmark status. The interiors provide intuitive wayfinding. The core encourages social and technological interaction. As visitors move through the collection toward exterior walls, the atmosphere becomes more private. The stacks are used as filters for sound, providing solitude. (Daly)

“This is a magnificent building, beautiful, functional, and we were so pleased with our partnership with LEO A DALY.”

Dr. Carol C. Harter, Former President, UNLV

## Pahrump Community Library, Pahrump, Nevada – USA 2001

Size 24,000 sqf.

LEO A DALY provided planning and bond issue assistance to the City of Pahrump for a new public library. The City had outgrown its 5,000-SF library, which housed the adult library, children’s library, offices, bookbinding and repair, employee kitchen, restrooms, checkout desks, computer areas and other amenities. The City was in need of a permanent home for the Pahrump Community Library, and was given two acres of land just north of the city cemetery. In 1998, voters approved a \$3 million bond issue for the new library, which included funding for paved parking, sewer, water and power and landscaping. The new Pahrump Community Library is a gathering and research facility for the people of Pahrump Valley. The 20,000-SF facility makes the entire library collection available to patrons, while providing much needed community meeting and conference space. The year following the building’s completion, LEO A DALY was retained to design a 4,000-SF, residential style library annex. (Daly)

## Council Bluffs Public Library, Council Bluffs, Iowa – USA 1998

Size 70,951 sqf.

### **Awards:**

Design Award Programm, AIA Nebraska 2000

Youth Design Award 2000

LEO A DALY designed this 68,500-SF Prairiestyle library to replace the city’s Carnegiestyle circa 1905 downtown main library. Its environmentally-friendly brick exterior and insulation and finish system (EIFS) was carefully combined with wide roof overhangs to provide an inviting atmosphere relating to adjacent residential neighborhoods and downtown structures. The interior of the two-story structure is flexible and open to accommodate changing technology, with the main focus being a dramatic central atrium that houses the central service desks. Providing three times the space of the old library, the new library uses the latest technology for book retrieval and check in. In addition to book, magazine, video, and computer station spaces, the program accommodates a large children’s area, public meeting rooms and volunteer gift shop. (Daly)

“We are quite proud of our new facility. The Library is a spectacular monument to the City. It is truly a great achievement and it would not have been possible without the professional skill and dedication, which you [LEO A DALY] gave to the project.”

John P. Nelson, Community Leader Library Journal Dec. 1999

## Dattner Architects, New York – USA

<http://www.dattner.com>

### **Libraries:**

## Bronx Library Center, New York Public Library, New York, NY – USA 2001 – 2005

78,000 sqf.

### **Awards:**

Building Design and Construction Building Team Silver Award

New York City Green Building Award Honorable Mention

Environmental Design + Construction Excellence in Design Award

International Interior Design Association / Illuminating Engineering Society Award of Merit

GE Edison Lighting Award of Excellence

GE Edison Lighting Award for Sustainable Design

The new Bronx Library Center replaces the former Fordham Branch Library. The facility provides expanded circulation and reference collections, cutting-edge information technology, a full range of education, business and technology training for all ages, literacy classes, and English language proficiency programs. The BLC also houses the Latino and Puerto Rican Cultural Center, with extensive bilingual collections, educational and cultural programs, and multi-media exhibits. Key design concepts include maximizing natural light, minimizing internal circulation, providing clear lines of sight, establishing an appropriate planning module for efficient stack layout, and providing an adaptable open plan. Each floor is conceived as a rational, rectangular public space surrounded by service, circulation and smaller program spaces fitting into the irregularities of the site. Planning follows a basic daylight strategy: Services at the relatively enclosed western side, books and other collection items in the middle and most of the seating in the glazed day-lit areas at the perimeter. Individually designed public stairs provide different types of processional experience between floors. They make circulation through the building an important part of the visitors experience, and highlight the connections between the various parts of the library collection distributed throughout the building. Bronx Library Center

DattnerArchitects The project received LEED® Silver Certification from the United States Green Building Council. It is the first public building in New York City and the first library in The New York Public Library system to receive LEED certification (Dattner)

## **Davis Brody Bond Aedas, New York – USA**

<http://www.davisbrody.com>

Davis Brody Bond is now **Aedas** <http://www.aedas.com>

### **Libraries:**

#### **Benning Neighborhood Library, Washington, DC - USA 2011**

Benning Library is located on a sloped site along Benning Road, N.E. The building is terraced into the terrain allowing access from both Benning Road at the upper level and from a commercial shopping area at the lower level. The two floors of the 22,000 square foot facility are connected by a public stair inside the building, creating a space which encourages pedestrian circulation through the library in order to connect one street elevation to another. Benning Library utilizes a warm color palette of earth tones and a copper panel facade to complement its residential setting. Approximately 315 copper panels chosen for the exterior reflect the sun and provide a warm glow in the late afternoon. The completed facility includes community spaces on the lower level including a 100-person multi-purpose room, two 12-person conference rooms and a public gathering and exhibition space. The upper level of the library houses the library's collection, which on opening day included 40,000 books, DVDs, CDs and other library materials. The library has space to allow the collection to expand to up to 80,000 items. Additionally, the upper level features separate reading areas for adults, teens and children, as well as the children's program area. Five small study rooms offer opportunities for quiet study or tutoring sessions. The library has 32 computers for public use. Designed to meet LEED Silver Certification, Benning Library incorporates a vegetative green roof, a displacement air system, solar control and daylight management and extensive use of recyclable and renewable materials. The quality and nature of light was an important factor in the design approach. The library is situated in a bowl-like condition with ample southern exposure. (Davis)

#### **District of Columbia Public Library, Benning Neighborhood Dorothy I. Height Library, Washington, DC – USA 2010**

The library received LEED Gold Certification from the U.S. Green Building Council for environmentally sustainable design. It has won a number of other design awards, including:

- Building of America Award 2010
- Associated General Contractors Washington Contractor Award 2010
- National Association of Contractors and Builders Proclamation Award 2010
- Developers and Builders Alliance Community Advancement Award, Best Developments of the Year, USA & Canada 2010
- North American Copper in Architecture Award, New Construction 2010
- Icestone Installation Award, Commercial Interiors 2010
- Washington Building Congress Craftmanship Award for Special Construction – Thermal and Moisture Protection Category 2011

The District of Columbia Public Library opened the new 22,000 square-foot Benning Neighborhood Library on Monday. It is the first of five new libraries to open this year and one of two designed by Davis Brody Bond Aedas. In addition to celebrating the library's opening, the event showcased the district's rapidly improving library system. The new \$12 million library, targeted for LEED Silver Certification, houses community space on the first level with library functions above connected by a staircase. Nestled into the site to maintain the scale of the mostly residential buildings around it, the building incorporates many sustainable features including a vegetated roof, solar and daylight controls; and extensive use of recycled and renewable materials. At the building's opening ceremony, Chief Librarian Ginnie Cooper said, "New buildings only scratch the surface of the library's transformation. More people are making their way to the D.C. library for the improved book collections, the great author talks and workshops, and the robust Internet connection. We are excited that people are becoming aware of the district's top-notch library." Additional Libraries will also open this year in nearby Anacostia (April 26), Deanwood (summer), Georgetown (October) and Tenley (December). The district is also moving forward with two new libraries designed by London-based architect David Adjaye. Sharon McHugh, U.S. Correspondent

#### **Watha Daniel/Shaw Neighborhood Library, Washington, DC - USA 2010**

22.800 sqf, \$ 12.000.000

In 2007, Davis Brody Bond Aedas was commissioned to design two new branch libraries, as part of the DC Public Library's initiative to develop a first-class, state-of-the-art neighborhood library system. Each library is programmed for 20,000 square feet of space, which, in addition to the traditional needs of a neighborhood library also includes public meeting space for the local community which can be accessible independently from the library proper. The DCPL has a mandate to build sustainable facilities, and our charge has been that these libraries should achieve Silver LEED Certification. The Watha T. Daniel / Shaw Neighborhood Library is located along Rhode Island Avenue at 7th Street, on a triangular urban site near Howard University. A wide variety of functions surround the site, including multi-family residential, commercial, educational and religious. The building marks this important intersection as a civic place. The building will fill the site, and be composed of three floors: one below grade and two above. The entry plaza at the east end of the site welcomes the public to the library. The main lobby provides access to the lower level which houses community spaces including a multi-purpose room for up to 100 people, as well as access to the library proper. At this main ground level are located the main service point and staff area for the library, as well as new materials and catalog stations for the general collections, and the children's library. The upper level of the library will house the bulk of the adult collection, including reference and periodical sections, and adult/young adult reading rooms. There will be online catalogs dispersed throughout the floor, with access to the DCPL electronic resources available at all locations. Conference rooms and individual study rooms allow for collaborative work in a non-disruptive setting. The library incorporates a number of sustainable features, including passive solar design and daylight management, displacement air system and extensive use of recycled or renewable materials. (Davis)

#### **Health Sciences Learning Center University of Wisconsin, Madison, WI – USA 2004**

The University of Wisconsin Health Sciences Learning Center is the second phase of a major consolidation of Health Sciences learning and research activities at the western end of the Madison campus. The 350,000 square foot building serves the Schools of Medicine, Nursing and Pharmacy, and is also a resource to researchers, clinicians and patients in the adjacent Hospital and Laboratory facilities. The major components of the Health Sciences Learning Center include: Health Sciences Library • Alumni Auditorium (350 seats), • Lecture Halls and Distance Learning Classrooms, • Classroom, Seminar and Group Study Facilities, • Computer Laboratories and Support, • Specialized Suites for Clinical Skills Education and Testing, • Administrative Offices for the School of Medicine, • A Lounge, Cafe and Bookstore, • Underground Parking for 220 Cars, • Bike Parking for 250 A major goal of the building is to foster interdisciplinary exchange, team work, and a sense of community for students in the health sciences. Student study space is organized as a series of clustered communities, including private study rooms, lockers, mailboxes

and lounge areas. The library and group study areas are organized around a central atrium, which introduces natural light and reinforces a sense of community within the building. (Davis)

#### **The Learning Resource Center Chesapeake College, Wye Mills, MD – USA 2002**

The Learning Resource Center at Chesapeake College, a rural campus on the eastern shore of Maryland, is a new facility that enabled the consolidation and expansion of traditional and new learning resources at the College. These resources include: print collections, electronic information, and learning assistance facilities. To create an integrated mix of resources and staff services that accurately reflects the needs of faculty and students at Chesapeake, compartmentalized functions such as “library” and “computer lab” were avoided. Instead, the program for the new Learning Resource Center is broken down into major components which include: Library Collections, Library Services, Electronic Resources, Labs and Classrooms, Faculty Development, Learning Assistance (Tutoring and Writing Center), Special Collections, and Building Support. The siting and development of the building afforded the College an opportunity to further develop a central campus quadrangle. The Learning Center’s massing also projects into the space of the quad to form both a physical and implied center of learning. (Davis)

#### **Wallach Division of Art, Architecture, Prints & Photographs Restoration, The New York Public Library, New York, NY – USA 2001**

The recently renovated Wallach Division is composed of three separate groups: the Art and Architecture collection, the Prints collection and the Photography collection. It houses original works of art as well as reference materials covering painting, sculpture, drawing, printmaking, photography, and the history of architecture and design from prehistoric times to the present. The renovation dramatically increased the public and staff space of the division. Collection space was centralized and expanded and a more efficient flow was created between the reference staff, the readers, and materials through the redesign of reference areas. The reconfiguration of staff work spaces into discrete areas opened up the space within the division’s reading rooms for Prints and Photography and for Art and Architecture. The reading rooms became wired for laptop computers and internet access. The Art and Architecture Collection is a conventional library facility, composed mostly of print materials that are available for view by the general public. The Prints and Photography Collections serve more curatorial functions and contain objects that require specific and controlled environmental conditions. The Prints collection contains a number of different storage facilities to provide for the different objects: flat files, boxes and file drawers. The Photography Collection is currently undergoing a major digital transformation and will include a digital library of its collection, enabling the collection to be viewed online. The Photography and Prints Collections offer limited access to their resources and are available only to those that apply to use these facilities. Size: 14,000 Square Feet. (Davis)

#### **Lila Acheson Wallace Library Renovation, The Juilliard School, New York, NY – USA 1999**

Located on the fifth floor of the school’s well-known 1960 building, the Music Library at the Juilliard School had not been renovated since its original construction. In addition to an overall refurbishment of the Library, the client desired to introduce data and power to all reader seats, provide small group listening and study areas, to create an environmentally controlled rare book room, to expand staff work space as well as to increase capacity for print collections. Due to the minimal amount of additional floor area available for program expansion, the renovation incorporated an underutilized organ rehearsal studio and a music practice room, which were converted to house rare books and manuscripts. Additional space for staff and collections was found by clarifying circulation pathways, utilizing compact shelving, replanning underutilized study space, and strategic expansion into the main open space of the library. The major design feature is a fourteen-foot freestanding wall, clad in cherry, which contains exhibit cases. This wall provides a sense of definition, a visual focus at entry, and a compositional balance to the open stair and railings that were retained from the original scheme. Upstairs, new stacks and a listening library reinforce the spatial organization around the open two story reading room. All library tables and carrels were custom-designed to accommodate accessible pathways for power and data, and to complement the character of the new space. (Davis)

#### **The Langston Hughes Community Library and Cultural Center, The Queens Borough Public Library, Queens, NY – USA 1999**

##### **Awards:**

Building Award for Excellence, Queens County Builders & Contractors Association, Inc. 1999

##### **Publications:**

Oculus, December 1, 2000, DDC Updates Emphasize Quality Design, Fair Pay

The Langston Hughes Community Library & Cultural Center was founded in 1969 to meet the local community’s need for an educational and cultural center that explored the Black Experience. Its centerpiece is the Black Heritage Reference Center, the largest circulating collection of books, magazines and artifacts on Langston Hughes in New York. In the late nineties, the collection outgrew its former storefront building, and Davis Brody Bond designed a facility to accommodate its ever-expanding collection and to provide for future growth in functions and services. The two-story building’s ground floor contains the library – a general circulation area, a Black Heritage Reference Room and a children’s library. Located on the second floor are the administrative offices as well as community-based facilities that include an art gallery and a multi-purpose hall for concerts and lectures. The adjacent outdoor plaza is designed for cultural events and community activities. The entrance is distinguished by a 28-foot-high wall etched with selected writings and an image of Langston Hughes. This powerful image and the words are intended to draw in visitors, establishing the library as a place not only to read books, but also to explore one’s heritage. (Davis)

Library Race: Charting Speed, Amenities & Attitude

The New York Public Library, completed in 1911, is a classical building with a unique plan, inspired by the library's first director, Dr. John Shaw Billings. Billings placed the monumental reading room on the top floor to maximize light and air, directly above 8 levels of book stack storage. Over the years the original space for readers diminished as other functions such as copy services, microforms and card stack storage encroached on it. Layers of dirt, water damage, and heavy usage left the reading room looking makeshift and tired. In addition to the need to preserve the reading room, the Library faced an increasing demand to provide access to electronic information. To meet this mission, Davis Brody Bond conducted a meticulous restoration which returned the room, one of the largest uncolumned rooms in the nation, to its former grandeur and function. The team of restoration architects adapted the room to maximize efficiency of library service while maintaining its historic and aesthetic integrity. Improvements to The Rose Main Reading Room include expanded capacity, new electronic resources, faster and more reliable book delivery, a multimedia viewing area, a self-service copy center, improved access for readers with disabilities and a reorganized open-shelf reference collection. Thirty of 42 original historic tables were carefully restored and adapted to allow most user stations to access data and power for library equipment and personal laptops. This project preserved one of New York City's most beloved spaces, restoring it to its original glory, while at the same time optimizing access to the collections it serves, and introducing the infrastructure to provide the latest in electronic, on-line services. Architectural Record February 1, 1995 Cable-Car College

Baruch College Journalism Program Juni 1, 1994 The New Campus Library and Technology center

Architectural Record February 1, 1995 Cable-Car College

The Baruch College Newman Library and Technology Center is the first part of a master plan designed by Davis Brody Bond to introduce much needed facilities onto the College's urban campus. Baruch College has one of the largest undergraduate business schools in the country, made up of student body which commutes daily to the school. To create the new library, the architects completely renovated an 1894 industrial building designed in Italian Renaissance style. The original Pompeian brick, terra cotta, and pink New England limestone facade was restored, while only the structural columns of the building are part of the new interior. The 330,000-square-foot building is divided into nine floors and includes, in addition to the library, a conference center, a state-of-the-art computing and technology center, a media center, and the offices of enrollment. A grand staircase in the two-story entrance lobby leads to the main floor of the library which is organized around a five-story skylit atrium created from an existing lightwell. The atrium, as well as most of the other library interiors, is paneled in cherry wood and topped by a 70-by-90-foot skylight. The new library accommodates 525,000 volumes. Since this facility opened, library daily attendance figures have tripled and the circulation of materials have more than doubled. (Davis)

**Biddle Law Library University of Pennsylvania, Philadelphia, PA – USA 1994**

In 1987, the University of Pennsylvania hired Davis Brody Bond to undertake a master plan for the expansion of its Law School. The first phase in implementation of this plan was construction of the new Biddle Law Library and Tannenbaum Hall. With the expansion, the School wished to maintain its small school atmosphere evoked by a quadrangle that contained the existing Law School facilities. This sense of cohesion was preserved by extending the courtyard with the addition of a U-shaped building that relates in scale and style to adjacent historic buildings. A major goal of the Library was to complement the existing campus buildings without diminishing their historic character. Its red brick and buff limestone echoes the materials on existing buildings while the simple details on its facade stand in contrast to those of original buildings, which are richly decorated. Round windows and double-height reading rooms, features from the original buildings, further provide a connection to the old Law School. The interior is planned to offer a variety of spaces for reading and study in a modern and flexible facility while preserving some of the grandeur of a traditional library. (Davis)

Bulletin of the Medical Library Juli 1, 1995 Technical Scale and high-level detail:

Vanderbilt's award winning Eskind Biomedical Library

American Libraries April 1, 1999 Honoring Advances in Architecture: The AIA/

ALA Building Awards

The Eskind Biomedical Library at Vanderbilt University is the "crown jewel" of the Medical Center Campus. It serves multiple purposes including teaching, clinical work and research and houses services that allow students and researchers to access information and to seek assistance from trained professionals in the use of information. Designed to mitigate the collegiate-scaled main campus and the overwhelming density of a modern academic medical center, the library serves as the gateway to the campus. The top floor is occupied by the Center for Biomedical Informatics, which is responsible for integrating the Medical Center's information systems and developing new applications for computers to medical research, education, and practice. The primary design challenge was to provide a building infrastructure to allow the smooth migration of generations of technology from the Center for Biomedical Informatics down to the Library floors where users could operate them. A transparent glass curtain wall introduces a light, delicate, and transparent facade and unifies the building's composition. The stacks, housed in clearly organized blocks, provide an efficient and highly functional arrangement for print materials while reading and study areas are located in open areas along the glass wall, near natural light. Throughout the Library a range of spaces was developed to encourage collaborative work, from group study rooms with monitors and white boards, to small informal areas. This library acknowledges that it serves as both a repository for traditional print media and as a center for the communication of electronic information. Throughout the design, the goal was to express both the traditional and familiar role of the library and the exciting potential of new technologies. The

Eskind Library is a dynamic addition to the Vanderbilt campus, both as a facility for information services, and as a symbol of the institution's future in the medical sciences. (Davis)

#### **[Astor Rare Book and Manuscript Reading Room, New York Public Library, NY – USA 1993](#)**

The Brooke Russell Astor Rare Books and Manuscripts Reading Room is a specially designed preservation environment that contains the New York Public Library's important rare-book collections. Once scattered throughout the Central Research Branch, they are now housed together in the former History and Genealogy Room, which is now a secure research space conditioned for the storage of rare books and manuscripts. The Rare Books Collection is now comprised of a storage vault and a reading room. The storage vault stands directly below the reading room and access is available by stairs and a dumbwaiter. Environmental control and theft prevention were the two main concerns in the design. Sophisticated HVAC units were installed to maintain the climate as well as environmentally sensitive lighting to prevent any damage to the books and manuscripts. The archival steel bookcases, designed to fit into the existing mezzanine structure, are completely sealed and finished with a powder coating to prevent out-gassing. A tinted UV-filtering glass is used for the glass doors. Library patrons are not allowed direct access to the cases, which are locked and kept secure. New furniture for the room includes illuminated oak study tables, which have built-in outlets for laptop computers. These individual tables, rather than the usual long ones, confine research material to a smaller area and make visual supervision of these precious materials easier for librarians. Other woodwork, such as the main counter and the original Carrère and Hastings chairs, was rehabilitated. (Davis)

##### **Libraries:**

#### **[Espanola Public Library, Espanola, NM – USA on design](#)**

This 16,000sf library will replace Espanola's existing outdated and undersized library with a modern facility that meets the community's needs. Phase 1 Preliminary Design focused on evaluating 5 potential sites for the new facility, defining the project goals and space program, and creating a preliminary site plan and floor plan. D/P/S is working closely with the Coalition for a New Library as well as providing regular updates to City Council and facilitating public input meetings. The new library will enhance the Plaza de Espanola area, and provide room for collection and computing expansion as well as needed areas for Children and Teen areas, a Cultural/Historical Alcove, and public meeting space. The library will be designed to enhance the image of Espanola, pursue LEED certification, plan for future expansion, and promote local culture, artists, and materials. (Dekker)

#### **[NMJC \(New Mexico Junior College\) Pannell Library, Hobbs, NM – USA 2010](#)**

3,800,000 \$

This renovation of a 30,000sf existing library focused on increasing space efficiency and thoroughly upgrading the building to respond to concerns about safety, accessibility, and sustainability. New classrooms, computer labs, offices, and support spaces will be created on the second floor. On the first floor, fixed stacks will be replaced with high-density mobile shelving units to provide additional collection capacity. Library support spaces will be renovated, the main circulation desk will be replaced, and a periodicals desk will be added. Restrooms, mechanical systems, ceilings, lighting, and the sprinkler system will be upgraded to meet current needs. A small building addition will provide a new entry vestibule, stair, and elevator to address code issues. This addition updates the look of the building with curtainwall, metal panels, and a metal canopy, all of which relate to the material palette of other recent campus buildings. Existing glazing is also being replaced to improve maintenance and energy conservation. (Dekker)

#### **[UNR \(University of Nevada, Reno\) Knowledge Center, Reno, NV – USA 2008](#)**

Size: 295,000sf

Dekker/Perich/Sabatini served as the lead design firm on the project and collaborated with Hershenow+Klippenstein (architect-of-record) throughout all project phases. Designed as a library of the future compatible with the neo-Jeffersonian style of the university's original campus, this building combines traditional library functions with technology classrooms, video-conferencing facilities and specialized computer labs. UNR has embraced the idea of the library as a comfortable space for both students and the public to spend long periods of time and the building features lounge areas, public meeting rooms, a café and a 13,000sf automated storage and retrieval system capable of providing 20 years of collection growth in a compact footprint. The building design incorporates efficient use of natural and artificial light: a combination of curtain wall, shading devices, light shelves, atrium glazing, and roof skylights to provide well-controlled natural light for a large portion of the public space, and an automated electric lighting control system to manage energy use and occupancy sensors to maximize efficiency. (Dekker)

#### **[San Juan College Learning Commons, Farmington, NM – USA 2005](#)**

This new Learning Commons serves as the new 'front door' to the San Juan College campus. The concept brings together the media center, art center, and student activities center to create a hub of intellectual and social interaction on campus. Traditional library functions are combined with multimedia resources and student amenities in a relaxed atmosphere. The wireless network and mix of study and lounge furniture allows students to work and socialize flexibly throughout the building. Low, widely spaced book shelves reinforce the open, spacious feeling of the library. Over 9,000sf of the existing building was renovated to house the bookstore operations and other spaces, and a 33,000sf two-story addition accommodates the remainder of the program. The first floor focuses on student activities, such as student club stations, recreation areas, gaming spaces, and student offices. The second floor houses library collections, seating, computer labs, and study rooms. (Dekker)

#### **[Paseo Verde Library, Henderson, NV – USA 2002](#)**

##### **Awards:**

AIA Nevada Excellence Design Award 2003

This 40,000sf library for the Henderson District Public Library System (HDPL) houses 100,000 volumes of general collections and 50,000 volumes of children collections. A large reading room on the north end provides patrons a separate quiet area with views of the entire Las Vegas valley. A secure courtyard can be used as a programmable space. Several additional features encourage greater community and individual use, such as a young people's library, a community meeting room, and a coffee/sandwich shop. The shop has indoor and outdoor seating and is a popular hangout, particularly during the lunch hour. Also incorporated were numerous private study rooms and computer labs. Daylighting is introduced through clerestories and high volumes, and stack and reading spaces are protected from direct solar exposure. The technological infrastructure includes a wireless network and a self-checkout system. Numerous computer stations are placed strategically around the library to provide accessibility and privacy. (Dekker)

#### **[Whitney Library, Las Vegas, NV – USA 1994](#)**

This branch library for the Las Vegas-Clark County Library District is organized around three distinct areas: Adult Reading, Young People's Library, and Performing Arts. All of these areas spin off a central control area which unites the circular form of the young people's area with the more linear plan of the other areas. Community use is encouraged through a 300 seat public auditorium, an art gallery and a special collections room dedicated to materials relating specifically to the American Southwest. Also included are several private study rooms, meeting rooms and computer rooms. To create an identifiable public image along a major, high speed city artery, the building is brightly colored with an introspective wall canted slightly to the plane of the street. This

attracts the eye without using the commercial signs associated with strip shopping. The building incorporates indirect daylight and clerestories to bring natural, protected daylight into the stack and reading areas. (Dekker)

## **designLAB architecture, Boston – USA**

<http://www.designlabarch.com>

### **Libraries:**

#### **Grosse Pointe Public Library, Grosse Pointe Farms, MI – USA on design**

The Grosse Pointe Public Library in Grosse Pointe Farms in Michigan is an exemplary work of modern architecture, designed by renowned 20<sup>th</sup> Century architect, Marcel Breuer. The library constructed in 1953, with its 17,000 Sqf. distributed on two stories enclosed in an unadorned, simple, brick facade and exposed steel elements, is the only Breuer building in the Detroit, Michigan region. designLAB architects, the winner of an international design charrette organized by the library Foundation to save the structure, has created a restoration and addition scheme for the Breuer library that will allow the GP library board to move forward with plans to keep the Modern treasure while still fulfilling their current & future needs. This project will set a precedent for the future of other modernist structures at risk of being destroyed. (designLAB)

by John Gallagher

It looks as though a library designed by Marcel Breuer in Grosse Pointe Farms, Michigan, will be spared the wrecking ball. The local community library board met last night to evaluate an expansion plan designed by Boston-based designLAB architects. The scheme retains the original, 1953-vintage building and doubles its space with a sympathetic, Breuer-inspired addition. Although the board is not scheduled to vote on the scheme until October 22, momentum has decisively shifted away from an earlier push to demolish Breuer's only Detroit-area building. Breuer was already famous for his furniture and residential designs by the early '50s when he crafted the library. It is a small but elegant structure, two stories tall, with a front facade of unadorned brick that echoes traditional building materials in Grosse Pointe. Generous fenestration allows daylight into a double-height main reading room that features exposed structural elements and beams. Members of the library board had recently complained that the 17,000-square-foot structure lacked adequate space for administration, computers, and children's activities—prompting discussions last year about whether or not it should be razed in favor of an all-new facility. But when Laura Bartell, the then-president of the board, stated publicly that Breuer's building was "pretty undistinguished" and not worth preserving, her remarks prompted a flood of e-mails and local protests. The library hired designLAB in June to develop a scheme for saving the building. Robert Miklos and his team from designLAB propose adding onto the rear of the current building in what is now a parking lot, creating something of a mirror image of Breuer's structure. The new space would include an interior courtyard, a gesture that Breuer included in many of his houses but didn't have room for in the original library. The children's reading area will be four times the size it is now, and there will be expansive space for computers and administration. A new underground garage will relieve parking problems. In presenting this scheme to the community last week, Scott Slarsky of designLAB explained that his firm conducted extensive research in Breuer's archive at Syracuse University, trying to imagine how the celebrated architect would approach the project. He described the attempt to channel Breuer's spirit and signature style as "séance architecture." Assuming that the library board approves designLAB's scheme later this month, it must next seek municipal approval and raise the \$24 million necessary for construction. Groundbreaking could occur in the spring of 2009. (<http://archrecord.construction.com>)

#### **Skillman Library, Lafayette College, Easton, PA – USA 2005**

Situated at the center of the pastoral Lafayette College campus this building was reconceived as a "studio for learning" rather than a traditional library. The original 1960's era Skillman Library presented uninviting concrete walls to the campus green. The challenge of the \$17.5 M project was to convert this existing library into an inviting landmark that would serve as an intellectual and social protagonist of campus life. The 110,000 sqf. addition and renovation project provides a café, formal and casual reading /information/ meeting areas, group study rooms, classrooms. Computer and media labs and an art gallery. Students work collaboratively in this open environment with learning resources that are convenient to work spaces. As a result, the library has become the most popular place on campus for both serious study and casual student gatherings. **In 2006, the building was awarded the AIA National Honor Award for Interior Architecture, as well as two AIA chapter awards.**

Robert J. Miklos FAIA design principal, Whitney M. Hudson and Scott Slarsky project designers while at Ann Beha Architects. see also: [Ann Beha](#)

## **Dewberry, Fairfax, VA – USA**

<http://www.dewberry.com>

A library is one of the most significant buildings within a community. Every library is different and unique, and deserves an image reflective of the community's image and goals. Library design offers the challenge of accommodating high and varied usage types, meeting the expectations of the community, and anticipating future technologies while being good stewards of the environment. The new library must provide something and someplace for everyone; it is the "Third Place" within the community. PSA-Dewberry is a library specialist, having completed over 220 libraries across the country. The library team is made up of LEED Accredited Professionals providing pre-design, planning, building design, interior design and thematic interiors for new construction, renovation/expansion and reimagining of existing facilities for clients throughout the country.

### **Libraries:**

#### **Renner Academic Library and Learning Resources, Elgin Community College, Elgin IL – USA 2012**

Project Costs: \$21.5 million, Architect: Dewberry, Engineers: MEP/FP-KJWW Engineering, Interiors: Dewberry, Construction: IHC Construction

Standing in the beautiful Renner Academic Library and Learning Resources at Elgin Community College (ECC), it's hard to imagine that the college's old library was so small that three of them would fit inside the new facility. But that was something ECC officials became all too aware of after the former library was cited as "unsatisfactory for students' needs" during a 2006 accreditation visit by the Higher Learning Commission. That library, which opened in 1970 as part of the then new Elgin Community College campus, was designed to serve several thousand students, not the more than eleven thousand that were using the undersized facility more than thirty-five years later. "While our students were receiving high quality service from our librarians and staff, our library space wasn't providing an appropriate learning environment," says ECC President David Sam. "It was time for a change, and that's why we made a new library a top priority." Voters agreed, approving the \$178 million referendum in April 2009, which included \$26 million for the new library.

Construction began in March 2010 and the new facility opened in January 2012. The overall project cost \$21.5 million, coming in \$4.5 million under budget. Named for the college's first president, Gilbert I. Renner, the Renner Academic Library and Learning Resources is a 57,000-square-foot marvel of practical, convenient learning spaces, tasteful architecture, and thoughtful sustainable elements.

### **Independence Park Library, Baton Rouge, Louisiana – USA 2011**

PSA-Dewberry as part of The Design Collaborative has been selected to design the 115,000-square-foot library for the City and Parish of East Baton Rouge. The library has been targeted for LEED Gold certification and is scheduled to open in late 2011. It will include a meeting room that will accommodate up to 300 people, multiple conference rooms, special areas for children and teens, study rooms, a technology lab, and a quiet reading room. An adult collection area will also house a room for genealogical studies and local history. Services provided included master planning through design and construction documents. (Dewberry)

### **Diller Scofidio + Renfro, New York – USA**

<http://www.dsrny.com>

#### **Libraries:**

### **The Broad: Art Museum, Los Angeles, CA – USA 2013**

Die Stadt Los Angeles hat ein großzügiges Geschenk erhalten: Die beiden Philanthropen und Kunstsammler Eli und Edythe Broad investieren 200 Millionen Dollar in ein neues Kunstmuseum. Der Neubau soll in Downtown Los Angeles entstehen und die Kunstsammlung der Broads, bestehend aus 2.000 Werken moderner und zeitgenössischer Kunst, beinhalten. Gestern stellte das beauftragte Büro Diller Scofidio + Renfro (New York) in L.A. die Pläne für den Museumsneubau vor. Die Broad Art Foundation wird sich auf der gegenüber liegenden Straßenseite der Walt Disney Concert Hall von Frank Gehry und des Museum of Contemporary Arts, kurz MOCA, auf der Grand Avenue im Herzen von L. A. erheben. Die Architekten beschreiben ihren Entwurf mit zwei Schlagworten: „the veil and the vault“, was so viel bedeutet wie „Schleier und Gewölbe“. Beim Betrachten der Renderings wird klar, wovon die Architekten sprechen. Beide Gestaltelemente verflechten die zwei vorgesehenen Nutzungen des Neubaus miteinander: Im Obergeschoss die weitläufigen Ausstellungsräume, die überdacht werden von einer transluzenten, aus Wabenformen bestehenden Deckenstruktur. Darunter ein sich auf zwei Geschossen ausbreitender, massiv wirkender und von Gängen und Kanälen durchzogener Gewölbekörper, in dem sich die Funktionsräume der auf Kunstbücher spezialisierten öffentlichen Bibliothek mit Archiv-, Magazin- und Büroräume sowie Lobby, Bookshop und Cafeteria befinden. „Unser Ziel war es“, so Elizabeth Diller, „neben der viel größeren, überschäumenden Architektur von Gehrys Concert Hall bestehen zu können. Im Gegensatz zu der glänzenden, reflektierenden Fassaden der Concert Hall wird „The Broad“ eher porig und löchrig wirken. Die schleierartige Fassade soll eine Rolle bei der Reurbanisierung der Grand Avenue spielen, indem sie Blicke zwischen Innen und Außen zulässt und sich eben nicht hermetisch von der Außenwelt abschirmt.“

Dubbed „the veil and the vault“, the museum’s design merges the two key programs of the building: public exhibition space and the archive/storage that will support The Broad Art Foundation’s lending activities. Rather than relegate the archive/storage to secondary status, “the vault” plays a key role in shaping the museum experience from entry to exit. Its heavy opaque mass is always in view, hovering midway in the building. Its carved underside shapes the lobby below and public circulation routes. Its top surface is the floor of the exhibition space. The vault is enveloped on all sides by the “veil”, an airy, cellular exoskeleton structure that spans across the block-long gallery and provides filtered natural daylight. The museum’s “veil” lifts at the corners, welcoming visitors into an active lobby with a bookshop and espresso bar. The public is then drawn upwards via escalator, tunneling through the archive, arriving onto an acre of column-free exhibition space bathed in diffuse light. This 24’ high space is fully flexible to be shaped into galleries according to curatorial needs. Departure from the exhibition space is a return trip through the vault via a winding stair that offers glimpses into the vast holdings of the collection. (diller)

### **The Juilliard School, Renovation / Expansion, New York, NY – USA 2009**

The Juilliard School now includes 45,000 square feet of new facilities and 50,000 square feet of renovated spaces. The renovation and expansion reinterprets the identity of the original building while maintaining a clear distinction between the old and the new. The redesign of Juilliard turns the school inside-out. The activities within the halls, studios, and other education spaces are now revealed to the rest of the city; the once hidden practice rooms of Juilliard become performance spaces for passers-by on the street. The structural limitations of the existing facility were used as an opportunity to create an identity with far greater visibility for Juilliard. Since the expansion could not be built above the school, it took the form of a three story volume that hovers over a public plaza along Broadway (building out instead of up; see image 1). The public spaces below the expansion now experience 24 hours of public life—people eat, lounge, play and are provided opportune moments to observe the inner workings of Juilliard (one of the dance studios protrudes into the public space—like a billboard—providing a rare glimpse into the practices of the school; see images 2 and 3). 1. A new three story volume “hovers” above a public plaza. 2. New dance studio can be seen from the street. 3. New dance studio. Specialized Spaces: Juilliard’s new interior spaces have highly technical needs for acoustic isolation and acoustic flexibility for a variety of sound requirements. They are both private education spaces and spaces for public performance, and walk the link between rough and ready and elegant and refined. In the black box theater (image 4), wall cladding is perforated plywood. An inexpensive and readily available material, the panels can be nailed and clamped to, repainted and replaced with ease. The perforations allow for acoustical absorption and are backlit, providing an elegant and consistent backdrop for performances that do not require a set. The walls of the Orchestra Rehearsal Space (image 5) are made of reversible panels with acoustically reflective material on one side and an absorptive material on the other. This allows the room to be tuned as needed. Some of the more specialized spaces include a manuscript reading room where rare manuscripts are displayed and studied by international scholars. The room is designed as an elegant treasure cabinet. The new music technology department brings together cutting edge A/V equipment with a suite of sound-isolated rooms where rehearsing, recording and mixing can all occur. 4. New black box theater, 5. New orchestra rehearsal space, 6. Rare manuscripts reading room, 7. New jazz rehearsal space, Social Spaces: Well-distributed “hang-out” spaces throughout Juilliard encourage the serendipitous encounters where creative and intellectual exchange often happen. The myriad of corridors throughout Juilliard were expanded and broadened into public spaces. Along 65th street, access is provided to Juilliard through a new grand lobby stair. The risers morph into couches and seats, providing a space for students to gather, 8. Informal gathering spaces, 9. New grand lobby stair, 10. Stairs morph into seats for students, faculty and visitors. Scale: 95 000 sqf, New and Renovated Spaces: Entrance lobby, Box office, Black box theater, Orchestra rehearsal space/recording studio, Jazz studios, Dance rehearsal studio, Library expansion, Rare music manuscripts archive, Rehearsal rooms, Classrooms Administrative offices, Lounges.

About Diller Scofidio + Renfro

Diller Scofidio + Renfro is an interdisciplinary design studio that uniquely integrates architecture, the visual arts, and the performing arts. Elizabeth Diller and Ricardo Scofidio founded the practice in 1979; Charles Renfro was made Partner in 2004. In 1999-2004, the MacArthur Foundation presented Ms. Diller and Mr. Scofidio with the ‘genius’ award, the first awarded in the field of architecture. For their contribution to art and design, Ms. Diller and Mr. Scofidio were named amongst Time Magazine’s 100 Most Influential People of 2009. In early 2009, all three partners were featured in a one-hour segment with Charlie Rose. Recently, The New York Times, Los Angeles Times, and The New Yorker named Alice Tully Hall and the High Line among the most culturally significant projects of 2009. Among the various projects of Diller Scofidio + Renfro: Lincoln Center for the Performing Arts in New York, including the redesign of Alice Tully Hall and the renovation and expansion of The Juilliard School; the High

Line, an urban park situated on an obsolete elevated railway stretching 1.5 miles long through New York City; the expansion of the School of American Ballet; the Institute of Contemporary Art on Boston's waterfront; the Creative Arts Center currently under construction at Brown University; and the Museum of Image & Sound currently in design on Copacabana Beach in Rio de Janeiro, Brazil. Diller Scofidio + Renfro is currently collaborating with the Australian Dance Theatre on Be Your Self, a dance production for the Adelaide Festival of Arts in Australia. (<http://www.abitare.it>)

<http://www.dlrgroup.com>

### **Libraries:**

#### **Udvar-Hazy Library and Learning Center, Chris & Stephan Embry-Riddle Aeronautical University, Prescott, AZ – USA 2008**

32,572 sqf., € 7,661,402

With about 1,650 students, Embry-Riddle Aeronautical University is the only accredited aviation university in the world. This new 32,500-square-foot Library and Learning Center is the first project in the university's updated master plan. The design concept for the Udvar-Hazy library uses flight as a metaphor. The building is composed of metal and glass, and seems to above the ground. The building's main entry is defined by an internally illuminated staircase that evokes the technological underpinnings of aeronautical education. The ascending staircase evokes flight, lifting students from the classrooms on the first floor to the resource center and commons on the second floor. The second level cantilevers in two directions; coupled with extensive glass, the space encourages informal learning surrounded by limitless views of the horizon. (<http://schooldesigns.com>)

#### **Century College, Science and Library Building, White Bear Lake, MN – USA 2008**

73,930 sqf., € 17,397,521

The new mantra for Century College is "learning-centered community," and the Science and Library Building embodies this mission. The first new campus structure in 17 years, the Science and Library Building was designed to be a hub for academic and community engagement. Built-in window seats, a fireplace, coffee shop and alumni hall combine to create a relaxed and Libraries/Media Centers environment for students and faculty to lounge, study or quietly socialize. The Science and Library Building was situated strategically at the end of a skybridge that joins the East and West campuses. The result is increased foot traffic through social learning areas that encourage student, faculty and staff interaction. Housing 5,000 lineal feet of bookshelves, nine science labs and five science classrooms, the new building combines the West and East Campus libraries, and consolidates science instructional areas into one central location. The building is built to exceed state energy-efficiency standards by 30 percent and features a glass southern elevation that electronically shades to reduce the need for air conditioning in the summer. (<http://schooldesigns.com>)

#### **Brokaw Early Learning Center, Oswego Community Schools, Oswego, IL – USA 2007**

39,800 sqf., € 9,075,082

Brokaw Early Learning Center is designed to meet the needs of young children, many with learning or physical disabilities. The facility features four small houses that pinwheel around a central core of shared facilities. Each house consists of five classrooms surrounding a light-filled living room, serving as the hub of the instructional program. From Portfolio student's perspective, this reduces the scale of the school to just five classrooms and a living room. In-floor and ceiling heat provides thermal comfort in response to the activities on the classroom floor. The many attributes of the school give students a place where they, during the most critical development period of their lives, can learn how to learn—a trait necessary for life. Undulating gable roofs allow natural light to penetrate 100 percent of all classrooms and more than 85 percent of the total building area. Additional windows are raised just off the floor so students of all abilities can connect with the outdoors. A child-friendly scale throughout the facility is created with horizontal lines through color, materials and texture. (<http://schooldesigns.com>)

#### **Elk River Library, Elk River, Minnesota - USA 2007**

The LEED Gold Elk River Library is a component of the new Elk River Civic Complex, adjacent to an existing city hall and public safety building. The library embraces sustainable design features including extensive daylighting controls, geothermal heating/cooling system, displacement ventilation, and adjacent water gardens.

The open floor plan allows for efficient library staffing. Special areas are designed with specific user groups in mind, including an enhanced children's area, a teen area, a reading room, quiet study rooms, and central fireplace. A large multi-purpose room is available for various public events and meetings. The library is placed on its site to maximize views of Orono Lake and is sustainably designed to allow for future expansion of double the existing 16,600 square footage. (DLR)

#### **Chisago Lakes Area LKibrary, Chisago, Minnesota – USA 2005**

This 12,000 SF library is a collaboration between four cities and three townships. The library is designed with state-of-the-art technology and every library amenity.

The single level building is fully accessible to all users and staff. Large windows provide picturesque views of two nearby lakes. A large multi-purpose room provides meeting space that can be used by community groups outside of normal library hours. Pedestrian accesses, bike racks, ample parking and a bus drop make the library accessible to all.

Chisago Lakes Area Library has an open floor plan. Durable, low maintenance materials were selected for both the interior and exterior. The overall design allows for future expansion. (DLR)

## **Durrant, Dubuque, IA – USA**

<http://www.durrant.com>

### **Libraries :**

#### **Edith Abbott Memorial Library ( expanded and renovated), Grand Island, NE – USA 2007**

Durrant provided architectural design, interior design, furnishings, and information systems engineering for this design-build project. Teamed with local architect Cannon Moss Brigger Associates and Mid-Plains Construction Company, this project includes a 25,000 SF addition as well as remodeling the existing 25,000 SF. The program for the library includes public meeting rooms with seating for 160 people, a large children's/family place designed to provide library materials and programs for children, young adult services including a homework center and computer stations, a local history/multicultural center, and a growing audio/visual

collection. The library also includes the Friends Bookstore/Cafe/Coffee Shop/Gift Shop. The design team utilized a design workshop approach to develop responsive solutions in a short time frame. (Durrant)

**Arizona School of Health Sciences, Mesa, AR – USA 2001**

100.000 sqf., \$ 11.200.000

A division of the Kirksville College of Osteopathic medicine, the facility offers postgraduate two- and three-year professional specialty healthcare degrees. A curving 55-foot-tall sandstone wall sweeps through the splayed building geometry, providing a backdrop to the northern building entry and the southern outdoor plaza and water feature. Providing a distinct identity and framing the space between the two building wings, the sandstone wall also is used as a backdrop to the two-story indoor lobby. Deep overhangs, steel shade structures and deepened window mullions are used to shade large expanses of glass. The building geometry organizes the space program between east and west for the library, auditorium, tiered lecture rooms and classrooms on the ground floor. Laboratories and faculty offices are on the second floor. Ground concrete floors in the lobby and circulation space provide continuity from the exposed aggregate exterior walkways. The outdoor spaces are developed with shaded areas for socialization and dining, while green lawn areas encourage outdoor recreation. ( <http://schooldesigns.com> )

**Cochise College, Benson Center, Benson, AR – USA 2000**

12.500 sqf., \$ 1.860.000

This project, which showcases the vista to the north, includes a media center, distance-learning classrooms, offices and parking for 150 automobiles. The classrooms were organized for maximum flexibility. The rooms can be opened up completely to create a large meeting area, or they can be partitioned into smaller spaces. The college make the facility available hours to local community groups for meetings, conferences, open houses and receptions. The project incorporates a large palette of materials (colored concrete, CMU, painted metal, rusted steel, corrugated metal, aluminum and stone) to achieve rhythms, patterns, textures and colors that relate to the surrounding desert environment and to the human scale. Future phases of the campus will total 100,000 square feet of buildings with parking for an additional 500 automobiles. ( <http://schooldesigns.com> )

**Wartburg College, Robert & Sally Vogel Library, Waverly, IA – USA 1999**

72.180 sqf., \$ 4.550.000

Wartburg College began a study of library needs in the early 1990s in response to student and faculty concerns about the aging library. Concerns included the need for updated and additional technical space to support information-literacy instruction in a variety of learning styles and purposes; space to house an expanding collection; handicapped accessibility; and the to address failing mechanical and electrical systems. In response to these challenges, designers recommended a three-level facility, which included 44,000 square feet of renovation; 28,180 square feet of new space; new mechanical and electrical systems; and an elevator for handicapped accessibility. Careful attention was paid to the library's exterior, focusing on aesthetics and the use of masonry materials similar to surrounding buildings. The library's unique design accommodates learners with varied learning styles and purposes. These spaces include a comprehensive advising center, information laboratory, reference collection, 67 computer workstations, center for faculty learning, classrooms, a curriculum wing, video/audio rooms, group-study areas, climate-controlled archives with extra space and a coffee shop. Classrooms provide space for information-literacy instruction.

( <http://schooldesigns.com> )

**Phoenix College, Fannin Library, Phoenix, AR – 1998**

66.000 sqf., \$ 5.384.000

Fannin Library is a powerful addition to the Phoenix College campus. The integration of old and new structures, the accommodation of the program within the budget, and the creation of grand and intimate spaces reinforce the small-school atmosphere beloved by the students attending the college. The original structure is clad in brick with a concrete frame and has designed to blend in with the 1930s-era structures surrounding the library. It was natural, then, that red- brick masonry and cast-in-place concrete were the uncontested materials of choice. Interior spaces are refined in detail with punctuations of red brick at the entrance and stairs. A two-story atrium connects the main level with the upstairs reading and stack areas, and is ringed with delicate aluminum trim and glass railings. The atrium is topped with a north-facing skylight. The library addition fits perfectly with the mission of the college—to provide a quality educational atmosphere, elegant and comfortable, linking the past with a vision to the future.

( <http://schooldesigns.com> )

**Marantha Baptist Bible College, Cederholm Library and Resource Center, Watertown, WI – USA 1996**

24.700 sqf., \$ 2.023.000

Marantha Baptist Bible College wanted a centrally located cultural learning center. The program included a library, computer lab, classroom, special collections and board room. The 24,700-square-foot, two-story library is the second building in a series to handle the projected growth of the college from 700 to 1,400 students. The Library exhibits a new direction of the historic character of the campus into a new quality of permanent structures, enhancing the image of the college while addressing the growing space needs. To support the campus' new image, the wall of existing coniferous trees were removed and a boulevard-type entrance was constructed, focusing on the library. The character of this building reflects the integration of the cream-colored masonry of the past with the educational technology of the future. Economical materials were still used; however, the warmth of the past was brought out in the carpet, wood, brass and paint, with small accents of stone. The library is the first major new building to flank what is to be a campus quadrangle and is located on a sloping site at the terminus of the new entrance drive. Parking and vehicular circulation in front of the library were reconfigured as part of site development. ( <http://schooldesigns.com> )

**DWL Architects + Planners, Inc., Phoenix, AZ – USA**

<http://www.dwlarchitects.com>

**Libraries:**

**White Tank Branch Library & Nature Center, Maricopa County Library District, Waddell, AZ - USA 2010**

The 29,000 SF White Tank Library is a truly unique facility. It is being constructed in a mountain preserve site and includes a Nature Center. Its wrap-around mountain view provided an additional challenge: western exposures that led to extensive shade walls, trellises and blinds as a solution. White Tank's tilt-up concrete and steel structure is part of the reason this is one of the least expensive libraries in the Phoenix metro area. The concrete panels are scored in a pattern similar to nearby rock formations and are lightly-stained three shades of desert green to blend into the site. DWL also helped write a grant that added a 53.2 KW photovoltaic array to the roof, which will meet 27.8% of the building's power needs—part of a total 47.8% electrical savings that will result in a LEED® Gold rating. New technology introduced to library operations include RF (radio frequency) scanning, which will allow staff

to automatically sort returned media. This project demonstrates what can be dramatically produced on a low budget and how a library can share a building with other uses—the facility also houses a 4,000 SF interpretive center, operated by Maricopa County Park District staff, which includes animal displays and exhibits designed to educate visitors and provide them a better experience as they explore the 30,000 acre regional park. (DWL)

2010 Environmental Design + Construction (ED+C) Excellence in Design Award – Government Honorable Mention

2010 Building of America Award - Gold Medal Winner and Featured Case Study

##### **Literature:**

Feb. 2010 Metal Architecture magazine

Designed in collaboration with **Douglas Sydnor Architect and Associates**, the Appaloosa Branch Library design theme celebrates the environment in a protected desert setting. Building finishes play with light like a mirage in northern Scottsdale’s upper Sonoran Desert. The library’s central location in a new community will establish itself as a cultural focal point for new and old residents alike. Rising from a very functional plan, the 21,500 s.f. library concentrates its interior drama in a single large Reading Room that is 70 feet wide and 130 feet long. The space is naturally lit with indirect light that changes during the day but rarely enters the room directly. Sunsets will color the whole room with changing shades of pink and orange, while thunderstorms will be visible wherever they occur. The Reading Room is separated from staff spaces and meeting rooms by a massive geologically-layered concrete wall. Rooms along the south side are wrapped in iridescent metal and float a few feet above the arroyo. At the west end, the building digs into the earth, but at the east end it opens onto a patio with filtered views of the McDowell Mountains. (DWL)

#### [Burton Barr Central Library, Phoenix, AZ – USA 2004](#)

##### **Awards:**

1997 AIA Excellence for Library Architecture

1996 Benedictus Award for Ingenuity in the Use of Glass Presented by DuPont in Association with the AIA

1995 AIA Western Mountain Region Honor Award

1995 AIA Central Arizona Chapter

1995 Valley Forward Association Environmental Excellence Award: Public Assembly Buildings & Structures

1995 Library Association Award

The Burton Barr Library demonstrates an award-winning collaboration with Will Bruder (see: <http://willbruder.com>) that successfully responds to site, program and budget considerations, while creating a symbolic destination for downtown Phoenix. Innovation abounds in this design: a tension structure suspends the roof above the building’s columns and side walls; sensors regulate a computerized louver system on the building’s glazed south side, reducing solar heat gain; and the building’s five-story atrium is topped by 22 skylights, which track the sun’s movement and ensure constant natural daylight. All this is augmented by a modular lighting system so efficient it received the largest energy conservation rebate ever awarded by the local utility company, Arizona Public Service. (DWL)

#### [Glendale Foothills Library, Glendale, AZ – USA 1999](#)

##### **Awards:**

2000 Valley Forward Association Environmental Excellence Merit Award

2000 Metal Architecture Interior Honor Award

1999 Arizona Masonry Guild – Excellence in Masonry Award

DWL designed the library’s curved floor plan in response to the constraints of its site. With approximately five acres to accommodate the building and required site elements, the curve prevented the library from appearing cramped between its access road and the neighboring park. The primary design goal for this project was to eliminate damaging direct sunlight. North-facing window walls admit indirect light, and the east and west walls feature “lizard eyes”—protruding wall sections housing north-facing windows. Internally, the curved walls create the illusion that there is always something more to see around the bend. Floor patterns, furnishings and artwork echo this free-formed theme. Through its use of indigenous materials, such as copper and brickwork laid in a Native American basket weave pattern, the library’s exterior exemplifies a new Southwestern regionalism. The tri-color pattern integrates the building into its desert environment, matching the colors of nearby hills, rocks and grasses. Spectacular mountain views and desert landscape integrate the form of the building with its surrounding area. (DWL)

**Renovation** (Elmer Grey / Myron Hunt – Los Angeles 1909 – 1911 / 1998 Pritzker Architecture Prize on the spectacular and historic grounds)

90,000 sqf.

Working closely with curators, photographers, and manuscript conservationists this three-story, 90,000-square-foot research facility was designed with every detail in mind. As the new home to one of the world’s most important collections of historical manuscripts and rare books, special touches abound. Climate-controlled reading rooms, galleries, a photographic studio and digital imaging laboratory make this one of the top research libraries in the world. (Earl)

#### [EDGE Studio, Pittsburgh, PA – USA](#)

<http://www.edge-studio.com>

##### **Libraries:**

#### [East Liberty Branch Library, Pittsburg, PA – USA 2010](#)

Client : Carnegie Library of Pittsburgh, LEED™ Silver Certification

##### **Awards:**

The project received a 2011 AIA Pittsburgh chapter award

The design team worked with the Carnegie Library of Pittsburgh to fully renovate the existing 33,000 sf, 1967 facility and provide a 9,000 sf addition which facilitates a complete reorganization of library services.

The existing building was completely transformed by removing its uninsulated, single glazed envelope and expanding the structure to enlarge the facility and to give shape to a building which would have a greater visual presence when approached from all nearby streets. The new exterior wall assembly helps to provide for a highly sustainable building with a thermally superior envelope. At the interior, the space was reorganized to locate all of the main library services, including adult, teen and children's department services on a single floor with maximum staff sight lines to minimize staffing requirements. Accessibility, both physical and visual, is important to the visitor experience. That the library is welcoming to its diverse customer base, and that all visitors can orient themselves to the space immediately upon entry ensures that services are readily perceived. An atrium connects the first floor to the second floor. At the second floor, four meeting rooms, two which can be combined by way of a folding acoustic partition into one large room, were provided along with open office space for central library operations. (EDGE)

The expansion/remodel of the East Liberty Branch of the Carnegie Library of Pittsburgh (CLP) added a two-story 9000 square foot space that includes meeting rooms and enhanced services for patrons of all ages. The upper floor projects the structure into the access corridors of three major streets, providing the library with a more prominent footprint. The lower level now houses the CLP Heritage Collection.

## **Carnegie Library of Pittsburgh, Main Facility, Pittsburgh, PA – USA 2004**

Opened: 1895

Longfellow, Alden & Harlow (later Alden & Harlow), of Boston, Massachusetts, and Pittsburgh, Pennsylvania,[1] was the architectural firm of Alexander Wadsworth Longfellow, Jr. (1854–1934), Frank Ellis Alden (1859–1908), and Alfred Branch Harlow (1857–1927). The firm, successors to H. H. Richardson, continued to provide structures in the Romanesque revival style established by Richardson that is often referred to as Richardsonian Romanesque.

Officially, the firm was Longfellow & Harlow from 1886 until March 1887, with Alden participating as its agent.[1] Then, it was Longfellow, Alden & Harlow, until 1896, when it became Alden & Harlow.

1890: Andrew Carnegie offered the City of Pittsburgh \$1 million to build and equip the Main Library and five branches.

Client : Carnegie Library of Pittsburgh Project : Expansion and renovation of Main Facility Date of Completion : 2004

### **Awards:**

This project won a Pittsburgh Chapter AIA Award in 2005 and a Info Comm/Archi-Tech Magazine Grand Prize Award in 2006.

EDGE studio provided architectural services for the renovation of the Carnegie Main Library of Pittsburgh, the first free public library in the United States. The library established three goals for the project: to make the library a destination, increase user-base, and make information more accessible to users.

Meeting these goals required an investigation into 1) the customers who use the library and 2) the way they search for information. From this information, EDGE developed a plan for an efficient, user-based facility that would assimilate the library's digital, physical and human resources, allowing users to locate useful information quickly.

This design employs a system of glass panels as a technological platform for the display of current events, resources and relevant items from the library's collection in response to each user's search. Gracefully assimilated with the historic architecture of the existing building, the panels reveal new possibilities for discovery while allowing advanced resources and groundbreaking user technologies to coexist with the timehonored sophistication of the nation's first free public library. (EDGE)

## **EHDD Architecture ( Esherick Homsey Dodge Davis), San Francisco, California – USA**

<http://www.ehdd.com>

### **Libraries:**

#### **City College of San Francisco Chinatown, North Beach Campus – USA 2012**

193,032 sqf.

"Vertical" college campus provides gateway to the future

EHDD's design of the new Chinatown/North Beach campus for City College of San Francisco exemplifies our firm's strengths: innovative design that makes the most of its location, while respecting the interests of our client, the users, and the community.

The project is a result of over 30 years of grass-roots community activism to bring a college campus to a traditionally under-served community. The design process required ten years of stakeholder buy-in from wide ranging interests such as the San Francisco political community, historic preservationists, and educators. The goal of the project was to find a balance in creating a building that fits into the nearby Financial District, Chinatown and the Jackson Square Historic District, while simultaneously incorporating 21st century teaching, technology and innovation. The building provides 39 classrooms and laboratories, administrative offices, library and a community room which opens up into a terrace overlooking Portsmouth Square. (A 4-story annex houses the culinary program which includes a teaching kitchen, a community auditorium, four classrooms and a public café.) The result is an artful combination of technology and transparency resulting in a compact (.25 acres), open and dynamic 14-story "vertical" campus serving over 4,000 students a day in the heart of the Chinatown community.

Taking full advantage of its urban site, the project is located within close proximity to an extensive public transportation network. Bike racks and showers are provided as an additional option for urban commuters. Almost all of the students live, work, or do business in Chinatown and nearby neighborhoods and attend college programs during the course of their busy days in the community. More than 90% of students walk or ride public transportation to class.

The project is slated for LEED® Gold certification, and creates a transparency that makes clear to passersby the building's academic purpose. In the context of a project that required the buy-in of a wide variety of interests, the ambitious green goals have been key in winning public support and creating a building that will serve as an anchor for the community. (EHDD)

## Tanimura and Antle Family Memorial Library, California State University, Monterey Bay, Monterey, CA – USA 2009

150,000 sqf., \$ 54,000,000

This new campus centerpiece will be at the hub of academic activities and anchor the campus quadrangle. The program includes book stacks, 1,600 study nooks, 350 computer stations, a 24-hour computer/study room, a 200-seat auditorium, a 100-seat classroom, five small classrooms, 24 collaborative study rooms, offices, and a ground floor café. The library will also serve the community as a public library. The open 2,200 square foot reading room with adjoining catering kitchen and balcony can be used for community and campus events, special lectures, and exhibitions. Our energy analysis influenced design of the building envelope and glazing systems for optimum energy-efficiency. Mechanical systems feature an underfloor air distribution system throughout, as well as an energy efficient central plant providing the building with its own chilled water utilizing a high-efficiency VFD chiller. Our design exceeds California's 2001 energy code by 30%. LEED Registered, the building is designed to achieve a LEED Silver rating from the U.S. Green Building Council, and is enrolled in PG&E's Savings By Design program. (<http://www.gb-eng.com>)

### San Mateo Public Library, San Mateo, CA - USA 2006

90,000 sqf.

#### **Awards:**

LEED Gold U.S.Green Building Council

2007 Green Building Award Sustainable San Mateo County

2006 Merit Award for Green Building California Construction "Best of 2006"

2006 Merit Award for Civic Building California Construction "Best of 2006"

The San Mateo Public Library's design evolved out of an extensive public workshop process that solicited input from the community about the building's massing, the quality of interior and exterior spaces, and the community's concern about noise levels. The library's design satisfies community desires while presenting a strong civic image and establishing a new landmark in downtown San Mateo. As a resource center for literacy and lifelong learning, the library features 100 public internet terminals, expanded reading and study areas for children and teens, and a sustainable, energy-efficient design. An airy two-story lobby, transparent to the street, serves as a welcoming orientation hub. Entering patrons can see through to all levels of the building; an information booth supplements any orientation needs. The building undulates inward to preserve an existing redwood grove, and a mezzanine level opens to the grove with tall windows. On the second floor, a two-story central reading room further aids in ease of orientation and brings daylight into the building's center from high clerestory windows, offering a comfortable space to visitors. Lighting and window shades are photocell activated for daylight control. Solar heat gain is controlled with sunshades and high performance glazing. The three-story building has two levels of underground parking. The architects, EHDD Architecture, used the latest technologies, including raised-access floors, a mechanized book storage system, electronic checkout, and wireless technology to accommodate the patrons. The library embraced several energy, material, and water conservation strategies. It is the first of a new generation of EHDD under-floor air projects and is full of interconnected multi-story spaces with natural ventilation and daylight. The library has quickly become San Mateo's premier civic building and a well-liked public destination.

(<http://archrecord.construction.com>)

### Merrill-Cazier Library, Utah State University, Logan – USA 2006

#### **Awards:**

Merit Award Excellence in Interior Architecture /AIA San Francisco 2007

Honorable Mention IIDA Northern California Chapter

Library services at Utah State University are provided in the Merrill-Cazier Library, a newly constructed facility that combines collections that were formerly housed in two buildings. Merrill-Cazier Library opened in September 2005 and houses materials in the arts, humanities, social sciences, agriculture, life and physical sciences, medicine, and engineering. The new library building (305,000 sq. ft.) was constructed from the existing Cazier Science and Technology Library, expanding the original building of 116,000 sq. ft. with an additional 189,000 sq. ft., thus replacing the 202,000 square feet of the Merrill Library building. Despite having slightly less total space, several technological innovations make the new library a much more functional building. An automated storage and retrieval system (ASRS) has capacity for over 1.5 million new volumes, allowing for approximately 20 years of collection growth. In keeping with the University's land-grant mission the Library has named the automated storage and retrieval system the BARN (Borrowers Automated Retrieval Network). Lesser-used books and all bound volumes of periodicals are stored and retrieved on demand from the BARN. Library users may use the Library Online Catalog from their offices, homes, or any computer with network access to request materials from the BARN. The materials are retrieved and made available at a service desk in the library within minutes of the request. The new library makes extensive use of computer technology for staff and library users as well. An Information Commons will offer over 150 workstations from which USU students and faculty will be able to use a wide variety of productivity software, such as word processing, spreadsheets, digital image manipulation, and statistical packages. Librarians and computer support staff work in tandem to provide technological training and research assistance to customers in the Information Commons. The Merrill-Cazier Library provides extensive service hours during the day, and is accessible to the USU community and the general public throughout the year (except during designated University closings). The new building has 305,000 total square feet, with a seating capacity of over 2,000. (<http://library.usu.edu>)

The new facility not only replaced the existing Merrill Library, but also integrated the existing 116,000 square foot Cazier Science and Technology Library, resulting in all library functions being housed under one roof. The building includes an expansive information commons, cyber cafe and an automated storage and retrieval system that can be used to store more than 1.4 million books and journals. (<http://www.jacobsonconstruction.com>)

### Christopher Center for Library and Information Resources, Valparaiso University, Valparaiso, IN – USA 2004

#### **Awards:**

Merit Award for Architecture. AIA Colifornia Council 2008

Library Interior Design Honor Award 2006

International Interior Design Association / American Library Association 2006

Comprising 105,000 square feet (9,800 m2) of space, the building was designed by Esherick Homsey Dodge & Davis of Chicago, which sought to "break the mold" of institutional libraries. Part of a \$33 million project, the Christopher Center was made possible through gifts from alumni and friends, including a \$16 million gift from Jay Christopher and his wife Doris. Support of the University's Three Goals, One Promise campaign made construction of the building possible. Among the major donors to the building project are those whose gifts are recognized in special areas of the building. The grid-like structure flanking the south and east sides of the building's exterior provides an interesting appearance for the building while serving as a valuable sun screen. This

protects the books from harmful, constant exposure to sun rays and helps soften the sunlight entering the two-story reading room overlooking Resurrection Meadow south of the chapel. At the same time, spaces throughout the facility are bathed in natural light.

#### **Building features**

The wireless building accommodates current study preferences by replacing study carrels with soft furniture in "living room" settings, several complete with fireplaces. Food and beverages are available at a café on the premises. There are some 2,400 data ports and 88 wireless access points in the building, all connected by 42 miles (68 km) of data cable. Computer clusters are located amply throughout the building, totaling over 250 individual computers available for student use. Sunshades also automatically lower when too much sunlight is entering the building, and raise when it is dark outside. Books and other traditional information resources mix with computers and access to the Internet on every floor. The computer-driven, robotic Automated Storage and Retrieval System uses space efficiently and allowed the overall shelving capacity in the center to increase to 600,000 volumes without having to increase the size of the building.

#### **Automated Storage and Retrieval System**

Perhaps the best representation of Christopher Center's integration of traditional library services with current technology is the Automated Storage and Retrieval System (ASRS). This combination of robotics and computer system has the capacity to store 300,000 files. Two stories high, the system features bins stacked along two aisles. Materials that are used infrequently by students or faculty are maintained in this location. When one of the 60,000 items is requested, the robotic system locates and retrieves the publication in about 15 seconds. Using a bar code logged into it, the management computer system runs the robot and simultaneously registers the volume's current location in the one of its 1,872 bins. Designed like a combination car-jack and fork lift, the computer-controlled cranes move along the aisles and up or down the stacks of bins to retrieve the requested material and place it on a tray desk in the main circulation area. Provided by a gift from alumnus Herbert F. Stride, this automated storage and retrieval system is one of the first five installed for use in libraries in the nation. (<http://en.wikipedia.org/wiki/christopher-center>)

#### **[Doraine Zief Law Library, University of San Francisco, California – USA 2003](#)**

60.000 sqf.

The Doraine Zief Law Library extends USF'S existing Kendrick Hall Law School, whose old library paces, approximately 20.000 sqf. on two floors, was vacated and renovated. There was no surge space on the campus, requiring the Law School to stay in operation throughout the complex construction process. The entire building was reorganized, renovated, and brought up to code, and the infrastructure was upgraded and modernized. Completed 2003, it comprises classrooms, lecture halls, seminar and conference rooms, a new moot court, student lounge, clinic, faculty and administrative offices, and student service facilities, as well as underground parking. (EHDD)

#### **[Montain View Public Library, Montain View, California – USA 1997](#)**

60.000 sqf.

Two distinctive built contexts informed the design of this library: On one side, the library joins with City Hall and the Performing Arts building to complete the Civic Center complex; on the other, the library blends into a residential neighborhood with traditional California. Entrances from each side open onto a grand, central lobby, surrounded by collections and support services that require easy access. An elliptical staircase rises to the vaulted spaces of the main collection. Both floors maximize natural light for reaching, take advantage of park views, and offer a rich variety of spaces for patrons to discover, such as the reading rooms, set in octagonal towers. (EHDD)

#### **[Main Library Complex, Doe Library and Moffitt Library Renovation, University of California, Berkeley, Berkeley, CA – USA 1995](#)**

#### **Awards:**

Design Award / AIA East Bay 1996

EHDD Architecture, a San Francisco-based firm that has designed dozens of academic and public libraries, has been awarded the Moffitt Revitalization Project. Construction is expected to begin when fundraising for the \$50 million project is completed. The firm designed and completed the David P. Gardner Stacks in Doe Library in the mid-1990s. This award-winning , 180,000 square foot underground addition provided a new home for the millions of volumes previously housed in the Doe core, making the collections open for browsing by library users. The addition also linked Doe to Moffitt via an underground passage. EHDD's history of work with UC Berkeley stretches back forty years. Other projects include renovations of the Environmental Design Library in Wurster Hall, a residence hall, and two phases of the Northern Regional Library Facility in Richmond, among others. The firm is known for creative approaches in designing for sustainability. Lead architects for the Moffitt Revitalization Project include Charles Davis, who directed the Gardner Stacks project, and Jennifer Devlin. In a July 5, 2009 profile in the San Francisco Chronicle, Devlin described a recent visit to Amsterdam's new public library, saying "Wherever I go, I go to libraries." She comments that the plans for Moffitt will meet the needs of today's students, who are "more collaborative, with more technology, in more ways than ever before." To read the article on SFGate, "Jennifer Devlin – pillar of design," go to <http://tinyurl.com/nwpxpj2> m.

Completed in 1992, the layout of the library minimized the number of redwoods to be removed, preserving the character of the mature grove. Large expanses of glass open into the grove and fill the open space with natural light. A terraced entry plaza, set into the hillside at the middle of the building's three levels, connects the library to the neighboring science buildings. The building's exterior palette compliments its forest setting. Cooper, left to patina naturally to a maintenance – free green, clads the nonstructural walls at the stair and elevator and its replated on simple windows and trim (EHDD)

## **Steven Ehrlich Architects, Culver City, CA – USA**

<http://s-ehrllich.com>

### **Libraries:**

#### **Los Angeles Public Library, Westwood Branch Library, Los Angeles, CA – USA 2005**

Ehrlich Architects was awarded both the master planning and design commission for the new Westwood Branch Library, the third branch library for the City of Los Angeles designed by the firm. Located near Westwood Village and the UCLA Campus, the library will include two levels of underground parking and 12,500 square feet of community-focused space. Due in part to its proximity to the University and affluent neighborhoods, it is one of the most politically charged projects within the library bond initiative. The immediate neighborhood context is the quintessential Los Angeles mix; high-rises along Wilshire to the north, two- and three-story commercial uses along Westwood Boulevard to the west, and one and two-story residences to the south. The design approach raises the primary library space to the second level, provides parking and the entry below, and frames views to the neighboring greenspace. The site's tiny size, a factor of land values in this part of Los Angeles, posed special challenges regarding access and parking. (Ehrlich)

#### **SBVC – San Bernadino Valley College – Library, San Bernadino, CA – USA 2005**

### **Awards:**

**American Institute of Steel Construction – Presidential Award 2006**

**American Association of School Administrators / American Institute of Architects / Council of Educational Facility Planners International Citation Award 2006**

The two-story open reading room of the 40,000-square-foot library is a glass and corrugated-metal prism supporting a multifaceted metal roof; like a giant origami, the roof folds down to form a protected entrance court. Service and support areas occupy a rectangular stucco box with punched windows. The elements interlock and overlap throughout the length of the building, highlighting public versus private spaces. A stained concrete floor serves as the finished floor and structural slab. (Ehrlich)

#### **Los Angeles Public Library, Encino – Tarzana Branch Library, Tarzana, Los Angeles, CA – USA 2003**

12,000 sqf., \$ 4.750.000

Located on Ventura Boulevard, the new 12,000-square-foot library for the city of Los Angeles sits at the intersection of a small residential neighborhood and the wider world, both physically and programmatically. As such, it connects the intimacy of home and community to the realm of knowledge and possibility. State of the art computer facilities complement a varied book collection that serves library patrons of all ages, while the comfortable reading and meeting spaces invite community use throughout the day. Simple forms combine to create dynamic geometries with a sweeping roof that thrusts up and out, and also gently down to provide shelter at the entrance. At street level, the prow-like corner opens with a large expanse of glass, allowing an exchange of views. Inside, the great room expresses a quiet simplicity, with exposed laminated wooden beams above providing warm color. Glass interior clerestories hover over interior walls, while skylights enhance the daylighting of the space. Exterior materials complement the geometry of the building: corrugated metal panels follow the sloping roof while standing seam metal roofs highlight its changing angles. The landscape design received special care, with materials selected for their appropriateness to the valley climate and more specifically to the nearby creek, thus restoring the feel of a natural environment. Permeable pavements and the introduction of a natural filtration system known as bioswales help control stormwater runoff, some of many measures employed to make this project environmentally friendly. (<http://www.archrecord.construction.com>)

#### **Biblioteca Latinoamericana and Washington United Youth Center, San José, CA – USA 1999**

Located one mile south of Downtown San Jose, the Biblioteca Latinoamericana and Washington United Youth Center anchors a 75,000 sf T-shaped site surrounded by commercial, educational and residential neighborhoods. Responding to the urban context and residential neighborhoods, a shaded courtyard invites pedestrians through two different entrances via trellis pathways. This outdoor plaza, complete with a stage, becomes a neighborhood focal gathering place for everyday casual use as well as special occasions and a cultural landmark for the community. Organized around the courtyard, the two buildings share a relationship of similar materials and forms; tall masonry masses formed by concrete block and brick, linked together by a lower, metal and glass clad "glue-like" elements.

The Biblioteca is an important Spanish language resource in the region, housing special collections of both Spanish and English literature. The Youth Center provides a gymnasium, boxing, weightlifting, counseling services by Catholic Charities, and a program/community room where both Library and Youth Center group programs can be planned and community meetings occur. For the project, Garcia Teague of San Jose served as the Executive Architect. (Ehrlich)

#### **Los Angeles Public Library, Robertson Branch, Los Angeles, CA – USA 1997**

### **Awards:**

**Arc space May 28, 2008**

**AIA / ALA Award 2001**

**California AIA, Biblioteca Latinoamericana Merit Award 2002**

The Robertson Branch Library is situated on a busy Los Angeles strip, where apartments, billboards and commercial structures clamor for attention. The design for this 11,000 sf community facility breaks the monotony of an efficient rectangular footprint with a bold pre-weathered copper element that soars above the otherwise modest two-story structure. From the exterior the component acts as a marketing device – announcing the library's presence, increasing attendance and inviting patrons to read and gather. Inside, the dramatic two-story volume serves as the central organizing element and contains a curving stairway of steel and stone that draws visitors up to the second floor. Located on a tight site, approximately three-quarters of the ground plane was allocated for surface parking and vehicular access. As a result the majority of the library's programmatic spaces are elevated. Public zones are located on the second floor and radiate from the central staircase. This synergy enlivens the simple reading rooms and physically connects the library to the ground place, sidewalk and local community. (Ehrlich)

#### **Library Paul Cummings, Santa Monica, Los Angeles, CA – USA 1996**

### **Awards:**

**AIA / ALA Award 1997**

Set among an assortment of converted warehouses and industrial structures, the Paul Cummins Library is an offering to an alternative campus that symbolizes the Library's greater importance within the learning environment. The 12,000 square foot facility is contained by a series of folded planes of exterior blue plaster, which descend in elevation along a busy urban street down to the pedestrian alley of the campus. The two-story periodical reading room penetrates into the "campus quad" (an alley), and supports a steel canopy that offers a shaded gathering place and leads into the double height entry volume. Vibrant yellow exposed structural steel framing supports the structure and inclined wall. Book stacks and administrative support facilities are positioned

under flanking low roofs that serve reading and study areas. They are centrally located within a two-story volume vaulting toward north-facing clerestory windows. The windows allow natural lighting during the day and save energy. (Ehrlich)

## **Eisenman Architects, New York, NY – USA**

<http://www.eisenmanarchitects.com>

### **Libraries:**

**Staten Island Institute of Arts and Sciences, New York, NY – USA 1997 on progress**

**Aronoff Center for Design and Art, University of Cincinnati, Cincinnati, OH – USA 1988 – 1996**

Peter Eisenman's program here was to re-organize 13,400 square meters of existing space and add 12,000 square meters of new space, including a library, theater, exhibition space, studio space, and office space. This was to unify the University of Cincinnati's schools of Design, Art, Architecture and Planning. Eisenman's work is part of an ambitious campus master plan with work (some in progress) by Frank Gehry, Michael Graves, Pei Cobb Freed, and Venturi Scott Brown. Eisenman came to public notice as part of the "New York Five" (Meier, Hejduk, Graves, Gwathmey, and Eisenman) of the 1970s. Known primarily for being a theorist, Eisenman's later forays into the built world have been greeted with a rather wide variety of opinion. Ohio seems to love him, commissioning work in Columbus and Cincinnati at a generous rate. However, were you to come of age looking at nothing but heavy, gridded, often oppressive and bleakly-toned sandstone, you might love someone who tilts a grid and paints it pastel, too. People often complain of the "disorienting" sensation of his tilted planes, to which Eisenman responds: That is what I have always been trying to do—to displace the subject—to oblige the subject to reconceptualize architecture. We have actually to change the relationship of the body to architecture. The body has to send messages to the brain saying 'wait a minute, something that I need to adjust to, something that I need to understand is happening to me.' Eisenman's "displacement" is particularly acute in the Aronoff center. I had no organizational understanding of the building, and wandered around like a confused freshman, looking for any orienting or central area. Since I visited in the summer, I did not have a chance to see how it was used by throngs of adventurous students. Of the forms of the Aronoff Center, Eisenman notes that his "vocabulary derives from the curves of the land forms and the chevron forms of the existing building; the dynamic relationship between these two forms organize the space between them." I found this "attention to the curves of the land" to be more notable in the landscape architecture (by Hargreaves Associates) of the site, especially on the rear side of the building. The most intriguing view of the center is of it nestled behind sensuous land forms and elegant trees—a responsive design to the University of Cincinnati's precarious hilltop site. (Christy Rogers) <http://www.galisky.com>

**Wexner Center for the Visual Arts and Fine Arts Library, Columbus, OH – USA 1998**

Since opening in 1989, the Wexner Center has attracted international acclaim for its innovative architecture and well-equipped facilities, as well as its bold artistic programs. Designed by architects Peter Eisenman and Richard Trost, the Wexner Center building houses four exhibition galleries (totaling approximately 13,000 square feet), an intimate video exhibition space called "The Box"; the Film/Video Theater; and the Performance Space, a "black box" theater with flexible seating. Also on site are Wexner Center offices and the Art & Technology facility, a state-of-the-art video postproduction studio.

Merston Auditorium, adjacent to the Wexner Center building, features a large multipurpose auditorium/theater, as well as complete front-of-house and back-of-house facilities and administrative spaces.

The Wexner Center also presents events at several other venues on campus. These include Weigel Auditorium, a 800-seat concert hall administered by Ohio State's School of Music, and Thurber Theatre at Drake Performance and Event Center, a mid-sized proscenium theater administered by Ohio State's Department of Theatre.

Ohio State's Fine Arts Library and Cartoon Research Library are located on the lower level of the Wexner Center building. The entrance to both libraries is from the outdoor walkway under the Wexner Center's grid and can be found just south of the 17th Avenue Plaza. (<http://www.wexarts.org>)

**City of Culture of Galicia Archive and Library, Santiago de Compostela – Spain 2011**

Masonry: Iberdouro, Metal doors: Lama, Built-up roofing: Pavimentos de Tudela

The evocative title of the exhibition Cities of Artificial Excavation: The Work of Peter Eisenman, 1978–1988 at the Canadian Centre for Architecture in Montreal in 1994 turns out to be an oracular description of the architect's City of Culture of Galicia in northwest Spain. Eisenman's project of a lifetime, now 12 years in design and construction, has involved serious digging and earthmoving to create topographical man-made structures that blur figure and ground. With two buildings just open, the complex's raw state presents an artificial landscape of thrashing, gnashing stone creatures restlessly rising up from the earth before subsiding into calm ripples.

Eisenman won the competition for the City of Culture in 1999 at the right time economically, and in the right country architecturally. Since the end of Franco's reign in 1975, Spanish architects have been turning out high-quality Modernist design in a country also receptive to the tours de force of internationally known architects. After Frank Gehry's Guggenheim Museum in Bilbao opened in 1997, Manuel Fraga Iribarne, the president of the Xunta of Galicia, initiated the 1 million-square-foot research, study, and arts center for his own region. The brief for the City of Culture ambitiously called for a periodicals archive, library, museum, music theater, central services and administration building, and international arts center with a budget of around \$145 million.

Eisenman's winning scheme, folded into the earth and seductively represented by a molded wood model, beat out varied proposals by ten finalists: Steven Holl Architects, OMA/Rem Koolhaas, Ateliers Jean Nouvel, Gigon Guyer Architects, Dominique Perrault Architecture, Studio Daniel Libeskind, Juan Navarro Baldeweg, César Portela, Ricardo Bofill/Taller de Arquitectura, and José Manuel Gallego Jorroto.

The 173-acre site on Mount Gaiás can be glimpsed from nearby Santiago de Compostela where the cathedral houses the remains of the apostle St. James, brought to Spain from Jerusalem after his death in AD 44. Since the eighth century, pilgrims have trekked to the medieval town to pay homage to his shrine.

Although Eisenman's proposal indicated eight buildings, today it's down to six. Two of the buildings, the 155,205-square-foot Archive of Galicia and the 186,990-square-foot Library of Galicia, opened in January. The 223,889-square-foot Museum of Galicia and the 80,729-square-foot Central Services Building are expected to be completed by late fall, although the museum won't be installed until next spring. It is easy to see that the scale is daunting. When all six structures are finished, the City of Culture could almost function as a small international airport (except, of course, the planes' pilots might mistake the buildings for runways). But the projected space needs were not determined by the architects.

The program, conceived at the cusp of the digital age and during the halcyon years of economic prosperity, got caught in a programmatic and financial time warp. And the government changed in 2005. The archive was slated to be a periodicals library with a large reading room. When it morphed into an archive for storing regional documents, the large space for a reading room was turned over to the exhibition of rare documents. But because of the presence of an expansive south-facing glazed wall, temporary polygonal structures enclose the fragile artifacts. As for the library, the original plan to house 250,000 books grew to a million under the wishes of the Galician administration. Now, while rare books occupy a central glazed core, the ongoing digitization of library collections generally raises a question about future space requirements. It

doesn't mean that these buildings can't undergo adaptive reuse. But the weak link to the program certainly turns the formal qualities of the architecture into the main event. As if anticipating such questions, the City of Culture has mounted its own exhibition in the archive featuring a video of Eisenman explaining how he arrived at these striated forms.

Eisenman began with the outline and street plan of the medieval city of Santiago de Compostela based on the shape and ridges of a scallop, the emblem for the shrine. He then placed a similar street pattern on the top of Mount Gaiás to separate the original eight buildings and let the site's topography mold this medieval pattern. Then he overlaid the plan with a Cartesian grid while finally digitally warping the result with a computer-modeling wire frame to generate, he says, "dimension and direction."

Overlays and interplays of these grids are called out in stonework, mullions, aluminum channels, and glazing, as well as contoured drywall soffits and walls inside the buildings. Lay people might find this flow and deformation a bit obsessive. A different matter is the dynamism of the actual shapes and the surface textures of the swelling and heaving structures. You don't need to climb all the contours of these convulsing carapaces (as some do) to know you have entered an experientially based landscape where kinesthetic and haptic, as well as visual, perceptions dominate. Even inside, where interior surfaces assume quite different shapes, contracting and expanding spaces heighten the temporal experience of architecture.

Executing these leviathan structures should ultimately cost an estimated \$581 million for the six buildings. But the economy has slowed down the construction schedule to a point where no one is talking about the completion date for the last two buildings, one of which is the opera, the other, now slated for a new technologies center.

Originally the design team wanted grass roofs, but found that grass was heavier and harder to maintain than stone.

Nevertheless, the local quartzite (in brown, rose, and off-white hues and varied textures) that clads the roofs and walls proved to be hard for the local quarry to supply on time. Stone also came from Brazil.

The hand-quarried stone, cut by machine in 20-inch square blocks (with blocks at the edges specially trimmed), is mounted on a steel armature of curved box beams (or steel girders in the archive) plus steel cross-bracing. The ventilated chunky roof surges over an under layer of concrete deck, waterproofing, and protective insulation. (The interstitial space between the two layers also houses mechanical equipment.) The side walls of mortarless quartzite panels with stainless steel reveals stand out from the buildings like a rainscreen against galvanized aluminum. But while the steel and stone do a lot of work, the actual structure of the buildings is reinforced concrete: the megacolumns are placed on a 53-by-66-foot grid, while a secondary 26-by-26-foot grid of round concrete columns is rotated 7 degrees from the main one.

The glazing posed its own challenge; where a double curvature is called for, flat transparent, reflective, and opaque glass is angled in layers to produce the contour. Since the library's glass wall soars to a 98-foot height, cable-stayed vertical trusses were needed for wind loads. They are plentiful: It seems even the trusses have trusses. Eisenman wanted (and thought he was getting) gray glass, but it turns bluish and greenish under different lighting. Oddly, the glass sometimes overpowers the stone, and the thick grid of variously sized mullions sometimes overpowers the glass.

This isn't a work of architecture where you are overawed by the elegant detailing of the mullions: the strength actually emanates from the skillful craftsmanship of the stonework. Eisenman gives much credit for the execution to architect of record Andrés Perea Ortega, plus Antonio Maroño, the architect for the Foundation of the City of Culture of Galicia, who has been on-site since 2001.

Although it is too early to fully evaluate a complex still very much under construction, already it has become a lightning rod for debate regarding its high cost, excessive space, and ambiguous program. At least the current government officials in charge appear to be fully behind it: Perhaps the perfect fit of program to form will evolve in time. As it ages, it will no doubt lose its rawness, but probably keep its brute energy. The gesture is so defiant. Its brazen monumentality and unsettling scale ravenously explore the difference between artifice and nature. Time will reveal its significance.

By Suzanne Stephens, June 2011 (<http://archrecord.construction.com/projects/portfolio/2011/06/galicia-archive.asp>)

## **Engberg Anderson. Madison, Wisconsin – USA**

<http://www.engberganderson.com>

### **Libraries:**

#### **Gail Borden, Rakow Branch Library, Elgin, IL – USA 2009**

Status: Completed August, 2009, Square Feet: 10,000 sf, Construction Cost: \$3,400,000

Optimum planning allows the library to operate this branch with a minimum number of staff; emphasizing customer interaction over material handling as the primary staff function will maintain the desired quality of library service. "Floating" librarians, express check, digital reference and, ultimately, automated sorting are all accommodated at the Rakow Public Library.

Using the LEED Rating System as a template, Engberg Anderson has integrated three crucial sustainable strategies in order to "achieve" a certification. The combination of cool daylighting, energy efficiency, and stormwater management has a compounding effect on the project that each would not have by itself. Together these strategies are a reasonable, civic-minded, and contemporary response to firmity, utility, and venustas.

The project has been registered with the U.S. Green Building (Engberg)

#### **Sequoia Branch, Madison Public Library, Madison, WI – USA 2008**

As part of a larger urban mixed-use development, the 20,000 sf Sequoia Branch is registered to attain LEED - CI (Commercial Interiors) Silver Certification through incorporating energy efficiency, natural daylighting and the use of sustainable materials. The facility provides a full range of print and electronic resources, group and quiet study areas, and serves as a major community meeting venue. (Engberg)

#### **Beloit Public Library, Beloit, WI – USA 2007**

From 1996 to 2007, Engberg Anderson provided design services for on-going projects at Beloit public Library. It was then decided that the library would relocate to the former JC Penney store at the Beloit Mall. The 58,000 sf renovated space contains all public functions on the first floor, and offices on the second. Features include expanded collections, a flexible computer training center, a divisible public meeting room, a children's program room and a two-story glazed entry lobby (Engberg)

P/A Progressive Architecture 1994

With the recent approval of the Madison City Council, Eppstein Uhen Architects (EUA) is moving ahead with the design of the City of Madison's new Central Library. This will be the second largest project in City of Madison's history, budgeted at \$37 million total cost. The Central Library will be built by a joint venture of Fiore Companies and Irgens Development Partners. Fiore Irgens Venture I, LLC, partnered with EUA to design the building and J.H. Findorff & Son to construct it. The Fiore-Irgens development proposal includes a whole-block redevelopment in the shadow of the State Capitol. Once the Library is relocated to its new location in 2011, design will begin on a 10-story mixed-use building in its place. This development is anticipated to include a parking structure for 400 cars, a 150-room hotel, 30,000 square feet of sidewalk-level retail, and an 80,000-squarefoot office building. Over 100 laborers, carpenters, ironworkers and tradespeople spoke at the budget hearing on November 10. The construction trades are facing record unemployment and urged the Council to approve this project in order to create over 200 jobs. "This project is a rare and exciting opportunity for people who enjoy being Downtown in Madison," said Steve Holzhauer, Managing Principal of EUA's Madison Office. "We are privileged to create a landmark facility that will serve and inspire people for generations and will make downtown a better place visit, work and live. We are thrilled to be part of this renaissance." Construction is scheduled to begin in 2010. The project is certain to become a landmark in the shadow of the State Capitol. For more information go to [www.fiorecompanies.com](http://www.fiorecompanies.com).

### **Libraries:**

#### **New York University, Gallatin School of Individualized Study, New York, NY – USA 2009**

Polshek Partnership Architects, 2009, Engineers- M-E Engineers, LEED Consultant- Steven Winter Associates

In a landmark redesign project that began in 2007, the Gallatin School of Individualized Study at New York University renovated its home at 715 Broadway to reflect the innovation that has defined the School since its inception in 1972. In the first renovation project at NYU to achieve LEED certification, a total area of approximately 32,000 square feet was completely renovated in 2007 and 2008. The project scope included a complete renovation of the 1st, 4th, 5th, 6th and 8th floors of the building. Renovations included a theater, dance studio, lecture rooms, gallery space, classrooms, administrative offices in addition to creating a comfortable space for students and faculty to gather and cultivate ideas. (Ennead)

#### **William J. Clinton Presidential Center, Little Rock, AR – USA 2004**

#### **Smith College, Brown Fine Arts Center, Northampton, MA – USA 2002**

Total area: 164,000 gross square feet, Project cost: \$35 million, <http://www.smithedu/bfac/building.php>

Smith College's renowned Museum of Art, art library and art department have a distinguished new home -- the newly named Brown Fine Arts Center -- thanks to the completion of a two-year, \$35-million building renovation and expansion. At its outset, the renovation was the largest capital project in the college's 122-year history.

Led by New York City-based Polshek Partnership Architects, the renovation stripped the former 1972 complex down to its steel girders and then rebuilt it entirely, transforming its architecture and infrastructure. The art library and department opened in September, 2002; the center's other key occupant, the Smith College Museum of Art, opened in April, 2003.

New features of the 164,000-gross-square-foot facility include a cutting-edge digital imaging center, updated ventilation and environmental controls and improved galleries and art studios. The Hillyer Art Library, regarded as among the best art libraries at American undergraduate institutions, was significantly redesigned. The new building features a greatly expanded technological infrastructure, a dramatic aesthetic overhaul and improved amenities for students, staff and visitors. (Ennead)

#### **New York Public Library for the Performing Arts, Dorothy and Lewis B. Cullman Center, New York, NY – USA 2001**

While it may look familiar from the outside, visitors to The New York Public Library for the Performing Arts will find it dramatically transformed when the Library reopens at Lincoln Center after a major renovation. After operating from temporary quarters during the three-year construction period, the Library reopens for regular public service with expanded hours on Monday, October 29. A free public open house will be held Saturday, October 13. The \$37 million project, designed by Polshek Partnership Architects, reflects the vast changes in the needs of users, and in methods of documenting the arts, that have developed since the Library was established in 1965.

"This redesign of one of the world's most popular research libraries is a response to the enormous increase in its collections and usership, the extraordinary advances in information technology, and the development of large multimedia collections that document live performances," said New York Public Library President Paul LeClerc. "We've made the collections more accessible, created inviting reading rooms and galleries, and added the latest technology to improve the environment for the public, the staff, and the collections."

When the building reopens to the public, it will also have a new name -- the Dorothy and Lewis B. Cullman Center -- in honor of the couple whose generous contribution to the Library made the new state-of-the-art facility possible. "The Cullmans' support will enable the Library to enhance greatly its ability to document the performing arts and provide broad public access to the materials in its collections," said Samuel C. Butler, Chairman of the Library's Board of Trustees. Major support for the renovation was also provided by the family of Donald and Mary Oenslager. The City of New York, under the leadership of Mayor Rudolph W. Giuliani and City Council Speaker Peter F. Vallone, has contributed more than \$20 million to the renovation of the Library for the Performing Arts. The Library will formally express its gratitude to all the contributors to this project at an opening ribbon-cutting ceremony on October 11.

"The list of improvements to the Library is impressive," said William D. Walker, Senior Vice President and Andrew W. Mellon Director of The Research Libraries. "They include a grand, light-filled reading room, spectacular loft-like exhibition galleries, new audiovisual stations, a vastly more efficient centralized retrieval system, expanded storage, an enhanced preservation lab, a four-fold increase in public-access computers, and a massive number of networked databases." He added that "an automated system will control temperatures where delicate materials are stored."

#### **The New York Public Library for the Performing Arts**

The Library for the Performing Arts, one of four major research centers of The New York Public Library, serves more than 425,000 visitors a year and houses the world's most extensive combination of circulating, research, and rare archival collections in its field. The materials are available free of charge, along with a wide range of exhibitions, seminars, and performances. Approximately 30 percent of the Library's holdings are books, but it is known particularly for its prodigious collections of non-book materials such as historic recordings, videotapes, autograph manuscripts, correspondence, sheet music, stage designs, press clippings, programs, posters, and photographs. The Library's Research Collections are the Billy Rose Theatre Collection, the Jerome Robbins Dance Division, the Music Division, and the Rodgers & Hammerstein Archives of Recorded Sound. It also features extensive Circulating Collections with materials in music, dance, drama, film, and arts administration, including large collections of circulating audio and video recordings.

"This marks the first major renovation of the Library since it opened in 1965," said Jacqueline Z. Davis, The Barbara G. and Lawrence A. Fleischman Executive Director of The New York Public Library for the Performing Arts. "The Library's collections have grown exponentially since then to nine million items that require more than seventeen and a half miles of shelves. In addition," Davis said, "technology has completely changed the way materials are stored and accessed. The reconfigured space will allow us to provide better service in a more pleasing environment that can comfortably accommodate continued collection processing and preservation work. It also gives us the opportunity to make significant improvements to our staff work areas."

#### **Bard Graduate Center for Studies in the Decorative Arts, Design and Culture, Academic Building and Library, New York, NY – USA 2000**

The renovation of 36 West 86th Street, a 1905 residential building located in Manhattan's Upper West Side Historic District, completes the second phase of work for the Bard Graduate Center's academic facility. Completed in 2000, the first phase at 38 West 86<sup>th</sup> Street entailed the restoration of the historic townhouse and two additional floors and an expansion into the rear yard to accommodate a 75-seat lecture hall, library, and digital imaging center, classrooms, lounges, and offices. Combining the adjacent

townhouses (“36” and “38”) allows significant expansion. More than doubling the space available for its programs, the new facility reinforces the BGC’s identity as a leading graduate research institution for the study of decorative arts, design history, and material culture. Achieving a principal goal of the renovation to fully integrate the library program and teaching spaces, library collections are distributed throughout the floors. A new lower-level study, conveniently situated near expanded stacks, offers quiet views onto a landscaped rear yard. Other more informal seating areas provide a variety of study and meeting spaces in addition to the existing second floor reading room. The academic facilities also include additional classroom and seminar spaces, as well as faculty offices and student lounge areas. The addition of a modern teaching media laboratory and conference center will afford the BGC the opportunity to accommodate expanded curriculum and to meet the needs of the institution as it takes its place among the preeminent centers for research in material culture. The entry sequence defined in the first phase is retained in the combined building but enhanced: the lobby on the first floor of the 38 building is unified with the adjacent space in the 36 building, which is transformed into a state-of-the-art lecture/public programs facility. A large opening from the lobby provides views into a rich, wood-paneled room with gently curved recesses lined with a horizontal wood screening that accommodates lighting, air outlets and acoustical material. The lobby also serves as a connector to the existing lecture hall and general building circulation. Taking advantage of the expanded floor plate and providing seamless transitions, openings in the original structural party wall connect the two buildings on all floors. A vertical maple-clad plane extending from the lobby to the upper floors references the original demarcation of the two buildings, acknowledges their domestic scale and organizes vertical circulation between floors. Two new communicating stairs – a dramatic steel and glass stair connecting the two primary library floors and a natural wood and steel stair connecting the two floors that house the Center’s faculty and staff – augment existing circulation. Large expanses of glass and new exterior terraces link interior and exterior, expanding the building perceptually. Open spaces extending north/south through the building and doubleheight spaces take advantage of natural light to choreograph movement. The careful insertion of the expanded structure into this historic framework has transformed the interiors into an open, light-filled public environment. With new and renovated facades, the building reinforces its presence as a vital civic institution within the urban fabric of the city. Physical Description:

Approximately 17,000sf (net) in the combined facility,

**[Queens Borough Public Library, Flushing Regional Branch, Queens, NY – USA 1998](#)**

[http://www.polshek.com/lib\\_queens.htm](http://www.polshek.com/lib_queens.htm)

The Queens Borough Public Library, located on a triangular site the intersection of Kissena Boulevard and Main Street, is the largest branch library in New York City. The current building, designed by Polshek Partnership Architects, is the third to be built on the site—the first was a gift of Andrew Carnegie. Metaphorically, the transparent façade, which faces a commercial thoroughfare, advertises learning: the glass membrane allows the facility’s collections and functional organization to be visually accessible from the street. The opposite façade is rendered with stone, its articulation alluding to the book stacks within and its opacity allowing perimeter shelving to be maximized. Other program spaces include: a 227-seat auditorium, a multi-purpose room for 150, conference rooms, exhibition areas, an Adult Learning Center and an International Resource Center. The Queens Borough Public Library, or Queens Library, as it refers to itself today, is the public library for the Borough of Queens and one of three library systems serving New York City, comprising some 63 branches throughout the borough. Since 1994, it has had high annual circulation, and it is the second largest library in the country in terms of the size of its collection. The first library in Queens was founded here, in Flushing, in 1858 as a subscription service. It became a free circulation library in 1869. In 1901, shortly after the consolidation of Queens into New York City, the city government proposed a new charter joining all libraries in Queens into the Queens Borough Public Library. All of the public libraries signed on, except for Flushing, which remained independent until 1903.

Metropolis, July 2012

This New Orleans neighborhood library is comprised of two buildings joined together with the intention that they function as a whole. One building is a historically significant bungalow built as a residence in 1917, sited prominently on the corner of South Broad Street and Napoleon Avenue. The other building, built in 1993 specifically to function as a library, was home to the main reading room and stock areas. Both buildings were severely flooded by levee breaks attributed to Hurricane Katrina. The bungalow was salvaged and raised for future flood prevention, but the modern addition was deemed necessary for replacement by the Federal Emergency Management Administration (FEMA).

The new 10,000 square foot combined library and community center serves the Broadmoor community by providing residents with an innovative 21st century library, community center, gathering space, and valuable educational resource. A visually open connection is maintained between the Historic House and Library Addition in order to create spatial relief as the two buildings touch. This “spine” allows for a clear line of sight to the playground across Broad Street and provides a clear entry sequence into the library. The new addition primarily houses book shelving, computer stations, and other core elements of the library function, while the historic house operates primarily as the community meeting center and home to a small café. 27.06.12 Archdaily

#### **Harry Elkins Widener Memorial Library, Cambridge, MA – USA 2004**

320,000 sqf. , Owner: Harvard University [www.harvard.edu](http://www.harvard.edu), \$ 92,000,000

The Harry Elkins Widener Memorial Library, designed by Horace Trumbauer and constructed in 1915, is located at the geographical and intellectual heart of Harvard University. In renewing the building for the 21st century, the school sought a restoration that would redefine the library in programmatic and technical terms, without losing the structure's aura, comfort, and connection to tradition. The renovation involved 27 construction stages stretched over six years. Phases were planned and timed to ensure the continuous operation of the library and maintain the availability of its collections. The early rehabilitation phases upgraded and modernized the building systems infrastructure, the 10-floor self-supporting stack structure, and various library support spaces. This work included updating climate control and life safety systems as well as improving public access. The architects also created new "found" space within two large light wells at the center of the building that house new mechanical space, staff work areas, and two new skylit reading rooms. These reading rooms symbolize a subtle proclamation of Widener's continued relevance at the core of Harvard's present and future intellectual life. Later construction phases involved restoring the historic public and reading spaces. Wherever possible, the team preserved existing features and room finishes while infusing the building with information technology and comfort standards necessary to meet the library's 21st century requirements. Where interventions were necessary, the architect designed them in a manner that creates a subtle dialogue with the 1915 structure: enhancing the character of the original building but expressing their own distinctiveness and design integrity as contemporary work. (EYP) "It has been a fascinating five years," said William C. Kirby, dean of the Faculty of Arts and Sciences, in brief remarks at the ceremony. "Those who study and work in this University have witnessed extraordinary feats of construction and reconstruction. We have marveled at the trucks and trusses and certainly that enormous crane lifting glass and steel to rather nerve-racking heights. Not to mention the daily symphony of hammering, drilling, pounding, sawing, and ringing."

The first phase of the project brought modern heating, ventilation, air-conditioning, humidity-control, electrical, lighting, fire-detection-and-suppression, and security systems to the 10 floors of stacks. Staff moved, cleaned, and reshelfed all 3.5 million books. Workers from contractors Lee Kennedy built a staff workspace and two new reading rooms, to the design of architects Einhorn Yaffee Prescott, in what had been the two interior lightcourts of the library. In phase two of the project, attention shifted to the front half of the building. The great reading room regained its original size, splendor, and serenity, while noisy, interactive library services moved to refurbished or newly constructed spaces.

Workers lifted 191 tons of steel into lightcourts; removed 92 tons of demolition debris from the nether regions of D-Level and 150 tons of ductwork and cast-iron debris from the attic; installed 55 miles of electrical cable, 15 miles of fire-alarm cable, 18 miles of electrical conduit, and 11 miles of "tel/data" cable; placed 5 miles of sprinkler piping, with 5,000 sprinkler heads; applied 2,000 gallons of paint; replaced 4,000 light fixtures and 1,000 switches in the stacks; cleaned, refinished, and sealed 120,000 square feet of marble flooring; and much more.

"I also want to offer my deepest gratitude," said Kirby, "to Widener's librarians and staff, who never flinched from their commitment to keeping this library fully operational through-out the renovation. They called it — 'orchestrated chaos.' I call it courage.

"That's not, however, unusual for this library or for this University," Kirby continued. "In the midst of an era of grave international uncertainty, Harvard persevered in its quest to advance human knowledge by building Widener Library. As they did in 1915, we gather on these steps during challenging times and once again we dedicate this place — we dedicate ourselves — to the proposition that learning is the only path to enlightenment and that from enlightenment springs permanent improvement in the human condition."

Larsen librarian of Harvard College Nancy M. Cline and President Lawrence H. Summers also spoke. A throng of modest size viewed the proceedings, to which the library invited all members of the Harvard community; at their conclusion, cookies and cider were dispensed in a tent in Tercentenary Theatre. Later, library benefactors attended seminars on teaching with Widener's global collections. In the evening, they gathered with senior administrators for a formal dinner in the Loker Reading Room.

This signal moment in the life of the library will be marked in November by publication of Widener: Biography of a Library, by Matthew Battles, coordinating editor of the Harvard Library Bulletin (distributed by Harvard University Press, \$50). A lively and wide-ranging narrative, it is an estimable addition to the shelves. (<http://harvardmagazine.com/2004/11/widener-reborn.html>)

#### **Harold B. Lee Library Addition and Remodel, Brigham Young University, Provo, UT – USA 2000**

This is a three story underground addition to the main campus library. Landscaping and walkways cover most of the addition and, as a result, the major quadrangle of the campus has been returned to its preconstruction character. The new building is zoned as follows: First level below grade contains classrooms, stacks, and study areas. The second level below grade houses new stack and study spaces, a 200 seat auditorium, a new special collections area with exhibit, work, and archival storage areas. The third level below grade contains mechanical and electrical equipment. The on grade changes include a new entry that links the existing library building to the new underground addition. /FFKR)

## **FGM Frye Gillan Molinaro Architects, Chicago, IL – USA**

<http://www.fgmarch.com>

As of September 1, 2012, Frye Gillan Molinaro regretfully announces that our firm principals have decided to discontinue our services. Both AJ and Lonn are moving on to different opportunities in their careers, and will no longer be available for commissions in this endeavor. We realize that this may have some implications for our past and current projects, and we apologize in advance if our decision will pose any inconvenience.

We would like to explicitly thank each of our clients for believing in, and for supporting our firm for the 29 years it has existed. We could have never accomplished what we did without such an amazing support base. The library world, in particular, gave us exceptional opportunities along with exceptional rewards.

Additionally, we want to thank our high quality consultants and staff that we have collaborated with. Our designs were enhanced by your professionalism.

Finally, we want to express gratitude to members of the press and the publications that helped breathe additional life into our projects. We are immensely grateful for the accolades that we were given for our work.

Thank you for allowing us to contribute and express our ideas with you. It has truly been a pleasure.

Sincerely,

Lonn L. Frye, FAIA

A.J. Rosales, AIA

Library Journal, Dezember 2009

Architects: Frye Gillan Molinaro Architects

In the western suburbs of Chicago, a dramatic transformation was propelled by merging an existing brutalist-inspired Library with a fluid new addition. After a 2½ year design and construction phase, it emerged as a contemporary structure with a green mindset and a sharp focus on technology. An entirely new image from Park Avenue features a facade enhanced by a canted glass tower. Soft light from the ramp handrails and the tower add a sense of mystery to the composition, drawing the eye to the entry. The original building, partly recessed below grade and glazed with smoky panes of glass, was far less transparent and attention-grabbing. With energy-efficient low-E clear glass, the new facade entices passers-by.

A sculpted facade features two distinct architectural zones. The administrative wing on the mezzanine level uses geometric light boxes to give the long facade relief and interest. Each light box connects to a separate room behind the facade. The board meeting room is the light box that protrudes outward; its shape is expressed internally, as well. On the main level, a clear glass facade greets patrons and entices them with the bright colors used in the Young Adults department. Visual connection between the street and the library's interior was a major goal for the renovation. Solar control at this part of the building is achieved by motorized shades that retract into the ceiling.

Over 15,000 square feet of green roof was integrated into the design. Lightweight sedum was used in conjunction with a tray system to capture and slow down the rate of flow and diffuse environmental pollutants. The green roof also insulates during the winter, prevents heat gain during the summer, and shields the roofing membrane from UV rays, extending the life of the roof.

The integration of a bio-swale along with roof scuppers provided an additional landscaping concept for the site. The bioswale is not a "wetland" area, per say, but an area that would allow quick filtration and release. Native Landscaping was used around the site to minimize lawns, which are not only maintenance intensive, but also create chemical runoff.

The existing building's architecture perhaps took some inspiration from Louis Kahn's Exeter Library, with a brutalist take on exposed concrete and wood beams. This reading room was transformed not only by the hanging light fixtures, but by the redesign of the mechanical layout to eliminate air ducts from protruding into the center of the space. The existing rounded windows were upgraded to double-pane, low-E glass. Shelves holding New Fiction complete the space, which encourages casual browsing and comfortable seating in a light-filled room.

A complex tubular structural geometry was employed for the interior of the west entrance glass tower. Diagonal and cross bracing provides lateral support and wind-load transfer. Round, hanging lights dance here, and throughout the building. Some are translucent, while others have exposed, energy-efficient lamping. The entrance also features an all-glass revolving door and an RFID security gate system. Flanking it is a large, four-panel video screen for slide shows, live cable TV feeds or other multimedia presentations.

Just beyond the intersection of two main hallways is the "Amoeba" space, so named because of a curvaceous platform that floats in the middle of the floor plan. This part of the library houses digital media as well as the Periodicals collection and is the project's signature architectural expression. The amoeba platform is pulled away from all sides of the building, allowing natural light to pass into the lower level. Atop the amoeba are light "scoops" that capture outside light and reflect it into the space. Each scoop was designed to take advantage of various sun angles in summer and winter to help with heat gain and light transfer.

As patrons descend to the lower level via the main stair, they encounter one of the building's several "technology nodes." Interplay of the orange amoeba edge, the burst of natural light from the skylight and the accent energy of the "light wall" is compelling. The light wall was envisioned as a "mirror" to the skylight above it, but also is an active artistic element. Most often, the light wall has a soft, white glow that provides pleasing illumination during overcast days or evening hours. But it can be made striking with colors, too. And it powers up and down with a special presentation at the start and end of each day, either greeting patrons or alerting them that the library is about to close.

The hustle and bustle of the main stair is expressed in the forms that surround it. The canted edge of the amoeba and the main stair are a unifying element that helps the form wind down to the lower level. A yin-yang statement is made where the two forms nearly touch, reminiscent of shapes championed by sculptor Richard Serra. The graceful arcs embody the movement of the patrons.

Teenagers were made a priority with a new 5,000-square-foot space that is their own special zone. Colorful patterns and whimsical furniture provide a youthful focus, while varying ceiling textures and lighting patterns make the space exciting.

The library's most daring idea probably is the "Green Zone," a connective hallway between the adult and children's departments that also doubles as a tech node. The spatially abstract space is also visually absorbing. As another technology hub of the library, it has WI-FI and a long row of computers opposite study counters. The walls feature a textural striped paint pattern to reflect light

from the illuminated panels. A fiber-optic sculptural “dragon” hangs in the space, its head and neck serving as official gateway to the children’s department.

This renovation of an existing space houses the grade school collection along with plenty of tables and private study rooms. A technology hub is nearby, giving older children their own computer center. The ceiling has round gypsum soffits placed concentrically on exposed concrete columns. Light fixtures were mounted to the columns and shine upward on the discs, providing an indirect light that softens the space. A self-check and search catalog “pod” reinforces the goal of using integrated technology to enhance the library experience.

This room formerly housed the entire children’s department, and was quite stark. Sheer walls of concrete and masonry were transformed with colorful panels to brighten the space and provide some acoustic tempering. New carpet patterns and a playful book stack layout accentuate the space, while above, ductwork once painted red, yellow and blue was changed to black to reduce its prominence. New lighting gives a warmer, more even feel to the space. In a dramatic change, a concrete walkway that once was the department’s entry point was removed, allowing a previously blocked skylight to flood the area with natural light.

On a more utilitarian note, the replacement of the original building’s single-pane glazing with modern low-E insulated glazing will dramatically increase the efficiency of heating and cooling the building as well.

The library utilizes high efficiency boilers, water heaters, and chillers with non-global warming refrigerants. Electronic temperature controls with energy conservation features were also implemented. Occupancy sensors were included in tandem with the lighting control system to reduce the amount of power usage for the facility. Low-flow plumbing fixtures and lavatories were used in all the bathrooms in the facility, in conjunction with dual flushometers for enhanced water savings.

LED fixtures were also used for task and accent lighting to provide high efficiency light sources. The inclusion of the LED “light wall” helped this technology not only illuminate the space in a creative way, but also infuse art into the space.

Low VOC emitting finishes were used whenever possible, including paints and flooring. For the majority of flooring, FGMarch specified recycled rubber flooring made from 72.8% post-consumer recycled tires. Any carpeting that was specified also certified compliant with green industry standards for recycled content, including PVC-free backing and padding, where applicable.

### [Northbrook Public Library, Northbrook, IL – USA 1999](#)

### [Summit Public Library, Summit, IL – USA 1999](#)

The Summit Public Library has moved into its new modern facilities which tripled its size. Public funds supported construction of a new 18,190 SF library, which replaces an out of date facility. Located on an important corner in the downtown area, the new library has become the village focal point and has generated public pride and economic growth for the merchants. The Summit Public Library has a diverse collection made up of Spanish texts, Adult Fiction, Non-fiction, Children's and Multimedia items. FGMarch has worked to house this collection with a mix of different types of community spaces. Features include an expanded Children's area with an exciting story hour room, a Quiet Reading room with comfortable seating, and a Public Meeting room, which fulfills the needs of community groups and organizations and provides library program space, which was missing from the original building. The new library has increased technological capabilities. In addition to Internet stations for children and adults, the library also provides an expanded multimedia department with books on tape, videos, CD's and DVD's. A drive-up book drop facilitates the convenience of using the new library. Most importantly the library has become an important civic presence for the community of Summit. Improved street lighting, sidewalks and an outdoor public space brightens the neighborhood and encourage growth in the surrounding areas. The entrance to the library has been moved away from the busy street, creating a safe point for arrival of families and library patrons. The result is a dramatic civic building for the community, contemporary library services for patrons, and accommodation of the needs of future expansion, providing community service for years to come. ## **Field Paoli, San Francisco, CA – USA**

<http://www.fieldpaoli.com>

#### **Libraries:**

### [Millbrae Library, CA – USA 2008](#)

The double height entry lobby at Millbrae's new 26,000 square foot library opens into light-filled reading and study areas. Expansive north windows look out onto tall willow and sycamore trees. As part of the planning process, Field Paoli also created Constitution Plaza at the center of the site, providing a shared civic center surrounded by the library, City Hall, a large community meeting room, and the town's relocated Historical Museum. (Field)

### [Tustin Library, CA – USA 2008](#)

Tustin Library is an innovative, green building, located in the existing Tustin Civic Center. The design features daylighting controls, under floor air distribution, large north facing windows, and extensive use of recycled materials. It is also configured so that it can accommodate a large field of photo-voltaic panels on the roof in the future. The library features a great children's area with an enclosed homework center, wireless access throughout, a new self check system, and a public literacy center. In addition to the new building, the project includes creation of a new central Civic Plaza with defined children's outdoor reading areas, a poetry corner, and the capacity to house large public events. The building also encloses three distinct courtyards with public access. (Field)

### [Marina Branch Library, San Francisco, CA – USA 2007](#)

The original Marina Branch library opened in San Francisco in 1954. Now, as part of a city-wide program of library renovation and modernization, the building was totally renovated and expanded to meet the current needs of the community. The scope of work

included upgrades for seismic, mechanical, electrical and accessibility, as well as a reconfiguration of the spaces to better meet current needs including current technology. Field Paoli are architects for this project in association with Tom Eliot Fisch. (Field)

#### **Almaden Library / Community Center, San José, CA – USA 2006**

Funds from two local bond measures were combined to create a new joint use library and community center set in an existing city park. The building's three wings accommodate a full service library; community room, gymnasium and fitness facilities; and dedicated activity rooms for children, seniors and teens. The 65,000 square foot building was carefully sited to wrap around a group of mature redwood trees and focus views to nearby park lands. Murals and a hanging glass sculpture by local artists are prominently displayed in the new space. Sustainable features include green building materials, permeable paving, high efficiency lighting, and maximum daylighting through clerestories and expansive courtyard windows. (Field)

#### **Belmont Library, Belmont, CA – USA 2006**

The new Belmont Library was designed to wrap around heritage oak trees in a three-acre neighborhood park. Expansive window walls in the adult and children's reading rooms face the park, providing ample north light and creating a magical space for reading and study. Amenities include self-checkout, a café and small outdoor amphitheater, custom rosewood furnishings, homework lab, and computer capacity to serve projected city needs for the next two decades. (Field)

#### **Vineland Branch Library, San José, CA – USA 2004**

Vineland Library is the first of 20 branch libraries in the City of San José funded by the local Branch Library Bond measure. The 24,000 square foot facility is based on the "San José Way" of library programming, incorporating retailing concepts such as new book displays and active kids zones. While sensitive to the scale of surrounding homes, the library building created a strong civic presence in a residential and commercial area with no existing public landmarks. (Field)

### **Fougeron Architecture, San Francisco, CA – USA**

<http://www.fougeron.com>

#### **Libraries:**

#### **Sunset Branch Public Library, Renovation, San Francisco, CA – USA 2007**

The project involves the renovation of a historic Carnegie library built in 1918. Work includes the complete renovation of both levels of the 9,500 square foot structure and the restoration of the exterior terra cotta and terrazzo. On the lower level, work included new public restrooms, a new program room and the complete reconfiguration of the Children's Room. Responsibilities also include selection of new lighting, shelving and all furnishings. The project required an extensive review and approvals process with the Landmark Preservation Board, the Mayor's office on Disability, the neighborhood community, and various user groups.

#### **RELEVANCE TO BERKELEY PUBLIC LIBRARY:**

- REHABILITATION OF EXISTING BUILDING
- HISTORIC PRESERVATION
- ACCESSIBILITY UPGRADES
- FURNITURE DESIGN
- IMPROVED & UPDATED BUILDING SYSTEMS

(Fougeron)

#### **Ingleside Branch Public Library, San Francisco, CA – USA 2009**

The Ingleside Branch Library in San Francisco was designed by Fougeron Architecture / Group 4 Architecture who won the national competition held by the San Francisco Public Library in 2002. The floor plan follows the urban grid and brings the consequence of L-shaped scheme. This scheme allows the egg-shaped reading room and community areas enclose the inner courtyard. The strong and light-filled design which is combined with sustainable design in this public building creates a welcoming gathering space to everyone. ([www//dulduld.com](http://www.dulduld.com))

### **Four Points Architectural Services, Inc., Akron, OH – USA**

#### **Libraries:**

#### **Bierce Library Learning Commons. The University of Akron, Akron, OH – USA 2011**

40,000 sqf., € 2,000,000

The renovation creates a contemporary library atmosphere by removing most of the print material from the 40,000 s.f. first floor and developing this space into a learning commons, based around digital technology. Integration of new furniture with the existing furniture further creates group and private study areas. New private group study rooms and an informal learning studio are also included. New casework was designed by Four Points for the Circulation Desk, MediaTech Services and User Support Services. The designs for each take into account the functionality and workflow of the spaces for both the employees and guests. New flooring materials were selected for the entire space that creates patterns that reinforce the functions and circulation patterns throughout the space. New furniture selections, textiles, materials and colors for cushioned chairs, task chairs, cafe furniture, and multimedia desks were also included in the scope. Four Points was the lead Architect, working with DesignGroup as the library design consultant. The first phase of the project included renovation of 9,500 s.f. of offices on the 2nd and 3rd floors. The project also included an 825 s.f. Einstein Bagels location. (Four Points)

#### **Libraries:**

Libraries are no longer mere repositories of the printed word. They have undergone a striking transformation, utilizing new technologies and thoroughly redefining the scope of their public mission. While much of the traditional library remains relevant and even essential - circulation, reference and periodicals - there are now new capabilities and innovative approaches that are driving the library of today and the future. In charting this new path, libraries have drawn inspiration from the business, retailing and hospitality sectors. Nimble, digitally-capable environments are now the norm - facilities where the quality of the patron experience is as important as a well-organized card catalog. At Freelon, we understand these changes have positioned the library as an ever more

vital component in the fabric of the communities they serve. For two decades, we have been active participants in the ongoing evolution of the library. Our expertise and portfolio of work exemplify the public library's marked transformation. (Freelon)

### [Martin Luther King Jr. Memorial Library, District of Columbia, Washington DC – USA on design](#)

In 2012, DC Public Libraries commissioned the Freelon Group to envision a future central library within the framework of an iconic Mies van der Rohe building in our nation's capital. As a conceptual planning study, the team worked closely with engineers, programming specialists, and the city's Historic Preservation Office to ensure feasibility.

The 21st century library is a place for knowledge creation. It is where we explore, connect to others, participate in communities, and create. It is both a portal to vast networks of information and an open forum for social interaction. It is quiet and personal, yet lively and public.

What, then, is the architectural expression of tomorrow's library in the nation's capital? DC Public Library is imagining a new flexible space within the existing walls of the Martin Luther King Jr. Memorial Library. Inspired by the progressive thinking of Mies van der Rohe (the building's original architect), this vision also lives up to the ground breaking aspirations of social inclusivity of the building's namesake Dr. Martin Luther King, Jr.

Tomorrow's library can be open, visually connected and filled with natural light. An expansive atrium can connect visitors to their destinations and reveal the multitude of daily activities and events. Equipped with the most up-to-date technology, the atrium – the new heart of the library – can be filled with a range of spaces for collaboration. The open plan creates visual access that transparently connects all parts of the building including access to a rooftop garden where customers can experience the library outdoors against the dramatic backdrop of the city.

District weighs proposals for renovating MLK Library while preserving historic status

By Philip Kennicott, September 19, 2012

By carving a large “donut hole” into the center of the existing Martin Luther King Memorial Library, the building could be an exemplary 21st-century main library space, full of light, open to multiple uses, easy to navigate and worthy of “a great city.”

Meeting on Wednesday night in special session in the main atrium of the rigorously modernist building — which is a study in right angles, rational layout and long vistas — the library's board heard proposals for how to renovate the dilapidated steel-and-glass icon. Ideas included adding two more floors to the existing four, renting space to other tenants, converting below-ground levels to commercial parking and adding a cafe space under its stern, classically inspired loggia.

At stake is the future of one of the city's most important examples of mid-century modern architecture, designed by Mies van der Rohe in the late 1960s — his only work in Washington, and his only library. The meeting advanced a process that began in November, when the library asked the Urban Land Institute to study its historically landmarked main building and consider all possible options. Among the possibilities on the table was to sell the structure and find a new home for a purpose-built main library branch.

This library was Mies' last building and his only one ever constructed in Washington, D.C. Additionally, it is the only public library ever designed by Mies. Completed in 1972, the building cost \$18 million. The building has been plagued by neglect and problems with its HVAC system. DCPL has recently restored lighting on the entire first floor. DCPL has also recently completed elevator and restroom renovations throughout the building.

On June 28, 2007 the District of Columbia's Historic Preservation Review Board designated this building a historic landmark. The designation, which applies to the exterior as well as interior spaces, seeks to preserve Mies' original design while allowing the library necessary flexibility to operate as a contemporary library facility. It was listed on the National Register of Historic Places in 2007

But Wednesday night's meeting suggests that the library is seriously considering the option of staying in its flagship, albeit with a major retrofit.

Library Board President John Hill said the purpose of the meeting was simply “to foster a discussion about the future of the library” and that no decisions would be made. But District librarian Ginnie Cooper said she had asked the library's architect of record, the Freelon Group, to build on ideas that emerged from the ULI report and to consider the question: “Is a knock-your-socks-off library possible?”

Freelon came back with two basic architectural plans, both of which require cutting a large light well into the center of the rectangular structure. One design would criss-cross that space with stairways and bridges to create more open and dynamic floors. The other would emphasize the verticality of the new light well, with a glass-walled auditorium fronting onto a soaring central atrium. Both designs would keep much of the ground floor essentially intact — a requirement of the building's historic preservation status — but would add stairs to allow patrons to circulate without using elevators.

Both designs include substantial renovation of the library's systems, in many cases the same ones in place since it opened. That includes \$12 million to replace the exterior glass windows — which, Freelon head Phil Freelon said, “waste energy to an appalling degree” — and \$3 million to give the metal framing a fresh coat of paint, its first in 40 years.

Although, aesthetically, the library was thoroughly modern when it opened, many elements — including the light fixtures under the ground-floor loggia — are now antiquated: Bulbs burn out every six months, and replacing the entire system with something more efficient would cost more than \$100,000.

The board also heard from real estate analyst Jair Lynch, who put some rough figures on the various options now before the board. Simply renovating the library as is, without the internal reconfiguration, would cost the District \$5 million to \$10 million a year in regular maintenance and upgrades. The plans presented by Freelon would cost between \$175 million and \$250 million. That could require an increase in the District debt limit, and could be a hard sell with the D.C. Council and voters. But other options, including a state-of-the-art automated parking facility below ground, might bring in new revenue, as would renting space on new floors added above the existing library.

The “dream big” approach of Wednesday's meeting was probably intended to generate momentum toward solving one of the District's most fraught architectural sagas. The Martin Luther King building is widely respected among architecture enthusiasts, and the city designated it a historic landmark in 2007. But despite new enthusiasm for the mid-century modern look, and concerted efforts at more consistent maintenance in past years, it isn't universally loved. As Freelon acknowledged, if the library site at Ninth and G streets NW were bare ground, he could build a new bells-and-whistles library much more cheaply than remaking the old one. Since at least 2000, when a team from the Washington chapter of the American Institute of Architects drafted a study for adapting the library, the city has studied, dithered and delayed finding a solution to the building's long-standing maintenance and design issues. In 2006, then-Mayor Anthony A. Williams (D) pushed hard for moving the library to a new home on the site of what was once the old convention center, but he couldn't sell the idea to the council.

### [District of Columbia Public Library, Tenley Friendship Library, Washington, DC – USA 2011](#)

Project Size: 21.472 sqft., Project Cost: \$10.200.000

#### Awards:

2011 AIA North Carolina Honor Award

The Tenley-Friendship Library has space devoted to children's services, including online access, a large collection of print and non-print resources (CD books, DVDs, mixed-media kits, etc.) for children from birth to age twelve. Children's librarians provide regular story programs in which they model early literacy behaviors and reader's advisory services to children and their caregivers to encourage reading and early literacy. Tenley Library is a welcoming civic building that provides a variety of spaces to meet a wide range of community needs. Spaces include a large public meeting room (for approximately 100 people), two smaller meeting rooms, a children's program room, as well as smaller rooms for group study and for tutoring. Stack areas for print and non-print materials are available for users of all ages. Multiple points of access to virtual spaces through the public PCs and wireless access for people with their own electronic devices are provided. The children's area has spaces (including collection and seating) dedicated to various age groups (five and under, beginning readers and elementary age). There is a distinctive area for Young Adults to meet and to learn. Adults have their own reading areas, online access area and a large collection of materials. A diverse, robust collection and online resources are available to users of all ages. A variety of spaces are accessible to individuals and groups to use, including study tables and chairs, lounge seating, group study and tutor rooms, and three public meeting rooms to accommodate groups of different sizes. (Freelon)

#### **Anacostia Library, Washington, DC – USA 2010**

Project Size: 22,348 sqf. Project Cost: \$ 10,300,000

#### **Awards:**

2011 AIA Triangle Honor Award

2010 AIA NC COTE (Committee on the Environment) Award (State)

2009 AIA NC Merit Award, Unbuilt (State)

2008 AIA Triangle Merit Award, Unbuilt (Local)

The Anacostia Library creates a civic building of which area residents can be proud. A variety of spaces to meet a wide range of community needs are in the new facility. Spaces include a large public meeting room (for approximately 100 people), two smaller meeting rooms, a children's program room, as well as smaller rooms for group study and for tutoring. There are shelving areas for print and non-print materials for all ages. Multiple points of access to virtual spaces through the public PCs and wireless access are included. The children's area has areas (including collection and seating) dedicated to various age groups (five and under, beginning readers and elementary age). There is a distinctive area for young adults to meet and to learn. Adults have their own reading areas, online access area and a large collection of materials. The Anacostia Library has a larger share of the library space devoted to children's services than in other branches, because its service area has more children than in other DC neighborhoods—both in numbers and as a percentage of the population. In addition to online access for children, there is a large collection of print and non-print resources (CD books, DVDs and mixed-media kits) for children from birth to age twelve. Children's librarians provide regular story programs in which they model behaviors and reader's advisory services to children and their caregivers to encourage reading and early literacy. (Freelon)

#### **South Branch Regional Library, Durham, NC – USA 2010**

Project Size: 25,000 sqf. , Project Cost: \$ 5,400,000

In May 2004, Durham County purchased the former Lowes Grove Elementary School site located at the intersection of South Alston Avenue and North Carolina Highway 54 for the development of a new South Regional Library. This facility is one several planned to support the County's long-range goal of providing the region with state-of-the-art lifelong learning and literacy resources. The new facility was originally conceived to be one of three prototype buildings. In order to recognize the former use of the site as one of significance to the Lowes Grove community, the prototype was modified to better respond to its more retail context. The library contains approximately 25,000 Sq. Ft. with provisions for a future addition of 10,000 Sq. Ft. It includes major spaces such as a large meeting room, administrative areas, adult collection, young adult collection, children's collection, various reading and study spaces, computer areas, reference area, and periodicals. The one-story structure is organized in a series of layers defined by heavy masonry walls and volumes. The front façade features a taller glass volume defining the main entrance and meeting room and providing an illuminated "lantern" during evening and dusk hours. A significant highlight of the design is the open and airy main reading space accentuated by a large shed roof that allows for maximum day-lighting and exterior views. Glazed walls at either end of the reading room provide a continuity of space and vistas into the surrounding landscape. The entire development accomplishes the goal of sustainable design in public buildings and exemplifies careful stewardship of the land and natural resources. The USGBC LEED® (Leadership in Energy & Environmental Design) system sets the benchmark for the design, construction, and operation of high performance green buildings. The design also incorporates CPTED (Crime Prevention Through Environmental Design) principles consistent with the County's goal of providing safer environments for the public. (Freelon)

[Haltom City, City of Haltom, TX – USA 2008](#)

[Lewisville Public Library, City of Lewisville, TX – USA 2007](#)

[Brownsville Southmost Branch Library, City of Brownsville, TX – USA 2005](#)

[Carrollton Library & Senior Center at Josey Ranch Lake, City of Carrollton, TX – USA 2004](#)

\$ 600,000 Owner: City of Carrollton

The new Carrollton Library and Senior Community Center enjoy commanding views of the 30 acre Josey Lake site. Site design fulfills two primary project objectives:

Integrate the new buildings with the natural environment. Native plant materials replace high water-use/ high maintenance ornamental typical of urban settings. Drought tolerant shrubs, perennials, and native grasses screen parking lots and enhance building foundations. All native plantings reflect the wetland/ prairie character to help ensure sustainability and low maintenance needs. Covered walkways and viewing terraces provide vistas of the lake and wetlands, with gently sloping walks to the lake trail below. The 3400 LF walking & biking trail takes visitors to the water’s edge, with connections to the adjacent city park trail and recreation facilities. Protect and celebrate wildlife habitat and wetland ecology Adjacent Blackland Prairie and bird rookery were set aside as protected zones during construction. Wetland edge native plants and native grass mixes create additional nesting sites for migratory birds and aquatic life already established in the area. Along the new hike/bike trail, redwood boardwalks, a pedestrian bridge, and lake pier access wetland and lake areas for wildlife viewing. Use of redwood decks and steel posts minimize water contamination by typical treated wood products. A “dry stream” outdoor classroom adjacent to the overflow pond provides an excellent opportunity to expand upon the library’s interior environmental programming and exhibits. (F&S)

### **Libraries:**

#### **Julia Idson Building, Houston, TX – USA 2011**

Constructed in 1926, the Julia Idson Building is one of Houston's civic treasures. A \$32 million renovation of the former main library resulted from a dynamic public/private partnership between the City of Houston and the non-profit Julia Idson Library Preservation Partners (JILPP). Providing a repository for Houston memorabilia and rare archival material, the "new" library serves as the official city reception space and venue for exhibits, meetings and special events. Designed by noted Boston architect Ralph Adams Cram, the Spanish Renaissance building is replete with polychrome painted ceilings, intricate woodwork, marble columns and lofty public spaces. The restored library introduces a south wing and reading garden that were unrealized features of Cram's original design. (Gensler)

#### **Leventhal Map Center, Boston Public Library, Boston, MA – USA 2011**

The Norman B. Leventhal Map Center at the Boston Public Library, created in 2004, is a nonprofit organization established as a public-private partnership between the Library and philanthropist Norman Leventhal. Its mission is to use the collection of 200,000 maps and 5,000 atlases for the enjoyment and education of all through exhibitions, educational programs, and a website that includes more than 3,700 digitized maps at [maps.bpl.org](http://maps.bpl.org). The map collection is global in scope, dating from the 15th century to the present, with a particular strength in maps and atlases from the New England region, American Revolutionary War period, nautical charts, and world urban centers.

The Leventhal Map Center is located on the first floor of the Library's historic McKim Building in Copley Square. It includes an exhibition gallery that features changing thematic exhibitions, a public learning center with research books and computers, and a reading room for rare map research. Other elements include a world globe three feet in diameter and a Kids Map Club with map puzzles, books and activities.

Educational programs for students in grades K to 12 are offered to school groups on site and in the classroom. More than 100 lesson plans based on national standards are available on the website, and professional development programs for teachers are scheduled regularly throughout the year.

The Leventhal Map Center is ranked among the top ten in the United States for the size of its collection, the significance of its historic (pre-1900) material, and its advanced digitization program. It is unique among the major collections because it also combines these features with exceptional educational programs to advance geographic literacy among students in grades K to 12 and enhance the teaching of subjects from history to mathematics to language arts. The collection is also the second largest in the country located in a public library, ensuring unlimited access to these invaluable resources for scholars, educators, and the general public.

#### **Darien Public Library, Darien, CT – USA 2009**

A long, flexible process helped the new Darien Library become the Northeast's first projected LEED Gold library building, while truly reinventing the public library

By Louise Parker Berry & Alan Kirk Gray -- Library Journal, 05/15/2009

The new Darien Library opened on January 10, 2009, a snowy day in our corner of Connecticut. After the speeches, the governor's proclamation, and the ribbon cutting, 7200 revelers headed toward the building (the crowds were so large, it took them more than 20 minutes to make their way in). Some 10,000 people visited that weekend.

When we first started thinking about how to provide new services to our community ten years ago, we had no idea how long it would take us, how much it would cost, or how, exactly, our plans would be realized. Certainly we had no idea of the technology involved, or that we would end up pursuing LEED (Leadership in Energy and Environmental Design) certification. And we could never have imagined the extraordinary building into which we'd eventually be moving.

We knew our project had a great pedigree. We already enjoyed strong community support—the library's use statistics were off the charts—and have for several consecutive years been ranked by Hennen's American Public Library Ratings among the country's top ten libraries. The library's trustees had created a long-range plan that set forth the community's need for additional services, concluding that a new building would have to be constructed. The subsequent building program was authored by Princeton Public Library, NJ, director Leslie Burger, also head of Library Development Solutions and later president of the American Library Association. Written in 2002 and significantly updated in 2005, it defined our new building needs clearly, including the need “to reduce maintenance and operating costs as much as possible...utilize efficient building systems and...achieve LEED certification.” We decided to work with Peter Gisolfi of Peter Gisolfi Associates in Hastings-on-Hudson, NY. Peter is an architect whose work we respected, someone who realized, as we did, the importance of a significant public building at the center of a New England community. Peter likes “heavy” buildings, but he imbues them with light and transparency, and we wanted our new facility to be open and accessible while also having a heavy, i.e., permanent, presence.

As it happened, our early planning was derailed in 2002 when our first idea—to acquire neighboring property and expand the existing 22,750 square foot library—fell through. In retrospect, it was a stroke of luck. On our initial trajectory, we would have built a better Darien Library, but we would have missed an opportunity to take our building vision, and our service vision, to the next level.

After several frustrating years spent looking for a suitable site in Darien, our perspective gradually changed. We shifted our focus to the future instead of trying to improve on the past. We stopped thinking about ourselves and about what we wanted and looked around the corner to a future we couldn't clearly see—a future in which we envisioned our patrons approaching us with entirely different concerns and values. We visited new libraries looking for takeaways and saw lots of great architecture but found few ideas we could use. So we decided to design a library entirely our own.

Considering what the future might look like

We knew the building would have to retain the small-town look and feel of the existing, 50-year-old library, which many of our users did not want to lose. We would be fanatical about making sure that every space in the new building worked exactly right. And we would place a big bet on technology as the means to allow us to provide an expanded array of services to each patron as an individual.

Our working partnership with Peter and his team was the most important element in the success of the project, because it was a true partnership. In a sense, we designed the library from the inside out, space by space, while Peter, as an architect does, designed the building from the outside in and from the ground up. At our request, he was a participant in every design meeting for the first three years.

We agreed on the building's core structure early on—a three-floor facility, plus a mezzanine, with an active main level, classic library functions on the upper level, and technology and computers on a lower level. When Peter first proposed this idea, he referred to Charles McKim's 1887 design of the Boston Public Library, a “palace for the people” with a busy main floor and a grand staircase that pulled people up to the second level.

That idea resonated with us, and it anchored us to hallowed library tradition, even on so much smaller a scale, but we had a different reference point: Ray Oldenburg's vision of libraries as described in his 1991 book, *The Great Good Place*. There, Oldenburg foresees libraries as “the third place,” that “heart of a community's social vitality, the grassroots of a democracy.” We wanted our library to be less what he referred to as “exacting, complicated and expensive internal arrangements,” i.e., less like a hospital, and more like a café or a bookstore, so that it would be at the heart of our community's social vitality.

With this perspective in place, we probably had a clearer view of what we wanted to accomplish than many other library clients do at the early working stage. This was sometimes to Peter's disbelief and sometimes to his dismay but often to the benefit of the project. In a couple of areas, we were breaking new ground as far as we knew, with our concept of a “Main Street”—an active central area with all our new books, DVDs, and audiobooks on CD arranged as though in a store, with sidewalk displays, café tables, connecting the Children's Room on one side and the Community Room (a 170-seat auditorium), café, and fiction stacks on the other. But it took more than nine months to agree on how the space would be laid out.

That's partly because we didn't have the same understanding of space as architects do. Architects know how big a space is just by looking at plans. We needed to see what the space was actually going to look like. We found a basketball court and bought a lot of blue painter's tape to lay out spaces like Main Street, to see how they would really work, where shelves would be, and if we could walk in and use it as our patrons would. In some cases, we were able to reduce the size of spaces when we realized what they were really like when they weren't on paper in 1/8" scale. We did it alone once but then included the architects, which was very helpful. Working together in a neutral environment, though not exactly a breeze, did promote the sense of us being on the same team.

We knew what we wanted to achieve on the lower level, where we placed most of the building's patron technology: a Power Library. The Power Library is as close to a learning commons as we could make it—a central space with PCs, a tech training center, a SO/HO (small office/home office) copy and binding center, two smart conference rooms that can be upgraded to allow for videoconferencing, and the Teen Lounge, which is a hangout space with books, chairs, and some fairly robust computers that can drive a flat-panel wall display.

We're much more comfortable than most libraries in putting computer users close together and letting them drink coffee while they do their work. We're also prepared to give a lot of help to users, so we saw the Power Library as an active, not a private, space, where users have a sense of being together. The values there are tech, not library. In a community where more than 95 percent of households have high-speed Internet access and nearly everyone has his/her own technology—a PC, at the very least—things get pretty busy. Kind of like a great good digital place.

Why is the Teen Lounge there, too? Someone said early on that we needed to put the teens next to either the coffee or the computers. Someone else said if they were close to the computers they'd be more likely to get into Harvard. Case closed.

Funding a higher price tag

Perhaps unique to Darien, the library board always knew the building project would be paid for with privately raised funds, as the existing library had been. The cost of the expansion, originally estimated at \$10 million, jumped significantly when it became a stand-alone building. We ended up with a design for a 54,000 square foot structure (including 7000 unfinished square feet on the lower level) and a project cost of \$28 million, including land acquisition and remediation. It is a library built to last a century, with steel columns and concrete block walls, brick and aluminum-clad windows, and a slate roof. The interior combines timeless New England and modern finishes.

George Wyper and Kim Huffard, as cochairs of the capital campaign and successive board presidents, took on the task of raising the \$24 million needed once we factored in the \$4 million proceeds from the sale of the old building. Their success is a tribute to their hard work and tenacity as well as to the community's widespread and longstanding support of our library. Though it didn't hurt that Darien, with a per capita income of over \$77,000, is one of the most affluent communities in the United States, this was a much larger fundraising effort than had ever before been attempted here. The citizens of Darien really took to heart the motto, “Once in a lifetime a community builds a library.”

The site we eventually chose was comprised of three properties, including a former gas station at which there had been several major spills. The environmental remediation project, which involved close coordination with the Connecticut Department of Environmental Protection, was complicated, lasted three years, and cost \$1.5 million. Dot Kelly, a socially aware community member who first joined our building committee, then later the board, played a major role in guiding us through the excavation and

contamination cleanup. She also enabled the library to receive a nearly \$1 million reimbursement from the state as a partial offset to those expenses.

#### The importance of materials handling

We decided early in our planning to use RFID technology as a means of rebalancing the services we could provide to patrons. We'd already invested in touch screens and omnidirectional barcode readers to make our circulation desks more efficient but still had to address that 90 percent of staff-patron interactions in the old building amounted to books and DVDs being pushed back and forth across desks.

After we studied RFID for several years, we realized that we needed to be thinking about materials handling—the automatic return and sorting of items—since that's where the potential savings lie. Because we were early enough in the planning process, we were able to avoid the problem we've seen with other libraries when RFID materials handling systems are put in as an afterthought, without getting much benefit for the expense they incurred.

We felt that the right way to approach the process was to involve the RFID vendors as active participants, not as passive respondents to a request for proposal (RFP). Out of the eight vendors with whom we'd consulted, we asked three to review our plans and propose the system they would install. Each examined our circulation statistics, a review of our operations, and the plans for the new building to make their proposals, which were then refined by a technology committee. At that point we asked each to make a financial proposal. On the basis of all this, we chose 3M to provide the RFID tags and self-check machines and FKI Logistex to provide the automated returns, conveyors, and sorting system.

Since the whole point of adopting RFID/materials handling technology was to allow us to provide better service to our patrons, we opted against having a circulation desk, which we felt has kept other libraries from achieving high patron self-check usage. Instead, we planned for a Welcome Desk, essentially a concierge desk for the building. But we didn't just dismiss our circulation staff.

Instead, those among them who were readers began a three-year education process to become readers' advisors (RAs). We sent them to conferences as well as brought in speakers from bookstores and publishing companies to share their insights, and we gave them the responsibility of purchasing all our fiction books. Main Street is their bookshop—they acquire the stock, and they handsell it. The remaining circulation staff, those who did not have futures as RAs, are mainstays in the materials management area, involved in the care and feeding of our automated return system and in organizing the shelvers who take the sorted return items and get them back on shelf.

Our adoption of materials handling technology caused us to consider the future of other critical interaction-based services like reference. In 2005, we asked ourselves: How long before patrons start IM-ing us their reference questions? How should we organize the library to manage IM and other kinds of internal and external e-reference services?

We spent the next four years trying to answer those and many other questions, and the resulting dialog influenced our thinking and design choices. For instance, we decided on “pods” as a way of describing the nature of our reference desk structures (meaning they would be collaborative spaces) but didn't have a clue what they'd look like. And we came up with “glades” as a way of expressing our plan to reorganize the nonfiction collection into browsing areas somewhat divorced from Dewey.

By 2007, on track to build a library we knew would be extraordinary, we put off design decisions on furniture and shelving [for more on furniture, etc., see p. 14] while working department by department on what services we would deliver and how we would do so. Throughout, we kept reminding ourselves that the new Darien Library was not our library but our patrons' library, the center of their community. This drove innovation, and change. We reconfigured our plans for children's services three times, for example, and our nonfiction shelving strategy four times.

#### Using technology to redefine user experience

We always knew we'd have an opportunity late in the project to decide on technology, since new generations of technology tend to follow closely on one another's heels. Leading up to that, we asked such library tech luminaries as Michael Stephens, Aaron Schmidt, and Jenny Levine to speak to our staff, we hosted conferences, and we made sure to stay current on the latest thinking and trends. We also attended conferences other libraries typically don't, such as InfoComm, which bills itself as the world's “largest information communications” conference.

It wasn't until we convinced John Blyberg of Ann Arbor District Library, MI, to join us in 2007 that we began actively planning the role of technology in our library. Technology ultimately became an integral part of the services we provide, and we attempted to infuse it into the library experience in ways that aren't glaring when they don't need to be.

This attitude led to a major innovation: Blyberg's concept of a UX (User eXperience) team to oversee all the technology-based interactions between patrons and the library, whether virtual or onsite.

Say you ask an information services librarian a question about the Crimean War—you might not recognize it's an ASUS EEE PC subnotebook she's using to access a database for you, you're just grateful to get the information you want. Similarly, if you're in the Technology Center taking a class on Excel, you don't care that you're looking at an 82" Samsung flat-panel display, you're just enjoying seeing all the details. And if a book you want is on the shelf, you might not give a thought to the role the materials handling system played in getting it there. The aim of Blyberg's UX team is to address the reality of these and other patron experiences and continually seek better ways to deliver the appropriate services.

We also wanted technology to create a contrast between the timelessness of the building and the immediacy of the digital world. To that end, we installed flat-panel displays driven by a neat piece of InfoComm software called Sedna Presenter to lighten our Main Street area. To make the statement that the library is committed to providing patrons access to the latest and best technology, we put 24" monitors on the ASUS EEE PCs in the Power Library and a Microsoft Surface in the children's room. (The former was a relatively inexpensive statement to make; the latter, at \$15,000, a costly one.)

#### The next generation library

In 2005, we'd decided we wanted to build the first of the new libraries, not the last of the old. We felt a responsibility to do something more than just expand on the success of the existing Darien Library. Our goal was not bravado, just a way of saying, “We haven't figured everything out yet, but we will.”

What we've learned in the intervening years is that we haven't figured everything out yet—and that we're not likely ever to. That said, when we unveiled the new Darien Library in 2009, we opened the doors to a wonderful building that fulfilled its ten years in the making. It is all we ever dreamed it might be—a library that will stand for generations as a tribute to this community's commitment to knowledge and learning and, we hope, a library to meet the opportunities and challenges of the future.

#### Author Information

[Yale University, Timothy Dwight College Library, New Haven, CT – USA 2003](#)

192,000 sqf., cost per sqf. € 280.00

The new library for Timothy Dwight College consists of three interconnected, light-filled floors overlooking the Libraries/Media Centers quadrangle. The top floor incorporates the original Timothy Dwight Library and reading room with a barrel-vaulted ceiling. The mid-level (formerly lounge and bathroom space) replicates the panel details of the original, and provides reading rooms and additional space for the collection. The lower level (formerly basement space) provides additional reading space and a computer

center. The library shares the “town hall” entrance with the commons, the expanded dining room and the new servery, and it connects to the basement level, which is dedicated to new student activity spaces. Its three entrances are adjacent to the ceremonial stair, which connects all of the student activity spaces within the college. Thus, the library becomes the centerpiece for student life at Timothy Dwight. (<http://schooldesigns.com>)

### **Libraries:**

**[Syracuse University, The Warehouse, Syracuse, NY – USA 2006](#)**

This project for Syracuse University is part of the Chancellor’s initiative to help revitalize the city center by creating a dynamic downtown presence for the University. The 140,000 sf renovation of a 1920s warehouse building is a temporary home for the School of Architecture, and a permanent downtown location for several School of Visual and Performing Arts programs. The building houses a 125-seat lecture hall, reading room, community and student gallery spaces, café, community and arts incubator spaces, administrative offices, library storage, and studio and classroom space. Driven by an extremely aggressive one-year fast-track schedule and a \$50/sf budget, the facility has been fully renovated with new mechanical, electrical, plumbing, and fire protection systems, and the installation of new elevators. A significant portion of the existing building skin was removed in order to create transparent, lively interior spaces open to the historic urban center. (Gluckman)

**[Robin Hood Library for PS 192, New York, NY – USA 2005](#)**

As part of its “Library Initiative” with the New York City Department of Education, the Robin Hood Foundation commissioned Gluckman Mayner Architects to design a 2,400 sf. elementary school library for PS 192 in Harlem. The renovation incorporates sustainable and child-friendly materials, as well as custom casework, into a bright, playful and inviting space for reading. A long, stepped window seat with jewel-colored cushions serves as a comfortable reading area and as amphitheatre-style seating for performances. Light fixtures that suggest books with flapping wings, and a ceiling that is papered to look like a blue cloudy sky, create a whimsical atmosphere. Major materials, including bamboo flooring, formaldehyde-free wheat straw board, and recycled plastic, were selected for their low environmental impact and low cost. (Gluckman)

**[Hockaday Upper and Lower School Library, Liza Lee Academic Research Center, Dallas, TX – USA 2001](#)**

**In cooperation with: Overland Partners**

### **Awards:**

**AIA/ALA Library Building Award 2003**

Good Fulton & Farrell collaborated with Overland Partners of San Antonio to deliver three important new buildings and a significant renovation for this prestigious north Dallas school for girls. Hockaday’s 54,000 SF Academic Research Center houses libraries for the lower school and the middle / upper school, uniting the campus, and enhancing a treed courtyard. This linkage addresses physical and psychological connections in a school serving a wide range of ages. The design serves as a counterpoint to the 1960’s rational concrete frame-and-infill of the original facilities. While adopting the structural rigor of the early buildings, the ARC introduces soft curves in the same St. Joe brick. Large planes of glass are protected from the Texas sun through motorized sunscreens. The building received design awards from the Dallas Chapter AIA and the American Library Association. (Good)

## **Gould Evans, Kansas City, MO – USA**

**<http://www.gouldevans.com>**

### **Libraries:**

**[Lawrence Public Library, Kansas MO – USA 2014](#)**

Last week (July 2011) the leaders of the Lawrence Public Library in Kansas unveiled the new design for a \$19m expansion of a library located at Seventh and Vermont Streets. Designed by Gould Evans, the expansion adds 20,000 sq ft of space to the existing 47,000 sq ft building and dramatically transforms its appearance with long horizontal windows framed by terra cotta stone panels to give it ‘a more open and natural feel’. At the unveiling, Library Director, Bruce Flanders described the design as ‘inspirational’. But judging from the over 100 posts on the Lawrence Journal’s web site, a local newspaper, the design has been overwhelmingly derided by those who weighed in as ‘too expensive’, and ‘out of character’: not to mention ‘a butt ugly building’ that ‘looks like a child’s Lincoln log set’.

Perhaps the comments are a sign of the times...mere tensions between a community that seeks to curb public spending and the powers that be that see it differently. But clearly this is not the reaction one hopes for when vetting a new design to the public. The project does have some controversial aspects that have yet to be addressed, namely how to make the building appear more ‘monumental’ when the adjacent parking garage that is part of the project has yet to be designed and will be at least a storey taller than the library proper, due to structural limitations of the existing library building. While the comments about the design could be called a ‘rush to judgment’ as so much more is yet to be learned, one could equally argue that the design itself was rushed in to public view. The integration of the parking garage is an important aspect of this project and one that is especially concerning to the locals. Going forward, the library plans to host several public forums on the design to get more feedback before taking the plans to

the City Commission for approval in mid-August. Jane Huesemann, a principal with Gould Evens, told the Lawrence Journal that 'the current plans call for the garage to be 10ft taller than the new building'. If city commissioners decide to add another level to the garage, resistance to the current design may grow. Sharon McHugh, US Correspondent (<http://www.worldarchitecturenews.com>)

Lawrence city commissioners on Tuesday saw the latest designs for a \$19 million expansion of the Lawrence Public Library and put the project on track to begin construction by mid-November.

"We really wanted to make this a signature public building," said City Commissioner Aron Cromwell. "All the elements really have come to play here. It will have a public-square feeling to it."

The design for the library, though, looks different than when it was unveiled by library leaders last year. The building still uses large amounts of terra-cotta stone, but the new design uses more glass at the corners of the building and along Vermont Street.

"I think it is a design that is very open," said Sean Zaudke, an architect with Lawrence-based Gould Evens. "We want a design that explains how the library can support the community."

The main way it does so is by letting the community see into the library. The new design put a particular emphasis on making the youth and teen rooms of the library on public display by making them visible from Vermont Street.

The inside of the building also will include fewer walls and more wide-open spaces, Zaudke said. Several reading rooms will be on the perimeter of the building, with larger, more bustling rooms near the building's main entrance at the southeast corner of the building. Smaller, individual reading rooms will be on the west and north sides of the building.

City commissioners also got their most detailed look yet at the parking garage design. Plans still call for a perforated metal skin to cover most of the garage, although glass towers to house stairways and an elevator also will be used.

"We really want to make the interior environment of the garage as open and light-filled and ventilated as possible," Zaudke said.

The parking garage will be the first part of the project under construction. Commissioners on Tuesday unanimously agreed to seek bids for 18 different bid packages, ranging from concrete to steel work, for the garage. Bids are expected to be approved by Nov. 6, and work would begin by Nov. 15.

Architects hope construction of the garage will be completed by June. Work on the library itself isn't expected to begin until February. April 2014 is the tentative completion date for the project.

Commissioners on Tuesday left their options open regarding how large the parking garage will be. The new garage will include at least 250 spaces — up from the 125 spaces currently provided in the library's surface parking lot. Commissioners also are considering adding an additional level that would provide another 72 parking spaces but are still considering ways to pay for the project. The bids for the parking garage will include amounts both with and without the extra level.

In other news, commissioners:

I balked at the idea of allowing \$695,000 in land acquisition costs to be reimbursed through a tax increment financing district for a proposed hotel development at Ninth and New Hampshire streets.

The development group, led by Lawrence businessmen Doug Compton and Mike Treanor, had sought to have the costs to purchase the land added to the list of items eligible for reimbursement through the TIF district.

But commissioners said it was too late in the process to bring up the request. A representative of the development group said the hotel project will continue on without the reimbursement.

**Awards:**

[AIA Honor Award 2007](#)

[Cedar City Library, Cedar City, Utah – USA 2003](#)

The Cedar City Public Library has won three awards since it moved to its new building in September 2003.

"We have received a number of awards," said Steve Decker, the library's director.

"American Institute of Architects awarded us with the Merit Award. AIA and the Utah Masonry Council presented us with the Best of Show Award."

He said the library was just notified a couple of days ago that it received the Intermountain Contractor magazine's Silver Award. Decker said he thinks the library has received so many awards because of Gould Evens Associates, the architectural firm that built it, and the large amount of community participation.

"I think we have been receiving these awards because we chose a firm with library experience," Decker said. "We also had community input. We held meetings where the community could come and tell us what they liked and didn't like. We didn't incorporate the negative things. We also had a good working relationship between the builder, architect and the owner."

Rob Beishline, associate architect for Gould Evens, said the library board was wonderful to work with.

The groundbreaking took place in September 2002 and was completed a year and a day later in September 2003.

Beishline said the new library was built to have a connection with the Main Street Park.

"We wanted a strong relationship with the park," he said. "We wanted readers to be able to see out into the park and to feel like they were out there while they were reading. That is why we used a lot of glass on the south side of the building."

Beishline said they focused on using natural materials.

"We wanted to use natural materials like red sandstone, reclaimed timbers and wood columns," he said. "The trestles are from the Great Salt Lake from the bridge stockpile. We bought some of them because we felt they had character in them and the stone.

"(The library) has a nice sense of proportion, and it feels comfortable," Beishline added. "We were careful to address the details, like the way the signs are bolted to walls and the way the light fixtures hang."

**Libraries:**

[Kavali Institute. University of California, Santa Barbara, CA – USA 1994 – 2004](#)

The Kavli Institute for Theoretical Physics is located at the eastern gateway to the UCSB campus, where its two splayed wings are oriented to the engineering complex on one side and to Lagoon Road overlooking the Pacific Ocean on the other. A cylindrical pavilion containing the library anchors one end of the building. A second-phase expansion filled in a former courtyard between the wings and created a bar-shaped addition with offices, meeting rooms and a small auditorium oriented to a gathering space at the

center of the plan, where interaction among faculty and researchers is encouraged. The character of the original building and the picturesque nature of the expansion are in keeping with the traditions of Spanish mission architecture in Santa Barbara. Clay tile roofs and stucco exterior walls are typical of the area. Wood trellises supporting climbing vines that screen the interior from the sun reinforce the connection to the landscape. (Graves)

#### **Martel College, Rice University, Houston, TX – USA 2002**

#### **Topeka & Swance County Main Library, Topeka, KS – USA 1995 – 2001**

Upon the 125th anniversary of its founding, the Main Library of Topeka and Shawnee County commissioned a total renovation of its 65,000-square-foot building built in the 1950s and an expansion of 100,000 square feet. New space is wrapped around the existing structure, resulting in redesigned facades that integrate the new and old portions of the building and re-establish the Library's identity as one of Topeka's most important public buildings. A three-story rotunda on axis with Washburn Street creates a new public entrance facing public parking. Flanking the entrance are several community facilities, including a 360-seat auditorium, a café, a bookstore, and a 3,500-square-foot art gallery. The circular lobby reinforces the communality of these amenities and leads to the Topeka Room on the third level. Large circular skylights allow natural light to enter the building during the day and create a monumental beacon when lit from within at night. Internally, the intersection of the building's east-west and north-south axes is distinguished by an atrium lit from above by a skylight. The atrium allows users to orient themselves within the Library and gain access to the surrounding Adult Collections, Periodicals and Youth Services Departments. While each of these departments has its own architectural identity, the openness of the plan allows flexibility for future program changes. On the north and west sides of the building, adjacent to the large open spaces, intimate reading areas allow individuals to sit and read quietly by the windows. (Graves)

#### **Charles E. Beatley, Jr. Central Library, Alexandria, VA – USA 1996 – 1999**

#### **Brown and Jones Colleges, Rice University, Houston, TX – USA 1999**

#### **Denver Central Library, Denver, CO – USA 1991 – 1996**

Denver Central Library, the eighth largest library in the U.S., is located on Civic Center Park between the city's art museum and history museum. The project encompassed a renovation of the existing 133,000-square-foot library, designed by Burnham Hoyt and completed in 1956, and an expansion of 405,000 square feet. The scale and coloration of the expansion, as well as the individualized massing of its components, allow the original library to maintain its own identity as one element of a larger composition. Two public entrances establish an east-west axis through the Great Hall, a three-story vaulted public room of urban scale, which is the focal point for visitor orientation and circulation. The south-facing rotunda contains specialized functional areas such as the reference room and periodicals center, with the Western History Reading Room above. (Graves). Date: 1991-1995; Renovation 1996 Location: Denver, Colorado, Size: 526,000 sf., Studio Head: Thomas Rowe, Associated Architect: Klipp Colussy Jenks, DuBois Architects, PC

#### **Clark County Library, Las Vegas, NV – USA 1994**

Date: 1994. Location: Las Vegas, Nevada. Size: 120,000 sf. Studio Head: John Diebboll

Associated Architect: JMA Associates (JMA Associates: (<http://www.jma-arch.com>))

The original 50,000-square-foot Flamingo Road Branch of the Clark County Library, constructed in 1968, had deteriorated significantly when MGA was hired in 1990 to design an expansion. The project ultimately included complete renovation of the existing building and expansion on all sides, a strategy that simultaneously remedied the deficiencies of the original structure and provided a new exterior image. MGA's plan expanded the library by 27,000 square feet and added a 43,000-square-foot community wing with a 400-seat thrust-stage theater. (Graves). Date: 1994. Location: Las Vegas, Nevada. Size: 120,000 sf. Studio Head: John Diebboll

114,000 sqf., \$ 20,800,000

#### **Awards:**

2002 American School & University 20th Anniversary Architectural Portfolio, The Integrated Learning Center at the University of Arizona, Tucson, Arizona

The Integrated Learning Center is a below-grade academic facility for freshmen students that incorporates the latest digital-learning technologies. Situated in the center of the University of Arizona's mall, the site was chosen so that freshmen would feel more involved in daily university life. The building has an information commons, 300 – 150-seat theaters, two lecture halls, classrooms and administrative offices. The information commons connects to the lowest level of the main library in a series of five separate "trays." Sunlight streaming into the information commons from the main entry stair is diffused by fritted, low-e green glass. The central courtyard also provides natural light and offers a flexible gathering space for spontaneous interaction or planned functions. Materials such as red brick and mill-finished aluminum were chosen to complement surrounding campus structures.

(<http://schoolsigns.com>)

### **Grimm + Parker Architects, Calverton, MD – USA**

Grimm + Parker Architects has recently planned and designed over 20 public libraries. With over 16 years of award-winning public library experience, combined with over 36 years of public architecture experience, our team is especially qualified to provide high quality library design services.

We are abreast of the latest trends in library services and technologies. We share our specialized knowledge and expertise in library furnishings, library lighting, library acoustics, and library technologies with our clients. Our award-winning library designs are not only attractive and inspiring, but highly functional, user friendly, easy to maintain, and cost-effective. Our extensive library experience allows us to share valuable insights into state-of-the-art library design and construction with our clients. We have developed expertise on issues such as construction costs, operating costs, mechanical systems, maintenance concerns, energy consumption, technology integration, and library security systems.

This expertise allows us to design public libraries that can be built both on time and within a client's specified budget with few construction changes. We have worked closely with library boards, library staff, and Friends of the Library in numerous library systems to help them achieve their visions for their systems. (Grimm)

**Rockville Library, Rockville, MD – USA 2006**

**Prince Frederick Library, Prince Frederick, MD – USA 2006**

The Prince Frederick Library is a 29,000 gsf, two-story building located in Prince Frederick's New Town Center and surrounded by retail, shopping, and nearby residential. The library is located in the heart of Calvert County, Maryland - a peninsula which is bound on the east by the Chesapeake Bay and on the west by the Patuxent River.

Interesting local features are the famous "Calvert Cliffs" (which are embedded with prehistoric fossils and overlook the Chesapeake Bay), the Drum Point Lighthouse, the history of boat building, the history of farming, and the numerous historic tobacco barns in the surrounding region.

The library's design refers to and celebrates many of these local features:

- The massing of the building takes its shape from local tobacco barns and boat building sheds;
- The main stair of the library is physically expressed as a lighthouse on the exterior of the building;
- The masonry coursing at the base of the building is reminiscent of the rock strata that forms the famous "Calvert Cliffs." (Grimm)

**AIA Honor Award for Architectural Excellence, AIA Potomac Valley Chapter**

**Governor's Smart Groth Award**

**Masonry Design First Place Award for Architectural Excellence, Masonry Institute Mid Atlantic**

Downtown Frostburg has a new landmark building on Main Street. The 20,000 g.s.f. Branch Library for Allegany County infills an empty lot in the fabric of this historic center. The library is above an open parking structure.

Exterior massing and the facade respond to the local and regional context of traditional masonry buildings. The detailed masonry exterior incorporates regional influences in elements such as arches, masonry checker-boarding, and accent banding.

The facility includes public meeting rooms; adult fiction; adult non-fiction; young adult collection; children's collection; audio-visual collection; reference; periodicals; computer catalogs; study areas; reading areas; staff work areas; public restrooms; an information desk; and a circulation desk;

Technological capabilities correspond with the progressive development of libraries throughout the region. The flexible design allows for incorporation of future technological advances. (Grimm)

### **Libraries:**

**Otay Ranch Branch Library, Chula Vista, CA – USA 2012**

Group 4's strategic facilities plan for the Chula Vista Public Library recommended taking advantage of opportunities to supplement service in east Chula Vista. One such opportunity is the City's new partnership with the management of regional shopping center Otay Ranch Town Center. The City and ORTC management commissioned Group 4 to design the new mall branch to meet both parties' goals, which include increasing community access to library services and increasing customer traffic to the shopping center. The project transformed three retail spaces totaling 3,500 square feet into a vibrant branch library emphasizing popular materials and technology. In addition to significant financial support from shopping center management, the project also was made possible through generous donations from the Chula Vista Public Library Foundation and the Friends of the Chula Vista Library. (Group 4)

**Oakland 81st Avenue Branch Library, Oakland, CA – USA 2011**

### **Awards:**

**Citation Award - American Institute of Architects San Mateo County Outstanding Project - American School & University Magazine California State Library grant-funded**

## LEED-NC Gold

The new 81st Avenue Library is a civic and community beacon for this underserved east Oakland neighborhood. The largest branch in the City's library system, it also serves as a new academic library for two elementary schools located on the same site. A large dedicated teen area, quiet reading room, and preschool area are zoned to provide multi-generational use with acoustic control. The distinctive architectural form and vibrant interiors reflect the library's commitment to innovation and sustainability. The building incorporates many innovative energy saving techniques and achieved LEED Gold certification. Group 4 prepared a successful application to the California State Library for a multi-million dollar construction grant.

This project grew out of the Group 4 prepared system-wide master facilities plan that also included a feasibility study for a new 160,000 sf main library.

The groundbreaking ceremony was held in May 2008. The grand opening of the new library was held on January 29, 2011. Click here for KCBS' report on the opening. (Group 4)

### [Scotts Valley Library, Scotts Valley, CA – USA 2011](#)

#### **Awards:**

IES National Award of Merit

Group 4 transformed an existing roller skating rink into a dynamic, light-filled library for Scotts Valley. On a limited budget and quick schedule, Group 4 worked with staff and the opportunities inherent in the existing building to create a design with minimal columns and an open, flowing floor plan.

Working within the existing shell, Group 4 organized the library around a new suspended polycarbonate lantern that brings in daylight and creates programmatic divisions while maintaining the generous interior volume. The teen platform re-creates booths from the original roller rink, and supports gaming and collaborative learning. The salvaged disco ball will be available for special night time programs.

Retail tenant space is also being developed adjacent to the library as part of this mixed-use redevelopment project. The library's grand re-opening was held in June 2011. (Group4)

### [Walnut Creek Library, Walnut Creek, CA – USA 2010](#)

The new Walnut Creek Library is the culmination of the community's vision and years of planning. The design is not only an efficient solution to the building program, but also a synthesis of the disparate desires of the community and user groups into one cohesive whole. Although the new library will more than quadruple the size of the former building in Civic Park, re-siting of the new building will result in a net gain in green space in the park as well as a stronger connection with Walnut Creek's civic center and downtown commercial districts. The new library incorporates a wide variety of green design strategies, including daylight harvesting, an advanced mechanical system, and recycled materials. The placement of 80% of parking spaces under the building and plaza areas reduces the heat island effect of paving and preserves space in Civic Park.

The grand opening of the new library was July 17, 2010. (Group 4)

### [South San Francisco Main Library Interior Renovation, South San Francisco, CA – USA 2010](#)

Group 4 worked with South San Francisco Library staff to create a new library within the shell of the existing 1966 main library building. Group 4's design supports an updated operational model and more efficient work flow for staff, as well as improved customer access to materials and services.

Group 4 designed an arching library "marketplace" that connects the building's two existing public entrances and displays new books, high circulation material, holds, and displays and exhibits. To maximize the limited budget, much of the existing furniture was refinished and combined with selected new furniture. Carpeting and wall finishes completed the transformation which has been hailed as "a diamond for a dime."

The renovated library re-opened to the public in April 2010. (Group 4)

### [Ingleside Branch Library, San Francisco, CA – USA 2009](#)

#### **Awards:**

Citation - American Institute of Architects San Mateo County

Special Citation - American School & University Magazine

Kirby Ward Fitzpatrick Prize - Architectural Foundation of San Francisco

The Ingleside Branch Library is a new community jewel along Ocean Avenue in San Francisco. Designed by Group 4 in association with Fougerson Architecture, the 6,100 square foot branch features a main reading room, a children's reading room, a community room, staff support space, and an outdoor garden — all on a small corner site in the heart of an urban commercial center and surrounding residential neighborhood.

San Francisco Chronicle architecture critic John King praised the new library: "...with its egg-shaped children's room, mahogany-framed study nooks and a roof that hovers eight feet above the entrance, the Ingleside Library sends an ambitious message that public buildings can strive to be civic landmarks, sources of neighborhood pride as well as books and DVDs." (Group 4)

### [Milpitas Public Library, Milpitas, CA - USA 2009](#)

#### **Award:**

Merit Award - AIA East Bay Chapter

Group 4's expansion to a 1916 grammar school building serves not only as the new Milpitas Public Library, but also as the centerpiece of the city's new North Main Street redevelopment district. New north and south wings frame and embrace the historic structure, complementing its strong classical design with bold, dynamic elements that celebrate the integration of the past and the future. A largely transparent building, the new library admits abundant light through well-oriented clerestories. A new tensile canopy transforms the school's central courtyard into a bright public reading room. The south tower features art that celebrates Milpitas history. The new library opened to the public in January 2009. (Group4)

### [San Leandro Washington Manor Branch Library, San Leandro, CA - USA 2009](#)

#### **Awards:**

Honor Award - AIA San Mateo County Chapter California State Library grant-funded

The new San Leandro Washington Manor Branch Library is a study of light and space. Windows along the street both define and blur the edge of the building, admitting reader-friendly light while preventing glare and heat gain. Bold and elegant details connect wood, steel, and concrete in a robust and dynamic, yet surprisingly delicate structural system. At night the library becomes a glowing beacon, inviting the community in for events, conversation, or even just a comfortable chair and a good book. Intuitive wayfinding and express-checkout stations enable customers to get in and out of the library quickly, while attractive displays and comfortable seating areas tempt them to linger. The program room doubles as overflow computer lab and study space. The circulation desk and the staff work room have excellent visibility of public areas as well as a streamlined flow of materials from the drops to the shelves. (Group 4)

## [Santa Clara Central Park Library, Santa Clara, CA – USA 2007](#)

### **Awards:**

Technology Award, First Place – ASHRAE Golden Gate Chapter  
Technology Award, First Place – ASHRAE Region X  
Award of Merit – APWA South Bay Chapter

Designed for a strong connection with its namesake park, the new Santa Clara Central Park Library provides both innovative and traditional services. Park-facing pavilions provide spacious and light-filled reading rooms, each with unique architectural features and gardens between. Underlying the warmth and beauty is one of California's most technologically-advanced libraries, with facility-wide wifi as well as RFID and automated materials handling systems. The library showcases original commissioned works by national artists celebrating the value and wonder of reading, knowledge, and creative thought. Sustainable design features include an award-winning variety of innovative systems, materials, and technologies. The project was completed on schedule and under budget, and received major utility rebates. (Group 4)

## [Burlingame Public Library, Burlingame, CA – USA 1997](#)

Following the 1989 Loma Prieta earthquake, the City again approved a bond issue to reconstruct a new main library. The original children's room and reference room, including the original furnishings were restored and reused in the reconstructed library. The library grew from 27,000 square feet to 48,000 square feet and maintained much of its original charm and period appeal. On October 4, 1997, the library was rededicated on the Bellevue and Primrose Roads site. The library was opened to much acclaim by then California State Librarian Kevin Starr and seven term Congressman Tom Lantos. The awarding winning architecture was featured in Library Journal in December 1997 and was a cover story in American Libraries in April 1998.

### **Awards:**

Honor Award AIA San Mateo County Chapter

### **Literature:**

"The Jewel of Burlingame" cover story in American Libraries, April 1998

This classic Community Library building was originally designed by prominent peninsula architect Colonel Norberg and constructed in the early 1930's (May 1931). The popular community landmark was completely gutted and totally reconstructed, with 15,000 square feet of additional space, including a new expanded full floorplate Basement and a new Second Floor. O'Mahony & Myer was retained to provide electrical engineering and lighting design services for the complete reconstruction and expansion. The lighting for this project was deemed to be critical to the overall success of the Architect's "historic" scheme, and was carefully designed by the staff of our lighting design studio, Peters & Myer, to both augment the period architectural design as well as provide the high levels and quality of light so necessary in a modern Library facility. Included in this effort was the development of a "family" of custom period chandeliers and wall sconces that use energy efficient lamps and ballasts. Our staff designed "period" pendant luminaires that are separated into lower (and low wattage) lamps within the hanging globe, and an array of upper lamps that bathe the ceiling in light. The results are soft glowing alabaster-like globes that are easy on the eyes, while providing abundant indirect illumination throughout the library.

All other specialized power, data and communications systems, including provisions for future evolution and expansion, were carefully incorporated into the finished project. The library also features a flexible electronic infrastructure as well as energy-conserving electrical systems.

([http://www.ommconsulting.com/projects/library/burlingame\\_library.php](http://www.ommconsulting.com/projects/library/burlingame_library.php))

Group 4 took to heart the Burlingame community's desire to build a much larger library without losing the charm of the original 1930s Italianate building, resulting in an expansion so well integrated that it feels like a wholly new building. Significant details from the original library were cast and reproduced in the addition in a seamless integration of the old and the new. The new library offers high levels of service and enhances the unique character of downtown Burlingame.

The distinctive entry tower showcases the library's collection of 17th and 18th century tapestries. A spacious skylit stairway provides a clear wayfinding cue, guiding customers to the public rooms on three floors. The library also features a flexible electronic infrastructure as well as energy-conserving mechanical and electrical systems. (Group 4)

[Allen County Public Library, Addition and Renovation, Fort Wayne, IN – USA 2007](#)

This two-story, 127,000 square foot addition to and renovation of the existing 240,000 square foot Allen County Public Library in Fort Wayne, Indiana creates a monumental civic building that integrates the best aspects of the existing library and acts as a revitalizing influence in the downtown area. The design identified the basic urban and architectural strategies that met the goals of the library and the community. The selected design gives the library, which has one of the largest genealogy collections in the nation, an image that reflects its prominent role in the community and enhances the urban context. It will make a significant portion of the collection "browse-able" by expanding open stacks. There are two public entrances to the expanded facility. The existing re-imaged Webster Street entrance maintains the current easy pedestrian access from downtown and incorporates a Café and Library Shop to permit a synergy of uses. The new Ewing Street wrap-around entrance integrates the connection to the new below-grade parking and includes a major glass component that affords attractive views to neighborhood churches and the historic district. The east and west entrances are interconnected by the great hall, which provides clear visual orientation and access to all library departmental facilities and seamlessly integrates the existing renovated spaces and the new construction. The curved roof of the great hall contains a large north-facing skylight and a shaded south-facing clerestory window, bringing daylight into the center of the building. The great hall can be separated from the library spaces, so that community functions can extend past library hours if needed, without compromising library security. The central great hall also houses the Circulation Desk, Central Reference Desk, self-check stations, electronic catalog stations, and informational components, as well as stairs and elevators to the Library's second level, the new Auditorium on a lower level, and the Garage below grade. Community use facilities are organized along the southern side of the first floor, between the great hall and Washington Blvd. These spaces include flexible Meeting Rooms, Access Fort Wayne Television, Community Computing and Public Computer Training, an Exhibition Gallery, the Café, and the Library Friend's Store.

(Gwathmey)

[Akron Summit County Public Library, Akron – Akron, OH - USA 2004](#)

**Awards:**

**AIA Cleveland – Citation 2007**

**Associate Architect: Richard Fleischman Architects, Inc.**

The 270,000 square-foot library building reestablishes the public and institutional image of the Main Library and reinforces downtown Akron as an urban, cultural and architectural center. The design of the facility reflects the Library as a patron-friendly place, accommodating its users in a variety of environments. The new addition negotiates the twenty-five foot difference in elevation between High and Main Streets. A three-story atrium along High Street brings natural light down to the lowest Main Street level and provides orientation for all patrons. The assemblage of building "objects" along Main Street includes the new library loft addition and the new theater flanking the existing library, maintaining a pedestrian scale along the mall in contrast to the automobile-scaled facade along High street, which is accessible by car. The building encompasses the most advanced applications of technology and communication systems for administrative management, the processing of library records, and bibliographic and information networks. Special design consideration was given to provide the most flexible, state-of-the-art infrastructure and distribution systems for digital information. Numerous community spaces are provided, including a 425-seat auditorium, a cafe, a bookstore, public meeting rooms and art exhibition spaces. An interior link to a new parking garage along High Street resolves into a new pedestrian ramp, activating the three-story addition. An outdoor amphitheater and landscaped park complete the complex.

[Middlebury College Library, Middlebury, VT – USA 2004](#)

**Awards:**

**American School & University Magazine Collegiate Citation 2007**

The new Middlebury College Library is the first step to fulfilling the College's master plan for the development of a campus intellectual and social center. The library is a state-of-the-art research and learning facility, combining a traditional print collection with the latest communications technology. Located on the eastern edge of the Front Quad, the facility also establishes a new campus center and enhances the existing relationship between both the College and the Town. The three-story, 143,000-square-foot facility accommodates the increasing use of technology in teaching and research. It also provides expansion space for the College's growing collection of printed materials to support evolving curriculum needs. The library is architecturally consistent with the other buildings on the historic front quadrangle in both its materials—limestone, granite and marble—and its scale. The project reconfigures a composition of existing roadways, buildings and prominent public spaces, establishing a new campus center that fits into existing view corridors and pedestrian circulation routes. Library interiors provide efficient and flexible space that will serve the College's needs well in to the next century. This includes increased seating to accommodate planned growth in the student body. Because of the importance of interactive and collaborative learning in the residential liberal arts environment, most seating is in group study and meeting rooms. In keeping with Middlebury College's overall concern for contextual and environmentally sensitive design, the project is designed to meet a high rating for the LEED (Leadership in Energy & Environmental Design) standard for environmental efficiency.

[New York Public Library, Mid-Manhattan Library and Renovation Project, New York, NY – USA 2004 Project](#)

The Mid-Manhattan Library is the main circulating library in the New York Public Library system, currently serving 4,000 New Yorkers daily, with 40% coming from boroughs other than Manhattan. Presently, this facility is severely overcrowded, congested, and unable to fully meet the needs of New Yorkers for library information resources, particularly through information technology. The proposed \$120 million renovation and expansion project of the Mid-Manhattan Library will better meet the daily information needs of 8,000 New Yorkers on-site and thousands more electronically, creating a powerful catalyst for educational opportunity and economic growth.

The current Mid-Manhattan Library occupies a prime location on Fifth Avenue and 40th Street in the former Arnold Constable

building which is owned by The New York Public Library. The expansion will add an additional eight floors and 117,000 square feet for library service to the existing 139,000 square foot building, while creating a 20,000 square foot ground floor presence for rental to a prominent retailer.

The design maintains the existing building, with structural modifications, retaining the contextual/urban reference, while re-imagining the limestone frame as a base and screen for a new, iconic intervention. Using the existing side facades of adjacent taller buildings on both Fifth Avenue and Fortieth Street, the addition acts as a counterpart to the original building; an articulate, glass sheathed, sculptural crystal volume that anchors the corner and establishes an extended and dynamic "place marker" for the New York Public Library/Bryant Park context.

The creation of a singular and memorable new object, as a counterpoint, embodies the visual and psychological presence of the original Beaux Arts Building with a modern vision: "A Beacon of Knowledge". The expanded Mid-Manhattan library will offer a massive presence of information technology including over 300 computers, 100 laptops, and broad access to hundreds of electronic databases and technology training programs combining computer literacy and library literacy.

Facilities will include five "Information Commons", one on each of five paired floors: Reference, Art, History and Social Sciences, Periodicals, and an extensive popular library including multiple copies of the latest best-sellers, language books and literature in addition to biographies, mysteries, travel books and vacation guides, books on tape, videos, and current multi-media items. (Gwathmey-Siegel)

Norman Oder -- Library Journal, 1/13/2009

Sale was to fuel system renovations

Real estate market in slump

"Attractive terms" not available for now

The New York Public Library's (NYPL) ambitious renovation plans have been snagged by the crash in the city's real estate market. In March 2008, NYPL announced it would sell the aging Mid-Manhattan Library, one of the central libraries of its branch system, and use the proceeds from the real estate deal to fuel a major renovation of the flagship Humanities and Social Sciences Library (HSSL) across the street to accommodate Mid-Manhattan's popular lending and other functions.

However, NYPL President Paul LeClerc, in a message to staff January 12, said everything's on hold. "After several months of discussions with potential purchasers of our Mid-Manhattan Library building, our trustees have concluded that it is unlikely that we will be able to complete a sale on attractive terms at this time," he wrote.

"Accordingly, Mid-Manhattan will remain open as an important circulating library for NYPL for the foreseeable future," he continued. "We remain committed to our overall OneNYPL strategy, so we will, of course, continue to pursue opportunities to improve service and efficiencies by consolidating collections and services, as appropriate, between Mid-Manhattan and other libraries, particularly HSSL and SIBL [Science, Industry and Business Library]." HSSL has already seen the opening of a new Children's Center, which holds much of the children's materials from Donnell Library. The building housing Donnell had been sold to a real estate developer prior to economic downturn

#### [Bryant University. George E. Bello Center for Information and Technology, Douglas and Judith Krupp Library, Smithfield, RI – USA 2003](#)

At Bryant University, the planning of the new George E. Bello Center for Information and Technology, which includes The Douglas and Judith Krupp Library, resulted in the creation of a new campus quadrangle displacing vehicular drives and parking.

An updated master plan introduced a landscaped academic quadrangle and a new sense of place and identity for the school. In the great tradition of University campus libraries, the Bello Center frames the quadrangle and provides a new focal point for campus life. The Bello Center's primary spaces are organized within a glass enclosed, double-height pavilion structure, which orients to the new campus quad. In the evening, the center radiates light and provides views into its facilities from the campus. The library, which occupies a major portion of the building, provides for the introduction of state-of-the-art, electronic information services, classrooms, conference rooms and study rooms that formerly had not been available. It will also accommodate the growth of the library's current collections which includes books, bound journals, audio-visual materials and microfilm. The other portion of the building is devoted to the entry Grand Hall and other spaces complementary to the library. The two-story rotunda serves as a central campus meeting place, special events venue and exhibition center. The Grand Hall and the library both connect to a cybercafe, library classrooms, group study rooms and a fully equipped Trading Room, all of which remain open to students and offer study spaces and electronic access when the library is closed.

Architectural Record-Record Interiors 1996

Siegel & Associates Architects llc

The New York Public Library's Science, Industry and Business Library (SIBL) is housed on five levels of the landmarked former B. Altman Department Store. SIBL is a full-service circulating library with storage for a collection of 1.5 million volumes, an open shelf reference collection, periodical shelving and a full catalog area.

The Library's philosophy is decidedly hands-on, with a highly trained staff of specialists supported by a complete reference department, open micro-form shelving, an electronic information center and several training rooms. SIBL is the largest branch of the New York Public Library, heralded as the "...a prototype of the 21st century Library."

Public areas are organized on the ground and lower floors, providing maximum horizontal adjacency for the Research Library below and easy street access to the Circulating Library and Reading Room on the ground level.

In addition to elegantly appointed public reception spaces and efficient reserve stacks, the facility provides 50,000 square feet of office space for library management. Storage and administration are organized on the upper floors; with staff areas surrounding the climate-controlled, structurally reinforced stacks.

Healy Hall, a 33 foot tall, two-story volume provides a highly visible forum for changing exhibitions and receptions. A stainless steel and terrazzo staircase and a pair of glass and stainless steel elevators lead down from the entrance lobby to the Research Library, which comprises extensive research facilities, a 125-seat Conference Center and an Electronic Training Center with four modifiable classrooms.

Flexibility and accessibility were the goals of the design. Workstations are separated by adjustable perforated dividers that provide lateral flexibility, create a discrete territory, and are handicapped accessible. Sight lines allow the entire library to be supervised by five people, maximizing staffing resources. A grid of removable concrete panels raises the floor six inches, permitting power and data lines to be easily reconfigured in the future.

SIBL is a classic solution to a problem of preservation and adaptive re-use: reclaiming the historic B. Altman façade while reconstituting the interior for a new purpose. (Gwathmey)

#### **Youth-Centred Library Spaces-Nationwide**

Over the past ten years, public libraries have demonstrated their increasing commitment to youth and teen services through new expanded, targeted facilities. H3's library specialists, Daria Pizzetta and Margaret Sullivan, have been responsible for giving architectural form to this national transformation.

Specifically, the Centereach and Selden branches of the Middle County Public Library demonstrate a dedication to specific youth and teen space. Sandy Feinberg, Director of the Library, was one of the first librarians to introduce "place as play" as a library initiative. In developing the design of space for the youth services collection, as well as the entire branch, our library specialist team aimed to invoke imagination, innovation, and the playful spirit that has proven to bring positive return from learning environments.

An innovative design approach for youth services can also be seen in the design of *ImaginOn: The Joe and Joan Martin Center* in Charlotte, North Carolina. Both Daria Pizzetta and Margaret Sullivan were involved in the programming of this "first library of the twenty-first Century" and the design for youth-centred services that, for almost the first time, created an environment that placed the emphasis on a child's experience and not on the design of space for the collections. The intentionally sensory design encourages brain development of youth ages 0-5 in support of the public Library Association's "Every Child Ready to Read" initiative. But more importantly, *ImaginOn* brings the world to each child's fingertips, whether through written, spoken or electronic word. The intention of the library to be a place for children to realize dreams has transformed the lives of Charlotte's youth. (H3)

#### **Dream Yard, New York, Bronx, NY – USA ongoing**

Dream Yard is the largest arts education provider in the Bronx, with programs that reach 8,500 K-12<sup>th</sup> grade students annually during in-school and out-of-school programs. The Dream Yard Art Center provides positive, creative programming for youth and arts learning training programs for educators and artists.

H3 has been working with Dream Yard over the past two years to provide design services to enhance their spaces to represent the creative spirit encouraged by the program. In addition, H3 and Dream Yard are beginning a new project: to design a prototype for a nation-wide model for a *YOUmedia*-inspired digital media learning environment for youth and teens.

The Center, located on the ground and lower levels of a housing development in the poorest congressional district in the country, is a vibrant community environment, fostering success through arts education, whose programs include poetry and creative writing, fine arts, dance and theatre. (H3)

#### **BRIT (Botanical Research Institute of Texas) Library, Fort Worth, TX – USA 2011**

In spring 2011, BRIT moved into a new 70,000-square-foot (6,500 m<sup>2</sup>) facility designed by Hugh Hardy of H3 Hardy Collaboration Architecture. The building is one of only six buildings in Texas to earn a LEED-NC Platinum Rating from the U.S. Green Building Council. The building's ingenuity and efficiency is supported by sustainable design and organized into two parts: an Archives Block and a Think Block.

The Archive Block of the Botanical Research Institute of Texas houses the extensive collection of botanical specimens in the Herbarium, a two-storey 20,000 sq. Climate controlled storage hall, together with a distinguished book collection found in the library stacks. Because of the delicate nature of the specimens, the structure is nearly windowless – a solid box of tilt-up concrete panels to provide maximum temperature and humidity controls.

BRIT's library houses more than 125,000 volumes of books and journals from more than 100 countries. The library facility includes a rare book reading room and children's library. The Herbarium, a collection of more than one million dried plant specimens representing much of Earth's plant diversity is among the largest in the United States and is the largest U.S. herbarium not part of a university, botanical garden, or broader natural history museum.

BRIT's plant collections and educational programs are open to the public to help fulfil their mission of achieving public understanding of the value that plants bring to life. Classrooms, children's library, rare book room, exhibits, gathering spaces and other public areas help support this mission. Taken all together, the project's elements create a fitting new home for the Botanical Research Institute of Texas. (H3)

#### **Fredrick Ferris Thompson Memorial Library, Vassar College, Poughkeepsie, NY – USA 2001**

One of the most important of early campus buildings was the Frederick Ferris Thompson Memorial Library. Originally a free-standing structure built in 1905 (1905, Francis R. Allen \*1844 Boston - + 07.11.1931 Boston), it has grown in pieces over time. Renovations to double its space in depth took place first in 1918 and then in 1937. The latter linked the library to Taylor Hall to the south and included John McAndrew's important early modernist Art Library. There were further additions to the north, including the 1977 Lockwood addition (Helmut, Obata and Kassabaum) and its renovation, which has created the Ingram wing (Hugh Hardy, 2001). Identifying the different parts of these renovations, some of which are indistinguishable to the untrained eye, would be a major goal of any educational material produced by the college as a result of this initiative. Such work would also help to focus attention on the ambitions of the early college and its original library—not just the central tower, which is truly monumental, or the Cornaro stained glass window, which shows the 17th-century Venetian intellectual, Elena Lucrezia Coronaro Piscopia, the first woman to receive a Ph.D.—but on the entire decorative program of the building, which links Vassar and its education to the world of wider learning.

The architectural character of this building, which mixes clear, box-like, Beaux-Arts massing with complex Gothic decorative detail, provides the dominant formal theme for the west side of the campus. Thus each of the linked additions (the Frances Lehman Loeb Art Center to the south and the Ingram wing to the north) relate to this original structure. Generations of students, under the training of the history department most notably, used the library and its epistemological frame for their own study. Thus the building not only housed books, but was, in its form, a lesson for generations of students.

### **Bull Street Branch, Live Oak Public Libraries, Savannah, GA – USA 2000**

Located in Savannah's Victorian district, the Bull Street Library is the largest facility of the three-county library region. Prior to 1998, the Bull Street branch consisted of three distinctly different buildings: the original neo-classical Carnegie structure built in 1916; a 1936 stack addition; and a 1966 concrete-block addition that doubled its size to 32,500 sqft.

The Library needed capital improvements including new and expanded services, space for growing collections, incorporation of new technologies and building systems upgrades. Our design more than doubled the existing the library and reconfigured space. Patrons now enter through the fully accessible original Carnegie entrance. Its interior has been reorganized to house services appropriate to the classically styled spaces. At ground level, the former check-out area has been returned to a sky-lit grand foyer with public meeting spaces and a newly expanded Georgia history department. The second floor contains the boardroom and administrative offices. New check-out, reference services, expanded public facilities and vertical circulation were added, while all historic spaces were enhanced with new architectural finishes appropriate to the period in which the library was built.

The new, two-story addition is attached to the north façade of the existing library. This wing houses a new children's reading room on the lower level, adult services on the upper level, and a mezzanine for newspapers and magazines. New landscaping and public spaces integrate the two environments. To be compatible with the Carnegie structure, new construction is clad in cubic blocks of Georgia marble. Extensive fenestration and clerestory windows maximize the use of natural light and provide views of the park and the city. (H3)

### **Hafer Associates, Evansville, IN – USA**

<http://www.haferassociates.com>

#### **Libraries:**

### **Rice Library, University of Southern Indiana, Evansville IN – USA 2006**

Association with: Woollen Molzan

155,000 sqf., \$ 26,300,000

Hafer Associates designed this 155,000 s.f. university library in collaboration with Woollen Molzan Partners. This is the tallest building on campus, visible from all directions. As the most widely used facility and the academic center of the university, it was important to design the facility to incorporate the latest educational technologies and also to provide the infrastructure to accommodate future technologies as they emerge. Most importantly, this is a building the students use often, so it was essential that the facility catered to this social need, and offered meeting places and a variety of group study areas. (Hafer)

### **Hammond Beeby Rubert Ainge Architects, Chicago, IL – USA**

(see also: Long & Kentish)

<http://www.hbra-arch.com>

#### **Libraries:**

### **Sterling Memorial Library, Bass Library, Yale University, New Haven, CT – USA 2007**

#### **Awards:**

Golden Trowel Award, New England Masonry Council, Regional Level 2008

Located in the shadow of Yale's Sterling Memorial Library [1930], Bass Library accommodates a 150,000 volume core collection and a variety of study areas in a two-story, 60,000 sf underground structure. Connection to Sterling is via an underground tunnel. Our solution creates a new above-ground entrance to Bass Library. A new day-lit lounge near the entry creates a focal point for both libraries and encourages student movement from Sterling through Bass Library. New classrooms and group study areas in the remodeled portion of Sterling draw patrons from the connecting tunnel at Bass to Sterling Library. (HBRA)

### **Kansas State University, Hale/Farrell Library, Manhattan, KS – USA 2007**

The design solution resolved disparities in floor levels, uncohesive circulation patterns, and the formal discontinuity generated by an episodic history of expansion, while doubling the library's holding capacity. Two new entrances to the library are extensions of existing campus walkways, and the character of the exterior combines both the Gothic and Romanesque expression of surrounding buildings. The entire building is now pulled into a composition that suggests that it was built over time in a way that was 1927 Collegiate Gothic Revival building. (HBRA)

### **Newport Public Library, Newport RI – USA 2001**

This project involved an addition and renovation to an existing library constructed in 1967. The existing building was considered an eyesore by most residents, and required extensive upgrades not only to library stack space, but to its mechanical and electrical infrastructure as well. The majority of the existing construction materials contained hazardous materials and required abatement. Aesthetically, the library needed to obtain a cohesive appearance inside and out, but without closing operations to the public. An addition extends the building to the north, expanding and relocating children's stack areas, children's activities, periodicals, and circulation on the upper level, and administrative and lecture hall space on the lower level. Both levels are connected to the existing building by means of new lobby spaces and new entrances from the exterior. (HBRA)

(see also [Conrad Sulzer Library, Chicago, 1985](#))

### **Harold Washington Library Center, Chicago, IL – USA 1991**

At approximately 756,640 square feet (70,294 m<sup>2</sup>), it is the largest public library building in the world.

The building has taken much flak for its unabashed post-modern behemothness; but Chicago loves its public library system; its big and loves big things; and takes great pride in its historic architecture. Now it has a great big historic-looking library. Ask and ye shall receive. Or in words of eminent architectural historian Vincent Scully, "This is a classicism that, in a sense, its all Chicago: big and brutal like the city itself, but specifically metallic and fluid like the interlocking iron work of Louis Sullivan's Carson Pirie Scott store...one powerful mass, built of the very bones and blood of Chicago, of the tough body of the Loop, and the ancient urban gesture

of its classical facade.” (AIA Guide to Chicago) Hammond, Beeby & Babka won a much –publicized and controversial commission to design the largest library building in the country, and spent \$ 195 million to carry out this missive. ([www.galinsky.com](http://www.galinsky.com)) The Harold Washington Library Center is a ten-story 760,000 sf main library facility for the Chicago Public Library. At the time of its 1991 completion it was the country’s largest circulating library and the largest design/build architectural project ever undertaken. It continues to be recognized as a model for the planning and design of major public libraries. (HBRA)

Chicago's Famous Buildings: Fifth Edition, by Franz Schulze and Kevin Harrington

The huge publicity preceding the 1991 opening of the new main Chicago Public Library mostly stemmed from two sources: a long-lasting argument over where the new structure should be erected (indeed, should it be a new building at all or a rehabilitated old one?) and the formal competition for a final design, a contest that unfolded once the South Loop site was selected.

Moreover, the winning entry generated considerable controversy in its own right. Design architect Thomas Beeby conceived a building of the sort one rightly calls an edifice, which mostly looks as if the modernist revolution of the last century had never happened. Clad with granite on the lower levels and brick above, the library is monumental in more than scale, harking back to the Beaux Arts manner of the late nineteenth century not only in its powerful axial symmetry but in the heavy representational decoration that adorns its exterior. It is clearly indebted to the ancient Western tradition of grandiloquent civic structures..... (<http://press.uchicago.edu/Misc/Chicago/740668hwlc.html>)

YOUmedia is an innovative, 21st century teen learning space housed at the Chicago Public Library's downtown Harold Washington Library Center. YOUmedia was created to connect young adults, books, media, mentors, and institutions throughout the city of Chicago in one dynamic space designed to inspire collaboration and creativity.

High school age teens engaging with YOUmedia can access thousands of books, over 100 laptop and desktop computers, and a variety of media creation tools and software, all of which allow them to stretch their imaginations and their digital media skills. By working both in teams and individually, teens have an opportunity to engage in projects that promote critical thinking, creativity, and skill-building.

Mentors from Digital Youth Network as well as Chicago Public Library librarians lead workshops to help teens build their skills and create digital artifacts – from songs to videos to photography to blogging. Teens learn how to use a variety of technology and digital equipment, including still and video cameras, drawing tablets, and video and photo editing software. YOUmedia also provides an in-house recording studio featuring keyboards, turntables, and a mixing board.

All high school age teenagers are welcome, and the YOUmedia technology is available for free with a valid Chicago Public Library card.

## **Hanbury Evans Wright Vlattas + Company, Norfolk, VA – USA**

<http://www.hewv.com>

### **Libraries:**

**Paul Barret Jr. Library, Rhodes College, Memphis TN – USA 2005**

Associated Firm: Shepley Bulfinch Richardson & Abbott

\$ 42,000,000

<http://www.traditional-building.com>

### **Awards:**

2009 Interior Design Excellence Award, First Place, ASID Virginia

2007 National Palladio Award, Traditional Building Magazine

2007 Honorable Mention, College Planning & Management Magazine, Education Design Showcase

2007 Algernon Sydney Sullivan Award, Jane Cady Wright, recipient

This Collegiate Gothic library transforms campus, aligning the intellectual heart with the geographic heart. It creates a new campus quadrangle, in the Oxford tradition and a stately new entrance to campus. The building accommodates classrooms, a media center, group study rooms, teaching/learning technology laboratory, computer labs, wired carrels, a 24-hour coffee lounge, faculty offices, and vastly improved facilities for the library collection, archives, and rare books. The project is rich with symbolism, which is embedded in the architectural features to communicate the story of the building and the campus. (Hanbury)

More Than a Building: The 136,000 square foot Paul Barret, Jr. Library, located in the center of Rhodes’ 100 acres, has become its symbolic heart as well. Its placement reoriented the campus so that the academic core physically and symbolically connects with co-curricular facilities. Large areas once relegated to the “back forty” are now integrated into the life of the college. And it is certainly not your grandfather’s library! Barret is a technology center with a theater, complete media production facilities and a teaching and learning center that gives our professors the capacity to hold virtual global classes with colleagues around the world. But we haven’t gone technocrazy. The collection includes books and traditional resources as well as databases and online journals.

It has dozens of collaborative study spaces where students can work with professors and each other and actually talk out loud. These spaces, like the rest of the library, offer a completely wireless environment. The 24-hour Middle Ground cybercafé has become the most popular gathering place on campus. Students like the Starbucks coffee and gourmet fare, the computers for checking email or working on a paper, the comfortable lounge furniture and the wall-mounted oversized plasma TV screen. Quieter interludes often occur in the literary garden that is tucked away behind the cloister on the east side of the building. Students relax on the benches or directly on the grass and enjoy the plantings that were featured in the works of Southern writers such as William Faulkner, Eudora Welty, Carson McCullers and Robert Penn Warren. ## **Harvard Jolly Architecture, St. Petersburg, FL. – USA**

<http://www.harvardjolly.com>

### **Libraries:**

**Town 'N Country Commons, Tampa, FL - USA 2008**

**43,000 SF**

### **Awards:**

**Hillsborough County City-County Planning Commission - Awards of Outstanding Contribution to the Community: Commercial, Public, or Quasi Public, 2009**

**Tampa Bay Regional Planning Council - 17th Annual Future of the Region Awards – 1st Place (Cultural/Sports/Recreation Category)**

Town 'N Country Commons is a unique facility in that it combines a library, senior center and Head Start facility and sits adjacent to a four-acre neighborhood park. The 45,000 square foot facility replaced an aging one-story library.

Upon entering the main lobby, patrons have access to an art gallery, coffee vending area, Friends of the Library bookstore, multi-purpose community room, as well as the internal entries to the senior center, Head Start program, and the library.

The majority of the 25,000 square foot library component is housed on the second floor of the building. Casual reading areas can be found along the exterior walls and windows, and tutor/study rooms provide dedicated quiet spaces. The library also features an abundance of public computers.

#### **Senior Center**

The 10,150 square foot senior center component was designed to accommodate independent active seniors, day-care seniors, and seniors with dementia who require full-time supervision and care.

#### **Head Start**

The 5,200 square foot Head Start component has three large classrooms with capacity for 36 children each, all of whom have direct access to a secure outdoor playground area.

#### **Park**

An open green space was designed around a gazebo within the adjacent, four-acre neighborhood park to accommodate large events. A paved walking trail meanders around the perimeter of the park that links to the gazebo, children's playground, and butterfly garden. (Harvard)

**Oldsmar Public Library, Oldsmar FL – USA 2008**

19,800 SF | 2008

### **Awards:**

**Tampa Bay Regional Planning Council - 17th Annual Future of the Region Awards, 2009**

**Florida Redevelopment Association - 2008 Florida Outstanding New Building Project**

Designed to characterize "Old Florida" architecture, the City of Oldsmar's public library embodies the city's rich history while contributing to the ongoing downtown redevelopment. The design exhibits a number of examples of Florida vernacular architecture and Mediterranean Revival styles, such as cast stone, painted stucco, and clay barrel tile roofing.

Exterior elements like the main entry façade and prominent octagon-shaped spaces on the corners of the building make the library appear larger than its actual size. Together these features create a proper civic presence within the city and visually anchor the building to its site.

Paddle fans and pendant lights adorn the interior, and the library's arched ceilings further reinforce the "Old Florida" design style. The center of the library is supported by stained wood beams that are naturally illuminated with daylight via clerestory windows, reminiscent of traditional grand reading rooms.

The REO Lounge, an octagonal teen room named after Ransom E. Olds, founder of Oldsmar and Oldsmobile, features sofas that are similar to the seats of a classic car. (Harvard)

**Cagan Crossings Library, Clermont FL – USA 2008**

Lake County | 30,000 SF | 2008

Known as "Four Corners," the intersection of Lake, Orange, Osceola and Polk Counties is one of the many growing areas of Central Florida with a population of about 100,000. Located near Walt Disney World, the population of Four Corners could jump to 250,000 residents by 2020.

Rapid growth and library space projections dictated the need for a new library, as local residents were previously using a 6,200 square foot leased space. Cagan Crossings Community Library was the first facility that Lake County built to specifically serve as a library. At 30,000 square feet, it includes a self-checkout area, public access computers, Wi-Fi, café and a 160-seat community room. The first floor's story time room permits views to a quiet reading garden nestled within the site's lush vegetation. The second floor features a special collections area and abundant casual seating. (Harvard)

**[Leedsburg Main Library, Leedsburg FL – USA 2007](#)**

42,000 SF

Located on the eastern edge of Main Street, the Leesburg Public Library epitomizes the city's architectural character and serves as the anchor of the historic downtown district.

First floor amenities include the Friends of the Library bookstore, multi-purpose rooms, and a café. The adult fiction collection is complemented with multiple casual seating areas adjacent to windows that overlook the downtown area. The library also boasts an outdoor reading garden.

The second floor has a large Palladian window with views to downtown. A "Florida Room" provides an ideal space for patrons to relax and read while enjoying the richly landscaped butterfly garden and amphitheatre below.

The library features the latest technologies such as a radio-frequency identification (RFID) system for book security and inventory, computers with public internet access, and Wi-Fi throughout the facility. (Harvard)

**[Broward Community College, South Regional Library, Pembroke Pine FL – USA 2006](#)**

72,000 SF

**Awards:**

Southeast Construction Magazine Awards, Best of 2006 - Merit Award, Category: Concrete

Building Owner and Manager's Association (BOMA) of Ft. Lauderdale and the Palm Beaches - 2007 Government Building of the Year

Associated Builders and Contractors - Excellence in Construction, 2008

As both a regional public and academic library, this building serves as Broward Colleges' principal research facility, while also meeting the specific needs of Broward County's local seniors, adults, teens and children. When opened, the library became one of the first joint-use facilities in Florida and the nation.

The joint-use trend allows multiple user groups to afford greater amenities by being more accessible to a larger cross-section of users.

The design concept is analogous to the way that the layers of a story are revealed to a reader through the pages of a book. Like a book, the layers of the library are expressed to visitors through a series of protruding planes.

A 40-foot glazed curtain wall creates a dramatic presence on the north side of the library. It welcomes visitors and also provides a great amount of controlled natural daylight to the interior, and is a beacon of light in the evening.

The library is the first LEED Certified building in the state college system and the first LEED Silver building in Broward County. (Harvard)

**[Clearwater Main Library, Clearwater FL – USA 2004](#)**

Harvard Jolly designed the library in conjunction with Robert A.M. Stern Architects.

92,000 SF

Uniquely sited on a bluff overlooking a public park, Intracoastal Waterway and Gulf of Mexico, the Clearwater Main Library is a locally recognizable landmark, a source of civic pride, and a community-wide learning resource. The 92,000 square foot library offers a local history center, café, computer lab, teen room, gallery space, expansive reading areas and a children's collection.

The street façade presents an urbane and dignified civic building by using traditional local materials such as cast stone and stucco. The garden façade opens onto the park and the waterfront, and features four stories of curtain wall glass that showcases panoramic views. A trellis-covered rooftop terrace provides additional views and an ideal space for social events.

Library features includes distributed network-cataloging systems, electronic smart cards, and magnetic locks that limit access to the building and selected interior areas, such as special collections. The main conference room, executive board room, and children's/young adult rooms are each equipped with plasma displays and electronic writing tablets at the speaker's podiums.

**[West Irving Public Library, TX – USA 2011](#)**

Statistics: 25,876 SF New Library Facility Construction Complete February 2011, LEED Gold Certification (Pending)

The West Irving Library serves as one of 4 new libraries for the City of Irving Library System. The facility is situated at the base of an existing water tower. The building's crescent shape curves with the circular shape of the water tower, opening to the north with walls of glass. The glass walls floods the facility with natural light, reducing the energy required to light the building and provide dramatic vistas to their park-like setting. The facility includes the latest in touch screen technology with micro-soft "Surfaces" table, SMART tables, and SMART walls located throughout the Children, Teen, and Adult spaces. A geothermal ground loop heat pump system to heat and cool the facility was utilized as well as a photovoltaic system consisting of solar panels situated over (2) carports and (6) arrays comprising of 1,444 (245W) solar panels providing enough power to create a NET ZERO building saving the city

approximately \$55,000 per year in energy costs. The project is required to meet the certified requirements of LEED, at this time it has enough points to be Gold (pending certification). (Hidell)

#### **Pleasant Grove Branch Library, Dallas, TX – USA 2011**

#### **Literature:**

**Featured in Library Journal's Year in Architecture 2011**

Hidell Architects was commissioned in 2008 to renovate and expand an existing Food Lion grocery building into a new home for the Bedford Public Library. The 40,516 square foot adaptive reuse, includes a 200 seat meeting room, an electronic resource center, an automated book sorting system, cyber/vending area, express zone, children's craft room, children's story time, a toddlers zone and a dedicated teen room. The existing building, with its "flat" front facade, was modified to present a new image for the library while tying into the adjacent Old Bedford School architecture. A large circular volume and curved wall begins to soften the front facade, providing the patron with a dynamic entry into this whimsical space. The existing "box" shape was transformed with flowing curved walls and ceilings, assisting the user to navigate the various program spaces as well as define the individual areas within. The use of colored glass is seen throughout the new facility (both interior and exterior), creating walls of changing colors throughout the day. A geothermal ground loop heat pump system to heat and cool the facility was utilized, increasing the building efficiency, and reducing life-cycle costs. The use of durable materials, energy efficient lighting (LED), and shading of exterior glazing has created a sustainable home for the Bedford Library. In addition the City received a SECO grant where they were able to add a photovoltaic system consisting of (824) Sunpower T5, 305W solar panel modules with integrated racking on the roof of the building providing a total system capacity of 251.32KW. (Hidell)

#### **Awards:**

**2008 Project of the Year Award - APWA Monterey Bay ChapterProject Information**

The Watsonville Civic Plaza building is located in one-square block, downtown at 275 Main Street, Watsonville, California. This government building is a 131,000-square-foot multi-use project, plus parking structure. The facility provides space for the City of Watsonville city hall and administrative offices, City Library, County of Santa Cruz Superior Court, and lease space including retail tenants. The downtown location provides a functional setting for the project that also serves as a revitalization engine for its immediate urban environment.

The project was constructed under numerous separate contracts, reflecting economic as well as political requirements. The parking structure was completed first prior to the construction of the main shell and core of the building. The County Courts were located on the first and third floor, City offices (fourth floor), the Library facilities (first and second floor), and for multiple tenants, including a self-help program area, offices for the District Attorney and commercial retail users on the first and third floor.

The Watsonville City Library more than doubled its size of the old library when it moved into its new facilities in April of 2008. As part of the Civic Plaza building, the library located on the first and second floor: first floor housed the children's department, circulation, technical services and the Literacy center. The second floor housed the adult collection, reference, computer Lab, California Agricultural workers' History Center, Teen zone, meeting rooms, study rooms and the administration offices. New technology was implemented throughout the new library of great benefit to the public. The Children's area features a "Toddle tech" area with eight bilingual Early Literacy stations that are programmed with educational programs targeted towards children from pre-school age to second grade. Patrons of the library can use the new Xpress Check stations to check out their own materials-including DVDs, videos and CDs. (Hidell)

#### **Civic Center Library, Warren, MI – USA 2006**

Statistics: 32,000 SF Library | Construction Complete November 2006

The new Warren Library evolved thru the desire to make the library more interactive, involving, educational and more entertaining. When the patrons arrive they are immediately aware of being in an exciting learning destination thru the immense collection of business, recreational and reference materials all illuminated with stack lighting. Vibrant wall and floor colors converge onto all areas, which are emulated in the handcrafted heat treated copper which forms various distinctive signage and components of the services desks; to the patterned layout of multi-colored laminated glass; to the playful energy of the youth area; to the "cool" interactive hang-out in the Teen area; and to the quiet study area while sitting in a comfy chair by the colored glass tile surround at the fireplace in the Special Collections room.

The serpentine motif and soft undulating curves allows the patron to navigate themselves to discover and explore the features of the library. The motifs encapsulates the ceiling, wall, programs spaces, signage, furniture and lighting in three-dimensional form, mirroring their two dimensional equivalent in the floor. Similar shapes, forms and seating continue in an exterior program space which creates a setting for quiet outdoor reading or children storytelling.

Occupying over 32,000 SF and ultimately housing over 151,000 items this new library creates a link to a world of information available today, allowing your studies, career, business and recreational pursuits lead you virtually anywhere you want to go. The

new library preserves the tradition of the library as a community center and gathering place but provides the idea of service that would be experienced by all users. (Hidell)

Statistics: 32,000 SF Library, Construction Complete November 2006

#### **Awards:**

**Grand Winner 2007 Best Building, Energy Consious Design/Construction**

**Alsoa winner in Municipal and Utilities**

**2007 AIA Citation Award**

**LEED Silver Certification**

Situated in the foothills of the Rocky Mountains just outside of Albuquerque, New Mexico this 32,000 square foot library is the centerpiece of this growing community. The building configuration and internal layout was oriented to capture the sweeping vistas it surrounds, while nestling into a flat level of a very undulating site. The overall building footprint emulates the site contours, enabling the building to "fit", while minimizing unnecessary site grading. The large overhangs provide sun shading throughout the summer, and allow natural light in the winter. Both interior and exterior materials have been chosen for their eco-friendly qualities.

This state-of-the-art library features the latest in technology and library design. Each visitor's experience begins through a gallery space modeled after a pedestrian mall, quaint in look and friendly in scale. The gallery space leads the patron to a main reading area with collections and programming areas (dedicated storytime and craft room, quiet reading room and study areas). A wireless system enhances the flexibility of each space and provides a user friendly experience. (Hidell)

**2004 Best Building Winner - Lighting (New Mexico Building Branch, AGC and NM Business Journal)**

This 52,013 SF "State of the art" library facility speaks volumes to the diverse culture of its community. The Library, located 80 miles from the Navaho Nation, gets its direction from elements found in the culture and architecture of the people it serves. The counterclockwise layout and "kiva like" rotunda bring a spiritual meaning to this community building. Working seamlessly within the dynamic layout of this complex are both indoor and outdoor programming spaces, allowing a broad flexibility of programs in this mild climate. Located within this exciting structure are many flexible spaces with state-of-the-art technology. Computers are located throughout as well as flat-screen monitors, which inform the patron of upcoming programs, local news, and entertainment. The library philosophy is one of customer service, which the layout and technology of this building enables through its self check stations, various multi-media rooms, and immense computer access, as well as, its built-in flexibility to allow change throughout the years to come. Farmington Public Library is a building for the Library of the 21st Century. (Hidell)

The building forms a gateway to the southern campus core and serves as a new pedestrian portal and information center. Services relative to the landscape

included landscape and hardscape design & documentation around the immediate building. (<http://www.sternassociates.com>)

#### **Harry Bennett Branch Library, Stamford CT – USA 2000**

by Alice Knapp

The dramatic, new Harry Bennett Branch Library has been a resounding success with the Stamford community. Opened in January 2000, and sharing the campus of a public middle school, the 24,000 square foot facility replaces the very tired Turn of River Branch, which had been operating in a cramped former church since the late 1960's. Project costs exceeded \$4.4 million, of which \$3.5 million was provided by the City of Stamford and \$350,000 by a state library construction grant. The library is named for long-time branch supporter and benefactor, Stamford realtor Harry Bennett. It was Mr. Bennett who, in the mid 1960's, was instrumental in getting the original Turn of River Branch built. Over the years he has been a tireless friend to the Ferguson Library. The new library has a soaring interior with skylights that flood the space with light. The result is a spectacular, modern building that is a delight just to enter. The floor plan is open; ramps and stairs link different sections of the library. A 120-seat auditorium, a meeting room, and a children's program area are included in the facility. State-of-the-art when it comes to technology, the library is equipped with 43 computers-28 for public use, 15 for staff. Public computers provide catalog services, electronic databases, Internet access, and word processing; several are dedicated to pre-school multi-media use. The branch has the capacity to add up to a dozen more workstations for the public, as well as laptop Internet access. "The Harry Bennett Branch incorporates the latest advances in information technology," says library president Ernest A. DiMattia, Jr. "We are also no longer limited by lack of space, so our ability to serve the public has expanded." In fact, as soon as the branch opened, users were clamoring for extended hours. The former Turn of River Branch had operated on a limited schedule, and the new branch maintained the same hours until additional city funding in January 2001 made it possible to keep Harry Bennett open longer. Now, the library is open six days a week, four days until 8 p.m.

Harry Bennett supervisor Susan Baldwin says that with the new hours librarians hope to offer more daytime programs for young children, as well as additional adult computer training in the evenings. "We expect the library to be even more heavily used now," says Ms. Baldwin. The branch averages about 13,000 visitors a month and circulates some 22,000 items per month. In its first six months of operation, the number of people attending library programs more than doubled attendance at the former Turn of River Branch. The Harry Bennett Library was designed by architect David Finzi of the Hillier Group in New York City and completed by Frank Mercede and Sons, Inc., general contractors based in Stamford. It is accessible to people with disabilities and has on-site parking for 75 vehicles. It also garages the Ferguson's Bookmobile and "Purple Bus." (<http://www.ctlibraryassociation.org>)

School Construction News, “Off the Shelf – High-Tech Library Ushers in The Digital Age at University of Nevada”, January/February 2009

Completed in 2008, the Mathewson-IGT Knowledge Center is the centerpiece of a new north quadrangle for the University of Nevada, and is one of the most technologically-advanced libraries in the nation. Here, computing and information technologies, multimedia tools, and the university’s extensive library resources are brought together in an environment designed for comfort, efficiency, and collaboration. H+K Architects was tapped to shepherd this significant project from advance planning through design and construction, a process that engaged the firm for more than eight years. The building represents a contemporary interpretation of the historic academic architecture that makes the campus core unique. Arcades and traditional brick detailing will relate to the existing buildings and serve as a new typology for the development of the north campus. (H + K)

**Joe Dini, Jr. Library, Western Nevada College, Carson City Campus NV – USA 2005**

Library Design Consultant: Ripley & Associates

**Literature:**

“Spend Billions And They Will Come”, Library Journal, December 2004

The Joe Dini, Jr. Library and Student Center occupies a prominent location at the terminus of Western Nevada College’s entrance road to provide a strong visual image at the entrance to campus. The 35,000 square foot building features a 25,000 square foot library and a 10,000 square foot student center. In response to the importance of information technology, the library contains a large “electronic commons” featuring 40 computer workstations for research and data retrieval. In addition to the information resources, printed materials are housed in a large reading room with a capacity of 50,000 volumes and a variety of seating and study spaces. The Student Center is made up of recreational, athletic, and administrative spaces for the student body and WNC staff. The building utilizes environmental principles such as drought-tolerant landscaping, day-lighting, recycled materials, and energy efficient heating, cooling and lighting controls. (H + K)

**Incline Village Branch Library NV – USA 2003/2004**

Associate Architect: Leo. A. Daly

**Awards:**

2007 Reno Magazine/AIA Northern Nevada Architecture Design Awards Award of Citation - Built Category

2006 American Library Association (ALA) and International Interior Design Association (IIDA) Library Interior Design Competition

The new Incline Village Library is designed to settle into the context of the existing site, respecting the vernacular of the area while incorporating a fresh, contemporary attitude in the “Tahoe Style.” The building features a sloped-roof silhouette that commands attention from the nearby highway. The new facility incorporates ample amounts of glass to take advantage of the tremendous views in all directions. Exterior wall materials consist of a combination of split-face concrete block at all load-bearing walls, and cementitious lap siding at the wood-framed exterior walls. (H + K)

### **Libraries:**

#### **Mt. San Antonio College, Learning Resource Center, Walnut, CA – USA on design**

The vision for the LRC project was to create a new vibrant campus center to attract and encourage interaction and knowledge sharing. The LRC gives new direction to an evolving progressive institution, by creating an activity center that merges student research, study, and activity spaces to create a central, multifunctional destination. The Architect worked with College leaders to design a dynamic campus landmark and gathering place that connects the academic, cultural, and social pursuits of the students, faculty and community. The Architect and client outlined the following objectives to help make the vision a reality: - To design a "beacon of knowledge", a prominent landmark and visual reference for students and the surrounding community. - To combine library functions, student government and clubs, dining facilities, and retail spaces within a central, multifunctional destination. - To create flexible interior and exterior gathering spaces to accommodate a variety of student needs and activities. - To maximize the quantity and variety of study space for individuals and groups. The 200,000 square foot LRC and Student Center include an open library with a focus on study areas, activity and meeting centers, a bookstore, a convenience store, and student and community dining. The complex sits down-slope from a newly defined campus quad, designed to accommodate the largest of campus gatherings. The complex engages the slope to address and invite participation from all campus levels. The central landscape of the LRC courtyard flows from the campus' main quad, meanders through the complex, and forms a series of gathering spaces capable of housing many cultural and social events. From this courtyard, students can access all the functions of the complex. Elevating the outdoor activities spaces creates an interactive plinth which supports the LRC and Student Center. Against a contextual brick background, the Student Center grows from the existing roots of the campus. The porosity of its exterior walls invites activity from many different points. The library is transparent and translucent to encourage the open flow of interaction, knowledge, and ideas, while the bridges interconnect multiple levels of the complex to link the interdependent programs. Patrons enter the library through a 3-story atrium featuring a cantilevered mezzanine study space with clear views to the campus. Circulation, study rooms, and the organizational layout are visible from every level within the atrium, a transparency that promotes the open flow of knowledge, information and ideas. A monumental staircase transitions through the atrium lobby, linking levels and connecting to the bridges that span the open courtyard. Indoor study spaces define the edges of the building and bridges, taking advantage of natural light and creating a direct visual link with the courtyard and campus. Concrete, glass, and brick masonry blend the LRC with the existing campus while the material treatment and utilization allow it to stand apart as a student activity center. Vertical exterior fins – symbolic of an "open book" – welcome patrons from all parts of the campus. LEED Platinum is the sustainable goal for the complex. The Green strategies promote the college's decree to save energy and maximize efficiency. Double skin insulates and ventilates the exterior envelope. Geothermal heating and cooling are captured and routed to each floor through the precast concrete slab channels. Horizontal sunshades screen sun while vertical fins protect from east-west rays. Green roofs insulate the building and help blend it with the surroundings. Large skylights and insulated glazing with solar tracking louvers around the building's skin allow natural light to penetrate deep into all levels. A greywater system is employed to reduce water consumption. And finally photovoltaic panels convert the areas abundant with sunlight into electricity. These sustainable goals reduce energy consumption, provide long-term cost savings, and enhance the learning environment.

#### **San Francisco State University, Paul Leonhard Library & Sutro Library, San Francisco CA – USA – 2012**

A major expansion and renovation of the J. Paul Leonard Library building is underway. Set to open Fall 2011, the new home of the J. Paul Leonard Library, Sutro Library, Labor Archives and Resource Center, Academic Technology and the Center for Teaching and Faculty Development, will provide expanded study and computing space for users, growth space for collections, access to new technologies, and a safe and healthy environment for work and study. Once completed the new Library will have 34% more total space; 50% more seating; 50% more group study areas; 50% more collection capacity, both in open stacks and a high-density automated retrieval system; and 100% more computers. The new library building will provide a flexible and congenial learning environment in the heart of campus. (<http://www.library.sfsu.edu>)

#### **Woodcrest Library, County of Riverside, Riverside CA – USA 2007**

The project required civil engineering services for a 10,000 square foot County Library. The Woodcrest Library is the first LEED certified building in the County of Riverside, initiating an environmentally concerned approach by the County for future projects. Services include providing the grading plan for the six-acre site in addition to water improvement plans.

### **Libraries:**

#### **Princeton University Library, Harvey S. Firestone Memorial Library – Princeton, NJ – USA ongoing**

See: Shepley Bulfinch Richardson & Abott, Boston, MA – USA

<http://www.sbra.com>

Firestone Library opened in 1948 (Robert B. O'Connor 1896 – Nov. 1993 Mount Kisco, NY), as the first large American university library constructed after World War II, Princeton University Library is the main library system of Princeton University. With holdings of more than 7 million books, 6 million microforms, and 48,000 linear feet of manuscripts, it is headquartered in the Harvey S. Firestone Memorial Library building, named after tire magnate Harvey Firestone.

Creating the vision for the Firestone Library Renovation Project has been a cumulative process involving extensive planning and research. This renovation will not only provide modern building systems and infrastructure, but it will also highlight and capture the unique character of the original 1948 building design. Through this renovation, Firestone's architectural history will be gracefully combined with the needs of today's scholars. In the words of the project's Architect of Record, Carole Wedge, "Firestone's central vision for scholarship remains a constant in a setting that reinforces its strong sense of place."

Celebrating Our History

In 1948, an issue of Princeton Alumni Weekly showcased the newly constructed Harvey S. Firestone Memorial Library. The article featured photographs, interviews and historical facts about the opening of the library, telling “the story of the new library and how it came to be.” Within the article, the University Librarian described the essence of what makes the library a successful study environment:

The outstanding characteristic of Princeton’s Firestone Library is its openness, its ease of access to books and to the library services....It is a building dedicated to the dignity and value of knowledge and of wisdom. It exists for these purposes alone. If the architectural ornaments are beautiful or if the technical paraphernalia of librarianship intrude themselves upon you, remember that they are present incidentally or through necessity. Their purpose is to house books and to make them conveniently accessible for your study and for the enlargement of the horizons of your mind. This, in effect, is what the new Princeton Library seeks to proclaim to every student who enters it.

—Julian P. Boyd, University Librarian

This is the legacy on which the renovation will build.

**Embracing Our Future**

Among the most important goals of the renovation project are improving reader and study spaces, upgrading Rare Books & Special Collections areas, introducing sustainable building features, updating life-safety systems, and renovating graduate study rooms, exhibit spaces, and shelving areas in the library.

This renovation work is being done so that, in the words of former President Harold W. Dodds, the miracle contained within this library can continue—“the miracle of imagination kindled, prejudice thrown overboard, dogma rejected, conviction strengthened, perspective lengthened.” (<http://libblogs.princeton.edu/renovations/the-vision/>)

**Free Public Library, Morristown, NY – USA 2006**

Through continued successful development of new services, this Library had again outgrown its existing building. HMR’s design responds to those changing needs and continued growth by providing enhanced public library spaces and a new Children’s Library through expansion of the existing Collegiate Gothic building. Future anticipated growth is accommodated through the relocation of the Local History collection to an adjacent historic structure and a new underground research reading room that serves as a connector to the Library building. **Hyde Park – Miriam Matthews Branch Library (Los Angeles Public Library), Los Angeles CA– USA 2004**

Built at the epicenter of the 1992 Los Angeles riots, the Hyde Park Miriam Matthews Branch Library stands as a testament to civic renewal and the healing power of architecture. More than just a place to read or gather, the library reaffirms the city’s faith in South Los Angeles as a vibrant neighborhood and a generator of hope. Part of an ambitious program to build 36 libraries in communities around Los Angeles, the Hyde Park branch needed to make a statement that reinvestment in small-scale civic structures could make people’s lives better. Although just 10,500 square feet, the new library offers almost twice the number of volumes as the neighborhood’s old facility (40,000 books, compared with 25,000). And it nearly triples the number of computer terminals to 28, up from 10. Hodgetts + Fung originally envisioned the Hyde Park library as an exercise in glass and colored light. But the client wanted something bolder, so principals Craig Hodgetts, AIA, and Hsin-Ming Fung, AIA, decided to give the building a more sculptural presence. “We looked at Brancusi’s work because it has such great energy,” says Hodgetts. Eventually, the architects designed the building with angled glue-laminated-wood columns and beams on the inside and moss-colored cement-board walls on the outside. “We wanted it to be muscular, to have an animal-like quality to it,” explains Fung. Sitting on a corner site, the building offers four different faces to its surroundings. While all elevations emphasize masonry at street level and glazing above (for security reasons), each has its own personality. The south-facing street front expresses a sense of motion with its long, linear composition of glass and cement board topped by a copper-tinted-steel sawtooth roof. On the north, where patrons enter from the parking lot, the architects greet them with a jazzy series of angled wood-frame brise-soleils projecting from the facade. The shorter side elevations speak in quieter tones. In plan, the library is essentially a simple rectangle, but Hodgetts + Fung imbued the interiors with a visual richness by layering materials and angled forms in a syncopated rhythm. “We wanted it to feel like jazz,” says Fung.

( <http://www.archrecord.construction.com> )

Standing at the crossroads of where the 1992 Los Angeles riots burned is the new Hyde Park Miriam Matthews Branch Library, named for the first African-American librarian in California. As designed by Hodgetts + Fung Design and Architecture, the library is helping to revitalize and unite the community, offering residents educational, social, and professional services. The 10,500-square-foot library – which replaces the former, smaller Hyde Park branch – draws on a rich palette of materials, colors, and forms. The culture and history of South Los Angeles informed much of the building’s design, which is marked by a layering of materials and angled forms. “We wanted Hyde Park residents to interact and respond to the library,” says Craig Hodgetts, AIA. “Instead of designing space sympathetic to Euro-American culture, we developed a fresh palette of materials and textures that residents would identify with. Aesthetically, the library is in complete response to the people who occupy it.” The library’s street-front façade is clad in crisp, pleated layers of moss-colored cement board and copper-tinted steel, and a hand-painted tile mosaic designed by artist Robin Strayhorn. The brightly-colored mosaic – inspired by local students – portrays the leadership and dreams that have helped bridge the Hyde Park community. At one end of the building is a courtyard garden designed by landscape architect Katherine Spitz Associates. The northern façade is marked by sculptural elements of glass, metal grating, cement board, and copper-tinted steel woven into horizontal panes provocatively angled and set above a slanted cement-board structural base. A jauntily-angled copper-colored flagpole provides structural support at one corner of the building. Inside, to break the scale of the 22-foot-high ceiling, exposed structural and mechanical elements diverge in various directions and orientations. Suspended horizontally overhead, copper-tinted air-conditioning ducts are angled as jagged, sculptural tubes. Support beams, constructed of recycled lumber chips, stretch vertically, adding to the thicket of elements and colors that inhabit the space. Over the book aisles, rows of elongated

concrete-clad light fixtures are rhythmically suspended below lowered ceilings. Perimeter spaces support computer kiosk stations, a children's reading area, seating areas, and book stacks. The center – largely open – is anchored by an information desk. There is also a large meeting room and administrative offices. Finding inspiration in the language of African art and culture, the architects layered and textured the interior and its functional elements with a warm palette of environmentally sustainable and durable materials – brown synthetic wood, moss-colored cement board, copper-tinted steel, and burnt-orange Corian counter tops. Tucked in a corner, the children's reading area, which includes a cozy storytelling nook, is distinguished by a curvy, synthetic-wood wall that snakes around and separates it from the main space. A clerestory that wraps around the upper-edge of the street front side brings natural light to the interior, and offers a glimpse of the landscape's mature trees and sky, creating an illusion of natural escape within the dense city surroundings. The library was designed to achieve the U.S. Green Building Council's LEED rating. In addition to employing sustainable construction materials, Hodgetts and firm principal Hsin-Ming Fung, AIA, incorporated an energy-savings concept that uses sun shades, natural light, and photovoltaic panels for solar access gains. The panels cover the roof and extend over the edge, forming a sleek, horizontal awning. The new library has indeed struck a chord with the community. According to Hyde Park's senior librarian Kren Malone, patronage and book circulation have tripled to 18,000 visitors and 9,000 books each month. Los Angeles-based [Hodgetts + Fung Design and Architecture](#) was founded in 1984 by Hsin-Ming Fung, AIA, and Craig Hodgetts, AIA. Fung's background in artistic design and Hodgett's engineering experience lend a playful, theatrical approach to architecture while fusing technology and fabrication. Their monograph, [Hodgetts + Fung: Scenarios and Spaces](#) by Kurt W. Forster, is regularly found on the desks of students. The firm has won more than 50 international international and national design awards. (<http://www.archnews.com>)

### [Sylmar Branch Library \(Los Angeles Public Library\), Los Angeles CA – USA 2003](#)

LOS ANGELES. More than 13 years after the LA Riots devastated South Los Angeles, the community is finding itself the benefactor of recent private and civic investment, including the new Hyde Park Miriam Matthews Branch Library, whose acclaimed design by Hodgetts + Fung Design and Architecture has been attracting residents into the library in record numbers. The ground-up, 10,500-square-foot library, which replaces the former, smaller Hyde Park branch saw its monthly book circulation quadruple following the November grand opening. According to Branch Manager Kren Malone, the library has since maintained a monthly book circulation of 9,000, which is triple the old library's monthly circulation. The library's patronage has also tripled to 18,000 visitors each month. The Hyde Park community is fully embracing the new library and the services we offer, Malone says. Patrons are particularly happy about the building's color scheme and unique ceiling structure, which are always getting compliments. The Hyde Park Miriam Matthews Branch Library funded under the Los Angeles Public Library's far-reaching bond program joins 35 new facilities that have been constructed across the city. Hodgetts + Fung widely known as the architect for the new Hollywood Bowl designed the library to reflect the culture of South Los Angeles. We wanted Hyde Park residents to interact and respond to the library, says Craig Hodgetts, AIA, principal of Los Angeles based Hodgetts + Fung Design and Architecture, which also designed the public library in suburban Sylmar. Instead of designing space sympathetic to Euro-American culture, we developed a fresh palette of materials and textures that residents would identify with. Aesthetically, the library is in complete response to the people who occupy it. (<http://www.sciarc.edu>)

### [UCLA Towell Library, Westwood, Los Angeles CA – USA 1997](#)

Our design for the Powell Temporary Library at the University of California at Los Angeles (UCLA) is conceived as a grouping of tented land-forms arranged to receive the Westwood extension of the original campus axis and redirect it towards the active Student Center to the south. The site is located between two Romanesque revival buildings and terminates Janss Memorial Stairway. It is marked by a monumental classical balustrade, which we thought to integrate by the array of internal axes and radii to define the building volumes. Thus, the semi-circular East Reading Room is tangential to the stair, while the circular West Reading Room is co-axial with the balustrade. Since the project was subject to severe time and budget constraints, we chose to employ a re-usable aluminum and fabric roofing system capable of rapid construction for the major enclosures, and to link them with an intentionally varied ensemble of disposable masonry, wood and plastic substructures. An integrally-colored concrete block similar in hue to the brick and limestone characteristic of the campus proper establishes the periphery of the land-form, suggesting the foundation of a building which is no longer there, and reinforces, by contrast, the temporary nature of the structure which covers it. The resulting assembly of rational individual components defines services and transition areas within the volume, while a braced steel substructure carries the mezzanine and stabilizes the ribs at mid-span. As in an aircraft, decorative emphasis is placed on the orchestration of fasteners, cables, and exposed elements necessary for the efficient operation of the library. Program Solution The design program was to provide a structure to temporarily house the collection of the main undergraduate library during 2-1/2 year seismic upgrading of the permanent library building. The architectural solution combined tensile, steel and masonry structures to create a library "complex" of four distinct buildings; an open plan Main Library Hall and mezzanine housing the majority of the collection, two reading room "pods" and an administrative wing. The structures were connected by passageways of informal "lounge" seating and a central service core containing bathrooms and mechanical/electrical rooms. Unique Requirements The University required a temporary building that would preserve the existing plaza between the historical Dance Building and the Men's Gym. The siting of the structure integrated existing elements of the surrounding context and the foundations were designed to preserve the existing paving beneath the building. The University intends to utilize the structure for other functions once the library seismic upgrading is complete. The design of four separate buildings breaks down the mass of the project and provides versatility for a variety of other programs to occupy the spaces. Library Director Statement Plan and design of the Temporary Library provided an opportunity to accommodate modernized services and electronic access now prevalent in academic libraries as well as traditional study and print oriented environments. Goals were to have an easily understood and logically organized facility with areas for activities requiring human interaction such as online catalog use, reference tool consultation and interpretation, teaching and computer labs along with areas more isolated to allow for concentrated individual study. The floor plan succeeded in providing such areas and provides a variety of aesthetic experiences for users. (<http://www.arcspace.com>)

## **[Holabird & Root, Chicago – USA](#)**

<http://www.holabird.com>

### **Libraries:**

#### **[Eastern Illinois University, Booth Library Renovation and Expansion, Charleston IL – USA 2002](#)**

Holabird & Root's renovation and expansion of the Booth Library preserves the integrity of the original library, reestablishes a clear organization of spaces, and integrates current technologies. The design recreates the 1948 north entry of the library and restores several original architectural details. A new, open atrium connects all floors with a grand staircase, while connecting the original building and a 1968 addition. The atrium exposes the original south façade, brings natural light into the heart of the library, and provides a central study/circulation area. (Holabird)

Constructed in 1948, the original collegiate-gothic university library included a large entry hall, reading rooms, and a central circulation desk with closed stacks. While a 1968 addition provided space for growth, it detracted from the original character of the building by covering the south facade, replacing the main entry with a side door, and creating a circuitous path through the building. The architect's design preserves the integrity of the original library, reestablishing a clear organization of spaces and integrating up-

to-date technology in this 134,200 square-foot renovation of existing space and 12,800 square-foot addition. Restoring the original north entry hall and adding a second south entrance created a clear north/south axis through the building. An open central atrium exposes the original south facade, bringing natural light into the heart of the library and providing a central study/circulation area. The atrium allows clear circulation and organization throughout the library. A "main street" spans one end of the facility to the other and is easily recognized from the atrium. Offices located in the south addition free the rest of the library for open reading and stacks. The original trim and detailing in the 1948 building was restored and contemporary interiors were specified for the 1968 building and the addition. A consistent pallet of interior finishes maintains continuity among the existing and new structures. The design promotes access to technology at nearly every seat. (Architectural record)

#### **Loras College, Academic Resource Center, Dubuque IA – USA 2002**

The 94,000-s.f. Academic Resource Center (ARC) encompasses the campus library, tutorial center, a museum, cafe and a bookstore. The ARC's siting offers panoramic views toward the Mississippi River, forms a new campus quadrangle, and connects to the Student Center. Several informal gathering areas and 15 closed study areas for groups up to eight surround an ornamental cascading staircase that connects all four floors. (Holabird)

#### **Northwestern University, Galter Health Science Library, Renovation, Evanston IL – USA 1996**

The renovation and expansion of the medical library provided a new facility to address the needs of information management. The 57,000-s.f. project included the renovation of a historic reading room, offices, group study rooms, a special collections room, a Learning Resource Center, and a new monumental stair hall to connect the various spaces. (Holabird)

A renovation and expansion project at the Galter Health Sciences Library of Northwestern University strikes a balance between traditional and future libraries, library ambiance and high technology, old and new. When guided by a vision of future building use, renovation projects can succeed in meeting many institutional goals as a viable alternative to new library buildings. Issues addressed include planning considerations, architectural history, library design, building features, information technology considerations, and ideal library space design when new construction is not possible. (<http://www.ncbi.nlm.nih.gov>)

### **Steven Holl Architects, New York, NY – USA**

<http://www.stevenholl.com>

#### **Libraries:**

#### **Queens library, Hunter Point, New York NY – USA 2010 - 2015**

PROGRAM: Library with adult reading collection, children's area, teen area, cybercenter, conference room and outdoor amphitheater, CLIENT: New York City Department of Design and Construction / Queens Library, BUILDING AREA (SQUARE): 21,000 sf, STATUS: competition first prize

The prominent site on the East River, facing a magnificent view of Manhattan, inspired the design, which cuts the lines of the main interior circulation route into the west façade. A "Manhattan view" stair rises up from the open arrival space, allowing the users a great view toward the city, flanked perpendicularly by reading tables in ascending sections backed with bookcases. While users may be on computers, the view from the entry is of books, and the view on the way up is of the East River and Manhattan. The program's separation into children's area, teen area and adult area, can be read in the carved cuts of the east face of the building, one façade opening for each area. Yet the programmatic divisions are fluid: not "this is that," as childhood can return. The building section of the new library is open and flowing, while the plan is compact, allowing for the most energy-efficient design and the greatest amount of public space on the site. Along the west is an elongated reflecting pond of recycled water, which is edged in the natural grasses that once grew at the bank of the East River. Frogs, turtles, and fish inhabit this year-round natural water strip. On the east entrance side, the library together with a low park office pavilion forms a public reading garden with a bosque of ginko trees. Ascending the stair inside one can reach the rooftop reading garden with amazing panoramic views. At night the glowing presence of the new library along the waterfront joins the Pepsi sign and the "Long Island" sign at the old Gantry to become a beacon and inviting icon for this new community place. The fabric-formed concrete structure is exposed and painted white inside, while exterior insulation and a foamed aluminum rainskin give the exterior a subtle sparkle and glow, without being overly shiny. As the material is 100 percent recycled aluminum, this outer layer relates to all the green aspects in the new facility. (Holl)

New York will be recipient of another Steven Holl project – a new library at the Queens West Development at Hunter point. Envisioned as a contemporary "urban forum", the project will shape public space and create new connections across the Queens West Development, Hunter Points South, and the existing neighborhood of Hunters Point. Steven Holl states, "we are very pleased with the great commission for an addition to the growing community. We envision a building hovering and parous, open the the public park. A luminous form of opportunity for knowledge, standing on its own reflection in the east river". This new library will also include community based spaces to encourage cultural growth, such as a multi-purpose meeting room fit for a variety of locally based events and a gallery space. Holl will also incorporate a separate structure to lead users into Gantry Plaza State Park, filtering people directly into the park. "Steven Holl Architects deliver dramatic architecture and innovative responses to complex client programs, and has proven to be adept at creating iconic buildings that respond to their site, culture, and history. This will be Steven Holl's first public New York City commission, and we are looking forward to working with him on this exciting project," said David J. Burney, Commissioner of the Department of Design and Construction, which is managing the project. (<http://www.archdaily.com>)

#### **School of Art & Art History, University of Iowa, Iowa City IA – USA 1999 – 2006**

PROGRAM: Art and art history building, including facilities for sculpture, painting, printmaking, graduate studios, administrative offices, gallery, and library, CLIENT: University of Iowa, SIZE: 70,000 sf, CONSTRUCTION COST: \$16,100,000, STATUS: completed

The new School of Art and Art History is a hybrid instrument of open edges and open center; instead of an object, the building is a "formless" instrument. Implied rather than actual volumes are outlined in the disposition of spaces. Flat or curved planes are slotted together or assembled with hinged sections. Flexible spaces open out from studios in warm weather. The main horizontal passages are meeting places with interior glass walls that reveal work-in-progress. The interplay of light is controlled through shading created by the overlapping planar exterior. Exposed tension rods of the partial bridge section contribute to the linear and planar architecture. Interior floors are framed in exposed steel and concrete planks, with integrated air and services distribution in the core voids. The resulting architecture is a hybrid vision of the future, combining bridge and loft spaces, theory with practice and human requirements with scientific principles. (Holl)

#### **Pratt Institute, Higgings Hall Insertion, Brooklyn NY – USA 1997 - 2005**

PROGRAM: wing for an architecture school containing: lobby, gallery, studios, auditorium, digital resource center, review room, gallery terrace, workshops, CLIENT: Pratt Institute, SIZE: 22,500 sf, STATUS: completed

The dissonance between the floor plates is opened at the center with panes of clear glass, allowing a view to the east court and marking an entry to the west. A two-throated skylight marks the top, striking dissonance and joining two types of light. South and north light are combined analogous to harmonious sounds in a dissonant chord. Brick from the burned section is recycled into a slumped brick and concrete base forming an entrance and viewing terrace. Rising from the burnt brick is a concrete frame supported on 6 columns spanned with concrete and sheathed with structural glass planks. An economical industrial material with translucent insulation, the planks span between floors, creating a translucent glow at night. (Holl)

[College of Architecture and Landscape Architecture, University of Minnesota, Minneapolis MN – USA](#)  
1990 – 1992

**Awards:**

**Progressive Architecture Awards – USA 1990**

**PROGRAM:** library, auditorium, offices, classrooms, **CLIENT:** University of Minnesota, **ADDITION & RENOVATION:** 47,710 & 107,220 sf, **STATUS:** completed

Articulating interior and exterior spaces, the CALA expansion promotes campus activity and pedestrian circulation while unifying both schools on campus. The addition is two overlaid L-shaped masses which include a library, auditorium, office, seminar and studio space. The addition is a complement and counterpoint to an existing building by Thorshov and Cerny. While this building is centralized and homogeneous, the addition offers peripheral views and morphological multiplicity. The existing is centripetal, with right angles framing four views onto the same court; the addition is centrifugal, with obtuse angles opening to exterior landscapes. In compliment to the horizontal existing building, the arms of the addition end in vertical elevations, bracketing "shafts of space" and activating the campus. (Holl)

[Herning Center of the Arts, Herning – Denmark 2005 – 2009](#)

5.600 sqf.

The Herning Center of the Arts unites, for the first time, three distinct cultural institutions: the Herning Art Museum, the MidWest Ensemble and the Socle du Monde. The new Center is intended to be an innovative forum combining visual art and music. The design fuses landscape and architecture in a one-level building that will include permanent and temporary exhibition galleries, a 150-seat auditorium, music rehearsal rooms, a restaurant, a media library, administrative offices and an active landscape. The design for the center aims at "building the site". In transforming the flat field, a new 40,000 sf. landscape of grass mounds and pools conceals all the parking and service areas while shaping inspiring bermed landscape spaces focused on reflecting pools positioned in the south sun. Herning's prominent relationship with textiles and art formed the inspiration for the design concept. Steven Holl states: 'Part of the current art collection is housed in an old shirt factory in Herning. This 1960s building was designed in the form of a shirt collar and is across the street from the site. It was the interaction between the factory owner and Arte Povera artists such as Piero Manzoni that enabled such a special collection of art to exist in Herning.' A fabric theme is carried throughout the project from the shape of the building which resembles a collection of shirtsleeves viewed from above, through the wall finishes. Fabric tarps were inserted into the formwork to yield a fabric texture to the buildings exterior walls of white concrete. (Holl)

[Knut Hamsun Center Hamarøy – Norway 1994 – 2009](#)

This center dedicated to Hamsun is located above the Arctic Circle near village of Presteid of Hamarøy and the farm where the writer grew up. The museum includes exhibition areas, a library and reading room, a cafe and an auditorium. The concept for the museum is "building as a body," creating a battleground of invisible forces. The stained black wood exterior skin is characteristic of the great wooden stave Norse churches. The spine of the building body is the central elevator, providing handicapped and freight access to all parts of the building. At the roof garden the long grass reflects the traditional Norwegian sod roofs in a different way. Strange, surprising and phenomenal experiences in space perspective and light will provide an inspiring frame for the exhibitions. (Holl)

[Franz Kafka Society Center, Prague – Czech Republic 2007 – 2008](#)

The basement of the small one-story building, formerly used for laundry and storage, now houses a space for exhibitions, lectures, and concerts, as well as it accommodates Franz Kafka's private library. On the first level of the building the Franz Kafka Society has located its offices. The previously dark and dismal spaces of the building are now washed in daylight coming through newly inserted windows and skylights that provide unexpected views to the towers of the Maisel Synagogue. Marcela Steinbachová (Skupina) and Steven Holl Architects have deliberately situated these windows off axis to the interiors. Inside the building new visual connections through openings and inspection holes give its small spaces depth and create visual connections. All new partitioning in the building, even when carving out spaces for restrooms and a kitchenette, is created exclusively by bookshelves. In one half of the building these bookshelves appear in white (offices) and the other half is filled with black bookshelves (entry hall). Coming from the central corridor one only sees black bookshelves and when coming from the offices one encounters white bookshelves. A 360-degree rotating door between the corridor and the director's offices, black on one side and white on the other, reverses white to black. (<http://www.archdaily.com>)

[Dover Public Library, Dover DE – USA 2010 Ground Breaking, 2012](#)

([http://imageservq.team-logic.com/media/Library/198/6043-Dover\\_Library\\_Report\\_Executive\\_v2.pdf](http://imageservq.team-logic.com/media/Library/198/6043-Dover_Library_Report_Executive_v2.pdf))

The Dover Public Library has been serving the community of central Delaware since 1885. Taking steps to address space and technology issues, as well as to anticipate future growth, the City of Dover, the State of Delaware, and the Library elected to construct a new state-of-the art facility. The proposed Dover Public Library, to be located in Dover's downtown historic district, adjacent to the Dover City Hall and the US Post Office, has been designed to be an "anchor" library for the Kent County Region and Central Delaware. The new facility will consist of nearly 48,000 sq. ft. (\$ 12,200,000) providing increased collection space, meeting spaces, training rooms for staff and the public, a large children's dept., a teen zone, a services center, a cybercafé, a gallery, an auditorium, an outdoor performing arts area and ample parking. The new library will undoubtedly prove to be a popular downtown destination.

### Rita and Truett Smith Central Public Library, Wylie, TX – USA 2010

The Outdoor Library: The new Rita and Truett Smith Central Public Library in Wylie, Texas, features both a large courtyard and a back porch where patrons can relax. Inside, a clerestory spine allows light to permeate the facility while delineating the various library zones.

### Tom Green County Library, San Angelo, TX – USA 2008

Renovation Architect: Holzman Moss Bottino Architecture, Cost: \$12 million, Size: 65,000 sq. ft.

Reuse and Restoration: The Hemphill Wells Department Store stood vacant for twenty years, but it once was the social and geographic center of town. Private donors made it possible for the library to transform the building into a library to contribute to the redevelopment of the downtown area. The restoration maintained the store's overall character, but added an undulating glass facade on street level to welcome passers-by into the library.

### St. Pauls Public Library System, Needs Assessment, St. Paul MI – USA 2007

### New Haven Free Public Library, New Haven, CT – USA 2006

### George A. Purefoy Municipal Center and Public Library, Frisco, TX – USA 2006

Client: City of Frisco, 148,000 sqf.

#### TEXAS CIVIC FORMALITY

The Municipal Center is Frisco's most important civic building but its impressive monumentality was created through material and programming ingenuity, not a lavish budget. Texas red-granite strips discarded from a quarry were re-purposed to clad ten large columns along the front of the Complex—an economical and sustainable interpretation of classic fluted columns. By combining a library and city hall into a single building, some facilities are shared and the Center can afford more dynamic public spaces than if each institution was housed in its own free-standing building.

#### MEMORABLE INTERIORS

The public areas of the Municipal Center are dramatic vaulted spaces made more memorable by the creative use of both custom and standard materials. The cherry-red, textured circulation desk is an easily identifiable destination for library users. Surprisingly, it is constructed by carving bold texture into the edge of standard plywood and staining the material a vibrant color. Richly patterned custom fabrics and flooring were used throughout the complex to unify the public spaces of both the Library and City Hall. The large quantities of materials required throughout the complex made designing the unique finishes affordable. (Holman)

### Georgia College and State University – Ina Dillard Russell Library, Milledgeville, GA – USA 2005

The Groundbreaking which expanded the building to approximately 150,000 square feet, took place Oct. 5, 2001. Principal architects for this \$19.5 million project were Cogdell & Mendrala of Savannah; associate architects were Hardy, Holzman, Pfeiffer Associates of New York. The project was completed in June 2005.

The first phase of the project added 93,000 square feet to the existing library. GC&SU got new computer labs, study rooms, and a cyber café known as Books and Brew. The small but bustling coffee shop brews Starbucks coffee, makes smoothies, serves muffins and sandwiches, and is a favorite to students and faculty alike. Throughout the renovated and expanded library are such features as 33 study rooms, a 75-person auditorium, space for 450,000 volumes, technical services, and a larger space for its special collections.

### Coronado Public Library, Coronado, CA – USA 2005 (s.a. Pfeiffer)

### ImaginOn . The Joe & Joan Martin Center, Charlotte, NC – USA 2005

ImaginOn joins a library and children's theater to create a place that engages children and their families with storytelling in ways unlike any before. The new facility, with its unique programs, inspires visitors of all ages to experience the written, spoken, and electronic word in a dynamic environment and has emerged as a new prototype for education, the arts, and entertainment. (Holzman)

Plans for ImaginOn: The Joe & Joan Martin Center, began in 1997 when two colleagues had an idea.

Bob Cannon, the former Executive Director of the Charlotte Mecklenburg Library (then named Public Library of Charlotte and Mecklenburg County), and Bruce LaRowe, Executive Director of Children's Theatre of Charlotte each led organizations with great programs for young people. And those programs were growing...

Bob and Bruce collaborated on how they might work together to meet the expanding needs of both organizations. Together, they imagined a new and innovative space, a shared facility. But not just a combination library/theatre - they imagined a new type of facility, and an original approach to education, learning and the arts. The more they thought about the possibilities, the more they realized Charlotte Mecklenburg Library & Children's Theatre of Charlotte shared much more than a need for more space - they also shared a powerful mission: bringing stories to life.

What came next was a unique partnership that features two state-of-the-art theatre spaces, a dedicated library space for youth 11 and under, four multi-use classrooms, a teen-only library, a multimedia production studio and an interactive exhibit space.

Together, under one roof, the Library's Executive Leadership, including Charles Brown, Vic Phillips, and now CEO Lee Keesler have worked together with Bruce and dozens of library and theatre staff members to ensure ImaginOn's success.

Since its opening in 2005, ImaginOn has received numerous accolades and awards from its neighbors in the community and gained national exposure during the 2012 Democratic National Convention when it was the site of filming for The Daily Show with Jon Stewart

At ImaginOn, young people learn in many ways, through all five senses and "from the page to the stage." It is the launching pad for remarkable journeys and endless possibilities.

#### OUR MISSION

ImaginOn brings stories to life through extraordinary experiences that challenge, inspire and excite young minds.

#### TIMELINE

August 1997: Children's Theatre and the Public Library create the ImaginOn concept

November 1999: Voters approve bond funds for construction

October 2000: Hardy Holzman Pfeiffer of NY (now Holzman Moss) and Gantt Huberman of Charlotte selected as architects

December 2000: Launch of Programming Endowment Campaign led by Ken Lewis and Ed Shelton

March 2003: Groundbreaking

October 2005: Grand Opening!

#### WHO ARE THE PARTNERS?

Children's Theatre of Charlotte

Founded in 1948, Children's Theatre has been opening young minds to the wonders of live theater for over half a century. Today, it continues to be one of the most technically imaginative and resourceful theatres in the country. Annually, it reaches more than 320,000 young people and families from preschool to late teens, with four strong program areas: MainStage productions;

Tarradiddle Players, the professional touring company; Community Involvement Program, and a full scope of education classes for both community and schools. Children's Theatre also works in the Charlotte-Mecklenburg Schools, with programs that address important issues in the lives of young people.

#### **Charlotte Mecklenburg Library**

Charlotte Mecklenburg Library began more than a century ago as a treasured repository of knowledge. Although humankind has evolved to read, explore and acquire knowledge in many new ways since then, one important feature has endured: Our services remain free to all who come to us with a desire to research, learn and experience. Today, libraries must remain nimble and responsive to the changing needs of our customers. Through the evolution of communication technology, there has never been more information available to more people in human history. We act as a guide through that universe of information, providing access for those who don't have it, and collaboration for those who do. We also provide the building blocks for understanding that information, through the development of literacy, skills for success, and community connections.

#### **WHO ARE JOE AND JOAN MARTIN?**

Joe and Joan Martin have been two of Charlotte's most passionately committed and inspirational residents, individuals who personify everything ImaginOn strives to be. Through the generosity of Bank of America, their support of the arts and education in Charlotte and beyond is recognized and honored in the facility's formal name – ImaginOn: The Joe & Joan Martin Center.

Joe, a champion of racial and gender equity, enjoyed a heralded career with Bank of America, retiring in 2001. He is author of two books: *Fire in the Rock*, a novel about growing up in the segregated South, and *On Any Given Day*, his personal and touching account of living with ALS. Joe touched many lives – as a father, a mentor, a grandfather, brother, confidant, civic and church leader, and husband. Joe passed away on July 1, 2006. He remains an inspiration to us all, in our work and in our lives.

Joan's commitment to our community has touched many lives as well, through her involvement in PTA, scouting, non-profit organizations, and learning programs in public schools. For 25 years, Joan has been a devoted leader of the Learning Center and a teacher at Christ Church kindergarten. She carries many titles: mother, educator, grandmother, tutor, leader, and wife.

ImaginOn is proud to be associated with Joe and Joan Martin, and our mission will always be to uphold their ideals of service and commitment to young people and to the community.

### **Grand Rapids Public Library, Grand Rapids, MN – USA 2003**

The historic Ryerson library was restored and the Keeler Wing addition was stripped to its skeleton frame and rebuilt in the largest improvement ever undertaken on a library in Michigan. Now the two buildings of the Grand Rapids Public Library flow together.

The Beaux-Arts classical library in rusticated Bedford limestone presides over Veterans' Memorial Park. Classical ornamentation—a festooned entablature, a modillioned cornice with anthemions—add to the library's formal dignity. The library was the gift of Martin A. Ryerson (1856–1932), a prominent Chicago industrialist who was a Grand Rapids native and grandson of Antoine Campau, one of the city's earliest pioneer settlers. Aware of Shepley, Rutan and Coolidge's distinguished library designs in eastern cities and in Chicago, Ryerson himself probably selected the Boston firm to create his library for Grand Rapids. The Keeler Wing addition wrapped around and connected to the rear of the Ryerson building but disregarded its design.

In 1997 voters of Grand Rapids approved a millage to improve the city's libraries. A large portion of the millage, coupled with private donations, funded the remaking of the main library more to the twenty-first-century community's liking. To get there the addition was reconnected to the historic library, reskinned, and windows added to make it compatible with the older building. Now the Keeler Wing rests on a masonry base that resembles the stone of the historic Ryerson building, limestone and glass replaced the concrete and tan brick exterior walls, and windows rise in three-story bands. But all attention focuses on the historic Ryerson building. The library's original entrance was restored and a lofty atrium connects and integrates the 1904 and 1967 structures. The renovated and restored main library places Grand Rapids in the forefront of a national library renaissance.

### **Columbia Public Library, Daniel Boone Regional Library, Columbia, MO – USA 2002**

The Columbia Public Library is the main headquarters for the Daniel Boone Regional Library in Columbia, Missouri. The building was made possible through a \$22 million bond that was passed by the citizens of Columbia. The structure was completed in 2002, and now offers stunning views of Columbia and the University of Missouri from the translucent entrance tower.

The library board members chose a New York based architectural firm, Holtzman Moss Architecture, to transform the location at Broadway and Garth Avenue. The library was constructed on the same piece of land as the old library, and was able to utilize the steel framework as homage to the predecessor. In addition to the steel framework, a chandelier was re-installed by the same electrician who had installed it in the previous building in 1970. Though the new building introduced modern, lively architecture to the traditional, college town setting of Columbia; an attempt was made to retain pieces of history.

The project was created by architect, Nestor Bottino. Bottino created an exterior infused with color from the natural resources used to construct much of the building, such as rosy granite, red clay blocks, and “peach and cream” sandstone. The interior is a mélange of blues, purples, greens, oranges, and more, while pine wood beams cross overhead. The library boasts a large 102,000 square feet. The creation of the Columbia Public Library did bring about some turmoil. A significant amount of tax payers protested the building because they felt their tax money had been misused. The cost of the structure paired with the high profile New York firm caused many to question the reasoning behind the decisions. The library board members followed the steps necessary to ensure the usability and longevity of the Columbia Public Library, and as a result, a stunning, lively piece of architecture was created to bring literacy to the public.

(<http://lis60001-access2information-drr.wiki.kent.edu/Columbia+Public+Library,+Daniel+Boone+Regional+Library,+Columbia,+Missouri>)

### **California Western School of Law, Law Library, San Diego, CA – USA 2000**

....The design phase of the project concentrated on melding the programmatic needs of the library with the aesthetic vision of the architect and law school community. Several constraints influenced both areas. First, the Board of Trustees made it clear that the \$9,000,000 appropriation for the building was firm. Second, the 12,500- square-foot lot put severe limitations on the footprint of the building. The main goal for the exterior was for the new building to serve as a visual link between the two existing campus buildings, one of which is a late 1920s Italian Renaissance style building, the other an early 1990s Post-Modern building. These buildings sit on diagonal corners of an intersection; the new library is on a third corner. The building, with its finishes, details and colors emulating the Italianate style but in a modern vernacular, is very successful in meeting this goal.

The old library's interior was dark, crowded and unappealing, so an important aesthetic goal was to design a building with a feeling of light, space and professionalism. The new building has reading spaces offering panoramic views of the downtown and the bay. Stack and reading areas have both direct and indirect lighting. Wide aisles are scattered throughout the building. Cherry wood is used on some interior walls and on the specially designed tables and carrels, imbuing a warm, professional look. Stack end panels are a combination of cherry and laminate, bringing a very finished look to the stack areas. Green, burgundy and gray-toned fabric, laminates and woods are used throughout the library and in the staff offices and work areas.... (Phyllis C. Marion)

### **Bull Street Branch of the Live Oak Public Libraries, Savannah, GA – USA 2000**

#### **Multnomah County Central Library, Portland, OR – USA 1997**

Fletcher Farr Ayotte – exec. Architect, Hardy Holzman Pfeiffer Associates – assoc. architect, McMath Dortignac – preservation consultant Hoffman Construction Co. – general contractor

One of Portland's best-loved historic landmarks, the Central Library was designed by renowned architect A.E. Doyle and constructed in 1913. Its innovative design was heralded for its functionality as well as its beauty. Over the years, the library suffered under heavy use and ill-conceived remodeling in the 1950's. By the 1990's it was overcrowded and inefficient, and 70% of its collection was inaccessible to the public.

Starting in 1993 the needs of the Library were assessed and a plan developed for a seismic and safety upgrade, incorporation of new systems, and also a re-organization of spaces. Working with George McMath, Doyle's grandson, and drawing upon historic photographs to serve as guides, lobby spaces and reading rooms were brought back to their original grandeur.

Exterior masonry was repaired. Wood windows were refurbished. Mid-century remodeling was reversed. Additional space was added in the basement and under the roof. Structural reinforcements and system upgrades were accomplished with little compromise of historic integrity.

Completed in 1997, this community landmark will inspire and educate many more generations of Portlanders. What a treasure we continue to have in the Central Library! (<http://www.visitahc.org/content/multnomah-county-central-library-case-study>)

#### **Cleveland Public Library, Cleveland, OH – USA 1996/1997**

Discussions regarding urbanism often center around one discourse - what is a proper response to an historic urban master plan?

Should something new reflect the old or interject a spirit of the new. Some believe responsive design is sensitive to the surroundings, incorporating previous established patterns and precedents. Others argue only something new is appropriate and forward-thinking.

The Cleveland Public Library demonstrates what Holzman Moss Architecture considers a more sophisticated and ultimately challenging approach - merging old and new in a thoughtful fashion. The library, one of the largest circulating libraries in the country, responds to an historic urban plan with four marble-clad towers that compliment the adjacent Beaux Arts buildings and yet offset the 10-story glass oval that provides a freshness and openness to the upper reading and stack areas. The design also integrates the beloved Eastman Reading Garden illustrating that effective urbanism is responding to the public by designing a building truly for the public, a place that becomes an integral part of the city by becoming an integral part of the lives of its citizens. (Holzman)

The construction of the new building made news on March 11, 1995, when the laying of its foundation became the largest continuous concrete pour in the city's history: 7,000 cubic yards of concrete were poured to complete the four-foot-thick foundation. The new \$65 million building was dedicated on April 12, 1997. With eleven floors, including the lower level, the new 267,000-square-foot building has more than thirty miles of book shelves—enough for 1.3 million books and is equipped with the latest electronic resources. The new building is named for Cleveland native Louis Stokes, who, in 1968, became the first African-American elected to the U.S. Congress from Ohio. During his illustrious career, Representative Stokes helped found the Congressional Black Caucus, and he became the first black member of the powerful House Appropriations Committee. He was re-elected fourteen times before retiring in 1998. The Louis Stokes Wing is one of many important buildings erected in Cleveland since the 1980s that have transformed the city's skyline while providing tangible proof of its remarkable renaissance. These include the BP America Building by H.O.K. (1985), Key Tower by Cesar Pelli & Associates (1991), Jacobs Field by H.O.K. Sports Group (1994), and I.M. Pei's Rock and Roll Hall of Fame and Museum (1995). Of all these, the Louis Stokes Wing is perhaps the most daring in its combination of traditional elements (the use of masonry, uniform cornice lines, and corner pavilions) and innovative architecture, through the use of an oval glass tower—a first for Cleveland. The \$24 million renovation of the landmark Main Building, directed by Robert P. Madison International, called for a sensitivity to the building's architectural integrity while incorporating new technologies. To the casual observer, the changes to the Main Building may not be apparent, but this serves to underscore the success of the architects in their delicate task. Electrical, plumbing, and ventilation systems were replaced. Modern fire safety systems, including sprinklers, were installed, and trenches were cut into the cement floors to accommodate wiring for new computer and electrical equipment. New mechanical machinery was placed out of sight in the basement, returning the light court to an uncluttered and light-filled state.

As part of the architects' goal of returning the building to its original luster, historic ceiling finishes were restored, the exterior marble was cleaned with a gentle water spray process, historical light fixtures were restored and rewired, decorative metalwork was repaired and polished, and the original leather doors were rejuvenated. For the first time in decades, the Main Building's historic spaces and architectural details can be fully appreciated, while featuring many technological advances and conveniences. Demonstrating the Library's continuing support for the visual arts, the Library Board commissioned a substantial collection of permanent art to be included in the buildings and garden. Thirteen artists of local and national reputation created original art for the Main Library, the Louis Stokes Wing, and the Eastman Reading Garden. Selected by a jury coordinated with the Committee for Public Art, the art works are significant additions to the Library's and the city's artistic heritage. The new art at the Main Library was made possible largely by generous grants from Cleveland foundations, corporations, and nonprofit groups.

#### **Middle Country Public Library, Centereach Selden, New York – USA 2003**

#### **Los Angeles Public Library, Central Library, Los Angeles, CA – USA 1993**

The Los Angeles Central Library, the largest public library in the western United States, is the centerpiece of a multi-block development, providing both a cultural facility and related landscaping for public use in the midst of a high-rise commercial district. Its expansion and rehabilitation incorporates Bertram Goodhue's (\* 28.04.1869 Pomfret CT - + 23.04.1924 New York NY) original 1926 landmark building with significant new construction. The 550,000-square-foot facility functions as a research center and headquarters for 66 branches. In addition to 90 linear miles of shelving and seating for 1,500 patrons, the library features a board room, meeting rooms, a conference center, a 235-seat multimedia auditorium, a cafe, a bookstore, offices, and more than 1.3 acres of public space. Pfeiffer Partners' 10-year effort began with master planning and program confirmation, and included historic preservation and adaptive reuse and full interior design services, in addition to designing. (Holzmann/Pfeiffer)

The last work of the major American architect Bertram G. Goodhue, the Central Library blends the past with the modern age. Its simple massed expanses of unadorned concrete and skyscraper-like profile herald modern architecture. At the same time, it alludes to ancient cultures including Egypt, Rome, Byzantium and various Islamic civilizations, as well as to Spanish Colonial and other revival styles.

Ornamental and symbolic artworks are integral to the library's design. The limestone sculptures on the building's exterior are by artist Lee Lawrie, and represent various disciplines and literary figures. The brilliantly colored tile pyramid at the building's summit features a sunburst and is topped by a hand-held torch symbolizing the light of knowledge.

The second floor of the Library includes a high-domed rotunda exploding with light and color. At the center of the dome is a stylized sunburst and an illuminated globe chandelier with the signs of the zodiac. On the surrounding walls, twelve murals painted by Dean Cornwall in 1933 depict the history of California.

The Library was proposed for demolition in the mid-1970s. Concerned citizens formed the Los Angeles Conservancy to save the Library and prevent similar crisis in the future through an on-going program to promote historic preservation. In 1983, after several years of public discussion and debate, the City Council directed the Community Redevelopment Agency (CRA) to preserve the Library.

Before restoration work could begin, however, two fires in 1986 destroyed portions of the library's vast collections and damaged many of the building's interior decorations. Despite this extensive damage, the CRA went ahead with a major rehabilitation and expansion plan for the Library. The firm of Hardy, Holzman and Pfeiffer served as the lead architects for this project, which included both a restoration of the original building and the addition of a new wing on the library's east side. In October 1993 - more than 15 years after the building was first threatened with demolition - the Library was re-opened in a grand community celebration. ## **Humphries Poli Architects P.C., Denver, CO – USA**

<http://www.hparch.com>

### **Libraries:**

#### **Green Valley Ranch Branch Library, Denver CO – USA 2011**

The \$11.4 million dollar GVR Library, located at 4586 North Andes Court, is the first of three Better Denver Bond funded, newly constructed Denver Public Library branches to be completed or to begin construction as part of the Better Denver Bond library improvements.

The new 26,000 square foot facility incorporates the latest in library technology including customer self-checkout stations and an automated handling system utilizing Radio Frequency Identification (RFID) technology, making the checkout of materials quicker and ensuring better tracking and accessibility of Library collections.

The Library branch also boasts fifty public computers, wi-fi accessibility, a lounge complete with a fireplace and views of the outdoors, areas for children with youth-friendly furniture, a sub-dividable 100-seat community room, small meeting rooms, and even an airplane cockpit provided by United Airline's Training Facility that encourages imagination and shared learning for visitors of all ages.

"I'm excited about this new Library and the difference it will make in Green Valley and the surrounding area," says Councilman Michael Hancock. "Everything about the Library, especially the fabulous access to computers, will add so much to the area's quality of life. Thanks to all the citizens who participated in the Library's planning and design brainstorming, and thanks to the voters for endorsing the Better Denver Bonds."

As part of the City's commitment to Greenprint Denver initiatives, the Library was designed and constructed with the goal of achieving Leadership in Energy and Environmental Design (LEED) Gold Certification through sustainable construction approaches recognized by the U.S. Green Building Council. Through the use of recycled and regional materials, materials with low emissions, low-flow water fixtures, solar tubes, day-lighting, and evaporative cooling systems the facility is estimated to use approximately 60% less energy and 40% less water annually than those buildings using conventional design approaches.

The Architecture: Plains and Planes

The vision for the Branch's physical design was derived from community comments emphasizing the building's relation to the plains landscape and the airplanes of the nearby Denver International Airport. Humphries Poli Architects specifically designed the building to accentuate the "i-Plains" and the "e-Planes" concept with an aerodynamic roof form, structural detailing developed from early aircraft design, and long and linear shapes that echo strip farming and other dry-land agricultural techniques. Additional character-defining features include a roof-line divided into four distinct levels, or "planes," and a beautiful xeriscaped garden (the "outdoor library,") which mirrors these four planes.

(<http://denverlibrary.org/bond/green-valley-ranch-branch-library>)

#### **Pueblo West White Branch Library CO – USA 2010**

Responding to community growth by renovating a 5,000 sq. ft. library and adding 23,000 sq. ft. of new space, the City and County of Pueblo Library District enhances capacity and community services in a dramatic transformation of space and purpose. Among numerous sustainable design principles being incorporated in this LEED Silver facility, an innovative series of light monitors will fill the library with natural light while simultaneously contributing to reduced energy consumption and lower heating and cooling costs. (Humphries)

#### **Anythink Brighton Library, Brighton CO – USA 2009**

Believed to be the first carbon-positive library in the USA, In 2009 it was offsetting 176,620 pounds of carbon dioxide. The building includes a 108 kw photovoltaic system which generates more than a third of the building's power and will save the library \$30,000 a year in energy costs. Also uses geothermal heating and cooling, and incorporates Solatubes which are reflective tubes that capture daylight and deliver it inside to illuminate interior spaces. (<http://www.greenlibraries.org>)

#### **Louisville Public Library, Louisville CO – USA 2006**

The Louisville Public Library benefited from a strong collaborative relationship between architect, client and public. During site selection, Humphries Poli suggested a location within the City's historic district rather than a commercialized location away from town. Embracing community context, the library now stands across the street from what will soon be Louisville's commuter rail station playing an important role in the reinvigoration of the City's core. (Humphries)

### **Awards:**

**2007 American Institute of Architects Denver Citation Award**

#### **Granby Library, Granby CO – USA 2006**

The Granby Library is a distinguished landmark that deftly combines contemporary aesthetics with local materials and historic forms, while taking advantage of the abundant Colorado views and daylight. Two prominent "sheds," oppositely angled, create a balanced composition that gives equal attention to the town's new Civic District and the long vistas to the west. (Humphries)

### **Awards:**

**2006 American Institute of Architects Denver Merit Award**

#### **Dolores Public Library, Dolores CO – USA 2005**

Site on a narrow parcel parallel to the Dolores River, this design is in harmony with the small mountain town community's desire to preserve local heritage and enhance the natural environment. Open reading and community rooms with floor to ceiling window walls maintain a constant connection with the adjacent river while the building's flexible floor plan allows for reconfiguration of space to accommodate changing community needs. (Humphries)

### **Awards:**

**Library Journal's Best Small Libraries in America - Special Mention**

"We were impressed with your professionalism, as well as your ability and willingness to seek creative alternatives and cost effective

solutions to meet the challenges of the project's location, environment and budget while achieving quality." -Carole Arnold, Director, Dolores Public Library District

#### **Philip S. Miller Library, Castle Rock CO – USA 2003**

The adaptive reuse of a former grocery store as a public library offered as many opportunities as challenges. Now an anchor of Castle Rock's central business district, the design took advantage of wide open structural bays and incorporated large store front windows to recall the building's retail past. A community center piece the building is a testament to the collaborative and creative process that make architecture our passion. (Humphries)

#### **Highlands Ranch Library, Highlands Ranch CO – USA 2000**

Planned as a keystone of the Highlands Ranch Civic Center, a dramatically vaulted two-story building organization is characterized by encompassing sight lines, navigational ease and engaging spaces. The use of stone and material coloration characteristic to local vernacular buildings helps the library relate to its surroundings and speaks to the energy and aspirations of this community's optimistic future. (Humphries)

### **HuntonBrady Architects, Orlando, FL – USA**

<http://www.huntonbrady.com>

#### **Libraries:**

#### **University of Central Florida, College of Medicine, Orlando FL - USA 2010**

173,400 sqf., \$ 53,335,000

This four-story, 171,000 square foot building will serve as the "ceremonial front door" for the new UCF College of Medicine campus located on 50-acres in Lake Nona, Florida. The building houses all medical school functions, including the medical library, lecture halls, classrooms, teaching laboratories, state-of-the-art simulation learning laboratories and a clinical skills center rivaling those of major medical schools throughout the country. Specifically, the Teaching Laboratories will focus on the biological sciences, including biochemistry, molecular biology, genetics and cell biology; the Clinical Skills Center will provide a simulated clinical setting for students to learn and practice essential skills such as conducting physical exams; and the Simulation Learning Resource Center will be equipped with training simulators and medical mannequins to simulate a variety of settings, such as an operating room, emergency room and delivery room. Additional spaces include faculty and administrative offices, kitchen and adjacent dining areas, public gathering spaces, media production room, and a student lounge and workout room. (HuntonBrady)

### **Ikon.5 architects, Princeton, NJ – USA**

<http://www.ikon5architects.com>

#### **Libraries:**

#### **Medgar Evers College Library, City University of New York, Brooklyn NY – USA 2013**

Immersion Zone | Cyber Cafe | Reference Information Commons | Archives | Media Services | Information Literacy | Reading and Collections | 40,000 square feet

The renovation and addition to the Medgar Evers College Library for the City University of New York is a transformation of an existing early 1980's traditional library into a contemporary information media commons. The program study includes maintaining traditional reading and collection areas as well as introducing new library services for the demanding student population such as: information immersion zone, media services and information literacy center. In addition to the addition of new program spaces, the study evaluated the architectural and infrastructure services and proposed options for upgrade that are consistent with the program. (Ikon.5)

#### **Kirkwood Public Library, New Castle County, New Castle DE – USA 2009**

22,500 sqf., Community Meeting Room, Children's Library, Young Adlts, Information Technology Center, EMS Station

Set along a commercial shopping strip highway, Kirkwood Public Library is designed as roadside billboard announcing the public civic function of reading, learning and exploration within. The objective was to create a new branch library for a growing diverse community that would serve as the iconic community center of the neighborhood. Shopping malls and fast food restaurants flank both sides of the site. Large commercial signs are stacked along the highway where this library is sited and a small scale residential neighborhood is set one block in from the highway site. It is within this context, that the library appears as a collection of books set on the highway. Facing the highway, the building facade, of stacked horizontal cement board siding, is fashioned as a series of boxes that represent the edge of books piled up on their side. (Ikon)

#### **Hockessin Public Library, New Castle County, New Castle DE - USA 2008**

Renovation and expansion of existing building / community meeting room / children's pavillon – 23,000 sqft.

The expansion at Hockessin Public Library is a pair of pavillons in the landscape. The expansion embraces the landscape and captures scenic views to the park is reinforced by a floating cantilevered glass pavillon which houses the children's collection and allows a flood plain to pass beneath. The simplicity of the design promotes a very clear internal organization while making clean connections to the existing library structure. (Ikon)

#### **Cafe Diem at Sprague Library, Montclair State University, Montclair NJ – USA 2007**

Seating for 70 | Fully Wired & Wireless Environment | Interactive Library / Cafe Workspace | 4,600 square feet

A new face and front door to the Sprague Library is created in a sleekly modern, transparent cafe to the quad and the campus. A glass curtain blurs the distinction between inside and out. The cafe and cafe terrace cascades down broad and generous steps to the campus green. The interior tone is set by the richness of stone and wood floor, the playfulness of a back-lit LED wall and the smooth simplicity of a clean ceiling plane. (Ikon.5)

#### **Brandywine Hundred Public Library, New Castle County NY – USA 2003**

Popular Collections | Community Meeting Rooms | Community Technology Center | Cafè | 40,000 square feet

Inspired by the landscape and history of the Brandywine Valley, this new library is a 21st century meeting house for the community of New Castle County. The library's forms and materials are inspired by Andrew Wyeth's pictorial paintings of the Brandywine. Like many buildings depicted in his paintings, this library is designed as a simple stone structure highlighted by the passage of the sun. (Ikon.5)

## **Gill Memorial Library Renovations, College of New Rochelle, New Rochelle, NY – USA 2001**

Bibliographic Instruction | Compact Reference and Reserve Storage | Café | Multi-media Instruction Classrooms | Special Collections/Archives | 38,000 square feet

A dramatic renovation radically transformed a 1938 vintage, late collegiate gothic building into a "sanctuary for modern learning." The renovation created a dramatic two-story tall lobby which connects the two levels of the building, spatially, visually, and functionally. Back-lighted colored glass windows are a modern abstraction of gothic stained glass. (Ikon.5)

## **Health Science Library, Howard University, Washington DC – USA 2001**

Bio-informatics | Distance Learning | Telemedicine | Multi-media Lab | Information Commons | 80,000 square feet

The Louis Stokes Health Sciences Library, the country's most technologically advanced health sciences library, creates a new campus green out of a large surface parking lot in Washington, D.C. This new quadrangle reclaims the historic essence of Howard University's distinguished 1935 campus master plan, connecting the buildings of Howard's schools of medicine, dentistry and nursing with the original Freedman's Hospital, our nation's first hospital for freed slaves. The library and its siting reassert the university's courageous original planning that claimed and expressed the roots of American democracy. (Ikon.5)

### **Libraries:**

#### **Traverwood Branch Library, Ann Arbor MI – USA 2008**

Project Traverwood Branch Library, Ann Arbor, Mich., Client Ann Arbor District Library, Architect Inform Studio, Northville, Mich.—Kenneth Van Tine (technical design principal); Gina Van Tine (marketing, managing principal); Michael Guthrie (design principal); Cory Lavigne (design director, project architect); Andrew Mannion, Lindsay Cooper, Amy Baker, Jason Roberts, Elizabeth Huck, Melissa Alexander (project team), Associate Architect VPS Architecture, Mechanical/Electrical Durkin & Villalta Partners, Structural Robert Darvas Associates, Construction Manager O'Neal Construction, Size 16,776 square feet

Client Ann Arbor District Library, Architect Inform Studio, Northville, Mich.—Kenneth Van Tine (technical design principal); Gina Van Tine (marketing, managing principal); Michael Guthrie (design principal); Cory Lavigne (design director, project architect); Andrew Mannion, Lindsay Cooper, Amy Baker, Jason Roberts, Elizabeth Huck, Melissa Alexander (project team) Associate Architect VPS Architecture, Size 16,776 square feet

By the time planning began four years ago for the new Traverwood Branch Library in Ann Arbor, Mich., it was tragic but not surprising for the architects at Inform Studio, of nearby Northville, to find dozens of dead ash trees on the proposed building site. Since 2002, some 30 million ash trees in southeastern Michigan have fallen prey to the emerald ash borer, a beetle thought to have boarded a ship or plane from Asia to the Midwest that has since spread to at least 14 states. Its larvae kill trees by eating their inner bark. Early in a design process focused on sustainability, the library's architects at Inform realized the dead trees' wood could become part of the library itself. It worked: The ash trees were used to make interior flooring, wall panels, ceilings and, conspicuously, a row of expressive columns along a bank of windows facing south into a nature preserve, their naked, sealed surfaces visibly scarred in rune-like patterns by chewing borers. "A happy accident"—and a guiding one, says Cory Lavigne, the firm's design director. Under the direction of artisan woodworker John Yarema, based nearby in Troy, Mich., the team employed draft horses to help move the ash logs, which were cut by hand, and began a yearlong process of air-drying the wood in Yarema's shop. Such an intensely local material would add to the design's ecology-minded strategies. Those strategies start with an L-shaped footprint for the 16,776-square-foot building, pushed to the street edges of the four-acre site to avoid intruding on the surrounding woods. Parking beneath the building, plus the city's permission to have 29 cars park on the street, reduced the city's parking requirement to only 26 paved spots on the site. Cost-cutting sacrificed a green roof, but a rain garden, planted with sedges, slows down and helps filter stormwater runoff that percolates into a nearby retention pond. Inside the library, narrow floor plates allow the sun to light the warm, ash-lined reading areas. The massing also promotes passive ventilation through operable windows activated by low-voltage actuators, which tie back to the mechanical systems. Window blinds on south- and west-facing façades are controlled by daylight sensors to cut unwanted glare. The Traverwood library is the third new branch built by the Ann Arbor District Library under its current director, Josie Parker, who wanted a sustainable building design but didn't initially expect, before the ash-tree epiphany, how poignant the results would be. People, not least children, may see the logs and ask what damaged them. The answer points back to a constant consumer demand for cheap imported goods in a global economy, which has hurt places like Michigan well before the emerald ash borer arrived. The architects at Inform followed the U.S. Green Building Council's playbook closely but didn't apply for LEED status because, quite simply, the money on certification could be used in the building itself. "In our community, it isn't necessary to pursue LEED to have a project validated and supported," Parker says. "What's important in Ann Arbor is that we do the right thing by our community."

## **JMA Architecture Studios, Las Vegas, NV – USA**

<http://www.jmaarch.com>

### **Libraries:**

#### **Windmill Library & Service Center, Las Vegas, NV – USA 2010**

New Construction, Architect: JMA Architecture Studios, Size: 36,233 sq. ft. (library, including future expansion space), 124,490 sq. ft. (full building, including administrative offices), Cost: \$45.7 million (full building)

The Windmill Library was built for future expansion, with more than 7,000 square feet that has been finished on the outside and wired and plumbed on the inside but that is currently unused. When the community grows, the dividing wall can be removed and that space converted to house library materials. The building features automated sorting equipment and RFID technology to improve material turnaround, and a custom self-service kiosk where patrons can pay fines and fees electronically, while a rooftop solar array will produce up to 8 percent of the building's energy demand.

([http://americanlibrariesmagazine.org/al\\_focus/photos/las-vegas-clark-county-library-district-windmill-library-and-service-center](http://americanlibrariesmagazine.org/al_focus/photos/las-vegas-clark-county-library-district-windmill-library-and-service-center))

The Windmill Library & Service Center, Las Vegas—Clark County Library District, NV, is the largest project this year, at \$45.7 million, encompassing 142,149 square feet. The building envelope was designed to provide efficiency and harmony among systems. Exterior balconies provide space for receptions and relaxation in the desert environment.

**Philip Johnson (\*08.07.1906 Cleveland OH - + 25.01.2005 New Canaan CT) – Alan Ritchie Architects, New York – USA**

<http://www.forarchitects.com/firm.aspx?id=1213>

The firm of Philip Johnson/Alan Ritchie Architects has been recognized as one of the most creative and innovative architectural firms for over half a century. Philip Johnson's leadership in the modern movement, and later playing a seminal role in the introduction of post-modernism and deconstructivism, has helped to form new ideas and exciting directions in design and architecture around the world. Now, under the leadership of Alan Ritchie, who worked with Philip Johnson for over twenty-five years, the firm continues to explore and present new and cutting edge designs. In 2004, when Philip Johnson retired, he expressed his confidence in passing on his legacy on to Alan Ritchie.

Philip Johnson/Alan Ritchie Architects is a New York Professional Corporation, with a staff of over twenty people and an in-house interior design group. The firm also has a registered architectural office in Shanghai, China with a staff of eighteen.

The firm of Philip Johnson/Alan Ritchie Architects has been recognized as one of the most creative and innovative architectural firms for over half a century. Philip Johnson's leadership in the modern movement, and later playing a seminal role in the introduction of post-modernism and deconstructivism, has helped to form new ideas and exciting directions in design and architecture around the world. Now, under the leadership of Alan Ritchie, who worked with Philip Johnson for over twenty-five years, the firm continues to explore and present new and cutting edge designs. In 2004, when Philip Johnson retired, he expressed his confidence in passing on his legacy on to Alan Ritchie. Philip Johnson/Alan Ritchie Architects is a New York Professional Corporation, with a staff of over twenty people and an in-house interior design group. The firm also has a registered architectural office in Shanghai, China with a staff of eighteen. Alan Ritchie, the managing partner of the firm, is a respected designer in his own right and has been responsible for the implementation of many of the office's most important designs. Mr. Ritchie and other senior members of the staff provide the knowledge necessary to assure the ultimate success of the project.

Philip Johnson/Alan Ritchie Architects' emphasis is on quality design and an understanding that input from the client is critical to its process. The firm's philosophy is founded on the belief that understanding the client's desires, needs and goals is an essential first step in generating designs that are functionally as well as aesthetically successful. Technical excellence, adherence to established schedules and budgets, and long-term performance are among its most important design objectives.

A team led by a senior member of the firm is established at the outset of each project and carries it through from design to completion of construction. This participation and continuity results in the creation of completed projects of the highest quality and design excellence.

The firm has won numerous awards and is well-known for many distinguished buildings, such as the At&T Corporate (a.k.a. Sony) Headquarters, Lipstick Building, Penzoil Place, Trump International, Williams Tower, Chrysler Center, The Amon Carter Museum, The Metropolitan, and The Business Center at Drexel University.

**Libraries:**

[Mathematics Tower / Science Library – Brown Hall Annex – Ohio State University, Columbus, OH – USA 1992](#)

Philip Johnson/John Burgee with Collins, Reimer & Gordon Architects 1992

Only blocks away from Peter Eisenman's Wexner Center for The Visual Arts (Columbus, Ohio) stand two understated buildings by Ohio native Philip Johnson. Though physically close to the Wexner Center, they are stylistically very distant from Eisenman's Deconstructivist structure. Johnson does, however, use the Wexner Center for inspiration (however loosely). In his two symmetrical brick buildings, he takes a design cue from a turret that Eisenman used in his design for the Wexner Center in order to evoke a campus building that once stood on the OSU campus.

In both of these buildings, Johnson uses brick in an inventive and layered manner that gives the buildings character, while allowing them to blend particularly well with other brick faced buildings in that area of the campus.

Located in a far less visible area within the campus than Eisenman's building, Johnson's design takes a back seat in both literal and architectural terms to the Wexner Center. By using materials that respect the environment, Johnson achieves a fluent transition from building to building, a feature which college campuses the sizes of Ohio State commonly lack. In these two buildings, Johnson manages to create interesting patterns and elegant use of materials within what is essentially a simple set educational structure. This notion is perhaps a sign of Johnson's lingering devotion to Mies van der Rohe and Mies' ability to use both elegant materials in interesting ways as well as his ability to elevate simple materials to nearly monumental heights.

The Mathematics Tower Science and Engineering Library were dedicated a year after Johnson's Museum of Television and Radio (New York City, NY) and five years after his Momentum Place (Dallas, TX.) yet Johnson's two buildings in Columbus share some qualities with these other Postmodernist offerings. In Columbus, Johnson displays a scaled back and clearly more institutional rendition of the arched entrances and symmetrical ornamentation from buildings like Momentum Place and The Museum of Television and Radio. Though possibly more restricted in monetary terms as well as in size in Columbus, Johnson still manages to shine, in this case by creating a small park-like setting in front of the Library by leaving large trees uncut. Though they partially obscure the view of building's facade year round, they give much needed shade during the summer, and in a way mimic the indoor courtyards which Johnson executed in buildings for more luxurious private clients such as PPG in Pittsburgh and Momentum Place (now Bank One Center) in Texas. (<http://www.galinsky.com/buildings/ohiomath/index.htm>)

**Johnson Fain, Los Angeles, CA – USA**

<http://www.johnsonfain.com>

**Libraries:**

[Los Angeles Unified School Center \(LAUSD\), Los Angeles, CA – USA 2006](#)

€ 161.000.000

The largest new high school for the Los Angeles Unified School District, Miguel Contreras Learning Center is located on approximately 18 acres in downtown Los Angeles in the Crown Hill District. The project addresses critical overcrowding at Belmont and Marshall High Schools by providing 71 classrooms and shared athletic facilities for the benefit of the academic community.

Facilities that can be shared with the community, such as the auditorium are sited intentionally to avoid disrupting classes.

Reflecting the density and scale of its urban location, the high school accommodates approximately 1,700 students in 221,100 square

feet of space and is comprised of an auditorium/administration building, two classroom wings, library/multimedia labs, food services/cafeteria, two gymnasiums, and a parking structure. The Classroom wings are distinctive with their open air vertical circulation stairs, open air corridors and a floating corrugated steel roof with butterfly shaped beams located above the central circulation spine of the buildings, providing protection from the inclement weather but allowing natural ventilation. The Courtyard is enlivened with distinctive smaller garden elements and performance spaces, each extensions of ground level teaching rooms. These include an outdoor music garden adjacent to the Instrumental music classroom, an outdoor stage platform adjacent to the Dance classroom, an Herb Garden and informal "cook out" pergola adjacent to the Culinary Arts classroom and a stepped garden for nature sketching adjacent to the Art Studio. Garden steps on the western edge of the courtyard function as an informal amphitheater for school announcements. The two Gymnasias, Sports Fields, Olympic size Pool, and Parking are located in the northern portion of the site in a self-contained Sports Complex. (Johnson)

#### **Playa Vista Library, Los Angeles, CA – USA 2004**

The project is a new 10,500 square foot branch library for the new community of Playa Vista located on the far West Side of Los Angeles. Landscape elements help define a pedestrian entry court and gardens are designed for views from within the library. The site provides parking for 21 cars. The library is a part of the first phase of residential development, which also includes a recreational clubhouse, nearby residential neighborhoods and an adjacent Community Center. The building program includes a 1,000 square foot community meeting room, specially designed areas for children's storytelling and a central reading room two stories high surrounded by books and natural light. The structure is wood-framed finished in a combination of plaster, wood and corrugated metals, reflecting the informality of the beach communities. The reading room is the cultural space around which specialized collections are organized and provides high clerestory light into the core of the building. (Johnson)

### **Johnson Favaro Architects, Culver City, CA – USA**

<http://www.johnsonfavaro.com>

#### **Libraries:**

#### **Manhattan Beach Library, Manhattan Beach, CA – USA 2015**

The new Manhattan Beach Library will replace the existing Library to address heightened demand for Library services by the local community. The new two-story 20,000 square foot Library, designed by Los Angeles-based architect Johnson Favaro, will feature a glass façade offering users a panoramic view of the Pacific Ocean, and will open up to the civic center plaza in the rear. The new Manhattan Beach Library will not only serve as a resource for books but also as a community hub with educational and cultural activities for a diverse constituency.

(<http://lacountyarts.com/civcart/projectdetails/id/211>)

Our design of the new City of Manhattan Beach branch of the County of Los Angeles Public Library replaces the existing one-story 12,500 SF facility with a two story 22,500 SF facility located in the city's downtown civic center along Highland Avenue. Occupying only half of the area of the original building, the new library allows for a nearly doubled expansion of the civic center plaza with open space. Designed for LEED Gold certification, the new library will include a dedicated children's library, a community meeting room, a teen center, adult collections, reading areas and public access technology. A key component of the ground floor is the children's library, as the current one is the most heavily used in all of the county library system. On the second floor, dramatic views of the Pacific Ocean are highlighted with a sweeping panorama from Malibu to the north and Palos Verdes and Catalina Island to the south. The library is part of a comprehensive facilities and open space strategic master plan for the city that was completed by our firm in 2008. (Johnson Favaro)

#### **Beverly Hills Library, Beverly Hills, CA – USA 2013**

The Friends of the Beverly Hills Public Library, founded in 1959, raised funds to enhance the library's services. In 1962, a bond issue for a new building failed by 464 votes. A second bond issue to fund the construction of the library, however, passed in 1963. The library opened in August 1965.

The library underwent extensive renovation in 1990 under Charles Moore's (+31.10.1925 Benton Harbor, MI - + 16.12.1993 Austin, TX) Renovation Group design. The plan included a new building for the library, which opened September 4, 1990.

See: <http://charlesmoore.org>

[http://www.greatbuildings.com/buildings/Moore\\_House.html](http://www.greatbuildings.com/buildings/Moore_House.html)

Johnson Favaro is currently renovating the Beverly Hills Library, which consists of the original 1960s-era building onto which Charles Moore, the world renowned late 20<sup>th</sup> century architect, added additional floor area in 1990. The 75,000 SF library contains large collections including a highly regarded research collection and reading room and one of the best fine arts collections in the Los Angeles area. The project consists of a large scale renovation of the children's teen areas and main lobby to improve overall configuration and interior organization while increasing interior daylight throughout. (Johnson Favaro)

#### **West Hollywood Library & Municipal Garage, West Hollywood, CA – USA 2011**

Named one of the top works of public architecture to open in Southern California in the last decade by Los Angeles Times Architecture Critic Christopher Hawthorne, the new West Hollywood Library is the largest capital investment and most significant civic building in the 25-year history of the City of West Hollywood. The new library and expansion of the West Hollywood Park is part of the first phase of implementation of the West Hollywood Park Master Plan, completed by our firm in 2004. Certified LEED Gold, the three-story 48,000 SF facility includes reading lounges, integrated computer and technology areas, group study rooms, shelving for over 150,000 volumes, special collections including an LGBT area and HIV/AIDS information center, the Wells Fargo Center, a children's library and theatre, a teen area, a community meeting room, city council chambers, also used as avenue for community events and performances, a café, a bookstore and the city's public access cable television broadcast station. The project also includes two parking garages, a 90-car subterranean structure for library patrons and a 330 car, five level parking garage. (Johnson Favaro)

### **Johnston Architects PLLC, Seattle, WA – USA**

#### **Libraries:**

#### **S'Klallam House of Knowledge, Kingston WA - USA 2007**

The House of Knowledge is the realization of a dream for the Port Gamble S'Klallam Tribe near Kingston, Washington. The project consists of a new Longhouse, Education Center, future Elder Center and future Library. The heart and soul of the complex is the Longhouse. It's cedar clad exterior and interior walls enclose a vast performance space and built-in wood seating, supported by a frame of Douglas Fir log columns and beams. The Longhouse is the first such building of its kind in over 100 years for the S'Klallam Tribe. This project is a collaboration between Johnston Architects and Cutler Anderson Architects of Bainbridge Island.

(Johnston)

### **South Park Library, Seattle, WA – USA 2007**

The South Park neighborhood in Seattle is a rich and diverse place. It has a strong Latin American influence but is also home to Pacific Islanders, Vietnamese, and dozens of other ethnic groups. The library is a meeting place and focal point for this underappreciated part of the city and in that spirit the design includes a courtyard or “front porch” for South Park. The red stucco is a lively reference to the area’s Latin American flavor, as is the outer and inner courtyard in the design. LEED Equivalent.

(Jonston)

### **Bozeman Library, Bozeman, MT – USA 2006**

Bozeman Library anchors one end of a vibrant Montana town. It acts as a cultural magnet for Galatin county and a primary year round destination for patrons. The site borders on Main street to the north, Pete’s Hill to the south, downtown to the west and Lindley Park to the east. The citizens of the region have developed an impressive private and public funding program to make this great new facility a reality. Soaring windows, incredible views of the Bridger Mountains from the Montana Room and an expansive physical and electronic library will bring exceptional information services to the region. The Bozeman Library has also been awarded LEED Silver certification. Green features include: natural daylighting, a photovoltaic electrical generation system water harvesting and reuse, water-efficient plumbing, the use of low-VOC and recycled materials, the recycling of construction debris. (Johnston)

### **Capitol Hill Library, Portland, OR – USA 2003**

The project consists of a new library on the site of an existing library at the corner of Harvard and E. Republican St. The site is the border between commercial and multi-family zones of Capitol Hill. In collaboration with James Cutler, the library is designed to be environmentally sensitive. The building is wrapped by a “vertical garden” which extends inside the building as well as out. The library also extends the living environment found in the residential neighborhood to the west towards the commercial district to the east through its two story central reading room, lined and surrounded by plant material and books, which will be a refuge of calm and quiet for those visiting from the commercial area. The exterior expression of the building is urban, the library will have an urban edge as well as a living skin. LEED Equivalent. (Johnston)

### **Richmond Beach Library, Shoreline (King County Library), WA – USA 2001**

The 5,250 SF Richmond Beach Library located within Richmond Beach Park, is designed to provide community level services including a collection of 45,000 volumes, electronic catalog, internet access, lounge and a meeting room. The library is prominent from the surrounding park and this is reflected in its design. Aesthetically, the building has been designed to “fit” the image of a building in the park. Arbors, trellises and berms surround the building to help it make it an integral and positive aspect of the park landscape. (Johnston)

### **Awards:**

**2004 AIA St. Louis Chapter Design?Award**

Located at the heart of the Hilltop Campus, KMW’s sixth building project for Washington University was the expansion and renovation of the existing central university library. The program called for a perimeter expansion at grade; the complete replanning and renovation of all of non-stack areas; and the redesign of the entire exterior to enhance the existing character of this vintage 1962 facility and bring more natural light to the redefined reading areas. The reworking of the exterior entailed the replacement of the solid masonry walls on the east and west sides of the top floor with a sun-screened curtain wall and an expansion of the number of windows on the floor below.

A new 7,000-sf Internet café now occupies the southeast corner of the building, where an existing outdoor courtyard was transformed into a three-story atrium, providing a fresh spatial focus for both the library and the café. As part of the complete reconfiguration of the ground floor, the entrance was moved from the east to the south side of the building, improving the controlled access through a common entry vestibule and consolidating the various user services – circulation, reserve, reference, inter-library loan – into a single shared-services and checkout desk. In order to increase the visibility of the most important holdings, the reading and work areas of Special Collections, which houses rare and archival materials, were relocated to the ground floor.

The dramatic transparency of the ground floor creates views to and from the rest of campus: an assertion of the connection between the cloistered study of the library and the rest of college life.

In association with Paradigm Architecture. (Kallmann)

In association with Baker Cooper & Associates

77,000 sqf., \$ 20,007,000

### **Awards:**

**1st Award Design. The Masonry Institute, Inc. 2001**

The new library for Howard University Law School is a state-of-the-art facility supporting legal research and instruction. This four-story, 76,000 square foot building provides for a book collection of up to 215,000 volumes; seating for over 295 students, including 90 open carrels, with all locations wired for computer use; enlarged micro-form and audio-visual facilities; and distinctive rooms of wood and brick for special collections, newspaper and periodical reading, and the Rare Book Collection. The library is organized around the second floor triple-height Reading Room, which addresses the new courtyard and the existing Holy Cross Hall to the south. The tall windows of this 4,000 square foot space give views onto the landscaped courtyard and celebrate the display of readers and books to the campus. Table and lounge seating for 80 students are provided in this great room, as well as the 2,000 volume reference collection. The book collection and individual study carrels are distributed equally on Floors 2, 3 and 4, which open directly to the Reading Room. (Kallmann)

**Information infrastructure within could provide interdisciplinary learning opportunities**

KVA worked with the Shady Hill School to create a new kind of library space that integrates digital learning tools with the physical intimacy of books and the pleasures of reading. The design provides a cross-disciplinary Learning Platform tailored to the School's Central Study based academic curriculum. Spaces in the Library are defined by the figure of a Learning Platform, an accessible, ramped landscape that organizes areas for the display and construction of student art projects, and spaces for storytelling, music and video centers, and tutorials. The Learning Platform integrates a raised floor plenum system that provides power and data raceways for the School's Intranet and the Internet. The edges of the Learning Platform establish a new wall typology that combines standard, adjustable bookshelves with electrical raceways, computer workstations, flat screen projection, and data ports. Artwork and cultural objects referenced by the curriculum are designed into the book stacks along with digital display surfaces. The Platform is clad with re-cycled wood pulp products that were shop built off site to meet the demands of a compressed construction schedule. These cladding materials are physical reminders of the relationships between manufacturing technologies, wood products and books. (KVA)

Bruce T. Martin: A new and powerful trend combines cyber space with physical space

The architect worked with the school to identify how information infrastructure within the library could provide interdisciplinary learning opportunities tailored to the school's curriculum. The design responds with a new kind of library which integrates digital learning tools with books. The library offers areas for the display and construction of student art projects, storytelling, music and video centers, tutorial rooms, and computer laboratories. A raised floor plenum provides power and data for the Internet and the school's Intranet. The digital platform is designed as an accessible, ramped topography that organizes the different activity areas of the open library loft space. Designed with lighting and wiring raceways, its edges combine industry standard, adjustable bookshelves, and digital learning tools, including flat screen projection, data ports, and workstations. Display areas for artwork and objects referenced by the curriculum are introduced into the book stacks along with digital display surfaces. The design creates different scales of space that allow students to develop age-appropriate independent research skills. The library provides spaces scaled for individual, team, and class group research projects. The circulation and reference areas are conceived as a living room with library navigation computers, oversized books, and reference book display areas. This living room provides a generous open space for special projects and meetings, and establishes a relaxed research atmosphere that redefines the public role of the library.

**Libraries:**

**Lafayette Library and Learning Center, Lafayette, CA – USA 2009**

Client: City of Lafayette, 70.000 sqf. \$ 30.000.000

**Awards:**

2011 California Redevelopment Association Award of Excellence Special Citation

The buildings of the Lafayette Library and Learning Center embrace the sloped topography of the site, defining a pedestrian street which extends the full length of the site and features a landscaped amphitheater, intimate reading areas and outdoor cafe seating. The Community Building anchors the busy corner intersection and includes a large meeting area, platform and art gallery. The Main Library spaces are supported by wood paralam columns and trusses, defining a modern interpretation of the distinctive Bay Area architectural style. High clerestory glazing infuses the interior with natural light, and deep overhangs and sun shades provide protection from heat gain and glare. The Children's Library features a large shaded patio, reading nooks, a stepped

storytelling corner, fanciful rCound windows in the shape of the Big Dipper and a multi-colored carpet tile floor pattern. The buildings' exterior is clad with amber gold granite, reclaimed teak siding and warm-toned metal panels. Photovoltaic panels above the surface parking lot will generate approximately 8% of the building's electrical needs. (Killefer)

#### **Thousand Oaks Library, Thousand Oaks, CA – USA 2006**

Client: City of Thousand Oaks, 22.000 sqf., \$ 11.000.000

The Children's Library addition to the 1982 Thousand Oaks Main Library respects the distinctive sawtooth massing of the existing building. High sloping ceilings and north facing clerestory windows flood the library with natural light, and a wood and glass paneled wall outlining the southern California coastline defines the spacious collection area. A saltwater aquarium nestled in a cozy space with multi-colored porthole lights and sea blue walls provides a dramatic link between the existing and new wings. Adjacent to the triangular shaped story telling room is an intimate children's garden, and an informal courtyard invites library patrons to enjoy coffee and reading in a shaded outdoor setting. (Killefer)

#### **Mid-Valley Regional Library – USA 2006**

Client: City of Los Angeles, 28.000 sqf., € 4.100.000

The Mid Valley Library includes the district's regional headquarters, a community meeting room, Friends of the Library bookstore and a bookmobile facility. The building, set in a neighborhood park, is organized in a cross axial format. At the important intersection of the building's entry axis and organizing long central axis is the reference desk, and floating above is a stepped pyramid roof, glazed in cobalt blue tile and topped by a translucent skylight. Small windows punctuate the pyramid, which sparkle at night with quartz lighting. At the north end of the axis is a light-filled reading area and clock tower, which announces the library to the street. At the south end is the children's library, where a storyteller's throne is positioned under a fanciful teepee and surrounded by an imaginative landscape mural. The landscaping features native and introduced drought-tolerant plants. Evergreen trees shade the parking areas while flowering shrubs and grasses serve as low screens. Existing trees were replanted to provide a mature landscape along the major boulevard fronting the property and along walkways leading from the neighborhood. Since its construction in 1994, the Mid Valley Library has become the center of the community it serves and enjoys high-volume usage. (Killefer)

#### **Palisades Library, Los Angeles, CA – USA 2003**

Client: City of Los Angeles, 13.000 sqf., € 3.900.000

The design of the Palisades Library, set in a park and surrounded by large existing trees, derived from numerous community meetings, and was enthusiastically embraced for its rustic yet contemporary feeling and for its varied use of contrasting materials. The K-shaped plan provides an organizational structure for the different program elements. Centered around a circulation desk, the reading rooms for adults, young adults and children pinwheel into three wings. A fourth wing contains a multi-purpose room and kitchen. The interior features cork flooring and exposed glu-lam beams and acoustic wood ceilings. The exterior is partially clad in stone, grounding the library solidly at its base. Multiple patios for outside reading and public gatherings complete the integration with the surrounding park landscape. (Killefer)

#### **Haines Hall, University of California, Los Angeles – USA 2001**

Constructed in 1927 as the campus Chemistry building, Haines Hall is named for Charles Grove Haines, a political science professor who taught at UCLA from 1925 to 1948. Costing nearly \$2.5 million at the time, the building covers 133,851 square feet over the six floors. As with Royce Hall, Powell Library and the Humanities Building, Haines Hall was constructed in a way to emulate a Romanesque or Italian Renaissance style, with red brick, cast stone trim, and tile roofs.

(<http://www.bruinwalk.com/places/ucla-haines-hall>)

\$ 14.300.000, 134.000 sqf.

Haines Hall, built in two phases starting in 1927, is one of four original UCLA buildings on the historic quad, along with Royce, Powell and Kinsey Halls. As part of a system-wide program of seismic upgrades to historic buildings, Haines hall's masonry walls were reinforced with concrete shear walls and steel tube bracing. Exterior stairs added in the 1970s were removed and the renovation also included fire life safety upgrades, disabled access improvements and air conditioning. The 134,000 SF building, housing liberal arts classrooms, faculty offices, and ethnic studies libraries, reopened for the 2001 academic year. (Killefer)

#### **Jefferson Library, Los Angeles, CA – USA 1998**

Client: City of Los Angeles, 9.600 sqf., € 2.400.000

The Jefferson Library expansion adds 6000 SF to the original historic Spanish-style library built in 1921, and includes a community meeting hall, homework room, children's story room, expanded reading rooms, new stacks, and staff support areas. Part of the pre-design process included community workshops at the library to make planning recommendations to the design team. The resulting design follows the direction set at the workshops and preserves the building's character-defining features. Set back from the existing south facade, the new addition is clearly distinguishable from the original structure. The new entry and circulation spine run along the east side of the existing library, exposing portions of the original masonry walls. The existing patio is restored, bringing light into the library and providing a secure outside reading room. (Killefer)

The library, an existing building with a new addition, accommodates 150,000 volumes, study seating for 300 students, multimedia classrooms, and a trustees meeting room. The curved limestone south facade forms a memorable campus landmark, a distinctive presence defining the edge of the Campus Green. The library provides a variety of spaces for reading and study. A two-story reading room on the second floor extends the full width of the building and looks out over the Green. Daylight is admitted through monumental wood windows with adjustable sunscreens and shutters and high clerestory windows. At night the room is a lantern at the heart of the campus. The ground floor reference room faces the Green. The periodical lounge is a two-story space opening onto a garden and a grove of beech trees. The collection is housed in accessible stacks in the older portion of the building. (Kliment)

This \$6,000,000 project consisted of a new 65,000 sq. ft. library/classroom building and a 10,000 sq. ft addition to the campus central boiler plant. The library was to eventually expanded into the entire building and the classrooms relocated. The presence of the classrooms posed potential problems of library security and separation of functions. Through careful planning and a thorough understanding of the client's needs KSA was able to avoid these problems and provide a highly functional facility. (Kline) (<http://www.dosterconstruction.com>)

[Clayton Glass Library, Motlow State Community College, Tullahoma, TN – USA 2008](#)

This 45,000 sq. ft. library serves 3,100 students from rural counties near the Jack Daniels Distillery. The building's exterior blends with the 60's campus architecture of rectangular brick buildings with horizontal limestone bands and vertical floor-to-ceiling windows. The second-story of the central rotunda is surrounded by glass enclosed library rooms, which allow light from the exterior to penetrate well into the interior spaces of the structure and accentuate the open plan of the facility. The Craftsman style of the interior was selected to harmonize with the building's pastoral setting. Accents of wood, stone and ceramic tile were utilized to provide warmth and texture. (Kline)

<http://koetterkim.com>

#### **Libraries:**

[Osher Map Library, University of Southern Maine, Portland, ME – USA 2009](#)

26,000 sqf., \$ 7,600,000

The Osher Map Library is an archival storage facility designed to preserve and protect a world renowned collection of maps, globes, and related documents. It is unusual in that mission is not only the preservation of these valuable artifacts but also to provide outreach and education of the public at large. Students of all ages will be able to visit the facility and learn about history and discipline of mapmaking through exposure to actual examples. (Koetter)

The \$12 million project was funded by donations, a state bond and a grant from the National Endowment for the Humanities, according to USM spokesman Robert Caswell. More than \$8 million was invested in the map library construction and updating of its equipment to make it a state-of-the-art digital map center. The new facility, which is decorated by 140, 3-by-13-foot aluminum panels depicting a 1946 Dymaxion map by futurist and inventor Buckminster Fuller, is four times the size of the old, 4,525-square-

foot facility in the Glickman Library (see: [SMRT Architects](#)). The new, 19,000-square-foot facility has a 75-seat auditorium for lectures and school visits, the Cohen Education Center. (<http://www.theforecaster.net>)

This major 50,000 sqf. expansion of one of Americas foremost academic libraries is situated at a prominent corner along historic Nassau Street, between campus and township, and acts as an extension of the librarys two lower below-grade floors. This major library expansion is devoted to book stack space punctuated by three new reading rooms. Related functions include reading carrels, seminar/classrooms, offices, study spaces, and computer facilities. This building establishes a new kind of interface between the campus and its surrounding community. At ground level, the low, upper perimeter of the building, presented as a long, stone-clad garden wall, relates directly to the materials of the existing library while defining a new linear park along Nassau Street. This park is terminated by a small cylindrical pavillion element that marks its important intersection location, while delivering natural top light to a major subterranean stair hall. (Koetter)

The Rothermere American Institute has been described in the British press as one of the most beautifully built modern buildings in Oxford. Dedicated by former President Bill Clinton in 2001, it stands in a leafy quarter north of the historic city center, close to Rhodes House, an institution with close American connections, and to the 19th century complex of Mansfield College. The Institute was created to serve as a center for research, teaching and discussion about America history, politics and government.

The basic parti is similar to that of Basil Champney's library at adjacent Mansfield College. In both structures, classrooms and ancillary spaces are arranged below a great reading room, overlooking and opening onto a shared private garden precinct. The new Institute building is sunk 11 feet below grade so that the cave line of the adjacent Mansfield College is maintained. The building's lowest level contains seminar rooms and opens out to a sunken terrace edging the lawn.

The position of the building on the site and of its terraces allows all four levels to take advantage of natural daylight—especially the 23-foot-high reading room, the project focus. This double-height reading room, which faces south overlooking the garden-galleries, contains study carrels looking down into the main space. Behind the carrels are book stacks and offices. The vocabulary is that of exposed concrete and natural Bath stone cladding, which is used to frame finely detailed steel and glass. The principal façade is strongly modeled, with fritted glass louvers to control solar gain and reduce the need for mechanical ventilation. Air conditioning is eschewed in favor of nighttime cooling, which relies upon the thermal mass of the structure and an earth-connected heat exchange system set below the garden. (KPF)

#### **Libraries:**

**West Lafayette Public Library, Lafayette IN – USA 2012 – 2013**

Client: West Lafayette Public Library, Project: West Lafayette Public Library New Construction

Brick and stone in harmony with aluminum and glass. Custom terracotta medallions. A welcoming terrazzo entryway. To casual visitors, these things could be interpreted as separate design features. But to discerning patrons, they're something more - a salute to the region's rich culture. The team who envisioned, designed, and built the new West Lafayette Public Library worked to understand this college town's past - as well as its promise for the future. The design was inspired by the library's collection of Frank Lloyd Wright furniture, as well as a neighboring building designed by [Louis Sullivan](#). The building's exterior includes a plaza that serves as a gateway to neighboring Purdue University. The library's interior spaces were painstakingly designed to be of service simultaneously to community members, Purdue students, staff, and volunteers. The building even makes use of an automated materials handling system that allows staff members to focus on assisting patrons, rather than carrying books. In these ways and more, the West Lafayette Public Library is a warehouse of knowledge and a beneficiary of it. (KRM)

**Kokomo-Howard County Public Library, Kokomo, IN - USA 2010**

Renovation

**Tipton County Public Library, Tipton, IN – USA 2010**

Client: Tipton County Public Library, Project: Tipton County Public Library Renovation and Expansion

The concept is simple. It is also quite true. When libraries are well designed, more people take advantage of them. Therefore, it's critical that any library project receive the highest level of planning, foresight, and creativity. The natural outcome of the process is more people seeking knowledge, more people taking part in public discourse, and more children developing a love of learning. The Tipton County Public Library is now seeing the benefits of just such a project. More people use the library now than ever before. KRM led a complete interior renovation and building expansion that included an adult reading room, a children's program room, additional work and storage space, updated lighting, new HVAC systems, and various other features - all within a budget that didn't require raising local taxes. The building's interior celebrates the cyclical nature of libraries. Books are borrowed and returned. Ideas flow from person to person. As such, circles are integrated throughout the library's interior spaces. To the trained eye, these circles might also be reminiscent of the perfect flow of communication between architect and client. (KRM)

#### [Noblesville Public Library, Noblesville, IN – USA 2005](#)

102.000 sqf., \$ 10.000.000

Client: Hamilton-East Public Library System, Project: Fishers and Noblesville Public Libraries Renovation and Expansion

When the population served by this library system grew by 98% in ten years, the need for expansion was obvious. But before the project could begin in full, serious questions had to be addressed: How do we honor our heritage while celebrating our future? How do we leverage today's growth to create new opportunities? How do we turn the two libraries in this system into true community destinations? We found the solutions, as we always have, through collaboration. Librarians themselves provided historic records that aided in the design process. We worked with stakeholders to assess the user needs. And our entire team researched ways the buildings could form a junction between the past, present, and future. The two resulting structures – one in Fishers, Indiana and one in Noblesville, Indiana - now serve as well-considered answers to those challenging questions. Each features new construction that flows naturally into existing architecture. They both feature dedicated spaces for children, teens, and adults, as well as computer labs and meeting spaces. Of course, we also made sure the buildings included something else – plenty of space for expansion in the future. (KRM)

The two resulting structures – one in Fishers, Indiana and one in Noblesville, Indiana - now serve as well-considered answers to those challenging questions. Each features new construction that flows naturally into existing architecture. They both feature dedicated spaces for children, teens, and adults, as well as computer labs and meeting spaces. Of course, we also made sure the buildings included something else – plenty of space for expansion in the future. (KRM)

### [Krueck & Sexton Architects, Chicago, IL – USA](#)

<http://www.ksarch.com>

#### [Libraries:](#)

#### [Spertus Institute of Jewish Studies, Chicago IL – USA 2007](#)

„Wir brauchten einen dynamischen, empfangenden Ort.“ So begründet der Sprecher des Spertus Instituts in Chicago die Entscheidung für die facettenartige Glasfassade des Institutsneubaus, das von den lokal ansässigen Architekten Krueck + Sexton entworfen wurde. Am 30. November 2007 wird das neue „Spertus Institut für Jüdische Studien“ nun eröffnet. Der Neubau an der Michigan Avenue Nr.610 hebt sich deutlich von der traditionellen Bebauung seiner Umgebung ab: Rund 1,20 Meter wölbt sich die 49 Meter hohe und 25 Meter breite Fassade dem Straßenraum entgegen. Sie besteht aus 726 Teilen in insgesamt 556 Formen, die meisten davon Parallelogramme. Um die Sonneneinstrahlung zu verringern, sind die Gläser mit einer Spezialbeschichtung versehen. Aber nicht nur äußerlich ist der zehn Geschosse hohe und rund 14.000 Quadratmeter große Neubau anders als seine Nachbarn: Im Inneren erwartet die Besucher ein Tageslicht-durchfluteter Raum, bei dem Oberlichter und Glaswände Licht bis in die hintersten Winkel transportieren. Das Museum des Instituts, eine große Halle, ein 400 Plätze großes Theater, eine Bibliothek, Seminarräume, ein Geschenkeladen sowie ein Café mit kosherem Essen sind nur einige der Funktionen, die hier angeboten werden. Im Frühjahr 2008 sollen noch ein interaktives Kinderzentrum und ein pädagogisches Forschungszentrum für Erzieher und Eltern dazukommen. Die Baukosten für das Projekt beliefen sich auf rund 55 Millionen Dollar. (<http://www.baunetz.de>)

Like a cut diamond, Krueck and Sexton Architects' Spertus Institute of Jewish Studies fits seamlessly Chicago's downtown street wall.

By Blair Kamin –

This is an excerpt of an article from the May 2008 edition of Architectural Record.

Like the imposing towers lining the edges of New York's Central Park, the street wall of historic skyscrapers fronting on Chicago's Grant Park exist as built topography—a man-made cliff of stone and brick that includes such seminal structures as Adler & Sullivan's robust Auditorium Building. Now, with the completion of the Spertus Institute of Jewish Studies by Chicago architects Ron Krueck and Mark Sexton, this mighty street wall—a mile and a half long—has made a dazzling leap into the 21st century. The 10-story building resembles a shimmering piece of quartz exquisitely inserted into a great stone wall, its faceted, folded facade of glass glinting in the morning sun.

While Spertus may appear to be yet another one-off “icon building,” it actually imparts several broader lessons. It is, first, a cultural building on a budget, with a construction cost of just \$39 million—far less than the recent crop of spectacular museums whose price tags typically exceed \$100 million. It is, second, a creative essay in Jewish architecture, eschewing facile iconography or familiar historicism for its beguiling study in light. Lastly, it is, like Steven Holl's much-praised Bloch Building at the Nelson-Atkins Museum in Kansas City, Missouri, an exercise in complementary contrast, with the new subtly juxtaposed to the old instead of trying to shout it.

For both architect and client, the building represents a felicitous debut on a broader stage. Krueck and Sexton's commissions have tended to be quiet triumphs, like the firm's skilled 2005 restoration of Mies van der Rohe's Crown Hall. For its part, Spertus, a leading Jewish institution in the Midwest, with three interrelated divisions—Spertus College, the Asher Library, and the Spertus Museum—was stuck in a remodeled turn-of-the-century office building. In a move straight out of *The Fountainhead*, the building suffered an International Style makeover in the 1950s that concealed its cultural identity. Inside, the institute's three divisions were

separated from each other by a conventional stack of office floors. “People would come in and they would say, ‘Spertus is dead. Why doesn’t anybody come here?’ ” recalls the institute’s ebullient president, Howard Sulkin. “There would be 700 people in the building. There was no way you could know that because everything was compartmentalized.” For its new home, located directly north of the old one on a former vacant lot, Spertus chose Krueck and Sexton over three highly regarded finalists—James Stewart Polshak, Tod Williams and Billie Tsien, and Rafael Pelli. The winning team wasn’t just brilliant, they were the best listeners, Sulkin said at the time.

Nevertheless, it took Krueck and Sexton several tries to develop a scheme that achieved the delicate balance of form and identity the client sought: A bold contemporary statement that would, of necessity, respond sensitively to the Michigan Avenue street wall, which Chicago had declared a landmark district in 2002. At the same time, the building would seek to communicate the Jewish values of learning and culture through light while it expressed the institute’s identity as a civic institution, “not a ghetto institution,” as Sulkin puts it. ### **Libraries:**

**Library / Academic Resource Center, Allan Hancock College, Santa Maria, CA – USA 2006**

23,000 sqf.

The integrated Learning Resources Center includes a Library, a Learning Center and an AV/Media and Instructional Materials Development Center. The column and brace structural framework, clad in pre-finished metal, is exposed and expressed as an architectural feature. A central circulation core is defined by a three-story metal-clad wall running diagonally through the building. Pedestrian bridges provide links at the upper levels. The core’s translucent roof allows daylight to filter into the building’s interior. The Learning Center contains 360 networked computer stations surrounded by ancillary support spaces. Also located on the first floor are a 108-station tutoring/group study area, a series of audio-visual production studios and a live TV studio. The second floor is devoted to the Library. The library capacity is over 116,000 volumes with 205 reader stations and 49 reference stations. The third floor consists of a rooftop penthouse of faculty offices, many with ocean views. The offices are served by covered walkways separated from the roofing surface by a raised landscaped planter. (KBZ)

### **Libraries:**

**Kean University, Human Rights Institute (Nancy Thompson Library), Union Township, NJ – USA 2009**

Kean University, Nancy Thompson Library, Union, New Jersey, FIRM KSS Architects LLP, CLIENT Kean University  
AREA 81,000 sq.ft., TOTAL COST \$5,000,000.00, COMPLETION DATE 4/1996, The addition, attached to a corner of the existing library, ADDITIONAL INFORMATION, COST PER SQ FT \$62.00, FEATURED IN 1998 Architectural Portfolio

Kean University wished to enhance the library’s position as the focal point of academic life on campus. Encompassing 20,000 square feet of additional space on three floors, the renovation and addition expanded and reorganized the existing library to encourage more frequent, skilled library use by students.

Construction of the project was phased to keep the existing facility in continual operation during construction.

\* Architect/Engineer: KSS Architects, Reynolds Group, Vanderweil, CMX (previously named Schoor DePalma)

\* Construction Type: Renovation/Addition

\* Basic Information: 12, 500 square feet, 3 floors, New curtain wall façade, \* Status: Appropriate permits in place Anticipated Bid Advertisement—November 8,2007, Project Completion—Summer 2009

A new, highly visible entrance closer to pedestrian walkways. The first floor exterior walls adjacent to the main circulation spine of the campus were designed with extensive glazing, allowing glimpses of the library within and encouraging passersby to enter. Special study areas include the Holocaust Resource Center, featuring a suspended curved wood ceiling, and a casual lounge located inside the main entrance.

The reference desk was renamed the information desk and placed directly in front of the main entry so that students could seek assistance immediately upon entering. The stacks were completely reorganized in a main-street fashion to ease book finding.

Brick and cast stone were used for the addition and continued the strong grid pattern of the original structure. Aligned cast-stone bands connect the addition to the original building. (<http://kean.edu/admin/uploads/pdf/purchasing/forms/ConstructionProject.pdf>)

#### **Central Library Austin, Austin, TX – USA 2016**

Collaboration with: Shepley Bulfinch

250.000 sqf., \$ 90.000.000

It's an exciting time for the Library Foundation, the Austin Public Library and the entire community, as Austin builds a new downtown central library, scheduled to open in 2016. This new flagship facility, designed by Lake Flato Architects and Shepley Bulfinch, will sit prominently along Shoal Creek overlooking Lady Bird Lake.

The building's design employs ambitious sustainable strategies such as energy efficient integrated systems, extensive use of daylight, a rainwater harvesting system, a vegetated roof and other features that will establish Austin's central library as the most sustainable in the country.

The design also captures Austin's unique character and natural beauty by means of outdoor reading porches, a rooftop garden, a street level café, and a bike garage.

Update:

September 28, 2012: the Design Development Phase (60% Complete Design) was presented to the Austin City Council.

View the New Central Library presentation document [HERE](#).

October 20, 2011: Austin City Council approved the schematic design, clearing the way for the project to progress into the next phase of architectural development.

September 22, 2011: the Schematic Design Phase (30% Complete Design) was presented to the Austin City Council. Electronic drawings of the new facility were on view and comments on its developing design were provided to the consultant architects.

December 9, 2010: City Council approved the New Central Library Architectural Building Program and the recommended funding plan of \$120 million for the New Central Library Project.

To read the Building Program in its entirety, [CLICK HERE](#).

Tentative Schedule for the New Central Library

November 2013 ~ Groundbreaking Ceremony

December 2013 ~ Construction begins

December 2015 ~ Construction completed

Spring 2016 ~ Grand Opening Ceremony

#### **St. Matthew's Parish School, Los Angeles-Pacific Palisades, CA – USA 2006**

9.850 sqf.

Because the old library's fascia had partially rotted and seismic upgrades were necessary, the architects took the one-story building down to its posts and beams. They removed various accretions, restoring the massing's original simplicity. The spirit of Jones and Emmons, rather than slavish reconstruction, guided the adaptation of the old library to new uses, with skylights added and windows adjusted to enhance the quality of light and visual connection with the outdoors. Along the facing canyon wall, just a few yards away, the design team sited the new library and classroom building. A hinged pair of volumes flanking an upper-level bridge, it has classrooms on one side and the new library, with music and multipurpose rooms below, on the other. Like a treehouse hovering at the tree canopy, the structure — clad in cedar with stucco to blend with the surroundings — perches lightly on the ground, the library not exceeding the pad of its demolished predecessor. Long and horizontal, the new building continues the spine of the existing classroom structures, stitched along the canyon's face. While the original classrooms were accessed from the back, via a path between the buildings and canyon wall, the new structure offers entry from generous porches along its front, as well. Replacing single-story buildings, the new one rises three stories to accommodate the grandeur of double-height library space inside. The result is an architecture fully engaged with this small canyon, yielding views across it while inviting activity to flow between interior and outdoor realms. Paths, extending from outside in, thread through the upper campus. Gentle switchbacks, amid native, drought-resistant plantings, now replace a straight road uphill. The building's bridge feeds into its porches. Steel-grate rails and wood planks underfoot bring the language of the porches inside, through a long stair in the library's double-height space.

#### **Great Northwest Library, San Antonio, TX – USA 1994**

### **Awards:**

AIA/ALA Library Building Award - 1997

Texas Society / AIA - 1997

AIA San Antonio – 1995

This branch library is located in a rural suburban area where the open, flat, south Texas plain meets the tree-covered, limestone-rich Hill Country. Located at a major intersection, the main entrance was oriented towards the neighborhood and away from the road to create a more tranquil atmosphere. Simple, indigenous building forms were used to reinforce the direct no-nonsense nature of the library. The quieter book stack areas are in low, limestone-clad "pods," while zones of public activity are in high vaulted spaces with clerestory windows. (Lake/Flato)

2006 - AIA San Antonio Design Award

### **Literature:**

2005 - American Libraries (Apr)

Exposed heavy timber construction and layered natural wood interiors reflect the forested location of Sierra Nevada College near the shores of Lake Tahoe. Nestled into its site, the building conveys the sense of shelter associated with the forest. Inside, a large reading room occupies the main level, with a stair ascending up to the floors of book stacks. Reading alcoves and study lofts perched above the book stacks take advantage of the voluminous, light-filled reading room. The three floors and two mezzanines also contain classrooms, meeting rooms, offices, exhibit space, bookstore and café. (Lake)

The library was conceived as the heart of the campus, fulfilling the College's vision of "high tech, high touch," bringing students together to learn and interact, and connecting to forest setting. Exposed heavy timber construction and layered natural wood interiors reflect the forested location of this liberal arts college near the shores of Lake Tahoe. Nestled into its site the building conveys the sense of the shelter associated with the forest. Inside the library, a large reading occupies the main level, with an

ascending stair up to the floors of book stacks, mimicking the familiar act of climbing the slopes in this mountainous region. Reading alcoves and study lofts perched above the book stacks take advantage of the voluminous, light-filled reading room while providing views into the forest. The three floors and two mezzanines also contain classrooms, meeting rooms, offices, exhibit space, and a cafe.

**Sustainability Description:**

The architects worked with a sustainability consultant to incorporate a variety of green technologies, each designed to save energy and increase energy efficiency. **Space Programming:** Efficient planning of interior and exterior space minimized material, energy, and construction cost impact. Interior space program allowed for abundant use of daylight.

**Heating/Cooling:** The only air conditioning in the building is located in the computer server rooms. All other spaces are naturally ventilated via operable windows. Vents located in the floors exhaust hot air up from each floor and out through the high clerestories in the roof. Passive shading also helps keep building cool. An in-floor radiant heating system is used to warm spaces in the winter.

**Lighting:** Clerestory windows allow natural, yet controlled, light to spill into the circulation, exhibit and reading areas. Maximizing the use of daylight in this way increases comfort (and learning), while reducing energy load. Lighting control systems and efficient secondary/task lighting were also incorporated.

**Local Materials:** Extensive use of local and regional materials, such as Douglas fir and native stone, enhance the building's connection to its specific place.

**Site Development:** The ecologically sensitive site was developed using sustainable practices, in close coordination with the Tahoe Regional Planning Agency, including:

- Building orientation reduces heat gain/mechanical requirements during summer,
- but allows solar passive heating during winter. •Construction waste management program •Water conservation and re-use
- Landscape design elements incorporate low maintenance native vegetation. (<http://library.nevada.edu>)

## **The Lawrence Group Architects, St. Louis, MO – USA**

<http://www.thelawrencegroup.com>

**Libraries:**

### **Henry S. Terrazas Branch Library, Expansion & Renovation, Austin, TX – USA 2006**

The library nearly doubled in size adding 4,600 square feet of community meeting space; separate adult, children's and youth services; computer technology; and staff support. We created a new entry that invites pedestrian traffic from the neighborhood and from new parking areas. Integrated into the front wall of the entry is a work by nationally recognized artist and Austinite, Connie Arismendi. The addition's roof design artfully suggests an open book metaphor. Historically the library is a community cultural mainstay. It was featured in Library Journal and in American School and University's "Architectural Showcase." (Lawrence)

## **Leddy Maytum Stacy Architects, San Francisco, CA – USA**

- Merit Award, National AIA Architecture for Education
- Merit Award, AIA California Council

This adaptive reuse of an historic Presidio army barracks built in 1912, for an independent high school features 22 classrooms, six sophisticated laboratories, art, music & seminar spaces, a 22,000 volume library, and a flexible student center & dining room. Designed to LEED Gold equivalent standards, the project integrates resource-efficient design strategies, building systems and materials throughout and is estimated to require less than half the energy consumption required to construct and operate a new school building of comparable size. (Leddy)

## **Leers Weinzapfel Associates, Boston, MA – USA**

<http://www.lwa-architects.com>

**Libraries:**

### **Massachusetts Institute of Technology MIT, Media Arts and Sciences Building, Cambridge,**

### **MA – USA 2009 in collab. with Maki and Associates Tokyo – Japan**

Project Data: Gross Square Footage: 162,665 SF, Construction Cost: \$90,000,000, Year Built: 2009

MA – USA 2009 in collab. with Maki and Associates Tokyo – Japan

The Media Laboratory was formed in 1980 out of the work of MIT's Architectural Machine Group and was built upon the seminal work of the faculty, which included a variety of research disciplines including cognition, learning, music, graphic design, video and holography. The lab has pioneered a research environment where academia and industry collaborate and has cultivated a culture built around cross disciplinary research groups much in the spirit and vitality of architectural "ateliers." The success of the school now depends on a major expansion project that will provide additional space for expanding research as well as spaces that will support and intensify the interaction among the Media Lab community. The new Media Arts and Sciences Building will provide 163,000 square feet of additional space adjacent and connected to the current Media Lab building, designed by **L.M. Pei in 1985**. In response to the Media Lab's spatial needs, Maki and Associates developed a building design concept with a multi-tiered atrium that will be the central hub of the complex and link to the existing building. The atrium will cascade and shift throughout the six floors and will serve as the primary space for moving vertically and horizontally through the building. Spaces for exhibition, performance, and social gathering will be located in various locations within the atrium, offering opportunities for the public to engage the activities and research conducted at the Media Lab.

Seven laboratories will be juxtaposed on alternating sides of the atrium and will range in size from 5000 to 8900 square feet. The laboratories have been designed with a rigorous modularity and deep floor plates to offer maximum flexibility and the ability to reorganize the space without major reconstruction. Six of the labs will be double height spaces and will alternate every other floor to allow the lower level of one lab to overlap with the upper level of the adjacent lab. The atrium space will cut between the adjacent laboratory spaces and will provide extended and elongated lines of sight to the various activities occurring throughout the building. This strategy will offer a high level of transparency and interconnection between the separate lab spaces, which is difficult to achieve

in traditional research facility configurations. Furthermore, each lab space will retain its own unique characteristics given its placement within the vertical sequence of laboratories and its relation to the exterior.

The Media Lab is frequently toured by visiting academics, sponsors, and film crews eager to meet with researchers and to catch a glimpse of the latest research projects. The building will be crowned with a 12,000 square foot event, conference, and teaching center offering a panoramic view of the Boston skyline across the Charles River. In a reciprocal relationship, the new building will contribute to MIT's skyline with a soft and variegated silhouette that will glow within a framework of pastel masonry buildings. The building will be sheathed in an aluminum and glass façade with a second layer of louvered screens that will overlay the glazing of the double height lab spaces providing the necessary environmental controls. The laboratories will have an abundance of natural light and a variety of views to the exterior, which is in stark contrast to ordinary laboratory facilities that are often highly concealed. The exterior image of the building is expected to transform throughout the day with the changing sunlight conditions illuminating the varying levels of transparency and spatial depth occurring within the building.

<http://archityperreview.com/24-university-/projects/840-the-media-lab-complex/description>

### HUL Administration, OIS & Weissman Preservation Center – Harvard University Library, Cambridge, MA – USA 2006

#### **Awards:**

**LEE Gold status**

On August 21, the US Green Building Council (USGBC) designated the University Library's multiservice facility at 90 Mt. Auburn Street a gold-certified, sustainably designed and constructed "green building." Through its LEED (Leadership in Environmental and Energy Design) certification program, USGBC recognizes concerted efforts to select sustainable sites, improve water efficiency, minimize energy use, select environmentally preferred building materials, provide an improved indoor environmental quality, and utilize innovative strategies to improve building performance. LEED certification is the nationally accepted benchmark for the design, construction, and operation of high-performance green buildings.

The University Library inaugurated operations from 90 Mt. Auburn Street in May 2006, uniting under a single roof HUL's Office for Information Systems (OIS), Weissman Preservation Center (WPC), and Open Collections Program (OCP), as well as Cambridge-based personnel for the Harvard Depository and HUL human resources. The facility, constructed and operated by Harvard Real Estate Services, was designed by Leers Weinzapfel Associates Architects of Boston, with an equally green interior fit-out commissioned by HUL and designed by Samuel Anderson Architects of New York City.

From the outset, 90 Mt. Auburn Street was conceived as a green building. Geothermal heat pumps heat and cool the building and provide its hot-water supply. While such systems have a fairly long history in residential construction, Harvard is a leader and innovator in installing ground-source heat pumps (GSHP) in institutional buildings, such as 90 Mt. Auburn Street.

Other green features include variable-speed drives on hot and chilled-water pumps, energy-efficient lighting, and "low-e" glazing in the windows, which together led to 90 Mt. Auburn Street's rating as 32% more efficient than a comparable building of standard construction. With its Energy Star roof and careful window placement—the majority of the fenestration has a northern exposure—the building limits its solar heat gain and lessens its cooling load throughout the year. Highly efficient sinks and toilets yield an estimated 43% reduction in water use.

According to Barbara Graham, associate director of the University Library for administration and programs, "The building exemplifies 'green' construction techniques and the University's commitment to them. HUL itself commissioned Sam Anderson's interior fit-out of 90 Mt. Auburn Street. We're proud to provide an unquestionably green environment as well as well-designed work spaces—notably the special collections conservation lab—that reflect the important nature of the work that HUL does every day."

### LEGAT Architects, Chicago – USA

<http://www.legat.com>

#### **Libraries:**

### Rock Valley College, Estelle M. Black Library Renovation, Rockford, IL – USA 2007

[Rockford, Illinois] – A blank concrete wall. Last year, that was the "face" the Estelle M. Black Library displayed to the Rock Valley College (RVC) parking lot. Inside, the library was dark and outdated: few windows, dim lighting, and the same red carpeting since the library was built in 1971. In July, 2007, the library re-emerged as a campus destination. A new glass entry displays library activity to those in the parking lot. A glass wall and a skylight disperse natural light throughout the interior. And light beige carpeting inlaid with leaf patterns has replaced the gawky red. "The renovated space draws students and staff into a more welcoming building and library setting with plenty of natural light, a beautiful view of the Rock Valley campus, plus specifically designed group meeting space for students, additional technology accessibility, and wonderful quiet study spaces", says Sam Overton, RVC VP of Administrative Services. He adds, "The door count data prove the new environment is making a difference." The 60,100 square foot renovation was completed at a cost of \$81 per square foot. The Force behind the Change The project began in 2004 when RVC created a Task Force. Its goal: to bring more students, staff, and community members into the library. Working with designers at Legat Architects, the task force explored ways of responding to the needs of today's community college user. Discussions covered programming, zoning, technology, and aesthetics. Throughout the project, the team refined the program and design based on input from many stakeholders: faculty, library and administrative staff, students, and community members. An Invitation to the Community Prior to renovation, visitors had trouble finding the library. There was no clear exterior identification. After passing through RVC's main entry, users had to traverse a long corridor to find the library's non-descript entry. Also, students often disturbed library activity as they passed through it to get to non-library classrooms. Today, the library's glass-faced entry welcomes students and community. A light-filled commons area next to the library avoids disruption, and attracts students from the bordering classroom buildings. "The commons offers a coffee bar and lounge seating to promote student interaction, while a curved sheet of glass displays the library, visually connecting it to this campus life space," says Greg Spitzer, project designer with Legat. Light and Views Previously, the main floor was windowless, and the few windows on the upper level only brought light to stacks. "Glass played an important role in achieving the Task Force's goal of creating a much more open, connected feeling within the library," says Jeffrey Sronkoski, director of higher education at Legat Architects. A floor-to-ceiling glass wall and a 20' by 20' skylight bring natural light to both levels. Stacks moved to the center, opening up spaces for study along the periphery. For instance, students had trouble determining where or if they could study in groups. Now the upper level offers bright study rooms with views of a "natural corridor" (i.e., trees and creek), as well as other campus buildings. Zoning also needed improvement; classrooms with non-library functions were dispersed throughout the facility. The renovations separate all library and non-library functions. Also, the layout offers strategically located campus life spaces with soft seating for collaboration, study, and spontaneous discussion. Blue accents within the carpet create a "main street" that starts at the entrance and passes through the main areas of the library. Evidence of Success Before renovation, library user door count averaged 3,165 per week during the early fall semester of 2005. After renovation, that number has grown to 3,889 – a 19% usage increase – in the fall of 2007. "Part of our mission is to foster innovative, collaborative relationships between students, faculty, and the community," says RVC Administrative Services

VP Sam Overton. "The Estelle M. Black Library, with its current technologies, interactive seating and study areas, and aesthetic statement, is a testimony to that mission." (<http://www.ibhe.org>)

### **University Center, College of Lake County, Grayslake, IL – USA 2005**

see also: **HOK**

91.000 sqf., \$ 19.925.000

A building combining higher education and workforce development shows its dual personality.

The first facility of its kind in Illinois, the 91,000-square-foot University Center of Lake County merges degree and workforce development programs from 18 higher education institutions. Legat and HOK set out to create a county hub for academic and professional advancement, while enhancing the client's visibility. The primary design challenge involved harmonizing with other facilities on a community college campus, yet distinguishing the client as a distinct entity, and responding to a key audience of working professionals.

### **Morton College. Library Renovation, Cicero, IL – USA 2004**

19.000 sqf., \$ 1.144.000

In order to respond to changing teaching and learning methodologies, as well as recent advancements in library technologies, the library at Morton College was renovated and reorganized. In addition to upgraded programmatic functions, the renovated space includes a new cyber cafe, group-study rooms, expanded technology-access areas, wireless internet capabilities, an gallery, a bibliographic instruction classroom, and an academic resource room for faculty and staff. The organization of the facility puts the public spaces adjacent to the all-glass entry, and the more private spaces are on the upper level. The circulation desk, with a large canted feature wall behind it, was moved to the center of the library, highlighting a north/south axis that runs through the space. This axis is expressed in the ceiling and floor patterns, and terminates at help desk "nodes." Many of the design decisions were driven by the desire to create clear sightlines, a logical wayfinding system and a renewed sense of energy throughout the space. The new design has transformed the library at Morton College into a true destination point for students, faculty, staff and the community. "Great transformation, very mod!"--2005 jury. (<http://scholdesigns.com>)

<http://www.llbarch.com>

### **Libraries:**

#### **Boyd Library, Boden, MA – USA on design**

The existing Boyd Library in Foxborough, built from 1967-1968, is a surviving example of mid-century brutalist architecture. By its design and nature of untouched longevity, it is a beautifully honest representation of construction method and structural integrity, yet was in need of an expansion and reconfiguration. A proposed renovation of the existing 20,833 sf space included replacement of mechanical systems, roofing, windows, elevator, addressing all handicap accessibility issues, and removal of all asbestos.

Working closely with the trustees, building committee, and neighboring community, the new addition is designed to complement the original building geometry and material palette of concrete, glass and monolithic limestone panels. It takes cues in interpreting the original design by continuing the horizontal datum and patterns of fenestration for a unified building. The additional 13,800 sf provides much-needed space to the library's growing collection for the next 20 years. The top floor houses an inviting and accessible children's area which doubled the size of the existing area. Another program element in high demand from the community was a new books and media area which is located on the ground floor. Additionally, more than thirty computers are available to the public and an improved meeting room provides space for Foxborough's community groups and organizations.

The \$11.6 million project is partially funded through a \$3.6 million construction grant from the Massachusetts Board of Library Commissions and an additional \$7.5 million of town-approved funding. Other funds will come from a fundraising campaign and private funds which includes money from the library's trust fund and donations. (Lerner)

#### **Wayland Public Library, Wayland, MA – USA on design**

For the past 104 years the Wayland Public Library has really been the true Community Center for the Town located in the "Town Center." Throughout its history the library has been fortunate to benefit from some incredible forward thinking community members who have donated both the land and funds to create the magnificent building. Like many adored historic properties and libraries that are so well used, the current building is inappropriate for today's level of use for a public space. In 2001 the Long Range Planning Committee surveyed and tabulated the results of over 650 citizens to identify the "perfect library" for Wayland. One of the highest priorities of the respondents included more usable and accessible spaces throughout. The challenge extends to the site as well. With the increase in parking that this project requires, the site developments, including parking, landscaping, building approach and entry are incredibly important. (Lerner)

#### **Walpole Public Library, Walpole, MA – USA 2012**

In the historic context of New England, the Walpole Public Library is a rare new building sited adjacent to the town hall and historic Blackburn Hall and just steps away from downtown. LLB Architects had been working with the Walpole community since 2007 when we were asked to re-envision and improve upon the previous library design, accepted for a construction grant from the Massachusetts Board of Library Commissioners. After a long, twenty-year process and funding approval by a slim margin, the community of Walpole can be proud of their new library.

The design of the new 32,000 sf building uses traditional architectural textures, colors, and fundamentals of traditional architecture to respond to the New England context. The library program is organized around four masses encased in fiber cement panels which anchor the building's entries. In between them, generous circulation paths, a sculptural staircase, and skylights create a feeling of openness and lightness. The difference in treatment and fenestration on each side of the library appropriately responds to its site orientation and the environmental effects on them.

On the interior, service desks for circulation, reference, and the children's area are centrally located for the highest visibility and security with the minimum number of staff. There are areas dedicated for young children, which includes a program room for community events; young adults, with computers and comfortable seating for lounging; and patrons looking for new books and media, or reference materials, or any of the 110,000 items (and counting) in the library's collection. One of the areas in the library that has grown in popularity is the quiet study rooms, designed with floor to ceiling glass, which allow for a sense of privacy and territory, but a sense of security as well.

The building is expected to receive LEED Silver certification and makes use of both passive sustainable strategies as well as active strategies. The incorporation of a green roof over the one-story wing creates a better insulated space for the program area. Natural light floods the interior spaces through the surrounding glazing and skylights and reduces the need for artificial lighting. The use of a photovoltaic panel system has assisted in generating over 5% of the building's utility features onsite, as well reducing the baseline energy use by nearly 25%. A rain garden at the entry of the building creates a small stream of rainwater from the roof to feed native plantings and remain within onsite in a retention pond. To further promote sustainable design, significant efforts were made to use both local and high-recycled content materials.

The library's past location was built in 1903 thanks to a grant from Andrew Carnegie, land donation by Walpole natives, and town money. Like then, Walpole's new library, with a project budget of \$11.2 million, has been made possible by various contributions including a generous grant from the MBLC, charitable donations from the community, and optimism from the taxpayers of Walpole. Since its dedication in April 2012, the Walpole Public Library has seen circulation levels dramatically increase and continues to welcome patrons offering endearing compliments. (Lerner)

#### **North Scituate Public Library, Scituate, RI – USA 2011**

In this classic New England village setting, the North Scituate Public Library holds the memories of all the residents of North Scituate who have used it since 1925. The modest 1,600 sf addition and renovation to the original building retain the beauty of the library's historical charm while bringing it into the 21st century to support the growing population.

The exterior prominently features the archive room which is clad in slate panels to portray the importance of the collection within. Another feature of the project is the addition of a large meeting room which will not only serve as a gathering place for events for the community but also as an art gallery where local artists can display their work. Large windows on each side of the library allow the community to look in and provide framed views of the village center from inside. A centrally-located circulation desk and a new books and media at the entrance provide a flexible space for visitors to encounter and interact with each other.

The library worked with local organizations and individuals to create new garden areas which enhance the beauty of the village, including the rain garden, designed to blend seamlessly into the traditional New England landscape. Through a careful renovation of the existing space and a modest but thoughtful addition, the library will continue to be a vital resource for the town for decades to come. (Lerner)

#### **Milford Town Library, Milford, MA – USA 2007**

The Milford Town Library was opened in 1986 providing an open-plan facility. The building served the community well, but in recent years the staff realized it had become difficult to meet the increasing needs of the community in the space with its current configuration. LLB Architects was hired to remedy the situation. Through program diagrams, such as the chosen scheme pictured below, LLB was able to create a new layout which met the demands of both the budget and the staff. The original plan had a number of deficiencies, accentuated by two main flaws. The Young Adult Area (located on the main floor) was separated from the basement Meeting Room typically used by the teenagers, resulting in a constant flow of traffic which disrupted patrons who were using the reading areas or computers. The layout of the Reference Section was inefficient; the desk was located in the center of the reading area, while the office was located along the back wall. By reorienting the reference section and locating the desk along a wall adjacent to the reference office, the reference librarian now has control over the entire main floor. The reorientation of stacks and the relocation of the Young Adult Section to the lower floor next to the meeting rooms solved several of these key issues. Librarians are strategically located throughout both floors to ensure control of each area. The Milford Town Library project was completed in October 2007, providing the Town of Milford with a library which meets both current and future needs. Although not pushed to receive certification, the Milford Public Library was designed to LEED status. (Lerner)

#### **Maynard Public Library, Maynard, MA – USA 2006**

The new Maynard Public Library was inserted into the shell of the formerly abandoned Roosevelt School, a locally significant and historic three story New England brick school. The 24,000 sf building serves as a spacious new home for the growing library collection. Due to the severe weather damage and water infiltration of the abandoned school, only the historic facades and entrances were preserved in the renovation. Lerner | Ladds + Bartels developed a sculptural curtain wall design on each end to allow for light to penetrate through the fire stairs and into the collection areas. The interior was reconstructed with a completely new concrete and steel structure and organized around a central opening and skylight that is occupied on the lower level by a monumental staircase. Each floor is also enhanced with the adaptation of a loggia-like central spine that beckons back to the arched ceiling of the original school's hallway. The site received a new parking lot and an accessible entrance, as well as a reading garden and seating area. (Lerner)

#### **Watertown Free Public Library, Renovation-Expansion, Watertown, MA – USA 2006**

Architects Shaw & Hunnewell (George Russell Shaw 1848-1937 / Henry S. Hunnewell 1851 – 1931) designed the original Watertown Free Public Library in 1884. Located prominently on Main Street in the heart of Watertown, this French Renaissance style structure has undergone several additions and renovations over the years. The most significant expansion occurred in 1956 with a modern brick and glass structure. The new design by Lerner | Ladds + Bartels, fully implemented by August 2006 at a cost of \$9 million, removed the later additions and restored the historic 6,000 sf red brick and brownstone library. The new 38,000 sf addition connects its main entrances with a two-story corridor/central spine that is washed with natural light from a skylight above, and provides a monumental stair connecting the two levels. The scale and materials of the addition are sensitive to the existing historic buildings. The design also reestablishes the street edge and creates a vibrant new urban green space showcasing the historic library structure. (Lerner)

#### **The Providence Athenaeum, Providence, RI – USA 2005**

Over the past 250 years The Providence Athenaeum has enjoyed a vibrant history in remarkable settings. Founded in 1753 as an independent member-supported library, it has been located on Benefit Street on the historic East Side of Providence since 1838. Situated between Brown University and the Rhode Island School of Design, the Greek Revival building, designed by William Strickland (1788 – 1854), is the only example of his work in New England and is credited with promoting the style throughout the area. Subsequent additions by Norman Isham and William Platner allowed the library to expand its collection and storage capacity as well as provide additional spaces for the members; including a children's area, a climate controlled rare book room, and additional office space. The Athenaeum contracted Lerner Ladds + Bartels to address structural and life safety deficiencies prevalent throughout the building, as well as refine their existing master plan. The "Bound," located directly below the circulation desk, (named for its traditional use as a bound-periodical storage area) was experiencing significant structural failure in the ceiling joists. Temporary steel columns filled the room in attempt to curb settling. LLB was charged with finding a permanent structural solution which would also eliminate all intermediate structure from the space. The removal of the existing columns and stacks, along with the subsequent finishes renovation, provided the Athenaeum with much needed flex-space usable for a range of functions. In conjunction with the structural renovation, LLB and their consultants identified all existing life-safety violations existing throughout the building. A report was compiled and presented to the Board of Directors which suggested ways to conform to current building codes while maintaining the historic integrity of the library. Construction was scheduled to coordinate with the Athenaeum's annual summer shut-down, which allowed all of the heavy work to occur without interruption to the library staff and patrons. Not only was the primary goal to assist in the stability and integrity of the building itself, but also to maintain distinct coordination between consultants, and ensure that full operation of the Athenaeum was maintained throughout its project timeline. Phasing proved crucial to the project's success, along with many protective measures to guard from debris, noise and other discomforts. (Lerner)

#### **Nevins Memorial Library, Methuen, MA – USA 2002**

Work performed by principal R. Drayton Fair, LEED AP, ALA, AIA, while employed at Tappe Associates. The Nevins Memorial Library is not only listed on the National Register of Historic Places; the benefactors are actually buried on the property. Juggling the complex siting issues of the building, grave site and specimen trees planted by David Nevins Jr., the design of the addition is sympathetic to the original Richardsonian Romanesque style of the exterior. The design brings complete new handicapped accessibility to the entire building for the first time and provides 17,000 additional SF for library services. The interior of the addition contrasts the original ornate oak with a lighter design and wood finish while still complementing the proportions of the

original. Architect designed furniture pulls the design through to the details, while the new stained glass windows in the Children's Library, also designed by the architect, carry an original theme throughout. (Lerner)

#### **Bolton Public Library, Renovation-Expansion, Bolton, MA – USA 2000**

Built in 1902, the original Bolton Public Library has been in operation for over a century without a single major renovation. The historic library had grown in other ways, however, requiring a new course of action. The abundance of materials gained over the years led to a general lack of space for other traditional functions. Increased technology needs, such as internet access and security measures, also needed implementation. For such a heritage-centric town as Bolton, demolition of the existing building in favor of a larger facility was out of the question. The key issue facing LLB centered around developing a design for the addition that was at once interconnected to the original through forms yet distinguished and functional. Several distinct styles were taken from the original structure and fused together, replicating materials to accurately reflect exterior themes. Repetition of dormers serve for both form and function, creating pop-out areas to maximize usable areas. The addition is linked to the original library through a glass connector, centralized with the new main entry and stair. This connection falls upon the new building's central axis, simplifying circulation and program distinction. Capitalizing upon the dichotomy of history and technology, program themes for each division relate back to the structures themselves. The cozy original building houses reading spaces, meeting areas, and historic materials. Elements in the addition include technology spaces, a separate children's room, and an expanded administration branch. (Lerner)

#### **Gleason Public Library, Carlisle, MA – USA 2000**

The historic Gleason Public Library of Carlisle, Massachusetts, built in 1895 and renovated/expanded in 2000, has an unfortunate history of water penetration and infiltration. Limited repair work addressed gutter replacement and slate roof maintenance, without long-term correction. Lerner | Ladds + Bartels, along with Envelope Preservation Consultant Simpson Gumpertz & Heger Inc., conducted a full site analysis to determine existing breaches and deficiencies as well as the best methods of repair. The entire foundation will receive new waterproofing equipment, and a perimeter drain shall be installed to prevent buildup of standing water. The exterior will receive full brick and granite repairing and repointing, complemented by a full slate roof and flashing repair/replacement. Window restoration throughout includes wood rot repair, glazing and hardware repair, and sill replacement and painting. Existing damage is addressed with Interior drywall and flooring replacement. (Lerner)

#### **Billerica Public Library, Billerica, MA – USA 2000**

Work performed by principal R. Drayton Fair, LEED AP, ALA, AIA, while employed at Tappe Associates. The original Billerica Town Hall sat vacant for over 10 years on the Town Common before the Billerica Public Library expansion project was able to bring the building back to life. The original cupola had been struck by lightning and removed, vandals had destroyed the grand staircase, and the windows had been broken and boarded up. The design fully restored the original building and expanded the square footage by 25,000 SF by duplicating the mass and roof forms of the historic building and connecting them with a new entry piece, providing full handicapped accessibility for the first time. Inside, the original Town Hall meeting hall on the second level was restored for use as the new reference room. The addition is open in plan, allowing a new three story bay window to allow natural light deep into the building. The full design is carried throughout with architect designed furnishings and a rich pallet of color finishes. (Lerner)

#### **Acton Memorial Library, MA – USA 1999**

Work performed by principal R. Drayton Fair, LEED AP, ALA, AIA, while employed at Tappe Associates. The original Acton Memorial Library, built in 1889 by Hartwell & Richardson, is a wonderful example of the Richardsonian Romanesque style and sits on the historic Acton Town Common next to the Town Hall. A 1966 addition expanded the original 1800 SF by more than 10,000SF but was built in a modern brutalist style. As requested by the client, the addition completely reclaims the 60's addition with a design more sympathetic to the Historic District. The new addition connects the original main floor level to the grade level expanded parking with a new accessible main entrance. The new entry facade continues and expands upon the design of the original building, blending old and new, without overpowering the original design. The interior design further expands upon the craftsman motifs utilizing woods and a classic color scheme throughout. The design was further enhanced by architect designed library furnishings and signage. (Lerner)

#### **Kingston Free Library, Kingston, RI – USA 1994**

Work performed by principal R. Drayton Fair, LEED AP, ALA, AIA, while employed at Tappe Associates. The original building, built in 1776, is one of the five original statehouses of Rhode Island. The project featured a new accessible entrance, elevator and egress stair discreetly attached to the rear of the building and allows for full handicapped access to the entire structure for the first time. The entire historic post and beam heavy timber frame of the building was reinforced with new steel to support current library loading without compromising the historic integrity of the original structure. New casework and millwork were designed to enhance the design of the original building. The second level was also brought up to code as a meeting hall for the community. Complete new systems including HVAC, fire protection, electrical and technology systems were fully integrated into the structure. The interior and furnishing design was coordinated and prepared by the architect to complement the original architecture. (Lerner)

#### **Middleborough Public Library, Middleborough, MA – USA 1992**

Work performed by principal R. Drayton Fair, LEED AP, ALA, AIA, while employed at Tappe Associates. Originally built in 1903, the Middleborough Public library is a classic example of a turn of the century Carnegie Library built in the classical style. Built of buff color brick with a limestone base, the building had never been updated until the 1992 addition. Incorporating complete new services, the new addition reinforces the design of the original on a very tight urban site, bringing the total building square footage to 25,000. On the interior, the new circulation desk bridges both the new addition and grade level entry with the original building and entry on North Main Street. The original building was completely renovated to restore original elements of the main skylight and salvaged brass light fixtures and features a public meeting room seating 130 and a climate controlled genealogy room for the Cranberry Collection. Although the original stack wing was demolished, Mr. Fair designed end tables for the building to incorporate pieces of the original glass floor along with designing the complete furnishing and finish package for the building. (Lerner)

### **Line and Space, LLC Tuscon, Arizona – USA**

<http://www.lineandspace.com>

#### **Libraries:**

#### **City of Phoenix Cesar Chavez Regional Library, Phoenix, AZ – USA 2007**

Designed to accommodate up to 40,000 visitors per month, this new 120,000-volume library for the City of Phoenix is located adjacent to an existing lake in a public park. A large roof shades floor-to-ceiling glass from the harsh summer sun and collects rainwater (stored in the existing lake) to be reused for irrigation, while earth berms surrounding the library, provide thermal mass and quietly integrate it into the park-scape. The Children's Area has an overhead sculptural "kite" which lowers the ceiling plane to a child-appropriate scale, and features an interactive display wall for kids ages 0-3, 9 dedicated computer stations, a "homework help" area with tables and chairs, and secluded study room.

An area for teens, christened "R3" for "read, relax rejuvenate" by local high school students, includes printed material in addition to high-tech amenities such as MP3 listening stations, a plasma-screen TV for viewing DVDs in a semi-enclosed lounge, and 12

dedicated computer stations. The building also provides spaces useful for the surrounding community such as a computer classroom, tutoring room, a 75-seat public meeting room, wireless internet access, and general computer areas (a total of more than 60 computers).

Extending the usability of exterior space for readers to enjoy during the summer, at the north end of the building, a large covered patio is tempered with recycled HVAC exhaust air and protected from the sound emanating from the busy street by an earthen berm. Along the west, 5,000 sf of private staff offices and workrooms are separate and secure. (Line)

### [University of Arizona, Poetry Center, Tucson, AZ – USA 2007](#)

Poetry is the food of the spirit, and spirit is the instigator and flow of all revolutions.” Since its inception, the Poetry Center has strived to live up to these words from founder Ruth Stephan. With nearly 70,000 items related to poetry in its collection, the Poetry Center is a living archive, a place where the spirit of poetry has served members of the community just like you for over 50 years. Within this single space you will find opportunities to enjoy readings and lectures, classes and workshops, library exhibitions, field trips, K–12 educational resources, discussion groups, or just a quiet place to sit and read a book. It is, as beloved teacher and friend Steve Orlen said, “The best living room in America for reading poetry.” Welcome; we hope you stay awhile and return often.

#### Mission

- The Poetry Center is a living archive, founded in 1960 to maintain and cherish the spirit of poetry.
- The Poetry Center promotes poetic literacy and sustains, enriches, and advances a diverse literary culture.

#### Activities

An internationally renowned poetry library, the Poetry Center sponsors numerous University and community programs, including readings and lectures, classes and workshops, discussion groups, symposia, writing residencies, poets-in-the-schools, poets-in-the-prisons, contests, exhibitions, and online resources, including standards-based poetry curricula. An area of special emphasis within the College of Humanities, the Poetry Center is open and fully accessible to the public.

<http://poetry.arizona.edu/about>

The University of Arizona's Helen S. Schaefer Poetry Center was opened to the public as well as writers, faculty and students in October 2007. The building creates a landmark facility where the mission of providing an outstanding research collection, quite possibly the most outstanding collection of contemporary poetry in America, and meeting place for writers and readers of poetry can be fulfilled.

Founder Ruth Stephan's concepts of accessibility and the connection between reader and poetry are overarching and drove the design for the building. Outdoor gathering and comfortable places of solitude and contemplation are an integral part of this project. The program includes stacks, controlled rare book collection, archives, administration, space for the Humanities Seminar Program and areas for discourse in both small and large groups. Integrated housing, one of the truly unique aspects of the center, is provided to honor and support the tradition of interaction among established poets and students as well as total immersion for those just emerging. (Line)

### [Peggy J. Slusser Memorial Philatelic Library \(Western Philatelic Museum\) Tucson, AZ – USA 1996](#)

The Slusser Memorial Philatelic Library contains a collection of over 30,000 books, journals, catalogs, photos, maps, and other reference items related to philately and postal history. Our archival collections focus on the postal history of Arizona and the Southwestern United States. The library also houses a collection of Civil War literature and material.

Dedicated in October 1996, the library is adjacent to the Postal History Foundation in the unique West University Historic Neighborhood District. Its aesthetic appeal and architectural features have received national distinction. It features a spacious reading room, exhibit area, book, and catalog sections. Most importantly, it has become one of the most recognized repositories of philatelic literature in the United States. Its material is an excellent resource for students, educators, historians and researchers. A trip to the Slusser Library is guaranteed to be worthwhile. We look forward to your visit!

<http://www.postalhistoryfoundation.org/slusser-library.html>

Located in an historic Tucson neighborhood and designed as an addition to the Western Philatelic Museum, the Slusser Memorial Library houses one of the most important collection of philatelic research materials in America.

Adjacent to but separate from the Museum's existing building, the Library provides a forum in which postal history is organized, preserved and provided, placing a premium on flexibility and maintaining special areas for users and collections. The expansion includes a circulation desk, work/storage area, card catalog, collections (stack/flat file), multi purpose reading/meeting, bathroom, technical services, vault and service spaces.

The Library's scale and material palette evokes a strong reference to its historical context; its construction places value on quality. Establishing a sense of unity with the surrounding neighborhood, and providing a low maintenance and cost-effective structure were important. Concrete block is clad with stucco to help the building blend into its residential context. Natural stone veneer for the angled entry wall evokes a strong reference to the historic use of this material, enticing patrons from the existing postal facility to the interior of the new Library. Openings and concrete projections provide an exciting visual dynamic, reinforcing the desired connection with the historical. (Line)

## [LiRo Architects + Planners, New York, NY – USA](#)

<http://www.liro.com>

### Libraries:

#### [Bronx High Bridge Library, New York, NY – USA 2010](#)

2.100 sqm. Addition, \$ 7.400.000

Thanks to the inspired work of LiRo Architects + Planners, the dark and oppressive building that once housed the High Bridge branch of the New York Public Library in the Bronx has been transformed into a welcoming space permeated by daylight. The New York Public Library specified that the renovated library become a neighbourhood landmark and gathering place. In response to this charge, LiRo Architects, who provided both Architecture and Interior Design services for the renovation, literally raised the roof of the building to allow natural light to flood in creating a luminous and expansive space that inspires gathering and learning. In homage to the neighbourhood's defining landmarks, LiRo's in-house talent created watercolour murals of the High Bridge Aqueduct and Water Tower for the library's main entrance, lobby and Children's Reading Room. A whimsical three-dimensional illustration of a tree emerges from the mural to shelter the Children's story area in which children gather on a circular amphitheater covered in grass-imaged carpeting. Bright green circles of flooring denote gathering areas in both the Children's and Adult Reading Rooms while brightly-coloured modern furniture creates a cheerful atmosphere in a clean, modern space welcoming to adults and children alike. “I believe that we are standing in the most beautiful urban library in America,” said Paul LeClerc, president and CEO of the New York Public Library, at the grand opening of the High Bridge branch and also called the Children's Reading Room “the single most beautiful space in New York”. LiRo Architects strive to make spaces that support, sustain, and inspire, and the High Bridge Library redesign meets, and exceeds all of those goals. (LiRo)

[Mt. San Jacinto, Menifee Campus Technology Center, San Jacinto, CA – 2008](#)

The Technology Center at Menifee Community College provides the college with much needed computer labs, digital classrooms, faculty offices, and a 200 seat assembly space. The 35,000-square-foot structure is a two-story configuration. The campus educational mission is to ensure state-of-the-art learning environments for all Menifee College students. The new Technology Center will be an icon for future digital learners. The Menifee College Technology Center is shaped in response to campus context, program uses, and the natural environment and client expectations for a digital classroom building. The campus is located in the high California desert exposing the buildings and outdoor spaces to strong winds and hot summer sun. Located on the valley floor provides the college panoramic views to the surrounding mountain ranges. An undulating profile of the distant ridge line creates a scenic backdrop to the campus and its buildings. The original campus buildings were designed to complement its natural setting. The Technology Center balances nature and technology continuing the campus tradition of building forms inspired by campus context and environmental conditions. The building program consists predominately of a wide spectrum of computer labs ranging from computer aided drafting, multi-media, graphic design, business labs as well as digital photography and arts labs. Instructional labs are protected from the environment by controlling and minimizing any natural light. The expectation of the college for this building is that no direct sunlight reaches into teaching spaces. All visual access into teaching spaces will be provided from within the building itself through a central circulation element. Continuous skylights above the circulation space will flood the public spaces of the building with natural light. Daylight from the second floor skylights will filter into the lower level through a translucent catwalk in the floor illuminating the public space on the ground floor. The two building entries are designed as gathering spaces where social interaction will take place. Visually these transparent lobbies will act as the windows into the technology center displaying students interacting with technology. Additional windows are provided on the north side of the building framing views to the mountains in the faculty offices. A roof garden allows students to gather outside under a perforated metal canopy protected from both the sun and wind. The sweeping curve of the building in plan faces directly into the strong winds. The opposite side of the building protects outdoor spaces and entries. The architectural expression of the technology center exaggerates the ornamental curved details of the existing campus buildings. The technology center boldly transforms building details into larger campus gestures leaving the impression of digitally enhanced higher learning. (LPA)

[Redding Library, Redding, CA – USA 2007](#)

The 55,000-sq.-ft., two-story county library incorporates spectacular views of Mount Shasta, state-of-the-art library services and historical references while demonstrating a responsible attitude toward sustainable design practices. The green features of the library include a 7,000-sq.-ft. vegetated green roof, photovoltaic power, thermal energy storage, indirect lighting and extensive use of recycled and recyclable materials. The library also includes an outdoor community area, a children's garden, an expanded local history area, a 200 seat community room, a heritage room, cafe, children's reading room, teen center, technology training center, bookstore and drive-thru book drop. (LPA)

### **Temecula Library, Temecula, CA – USA 2006**

This 33,000-sq.-ft single-story library sits on two-acres of land in the heart of Temecula. The library is located near Temecula's Community Recreation Center and Sports Park, and the local high school. The facility, with panoramic views, features a 200-seat community room, small-group workrooms, a children's reading area, a heritage room and a "Friends of the Library" bookstore. From the reading porch, one can look out over the dramatic views of the city and the Temecula Valley. (LPA)

### **Santiago Canyon College, Library, Orange, CA – USA 2006**

The 39,900-square-foot facility includes a library, audio visual and information technology support services, faculty resource center, library instruction computer lab, and computer commons. Energy efficient Low-E glazing, skylights, perforated metal solar fins, and the deep metal panel roof all help protect and control direct sunlight while allowing natural daylight to permeate into the building interior and inversely becoming a beacon in the darkness. The linear layout of the palm trees address the orientation of the building's main entry and extend out to Chapman Avenue. This gesture responded to the formality of the campus gateway as a first impression for students and visitors, and unfolded like arms that welcome the community. (LPA)

The library building earned a merit award from the American Institute of Architects' Committee on Architecture for Education. The library, which opened in 2006, is 40,000 square feet (3,700 m2) and holds 100,000 books. It was designed by LPA Architecture. The Library offers not only a wide selection of books, but computer access, private study rooms, and educational media. (Wikipedia)

### **Mission Viejo Library, Mission Viejo, CA – USA 1997**

Responsible for the design of the original 26,000-sq.-ft. library and the addition, LPA expanded this library to a total of 42,000-sq.-ft. The 16,000-sq.-ft. addition included a local television station studio, an expanded children's area, an enlargement of the library's data capabilities providing more computers in a new area with greater public access to technology, additional study rooms and a larger local history and genealogy area. The original library features specialized technology for on-line research, young adult programs, children's story-time theater, local historical research and display, cultural events, and Friends of the Library retail space. (LPA)

### **Carnegie Library of Pittsburgh – Squirrel Hill, Pittsburgh, PA – USA 2006**

#### **Awards:**

**2007 AIA Architectural Honor Award**

It reinvents the library from a place to go to a place to be. It defines a new experience to attract and engage users. The library is a singular open space in an expansive light-filled volume. Spaces are defined by the porosity of books, changes in materials, and varying acoustic and light levels. Continuous bench seating facing the streets allows people to participate in the activity below. Individual seating in window boxes provide memorable framed views of a neighborhood church. This \$ 4,7 million renovation and addition project is the busiest library in the CLP system. The library experienced a 74% increase in visitors since its reopening. It uses state-of-the-art ideas about building performance, systems integration, and its LEED™ certified. The library is adaptable & flexible to accommodate shifting patterns of use over time. A raised access floor system allows the library to modify data systems and technological upgrades. Lightweight furniture, wheeled shelving, and display panels facilitate continual reconfiguration of the space. Every visit is potentially a fresh experience. (Lubetz)

## **M Architects ( Michael D. Morton), Houston, Texas – USA**

### **Libraries:**

### **Bracewell Neighborhood Library, Houston, TX – USA 2009**

m Architects designed this library with the intention to moderate between the large scale of the freeway and the smaller scale of the surrounding neighborhood. A typical Houston site, the library is situated on swampy former pastureland. Materials and massing were chosen to relate directly with the adjacent operating horse ranch. Sustainable strategies include regional and recycled materials, passive solar, and an energy recovery system. Currently under construction, the library is on track to achieve LEED Silver. (M-Architects)

### **HPL (Houston Public Library) Express-eLibrary Prototype (Frank Library), Houston, TX – USA 2008**

#### **Awards:**

**2004 AIA Houston Design Merit Award**

We have recently completed the first in a series of projects for the Houston Public Library called HPL Express. These facilities provide visitors access to email, Internet, and computer training, as well as books. It is very rewarding to work on a project that empowers people without a computer by giving them access to information that many of us take for granted.

(<http://texasarchitect.blogspot.com>)

The Morris Frank Branch provides users with access to both computer technology and traditional library services. Occupying the first floor of a 1970's era office building, the 10,000 sq. ft. library was designed using concepts from the e-library prototype by m-architects. (M-Architects)

## **M2A Milofsky Michaeli & Cox Architects, Los Angeles – USA**

<http://www.m2a-architects.com>

### **Miraleste Library Expansion, Palos Verdes Estates, CA – USA on design**

The Miraleste Branch Library, sited in a pastoral setting overlooking the San Pedro Harbor, serves the City of Palos Verdes Estates. Originally constructed in 1967, the branch library program had long since outgrown its existing structure's limitation and had become overcrowded and technologically outdated. In 2007, working with the Palos Verdes Library District, the Library Board and the public through presentation meetings, M2A analyzed the existing facility and developed five master plan options ranging from very low impact to full reconstruction. From these, M2A developed one preferred option in response to the outreach process requirements. The resultant scheme creates a new dual Library entrance, and will add a new Youth Wing including new Children's Room with Storytelling area, Teen Collection, new Staff areas/lounge, clerestory windows and a new outdoor Storytelling Terrace. The existing branch layout will be reconfigured to include a new expandable meeting room, adult reading areas, new toilet facilities,

and new reference and circulation areas. The branch will have 14 new computers, flexible expansion and 30% more collection capacity. Site renovations include an additional 16 parking stalls, storm water bioswale, botanical garden path and compliant ADA accessible entrances. (M2A)

#### **Silver Lake Branch Library, Los Angeles CA – USA 2009**

Serving as a gateway to the community, the Silver Lake Branch of the Los Angeles Public Library seeks to carve out a corner at a busy intersection with a channel glass spine to create a public plaza, which embraces the larger community and creates a welcome backdrop for the primary literary and social gathering functions of the building. The plaza, raised above the adjacent street, incorporates traditional references to the ascent to knowledge while creating a gathering place previously non-existent within this community. The fully glazed reading room and a glass garden dematerializes the definition between interior and exterior space, opening up this “living room space” to the plaza. The central spine also brings natural light into the center of the building and, with its photovoltaic skylight helps the facility attain its LEED Gold certification. A continuous clerestory window around the building allows the roof plane to float above the stacks bringing in natural light and affording views of the adjacent hills and sky. The split level design incorporates the subterranean garage while opening the Multi-purpose room at the plaza level for a clear connection to the street, book fairs and other community activities. (M2A)

#### **Arroyo Seco Regional Branch Library, Renovation, Highland Park, CA - USA 2003**

##### **Awards:**

Highland Park Heritage Trust, 2004 Award of Merit

The project design reflects the community of Highland Park and the Highland Park Heritage Trust’s great pride in its wealth of historic turn of the century Mission and Craftsman style civic and residential structures. The site is located on a triangular portion of the park at the intersection of Figueroa Street and Piedmont Avenue and the 14,000 sq. ft. facility replaces the 10,200 sq. ft. library built in 1960. The project includes a large wall mural painted by the artist, Luis Becerra, which was relocated from the original building to a prominent location directly opposite the rear entrance. The new facility continues this tradition by utilizing indigenous arroyo stone and brick materials and traditional building forms, volumes and details. At the triangular corner, a thirty-five foot high stone tower announces the library location and frames the low entry vestibule. From this low entry, a simple and traditional, large open reading room with heavy timber wood trusses is sited along the street wall on Figueroa Street. Along this street a long massive stone “garden” wall punctuated by a variety of window openings and bay windows reflects the craftsman tradition represented by stone buildings and separates the busy street from the quiet of the inside functions. Inside, the adult, reference and teen reading room is organized around a central axis, which terminates in a large bay overlooking the adjacent park. A variety of various bays, alcoves and mezzanine reading rooms provide outside vistas and intimate seating areas for the patrons. Small book alcoves along the outside walls interrupted by chance views, give an immediacy to the book collection while orienting the people back to the surrounding outer world. New computer tables share the central space with traditional reading tables. The separate children’s reading room features a skylight filtering down and a private storytelling area set in a large bay element which overlook a landscaped garden area of the park. Facing the corner and reminiscent of the original Carnegie library is a large circular trellis structure, dark brick wainscot, and decorative iron balcony leading to the public meeting room and Friend’s Bookroom. (M2A)

#### **North Hollywood Regional Branch Library, North Hollywood, CA – USA 2002**

##### **Awards:**

State of California, 2003 Governor’s Award

Los Angeles Conservancy, 2003 Preservation Award

##### **Publications:**

Clean, Well-Lighted, Los Angeles Time Magazine, July 13, 2003

The North Hollywood Amelia M. Earhart Regional Branch Library is located at the intersection of Tujunga Avenue and Magnolia Avenue occupying a rectangular lot at the corner of the North Hollywood Park. The original facility is a single story brick building in the Spanish Colonial Revival style of approximately 4,300 square feet, designed by Weston & Weston Architects. It was built in 1930 as one of several branches funded by revenue bonds voted by the citizens of Los Angeles in the 1920’s. In 1956, an extensive addition in the same style by John Landon increased the library area to approximately 12,500 square feet. In 1984, the 1930’s URM building was seismically reinforced to Division 88 standards. This project incorporates a second addition of approximately 2,500 square feet and the addition of new parking areas. The 1930’s portion of the facility is a clerestory volume with seven multi-pane windows centered over the entry. The clerestory has a shallow hip roof of red Spanish tile and two chimneys at the south end. On the south and east sides, a second tile roof below the clerestory windows extend over offices and a porch that asymmetrically covers three-quarters of the front. The porch roof is supported by a row of stylized concrete columns and capitals resting on a two-foot high concrete wall finished by a brick course. Entry is through a small rectangular vestibule, decorated with wrought iron gates, grilles, and Mexican tile. Doors of oak and leaded glass lead into the circulation and adult reading area with open wood trusses and a fireplace at the south end. The 1956 addition encompasses the existing reference area, staff area and children’s area and matches the original exposed brickwork, clay tile roof and exterior detailing. (M2A)

#### **John C. Fremont Library, Renovation, Los Angeles, CA – USA 1996**

##### **Awards:**

Los Angeles Conservancy, 1997 Preservation Award, City of Los Angeles, Historic Preservation Award of Excellence

M2A completed the rehabilitation, seismic upgrade, and 2,000 sq. ft. addition to this historic branch library. All work on this Los Angeles Cultural Monument No. 303, constructed circa 1927, was designed to meet the Secretary of the Interior’s Standards. Organized around a new entry/reading court, the existing library and new support and community spaces are fully accessible. A new entry “drum”, separated from the existing structure by skylights, leads into the restored reading room complete with truss ceilings, fireplace and recreated chandeliers. Original stenciling was restored; original colors were researched and recreated. A new landscaped parking lot integrates existing trees to maintain the context of the residential neighborhood. The completed project was the recipient of a 1997 Design Award from the Los Angeles Conservancy. (M2A)

#### **Pico-Union Branch Library, Renovation, Los Angeles CA – USA 1993**

##### **Awards:**

City of Los Angeles, Cultural Affairs Commission, 2003 Architectural Excellence Award

Located within the historic Pico-Union neighborhood, the community requested that the building design respond to the turn of the century building type and style predominant throughout their area. The design recreates a Carnegie Library prototype with traditional reading rooms set behind a formal monumental brick and clay tile building form. The building is set back from the dense street trees with a decorative plaza and formal stairs leading to an arched entry porch. The facade features a triple arched entry porch at the center of the main mass and smaller decorative view windows at the axis of each room. On the interior a lobby leads through arches to a traditional book lined main reading space with a large central skylight and built-in computer work carrels.

Arched openings lead to each of three separate beamed reading rooms for Teens, Children and Adults and rear stack room. Each room opens onto a tiled courtyard with seating and specimen trees. (M2A)

**Machado and Silveti Associate**

Honor Award, Boston Society of Architects 2003  
Honor Award, AIA New England 2002  
Honor Award, Boston Society of Landscape Architects 2002

Willard J. Walker Hall is designed to accommodate both recent and future growth anticipated at the Walton College of Business at the University of Arkansas in Fayetteville. The building showcases state-of-the-art teaching classrooms and student learning spaces, teaming rooms, spaces for industry partnering, and a trading room. Walker Hall takes advantage of its hillside location to project a contemporary image visible from downtown Fayetteville. It presents itself as a solid mass with a series of protruding glass boxes that express key interior spaces. Inside, four architectural staircases connecting the five floors lead one through a succession of double-height spaces that are nodes for the primary programmatic elements of the building. Red, ochre, and gray stained concrete floors visually define a hierarchy of plazas, avenues, and streets. The vertical organization of the program promotes connections between undergraduates, graduate students, and the various research centers. The largest of these double-height volumes is the forum, which links together Shollmier Plaza, café seating areas, a 150-seat auditorium and the trading center. Other double-height spaces are adjacent to undergraduate classrooms, research center meeting rooms, and a [graduate reading resource room](#). Walker Hall, along with the adjacent Center for Academic Excellence building, frames a new academic quadrangle. The strong massing, materials, and landscape tie together the previously undefined campus precinct. (Machado)

[Boston Public Library – Honan-Allston Branch, Allston, MA – USA 1998 – 2001](#)

**Awards:**

2004 AWARD FOR DESIGN EXCELLENCE, Boston Society of Architects  
2003 AIA NATIONAL HONOR AWARD FOR ARCHITECTURE, National Association of the American Institute of Architects.  
HARLESTON PARKER MEDAL, Boston Society of Architects  
2002  
HONOR AWARD, Boston Society of Architects  
HONOR AWARD, AIA New England  
HONOR AWARD, Boston Society of Landscape Architects

The new Honan-Allston Branch Library is a single story 20,000 square foot building along a prominent neighborhood street. The building addresses issues that are important to the Boston Public Library, including maximum visual control within the library, a reading garden that serves as many spaces as possible, off-hours access for community use, and a prominent reading room on the front of the building. The scheme divides the building into three parallel zones. The front zone contains all the active, information-gathering program components, including the stacks. The rear zone contains all of the meeting and program spaces, which have off-hours community use. The middle zone is very transparent, with alternating gardens and glass pavilion reading rooms. By creating several small garden spaces rather than a single large garden, each reading room is able to have a garden on both sides. This organization allows a beautiful specimen Beech tree to be preserved in one of the gardens. The warm material palette is made up of slate shingles and panels, rough slate blocks, and wood cladding. Natural finished wood windows are used with a combination of fixed and operable units. The interior floors are a combination of wood and cork which shares the same warm tones of the exterior materials. (Machado)

The Machado and Silveti design team actively engaged the community in every aspect of the design process. Their participation in numerous meetings and community events helped to develop a design scheme that not only addressed the multitude of tasks and services provided by our public library today, but also transformed a site into an inviting and vibrant new civic structure. The end result is a fantastically well-received building now being overwhelmed with significant public use. (Bernard A. Margolis, President The Boston Public Library)

[Suzzallo Library, University of Washington, Seattle WA – USA 2002](#)

Suzzallo Library's importance to the psyche of the University of Washington is profound. A powerful symbol of learning, it is monumental in scale and magnificently ornate. Successful restoration and rehabilitation of this landmark involved discreet integration of structural, technology and life-safety upgrades without interfering with the Library's aesthetic integrity. Great care was taken to preserve historic interior finishes, particularly within the entry lobby, grand stair, octagon and reading room. The new design introduces an exposed batwing-shaped steel strut that grasps existing trusses over the reading room and anchors them to the core structure. Aside from this dramatic intervention, the new steel bones, structural bracing and seismic upgrades are hidden, restoring the building's historic beauty and preserving its legacy. Scope: \$47.3 million, 318,000 SF (Cardwell)

#### **Libraries:**

**Glen Oaks Branch Library, Queens Borough Public Library, Queens, New York, NY – USA 2009**

#### **Awards:**

Design Excellence Program, NYC DDC

Art Commission Award, NYC

Merit Award, NYC AIA

Glen Oaks Branch Library replaces an existing one story facility with a new 18,000sf high performance, LEED certified building located at the juncture of a low scale commercial/institutional area with a suburban residential neighborhood. The program includes reading rooms on all three levels, a cybercenter, and community meeting spaces. As the building area required is double that allowable by zoning, half of the interior spaces are placed below grade. A double-height space adjacent to the building entry and strip skylights in the plaza bring light through a contoured ceiling to define specific reading areas located below. The profile of the contoured ceiling is read at the double-height space, making a visual connection between the plaza and ceiling surfaces, accentuating the artificiality of the ground. The landscape strategy acknowledges the ground surface's dual role as an outdoor public space and its inversion as the roof of the cellar below, exploring the relationship between artifice and nature.

Above grade massing and material treatment respond to differing site conditions on each elevation. A large picture window along the front elevation provides views into and out of the second floor children's area, while providing a civic identity to the community.

Exterior materials merge the scale of the library to Union Turnpike and the residential context. (Marble)

**Slides Library, Department of Art History and Archaeology Columbia University, New York, NY – USA 2007**

#### **Award:**

Honor Award, New York City AIA

ID Design Award, Honorable Mention American Architecture Award

This project was completed both as a prototype research project to test computerized fabrication techniques, and to fulfill the immediate program needs of the client as the first phase of a longer-term master plan. The design consists of four walls defining the space of the slide library and lit by the skylight above. The east wall is made up of 435 sandwiched layers of 1" thick ultralight (lightweight mdf). Occasional viewing portals are formed by carved layers on opposite sides of the wall where two 1/2" thick glass panels are inserted. The middle of the east wall curves into the space to capture light in the hall outside from a skylight above. The edges of the glass panels refract and glow from natural light. The north, south and west walls are patterned with 1/4" perforated lines outlining the actual tooling paths for each of the layers of the east wall – these lines are illuminated by the light of the skylight in the slide library. As part of the rigor to digitally draw, fabricate and manage the entire project, every component of the design was milled regardless of its complexity to enable the walls to be assembled like furniture. (Marble)

### **Marpillero Pollak Architects, New York, NY – USA**

<http://www.mparchitectsnyc.com>

**Queens Public Library Network, Elmhurst Library, New York, NY – USA 2008 – 2010**

\$ 11,328,000, Sqf. 30,515

The existing Elmhurst Library is the second busiest circulating library within the Queens Library (QL) network. MPA's design for a **new building more than doubles the size of the existing building** and triples usable program space. It will provide state-of-the-art technology, including more public computers, wireless internet access, self-check out capabilities through radio frequency identification technology, and a 24 hour book drop, as well as the Adult Learning Center, one of six in the QL system, which offers classes, video and writing groups, and technology-assisted education. The new library creates a number of inviting, comfortable spaces with careful consideration to material qualities, durability, acoustics, and color. Respecting and engaging the neighborhood context, the new library will acknowledge the larger massing of contemporary buildings, while relating to the smaller scale fabric of historical architecture through the design of two special glass enclosed reading-room spaces, one in the park and one above Broadway. The project maximizes green space and connection to the outdoors, using the constraint of a rear no-build zone as opportunity for a garden which connects visually to open space at the interior of the block. Transparency through the glass-enclosed reading room at the center of the building provides a visual connection between existing park and new garden. The library has a new presence on Broadway, contributing to the quality of the street and announcing itself to the community. As a DDC High Performance Pilot Project, Elmhurst Library's integrated building design balances energy efficiency, accessibility, spatial quality, daylight, thermal and acoustical comfort, and maintenance. (Marpillero) (30,515 sqf.)

**Exhibitions: AIA Going Public, DDC Design Excellence Report**

Client: Queens Public Library, New York City Department of Design and Construction Location: Queens, New York

**The Horticultural Society of New York, Library, New York, NY – USA 2008**

The new headquarter builds upon the Horticultural Society's (HSNY) 106 year historic legacy, and contribute to its ongoing mission concerning education and outreach of the organization. The flexibility of the space with a movable panel and sliding panels allows a dynamic transformation from **full-length Library to Gallery and large scale Lecture space**. The design approach which accommodates a high environmental quality by maximizing daylight through the planter screen and natural ventilation provides the feeling of a park in the middle of a part of the city dense with office spaces. Conference room, offices and workstations all have direct

light and views to the outside, and are accessible from the Library/Gallery to support the vibrant future of the institution. Simple and sustainable design strategies were implemented within a landlord's build-out limited budget, yet promoted a clear identity by also integrating in the space a small but focused amount of custom furniture.

#### **PS1 Bergen School Library, Robin Hood Foundation, New York, Brooklyn NY – USA 2004**

##### **Awards:**

**Citation Award 2005**

The PS1 Bergen School Library is part of the Robin Hood Foundation Library Initiative, a program whose long term mission is to have all NYC children reading at grade level or above. MPA was part of a small group of architectural firms selected to design one of the libraries, each of which must accommodate 10,000 new books, an instructional area with tables and seating for thirty-two second to fifth graders and a reading aloud space for 30 younger children. MPA's design creates an integral assembly of custom designed work tables, a "stage" for the younger children, and a frieze of children's drawings. Elements of the new library extend outward into the corridor and stairwell to construct a strong identity within the overall space of the school. (\$ 428 000) (Marüillero) (<http://www.designshare.com> <http://www.schooldesigner.com> )

#### **A.C. Martin Partners, Inc., Los Angeles – USA**

<http://www.acmartin.com>

##### **Libraries:**

#### **Henry Madden Library, California State University, Fresno, CA – USA 2008**

Partners: RMJM (UK)

325.300 sqf., € 78.800.000

This project renovated an existing 85,000-square-foot structure and added 240,300 square feet to it, creating a five-level structure with a transparent north facade that brings light into the library while offering users a view of the neighboring Peace Garden. The building's internal circulation is organized around a series of stairs and landings, with the main stair traversing the entire northern wall and guiding visitors through the heart of the library. Other features include a café on the second level and a rooftop terrace adjacent to university's administrative offices. A variety of seating areas include built-in seating on the library's grand staircase and comfortable places that are tucked away so patrons can retreat to read or study. (<http://chronicle.com>)

In the course of the renovations to the California State University library in Fresno, ag4 media facade GmbH in collaboration with A2aMEDIA Inc. and GKD USA have realized a 50 m2 media facade made of Mediamesh®, a product developed by ag4 and GKD Düren. Mounted behind a glass wall, the media facade is part of an artistic installation set up throughout the entire university building. Not only the media facade is integrated into the mediatectonic overall concept, but also its content. The media facade displays an installation that runs day and night, depicting in real time the traditional basket weaving process by a Native American Indian woman. Fresno's new Henry Madden Library was built by AC Martin Partners and includes a video installation by the artist and architect Susan Narduli. The installation shows a basket weaver at work. Susan Narduli filmed the basket weaver during the course of 12 months. From this material, an installation was created that shows the complete process of creating a basket from start to finish in real time running over a two-week period, making this undoubtedly one of the longest art films ever made. The installation is displayed through Mediamesh®, a transparent stainless-steel wire mesh panel with embedded high-luminosity LED profiles. This innovative technology makes it possible to mediate the entire surface of large facades, displaying brilliant image quality both by day and by night. Be it for high-resolution images, videos or live broadcasts: the configuration of Mediamesh® is determined by the planned application, the location of the structure, and the image resolution, and is based on the specifications of the project and the customer. The quality of the images is determined by the viewing distance and by the interplay between the horizontal and vertical distances between the pixels. The denser the alignment of the pixels, the higher the resolution and the more detailed the image display is. For the installation in Fresno, a distance of 6 centimeters both horizontally and vertically was selected, guaranteeing a high transparency of the system. Minimal power consumption, long life span and durability, weather and temperature resistance covering a range of -20° C to +70° C as well as the ability to easily exchange the profiles or the control elements when needed further demonstrate the innovation of the overall concept. "One of the reasons we chose the co-operation is because its technology is above and beyond what is available in the marketplace today. Of all the companies our team looked into, it was the only one that could apply futuristic technology to bring a historic tradition to life in a genuine and realistic format", said Cynthia Teniente-Matson, Vice President of Administration at California State University in Fresno. "Our goal for the Henry Madden Library expansion project was to blend the ancient Native American heritage of the Central Valley of California into the state-of-the-art facility." The 50m2 large media facade will be mounted in the interior of the building behind a large glass facade with its brilliance radiating outwards onto the planned "Peace Garden". Students and visitors walking past the garden or the library will thus be able to view the basket creation process. This is a significant aspect of the installation. Dr John D. Welty, President of the University, explains, "As we move into the future, it is very important that we never lose sight of the past. The contributions, wisdom and connection to the land of the entire Native American community in our region need to be cherished, recorded and passed on to future generations. This technology allows us to do that." The team, consisting of ag4, GKD, A2aMEDIA and Susan Narduli, have created an installation that successfully demonstrates how the past and the future can be woven together in an interesting way, thereby creating new and enlightening associations. (<http://www.medienfassade.com>)

#### **Martinez + Johnson Architecture, Washington DC – USA**

<http://www.mjarchitecture.com>

##### **Libraries:**

#### **Georgetown Library, Washington DC – USA 2010**

The design objectives for the Georgetown Library were to provide a state-of-the-art library facility that would meet the program needs of the twenty first century user. Set within the historic Georgetown community, this 80 year-old building suffered greatly when a fire tore through the structure in early 2007 damaging much of the original oak woodwork and historic elements. M+J worked very carefully to restore the significant architectural details of the building and provide a setting for new activities. To achieve some of these objectives M+J sought to reintroduce the original reading terrace that once sat on the south side facing historic Book Hill Park. While maintaining minimum impact to the historic fabric, this allowed for the expansion of the building - accommodating the library program and allowing for a new public meeting room. Additionally, the generous height of the original roof provided the opportunity to add a third level that now houses the Peabody reading room and historic collection. The third level

Peabody reading room sits neatly within the roof restoration under the new cupola and takes advantage of the views of Georgetown through the new dormers.

As a contributing structure to the Georgetown Historic District, the design for the Georgetown Library had a number reviews to undergo. M+J shepherded the design through an extensive series of neighborhood meetings, fully vetting both the interior design as well the exterior restoration design with neighbors and the ANC. Formal reviews took place with the Old Georgetown Board, the body that handles reviews in Georgetown for the US Commission on Fine Arts. Reviews with the Historic Preservation Office were on an informal basis, but just as rigorous as if the project were to go before HPRB. (Martinez)

#### **Takoma Park Library, Washington DC – USA 2009**

Takoma Park Library has been serving this community since first opening in 1911. This historic building was a Carnegie-funded facility, set in nationally registered historic district. In recent years it became the goal of the DC Public Library system to restore and renovate many of their libraries so that they can continue to meet the demands of the District's residents. In 2008, Martinez+Johnson Architecture, as a part of a design/build team was asked to provide interior and exterior renovations for this historic structure, all within an exceedingly exacting budget. The DC Public Library (DCPL) and the supporting neighborhood groups had a vision of what they wanted to accomplish at the site, complete with some initial design parameters. M+J was able to successfully work with all of the parties involved to further define the scope of the project, given the budget that had been established when DCPL accepted the design/build proposal. The exterior design effort required a working relationship with the Historic Preservation Office in order to develop the most appropriate restoration scheme.

The interior of the building did not have an official DC landmark designation, never the less, M+J's design had to maintain the original interior aesthetic while adapting it to the technologies and services required by a modern library user. Designs were drawn for new HVAC and lighting systems, library stacks, security desk, and computer stations. In addition all the finishes in the building were upgraded according to M+J's design. This project was completed in March of 2009. (Martinez)

##### **Libraries:**

#### **The Atlantic Center for the Arts, New Smyrna Beach, Fl. – USA 1997**

##### **Awards:**

Two State of Florida grants

1998 American Institute of Architects National Honor Award for Design Excellence

1997 I.D. Magazine Annual Design Distinction Award

1996 Boston Society of Architects Design Honor Award

1995 American Wood Council Honor Award

the 1995 Progressive Architecture Citation Award

1993 Boston Society of Architects Unbuilt Architecture Award.

The project has been featured in several publications including the September 2001 issue of A+U, the June 1997 issue of Architectural Record, the June 1996 issue of Architecture, the February 1994 issue of Progressive Architecture, the March 1994 issue of INSITE magazine, and the November 1994 issue of Architectural Record. The project was included in the Norton guide to 250 key 20th Century American buildings.

The Atlantic Center for the Arts offers artists residency programs in a lush Florida jungle setting. The Center offers residencies to writers, dancers, visual artists, composers, choreographers, and actors. Past participants include Allen Ginsberg, Lukas Foss, Robert Rauschenberg, Edward Albee, Alice Aycock, and other nationally known artists. The program includes a black-box theater, painting and sculpting studios, recording studios, a dance studio, a library and various support spaces. The design includes six buildings interwoven into an indigenous Florida jungle landscape, linked by an elevated boardwalk, and made of wood, glass, and metal. The project completed an intensive value engineering process, and the design team worked closely with the construction manager to refine building costs so that the project came in below budget. Construction was completed in 1997. (Maryann)

#### **Life Science Technology Building, Cornell University, Ithaca, NY – USA 2001 - 2007**

#### **The Getty Center, Los Angeles, CA -. USA 1984 – 1997**

The Research Library at the Getty Research Institute focuses on the history of art, architecture, and archaeology with relevant materials in the humanities and social sciences. The range of the collections begins with prehistory and extends to contemporary art. Presently, the collections are strongest in the history of western European art and culture in Europe and North America; however, in recent years, they have expanded to include other areas, such as Latin America, Eastern Europe, and selected regions of Asia.

The general library collections (secondary sources) include over one million volumes of books, periodicals, and auction catalogs. The literature of art history, the methods and materials of artistic production, and conservation are core areas of the holdings in classical antiquities, medieval and Renaissance art, sculpture and the decorative arts, prints and drawings, and photography. The conservation collection includes more than 45,000 titles and 60,000 volumes of primary and secondary sources related to the conservation, management, and protection of cultural property from paintings to architecture.

The special collections contain rare and unique materials in selected areas of art history and visual culture. Predominately works on paper, these collections include rare books, prints, and photographs. Archives, manuscripts, sketchbooks, and albums provide

perspectives on artistic production, illuminating intellectual exchanges that fostered creative collaborations. More recent acquisitions focus on art and architecture in Southern California, revealing Los Angeles's significant role in the postwar era. The Photo Archive contains approximately two million study photographs of art and architecture from the ancient world through the 20th century. The library also maintains a copy of the Princeton Index of Christian Art, an iconographic index of Early Christian and medieval art objects. The Research Library supports its own conservation laboratory dedicated to the preservation of Research Institute collection materials, and is home to the Getty Institutional Archives. ### **The Hamburg-America-Center, Hamburg – Germany 2009**

Project development: DS-Bauconcept GmbH, Start of construction: September 2007, Completion: Spring 2009, Total rental space: approx. 7,950 m<sup>2</sup>, 8 storeys plus stepped storey, Common roof terrace for all tenants, Private roof terrace for the 8th floor, Underground parking. (<http://www.hamburg-america-center.de>)

In der HafenCity am Sandtorpark entwickelt DS-Bauconcept das Hamburg-America-Center. Das neue internationale Zentrum wird unter dem Motto "Business & Culture - Amerika in Hamburg" amerikanische und internationale Firmen und Dienstleister in einem Haus vereinen. Gebäude mit qualitätvoller Architektur, geplant vom bekannten New Yorker Architekturbüro Richard Meier, bieten den zukünftigen Mietern attraktive Büroflächen in bevorzugter Lage. Kultureller Kern des Hamburg-America-Centers wird das Amerikazentrum. Aufgaben des dort einziehenden Vereins Amerikazentrum e.V. sind der deutsch-amerikanische Bildungs- und Kulturaustausch, Beratung zu Ausbildung, Sprache, Stipendien und Veranstaltungen im Kunst-, Kultur- und Musikbereich. Der American Businessclub bietet neben Konferenz- und Besprechungsräumen ein Restaurant in anspruchvollem Ambiente und rundet damit das Business & Culture-Angebot des Hamburg-America-Centers ab. (<http://www.ds-bauconcept.com>)

Im Februar 2004 wurde der Wettbewerb entschieden (siehe BauNetz-Meldung vom 10. Februar 2004), nun ist endlich auch Baubeginn: Mit der Grundsteinlegung hat am 6. Dezember 2007 in der Hamburger Hafen-City der Bau des neuen Hamburg America-Centers offiziell begonnen. Der Entwurf für das Gebäude am Sandtorpark mit viel Glas und weißem Putz stammt unübersehbar von Richard Meier & Partners (New York). Unter dem Motto „Business & Culture – Amerika in Hamburg“ wird hier neben Büros für Unternehmen, die den Vereinigten Staaten verbunden sind, der Verein Amerikazentrum e.V. ein neues Zuhause finden. „In Zukunft werden hier eine große Bibliothek, eine Videothek und viele kulturelle Veranstaltungen entstehen Am Sandtorkai 48 etwa 8.440 Quadratmeter Bruttogrundfläche auf acht Geschossen plus Staffelgeschoss und einer Tiefgaragenebene. 30 Millionen Euro investiert die Norrporten AB aus Schweden in das Hamburg-America-Center. (<http://www.baunetz.de>)

In 1987, after a competition full of fireworks, the American architect Richard Meier beat the favourite (OMA) to collar the commission to build a new City Hall. Three years later construction began on a mixed-use building. Combining shops, rentable office space, a public library and the City Hall itself, it is the hub of the redevelopment of this part of the city centre. Two office wings lie along the long sides of the available plot, separated by a vast public atrium sporting a glass roof. A key attention-grabber is the cylindrical library at the building's head end on Spui. (<http://www.architectureguide.nl>)

## **Meyer, Scherer & Rockcastle Ltd., Minneapolis, MN, Hyattsville, MD – USA**

<http://www.msrltd.com>

#### **Awards:**

- Winner of a 2001 Building Design & Construction Magazine Project Team Merit Award.
- Ranked third for libraries serving populations between 25,000-49,999 in American Libraries 1999 Hennen's American Public Library Ratings Index II.

#### **Libraries:**

**Ramsey County Roseville Library, Roseville, MN – USA 2010**

76.588 sqf.

Despite being the busiest library in Minnesota, this building was dark, unwelcoming, dated, and inefficient. A much-needed renovation and second floor expansion completely transformed the 1990s building. Meyer, Scherer & Rockcastle's design, LEED Gold certified, uses the addition of daylight open spaces and views to the outside to accomplish this transformation. More photographs following the break. Conveniently located off the major highway that runs through this community (a first-ring suburb of the Twin Cities) and also near the area's popular shopping destinations, the library is nestled into a dense residential neighborhood of 1950s era homes. The context shaped the form and orientation of the building. Instead of expanding to the north on land purchased by the library for this purpose, the architect suggested expanding upward, an option that the library had not previously considered. This

space-saving alternative allows much-needed additional parking for the busy library and saved money as well. The most sustainable building is one that can be reused. Because the community considered the existing building an eyesore, reusing it was not a popular decision. But reusing the existing building was a sustainable choice. One of the key sustainable strategies entailed reinvesting in the existing site and reusing 75% of the existing structure. The refreshed exterior and new native plantings and rain gardens for on-site stormwater management have proven to be an attractive addition to the neighborhood. To transform the inward-looking existing building and its dark interior, the new design focuses on incorporating daylight and views to the outside. Located in an established first-ring suburb, the renovated building offers views that frame the mature tree canopy and screen the public's view into adjacent residential backyards. Clerestories also provide ample daylight. Other sustainable strategies included selecting regionally-produced and recycled materials, as well as high efficiency systems to save water and energy. The building is LEED-NC 2.2 Gold certified. The library is designed for maximum efficiency. The most popular services—computers, audio/visual materials, and the café—are located on the main level in a central marketplace. Open sightlines and clear wayfinding allow patrons to easily find what they are looking for. Within the bright, white interior, select application of color designates program areas to provide easy wayfinding for children (magenta), teens (orange), and adults (green). These primary service areas are arranged compactly around the central marketplace. Self-check stations are provided throughout the library. This approach to design for self service, combined with technologies such as RFID tagging and automated materials handling, helps staff to focus on interaction with patrons and provide excellent service with limited resources. (<http://www.archdaily.com>)

#### **[Hennepin County Maple Grove Library, Maple Grove, MN – USA 2008 – 2010](#)**

#### **[Bud Werner Memorial Library, Steamboat Springs, CO – USA 2008/2009](#)**

September 12, 2008 marked the grand opening of the newly expanded Bud Werner Memorial Library! The Library showed commitment to sustainable building design by earning a Silver LEEDs certificate. This effort will possibly make the Bud Werner Memorial Library the first public library in Colorado to have achieved such a high level of certification. Echoing the intent of the present library to serve as a memorial to local ski legend Buddy Werner, the main floor of the old library will be renovated into a beautiful community meeting room while a 25,000 sq. ft. addition will be added to accommodate inviting public spaces and vibrant collections. Renovations planned for completion in Winter of 2009. (<http://www.steamboatlibrary.org>)

#### **[Central Fargo Public Library, City of Fargo, ND – USA 2009](#)**

The new Fargo, ND central library will open to the public at the end of April. In advance of this opening, the local newspaper, The Forum, asked for us to answer a few questions about the design of the building. Listed here are the responses to these questions as prepared by Jeffrey Mandycyk, the Project Architect. Please discuss the design: The Fargo Main Library is the result of community process; a community seeking an enlarged, resource-rich library acting as an indoor town square taking full advantage of its location on the civic edge of downtown Fargo a mere block from the Red River. The building presents itself to the city with a pair of brick facades acting as book ends supporting daylight filled spaces: community meeting rooms, a gallery, reading/study areas, staff spaces and book stacks. Daylight and views of the surrounding city and river guided the design. Large windows in the brick façade frame views of the Red River. These articulated openings in the brick were derived from the building traditions of downtown Fargo and the legacy of Carnegie Libraries. To fully engage the Red River vista a two-story glass bay, containing the Children's Reading Area and the Fireplace Room, protrudes through the east "bookend." These light-filled rooms present the community activities to passers-by and are an integral part of the library's identity. Within the building, daylight guides patrons through their experience of the library; from the entry gallery looking upon the civic plaza, to the daylight-filled stair (with treads of granite salvaged from the old Main Library) leading visitors to the voluminous second-floor, and to reading spaces along the windows. The broad length of windows makes the interior spaces and the internal activities a visible part of library's identity. What colors were chosen, and why? The vibrancy and richness of North Dakota's varied landscape were the inspiration for the library's color palette; from the flora and fauna of the springtime grasslands and agricultural fields to the warm autumn tones of autumn to the serenity of winter whites that cover the Great Plains. I overheard the building went through a major change. Why was this? The previous design intended to salvage the existing structure and portions of the exterior facade of the old main library while expanding the building's footprint and adding a second floor to it. The technical complexities of this approach were compounded by the poor soils of the site and ultimately were more costly than the estimated construction cost. The revised design retained the plan layout and design concepts of the previous design all within an entirely new structure and building envelope. This design came in under budget. How do you feel the building and design turned out? We, as this is a team endeavor, are proud and elated to have worked with the citizens of Fargo and the dedicated people of the Library to envision and to realize a building that will become an integral part of ones experience of the City of Fargo. Personally, I feel joyful. Standing in the new library, I feel the openness, connectedness, warmth and delight that were always part of our conversations and explorations of the library's design. Other comments: There is a sustainable story embedded in the library's design. Selecting the old Main Library's site was only the first step in reusing Fargo's resources. Salvaged granite from the existing building became the treads of the main stair. A bio-based material created from sunflower hulls was used for selected pieces of the library's casework. And designing and thinking locally, regional woods like ash and maple are used throughout the library. Outside, native grasses and plants surround the library. Creating a transparent and open library creates its own unique challenges for a building's performance. The ample daylight in the building allows for daylight harvest, which reduces energy consumption by automatically turn of the lights when photo-sensors read sufficient sunlight levels. The large expanse of glazing utilizes high performing insulated glass. In addition, a computer controlled shading system tracks the sun's movement and adjusts the shades accordingly. These shades allow daylight into the library and views to the exterior, yet they block the majority of the sun's rays, which increase the building's internal temperature during the summer and can cause glare on computer screens. During the off hours of operation the shades can be programmed to be down and this increases the insulating properties of the building envelope. As a result of this, the energy loss through the glazing is decreased and the amount of heat or cooling the building needs to do is decreased as well. Moreover, the heating and cooling system were designed to perform above current energy standards. (Meyer) (MSR)

#### **[Hennepin County Southdale Library, Edina, MN – USA 2009](#)**

Renovation: 65.000 sqft., Expansion: 15.000 sqft.

#### **[St. Cloud Public Library, St. Cloud, MN – USA 2008](#)**

##### **Awards:**

##### **IIDA Northland FAB Award**

The Saint Cloud Public Library received an IIDA Northland Chapter FAB award for its welcoming, transparent spaces that people love to use. The FAB Awards, which gets its name from the acronym for "Fresh, Artistic and Brilliant," are presented by the Northland Chapter of the International Interior Design Association. The Saint Cloud Public Library won in the government/institutional category. Jurors were impressed with the amount of daylight flooding the library's two large floors and how the design firm, MS&R, seamlessly integrated architecture and interiors. They specifically noted how the library was about people actively using, not merely visiting, the space. Since opening in September, the library has seen its patronage increase by 65%, and library card renewals and registration numbers are up over 200%. According to deputy library director, Verne Oleksowicz, the most popular spaces are the community meeting rooms, children and teen areas, and the many reading spaces aligning the library's expansive windows. (<http://msrlibraryworld.wordpress.com>) (MSR)

#### **[Rancho Mirage Public Library, Rancho Mirage, CA – USA 2005](#)**

### **Minneapolis Public Library, Franklin Community Branch, Minneapolis, MN – USA 2005**

Built in 1914 with a grant from Andrew Carnegie, the Franklin Community Library is Minneapolis' oldest library. Today it thrives as an active community resource for people of all ages. The popular Phillips Computer Center and Franklin Learning Center, located within the library, add value to this essential neighborhood gathering place. The historic building however, has been stretched beyond its capacity for programming and library materials and is in need of repair. The architectural beauty and distinctive features of the building are being carefully retained and preserved with the renovation under way. The renovation will include restoration of the library's distinctive stone and masonry features and also the alignment of the lower level floors (which were added over time and do not presently align). This alignment increases the program area—allowing increased usage of the lower level area—without expanding beyond the perimeter of the library's exterior walls. Size: 14,500 sf (renovation), 4,000 sf (addition). (MSR)

### **Fayetteville Public Library, Fayetteville, AR – USA 2004**

#### **Awards:**

**US Green Building Council**

**Thomson Gale / Library Journal Library of The Year 2005**

Following a national search, the Library Board hired MS&R to complete a comprehensive master plan, provide a feasibility study and full design services for a new central library. Because Fayetteville is a very public-participatory community, MS&R conducted a series of thirty-seven public forums to address the issues of expansion versus building a new facility, with a final decision to build a new 83,000 squarefoot facility. The design of the new library extends the historic fabric of Fayetteville's town center and incorporates the newly established downtown design guidelines. The urban texture and figure-ground of the library ensure that the building reinforces the fabric of the city. The building will be placed on the northeast quadrant of the site to take full advantage of the site's topographical shape, preserve as many trees as practical, provide easy access to parking and to place the entrance to the library at the highest point on the site. The library is the first LEED-certified building project in the State of Arkansas. (MSR)

### **Mount Prospect Public Library, Mount Prospect, IL – USA 2004**

MS&R provided pre-design and full architecture and interior design services for the extensive renovation and expansion of the Mount Prospect Public library, which will reopen its doors this weekend. Tied to the original structure with a completely redesigned exterior facade, a new 50,000-square-foot second-floor addition doubles the size of the library. Large openings cut into the existing exterior walls convey a new identity for the library and provide additional daylight. The redesigned main entry serves as an anchor for a new public exterior space, which extends from the proposed Village Hall (to be constructed to the south of the library). The renovation also includes new HVAC, electrical, technology, and security systems and new interior finishes and furniture. A new central stair provides a visual datum around which public service desks are organized. Larger, reorganized staff areas increase functionality and efficiency. Size: 50,000 sf (renovation), 55,000 sf (expansion). (MSR)

### **Stillwater Public Library, Stillwater, MN – USA 2004**

### **Denton Public Library, North Branch, Denton, TX – USA 2003**

#### **Awards:**

**AIA Minnesota Honor Award**

The Denton Public Library System hired MS&R to convert an existing grocery store building into a new branch library. Design challenges include reconfiguring the site to provide a foreground for the building that supports its reuse, visually transforming the building from a grocery store into a library, and successfully adapting the existing building footprint into a functional library. Inserted planes and volumes enhance the building by reducing and breaking up the mass and monotony of the existing building shell. The addition of a translucent glass bar and entry canopy transforms the entry facade, while linear strip windows are introduced on the other facades. Functional areas of the library are arranged around the building entry for easy orientation and wayfinding. The site now also includes linear rows of trees that, when mature, will create exterior spaces consistent with the concepts of the new building plan and exterior. Size: 32,000 sf. (MSR)

### **Saint Paul Central Library, Saint Paul, MN – USA 2002**

A historic landmark building in downtown Saint Paul, constructed in 1917 and on the National Register of Historic Places, the Saint Paul Central Library was undersized, inefficiently organized and technologically out of date. The renovation increases public accessibility to the collection, consolidate service points, upgrade power, data and communication systems, and restore historically significant interior spaces. The design both respects and enhances the historic and aesthetic nature of the building. The renovation also creates a new entrance addition on Kellogg Boulevard. A major renovation of the West Wing features four new floors to accommodate periodicals and books, study carrels, and computers to access electronic library catalogs. The existing stone and plaster surfaces were cleaned, and new ceiling and lighting systems, new flooring, new accessible and flexible systems for power and data, new HVAC distribution, and new fire suppression system have been added. Renovation of the East Wing entailed remodeling the interior partitions and spaces, cleaning the existing stone and plaster surfaces, new electrical and mechanical systems, and a new access ramp system for the Lower Level Youth Services. Size: 81,500 sf (renovation) (MSR)

### **Carthage College, Hedberg Library, Kenosha, WI – USA 2002**

#### **Award:**

**Wisconsin Library Association Library of the Year 2004**

Located on the heavily-wooded site of a former city park, the new Hedberg Library replaces Carthage College's original library with a state-of-the art facility adjacent to the Siebert Chapel and Johnson Art Center complex. To work more effectively with patrons, staff areas are located on both levels. Public areas include the collection and browsing areas, reading and study spaces, individual and group study rooms, electronic classrooms, and a presentation room. The design features two state-of-the-art technological areas. The Information Commons—the center of activity of the library—functions as an updated reference area where reference materials previously housed on shelves, are now accessed electronically. The Cyber Cafe offers a 24-hour gathering place with food and laptop hookups with Internet and campus network connections. Size: 65,000 sf. (MSR)

Completion Year: 2001

### **Forth Smith Public Library, Fort Smith, AR – USA 2001**

MS&R evaluated seven sites for a new main library and three branch libraries in Fort Smith, resulting in the selection of a historic intersection overlooking Creekmore Park for the main library and central locations in the eastern, northern, and southern communities for the branches. These new facilities emphasize patron and customer service by building upon the library's traditional resources simultaneously with the library's goal of expanding its use of newer, electronic information resources. New features and services for the main library include a large electronic meeting room to seat 150 people for community use; an enhanced genealogy center and Arkansas/Fort Smith history collection; youth services for ages preschool through high school; an expanded reference section with more computers for internet access; "smart" carrels for laptop computer use; and a computer lab for training classes. Size: 67,000 sf (main library), 11,720 sf (each of 3 branches) (MSR)

### [United States Senate Library, Renovation, Washington, DC – USA 2000](#)

Located in the United States Capitol Building, this project involved the restoration of the United States Senate Library reading and reference rooms with the partial relocation of the collection to the Russell Senate Office Building. The design restores the Reading and Reference Rooms back to the period of initial occupation (c. 1870), featuring a Neoclassical design. New mahogany shelves line the walls, original rugs have been recreated, Minton tile and wood floors have been repaired and restored, and the furniture has been replicated or rejuvenated. The Senate Curator, along with MS&R and The Architect of the Capitol, have archivally restored fireplaces and decorative murals that were discovered during the renovation. The relocated Senate Library in the Russell Building houses on-line reading and research areas. As the first project on Capitol Hill to be networked into the new Capitol Hill computer mainframe and Senate Array, the new location offers cutting edge technology in addition to its historic book and document collection. Size: 10,000 sf (MSR)

### [Wilkinson Public Library, Telluride, CO – USA 2000](#)

After only ten years, the community of Telluride outgrew its library facility and hired MS&R and library consultant Anders Dahlgren to evaluate the feasibility of expanding the existing facility versus building new, ultimately deciding to build a new facility. Because of site constraints and land costs, the library extends vertically onto two floors with underground parking, required by city zoning laws. From the vigorous review process conducted by the local historical preservation board arose colors and detailing that abstractly recall Telluride's early prosperity as a flourishing mining town. The central feature of the library-a two-story rotunda surrounded by a reading plaza-borrows its design imagery from a historic railroad water tower. Functionally, the new facility better accommodates today's technology, including a separate room for computer research. Size: 21,000 sf, 15,000 sf underground parking ramp. (MSR)

### [Carmel Clay Public Library, Carmel, IN – USA 1999](#)

The new Carmel Clay Public Library serves as a physical and metaphorical bridge between many different constituencies frequenting the building. The form and siting of the building intentionally respect the street grid (a prominent gesture in Midwestern cities) and are inflected with a concave space that uses "open arms" as the welcoming metaphor. The exterior form reflects the needs of a civic building-gravity, order, proportion, and substantiality. The internal public "street" created by the curved physical gesture includes access to the coffee shop, public meeting rooms, and rest rooms and serves as a gathering/waiting area for patrons. While maintaining a simple and classical ordering of space, MS&R balances tradition with playfulness, symbolizing the joy in discovery. The overall design considers the need for both open spaces and sequestered nooks. Size: 113,600 sf

### [Kendall Young Library, Webster City, IA – USA 1997](#)

(renovated Carnegie library building). "Your attention to detail played a large part in the success of the building. All your little touches help make the addition feel like a natural extension of the original structure." —Cynthia Weiss, Director, Kendall Young Library.

### [Sahara West Public Library and Fine Arts Museum, Las Vegas, NV – USA 1996](#)

Regional, civic, and site phenomena informed the design of the building's articulated mass, compound spaces, and expressive details. Unique programmatic components, a sensitive response to the harsh climate, and our interest in representing a variety of metaphorical and symbolic ideas, underlie much of the building and site design. Inside, the entry court creates a shared entry for the two separate institutions and is spatially continued by an internal atrium that unites the library and museum. Appropriate shared functions (assembly hall, board meeting room, used book store, fine arts reading room, visiting artist studio, and museum store) all gather around this center. The library is formed as a stable, plain container for the gridded stacks of books it holds. It is crowned by a telescoping gaze to the east, toward the world famous gaming "strip" and Sunrise Mountain. An arched "celestial wall" marks seasonal, mythic and celestial events as "concrete" or built story. Harsh southern sunlight is shielded by broad overhanging screens to protect the windows facing the sculpture garden, and is scattered and driven down through the central spine of the library on the north side of the central vault of the upstairs reading room. The result is gentle, even, comfortable daylight throughout the library. Size: 122,000 sf (MSR)

[West Jordan Library & Event Center, West Jordan, UT – USA 2012](#)

Location: West Jordan, Utah, Size: 71,000 SQ. FT., Cost: \$14,000,000, Date: 2012

Viridian is the color between green and cyan on the color wheel, and comes from the Latin viridis, meaning 'green'. We often associate green with a verdant garden, and cyan (blue) with the sky. Most simply, these two elements are the design informants of this library/event center. The building poses a long transparent face along the edge of the city's park, allowing library and event patrons to feel connected to the most significant green space of the community. Connections to the sky occur via three 'light boxes' – basically, incisions through the center of the building, from roof to ground level, that reflect and bounce sunlight to internal spaces. The 70,000 sf project uniquely combines a community event component with a library and headquarters for the administrative offices and data center of the county library system. The library's vision is that the written word is a community-builder that can be extended into the spoken and performed word, and that this place will become a vibrant forum of exchange utilizing all of these modes.

During largest seasonal events, like the Annual Summer Reading Kick-Off, a bi-folding glazed wall is designed to open to the outdoor amphitheater, linking outside and inside ongoing performances, presentations, and activities. (MHTN)

[Salt Lake County Draper Library, Draper, UT – USA 2005](#)

Location: Draper, Utah, Size: 21,000 SQ. FT., Cost: \$3,000,000, Date: 2005

#### **Awards:**

2008, AIA Utah, Sustainable Design Merit Award

2006, Intermountain Contractor Best of 2006 "Best Green Project - Merit Award"

2006, Utah Masonry Council and AIA Utah "Excellence in Masonry"

With a concerted focus toward the utilization of sustainable elements, this project was a nod to Draper's historic agricultural context informed by the iconography and composition of specific forms and materials.

One of the primary challenges of the project was to site the building for best balance of sunlight, views, wayfinding, and energy performance. To overcome a property boundary with a minimum area of street frontage and a majority of level grade sitting lower than the street itself, the building is oriented with its entry facing the neighborhood and the reading areas facing a south garden, east mountain views, and neighboring park.

Strategic siting and 3D modeling studies allowed the building to be oriented on an east-west axis for optimum sun-light/sun-control in the form of horizontal light fins

and roof overhangs which also direct roof water through the landscape. The Children's collection environment remains one of the most popular in the County Library system because of its tactile interior and window benches that connect children with the garden immediately outside. This library is a modern narrative to historical Draper. Even the west shading arbor has re-assembled and detailed the mayor's salvaged barnwood – homage to the original builders of this community. (MHTM)

## **Miller Hull Partnership LLP, Seattle, WA – USA**

<http://www.millerhull.com>

### **Libraries:**

#### **Vancouver Community Library, Vancouver, WA – USA 2011**

Currently housed in a dated building at a site cut-off from the city by the freeway, the new Central Branch for the Fort Vancouver Regional Library aims to significantly increase services and play a more central role in the community by more than tripling the current space (to 90,000 square feet), and providing indoor and outdoor meeting and presentation space for civic events. By relocating to the urban core as part of a four-block 600,000 square foot mixed-use development the library will enjoy a well deserved prominence in a highly accessible new location. Four stories of program will radiate around an active and organizing atrium space, encouraging patrons to travel through the various collections, browse media in a 'retail' sense, and to participate in the various programs and events in the library. Places designed for lingering will encourage more casual, comfortable use of the building by the community, and will culminate in roof-top reading room and terrace with views of the adjacent public plaza and the city.

The Library District's emphasis on early learning and early literacy has led to the inclusion of children's museum-like Early Learning Center as part of the facility. Partnerships with the local school district, community college, and Washington State University have contributed to plans for pre-school and kindergarten classrooms, with research planned on literacy and early learning development. (Miller Hull)

#### **Fort Vancouver Regional Library, Vancouver, WA – USA 2009**

- **Carnation Library - 5,000 square feet**

Each library replaces an older, outdated building. Some have been located in the exact same place as the original, some were sited elsewhere on the same property, and others were design designed and constructed on a different piece of property that better serves its growing community. Each branch devotes space to collections for adults, teens and children. Also included are new technologies, public space (and meeting rooms), and customer service. Behind the scenes areas include administration work space and maintenance functions.

The modern library functions more like a community center and gathering place than the library of the past. Learning and exploring are still the main functions, but the way they are achieved is more open and inclusive. The new libraries serve as the "heart of the community," a place where local organizations meet, citizenship classes are taught, political activity takes place, KCLS programs are conducted, materials are lent, and used books are purchased. Meeting rooms function as quiet study areas when meetings are not being held.

Though the branches are small, they are vital to each community and have been designed to have significant street presence, a transparency that advertises goings on and invites the user. Each branch is designed for its population and reflects the distinctive character of each community. (Miller)

#### **Snoqualmie Branch Library, City of Snoqualmie, WA – USA 2007**

#### **Northgate Library and Community Center, Seattle, WA – USA 2006**

MillerHull worked with the Seattle Department of Parks & Recreation and Seattle Public Libraries on a joint venture project in the Northgate neighborhood of Seattle. The 3.5 acre site for the new civic center is across 5th Avenue from the Northgate Shopping Center. The east side of the property is adjacent to a residential neighborhood and the Thornton Creek watershed park. This project creates a pedestrian link between the hardscape retail development, and the wooded, residential community it serves.

Consisting of a 20,000 s.f. community center, a 10,000 sf library, and a civic green, shared design elements, create a sense of a larger, civic development: a modern town center for the community. The central plaza links both the Library and Community Center, and forms an entry for both. The new center gives the neighborhood more than just an entrance on the street: it creates a place between buildings for people to congregate, for activities to take place. Multiple pedestrian entrances to the site allow the project to act more as a node of activity, (both a thoroughfare and a destination) rather than a one-stop destination. The design language consists of solid, brick-clad forms contrasted against soaring roof planes with glazing and skeletal steel forms below. Windows at street level are plentiful in order to convey both a storefront (retail) appearance, and to allow the community to see the activity within the buildings. (Miller Hull)

#### **King County Library, Service Center, Issaquah, WA – USA 2000**

The Miller|Hull Partnership designed an 80,000 s.f. service center located in Issaquah, Washington. Designed to serve the library system's 180 person headquarters staff, the facility houses administration, training, book processing, information services, maintenance, a traveling library program and includes space for a new West Issaquah Branch Library. A large 2000 s.f. public meeting space for community use is included in the building. The three story building mass is configured to engage the main arterial in the area, Newport Way. The north-south oriented building screens the 100 car parking area from passing vehicles on Newport Way. Pedestrians and bicyclists using the planned bike trail on Newport Way can view the activities going on inside the building, a rare occurrence in this suburban business office zone. A preserved wetland on the east edge of the property can be viewed from the office space on all three floors as well as from the building's board room and staff lounge. Construction bids to build the \$10.5 million facility came in well under budget and allowed the owner to select all of the alternates. (Miller Hull)

#### **Moody Nolan Architecture Inc., Columbus, OH – USA**

<http://www.moodynolan.com>

#### **Kenmore Branch Library, Akron-Summit County Public Library, Akron, OH – USA 2008**

2,150,000 \$, 12,000 sqf.

Situated within a redeveloping business district and well established urban neighborhood, this new library serves as an anchor for the surrounding community. The materials and colors selected blend in well with the surrounding buildings and are durable in nature. The facility has both small and large meeting rooms that accommodate anywhere from 20 to 100 people and are available for use by local organizations and non-profits. The library also consists of separate children, teen and adult reading areas. Scattered throughout these areas are more than 20 public access computers with free internet connectivity. (Moody)

#### **Helen E. Arnold Community Learning Center, Akron Public Schools, Akron, OH – USA 2007**

The Helen E. Arnold Community Learning Center is a two-story educational facility at Vernon Odom Boulevard and Rhodes Avenue. A masonry veneer wraps the exterior in two rich, natural brick shades. A sweeping curve on the west side of the building envelops the administrative suite, media center and art room. The curve is penetrated by the main entrance and leads to a corridor bathed in sunlight courtesy of clerestory windows. From this corridor, students can access the 8,000-square-foot gymnasium and student dining areas. The Helen E. Arnold CLC shares the site with the Urban League, but the facilities will function independent of one another. (Moody)

#### **Linden Branch Library, Columbus Metropolitan Library, Columbus, OH – USA 2004**

1,800,000 \$, 12,000 sqf.

Set in an urban environment, this new library fits into the surrounding area not only aesthetically but functionally. The 12,000 sq. ft. branch sits right up to the property line taking full advantage of the site area. One of the design challenges in marrying building and site was creating an easy circulation path around the building, accommodating a drive-thru book drop and providing adequate parking. (Moody)

#### **Library and Classroom Building, Ohio State University, Marion, OH – USA 1996**

12,000,000 \$, 56,350 sqf.

#### **Award:**

**Design Excellence. National Organization of Minority Architects (NOMA) 1996**

The central defining feature of the design is the large entry rotunda which is topped with a clerestory window and decorative metal clad sunscreen. This rotunda serves both as the public entry and the link between the three distinct functions of the building: library, classrooms and computer laboratories. The library and classroom wings each are accessed on the ground floor of the rotunda, while a sweeping monumental stair leads from the entry up to the computer laboratories on the second floor. (Moody)

#### **Moore Ruble Yudell, Santa Monica, CA – USA**

<http://www.moorerubleyudell.com>

AIA National Firm Award 2006

#### **Libraries:**

#### **Santa Monica Public Library, Santa Monica, CA – USA 2006**

Despite a great many environmentally conscious architects calling Santa Monica home, green building on a large scale hadn't occurred until the new library was constructed in 2006. Great care was taken in all of the building systems to use as little external energy as possible, no small feat for a building type that requires constant air quality for maintenance of books. The skin of the building is tilt-up concrete composed of fly ash and recycled glass. And unusual for a library, there is a lot of windows, allowing a lot of natural light without exposure to the books. The roof is designed as an impluvium, an ancient Roman system of draining rainwater to a cistern. The water is later used for all of the sites irrigation. ( <http://mimoa.eu> )

This new main Library reflects the character of Santa Monica as a place and as a community, supporting a well-informed public in the comfort of the benign coastal climate of southern California. Seeking to enhance community awareness and encourage public use, the design presents a building of approachable scale and civic proportions, opening in all directions to access, daylight, and views into and out of the building.

Designed through a series of community meetings, the 110,000 square foot library responds to Santa Monica's breezy-but-enlightened culture by incorporating large, sun-shaded windows, colorful pocket gardens, and a broad spectrum of sustainability features—ultimately winning the project LEED™ Gold certification. One of the many sustainability measures is the use of an inverted “impluvium” roof and underground cistern to collect rainwater for landscape maintenance.

At the center of the whole is a large enclosed garden court containing a small café

with wireless connectivity. The north court and central garden/café combine with a 200-seat auditorium and multi-purpose rooms to offer a dynamic venue for public use. In addition, a small museum and flexible spaces can alternately accommodate exhibitions and informal presentations. The building serves as an urban oasis at the center of fast-paced residential and commercial redevelopment, earning its title as the “Living Room of the City.” (Moore)

### **Hugh & Hazel Darling Law Library, UCLA School of Law, CA – 1998**

Our design for this 130,000 sf library takes full advantage of its restricted site as it establishes a strong identity for the entire Law School. The library is composed of places that function at multiple scales for individuals, group study, and events. The formal renovated main reading room and other public areas are located on the main level adjacent to the collection, while more secluded study areas at upper levels provide space primarily for the Law School community. The core collection is now organized as centrally as possible to minimize direct outside light and is arranged for continuity with the existing stacks. A corner tower with spectacular views to the city and mountains creates a major icon for entry into this district of the campus.

The massing of the building is carefully sculpted to mark the eastern corner of a major east-west campus axis while transitioning back to the scale of the adjacent Law School buildings. New faculty offices are located next to the library on upper floors and link to existing faculty offices. All of these enjoy mountain and courtyard views and share a rooftop trellised patio. The library’s exterior composition offers a fresh interpretation of the University’s traditional scale, massing, and materials, including patterned brick, precast concrete trim, and glass. (Moore)

### **Stadtbibliothek Reinickendorf (Tegel), Humboldt Bibliothek, Berlin – Germany 1989**

Associate Architect: Abeln Lubitsch Skoda

Im Rahmen der Internationalen Bauausstellung IBA 1984 – 1987 ist mit der Humboldt-Bibliothek am Tegeler Hafen ein besonders einprägsamer Ort entstanden. Ein langgestrecktes Gebäude, von außen klassizistisch und zurückhaltend, bietet es im Innern ein beeindruckendes Raumerlebnis: ganz im Sinne des Architekten Charles Moore zieht die Architektur die Menschen an, erzählt und weckt Erinnerungen an bereits erlebte und gesehene Bauten, schafft Freiraum für die Phantasie und stellt die Verbindung her zu bereits vergangenen Zeiten. Die meisten Besucher lassen sich ein auf dieses Erinnerungs-Angebot, entdecken Ihren persönlichen Ort, mit dem sie sich identifizieren und an dem sie gern verweilen. Die eingebauten Bücherwände über zwei Etagen erinnern an barocke Klosterbibliotheken, und die großzügige dreischiffige Halle fordert verschiedene Vergleiche heraus: vom Sakralbau bis zur Industriearchitektur. Seit Eröffnung im Jahr 1989 wird die Bibliothek von ca. 1.500 Lesern täglich besucht, denen ein vielfältiges Medienangebot zur Verfügung steht. Sie hat sich aber auch zu einem kulturellen Ort entwickelt, denn Moores Architektur bietet den idealen Rahmen für Ausstellungen, Lesungen, Konzerte und Preisverleihungen. Die zahlreichen Fachbesucher und Architektengruppen aus dem In- und Ausland, die in den letzten Jahren die Bibliothek besichtigt haben, zeugen von dem großen Interesse, das dieses postmoderne Bauwerk hervorgerufen hat. ( <http://www.stadtbibliothek-reinickendorf.de> )

This 48,000 sf branch library forms the first phase of the Cultural Center for the Tegel Harbor Master Plan, created by Moore Ruble Yudell after winning an international design competition. The library covers a full range of related activities, from music, graphic art, lending children’s programs, and youth programs, to general public use. Its design brings this varied program together in a loft-like building which combines industrial and classical elements. Its classical façade is broken by a glassy entrance bay framed by a pair of free-standing portals. These lead to a central rotunda encircled by an arcaded balcony at the second floor. From the rotunda, a grand wall of books meanders along one side of the main reading room, and gives access to the open stacks and smaller reading alcoves beyond. A double-layer, vaulted ceiling lit by a clerestory window brings light through the lower vault. On the north side, the light is balanced by a series of bay windows and doors that alternate with niches for books.

The industrial toughness of the exposed steel and concrete frame on the interior is contrasted with a playful, almost baroque set of details for the arches and ceiling. The metal sash, stucco and standing seam zinc roof on the exterior combine with spare classical elements of precast concrete. High volume spaces and natural ventilation provide controlled cooling as the combined thermal mass and insulation of heavy masonry construction greatly enhance heating. Use of a carefully baffled south-facing clerestory provides daylight in all seasons, minimizing the need for artificial lighting in the reading areas and reducing energy consumption. (Moore)

### **Morphosis Architects, Los Angeles – USA**

<http://www.morphopedia.com>

#### **Libraries:**

### **Dr. Theodore Alexander Science Center School, Los Angeles, CA – USA 2002 – 2004**

196,000 gross sq ft / 18,208 gross sq m Program: K-5 elementary school and Science Education Resource Center Design: 1993 - 2001 Construction: 2002 - 2004 Type: Educational, Project Credits Morphosis Team, Mechanical Electrical Plumbing Engineer Donn C. Gilmore Associates, Structural Engineer Englekirk and Sabol Consulting Engineers

The Armory’s Main Hall, converted into a flexible, open two-story atrium and dominated by a large interior bamboo garden, is the heart of the Science Education Resource Center. Libraries, labs, meeting rooms, and classrooms flank the atrium’s perimeter and are provided access to the new North school building via a pair of bridges that lead across an outdoor garden lunchroom. The interior bamboo garden, pierced midway up by skywalks and punctuated with meeting spaces is meant to bring a piece of nature into this somewhat blighted inner city environment. It is possible, once the bamboo is fully grown to find a space of respite among the plants or to use areas carved into the midst of the planted space as an experiential teaching opportunity.

The new North building burrows into sculpted earthworks along Exposition Boulevard; its landscaped roof is perceptually an extension of the garden. Classrooms are grouped in clusters of four that share a common room, to provide an open and flexible teaching environment. In response to the Exposition Park master plan and to highlight the historic Armory, this “non-building” nestles into excavated land below grade, its program essentially tucked and embedded into the park. The structure emerges quietly from the adjacent Rose Garden — a welcoming and protective environment for children that has forgone the traditionally overt sense of enclosure of most public schools. From the vantage point of the Rose Garden, the roof appears as ground plane, whereas from the heavily trafficked Exposition Boulevard, the building appears autonomous and active. The project engages the site and the community and is perceived as both an intervention and a connection between the disparate adjacent conditions. Morphosis

## **MSKTD & Associates, Inc., Fort Wayne, IN, Indianapolis, IN – USA**

<http://www.msktd.com>

### **Libraries:**

**Concordia Theological Seminary – Walther Library, Addition and Renovation, Fort Wayne, IN – USA on design, 2009 groundbreaking**

\$ 8,000,000

The existing Walther Library, designed by Eero Saarinen (\*20.08.1910 Kirkkonummi, Finland - + 01.09.1961 Ann Arbor, MI USA) as part of the 1958, "New Campus", has received no major addition or renovation since its construction. The new addition and existing building renovations are designed to extend and complement both the original Saarinen campus and library.

The building addition will provide a quieter and more reflective environment. Constructed along the shore of the existing Campus lake, the addition will complement the Chapel which remains the campus focal point.

This \$8,000,000 project will add 40,000 gsf to the existing Walther Library's current 15,000 gsf.

**Allen County Public Library, Fort Wayne, IN – USA 2007**

Design Architect :: Gwathmey Siegel & Associates Architects

At the center of Allen County's system, the Main Library in downtown Fort Wayne is one of the busiest in the nation; however, its size was inadequate to handle the library's ever-increasing collections and demands for services. With the 127,000 s.f. addition and 240,000 s.f. renovation, the new building should accommodate growth for twenty years, and hopefully beyond.

In addition to allowing the main library to expand its open shelf capacity, some of the highlights of the completed project will include:

A patron parking garage for 130 cars

Full accessibility to people with disabilities

More reader seating

Self-service checkout stations

New entrance on the west with drive-up access

New plaza at the east entrance

280-seat auditorium

An exhibit gallery

Library cafe

New flexible public meeting rooms

New lighting, data and telecom systems

Integrated HVAC system.

Children's Services area.

Construction started May 2004; facility will be turned over to the Owner December of 2006.

**Indiana University, Southeast Library, New Albany, IN – USA 2005**

74,600 sqf., \$ 10,900,000

The new 75,000-square-foot library for the Indiana University—Southeast Campus enhances the learning experience for students by providing a dramatic visual and campus-life focal point. Situated along a major pedestrian axis, the library has copper roofs, brick walls and gray-tinted glass that harmonize with the existing campus architecture. The main entrance, with its limestone clad reading room cantilevered above the vestibule and marked by a copper-clad cylinder lighting the entry rotunda beyond, sets this design apart. The 24-hour student lounge/coffee area and computer classroom make the library an inviting student destination. Built into the hillside, the four-story building's main floor and entrance are at mid-level. Here, the dramatic top-lighted entrance lobby/rotunda and adjacent monumental stair provide focus for the entire facility. Fully integrated into the building systems, robust high-tech infrastructure supports all the technology required for study, research, information storage, collection access and retrieval. These activities are complemented by the colorful and light-filled interior spaces, which provide wonderful vistas to the surrounding countryside. Functionally, the main floor includes administration, circulation, reserves, reference collections, reading and study areas. The floors above and below contain the bulk of the library's circulating collection. The lowest level is dedicated to receiving, storage and mechanical support. (<http://schooldesigns.com>)

**Manchester College, Funderburg Library, North Manchester, IN – USA 1999/2000**

The original library had not changed since it was constructed in the 1960's. A complete interior renovation accommodates a new listening center, computer center, reference areas, and all new finishes. The exterior was changed to add a plaza and new facade. All handicapped accommodations were addressed. (MSKTD)

## **MS&R see Meyer, Scherer & Rockcastle Ltd.**

## **Murphy / Jahn, Chicago – USA**

<http://www.murphyjahn.com>

### **Libraries:**

**Joe and Rika Mansueto Library, University of Chicago, IL – USA 2008 – 2010**

In late September, the University of Chicago broke ground on a \$42 million addition to its Regenstein Library. Designed by Chicago's Murphy/Jahn, it is not a wing, per se, but rather a bunker of books topped by a glass dome. In 2005, the university commissioned Murphy/Jahn to design an addition to the Regenstein, a Walter Netsch–designed Brutalist work (compare with: Northwestern University Main Library, 1970; Regenstein Music Library, 1977) that anchors this predominantly Gothic campus. Although Netsch had created expansion plans for the five-story limestone building, those were nullified by a new dormitory, designed by Ricardo Legorreta Vilchis, that took over the site Netsch had wanted. Architects Helmut Jahn and Scott Pratt sketched various appendages for the Regenstein, but its self-contained form seemed to resist any attachments, says Pratt, principal architect for the project. What they settled on was a solution that was as “as minimal as possible,” Pratt says. In the new facility, called the Joe and Rika Mansueto Library, a 25,000-square-foot ground level will contain a 160-seat reading room and preservation operations, all topped by an elliptical glass dome that reaches 36 feet at its apex. Books will be stored in a double-layered underground vault

consisting of a 30-inch thick slurry wall, a 5-foot-wide buffer space, and a hermetically sealed liner wall—a design that best ensures the constant humidity and temperature required of fragile tomes, Pratt says. Any book can be retrieved via an automated system and delivered to patrons in a few minutes. The facility will hold 3.5 million volumes, enabling the university to be one of the few remaining American schools to house its entire collection of academic research on campus. Visually, the building will look strikingly different than its neighbor. Where the Regenstein sports narrow windows, the new structure will be sheathed with glass. Where the Regenstein's interior is dark and heavy, the dome will convey openness. And in contrast to the Regenstein's blocky, dominating profile, the Mansueto's elliptical form will enhance the open character of the site, while preserving green space around the library complex. The facility is scheduled to open in 2010.

## **MWA (Michael Willis) Architects, Oakland, CA – USA**

<http://www.mwaarchitects.com>

### **Libraries:**

#### **Africana American Museum and Library at Oakland, Oakland, CA - 2001**

MWA led a team of thirty planners, museum and exhibit consultants, preservation specialists and engineers for this major adaptive reuse project. The facility is now Northern California's largest museum devoted to African American history, and draws a national audience. In adapting the building MWA carefully integrated new uses and environmental controls into the historic structure. As an historic building on the National Register of Historic Places, all construction was subject to strict preservation guidelines. An unreinforced masonry structure, the building was heavily damaged in the 1989 Loma Prieta Earthquake and had lain empty for nearly a decade. (MWA)

## **NAC Architecture, Seattle – USA**

<http://www.nwarchco.com>

### **Libraries:**

#### **Washington State University, Academic Center, Spokane, WA – USA 2006**

\$ 33.850.000

Located at the heart of the Riverpoint Campus, the Academic Center houses a number of academic programs and administrative units, as well as the Riverpoint Campus Library. The 106,000 square foot building showcases the 14,660 square foot library, 15 classrooms, two auditoria, a computer lab and 18 academic and administrative units. WSU Spokane is the urban campus of WSU, a land-grant research university founded in 1890. The campus features advanced studies and research in health sciences and health professions, the design disciplines, education, social and policy sciences, and science and technology. WSU is one of just 95 public and private research universities with very high research activity, according to the Carnegie Foundation for the Advancement of Teaching classifications. In addition, U.S. News & World Report ranks WSU as one of the top public research universities in the nation. ( <http://www.wsu.edu> ) Academic Center:<http://www.spokane.wsu.edu/aboutWSUSpokane/>

#### **Woodrow Wilson High School Library, Tacoma – USA 2006**

### **Awards:**

#### **AIA Seattle Honor Awards 2008**

#### **Learning in Design, Citation of Excellence 2008**

( [learningbydesign.biz](http://learningbydesign.biz) – Green School Buildings )

Primary challenge: Rejuvenate an aging campus with a single building intervention broader issues: The new building, conceived as a site intervention, seeks to re-engage the school with its site and poses the question, “Can a high school campus provide some measure of meaningful public space that is so invariably absent from our typical single family residential neighborhoods?” Is rejuvenating our aging campuses a vital issue of urban sustainability both in the terms of energy and materials conservation, as well as for preserving the role of the civic space? Matrix alteration: The building seeks to transform a campus where “site” has long been relegated to the “space between building modules.” Plaza, yard, stairs, bridge, and walk are carved out of both site and building and visually and experientially intertwined, creating not only “public” space but real “community.” The project alters the site's spatial matrix and transforms its scale and character from uniform and predictable to varying and experientially stimulating. The new design stimulates social interaction by redefining and animating exterior campus spaces and by establishing engaging transitions from “private” campus spaces to the broader public domain. The scope: The new three-story building replaces five existing buildings and eight portables, consolidating and opening up the campus. The regained site area is developed with planting, plazas, and parking. The new building houses: general classrooms, science and computer labs, a therapeutic learning center, the library, and administration and guidance centers. This high-performance facility features integrated design strategies providing both functional classroom daylighting and displacement ventilation. ( <http://idesignawards.com> )

#### **Shadle Library, Spokane, WA – USA 1997**

### **Awards:**

#### **Award of Merit AIA Spokane 1998**

The largest of Spokane Public Library's branches, this 17,847-square-foot facility serves northwest Spokane from the northwest corner of Shadle Park. The gentle curve of the floor plan focuses the user on the park setting and activities to the south. The main entry was emphasized by creating a glass vestibule that has a dramatic angular shape. The dark-green roof parallels the sloping ground plane, allowing the low south eave to control the amount of sun entering the reading areas, while the north side of the roof is lifted to allow north light into the interior and create a segmented rolling edge that becomes a part of the tree canopy when viewed from the park. (NAC)

#### **Spokane Downtown Library, Spokane, WA – USA 1994**

The collaborative process used to design Spokane's 126,000-square-foot, three-story main library encompassed a series of sessions with the library board and director as well as user groups, making the final building organization a reflection of the collective wisdom of dozens of participants. Led by NAC|Architecture, the Downtown Library team included associated architect THA Architecture. The ground floor provides spacious, flexible public meeting spaces and a large grand stairway leading to the library's public service spaces on the second and third floors. To provide maximum flexibility within the floor plates, the library spaces are organized by an open-column grid. The southern edge of the grid features large masonry openings that provide framed views of the historic section of Spokane. The northern edge is a full glass wall showcasing an expansive view of the Spokane River Falls below. A large roof monitor fills the central volume with natural light, augmenting the lighting system. A grid of ducting for power, data and telecommunications weaves through the floors of both public service levels, providing ample flexibility for future access. (NAC)

## **Withworth University, Cheney Cowles Library, Spokane, WA – USA 1992**

The second addition and complete remodeling of this centerpiece building includes 25,000 square feet of new space added to the existing 27,800 square feet for a total of 52,800 square feet. This building houses a traditional academic library, research facilities, archives, archival reading room, education curriculum library, audio-visual department, academic computing with two micro-labs, word processing, and administrative computing for the campus. (NAC)

## **Nacht & Lewis Architects, Sacramento, CA – USA**

<http://www.nlarch.com>

### **Libraries:**

#### **Natomas Public Library, Sacramento, CA – USA 2009**

The Natomas Public Library is a joint-use effort between the City of Sacramento, Natomas Unified School District and the Los Rios Community College District. Located on the Natomas Education Center site, this 23,000 s.f. branch library facility will serve not only the growing Natomas community, but will serve the adjacent Inderkum High School and American River College's Natomas Center. The library will be the centerpiece of the Natomas Education Center and is organized along the axis of the adjacent Natomas Town Center's main street. The building's entry plaza addresses the neighboring community and encompasses the library's two primary entrances. Marked by a clock tower, the library faces the community and emerging Natomas Town Center and forms the western boundary of the Education Center's central courtyard. The library entrances connect to a vaulted reading room thru a public gallery designed for community events and the display of school art projects. The reading room is flooded with controlled natural daylight through clerestory windows. In addition to the usual library functions, the facility includes shared computer labs, distance learning center, study rooms and interior and exterior meeting spaces. The building incorporates numerous sustainable features and is on track for a LEED Silver rating from the United States Green Building Council. (Nacht)

#### **Cosumnes River College Learning Center, Los Rios College District, Sacramento, CA – USA 2004**

### **Awards:**

**AIA – Central Valley Chapter Merit Award**

46,000 sqf.

In 1968 Nacht & Lewis Architects developed the master plan for Cosumnes River College campus, part of the Los Rios Community College District. Nacht & Lewis continues to add to the campus with their design of the Instructional & Library Facility, set for construction in Spring of 2004. This is a 2 story, 43,000 s.f. building that provides two 90 seat lecture halls, classrooms, learning resource centers, faculty offices and program administrative areas. The building design fits tightly within a formal masterplan and utilizes brick and concrete in a contemporary manner to respond to an established campus architecture. The site development and landscaping introduces informal pedestrian circulation and outdoor gathering areas which encourage the student and faculty use of outdoor spaces. At night the top of each stair tower will glow as lanterns to anchor the building within the campus, and the grounds will be accentuated with low level and LED lighting. The interior of the building utilizes extensive natural daylighting and is divided into recognizable patterns of horizontal and vertical circulation. Some of the design challenges include providing privacy for the staff and faculty while maintaining open public space for student use. The facility also incorporates extensive data and technology distribution for support of computers and learning spaces. (Nacht)

## **Nagle Hartray Danke Kagan McKay Penney, Chicago, IL – USA**

<http://www.naglehartray.com>

#### **Chicago Theological Seminary, Chicago, IL – USA 2011**

Area: 78,000 square feet

**Site & Program:** The new home for the historic Chicago Theological Seminary is on the campus of The University of Chicago. The program includes administrative and faculty office, classrooms, meeting rooms, a chapel, a library, a reading room, and computer/learning commons within the first three floors. The fourth floor is dedicated for the Seminary community, housing a larger chapel and a dining space for 300 people each. This level features terraces and green roofs to reinforce a connection to the Midway Plaisance.

**Design:** Exterior design takes into consideration the surrounding campus context by incorporating stone as the primary exterior material, in keeping with the majority of University buildings. Metal panels wrap the second and third floors on the west and south facades. The LEED Gold building expresses its environmental stewardship in the form of green roofs, a bioswale at grade level, and the use of local natural materials to express and enhance the connection between the spiritual and the secular.

#### **Fountaindale Public Library, Bolingbrook, IL – USA 2011**

Providing a new main library facility with ample space to serve the many needs of the community, while fitting into an otherwise residential area, was the challenge faced by the architects for this project. The new \$25-million, three-story 96,000 s.f. facility with an additional 13,000 s.f. of basement space is the result. The site plan and building footprint are organized to create a presence for the library along the primary access, Briarcliff Road, while maximizing views of the existing park in which it is being constructed. The size of the floor plates approach the maximum size recommended by library planners with proportions that will provide flexibility for the future. Plans feature green roofs that further reinforce a connection with the building's park setting. The building has been designed to achieved a prestigious LEED 2.2 Gold Certification. The planning for the building began as with any other, with rectangular floor plates. As the process evolved pieces of the floors were carved away to provide a less formal form with the result that no two floors in the building have the same footprint and the total three-dimensional volume becomes a very organic element that fits well into the park setting. Given the varieties in the floor plates and the complexities of the shapes, reinforced concrete proved to be an ideal structural system. Typical interior bays measuring 24'-6" x 30'-0" resulted in the selection of a two-way flat slab system with capitals at the interior columns. The use of the concrete floor system also helped to minimize the overall structure depth which was critical in controlling the overall height of the building. The use of high strength concrete made it possible to limit maximum interior column size 24" x 24". The exterior wall system chosen included a masonry veneer with light gauge stud backup construction. The use of downturned beams at the perimeter of the floor plates allowed for the installation of a continuous shelf angle at each floor to support the masonry veneer at the level of the window heads. The beams also helped to minimize the deflections in the slab, a critical consideration in supporting the masonry veneer. The concrete slab system easily accommodated the use of the selected green roof system. The sloping concrete slab of the main roof with an upturned curb at the perimeter proved ideal for directing the required drainage to interior downspouts. In conjunction with relatively slender circular concrete columns along the perimeter curtain wall the system provides for very dramatic stack spaces for the libraries materials. In order to provide for resistance to lateral wind and seismic forces it was decided to include a limited number of cast-in-place concrete shear walls at the

elevator shafts and stairwells. The combination frame/shear wall structure proved to be a very efficient and economical lateral load system. The building is supported by conventional spread footing foundations. At the ground level the floor slabs are conventional slab on grade construction with the exception that in place of traditional welded wire fabric to control random shrinkage cracking, the concrete mixes include micro-fiber reinforcement. The building is currently under construction with completion anticipated in early summer of 2011. (<http://www.cement.org>)

### **Evanston Public Library, Evanston, IL – USA 2003**

115,000 sqf.

#### **Awards:**

**Chicago Building Congress Award  
Excellence in Masonry Gold Award  
Evanston Preservation Award  
ALA/IIDA Library Interior Design Award for The Loft  
Chicago AIA Interior Architecture Award for The Loft**

**Site & Program:** The urban site is centrally located in downtown Evanston. The building is the result of a national competition won by a young architect who chose to team with Nagle Hartray to execute the project.

**Design:** The design conveys the library's civic importance. The arrangement of building massing, particularly masonry piers, create strong shadows that provide the architecture an unusual depth. The architecture strikes a balance between monumentality and human scale appropriate to its purpose. Library interiors are organized around a central open stair that provides orientation to visitors as they move between floors. The main reading room on the top floor is a primary feature. It is larger than usual for a public library in order to serve both citizens of Evanston and students from nearby Northwestern University. We recently completed the renovation of the existing Children's Room and the build-out of The Loft – a dedicated space for teens. We collaborated with architectureisfun, Inc., a firm that specializes in designing environments for children, on the development of age-specific zones that include interactive, museum-like elements. (Nagle)

### **Oak Park Public Library, Oak Park, IL – USA 2003**

104,000 sqf.

#### **Awards:**

**Chicago Building Congress Award of Merit and Midwest Construction Magazine's Best of 2004 Award for New Library Construction**

**Site & Program:** The site is a transitional location in central Oak Park. It is across from Frank Lloyd Wright's Unity Temple and other similarly monumental and formal buildings. It also fronts the Jens Jensen-designed Scoville Park, which is informal by comparison. The program called for doubling the size of the former library on the same site. **Design:** Nagle Hartray led a community-wide design process through 20 to 25 public meetings. The resulting library truly reflects the community's values, which include respect for architectural heritage, diversity and sustainability. A paved plaza replaced the street between the library and the park, increasing library flexibility through larger floor plates and providing the Park District an amenity for summer festivals. The stone-clad street façade reinforces the formal architecture of neighboring buildings. The undulating, copper-clad façade reflects the informal and organic nature of the park. The architectural "style" is intentionally non-referential to reflect the community's diversity. Sustainability goals were achieved within a limited project budget. Flooring consists of recycled rubber sheet goods. A green roof increases insulation and roofing life, and reduces storm water drainage demand. Copper cladding consists of about 75% recycled material. Stone cladding is quarried within a 500 mile radius. (Nagle)

#### **John Jermain Memorial Library, Sag Harbor, NY – USA on design**

**Sag Harbor Votes to Restore and Expand Library**

(The John Jermain Memorial Library is the public library in Sag Harbor, NY. Founded in 1910, the library building and initial collection was a gift from Margaret Olivia Slocum Sage to the people of Sag Harbor).

The citizens of Sag Harbor, New York, voted resoundingly in favor of restoring and adding to its John Jermain Memorial Library. In August 2009, design work will begin to create a 21st century library for this historically significant eastern Long Island town. The deteriorating fabric of the existing Beaux Arts building will be restored. A new addition will express the new relationship between the institution of the library, information media, and the community. Richard Munday is partner-in-charge. Michael Scott is the project manager. (Newman)

By Amanda Wyatt

The year 2012 was a whirlwind for John Jermain Memorial Library (JJML), but don't expect it to slow down too much in 2013. In fact, the library is moving full speed ahead with its renovation and expansion during this new year.

Already, scaffolding is being slowly taken down from the historic building, which has been undergoing a massive renovation since last spring. And if all goes according to plan, JJML will be able to break ground on its new, modern addition to the 102-year-old structure later this month.

The multimillion-dollar construction project has been years in the making, and was approved for funding by library district voters in 2010, but as Catherine Creedon, JJML's director, explained this week, the library really kicked the project into high gear last March.

That was when JJML received its building permit from the Village of Sag Harbor, as well as a construction loan from the Bridgehampton National Bank.

"Those two things really allowed us to begin the project in earnest," Creedon said.

For Creedon, nine months ago feels more like "a million years ago," considering all of the work that has been accomplished in such a small amount of time.

The exterior bricks at the historic building have been restored with a new roof currently in the works. The restored stained glass lay light — one of the architectural gems of the library — will also be installed soon.

All of the windows have been restored, and new mahogany storm windows have also been fabricated for the outside of the building.

The library's lighting fixtures, which were originally wired for gas, are being cleaned and rewired by a master craftsman in Connecticut.

The building's "crown jewel" — the terracotta dome designed by the R. Guastavino Company and located on the third floor rotunda — has also been restored after a rather anxiety-provoking discovery this summer.

“We took off the old copper dome and it was in very bad shape, corroded in a variety of places, worn very thin and quite grayed out and green,” said Creedon.

But when workers began to take off the terra cotta tiles to replace them, they discovered that the steel compression ring — which went around the base of the dome — had been corroded. As a result, they built a temporary shoring ring which was used until the new compression ring was built.

“We knew we would discover the unexpected, and indeed we did. So that was a time delay and an extra cost,” Creedon said.

“I’ve been told that most of the surprises will be behind us. The old building held a lot of mystery, but the new construction should be a little bit more straightforward,” she added.

But as Creedon noted, the library’s “ongoing priority is to restore and stabilize the historic structure before we break ground [on the new addition], before we do any on-site vibration that could further damage it.”

And while the library’s exterior might be the most visible part of the John Jermain building project, its interior renovation is just as exciting to Creedon.

The library is looking into purchasing small, freestanding charging stations that are solar operated, which Creedon noted will be useful during power outages. These stations would be able to “power up a cell phone, a laptop or an espresso maker — depending on what you feel your critical needs are,” Creedon joked.

Currently, Trunzo Builders, the Wainscott-based company heading the renovation, is finding ways to rewire the historic building to improve wireless communication. Pat Trunzo III said his firm was picking out special floor boxes to be installed on all three floors that would allow for patrons to both charge their laptops and hardwire them to get internet access.

JJML is also planning to put in place a LOOP hearing-amplification system throughout the building for the hearing impaired, as well as computers with specialized voice recognition software, movie and music-editing software and more.

In the new building, there will be less space for DVDs, which Creedon likes to call “the VHS tapes of the very near future.”

The library, said Creedon, is seeing an increase in the number of people asking for help with digital downloads, e-book devices and specialized computer applications.

“We’re really looking at the new space and saying how can the library fulfill its mission of providing information to the community by being a teaching institution, by making sure that if more and more information is available only electronically, that we’ve not only provided access to that information, but we’ve given our community the skills with which to access it. So that has been key as we look at the design of the building,” she said.

“We’re always responding to changes in culture.”

30,000 sqf

When it was built in 1958, the Case Library conformed to the notion of a library as a warehouse for books, and its architectural treatment reflected that idea. With our addition, we give it a heart, reflecting its importance as the center of learning at the University, and a place for imagination. Our solution hides the existing library behind a 30,000 square foot addition, treating it like a “bustle” behind the new mass. This gives the library new prominence on the campus, forming a stone and brick façade that makes it compatible with the surrounding mid-nineteenth century Georgian and Victorian architecture. A new two-story central reading room is now its heart, offering views to the north and a variety of reading rooms, ranging from alcoves to an attic loft, allowing students to choose from many group or single study spaces. (Newman)

Our addition and renovation responds to programmatic requirements that require discreet spaces for the complex needs of today’s library.

A town library is an emblem of civic pride. The Westport Library has long been an important town resource and meeting place, but its structure was lacking appropriate circulation and space to meet enhanced use, and required expansion. Our solution was to renovate the original library, and design a new addition that will meet the needs of its growing community and new technology.

#### **Levi Watkins Learning Center, Alabama State University, Montgomery, AL – USA 2011**

Owner Alabama State University, Architect NHB Group, LLC, Engineering Consultants MBA Structural Engineers, Structural Engineer Zgouvas, Eiring & Associates, Contractor Rabren General Contractors, Square Footage 46,000 SF Addition, 86,964 SF Renovation, Costs Total \$ 16,700,000, New \$ 7,800,000

The new addition and renovations to the Levi Watkins Learning Center consist of a five floor addition to the existing library as well as complete interior and exterior renovation to the existing library. Renovations include installing new electrical and Mechanical systems to bring the existing building into full compliance with the 2006 International Building Code, a new HVAC system, furniture, carpeting, shelving systems and staff office renovations. The addition allows the library to be a resource to the 21st Century student by providing the technology, research facilities and academic support that will serve current and future ASU students and faculty for years to come. Once the project is completed, the library will have the capability to expand the archives and special collections and will house new information commons areas, group study areas for faculty and students as well as an internet cafe with outdoor seating. The addition will also increase shelving space to accommodate ASU's nine new academic programs. (NHB Group)

### **Libraries:**

#### **Nam June Paik Library, Nam June Paik Art Center, Yong-In – Korea 2011**

The Nam June Paik Library is a new public art library in Nam June Paik Art Center in Yong-In, Korea, open to general public on April 15th, 2011. The library was designed by a U.S. based design and research collaborative N H D M / Nahyun Hwang + David Eugin Moon. The library collects, preserves, and provides access to historical and contemporary material related to Nam June Paik and his art. It offers to scholars a space for professional research, and to the local community an open forum for cultural engagement. The library houses and circulates the Center's Nam June Paik Archives Collection, Nam June Paik Video Archives, and a rare Fluxus Footages Collection, as well as the user generated materials. The design and construction of the library was made possible by City of YongIn and Gyeonggi Province Government's Small Library Fund. Inspired by Nam June Paik's artistic processes, the goal of the project was to design a multi-functional spatial device, which redefines the relationship between library users and information. While the conventional library is characterized by the one directional transmission of information, where the static, centralized, and predefined content is passively received by the readers, the Nam June Paik Library aims to promote non-linear and random access to information, to stimulate production of information beyond consumption and advocates spontaneous expression and juxtaposition of ideas. The Library Machine located in the center of the library deploys the following 6 architectural and programmatic devices.

##### **1. Scattering**

The juxtaposition of the dispersed information produces complexity that contrasts the simple geometric initial form.

##### **2. Non-Textual Content / Off-Site**

Objects related to Paik's work are scattered, plugged, and mapped throughout the surface of the machine. Reprogrammable dynamic media can communicate Paik's previous works, as well as information on artistic and other happenings from the off-site locations of interest.

##### **3. Physical Engagement**

Additional storage areas and unique shelving in the long drawers are incorporated to help the future expansion of the collection, while inducing curiosity, interactivity, and playful engagement.

##### **4. Production Lab**

Inside the machine is reading, installation, video laboratories, and a space also for debates and group workshops.

##### **5. "Representation Cells"**

Content is also generated by users who can contribute to the information exchange. Small spaces or vitrines are made available for public display.

##### **6. Library "Machinettes," The Propagation Aides**

Parts of the machine can detach as independent modules and can freely travel to other rooms or even outdoors to perform communicative functions, such as video projections or sound performances.

The design attempts to make the intangible physical and to turn a personal experience to a collective and interactive one. Through the Library, the contents become dynamic, and the consumer of information becomes the producer. The collective generation and appreciation of information makes the library experience multi-directional and reciprocal. (<http://www.dezeen.com>)

## **Noll and Tamm Architects, Berkeley, CA – USA**

Cris Noll, Janet Tam

<http://www.nollandtam.com>

### **Libraries:**

#### **Alameda Branch Libraries, Alameda, CA – USA 2011**

City: Alameda Free Library, City of Alameda, Construction Cost: \$ 2,000,000

After a feasibility study for the City of Alameda, Noll & Tam was hired to renovate two branch libraries. We worked closely with library administration and city staff to give them the most "bang for the buck," resulting in upgrades to accessibility, electrical and data systems, HVAC, new furniture, lighting fixtures, and finishes. The historic West End branch received structural and seismic improvements. (Noll)

### **Los Gatos Library, Los Gatos, CA – USA 2011**

Client: Town of Los Gatos, Construction Cost: \$ 18,000,000

Nestled at the foot of a wooded hillside, the two-story, 30,250-square-foot Los Gatos Library provides a visual connection between the Town's historic Pageant Park and the adjacent Civic Center. The design concept is based on the lantern, which in architectural terms suggests an open, light-filled structure. Daytime illumination optimizes the use of natural daylight, with glazing on the north wall, skylights at the stairway well, veiled glazing on the south wall, and use of louvers to bounce light into the library. At night, white and colored artificial light allows visibility from the street and views into the library.

The site is at the edge of the existing Civic Center and abuts a steeply graded hillside, so building footprint options were limited. To eke out the maximum possible square footage, the architects designed a rectilinear building, then added cantilevered "pop-out" elements to break up the static shape. The steel-frame building is clad with stone veneer, porcelain tile, a wood veneer composite panel rainscreen, honeycomb core aluminum panels, and an aluminum solar shading system. The materials and exterior colors take inspiration from surrounding natural elements and buildings.

Inside, the low lobby ceiling opens suddenly onto the two-story main staircase, giving a sense of airiness and arrival. This stair is the central focus of the library and a feature design element. An etched glass art installation by Sheri Simons decorates the back wall of the staircase, alternating transparent and frosted panels and graphic elements.

While the open floor plan celebrates large spaces, the design also incorporates more intimate reading areas. Special attention was given to design elements that make each program space unique. The periodicals reading room, located behind the stairwell on the main floor, has a dark-paneled clubby adult atmosphere, with a gas-lit fireplace. A moveable window wall opens onto a patio, creating an outside room in the warmer months. Off the main floor lobby, a brightly colored sign denotes the children's library. Entering the children's area, visitors find themselves beneath an undulating starry sky, with glowing back-lit cutouts of celestial swirls and planets. On the rear wall, recycled transparent plastic has been fashioned into luminescent circular artwork by Benjamin Phipps. Smaller circles act as wall sconces, while larger circles are recessed to serve as reading nooks. A door to the outside leads to a secret garden, where larger-than-life books sculpted in cement represent favorite classic children's literature.

Like a hip treehouse, the teen area is located on the second floor in the cantilevered "pop-out," which gives it views to outside as well as visibility from the street. Teen lounge-style seating offers a group gathering area. The ceiling is detailed with Interlam, painted a vibrant red. The second floor also features a Local History Center, with exhibit cases and a video screen to display artifacts of note. The design team is aiming for a LEED Gold certification, emphasizing visible sustainable systems and educational display features. Archdaily 27.09.2012 (<http://www.archdaily.com>)

### **Valley Hi North Laguna Library, Sacramento Public Library, City of Sacramento, CA – USA 2009**

Construction Cost: \$ 10,800,000

This new high-performance, LEED Gold-certified branch library for the City of Sacramento pushes the envelopes of sustainability and design. The 20,500-square-foot building has been embraced by the community, offering an expanded collection, community meeting room, technology center, self-service checkout, study rooms, a Teen Area, and Children's Library. Valley Hi-North Laguna library won a Design Excellence Award from the AIA San Francisco in 2011. (Noll)

### **Castro Valley Library, Alameda County Library, Castro Valley, CA – USA 2009**

Client: County of Alameda General Services Agency, Construction Cost: \$ 12,200,000

A light-filled, ultra-modern facility, the 34,000-square-foot Castro Valley Library offers a flexible design that accommodates a variety of community needs. Preschool-aged children, teens, and seniors all have their own reading/study areas, and a Friends of the Library bookstore and café offer a sophisticated way to enjoy a good read. Abundant natural light and an efficient heating and ventilation system contribute to the building's LEED Gold rating. (Noll)

### **Portola Branch Library, San Francisco Public Library, City of San Francisco, CA – USA 2009**

Construction Cost: \$ 3,400,000

The 6,300-square-foot building is the culmination of creative collaboration between the joint venture of Noll & Tam Architects and Stoner Meek Architects, the San Francisco Public Library, and the Portola community. The new library offers designated teen space, a children's room, and flexible space to support events after hours. An open book motif is represented in the sunshades along the building's southern wall. (Noll)

Program: A single-story, 6,300-square-foot public library on a residential street, with stacks and periodicals along the south wall and a children's room, a program room, and staff offices along the north. A side garden borders the children's room and program room, which also has a separate entrance from the outside. Design concept and solution: To integrate a civic building into a residential context, the architects wanted to strike a balance between exposing and obscuring: much as a house does, the library brings in light without fully revealing the activity within. On the southern facade, a sequence of tall "shutters" resembling the pages of open books offers shade and privacy, while tall windows tucked behind the folds bring in a play of daylight that changes throughout the day. The shades' interior bays double as private reading spaces that together form a kind of indoor porch. A stretch of skylights spans the length of the library and divides the public program from staff spaces. To underscore the residential motif, the architects clad the library with shiplap wood siding, which they also used on the interior in rust red and in a natural wood stain.

(<http://archrecord.construction.com>)

### **The Bancroft Library, Doe Library Annex, University of California, Berkeley, CA – USA 2008**

Construction Cost: \$ 42,000,000

Noll & Tam Architects served as the Associate Architect with Ratcliff (Prime Architect) for the seismic and programmatic improvements of The Bancroft Library, which houses UC Berkeley's rare book and manuscript collections. The scope of work included a complete re-design of the building's 217,500-square-foot interior to meet current and projected needs. Noll & Tam's programming capabilities, group facilitation, and interior design expertise were central to the renovation of this historic building. (Noll)

### **Marina Branch Library, City of Marina, CA – USA 2007**

Client: City of Marina, Construction Cost: \$ 6,200,000

Noll & Tam Architects designed the new 20,000-square-foot Marina Branch Library and administrative offices for the Monterey County Library system. In addition to a children's library, periodicals room, and general reference, the new facility provides study rooms, a large community meeting room, and a homework center. Careful attention was given to siting the building among the natural features in this coastal city. (Noll)

### **Carmichael Branch Library, Sacramento, CA – USA 2006**

Client: Sacramento Public Library, City of Carmichael, Construction Cost: \$ 4,700,000

Noll & Tam Architects designed the renovation and expansion of the Carmichael Branch of the Sacramento Library, transforming an outdated design. The open layout features expansive window walls and a series of light wells. An expanded children's area, adult reading room, teen area, technology center, special collections area, community meeting room, and staff and support spaces serve the local community. (Noll)

**Fong Library, School of Optometry, University of California, Berkeley, CA – USA 2002**

Construction Cost: \$ 1,200,000

Noll & Tam Architects transformed the 4th floor of Minor Hall into a state-of-the-art student resource center for Optometry students, comprising a new library, lecture theatre, teaching computer laboratory, and meeting rooms. The Optometry School wanted to unify these spaces into an active student center and focal point. The project required careful coordination with existing conditions to provide upgraded systems routed through the concrete structure. (Noll)

**NTDStichler Architecture, San Diego – USA**

<http://www.ntdstichler.com>

**Libraries :**

**Lincoln Public Library at Zwelve Bridges Learning Center, Sierra Community College District, City of Lincoln, CA – USA 2007**

39,311 sqf., \$ 11,136,000

This library is housed at a unique shared-use campus developed by Sierra Community College, Western Placer Unified School District and the city of Lincoln. In addition to supporting blended programs that involve all students, the facilities will serve the individual needs of Lincoln citizens, college students, high school students and business partners. The Lincoln Library represents the first joint-use building design to emerge from the master plan. The curriculum and planning process represents a community effort that involved all three agencies and local citizens. The library exists as a pivotal point on the site, acknowledging the space where all parties come together. The library houses a comprehensive, multi-generational collection. This public facility is designed to be a beacon of lifelong learning for the entire community. ( <http://schooldesigns.com> )

**Office dA, Inc., Boston, MA**

**Libraries:**

**Fleet Library at the Rhode Island School of Design, Providence RI – USA - 2007**

**Literature:**

**Architectural Record, June 2007**

Office dA inserts a new sensibility within a historic shell to create the Fleet Library at RISD

By Clifford A. Pearson

How do you turn a Renaissance Revival banking hall from 1917 into a 21st-century visual-arts library and do it on a tight budget? That was the challenge facing Office dA, the Boston-based architecture firm headed by Nader Tehrani and Monica Ponce de Leon, when it started work on the 55,000-square-foot Fleet Library at the Rhode Island School of Design in Providence.

Designed by York (Edward York 1863 – 1928) & Sawyer (Philip Sawyer 1868 – 1949) and listed on the National Register of Historic Places, the old building features an interior space 180 feet long and 114 feet wide and topped by an elaborately coffered, barrel-vaulted ceiling. The banking hall might easily have served as a magnificent reading room, if only the school had the luxury of devoting all of it to one use. But the library's program called for 90,000 books in open stacks, seating for 250 people, 400 periodical titles available for browsing, and a variety of different study, administrative, and multimedia support spaces.

Even with a balcony running along one side of the banking hall and a second floor wrapping around the vaulted ceiling, there wasn't enough space for all of the programmatic elements. "We had to make the height of the space work for us," says Tehrani, who studied at RISD and, like his partner, has taught there. Despite initial resistance from the client's design-review committee to interrupting the hall's impressive volume, Office dA developed a "double-decker" strategy that inserted a two-level study pavilion and a single-level circulation center within the grand space.

"We wanted to maintain the scale of the banking hall," states Ponce de Leon, "so we decided to install two objects as if they were informal elements in an ancient ruin." The old bank building was actually in good condition—hardly a ruin—but the architects imagined their project as adding a new layer to a historic place, much like the multiple strata we see today at the Roman Forum. Rather than obscuring the past, the new elements add a modern resonance. Office dA also wanted its work to have a temporary quality that contrasts with the more permanent nature of the Italianate setting.

To respect the old building, the architects developed three different strategies for the elements added inside it. The largest pieces—the study pavilion and the circulation center—are designed as insertions, milled by computer-numerical-controlled (CNC) machinery off-site, and then assembled quickly inside the banking hall. Their prefabricated nature not only sets them apart from their historic context but implies they could be dismantled and carted away if needs change in the future.

(<http://archrecord.construction.com/projects/interiors/archives/0706fleet.asp>)

Accolades and Recognition for RISD Fleet Library

Providence, RI and Boston, MA - July 20, 2007 – Shawmut Design and Construction ([www.shawmut.com](http://www.shawmut.com)), a \$700 million national construction management firm, along with the architecture firm of Office dA, both of Boston, MA, are announcing several recent award wins and feature articles on Fleet Library at the Rhode Island School of Design (RISD) in Providence, RI.

The Fleet Library, located in the main hall of the historic 1920 Hospital Trust Bank building in downtown Providence, is an example of the successful synergy of preservation, architecture, construction and programming. The project team was able to not only preserve this special space, but improve its functionality, and increase its lifespan within the context of Providence's historical character. The project clearly has not only positively impacted the college community, but has significantly added to the character and charm of the Down City section of Providence.

The main goal of this challenging project was to preserve and restore the unique character of the historic interior, while providing RISD with ample room to house their extensive collection and an inviting place to study and interact with fellow students. To solve this issue, two modular birch-plywood pavilions were placed within the open hall to provide study and service spaces for the new library – this innovative solution kept the majestic feeling of the original interior completely intact, while realizing all of RISD's program areas. One pavilion, a "study island," features a broad amphitheater-type stair, where students can sit and informally

gather, with an open reading room at the top. The other pavilion serves as a circulation and reference desk, with a lounge area set between the two structures. The library now houses an extensive collection of art and design volumes, magazines and multimedia resources, as well as group study areas, classrooms, administrative offices, and an adjacent café. With a 300-bed dormitory on the top floors, the café and the library becomes an extension of the living space where students emerge from their rooms to interact with each other and move freely between the programmed spaces.

The project has recently received several distinguished awards recognizing the library and design team's dedication to its preservation. In the past few months, Fleet Library has won a 2006 Adaptive Reuse/Material Conservation/New Design/Institutional Award from The Providence Preservation Society, an AIA/ALA Library Building Award jointly awarded by the American Institute of Architects and the American Library Association, and it was recognized as one of the 2007 Best Environments by I.D. Magazine. The Fleet Library has also been mentioned in several international, national and local publications. In June, the project was featured in Architectural Record, Proyecto (magazine of the Latin Builders Association), and Architect Magazine. Prior to these recent features, the project was also profiled in Frame (from The Netherlands) and The Boston Globe.

About Shawmut

Headquartered in Boston, Massachusetts with offices in Providence, RI, New York, NY, and Atlantic City, NJ, Shawmut Design and Construction is a \$700 million national construction management firm providing client-oriented services for academic, banking, corporate interiors, cultural and historic preservation, retail, restaurant, and science and healthcare markets.

## **Oglesby Greene, Dallas, TX – USA**

<http://www.oglesbygreene.com>

2006 Architecture Firm Award, Texas Society of Architects

**Libraries:**

**Grauwlyer Park Branch Library, Dallas, TX – USA 2007**

**Awards:**

2010 Design Award, Texas Society of Architects

The Grauwlyer Park Branch Library, at only 12,500 s.f., is Dallas' smallest programmed new branch facility. The site, hemmed in by setbacks, a curving utility easement, and a city park, determined the footprint of the building. The residual layout is compact, efficient, and simple. Parking is shared with the park and connected to its trails. The library acts as a gateway between the two, with a clocktower as a prominent marker, integrating its community and the park. The common public portion of the library opens up to the wooded park offering expansive views, and the "back of house" areas zone to the street edges. Decking extends to shade areas of full height glazing and vertical metal sunscreens block low afternoon sunlight. The plan of the library is arranged so that all areas have natural light and views. The centrally located check-out/information desk, on axis with the single point of entry, allows for efficient staff supervision. The desk is also located directly under a clerestory skylight to give prominence to this area with optimal. Materials, such as the wood decking and beams, were chosen to give warmth to the space but also to be durable and to meet sustainable LEED criteria. Bookshelves near the information desk are held to a lower height and run parallel for ease of supervision, and to highlight views to the adjacent park. An emphasis was placed on making each user-group's area of the library distinct, while still maintaining an overall image and easily supervised space. This was done through the use of differing, but coordinating carpets, paints, wall coverings, furnishings, and fabrics. The result is a widely-used, enduring facility that is appropriate to and appreciated by both the community and the librarians and staff who call this branch their home. (Oglesby)

## **Olson Kundig Architects, Seattle, WA – USA**

<http://www.olsonkundigarchitects.com>

**Libraries:**

**Seattle Public Library, Southwest Branch, Seattle, WA – USA 2006**

Our firm played a major role in the renovation of Seattle Public Library's neighborhood branch system with the redesign of the Southwest Branch. The addition transformed the existing 1960's era neighborhood library into an up-to-date facility, doubling its former size to 15,000 square-feet and creating room for new books, DVDs and music. The expansion advances the building to the street, with a two story addition which increases the building's civic presence. British Columbia artist Katherine Kerr created an installation piece of outstretched hands, cast from the hands of some of the library's most active patrons. (Olson)

**Public Library Auburn, City of Auburn, WA – USA 2002**

Set in a suburban park on the edge of a busy highway, this 15,000-square-foot library forms a strong street presence, calling attention to itself amidst the riot of color and signage typical of suburban thoroughfares. On its opposite side, the building softly modulates to meet the park. Inspired by the shape of an open book, the building contains the collections area, a community resource room, computer stations and support areas (Olson)

**Seattle University, School of Law, Sullivan Hall, Seattle, WA – USA 1999**

**Awards:**

Masonry Institute of Washington Citation Award 2001

Seattle AIA Merit Award 2001

Designed to accommodate 850 students, the building promotes the sense of the school as a unified entity in a comfortable, open environment. The primary building feature is the central atrium, which connects three levels of the 136,000-square-foot structure, brings in natural light and promotes a sense of community. The building complements the existing campus architecture without sacrificing its own identity. The building includes a 250,000-volume law library. Virtually every place a student can sit down is wired with data communication capabilities. This project was completed in association with Yost Grube Hall Architects. (Olson)

## **OPN Architects, Cedar Rapids IA, Des Moines IA – USA**

<http://www.opnarchitects.com>

### **Libraries:**

#### **Baraboo Public Library, Barboo WI – USA on design**

Sqf. 36.800

Since 1903, the community of Baraboo, Wisconsin has respectfully preserved their beautiful, historic Carnegie library. An addition constructed in 1982 extended the functional life of the building and preserved the main public appearance of the Carnegie design. However times change and this growing community realized that the provision of modern library services requires a major addition to the facility. Utilizing a Building Program from 2009, prepared by George Lawson as a working guide, the design team organized and held a three-day public Charrette to develop the conceptual design for the new addition and renovation.

The Charrette allowed the design team, library board, community leaders, and patrons to quickly explore potential expansion options and to clearly understand the property purchase requirements with each option. Consensus was quickly found for the preferred design, but the challenge was that this option required an agreement to purchase additional land from an adjacent Church. The public participation process helped garner the support of the church congregation and the Library Board was able to successfully negotiate the purchase of additional land.

The new design preserves the setback of the original Carnegie Library and provides a new addition of the same proportion, to the east. A new, predominately glass entry zone provides a clear delineation between the original library and the new addition, while also solving a critical accessibility issue with the two-story Carnegie design. Careful attention to the axial design of the Carnegie facility helped to organize the new plan and redefine the functional layout of the library to create a design that is both respectful of the historic facility, but will also serve the library's future needs.

For the Baraboo project, OPN Architects partnered with Dorschner Associates, a Madison-based architecture firm. OPN is providing schematic and design development services for the project and Dorschner will provide construction documentation and administration. Fundraising for the project has begun, utilizing the presentation graphics prepared by OPN Architects. (OPN)

#### **Ankeny Public Library and City Offices, Ankeny IA – USA on design**

\$ 30.000.000

OPN Architects is the primary designer of a new City Hall and Library project for the City of Ankeny. Plans locate the new facility in the 1200-acre Prairie Trail development, a joint venture between the City of Ankeny and DRA Properties. The goal of the development is to create a new cultural focal point for the Ankeny, a growing community just outside of Des Moines, Iowa. An 80-acre zone called the Town Center will be created at its heart built on the model of traditional Iowa town squares. Anchoring one side of the "square" will be a new structure to house the public library and city offices. As a mixed-use structure, the project presented a series of design challenges including establishing distinct entries for the building spaces and clear way-finding strategies, while creating a consistent visual style and uniform appeal. Design for the building calls for a wide variety of innovative and sustainable building options to accommodate the needs of the building's different user groups. In addition to design, OPN Architects, working with the Weitz Company in a design/build relationship is managing all of the communications and needs for the various stakeholders, including Ankeny's city administrators, council, residents, the Board of the public library, library administrators, and associated developers.

DRA Properties, acting as the Master Developer of Prairie Trail, is working with co-developer TerreMark to create a mixed use facility incorporating civic, commercial, residential, educational and retail components into a walkable, sustainable city center. OPN has engaged with all vested stakeholders in a series of public meetings and presentations. During these presentations, OPN presented concepts, collected feedback from each group, incorporated feedback into the plan and redistributed the updated results to participants.

Future work calls for OPN to collaborate with Nilles Associates, Civil Engineers for the project, 5o5 Design and JPRA Architects as the vision for this ambitious development is realized.

"I will say that already we are extremely pleased with OPN and very excited to move along with them on the project! ....they are great listeners!

– Myrna Anderson, Former Library Director, Ankeny Public Library (OPN)

#### **Cedar Rapids Public Library Downtown, Cedar Rapids, IA – USA 2013**

\$ 45.800.000

In June 2008 a destructive flood swept through Cedar Rapids. Hundreds of homes and businesses were lost including some of the city's most prominent public structures such as the Courthouse, the City Hall and the 25-year old Public Library. The loss of the library was particularly devastating. Everything on the first floor of the 85,000 square foot facility – which occupied a city block – was lost to the flood including the entire adult and youth collections, public access computers, computer labs, and a state of the art check-out system. Approximately 200,000 items in the collection were ruined. In addition, thousands of furniture items and pieces of electronic equipment were destroyed. OPN quickly stepped in to assist by helping design temporary library spaces downtown and in a shopping center on the west side of the city. Meanwhile the community coalesced around the need to rebuild the public library. A dedicated team of community volunteers and the Library Board of Trustees kicked off a campaign to re-envision how the library should function and to find a new home for this important public resource. A site was selected

The new site for the new library fronts Greene Square, a park within the urban core. Bookending the Cedar Rapids Museum of Art, this library completes a larger urban dialogue and civic oriented zone. The building not only completes the urban edge fronting the park, but also steps back to create a large urban plaza, an extension of the public space of the park and street. As the entire building aims to reveal inner functions to the public, it also offers patrons and building users unprecedented views to the urban and park settings beyond, connecting them to civic art, public gathering spaces, and programmed events.

The new 95,000-square foot library is designed to be a vibrant, multipurpose destination and a space for the community to mix and collaborate. The design of the new library was driven by the desire to embrace openness, transparency and foster public engagement with and within the space. With those principles in mind, the team looked for innovative ways to present vistas and views throughout the structure while visually connecting the streetscape with the functions occurring within the building.

In keeping with the themes of openness and transparency, large expanses of glass occur at the first and second floors of the collection spaces. Views into the building frame the rhythmic placement of library stacks juxtaposed with a lively and active Children's Collection. The views in and out of the collection spaces are seen from nearly every vantage point around the new library. A 200-seat auditorium situated on the second and third levels looks outward toward Greene Square. The auditorium stage is set against a curtain wall of glass allowing for the changing seasons and cityscape to serve as a living backdrop.

#### **Centralized Services**

The central space of the library is the Service Core Zone. This space brings together all of the core patron services in a hub and spoke system allowing users to orient themselves in the building as well as gather to meet. The spaces and mixing of circulation paths

is most clearly expressed within this zone. It is defined architecturally by the rake of the auditorium as it vaults over the first floor Adult Fiction collections and 2nd floor “bridge” links within the Service Core. The zone was designed with clear sight lines and open vertical circulation to allow users to readily navigate their way to various destinations.

A café and coffee shop is nestled in the core enticing visitors to gather, linger and engage with each other. Off the café is the Young Adult Area where rooms for gaming, study, and group work open to an active collection space. The Children’s Collection occupies the east portion of the first floor. The second floor consists of the Adult Non-Fiction collections, a large dividable conference space, and staff and administrative offices. The third floor consists of a break-out lobby for the Auditorium and public access to the green roof.

The 24,000 sf green roof provides an attractive space for library patrons to gather while offering yet another set of views and visual access to the surrounding cityscape. Functionally, the roof will aid in waste water management while serving as an outdoor plaza to be used by individual visitors and for library-hosted and private events. Importantly, this space is the first publically-accessible green roof in Cedar Rapids.

#### A Sustainable Solution

The new library represents a tremendous investment of resources. It was essential that the design be flexible to accommodate the future needs of the community. One method of “future proofing” was the integration of raised access floors as part of the design. These raised floors will allow for the distribution of power, data, and low velocity supply air permitting the collection spaces to evolve over time. The collection spaces were intentionally designed to be very open; they incorporate few walls and a clear span between the columns to allow for the full utilization of the available square footage. Dedicated mechanical spaces and “core functions” are located on the west side of the site in an area that fronts a rail line and parking garage. The southern portion of the site is surface parking, which could be utilized as space for future expansion. In addition to the green roof, the building was designed to achieve LEED Platinum status and is on-track to do so. Energy and cost-saving features were integrated into the building design and the roof itself will offer conservation-based educational opportunities for visitors.

#### “Green” Features:

- Targeting LEED Platinum Certification
- Designed to exceed the Iowa Energy Code by 55%
- Pump & Re-inject Geothermal HVAC System
- Pre-flood Library used energy at a rate of 100 kbtu/square foot
- New Library designed to use energy at a rate of 37 kbtu/square foot
- Exterior Glazing covers approximately 37% of the building envelope
- Thermally broken aluminum framing
- 1” insulating glass has low-E coating and is argon filled
- Exterior Envelope: R-28, maximized thermal performance
- Daylight Harvesting: (Daylight sensors, dimmable ballasts, and T5/LED Lights)
- Use of Natural Light: (15 solatubes and large clerestory on roof)
- Storm Water Management: Retain 90% of normal annual rainfall and 100% of all rainfall up to 1” in a 24 hour period on site.
- 24,000 SF accessible green roof with rainwater harvesting for irrigation
- Pervious paving with storm water collection chambers below parking lot (OPN)

#### [Williamsburg Public Library, Williamsburg IA – USA 2011](#)

Sqf. 17,825, \$ 2,700,000

The new Williamsburg Public Library is sited on the northwest corner of the town’s main square. It engages the square with an entry plaza on the southeast corner of the site and utilizes a clock tower to signal both the entry as well as give the library it’s civic presence. The exterior material palette is composed mainly of brick with stone accents which relates to the traditional character of the buildings on the square but has a metal standing seam roof and metal skinned window bays to hint at the contemporary nature of the functions within.

The upper level contains 12,400 sf and features the reading areas, book collections, children, young adults and computer area as well as three different sized study and meeting rooms. The main entry, public bathrooms, staff offices and workspace encompass the remainder of this level. The lower level contains the multi-purpose room(s), a meeting room and staff lounge. It also includes public bathrooms for this level, mechanical spaces and has an ADA entrance serviced by an elevator.

The interior has an articulated vaulted ceiling over the stacks and reading areas along the North and South bays. It has a high ceiling with a slot for the skylights over the central bay. It has an undulating curved ceiling plane over the Youth Area. The casework at the main and children circulation desk has a slated wood motif to recall the areas agrarian history. The cherry wood interior woodwork and gas fired fireplace gives a warm comfortable feel to a contemporary library space.

The library targeted LEED Silver certification and was awarded LEED Gold. (OPN)

#### [Carnegie Stout Public Library, Dubuque IA –USA 2010](#)

Sqf. 54,957, Budget4,730,176, Market Historic Restoration Library, LEEDLEED Silver

#### **Awards:**

**2011 Merit Award – American Institute of Architects – Iowa Chapter**

**2011 Silver Award – International Interior Design Association – Great Plains Chapter**

The renovation and restoration of Dubuque’s historic Carnegie library was a tremendous challenge. The 50,000 sf building consisted of the original Carnegie structure constructed in 1901 and a 1984 addition that, while dramatically increasing the size of the library, effectively created two separate halves, each with its own architectural style and personality, and with very little connection between the two. The 1984 addition also housed the majority of the public spaces, limiting the community’s opportunities to experience the historic portion of the building. The design team was challenged to unify these two disparate halves as a part of a building-wide reorganization and remodel, while reclaiming the historic, original portion of the building for public use. Rather than a strict historic restoration, which would limit the building’s functionality, the renovation honors the historic nature of the building, restoring certain key components, while re-purposing others for modern use.

To embrace the historic aspects of the original building, the team focused on a number of design goals:

- Opening the grand main entrance;
- Opening the historic mezzanine and skylight above;
- Renovating a community meeting room on the upper level while opening the skylight in that room;
- Reopening the exterior windows on the lower level, and relocating significant parts of the collection to the historic building.

Perhaps the most dramatic impact created by the new design is the experience of entering through the reopened historic main entrance. Since the 1984 addition, the mezzanine had been off-limits, the skylight was covered, a wall blocked views to the exterior windows, and the historic entry doors were locked. Today patrons stepping through the main entrance are greeted by an axial view through the historic lobby to the reinvented mezzanine seating area. The seating area is flooded with natural light from the skylights above and the dramatic windows on the back of the building.

The collection and seating areas are now equally divided between the historic portion of the building and the 1984 addition. The challenge of unifying the original and added portions of the building was perhaps the greatest difficulty faced by the design team. This was addressed by creating a new opening between the two building halves on the main level and simplifying vertical circulation. Two solutions that have dramatically increased the feeling of connection and improved patron circulation and way-finding. An historic central staircase that was removed in the 1984 remodel was reconstructed and reinstalled, restoring the original character. The rotunda in the historic lobby acts as a unifying, signature feature that creates a dramatic “sense of arrival.” Taking cues from the rotunda, a round form is introduced as an arrival feature in both the Children’s Area and the Teen Area. In the Children’s Area, this custom built seating area becomes the heart of the space, while in the Teen Area, this contemporary rotunda-like feature signifies the entrance to the area and acts as a threshold or buffer between this age group and other patrons. In addition to the final design and project management, OPN completed the pre-funding phase of planning and developed a presentation package of drawings and illustrations that were used by the library board for capital campaign fundraising.

“ I am proud we had the foresight to choose your firm as our architects. I’ll always be grateful for the chance I had to be a part of helping to bring your inspiring vision for our library to the citizens of Dubuque. ”

- Susan F. Lindsay, Former Board of Trustees Member, Carnegie-Stout Public Library (OPN)

#### [Washington Free Public Library, Washington IA – USA 2009](#)

Sqf. 30,000, \$ 5,000,000

OPN Architect’s design for the Washington’s Free Public Library placed the library in a new building, replacing three vacant storefronts, and will serve as a catalyst for future downtown development.

The library occupies portions of three levels with approximately 10,000 sf per floor. Meeting rooms, the reference and adult non-fiction collections and an adult reading lounge overlooking the town square are located on the upper floor. The main level features the children’s collection, circulation services, popular materials, another reading lounge, and the adult fiction collection. The local genealogy collection and future library expansion areas are located on the lower level.

An open stairway and elevator link the three floors; as does an opening in the upper level floor which visually connects that floor with the main level. Natural light is brought into the library through glass storefronts and a skylight located above the opening in the upper floor.

Sustainable Design Features:

- Recycled and salvaged as much interior structure as possible, including three stories of hardwood floors.
- Exploring geothermal systems for energy
- Daylight Harvesting: by utilizing the orientation of the site, maximize the amount of light available while minimizing the amount of artificial lighting.
- Responsible use of sustainable and renewable building materials
- Maximizing indoor air quality by using low VOC emitting products and finish. (OPN)

#### [Fort Madison Public Library, Fort Madison, IA – USA 2007](#)

Sqf. 16,000, \$ 1,832,000

In 2007, OPN assisted the town of Fort Madison in locating and designing a new home for their public library. The former Valley Clinic building was converted into a welcoming and functional space for the Fort Madison Public Library. The existing building was renovated and an addition of approximately 2,000 square feet created to provide 16,000 sf of finished library space. One of the challenges of the design was that the original ceiling heights were too low to accommodate the height of library book stacks and suspended indirect lighting. The entire roof structure was removed and a portion of it was raised between six and eight feet in order to accommodate the necessary elements. A new radiant entrance was added to the front of the building providing a sense of place in keeping with the civic importance of the structure.

Sustainability Features:

Adaptive reuse of an existing structure reduced waste Cool Roof membrane to avoid heat-island effect Low E glazing on glass for improved energy efficiency Light shelves and advanced daylighting techniques including sun screens Indoor chemical and pollutant controls for improved indoor air quality Recycled cellulose and denim based building insulation Water conserving fixtures in bathrooms and public spaces Upgraded HVAC uses water source heat pump Site provides bike racks and easy access to public transportation (OPN)

#### [Marengo Public Library, Marengo, IA – USA 2007](#)

Sqf. 12,570, \$ 1,540,000

The Marengo Public Library, one of the State’s original Carnegie libraries, served the community for almost 100 years with little change to its functional layout. Recognizing that the facility needed to be modernized to accommodate new uses, OPN Architects was selected to reprogram the existing Carnegie and to design a two-story addition. The new addition provides a much needed increase in collection space, staff areas, and seating, while also providing a new public meeting room, genealogy space, and room for children’s programming.

The design team set out to meet the programmatic requirements while maintaining the historic integrity of the building. Before beginning the design process, the team analyzed the existing facility to determine the proportioning system used by the original architect. The team then applied the rules of the original building to design the addition creating a seamless aesthetic between the two buildings.

A new on-grade entrance leads to a dramatic two-story lobby that provides access to both levels via a stair or elevator. All library functions are located on the upper floor, allowing for ease of supervision from the staff area. The lower level, containing the public meeting room, genealogy, and children’s program space, is accessible after-hours, while maintaining the security of the library. A complete new mechanical and electrical system was also part of the project. (OPN)

#### [Kirkwood Benton Hall Library, Cedar Rapids IA – USA 2007](#)

Sqf. 16,800, \$ 1,480,000

Kirkwood Community College initiated a remodeling of the central library following the successful issue of a \$27 million bond for capital improvements. The library’s original character and furnishings, circa 1973, were still in place and in declining use. The outdated finish palette and well-worn furnishings portrayed a “tired” environment, and student usage had been declining.

OPN Architects worked with users to develop a new cosmetic that combined freshness, durability, and aesthetic longevity. Operational areas were renovated to support current technologies and processes. The overall layout was modified to promote a “friendly” attitude, and reinforce a message of customer service.

Mechanical systems were improved to increase fresh air ventilation and the lighting system was redesigned to brighten the space. The furnishings were replaced in their entirety, using two-tone wood accents and durable fabrics.

The project was executed in phases and while maintaining library operations.

Project Objectives:

- Improve and update operational aspects
- Align space with student usage
- Aesthetically refresh space & furnishings

**Project Constraints:**

- Maintain library operations during project
- Overhaul, improve mechanical systems
- Maintain 44,000 sq. ft. two-story space
- Hypo-allergenic materials and methods throughout (OPN)

**Monticello Public Library and Renaissance Center, Monticello IA – USA 2006**

Sqf. 16,000, \$ 3,600,000

The Monticello Public Library and Renaissance Center is a multipurpose building that sits adjacent to City Hall. In addition to the library, the center features a new community meeting room which serves as the City Council Chambers and a Veteran’s Memorial Hall.

The public library occupies the entire upper floor with an at-grade entrance on the side of the building facing Grand Avenue. The entrance to the Veteran’s Memorial Hall and community meeting room / Council Chambers on the lower floor sits at sidewalk level along First Street. The First Street facade features brick and limestone details. These materials echo the materials used on other historic downtown buildings and help the new structure blend in. A recessed arcade with arched openings and projecting, suspended canopies leads to the main entrance on the lower floor. Large windows on the upper level, as well as a centrally located “eyebrow” dormer window introduce natural light into the library’s interior. The building is capped by a colored standing seam metal roof and flanking brick chimneys.

**Sustainable Design Features:**

- Use of building materials that use recycled content
- Low VOC paints, adhesives and carpeting
- Low-E glass; daylight harvesting sensors
- Locally extracted and manufactured building materials
- State-of-the-art ventilation system that will provide a high level of indoor air quality

“ I also want to extend my appreciation to all for the design of our new library. It not only is a classical design but very functional. When we started this process I expressed my concern that we have a building that would be architecturally pleasing. You achieved that and more. This building is a wonderful addition to our downtown and something we can all be proud of.”

— Jon C. Husman, Building Committee Member (OPN)

**Moline Public Library, Moline IL – USA 2006**

Sqf. 72,710, \$ 10,300,000

The library is two stories with an arrangement of the active collection areas, primarily the popular materials and children’s collection, on the ground floor. The general adult collection, consisting of the reference, periodical, non-fiction, and fiction collections, was located on the upper floor. The design concentrated the enclosed staff areas, conference space, and mechanical/storage areas on the east side of the facility.

A large expanse of fenestration created transparency and opened the collection spaces to passing motorists to serve as a beacon and highlighted the library and what it offered. The two-story library was constructed of brick with stone accents and a variety of window openings. The size and scale of the window openings responded to the interior layout of the facility. The goal was to create a variety of experiences within the library so that each patron could find their “favorite spot”.

A copper-clad entry form housed a coffee shop and public meeting areas. The facility was designed so that these areas were accessible during non-library hours. The City of Moline now has a library that truly lives up to its vision: Treasured Past, Vibrant Future.

**Unique Aspects of the Design Process:**

- Extensive community charrettes
- Explored multiple option for renovation vs. new construction including multiple site plans
- Provided furniture and fixture options and managed purchasing/installation

**Sustainable Design Features:**

- Ambient light sensors control interior light levels and lower energy use
- Interior materials choices favored recycled or low VOC products
- Exterior materials sourced from local suppliers (OPN)

**Des Moines Public Library, East Side Branch, Des Moines, Iowa – USA 2006**

Client: City of Des Moines, sqf. 13,000, \$ 2,400,000

OPN Architects was selected by Des Moines Public Library Board of Trustees to design an addition and to renovate the East Side Branch Library. The East Side Branch renovation was one component of the Des Moines Public Library’s \$48 million capital improvement plan. The dated facility was greatly in need of an update. OPN’s design added a new 100-seat community room, entrance gallery, and landscaped entry walks. The interior layout was reorganized to improve way-finding and establish an identifiable sense-of-place for the children’s and young adult areas. The result was a modern, functional and welcoming library for the city’s east side.

**Sustainability Highlights:**

- Cool roof membrane to avoid heat island effect
- Maximizing indoor air quality by using low VOC emitting products and finishes
- Low E glazing on windows for improved energy efficiency
- Light shelves and advanced daylighting techniques for improved energy efficiency
- Indoor chemical and pollutant control improved indoor air quality
- Responsible use of sustainable and renewable building materials (OPN)

**Anamosa Public Library and Learning Center, Anamosa, Iowa – USA 2004**

Sqf 14,300, \$ 1,450,000

In 1983, the historic Anamosa Library was listed as one of three Eastern Iowa libraries entered in the National Register of Historic Places. The community cherished the historic building, but recognized the need for a larger, more accommodating library and learning center. OPN Architects, Inc. worked with the community and library leadership to design a new 14,300 sf public library. The design condensed the “hard-wall” space accommodating the program room, staff area, friends room, restrooms, and mechanical in the south third of the building. This created a continuous, open space for the collection and seating areas. The service desk, located

in the center of the facility, has visibility to the entire collection area. Features of the design include the ability to secure the library area while still maintaining after-hours access to the program room, two outdoor reading rooms, ICN capabilities, a drive-up book drop, and flexibility for future expansion.

The exterior character of the library recalled the historic atmosphere of the community. Five varieties of Anamosa stone, native to this region, are incorporated into the exterior design. The hip roof form culminates in a raised element that provides clerestory lighting to the center of the facility. In November of 2004, the new Anamosa Library and Learning Center opened. In 2005, the historic town library was re-purposed as the home for the Anamosa Police Department.

“ We are so pleased and proud of our Anamosa Library and much credit goes to OPN for putting all our ideas together and coming up with a great design.”

- Charlene George, President, Board of Trustees (OPN)

#### **Oskaloosa Public Library, Oskaloosa IA – USA 1997**

Sqf. 25,000, \$ 2,700,000

The original Oskaloosa Public Library was constructed in 1902 in the Jeffersonian Revival style. Funding for the original library was provided by Andrew Carnegie. In 1996, OPN Architects was selected to provide professional design services for the renovation and addition to the Oskaloosa Public Library. Funding for the new addition and renovation was provided by a local option sales tax. Prior to schematic design, OPN analyzed the Carnegie facility to determine the organizing principles used by the original designer. Utilizing these same principles of design, a new addition was created that was in harmony with the character of the historic building and satisfied the program requirements for contemporary library. OPN assisted in the specifications of all finishes for the facility. OPN also provided design services to assist the library staff in the selection and specification of all furnishings.

“ I would give OPN my highest recommendation for any public library planning a building project. From the beginning they conducted the architectural design of our new facility in a very professional manner. They realize the importance of the library staff's time. Punctuality and good organization were hallmarks of each meeting. I would be happy to visit with anyone about our experience with OPN.”

— Nancy Simpson, Former Library Director Oskaloosa Public Library (OPN)

#### **Osborn Architects, Glendale, CA – USA**

<http://www.osborn320.com>

##### **Libraries:**

#### **Robert Viramontes Learning Resource Center, Baldwin Park CA – USA in design**

Client Baldwin Park USD, Size 19,000 sqft., Project Value \$9,000,000

The design of the Robert Viramontes Learning Resource Center is the product of an intense collaboration between the designers, administrators, teachers, librarians, parents and students. The library includes a large open reading area defined by an acoustical wood ceiling and a central glass atrium. Private study rooms are located to the north, while past the reference desk to the south is a gallery, audiovisual room, computer lab, faculty workroom and a conference room. (Osborne)

#### **Glendale Satellite Library, Glendale, CA – USA 2008**

Client City of Glendale, Size 2,400 sqft., Project Value \$610,000, Completion Date 2008

##### **Awards**

**Pasadena & Foothill AIA, Honor Award, Interiors, 2008**

The final design of this new satellite library in Glendale creates an open and adaptive working space within a limited area. At 2,000 square feet, the small, semi-circular space realizes an evolving paradigm for libraries, changing from stack-centered and spatially intensive to resource-driven, time-based, and community-oriented. Programmatically, the Glendale Public Library system proposed a library wherein the collection was entirely flexible, drawing from the Central Library. The design amplifies the fluid relationship between an institution and its stakeholders through material transparency where the changing content in the library becomes the literal façade. (Osborn)

#### **Duarte High School Library, Duarte, CA – USA 2004**

Client Duarte USD, Size 46,000 sqft., Project Value \$3,000,000, Completion Date 2004

Duarte High School selected Osborn to design the modernization and expansion of the prominently sited library on the school's west end of the campus courtyard. The design provided an opportunity to expand the book stack collections, improve and redirect access and circulation, upgrade IT/technology and computer stations, increase acoustics and sound isolation, and upgrade mechanical components. The study room is the heart of the building. A high wood panel ceiling with acoustic backing guarantees a quiet, comfortable area and different roof heights allow clerestory windows to bring abundant light into the building, while additional large window openings allow for views into the landscape. (Osborn)

#### **La Cañada Middle and High School Library & Classroom Building, La Cañada CA – USA 2002**

Client La Cañada USD, Size 14,500 sqft., Project Value \$5,000,000. Completion Date 2002

##### **Awards:**

**School Construction & News Design Award, 2002**

La Cañada Unified School District asked Osborn to create a new classroom building and a new library building. The new library creates a sense of place with the juxtaposition of the curving wall of the library reading room to the three-story façade of the new classroom building creating a powerful dynamic both inside and outside the building. An open plan with a mezzanine provides the library staff complete visual connection to all spaces from the circulation desk. Separate entries allow the building to function independently after school to serve the needs of the surrounding community. The additions create a new courtyard that provides a separate identity for the lower grade students. (Osborn)

Staten Island Advance, Summer 2008

Bookmark Magazine, Fall 2008

The project is a one-story branch library for the local community and is situated on a 16,000 SF plot in the Mariner's Harbor neighborhood of Staten Island. The design concept is of a cracked open shell, rougher on the outside and smooth and mother of pearl like inside. The main environmental objectives are daylight and views, energy efficiency and preserving the existing mature trees in the back garden. "Since the 1930s, residents of this former oystering community have been harboring a dream of producing a pearl of their own – a community library. In a few years, that dream will become reality with the completion of a gem of a building inspired by the neighborhood's rich maritime history. The end result, unveiled a few weeks ago during a Community Board 1 meeting, is receiving praise from residents and board members alike. .The branch will have another unique feature: it will be the first NYPL branch to have a ground-level outdoor terrace." -Staten Island Advance, Summer 2008. "In the single story, 10, 000 SF building, transparent glass walls and skylights will draw an abundance of natural light, minimizing the need for overhead lighting during the day. The luminous new Mariner's Harbor library will engage the surrounding community-promoting the library as a freely accessible public gathering space for information and ideas, and serving as a true beacon for the residents of Mariner's Harbor." - Bookmark magazine, Fall 2008. #### **[Public School 158 Library, Manhattan, New York, NY – USA 2011](#)**

Atelier Pagnamenta Torriani has completed renovations of school libraries throughout several boroughs of the city. With the aim of spending energy where it matters, the firm has put a good deal of time into public schools in order to provide quality for those who can benefit the most.

The libraries are conceived as friendly oases within these institutional buildings, specific to each school. Once built, they soon become a living room used by the whole school.

The library at this primary school is equipped with a story-telling area, comfortable seating and specially-designed low shelving accessible to the children. The space is designed as a sequence of different functions articulated by the undulating high ceiling and stimulating lighting pattern above. (Pagnamenta)

#### **[M 13 Central Park East Library, Manhattan, New York, NY – USA 2010](#)**

Atelier Pagnamenta Torriani has completed renovations of school libraries throughout several boroughs of the city. With the aim of spending energy where it matters, the firm has put a good deal of time into public schools in order to provide quality for those who can benefit the most.

The libraries are conceived as friendly oases within these institutional buildings, specific to each school. Once built, they soon become a living room used by the whole school.

The Central Park East library serves both High School and Middle School students. The reading area can morph into a classroom with an interactive whiteboard. Furnished with ergonomic seating and modular light tables, the space can be organized to fit multiple configurations for parent or teacher meetings. The media area is defined as a bright ribbon with motivational signage, drawing students. ([http://www.american-architects.com/en/projects/36060\\_m13\\_central\\_park\\_east\\_library/11/indexAll](http://www.american-architects.com/en/projects/36060_m13_central_park_east_library/11/indexAll))

#### **[A. E. Smith High School, Library, Bronx, New York, NY – USA 2010](#)**

### **Literature:**

**A. E. Smith High School Library. Architonic Website, May 2010**

Atelier Pagnamenta Torriani has completed renovations of school libraries for the New York City School Construction Authority throughout several boroughs of the city. With the aim of spending energy where it matters, the firm has put a good deal of time into public schools in order to provide quality for those who can benefit the most. At the Alfred E. Smith vocational high school, the suspended soffit facing the open library space is designed as a geometrical progression, a double helix repeating modules of 12 triangular facets. This element, while serving as a sound attenuator, highlights the arts and crafts, vocational aspect of this high school, such as the automobile mechanical workshops and building construction workshops. The classroom, the lounge, and the open computer area are separated by low open shelving, creating discreet areas and leaving clear sightlines for the librarian, who has a desk adjacent to her private office space. (Pagnamenta)

#### **[Wagner Middle School Library, Manhattan, New York NY – USA 2007](#)**

The Wagner Middle School is a large school building on the Upper East Side of Manhattan for junior high school students. The project is the reconstruction and enlargement of a library space. The goal is to transform this space into the school's living room.

The librarian requested shelving, a classroom, computer areas, a media center, lounge area and a librarian's desk. The young principal imagined a space that could morph from a classroom to an informal crescent layout to a formal meeting area for the teachers and parents.

We manipulated the space by creating a series of waves. Waves of knowledge, expressed as deep shelving with an undulating soffit above and a waving flooring pattern below, create intimate spaces, where the young adults can linger. Low shelving units in the main library space define the various reading areas. The use of light and dark wood characterizes the periphery and the middle section of the space.

All furniture is modular, light and stackable. The ergonomic chairs and lounge furniture, as well as the modular tables can be reconfigured easily to suit the needs of each day. The computer niches are set near the main desk, where the librarian will have an unobstructed view to the whole library space.

All materials and finishes used in the project are environmentally friendly, recyclable and contain low VOC. (Pagnamenta)

### **PS 11R Thomas Dongan School, Staten Island, New York, NY – USA 2005**

Atelier Pagnamenta Torriani has completed renovations of school libraries for the New York City School Construction Authority throughout several boroughs of the city.

With the aim of spending energy where it matters, the firm has put a good deal of time into public schools in order to provide quality for those who can benefit the most.

The Primary School library incorporates an activity strip that separates the integrated wall shelving from the classroom and provides a continuous area for the kids to sit and play, as well as an area for the librarian.

The classroom is organized with modular light tables and ergonomic seating, which can be adjusted to fit multiple configurations for parents' or teachers meetings. (Pagnamenta)

### **Gibran Library, Byblos – Lebanon 2008**

#### **Literature:**

Abitare, June 2005

The University desires to offer library spaces where the electronic access is ubiquitous and where books have a strong presence. In addition to the 650 seats and open air reading spaces, the new library complex will include video conferencing facilities, an auditorium and a museum. The library will be built in a limestone hill above the ancient town of Byblos, overlooking the Mediterranean. The main elements will be layered deep into the hillside: the book depository at the back, then the reading spaces and the lower components, the annex, the museum and the information technology areas, resting at the foot of the hill generating a layered courtyard. A dynamic filter expressed by a series of skewed columns, symbolizing the rhythm of Khalil Gibran's verses in the Prophet, ties the project components together. The exterior skin is composed of modular horizontal limestone layers alternatively forming a flat opaque surface or opening up to allow filtered daylight inside. The limestone hills into which the library is placed are in dialogue with the building materials. The lower floors along the courtyard are glazed, establishing a direct relationship between the library and the whole campus. Passive design features rooted deep in the local culture and derived from the typology of the region were used throughout the project. The traditional library as the permanent symbol of the values of civilization and the laboratory library where the users connect anywhere in the world through electronic impulses coexist and interact side by side. The Byblos Gibran Library for the Lebanese American University is currently under construction with an anticipated completion date of 2008. The architect of record is ACE Engineering.

### **Nassar Library, Beirut – Lebanon 2006**

The 70,000 s.f. library serves a projected enrollment of 4,000 students and accommodates a collection of over 250,000 volumes. Additionally the library provides 480 study spaces, periodical and audiovisual collections, lounge areas, offices, classrooms, electronic access at each seat, and four levels of compact shelving. The interior architecture was developed to optimize natural light, local materials and user needs. The low e-glass, the automatic interior shades, provide passive strategies to protect the reading rooms, facing a northern exposure, from indirect glare. The Nassar Library for the Lebanese American University was finished in Summer 2006. The opening ceremony took place on November 11, 2006. The architect of record is SKP Architects and Planners. #### **Awards/Certifications:**

AIA San Francisco Chapter 2012 Honor Award for Historic Preservation

AIA California Council 2012 Honor Award for Architecture

LEED Gold – CI

David K. | December 7, 2012

As part of the San Francisco Public Library's Branch Library Improvement Program, Tom Eliot Fisch and Paulett Taggart Architects renovated the historic Golden Gate Valley Branch Library in the city's Cow Hollow neighborhood. Completed in 1918 as a Carnegie library, the two-level brick and terra cotta Beaux-Arts structure was designed by Ernest Coxhead in the shape of a basilica. The project had to meet the Secretary of the Interior's Standards for Rehabilitation & Guidelines for Rehabilitating Historic Buildings and comply with the Americans with Disabilities Act while targeting Silver certification or greater under the LEED for Commercial Interiors rating system. The project has exceeded its sustainability goal by achieving LEED Gold certification.

The most significant challenge was to provide access for people with disabilities while maintaining the 7,400-square-foot structure's historic integrity. Rather than add a long ramp to the main entrance, which would distract from the original facade, the design team created a new, small modern addition in the existing courtyard toward the building's back corner. An aluminum and glass box, this addition provides elevator access to both levels of the library and clearly reads as contemporary while complementing the historic

architecture. The existing building's southwest corner is showcased as an interior element within the two-story addition, celebrating the combination of old and new.

To reduce solar heat gain, windows on the south-facing facade to the rear were replaced with high-performance glazing, while historic windows on the other three sides were restored and cleaned. Solar panels provide about 25 percent of the building's power. A new high-efficiency mechanical system ties into the existing radiant system. Other resource-saving elements include specification of energy-efficient lighting and low-flow plumbing fixtures, restoration of original furniture, and new linoleum flooring. Previously, the main level reading room was lit with harsh fluorescents. New pendants provide ambient lighting, while a new metal valance along the perimeter conceals a strip fluorescent that washes the walls with light. Daylight sensors dim these fixtures depending on the amount of natural light available. New lighting also brightens the formerly dark basement program room, which was leveled to eliminate a flight of stairs that broke up the space. The renovation of the basement also added a sink and ADA-accessible bathrooms while increasing the amount of storage space.

Staff support areas at the back of the building were reorganized to make them more functional. Adding a staircase at the new entry allowed for the removal of an existing stair to make more room for the support areas and provide an office for the branch manager. The project also involved seismic strengthening and creation of a new designated teen area separate from the main reading room.

#### **Collin College Campus Central Park Library, McKinney, TX – USA 2009**

65,000 sqf., Cost per sqf. \$223.89

In June 2009, Collin College opened the Central Park Library in McKinney, Texas. The design successfully combines timeless classical architecture with 21st-century innovation, creating a true learning-centered environment. The library presents itself as a showcase of Jeffersonian architecture; a grand entry leads to a rotunda bathed in sunlight, with arched windows, tall columns, marble parquet flooring and a stone staircase that leads to the second-floor gallery. The challenge to create an accommodating atmosphere of open communication for students and professors was met by designing a learning community within a teaching library. The flexible plan has lecture rooms, laboratories and faculty offices on the second floor encircling a grand reading room below. Students have a variety of research settings: group and private study areas, interspersed lounge seating or in the library's cafe—all of which contain the latest computer technology. The interior finishes include wood paneling, stainless steel, marble and an expansive wall of windows framing cottonwood trees. Completed in 28 months and while classes were in session, the library incorporates a centralized chilled-water system, automated building controls, energy-efficient lighting and HVAC equipment throughout. The result is a modern architectural environment that serves as a catalyst for student achievement.

### **Libraries:**

#### **Carol Grotnes Belk Library and Information Commons, Appalachian State University, Elon, NC – USA 2005**

-The Carol G. Belk Library is a technology-rich "information center" nationally recognized for its green building design. Pease designed the library in association with Shepley Bulfinch Richardson and Abbott. The 231,000 SF library incorporates state-of-the-art computer and telecommunications technology, offering a full range of traditional and electronic information resources. Lounge seating, cyber café, 24-hour study facility, numerous group study rooms, electronic classrooms and a multimedia authoring center create a warm, inviting environment that offers a wealth of resources to the university and community. An environmentally-controlled Special Collections Reading Room houses the renowned W.L. Eury Appalachian Collection and other rare books and materials. A cold storage room preserves photos and film. Sustainable design features include an energy-efficient HVAC system comprised of multiple built-up air handlers with VFD fan operation; direct digital temperature, humidity, building pressure and carbon dioxide/IAQ controls; OA energy recovery units; variable speed centrifugal chiller; cooling tower and waterside economizer. An 115,060 GSF parking deck serves the Belk Library. The 5-level, 300-car deck is a post-tensioned, poured-in-place concrete structure with a foundation on caissons. (Pease)

BOONE – Carol Grotnes Belk Library and Information Commons at Appalachian State University has been recognized for its green architectural design by two leading library magazines. The April 2008 issue of American Libraries included Belk Library among 27 facilities spotlighted in its "2008 Library Design Showcase." The magazine featured libraries that "demonstrate a commitment to making a beautiful space that serves both the community and the planet." American Libraries is the magazine of the American Library Association. Belk Library was also included in the December 2007 issue of Library Journal, which highlighted 21 academic buildings and 168 public library projects in an article titled "Going, Going Green." Library Journal described Belk Library as "a 21st-century facility that combines the best of technology with the expertise to retrieve and validate its information. The central atrium is the focal point of the new four-story structure, built with environmental sensibility and sustainability in mind."

The green features of Belk Library include an emphasis on natural lighting as well as advanced mechanical equipment for energy savings, cork flooring, energy-efficient elevator system, electronic sensor faucets and toilets, computer-controlled shades and recycled/recyclable carpeting. "We are proud of this national recognition of Appalachian's bright and spacious Carol Grotnes Belk Library and Information Commons, and we are thrilled that students are using the facility's great study spaces, technology and information resources in greater and greater numbers each year," said University Librarian Mary Reichel. "Library personnel were proud to work with the university's Office of Design and Construction, which led the way in making the new library as environmentally sound as possible. We know students appreciate this guardianship of the environment as well," she said. Belk Library and Information Commons opened in summer 2005. It has 221,000 square feet, making it about 50 percent larger than the 1960s structure it replaced. The \$37.5 million building was designed by Pease Associates Inc. and Shepley Bulfinch Richardson & Abbott. The library's construction was funded through the 2000 bond referendum in which North Carolina voters approved \$3.1 billion for capital construction and renovation on UNC campuses and at the state's community colleges.

## **Pei Cobb Freed & Partners, New York – USA**

<http://www.pcfandp.com>

### **Libraries:**

#### **Edmund D. Bossone Research Enterprise Center, Drexel University, Philadelphia, PA – USA 2005**

80,000 sqf. new construction, 70,000 sqf. renovation

The Edmund D. Bossone Research Enterprise Center is designed to create a powerful architectural statement reflecting Drexel University's presence in the vanguard of technology research and education. The program combines 80,000 s/f of new construction with 70,000 s/f of renovated space within the adjacent Commonwealth Hall, creating an integrated facility for multidisciplinary research. The new facility serves to achieve synergy among researchers, the student body, and the surrounding scientific and corporate communities. The new facility, situated at the gateway to the Drexel campus, was designed to coordinate with campus master planning efforts to strengthen the reading of Drexel as an urban campus, combining strong street frontage with landscaped mid-block gathering spaces for visitors, students, and staff. The main entry to the building off Market Street is provided by a seven-story, north-facing public atrium, reinforcing the definition of the street while beckoning visitors as a grand entrance to the new facility. Major programmatic components at the ground level include a 280-seat lecture hall and reception area, student cafe, exhibition lab, and electron microscope suite. Penetrating the atrium at the upper three levels from the south, the primary body of the new lab program is oriented perpendicular to the diagonal axis of historic Lancaster Avenue and set back from the Peck Alumni Center, which is located on the adjacent site to the west and originally designed as a bank by Frank Furness. The resulting exterior space bordered by the public atrium, lab wing, and Peck Alumni Center provides an upper-level outdoor terrace overlooking the main entry atrium to the north and a landscaped garden to the south. Internally, the new and renovated laboratories at the upper levels provides flexible, state-of-the-art lab space organized around a three-story skylit private atrium, creating a common gathering space for the building's users and focusing the horizontal and vertical circulation in a manner that facilitates a sense of community within the building and informal interaction among faculty, students, and staff. Laboratory complex with "wet" and "dry" labs for multidisciplinary research, as well as computer-based telemetry stations for data gathering and analysis; 7-story public atrium; 3-story private atrium; 280-seat lecture hall; student cafe; electron microscope suite; outdoor terrace. (Pei)

#### **Center for Government and International Studies, Harvard University, Cambridge, MA – USA 1998-2005**

268,000 sqf.

The Center for Government and International Studies houses the Department of Government and various research centers affiliated with the Faculty of Arts and Sciences at Harvard University. The Center includes new and existing structures in an integrated complex accommodating a range of academic and administrative uses, including faculty offices, classrooms, library and computer facilities, the Harvard-MIT Data Center, and a café. The new complex unites members of the Government Department in a single location alongside the thriving research centers. It promotes both formal and informal interactions among faculty from different departments and disciplines and with visiting scholars from other universities in the United States and abroad. It provides space for graduate students in close proximity to their faculty advisers and to students in related fields, thus deepening the mentoring relationship so essential to graduate education and opening opportunities for first- and second-year graduate students to learn from and interact with their more advanced colleagues. And, by including undergraduate instruction among the functions of the new complex, it will provide Harvard College students with the opportunity to learn in a modern facility while increasing their opportunities for everyday contact with faculty, tutors, and teaching fellows. Knafel Building: 5-story atrium, Library, Data Center, interior Wintergarden, Café, faculty and graduate student offices, seminar rooms, interconnection to the Graduate School of Design (Gund Hall), exterior Garden, South Building: 5-story atrium, 149-seat Lecture Hall, 60-seat Case Study room, seminar rooms, faculty and graduate student offices, exterior sunken garden. (Pei)

#### **San Francisco Main Public Library, CA – USA 1990-1996**

Pei Cobb Freed with SMWM

### **Awards:**

State-of-the-Art public library

Lead Designer: Lames Ingo Freed

Building Stone Institute: Annual Tucker Award 1998

AIA / ALA Library Building Award. Award of Excellence for Library Architecture 1997

18<sup>th</sup> Annual Interiors Award: Best Library 1996

77,000 sqf.

This public library was designed to complete San Francisco's Civic Center, perhaps the finest example of the City Beautiful movement in America. It echoes with a modernist attitude the materials and massing of neighboring Beaux-Arts institutions, fronting on the Civic Center with two symmetrical façades. The library's two other facades make a contemporary response to the adjacent commercial district. The design is organized to permit passage into and through the building and out to the opposite side of the full-block site. The Library is thus both a destination and a link connecting the modern city with its cultural core, a bridge between the people of San Francisco and the institutions that serve and enrich them. Internal organization centers around a monumental open staircase and a five-story atrium, 60 feet in diameter, that provides a luminous hub of orientation. A glass-enclosed Periodicals Reading Room, suspended above, further helps to draw light into the core of the 300' x 200' building. Bridges link the different precincts and reinforce the metaphor of connection in a library that provides access to both advanced online information systems and more than three million books on open/closed stacks. The New Main attempts to integrate the different people, interests, and precincts of the city, both traditionally and electronically, physically and symbolically, now and well into the future. 32 miles open / closed books stacks; 300 terminals, 500 on-line ports; 80' high public atrium (3,700 s/f circular component only); Monumental Stair; 5,700 s/f Periodicals Reading Room; Special Collections (8 rooms @ 1,100 s/f each), 3,550 s/f auditorium (620 seats), public meeting rooms, exhibition spaces, roof garden, café, bookstore, commissioned art (Alice Aycock Stair, Nayland Blake Installation, Ann Hamilton and Ann Chamberlain Installation, Charley Brown and Mark Evans ceiling mural)

#### **John E. Anderson Graduate School of Management at UCLA (University of California), Library, Los Angeles, CA – USA 1987 - 1995**

### **Awards:**

AIA:New York State Design Awards: Honor Award 1998

AIA-Brick Institute of America: Brick in Architecture Award 1997

270,000 sqf.

GSM is the second largest building at UCLA on one of its most important sites. The challenge was to integrate its 270,000 s/f mass within a complex campus setting so as to benefit not only the management school but also the university as a whole. The building's language, materials and modest scale are all informed by the nearby historic campus core. A bucolic creek, a multilevel garage, and a key campus walkway otherwise border the site. In solution, AGSM was designed not as a single building, but as a campus within a campus, permeable and fragmented in response to both the varied site and to a multifaceted client institution with diverse programmatic requirements. The five-story complex consists of seven components, each distinct but linked on several levels so that it functions internally as a whole. At center is an outdoor plaza that invites personal interaction and community as it emphasizes circulation. AGSM was designed as a pivotal campus crossroads. It maximizes its sloped site with access to the outdoors on four of its five levels and provides a much-needed link between UCLA's upper and lower compounds. It acknowledges its privileged site by providing new and very useful pedestrian paths, by augmenting UCLA's memorable and attractive spaces, and by extending the rich architectural traditions of the University's academic core.

154,000 s/f MBA Halls (3); 5,400 s/f Convocation Hall (420-seats); 50,700 s/f library; 31,350 s/f Executive Education Center; 35,800 s/f Commons Building; 3 pedestrian bridges; Anderson Court 48'-5" radius; underground parking for 80 cars below courtyard. (Pei) [John Fitzgerald Kennedy Library, Boston, MA – USA 1979 / 1991](#)

#### **Awards:**

**Adaptive Environment Center: The Best of Accessible Boston: Commendation Award 1986**  
**Pressed Concrete Institute Award 1980**

The Kennedy Library was erected on a landfill site overlooking Boston, Dorchester Bay, and the ocean beyond. To overcome existing conditions, the site was raised 15 feet and planted with beach grasses to recall Kennedy's love of the sea. Within a limited space and budget, the design had to fulfill a complex-mixed use program while symbolically remembering the late young president in terms both contemporary and timeless. A split-level design was developed, organizing museum spaces in a layer below ground, with key emotive elements dramatically isolated above. The solution consists of a triangular 10-story tower housing archival, educational and administrative functions, a two-story base containing exhibition space and two 300-seat theaters, and a 110-foot high memorial pavilion, which gives coherence and focus to the whole. After viewing a film about Kennedy's life, visitors descend into linked exhibition areas highlighting the president's family and administration. From this darkened setting they emerge into the sun-filled, silent void of the space-framed glass pavilion. Except for an enormous American flag suspended above, the space is empty to allow the viewer to contemplate what he has seen and experienced against a great panorama of sky, land and open sea. In 1991 a 21,000 s/f multifunction waterfront addition was constructed to support the library's active educational and cultural programs. (Pei)

#### [China Europa International Business School, Shanghai – China Phase I 1999 / Phase II 2004](#)

34,000 sqf.

The four-hectare CEIBS Campus provides international-standard teaching, research and residential facilities for the school's MBA, EMBA and Executive Development programs. Acknowledging initial funding limits and the likelihood of future growth, the design permits phased construction, without disruption of school activities. Four key elements are involved: 1) a modular organizational grid, 2) a large L-shaped central garden enclosed by a six-meter-high arcaded walkway, 3) an adjacent zone for school buildings, each linked by the arcaded walkway, and 4) a perimeter zone providing vehicular access and parking on all sides of the campus. The buildings are arrayed around the garden for functional adjacency and to foster lively interaction. Their uniform 15-meter height, together with their shared materials and details, collectively creates a memorable campus identity. The library alone asserts a strong figural presence, affirming its role as the school's symbolic heart. The most important principle governing the design is the primacy of open space over buildings. The extensive garden landscape and its enclosing arcade are intended to affirm those values that underlie the CEIBS educational mission: communication, teamwork, social and ecological responsibility, and harmony born of mutual respect in the increasingly fruitful partnership between China and the West. (Pei)

In León, Mexico, a white stone-and-glass-clad structure expresses monumental solidity while maintaining indoor-outdoor connectivity. A three-story pergola of white-painted steel covers a plaza and rooftop terrace, adding a rhythmic lightness to the composition. This is the new library designed by Pei Partnership Architects for the state of Guanajuato.

The building was recognized for outstanding library design by the American Institute of Architects and the American Library Association in the 2009 AIA/ALA Library Building Awards. From a small-town public library in Arkansas to an immense cultural complex in China, the award-winning eight libraries address many similar challenges, balancing transparency and modern library functional needs with a strong institutional presence.

#### **State Library in Mexico**

The Guanajuato State Library Wigberto Jiménez Moreno is the first building constructed toward Pei Partnership's master plan for the encompassing 9.6-hectare (24-acre) cultural forum.

Two primary stone-clad volumes connected by a two-story glass gallery compose the library, totaling 6,750 square meters (72,700 square feet). Providing access and visual connection, the gallery contains a grand staircase for vertical circulation, and connects to the central atrium in the taller structure. The glazing offers views of trees and gardens to those inside, and reveals the activity inside the library to passersby.

#### [Guanajuato State Library Wigberto Jiménez Moreno, León – Mexico 2006](#)

The 6,750-sq. meter Guanajuato State Library is the first building of the Centro Cultural Guanajuato masterplanned by Pei Partnership Architects in 2003. The library consists primarily of two volumes interconnected by means of a 2-level glass gallery. The main volume is composed of three levels and the second volume of two levels. A large terrace occupies the third level of the lower volume. This terrace and the elevated plaza of the library are covered by a large, 3-story steel pergola painted white. On the lower level of the library, the gallery serves as an access and distribution vestibule which leads directly to a central atrium covered by a skylight, which connects the three levels of the principal volume. The vertical circulation of the building is assured primarily by means of a monumental staircase located on the north façade of the access gallery whose own glass space offers generous views of the gardens to those inside and the activity and animation within the library. Three materials dominate the exterior of the building: white cantera, a Mexican stone which covers the outside walls; the glass of the gallery and the main staircase and the steel painted white of the pergolas. The Guanajuato State Library was dedicated in September 2006. The project which was designed under strict cost constraints, was selected in March 2009 as one of eight recipients of the 2009 AIA/ALA Library Building Award. Biennially, representatives from the American Institute of Architects and the American Library Association (ALA) gather to celebrate the finest examples of library design by architects licensed in the US. (Pei)

## **Pelli Clarke Pelli Architects, New Haven, CT – USA**

<http://www.pcparch.com>

### **Minneapolis Central Library, Minneapolis, MN – USA 2006**

353,000 square feet / 33,000 square meters

The Minneapolis Central Library is a vital civic and cultural center for downtown Minneapolis. The highly sustainable design — the result of a collaborative, public process — reinvigorates the idea of the grand urban library, making it accessible and appealing to new generations.

The library is located between two of the city's most active thoroughfares: Nicollet Mall, the central shopping and business district, and Hennepin Avenue, the city's main street for the performing arts. Two street grids meet at the site, inspiring the building's design: two rectangular volumes, one aligned with each grid. The two volumes come together at the Commons, an enclosed public space that joins the two avenues.

The Commons is a six-story glass atrium that fills the building with light and activity. This space is topped by a metal "wing" that appears to hover overhead, extending beyond the building at both ends. Visible from afar, the wing is a new landmark for downtown Minneapolis. The design also accommodates the addition of a planetarium dome, which would project from the corner of the roof. Architecturally, the two halves of the building are reminiscent of warehouse lofts, with large open floors structured by a grid of concrete columns. A strip of ochre Minnesota limestone outlines the edges of the floor plates on the building's exterior and glass walls stretch from floor to ceiling. Windows vary in scale, depth and transparency and include surface patterns digitally translated from photographs of four Minnesota landscapes: water ripples, birch trees, snowy branches, and prairie grasses. The result is an active, lively composition.

The library's design includes many sustainable elements. The roof of the building is planted with drought-resistant ground cover, creating an 18,500-square-foot roof garden that slows storm water runoff and reduces the urban heat island effect. An under-floor ventilation system reduces cooling costs by 20 percent, and the combination of copious daylight and energy-efficient light fixtures contributes to a building that exceeds Minnesota's energy code requirements by 27 percent. Finally, materials with high recycled content and low volatile organic compounds were specified, and 96 percent of the demolition and construction waste was recycled. (Pelli)

### **Sarah M. and Charles E. Seay Building, University of Texas, Austin, Texas – USA 2002**

175,000 square feet / 16,000 square meters, 2002

The Seay Building is the first project completed under the Pelli Clarke Pelli master plan for the University of Texas at Austin. The building extends the Spanish Mediterranean vocabulary of Paul Cret's original master plan in a new structure that holds street edges and encloses a landscaped courtyard.

The building, which houses the Department of Psychology and Human Ecology's Division of Human Development and Family Sciences, contains wet laboratories, a library, computer classrooms, student counseling and observation rooms, acoustic isolation chambers, faculty and administrative offices and a preschool.

Following the natural slope of the site, the building steps down from a five-story lab wing on the west, around the landscaped courtyard before ending on the west side in a three-story wing scaled for the preschool. Five main entrances with appropriate security are located around the building perimeter, while the building's formal entry on the southeast corner is an open double-height space with a grand stair that brings visitors up to the reception area. From this corner on the fourth floor, the library affords commanding views of the campus and the state Capitol.

The building's materials and details are designed as modern interpretations of the original Cass Gilbert and Paul Cret buildings that form the heart of the campus. A solid stone base, Texas brick body, and glassy top express the tripartite composition of the older buildings. The painted wood soffits found on the roof overhangs of many UT buildings are recreated on the Seay Building with brightly colored enameled metal panels that will not fade in the Texas sun.

The courtyard, clearly defined by the rectangular bars of the building, imparts a sense of life and energy with the swooping curves of its plantings and walkways. The focus of the courtyard, which has a patio on the south side, is a center seating area used as an outdoor classroom. A modest fountain in the center, fed by a rill of water that flows alongside the walkway, creates a cool oasis. (Pelli)

### **Greenwich Library Addition and Renovation, Greenwich, CT – USA 1999**

100,000 square feet / 9,000 square meters, 1999

This addition to the Greenwich Library joins the original 1931 building and a 1960 addition. The design is respectful of the new building's context, of the urban qualities of the surroundings, and of the civic nature of the public library. With two large curved areas of glass, each one overlooking a small open courtyard, the building is transparent, friendly and welcoming.

Although the site is at the edge of the retail center of Greenwich, almost all patrons of the library arrive by car, and many are dropped off and picked up. Such drop-offs and pick-ups are not allowed on the street because of its heavy traffic. This dictated that the main entrance of the library be towards its parking lot. A street entrance for pedestrians is on the original building, and the Library presents a very urban façade to the street.

Upon entering, patrons are greeted by a Welcome Center and continue along a circulation path called Main Street, which is defined by a double row of columns visible from the entrance. The east end of Main Street ends in a new reading area located along a large, curved, glass wall facing an open garden. Patrons can ascend to the second level on elevators or via a dramatic metal and wood curved stair suspended from the ceiling. A counter curved, two-story glass wall serves as a backdrop for the stair. The glass wall views onto a courtyard, open to the sidewalk, where an existing large oak tree has been preserved.

The New Book area is in a two-story public gathering space, while another public gathering space on the second level offers views of the expanded gallery through the glass entry wall. The Children's Room is a comfortable, friendly place with child-sized furniture in the form of train cars, while the Program Room features a fiber optic ceiling display of a starry sky.

At the eastern end of the building, by the main entry driveway, the building includes a new reading room in a sculptural form that combines the geometries of a triangle and a circle. This element marks the main auto entrance and announces the special character of the new Greenwich Library. (Pelli)

### **Physics and Astronomy Building, University of Washington, Seattle, WA – USA 1994**

265,000 square feet / 25,000 square meters, 1994

A major research and instructional building on the University of Washington campus, the Physics and Astronomy Building includes laboratories, faculty and administrative offices, classrooms, computer facilities, four auditoria, a planetarium and a library. The building consists of a six-story tower, a four-story horizontal building, and a two-story structure, all resting on a one-story basement

platform that ties the components together internally. A one-acre courtyard planted with large trees is the primary outdoor public space for this part of the campus.

The building forms and details relate to campus building traditions. The exterior surfaces are textured multi-colored brick set in an English cross bond pattern, with cast stone accents and copper panels. The planetarium and the largest auditorium are emphasized with argyle patterns like those on existing campus buildings.

An exterior colonnade reinforces the tall, linear auditoria lobby space. An adjacent circular stair to astronomy classrooms and the planetarium is contained in a tall glass structure, creating a focus for the lobby as well as a location for a Foucault pendulum. Physics and astronomy demonstrations are incorporated throughout the building: the Foucault pendulum, a sundial, crystal formation and atomic grid patterns in patterned glass and tile, and carvings of physics and astronomy formulae in the cast stone piers.

There are gathering spaces throughout the building, particularly at important entrances. The two-story building, which houses the most used instructional spaces, includes a lobby used as a waiting space for students and for departmental gatherings and receptions. Smaller spaces are used for informal meetings. Faculty offices are grouped in clusters around semi-open discussion areas, which have become essential places for the exchange of ideas among faculty.

The building is designed to easily incorporate future changes. Where appropriate, labs are in a linear layout to provide flexibility for function and size. The mechanical, electrical and other support systems of the building are also designed to allow easy conversion of spaces should functional changes occur. In addition, the basement level contains 15,000 square feet of expansion shell space.

In 1997, the Physics and Astronomy Building received a Brick in Architecture Design Award from the American Institute of Architects. (Pelli)

### **Frances Lehman Loeb Art Center, Vassar College, Poughkeepsie, NY – USA 1993**

69,000 square feet / 6,000 square meters, 1993

The Frances Lehman Loeb Art Center combines the academic requirements of teaching art history with the exhibition and support requirements of a major regional museum. The new construction contains exhibition spaces, curatorial and administrative offices, storage and conservation spaces. The renovated art history department includes classrooms, offices, slide and photography study rooms and a library.

The Center responds to its position on campus. It establishes a presence at the main campus entrance and along Raymond Avenue, the most public edge of the campus. Its connection to Taylor Van Ingen Hall, the existing art history department and former art gallery, unifies the complex and establishes a dialogue between the two buildings.

The entrance to the gallery is a hexagonal glass pavilion. As a symbol of the Art Center, it connects to the art department by a colonnade, reiterating the scale of Taylor Van Ingen Hall and creating a new forecourt for the complex. The gallery is situated between Taylor Van Ingen and the Vassar Chapel on Raymond Avenue. The gallery is connected to Taylor Van Ingen by a glass-walled passageway, creating a procession to the gallery and another small courtyard. The gallery wing entrance is a vertical space with light emanating from high dormer windows. This space acts as an entry hall to the prints and drawings gallery, the permanent gallery, and the temporary exhibitions area.

The exhibition spaces are designed for maximum flexibility on a near-cubic module 20 feet on each side with 4.5-meter-high (15 feet) walls converging at six meters (20 feet) to clerestory windows. The clerestory brings down controlled natural light into the modules, which can be joined and recombined freely for changing exhibitions. Limestone walls, infilled with rust-colored brick, complement the fieldstone framed with limestone walls of the existing building. While Taylor Van Ingen repeats medieval forms, the new structure, which is of similar proportion, materials and color, is expressed in a crisper and more abstract manner.

Together with the renovated and enlarged home of the Art Department, the Frances Lehman Loeb Art Center contributes to the high profile of the visual arts on the Vassar campus.

In 1996, the Frances Lehman Loeb Art Center received an Honor Award from the AIA/Connecticut and the Taylor Hall received a Preservation Award from the Preservation League of New York State. In 1994, the Center received an Honor Award from the AIA Westchester/Mid-Hudson Chapter and a Certificate of Merit from the State of New York Executive Chamber. (Pelli)

### **Yale-NUS (National University Singapore) College, Singapore – Singapore 2015**

667,000 square feet / 62,000 square meters, 2015

Yale-NUS College will be first liberal arts college in Singapore, offering four-year undergraduate degrees on a campus that integrates learning and living. This new institution, jointly created by Yale University and the National University of Singapore, will enroll up to 1,000 students. Adjacent to NUS's University Town, the Yale-NUS campus comprises a central campus green flanked by academic and administrative buildings as well as three residential colleges, each arranged around its own courtyard.

Balancing the traditions of Yale with the cultures of Southeast Asia, the campus is designed in a contemporary architectural language influenced by the climate of Singapore. Sun- and rain-screened colonnades and roofs with generous eaves are used throughout the campus. Five-foot ways, the shaded walkways found alongside traditional Singapore shop houses, further tie the buildings together. For clear and inviting processional entrances, the signature gates of the Yale campus are reinterpreted with metalwork patterns inspired by Southeast Asian textiles. At the main entrance, glass-enclosed stairwells and a colonnade are topped by an inward-sloping roof of grand scale. At the center of the roof is a square oculus, which sends a dramatic cascade of rainwater into a large circular reflecting pool below.

The heart of the campus is a lush garden and arboretum with six heritage trees and an eco-pond that will capture and filter rainwater. At opposite sides of the central green space will be academic and administrative buildings to include a library, performance complex, science labs and sports center. The Learning Commons, which contains the library and a multi-media center, will be set on a slope to symbolize the pinnacle of knowledge. Outside the Commons is the Agora, an open-air, sheltered gathering place.

The residential colleges will be central to campus life. Students will expand their social and leadership skills while enjoying the support of "nested academic communities." These small-scale communities are arranged vertically in residential towers, which contain both student suites and faculty apartments. Floors will be grouped into neighborhoods, each with its own skygarden, a landscaped outdoor space for high-rise buildings that was pioneered in Singapore. In addition to residential towers, the colleges will have their own dining halls and butteries, the informal student-run eateries that are a Yale tradition. As an extension of the academic environment, the colleges will also have classrooms, seminar rooms, faculty offices, and study spaces. To reinforce the distinct identities of the residential colleges, the design of the buildings within each will vary. The campus is being designed to achieve the highest rating under the Building and Construction Authority's Green Mark, Singapore's benchmark for sustainable design. In addition to visible sustainable design strategies such as the eco-pond and the frequent use of natural ventilation, the campus will integrate advanced building systems for energy efficiency. (Pelli)

### **Kuravoshi Library, Kuravoshi – Japan 2003**

Collaboration with Apicella + Bunton Architects, New Haven CT (<http://www.apicellabunton.com>)

43,000 square feet / 4,000 square meters 2001

The Kurayoshi Library is located in the heart of Tottori Prefecture, adjacent to the new Chubu Cultural Center and Museum also designed by Pelli Clarke Pelli Architects. Comprised of two primary sections – the main City library and a disaster communications center – the facility includes spaces for computer training, group seminars and a 180-seat auditorium.

The Library is accessed through a two-story glazed lobby, which will display exhibits of community arts, books and information. A sweeping glass wall in the reading room and open stack area faces a landscaped plaza that separates the Library from the Cultural Center. A 14-meter (46-foot) high elliptical atrium space is located above the reference desk at the center of the building with a ribbon window stretching from end to end along the top of its northern edge. Three custom designed skylights penetrate the roof, creating patterns of light and shadow on the atrium walls and Library floor. A series of custom-shaped windows articulate the south wall of the atrium and allow views from the second floor to the Library below. (Pelli)

## **Perkins Eastman, New York – USA**

<http://www.perkinseastman.com>

### **University of Arkansas: Donald W. Reynolds Center of Aging, Little Rock, AR – USA 2008**

The Reynolds Center on Aging is an interdisciplinary clinical and research center for gerontology medicine, science, and education. Intended to accelerate and disseminate patient-oriented research, the Center on Aging will pioneer integrated therapeutics in the care of the aging. The Center was conceived as the first functioning model for translational geriatric medicine, in which the powerful new tools of genomic and structural biology are directly applied to patient outcomes in the clinic setting, and at the bedside. Within this single new building, the Medical Center provides a gerontology primary care and physical rehabilitation clinic; two floors of clinical and basic research laboratories; and a library, classrooms, and lecture hall, all equipped for video imaging and distance learning. Throughout the Center, the University committed resources for a sophisticated telecommunications infrastructure to connect students and faculty to colleagues and clinicians, not only via the Internet, but also, via video connection in live time, to other sites in the Medical Center's network. (Perkins)

### **C.C.Young: The Point, Dallas, TX – USA 2007**

The Point center for arts and education at C.C. Young offers a fresh concept for a senior activity center: a standalone facility at a continuing care retirement community (CCRC) that attracts both residents and the surrounding intergenerational community with a distinct identity and innovative programming. The 20,000 sf building was designed to create an environment "where the spirit is ageless," a key focus of the client. The facility serves this mission through a strong emphasis on the arts. Spaces within the center correspond to one of three specific focal points—mind, body, and spirit—and play host to highly interactive, creativity-focused programs that welcome people of all ages. To enrich the mind the library offers extensive resources on healthy aging, multipurpose classrooms support lifelong learning, and a computer lab plays host to training on next-generation technologies. The body is nourished at a café offering healthy choices and strengthened at a fitness center that embraces preventative wellness. To engage the spirit, a performance hall presents live entertainment, art studios support the expression of creativity, and a meditation room and sculpture garden provide sanctuaries for reflection. (Perkins)

### **University of Connecticut (UNCONN), Stamford Branch Campus, Library, Stamford, CT – USA 2005**

Perkins Eastman designed a new branch campus for this state university in downtown Stamford. The design team master planned a new university precinct in the downtown area, as well as the \$58M campus building. This first phase included renovation of a vacated department store for use as the major academic building, rehabilitation of an existing parking garage, and a new urban park. The building program consists of traditional instruction spaces including auditoriums, classrooms, teaching laboratories, art studios and computer laboratories with ancillary spaces such as faculty and administrative offices, research laboratories, library, lounges, dining and exercise rooms, conference center, and support spaces. The building was planned as the centerpiece of a growing campus located next to the Rippowam River and marks the northwest gateway to Stamford's Central Business District. A three-story academic concourse which was added to the south street front of the existing building. Forming the primary entry to the university, this concourse is clad in a transparent cable-truss curtain wall. The program for the concourse includes the more public functions of the campus: the library entrance with overhead reading room, food facilities, bookstore, art gallery, entrance to the conference center, open access computer labs, student service functions, and the main security and information desk (Perkins)

### **Fairfield Public Schools: Roger Ludlowe Middle School (Library), Fairfield, CT – USA 1998**

After winning a competition, Perkins Eastman designed a new 200,000 gsf middle school for 875 students in Fairfield, Connecticut. Its features include a full-size gymnasium with seating for 1,000, an auxiliary half-court gymnasium, a library/media center, a 650-seat auditorium, a cafeteria, administrative offices and support spaces. The new three-story middle school shares the site with a newly renovated high school. The site development includes athletic playing fields, vehicular and service parking, and an educational wetlands/ecosystem area. To take full advantage of the sloping site, the gym and auditorium are at the level of the playing fields, the classrooms are on the top floors, and all common areas surround a mid-level patio. The siting of the building maximizes the benefit of the landscape features and creates a strong relationship with the adjacent high school. This new school is part of a three-school project Perkins Eastman designed for Fairfield. The other projects include renovations of the existing building on site to accommodate 1,400 high school students, and, on a separate site in the town, renovations to a second building to house an additional 1,400 high school students. (Perkins)

### **Chongqing Library, Chongqing – China 2007**

€ 38,000,000

The 50,000 sm (540,000 sf) Chongqing Library is an important educational, cultural, and social center where people will meet to study, access knowledge, and exchange ideas. The building's design is modern and evocative of the traditional form of the Chinese courtyard. Three main programmatic elements—the open public access zone, secure public zone, and the private secure zone—are built around a center courtyard garden that acts as an experiential space or a scenic opportunity from the adjacent reading rooms and café. The design uses glass and stone to articulate public and private areas of the library. The public areas facing Feng Tian Avenue are sheathed in glass to connote transparency and visibility for users and pedestrians. It also provides a visual transition from the public plaza to the public areas of the library. The book stacks and service areas to the west are clad in stone to represent security and the solidity of the library's collection. The stone pattern also reflects the design of older buildings in Chongqing, linking the library to the city's architectural heritage as it looks to the future. (Perkins)

### **Hopkins – Nanjing University Center for Chinese and American Studies, Samuel Pollard Building, Nanjing – China 2005**

Johns Hopkins University and Nanjing University selected Perkins Eastman to design a new academic building on the

campus of Nanjing University. The new Samuel Pollard Building expands the unique academic program of the Hopkins-Nanjing Center for Chinese and American Studies, and serves as a signature landmark of the area that establishes a precedent of construction quality for subsequent build-out of the Nanda campus. The new ten-story, 10,000 sm (108,000 sf) academic building, located next to a building currently housing the program, comprises academic space including classrooms, lecture halls, faculty offices, student lounges, resource areas, and a library. Although the new building represents an aesthetic departure from the existing campus, a portion of the building will take on architectural cues from the old prominent provincial government buildings on Beijing Road—marking the transition between old and new. A glass curtain wall juxtaposed with solid wall space sets up a visual dialogue with the surrounding campus. The glass corner of the building overlooking Beijing road features an uninterrupted expanse of glass that blurs the point at which the building ends and the sky begins, making the building seem taller and lighter than its actual dimensions. (Perkins)

<http://www.perkinswill.com>

### **Libraries:**

#### **Gateway Community College, New Campus, New Haven, CT – USA 2012**

Square Footage: 367,000

Gateway is one of the top community colleges in the state, serving more than 11,000 students a year. Its new consolidated campus is a key element in New Haven's plans to revitalize the southwest precinct of the City. Its presence in the center of New Haven enables the college to play a central role in the educational, economic and workforce development initiatives in the Greater New Haven region. The campus occupies a two-block site along Church Street. Transparency, openness, identity and engagement characterize the design. The two site parcels are united into a single campus with a light-filled linear atrium, an "internal street", that spans George Street with a multi-story glass wall. The building culminates in a curved 3-story glass volume that houses the college's library and makes a dramatic urban gesture as a "gateway" to the city. The College's new home optimizes learning opportunities, engages the community, incorporates efficiency and sustainability, projects a strong institutional identity and provides an inviting, secure campus environment for its diverse student body. The public atrium is a visible space defined by an interactive "learning wall" that allows views into the building and features interactive displays. Within the atrium, stadium seating can be used for studying, informal and formal gatherings. Program elements include teaching and administrative space for general education, allied health, culinary arts and early childhood development as well as community accessible spaces including an art gallery and meeting rooms. The project also includes a day care center and a 600-car parking garage. Tracking LEED-NC Gold certification, Gateway Community College's new campus incorporates numerous sustainable strategies and technologies, including solar hot water, ice storage, photovoltaic and green roof systems. (Perkins)

#### **Sammamish Library, Sammamish, WA - USA 2010**

The new library currently being built next to city hall in Sammamish is being constructed to cutting edge standards, and will be the first library of its kind to adopt a number of energy saving design features. This week The Reporter took a look around the library-in-progress with Construction Manager Bob Carns to learn more about how the building will take advantage of nature's own energy - light, heat and air - to reduce energy consumption and increase the comfort levels of patrons. One of the most remarkable features of the building is the use of geothermal heating and cooling. While the construction site may look just like a heap of dirt and mess, about 6 feet underneath that soil a state of the art energy system has been put in place. Geothermal heating and cooling systems work by absorbing the heat contained under the surface of the earth, and circulating it through a closed loop. In the case of the new library, that closed loop includes a system of pipes laid into the radiant concrete floor. This geothermal loop circulates a carrier fluid, in this case water, through a system of coiled pipes buried in the ground. "They're a lot like a big slinky," Carns said. "They stretch the slinky out, lay it in a long trench, and then fill it up." As the fluid circulates underground it absorbs heat from the ground, which in this area is typically at about 55 degrees. A heat pump uses electricity to extract the heat from the fluid. Even cold ground contains heat, and due to advances in technology, geothermal heat pumps are more available now to everyday builders than in previous decades. By utilizing the natural heat from the ground, more heat is generated than if electricity alone had been used directly for heating. Switching the direction of the heat flow, the geothermal system can be used to circulate cooled water through the building in the summer months. This alternative energy technology that is becoming more common, particularly in states like Washington where there is a lot of exploration into green design. While some private houses are currently taking advantage of geothermal loop systems, the new Sammamish building may well be breaking new ground for library facilities. "It's just driven by the library's desire to do the right thing," Carns said. The reason geothermal technology is more energy efficient is this: air temperature ranges throughout the various seasons drop as low as 26 degrees and rise as high as 86 degrees. To provide a comfortable working environment air conditioning systems need to convert this to about 70 degrees. The water in a geothermal loop is already at a fairly constant 60 degrees by the time it circulates out of the ground, meaning that much less energy output is required to reach that 70 degree point. According to Brian Griffith of mechanical engineering firm Stantec, one of the library design teams, water is four times more efficient at distributing energy than air, and the geothermal loop system meshes very well with the radiant flooring. This ensures even temperatures throughout the building, and reduces the energy wastage of having particularly cold or warm sections, as is often the case with air conditioning systems. But Griffith said the way the building was heated or cooled was only part of the idea of energy efficiency. "What it is also about is reducing the need for energy consumption," he said. "We do this by creating a good quality "envelope," the building's shell." Griffith said that a number of other modern design elements had been included to both help the building retain warmth or repel excessive heat, regulating fluctuations in the internal temperature. Some of these are as simple and traditional as shade trees, and the inclusion of operable windows, so those inside can make use of breezes and fresh air. It might not sound like a particularly new or interesting idea - but when was the last time you were in an institutional building and were able to open a window? Sealed environments are energy intensive, and the use of natural elements such as this is a big part of the library's construction which designers believe will save between 30 and 50 percent on energy costs. Another is the inclusion of large windows and sky lights, so as often as possible the library will be lit by natural light from outside. The east-west siting of the building will maximize daylighting and minimize solar heat gains. But it's not all low-tech. The large west facing window will feature the use of Warema blinds, a technology from Germany equipped with a solar tracking system which automatically regulates the positioning of the blinds to provide the most, or least, shading, depending on the temperature inside the building. As the City of Sammamish begins to deal with the imposition of new, stricter Department of Ecology storm water regulations, they will be pleased to know that the library next door is ahead of the game when it comes to filtration and retention. A portion of the roof will soon be covered with 8 to 10 inches of soil into which will be planted rows of low maintenance Sedums, a hardy leaf succulent native to the area. The purpose of this green roof is to filter rain water that falls on the roof and regulate the water's flow into a system of filtration and retention tanks underneath the site. Green roofs such as this are one of a number of design features that the Department of Ecology is encouraging cities like Sammamish to include in their development as a way to simulate the natural functioning of watersheds. They have also been found to improve insulation values. Parking for the library will be directly underneath the library building, thus reducing the footprint of impervious surface. (<http://www.pnwlocalnews.com>)

To accommodate the growing City of Sammamish, the Sammamish Library decided to move to a larger site to accommodate a new 20,000 square foot facility within the Sammamish Commons. The new building is sited immediately to the south of the Civic Plaza edge. Large expanses of glazing and programmatic elements such as the meeting room, cyber bar and teen area overlook the plaza. Below this glazing, a plaza seat wall, landscaped zone and vertical green plantings greet visitors. The library space main reading and stack area contains skylights and clerestories of both translucent and clear vision glazing to reduce the need for artificial lighting and create a warm and inviting space. This main space terminates in a great reading room concept that draws people to the glazed edge with views to the west overlooking the nature preserve, Olympic Peninsula and Seattle skyline. A gas fireplace in a concrete finish and glass enclosure provides a central gathering point at this great reading room. Wood elements mark a progression through the library and include the entry lobby signature wall, meeting room walls and ceiling and lower column enclosures in the primary reading room. The children's area overlooks the new eastern lawn which includes a reflexology path, native plantings and a grove of birch trees. Sustainable design practices have been a top priority in the development of the site and the building. In order to reduce the impervious surface on the site, parking is located under the building with an elevator to access the library floor. In addition, the library's lower roof is planted with low maintenance, native sedum to reduce the water runoff from the roof. Water runoff from the exposed parking area is infiltrated into the site through pervious surface parking and an on-site rain garden. The new library features a highly insulated and efficient building envelope designed to reduce heat gain and loss while maximizing passive solar gain and daylighting. The primary cooling and heating for the building is through a radiant slab with a mechanically assisted ventilation system. (Perkins Will)

#### **Fuqua School of Business, Breeden Hall and the Ford Library, Duke University, Durham, NC – USA 1999 – 2008**

90,469, sqft., LEED NC Silver Certified

Breeden Hall and Ford Library is our most recent project for the School of Business. It is part of our phased, long-range planning effort to provide a physical framework for collaborative learning and research and the result of a successful 14-year working relationship with the school. Breeden Hall is linked to the Fox Student Center and East Fuqua campus by a three-level skylit atrium, an extension of the school's mallway. It is designed with a great sense of openness and transparency in the interior common spaces and library as well as the natural landscape outside. The program includes business-style classrooms, executive lecture rooms with distance learning and TelePresence capabilities, breakout and team rooms and large multipurpose rooms that open to an outdoor roof terrace. The TelePresence classroom provides business school students with access to professors, business leaders and guest lecturers located around the globe. The 18,000 square foot Ford Library, located at the second level, provides students with a spacious setting to support browsing and the more intense studying that occurs during the short 6-week terms. It is designed for reader comfort with abundant natural light, a variety of comfortable lounge seating, reading tables and generous display space. (Perkins)

#### **Stanford Auxiliary Library III – Rare Book & Collections Archive, Stanford University, Stanford, CA – USA 2000 – 2004**

The Rare Books and Collections Archive at Stanford University achieves a fine balance between highly technical requirements of a complex building and the need for a warm, inviting work environment. Stanford Auxiliary Library III provides high-density archival storage for 2.88 million volumes in a low-temperature and low-humidity environment. Due to the extreme value of the collection, risk management informed almost every aspect of design, including site layout, structural systems, envelope detailing, and the development of state-of-the-art fire detection and suppression systems. Future phases are planned to quadruple the storage capacity of the facility. Due to the relative isolation of the site and its location in an industrial park, creating a pleasant work environment with a reading room, staff lounge, offices and processing space was important. Interior and outdoor gardens provide a landscaped buffer and bring a sense of intimacy to the facility. Work areas are characterized by generous natural light and warm colors with abundant views of the distant hills or adjacent gardens. The exterior palette of buff-colored split-face concrete masonry and precast panels, reflects the hues of the coastal hills and brings some of the character of the Palo Alto campus to this outpost. (Perkins)

#### **Oak Park Public Library, Oak Park, IL – USA 2003**

104,000 sqf.

##### **Awards:**

Signature & Environmental Graphics Category, 2005

American Corporate Identity Annual Corporate Office over 30,000 SF Category, 2004

ASID, Illinois Chapter

In collaboration with building architect Nagle Hartray Danker McKay Penney, the Perkins+Will Branded Environments practice developed a new public library for Oak Park, a reinvigorated educational and civic meeting center adjacent to the city's central park space and across from Frank Lloyd Wright's Unity Temple. We based our interior design, finishes, environmental graphics, wayfinding and new identity system on a series of experiences to "open the door to a community at home in the world of learning." We integrated the inspirational concepts of "discover, connect and participate" throughout the facility, including the community space, main lobby, children's educational "exploratorium" and glass-enclosed elevator shaft. Our design solutions expressed the spirit and rich diversity of Oak Park and created a destination in the heart of the community for today and decades to come. (Perkins)

#### **Stanford Auxiliary Library III – Rare Book & Collections Archive, Stanford University, Stanford, CA – USA 2000 – 2004**

The Rare Books and Collections Archive at Stanford University achieves a fine balance between highly technical requirements of a complex building and the need for a warm, inviting work environment. Stanford Auxiliary Library III provides high-density archival storage for 2.88 million volumes in a low-temperature and low-humidity environment. Due to the extreme value of the collection, risk management informed almost every aspect of design, including site layout, structural systems, envelope detailing, and the development of state-of-the-art fire detection and suppression systems. Future phases are planned to quadruple the storage capacity of the facility. Due to the relative isolation of the site and its location in an industrial park, creating a pleasant work environment with a reading room, staff lounge, offices and processing space was important. Interior and outdoor gardens provide a landscaped buffer and bring a sense of intimacy to the facility. Work areas are characterized by generous natural light and warm colors with abundant views of the distant hills or adjacent gardens. The exterior palette of buff-colored split-face concrete masonry and precast panels, reflects the hues of the coastal hills and brings some of the character of the Palo Alto campus to this outpost. #### **Xi'an Jiaotong-Liverpool University, Campus Plan and Academic Building, Shuzhou – China 2006 – 2018**

<http://www.xjtlu.edu.cn/about/development/>

407,000 m<sup>2</sup>

Xi'an Jiaotong Liverpool University – the first independent Sino-foreign university in China – is a partnership between Xi'an Jiaotong University and the University of Liverpool in the United Kingdom. The University's vision is to develop a

world-class research university, committed to training leaders with the skills necessary to excel in the emerging global marketplace. Our design concept for the University's campus master plan structures the campus into three zones, each reflecting different cultural and environmental characteristics of Suzhou, an international commercial hub renowned for its ancient and beautiful gardens. A contemplative Nature Garden at the campus core is the focus of campus community life. Incorporating features of traditional Chinese water gardens, the Nature Garden links the existing Academic Building #1 to [the Library](#), the Student Activities Center, the Administrative Building, an International Residence Building, and the multiple classroom and lab structures of the Academic Village. The first Phase of the master plan is the construction of the new Academic Building #2, which establishes a campus design vocabulary of ground level courtyards and elevated green plazas with numerous points of connection from the outdoor gathering spaces to indoor classrooms, lecture halls, and laboratory spaces. At Academic Building #2 a landscaped podium structure of lecture halls supports four wings of teaching labs, research labs, and classrooms. One level above the ground, a continuous interior circulation loop links the pavilions to lecture halls, faculty office spaces, courtyards and interior gathering spaces. This academic "street" provides opportunities for spontaneous interaction and collaboration among students, faculty, and staff. At the third level, the landscaped roof gardens of the lecture halls create casual environments for socializing and learning. (Perkins)

[Universidade Agostinho Neto, New Campus, Phase I, Luanda – Angola Complete: 2011, Phase I](#)  
330,000 sqf.

**Awards:**

American Architecture Award, 2009 - the Chicago Athenaeum

This new national university is sited on a 5,000-acre green field site southeast of Luanda. Our master plan, developed in 2000 and updated in 2009, is designed to accommodate 40,000 students when all phases are complete. Phase I, of this new campus comprises the University's core curriculum, and includes: four classroom buildings housing faculties of chemistry, mathematics, physics and computer sciences; the [central library](#) and plaza; a refectory, student union and conference center. Subsequent phases will complete the development around the central plaza, adding administration, student residences, foodservice, sports fields and facilities, a research zone, parking and user-friendly service areas. Classroom buildings feature a cantilevered canopy system providing solar shading. The canopies extend between buildings, covering an elevated walkway system interconnecting the facilities within each college. In addition to screening the tropical sun, the canopy's innovative design encourages air movement around campus buildings. [The library is the tallest structure on the campus, creating a focal element and identifying landmark. The library is sited upon a central plaza featuring native plantings, reflecting pools and a sunken garden. The plaza and garden serves as a gathering space as well as an outdoor reading room.](#) (Perkins)

[University of Toronto at Mississauga, McCallion, Hazel McCallion Academic Learning Centre, Mississauga, Ontario – Canada 2007](#)

sqf. 98,000

LEED silver certified

**Awards:**

Innovation in Sustainable Design Award, 2008 - American Library Association/International Interior Design Association

Award for Design Excellence, 2008 - Ontario Association of Architects

Award of Excellence, 2007 - Mississauga Urban Design Awards

[This Learning Centre and Library](#) provides a vibrant focus for student activity on the University's north campus. It is sited and designed to reinforce the campus plan with indoor and outdoor spaces that animate the campus, and link to existing pathways and green space. The need for high density mobile compact shelving to house the Library's permanent collection, and the University's desire to create a structure that would adapt well to the demands of future digital content, led to a building design inspired by the metaphor of the Japanese puzzle box. An arrangement of interlocking pieces is organized around the building core – the "treasure" (library collection) within the box. This allows generous perimeter space for study and lounge areas, in an open and flexible arrangement with views out to the surrounding campus and natural landscape. The library provides a wide range of collaborative study and work environments that reflect evolving pedagogical and technological trends as well as student work habits. A series of interconnected two-story spaces provide clear circulation and orientation within the building, as well as space for social interaction and collaboration. An information commons, café, conference space, instructional lab and career counseling center are located along this linear "street". The stepped atrium, two-story cantilevered study wing on the building's west façade, study bays to the east and north, the south-facing roof garden and three sunken gardens – all these elements pull the outdoor environment into the building, and push the building into the fabric of the campus. Exterior wood panels reflect the naturalized landscape and respond to the campus' ecological context. (Perkins)

[Whitby Public Library and Civic Square, Whitby, ON - Canada 2005](#)

Square Footage: 56,000

The primary design objective for this 50,000 square foot central library is the creation of a dynamic relationship between a grand interior public space and an outdoor urban public space in the form of a new civic square. The design team has adopted a simple "L"-shaped configuration in order to maintain the existing library structure during construction and to create a strong spatial definition for the proposed urban plaza that faces onto a heavy traffic artery. A three storey, north-facing Library hall opens directly on to the urban square. The new urban square is animated by the concentration of vertical circulation, information commons and displays, all visible through an uninterrupted expanse of glass at the edge of the square. From the urban square, landscape elements including a green promenade and a linear reflecting pool penetrate the building bringing natural light and colour deep into the building mass. The lower east wing of the building brings the presence of municipal archives, meeting rooms and a café to the existing streetscape. While the building's south facade presents an abstract composition of masonry planes with a reduced scale to the existing residential neighborhood. (Perkins)

[Angus Glen Community Centre and Library, Town of Markham, ON – Canada 2004](#)

150,000 sqf.

**Awards:**

Silver Award for Architecture - Commercial Category, 2005, National Post Design Exchange

Good Design is Good Business, 2006, Ontario Association of Architects

Large Institution, 2006, Canadian Wood Council, Wood WORKS! Award, Wood Design

Sports and Recreation Facility, Facility of Merit Award - Outstanding, 2006, Athletic Business Award

Angus Glen Community Centre and Library is situated on a 12-hectare, gently, sloping site overlooking the Angus Glen Golf Course in Markham, Ontario. The major elements of the program include a twin-pad arena, gymnasium, pool, related change rooms and service spaces, multipurpose rooms, senior and youth areas, a [district library](#) as well as ancillary retail,

food and beverage outlets. The building layout connects at several locations on three levels to outdoor passive and competitive activities. The building is designed to harmonize with the strong natural landscape incorporating natural materials such as zinc cladding, Wiarnton limestone, clay brick and Douglas Fir heavy timber and glulam. The massing of the building similarly utilizes the topography of the site to partially bury the large bulky volumes of the arena, while showcasing the more animated volumes such as the pool and library. Large sweeping roofs above the pool and arena create a strong design theme, replicating the undulations of the site. (Perkins)

#### **Nicola Valley Institute of Technology, Eagle's Perch Campus, Merritt, BC - Canada 2001**

sqf. 48,631

#### **Awards:**

Excellence in Architecture/Honor Award, 2005, AIA Committee on Education and Society for College and University Planning

High Performance Building Award, 2005, Canadian Wood Council

Excellence in Architecture, 2004, Governor General Award

Design Award, 2002, International Green Building Challenge

This institute is one of the first facilities in Canada shared by native and non-native students. Phase I of the 43-acre campus master plan is a semi-circular plan that will ultimately evolve into a circle, a shape chosen for its deep significance to native cultures. The building is symbolically oriented to the four cardinal points with the main entry at the east axis facing the rising sun. The design process involved intensive user group interaction and many site visits with native elders resulting in learning spaces that support traditional First Nations' culture and foster student success. Spaces are functionally organized to eliminate any sense of hierarchy. Program elements include classrooms, faculty offices, social spaces, laboratories, a bookstore, cafeteria and library. The building is designed to grow out of the landscape with minimal disruption to the surrounding area. Its wood column structure visually recalls native pithouses with poles rising up through the interior space. As a cold climate green building, it reflects traditional aboriginal structures and values. A glazed ventilation stack with operable windows creates airflow patterns that ventilate the building naturally. Tensioned fabric, a reference to 'stretched skins' in aboriginal design, is used for shading and for the front entrance canopy. (Perkins)

#### **Perry Dean Rogers Partners Architects, Boston, MA – USA**

<http://www.perrydean.com>

#### **Libraries:**

#### **National Library of Medicine, National Institutes of Health, Bethesda, MD – USA (on design) on hold pending congressional funding**

The National Library of Medicine addition nearly doubles the footprint of the existing Library and provides three distinct new programs: subterranean book storage; office / research space for the growing number of employees whose work is computer-based; and a series of public spaces including conference facilities and space for medical exhibitions. Together with a comprehensive reorganization of existing space, the addition provides the Library with a sophisticated facility appropriate for current and future work, and reflective of its global significance. Sustainability: Solar gain and glare are not acceptable for computer-intensive research environments such as the National Library of Medicine so the building form and envelope respond accordingly. Aserrated western façade selectively captures diffuse north light and a double-layered eastern façade acts as a climate buffer while providing flexible program space. Roof gardens and terraces cascade down the south façade, providing outdoor spaces for inhabitants of this high-security building. Project Type: Addition and Renovation, Size: Existing: 332,500 gsf, New 194,500 gsf, Construction Cost: \$133,000,000 (estimate), Completion Date: On hold pending congressional funding. (Perry)

#### **Miller Library Washington College, Chestertown, MD – USA 2012**

Project Type: Addition and Renovation, Size: Existing 40,000 gsf, New 10,000 gsf, Construction Cost: \$16,500,000 (estimate)

Completion Date: In pre-design phase, anticipated completion 2011.

Miller Library sits at the heart of campus, tucked between the contemplative and historic College Green and the bustling hardscape of Martha Washington Square, a principal gathering place for student activities. The proposed design links and streamlines these exterior spaces, and introduces an addition whose materials and forms reflect and reinterpret the character of existing campus structures. New program includes group study rooms, an academic skills center, staff offices and a café. Sustainability: Transferring a portion of the library collection to compact shelving reduces square footage requirements and minimizes new construction. The streamlined addition sits to the north of the existing library and funnels diffuse north light to the interior through a large expanse of glazing. East and west facades incorporate louvers to prevent direct solar gain. Interior spaces use demountable partition systems for long-term flexibility. (Perry)

#### **Massachusetts Maritime Academy, The American Bureau of Shipping Information Commons, Buzzards Bay, MA – USA 2011**

43,000 GSF NEW CONSTRUCTION, LEED PLATINUM TARGET, Client THE AMERICAN BUREAU OF SHIPPING INFORMATION COMMONS

This new library integrates a rich program of study, training, and research spaces, in a cutting-edge building that is targeting LEED Platinum Certification. Perry Dean was commissioned to program, evaluate, and create the conceptual design for the re-use or replacement of the existing Hurley Library, and provide the Academy with a facility that enhanced learning and research. Following the programming phase, we conducted extensive campus planning and existing building evaluations, which concluded that a new library was required and that the existing building can be successfully renovated to support other academic and student services programs. The program is dispersed on two principal floors with high ceilings and extensive views of the campus, the Academy's training ship, and the Cape Cod Canal beyond. On the lower 'deck' is an open plan learning commons with student-centered flexible furniture to foster collaborative and social learning. On the upper 'deck' is the Academic Resource Center with flexible, technology-rich learning spaces. It includes academic advising, learning resources, a writing center, multimedia classrooms, study rooms and instruction labs. A ship bridge simulator (essential to the Academy's mission) and a smart classroom form a cylindrical object that runs through both of these spaces. The Academy's traditional library collections and library offices are stacked on the north side of the building with views to Buttermilk Bay. A new plaza was created, connecting the new library, the old library, the nearby dining hall, and residence halls. (Perry)

#### **St. George's School Hill Library Addition & Renovation, Middletown, RI – USA 2011**

Targeted LEED Gold, Addition: 5,200 GSF, Renovation: 16,700 GSF, Construction Cost: \$6.4m, Completion: August 2011

Scope of Services: St. George's School approached Perry Dean Rogers to design an addition to the existing library with the goal of providing students with a new facility that will prepare them for college-style learning. The project was defined by this important mission, which translated into spaces programmed for active, collaborative learning.

The addition includes a new entrance and multi-purpose teaching space that reorients the Hill Library towards a student-centered hub which includes the Arts Building, the Student Center, and Dining. A transparent, three-story volume is introduced, defining a new entry and bringing light down into the ground floor level. The renovation opens up the interior with an open-plan service desk, group study rooms and light-filled, technology-rich learning spaces.

Indoor environmental quality is improved by increasing natural light with new skylights and enlarged existing openings. Thermal performance of the existing exterior brick constructed facade is greatly augmented with a new interior wall system filled with spray foam insulation. Similarly, roof replacement with regional slate shingles allows added insulation, ensuring an overall weather-tightness of the exterior envelope. Finally, mechanical systems will be upgraded for optimized performance.

"The St. George's library serves as a vital center of campus intellectual life. It supports our academic programs by providing outstanding services, resources, and facilities for research and study.", Mission Statement. (Perry)

### **[Daemen College, Center for Information, Research and Community Programs, Amherst, NY – USA 2009](#)**

Size: 49,000 GSF new construction, 2,000 GSF Renovation, Cost: \$13.4m, Completion: 2009

#### **Awards:**

**2010 AIA New England Award for Design Excellence**

The Center for Information, Research and Community Programs gives Daemen College a prominent public face by maximizing street frontage and using a bold expanse of curtain wall to frame student activity within. A 24-hour, multi-story Information Commons forms the core of the new structure, joining traditional and high tech research facilities to become a major campus destination. The building also provides the largely commuter population with spaces – including a lobby, café and group study rooms – for social interaction. Sustainability: A central light well spans the full height of the Library, drawing natural light into the heart of the plan. Selective glazing on north, east and west facades lights perimeter classrooms and offices, and a fully-glazed southern façade lights public study spaces. Vermont slate shingle is a sustainable cladding choice because it is regional and durable. The building interior uses a raised floor system that allows for long-term flexibility of building systems and technology infrastructure. This project is working toward LEED Gold. Project Type: Addition and Renovation. Size: Existing: 12,185 GSF New 48,944 GSF, Construction Cost: \$13,350,755 (estimate), Completion Date: 2009 (under construction) (Perry)

### **[Clark University, Goddard Library, Worcester, MA – USA 2009](#)**

Goddard Library, an award-winning structure designed in 1966 by John Johansen, presents the challenge of introducing new programmatic, technological and space requirements to a historically significant structure without damaging its original character. The addition and renovation remain respectful by capturing an existing but under-used exterior plaza to house a 24-hour information commons, and locating additional program – group study spaces and a faculty teaching center – on the existing second level. Materials are clearly contemporary, providing an engaging dialogue between old and new. Sustainability: Conscious of the effort, cost, and energy required to modify the cast-in-place mass of the existing library, the design proposes to reuse existing space rather than to introduce new construction. An underused two story plaza tucked under the library becomes a new information commons when enclosed and reworked. This creative and unexpected approach is cost-effective and contextually sensitive as well as environmentally sustainable. Project Type: Addition and Renovation, Size: Existing: 93,000 GSF, New 13,000 GSF, Construction Cost: \$12,000,000 (estimate) Completion: 2009 (Perry)

### **[Frank and Laura Lewis Library, Lagrange College, LaGrange, GA - USA 2008](#)**

The Frank and Laura Lewis Library sits atop the College's historic Hill Campus where it shapes significant new exterior spaces: a plaza at the main entrance and a quadrangle connecting the Hill Campus to existing buildings to the south. The program reflects an increased interrelationship between library collections, media, and campus-wide computing services but at the same time emphasizes the building's role as an important campus "place". Strong inside / outside relationships, interconnected interior spaces, and copious natural lighting reflect a contemporary design approach. Sustainability: Extensive daylighting – achieved with a series of north-facing roof monitors and exterior wall glazing – dramatically reduces the Library's electrical load. Overhangs and shading elements prevent solar gain and glare. Locally harvested and finished brick, wood, concrete and stone with low embodied energies further reduce the building's environmental impact, as do the recycled carpet tiles from a nearby manufacturer that are a uniquely regional contribution to the project. This project is working toward LEED Silver certification. Project Type: New Construction, Size: Existing: 44,884 GSF, New 28,100 GSF, Construction Cost: \$10,933,782 (estimate), Completion Date: 2008 (December) (Perry)

### **[Agnes Scott College, McCain Library, Decatur, GA – USA 2002](#)**

For more than six decades the McCain Library has stored the College's "food for the soul." A contribution of \$15,000 for books from the Carnegie Corporation made the construction of a library essential. An additional contribution from the corporation made it possible to commission outside librarians and architects as consultants. The building was designed by Edwards and Sayward of Atlanta and built in 1936. Originally named for Andrew Carnegie, the library was renamed for Agnes Scott's second president James Ross McCain upon his retirement in 1951. Smaller renovations occurred through the years, but it wasn't until 2001 that a total renovation was achieved.

The library houses more than 200,000 volumes with capacity for 250,000. The 2001 renovation added features that included wireless internet connectivity throughout the building, a multimedia production facility and classroom, sound-buffered group study rooms, and a speaking and writing center. Central to the academic life on campus, McCain Library also contains the College archives, which include a collection of Robert Frost's poetry and memorabilia from his visits to the College. Robert Frost maintained a 30-year relationship with the Agnes Scott, visiting numerous times during annual pilgrimages to Florida. The McCain Library houses one of the nation's finest Frost collections, including original material and a portrait of the poet.

(<http://puka.cs.waikato.ac.nz/cgi-bin/cic/library?a=d&d=p45>)

### **[Waidner-Spahr Library, Dickinson College, Carlisle, PA – USA 1998](#)**

#### **Awards:**

**2004 The Best College Library in the Country**

The Best College Library in the Country The Princeton Review, 2004

The synthesis of contemporary forms and old materials in the award-winning addition integrates the existing library, a late International Style building, into the Civil War-era campus fabric. The addition knits disparate campus elements together by using the same limestone used for the original campus, an original wood window system, and carefully scaled building components. The addition provides new stack and reader spaces as well as a self-contained Special Collections area with dedicated stacks and readers. Sustainability: Choosing to reuse an existing building, rather than to build anew, is one of the most sustainable decisions an institution can make. At Dickinson, renovation of an existing mid-century library combines with an addition to accommodate new program requirements with as little new construction as possible. The addition minimizes environmental impact with natural

lighting throughout, and with stone cladding sourced from the same regional mine that provided materials for the original civil war-era campus. Project Type: Addition and Renovation, Size: Existing: 72,000 gsf, New 46,000 gsf, Construction Cost: \$8,353,889  
Completion Date: 1998 (Perry)

## **Pfeiffer Partners Architects Inc., Los Angeles, CA. New York, NY – USA**

Pfeiffer Partners is a leader in the planning and design of library facilities world-wide

<http://www.pfeifferpartners.com>

### **University of California - Santa Barbara, Davidson Library Addition and Renewal, Santa Barbara, CA – USA 2014**

Size: 150,000 s.f. (60,000 s.f. new; 90,000 s.f. renovation)

Pfeiffer Partners programmed and designed the addition and renewal of Davidson Library, the main library at UC Santa Barbara, which serves 18,800 students and 1,000 faculty members in addition to the surrounding community. The existing library was initially built in 1952, with an 8-story addition in 1967 and a 4-story addition in 1978. The project expands the library by 60,000 sf on the north side of the original building, and renovates the 90,000-sf two-story portion of the existing building to accommodate the growing campus population and library collection. The library supports research collections, digital services, and instructional functions, along with significant special collections. The expanded library includes a 24-hour access area, 2,700 user seats in a variety of casual and study arrangements, seminar rooms, an exhibit area, and a new entrance intended to link the east and west quadrangles of the campus. (Pfeiffer)

### **Seattle University, Lemieux Library & McGoldrick Learning Commons Renovation and Expansion Seattle, WA – USA 2010**

Size: 120,000 s.f.

Pfeiffer Partners programmed and designed the renovation and expansion of the A.A. Lemieux Library at Seattle University, originally constructed in 1966. LEED Gold-certified, the project expands the library by 33,000 sf to better serve its 7,751 students, 653 faculty, and the surrounding community, incorporating new media development functions, academic support space for teaching and learning, new technology-rich spaces, a distance learning environment, and improved library instruction spaces. The expanded library accommodates more than 1,000 seats and 380,000 volumes to support the 15-year acquisition growth rate of the library. It features centers for media, instructional design/multimedia development, student success and technology training, 24/7 study areas, interactive "smart" classrooms, a 48+ person flexible instruction room, a café, a range of group study rooms, five distinctive reading rooms including a richly-appointed grand reading room, and a special collections archive and reading room. The three-story addition enhances the connection between the library and the adjacent student union and campus green, connecting with the academic center of the campus to create a defined student precinct. (Pfeiffer)

When Seattle University leadership took on its largest single capital project—expanding the campus library to encompass a learning commons and create a campus hub—it created a landmark knowledge resource for the future that engages and inspires students today.

The goal was to create a Leadership in Energy & Environmental Design (LEED) Gold environment that provided a collaborative, stimulating experience for users. Inside, students would find quiet and active spaces; an array of artwork (including works by Henry Matisse); computer labs; book, journal, media, and special collections; the university's first media production center; smart classrooms; and academic support services like the writing center, research consultation, math lab, and tutoring and study assistance. Outside, students would be drawn to equally compelling spaces for socializing, studying, and -exploring.

One judge had this to say: "This project is replete with superb spaces. While the details are well conceived, they are not overwrought. The conflation of architecture, landscape, and art makes for a beautifully sinuous project." Mithun was associate architect for the project.

A complicated task

Still, it wasn't easy to accomplish. A complicated ten-year project grew the original 1966 library by 33,000 square feet without losing what stakeholders loved the most—the original veined white marble façade and double helix staircase that integrated a plethora of services into one facility and created linkages to nearby buildings while retaining habitual pathways.

The white marble façade was retained as an interior wall and made visible by glass curtain walls on the exterior. The staircase facelift is an ode to mid-century design. Dropped was the ideal notion of a single entrance/exit in favor of five entrances with door controls and monitoring for maximum convenience. Gained was a "learning commons partnership" to coordinate services in the multifunctional facility. The result is a stunningly transparent and airy library and learning commons at the crossroads of the campus.

Green expectations

Students and all stakeholders were united in their expectation that the building be built and operated green. Going for LEED Gold certification was an easy choice and meant the reuse of the existing building and some furnishings; operation of energy-efficient systems and lighting; strategic harvesting of daylight; glass curtainwalls with special frit and UV coatings; low-emitting materials and furnishings; and the capture of 100 percent of the building's storm water runoff for use in water features and the landscape.

The site's slope dictated a step-down approach to a three-story addition. That strategy resulted in an addition that is appropriately scaled for pedestrian movement through the campus core. But now people stop to rest, read, or socialize in the new plaza, terraced amphitheater, meditation lawn, rain garden, and bioswale. Like a town square, these exterior spaces are a campus destination.

Creating gathering and contemplative spaces both indoors and out came as no surprise. From the get-go, planners stepped beyond standard programmatic needs and sought new opportunities. Many conversations with stakeholders shaped the direction, including two summer retreats by campus leadership. Soliciting input was taken seriously at all levels. The whole campus was invited to test seating options; students were queried via focus groups on size, layout, and furnishings; and the deans were invited to explore their need for a technology-rich classroom, which became the now-sought-after Boeing Room.

Educating the whole person

Flexibility is a key organizing principle of this project. Staff work areas are outfitted with reconfigurable desk systems. All furnishings were selected to be durable, mobile, cleanable, and easily maintained. Raised floors throughout the addition contain data, electricals, and HVAC vents enabling future reconfigurations. Around-the-clock services are provided in an expandable zone that extends across most of two floors of the addition. Containment is handled by drop-down security gates and security via ID card access.

Internally, placement of services through the six-floor building is maximized for easy access. The Boeing Room is on the lowest level to accommodate events that occur outside of regular hours. The second floor contains the aforementioned partnership services and private cubicles for client meetings; an "iDesk" staffed during regular building hours; a café; and several classrooms with laptop

and charging stations. Traditional book and journal stacks are on the upper floors, with special collections on the top floor. Help desks are located in major traffic areas, computer labs that support individual and group work are on two floors, and roaming reference librarians are available via iPhone. Over 950 seats and 200 computers are available for visitors. By deciding to ponder deeply and question what a library is, Seattle University artfully crafted a library experience that matches its 21st-century focus on educating the “whole person...for a just and humane world.” (<http://lj.libraryjournal.com/2012/06/buildings/national-landmark-academic-library-5-lemieux-library-and-mcgoldrick-learning-commons-seattle-university/>)

#### **Church of Jesus Christ of Later-Day-Saints, Church History Library, Salt Lake City, UT – USA 2009**

Project Team: Salt Lake City, Owner: The Church of Jesus Christ of Latter-Day Saints, Contractor: Jacobsen Construction, Swinerton Construction JV, Design Firm: MHTN Architects, Pfeiffer Partners, Start: April 2006, Finish: March 2009

The five-story LDS Church History Library houses and preserves the church’s expansive archives, including records, manuscripts, publications, photographs and audiovisual items.

Located on the northeast corner of North Temple and Main Streets in Salt Lake City, the facility contains 13 storage vaults spanning three floors. The library also features two public reading rooms, conference rooms, 120 staff offices and a digital image processing center, as well as a conservation lab and an audio/video preservation facility.

The CHL needed to provide security and a closely controlled environment for the archives, while also providing light and views for staff and patrons. The team created a wrapper of public and office spaces around the solid core of the collection, expressed architecturally as a solid stone monolith, while the wrapper is more open and welcoming. The two opposite elements are contemporary in spirit, yet respectful of the architectural traditions of the church.

([http://mountaistates.construction.com/mountaistates\\_construction.projects/2009/1207\\_LDSChurchHistoryLibrary.asp](http://mountaistates.construction.com/mountaistates_construction.projects/2009/1207_LDSChurchHistoryLibrary.asp))

#### **Santa Clara University, Harrington Learning Commons, Sobrato Technology Center and Orradre Library, Santa Clara, CA – USA 2008**

Size: 194,000 s.f., \$ 92,000,000

The new Information Learning Center for Santa Clara University will combines library, media services, and information services functions of the campus into one building and, with the nearby Benson Student Center, provides a vibrant student precinct at the heart of campus. The site of the original library was selected for the project following a programming and analysis process that considered both renovation and new construction alternatives. A primary component of the new facility is a 1.1-million volume automated retrieval system (ARS), which is intended to house half of the general collection and provide room for 20 years of expansion. Other features of the new facility include a student commons with access to the public, drop-in computer labs, a variety of viewing/taping labs and dubbing/editing rooms, wired carrels and workstations, a café, and exhibit space. (Pfeiffer)

#### **University of California San Diego. Biomedical Library Renovation and Expansion, La Jolla, CA – USA 2006**

Size: 74,000 s.f. (including 41,000 s.f. addition)

Pfeiffer Partners’ renovation and expansion of the Biomedical Library at the University of California, San Diego, now complete, includes a 41,000-square-foot addition that more than doubles the size of the existing library and incorporates a wide range of technologies and collaborative learning spaces to serve today’s students and scientists. The \$17 million renovation and expansion of the nearly 40-year-old library renews the landmark structure, designed by Robert Evans Alexander in 1966, and provides a dynamic new environment for medical research and innovation in the 21st century. A key aspect of the facility’s design recognizes the major expansion of the campus over the years and plans for future medical school facilities to the south of the library. As such, the new building serves as a welcoming lantern for visitors to the school arriving on Gilman Drive and creates a new 24-hour promenade between the north and south precincts of the medical school.

([http://info.aia.org/aiarchitect/thisweek06/1110/1110d\\_ucsd.cfm](http://info.aia.org/aiarchitect/thisweek06/1110/1110d_ucsd.cfm))

#### **Soka University of America, Daisaku and Kaneko Ikeda Library, Aliso Viejo, CA - 2001**

Size: 124,000 s.f.

The Ikeda Library on the Soka University campus was completed by Pfeiffer Partners as part of the final master planning and Phase I construction Pfeiffer Partners. Pfeiffer Partners was the architect for 11 of the first 19 buildings, including the new Library, which is among the university's most significant structures. The facility serves as the western gateway to the entire University, with a grand stair that leads into the campus through a monumental arch. Library services are housed in the north wing, while the south wing is home to the Information Technology and Multi-Media Resource Center. Initially, the library also housed offices for student activities, student housing and the Dean of Students, as well as the Pacific Basin Research Center, which will be relocated to other buildings as the campus grows. Included in the Library is a Learning Center with a computer lab, 24-hour study space and several tutorial rooms. (Pfeiffer)

#### **Multnomah County Central Library. Historic Renovation and Penthouse Addition, Portland, OR - USA 1996**

Sqf. 123,000

When the original Multnomah County Central Library opened in 1913, it was considered one of the most modern in the country. When it closed for renovation in 1994, it was the most used public library in the nation on a square-foot basis. Listed on the National Register of Historic Places, the library has been meticulously restored and reinvented, maintaining a strong civic presence. On the exterior, original windows and delicate wooden mullions were retained to preserve the original appearance. Inside, the building was reorganized for greater access to materials, integration of state-of-the-art technologies, and expanded community facilities. The public spaces on each floor are distinguished by pastel colors accented with white ceilings and window trim in true Georgian style. Technology is respectfully integrated within the stately rooms with custom tables that conceal telecommunications lines and wires. A 20,000-sf addition was placed on the roof of the building for administrative offices and a staff lounge. (Pfeiffer)

#### **Los Angeles Public Library. Central Library Historic Renovation and New Tom Bradley Wing, Los Angeles, CA – USA 1993**

Size: 225,000 s.f. (Renovation); 330,000 s.f. (Addition)

The Los Angeles Central Library, the largest public library in the western United States, is the centerpiece of a multi-block development, providing both a cultural facility and related landscaping for public use in the midst of a high-rise commercial district. Its expansion and rehabilitation incorporates Bertram Goodhue's (\*28.04.1869 - + 23.04.1924 New York City) original 1926 landmark building with significant new construction. The 550,000-square-foot facility functions as a research center and headquarters for 66 branches. In addition to 90 linear miles of shelving and seating for 1,500 patrons, the library features a board

room, meeting rooms, a conference center, a 235-seat multimedia auditorium, a cafe, a bookstore, offices, and more than 1.3 acres of public space. Pfeiffer Partners' 10-year effort began with master planning and program confirmation, and included historic preservation and adaptive reuse and full interior design services, in addition to designing the 350,000 sf addition. (Pfeiffer)

**University of British Columbia, Irving K. Barber Learning Center, Vancouver, BC - Canada 2008**  
240,000 sqf.

The new Irving K. Barber Learning Centre, designed by Pfeiffer Partners with Downs/Archambault & Partners, transforms the campus' historic main library into a visionary education and research support facility, integrating library services and collections with classrooms, lecture theatres, learning commons, academic units, and a community concourse. The Heritage Core, the 36,000-sf central portion of the existing building, constructed in 1925, is retained, while surrounding additions built in the 1940s and 1960s are demolished. New construction encompasses 200,000 sf surrounding the core. In addition to providing a unified architectural complex, the major new addition provides a contemporary new façade along the University's East Mall, a busy pedestrian pathway linking the facility to the student union and other student services. The Learning Centre houses the first Canadian library installation of an automated retrieval system (ARS), with storage for 1.4 million volumes. Nine-hundred study seats, and 300 computer stations, along with informal social space, a recital hall, and exhibition gallery, are provided to actively encourage collaborative learning. (Pfeiffer)

**University of Otago, Information Services Building and Student Union Expansion, Dunedin - New Zealand 2001**

Completion Date: 2000 (Phase 1); 2001 (Phase 2), Size: 170,000 sqf.

The University of Otago's new Information Services Building (ISB) is a major renovation and addition to its central library, and includes a new enclosed link to the University Union that creates a 24-hour information marketplace. It is also the centerpiece of a new student precinct being developed simultaneously in response to Pfeiffer Partners' master plan. The ISB holds 400,000 volumes of books and offers convenient training, seminar, and group-study areas; lounge seating; print-and-copy centers; Internet terminals; wired carrels; and computer stations. The two-story connection between the library and union contains kiosks with concessions and conference suites, a new campus store, and electronic information systems. By grouping buildings and landscaped areas into a cohesive plan, a learning environment was created where students can interact with both electronic information and each other. (Pfeiffer)

**Van Ingen Art Library, Vassar College, Poughkeepsie, NY – USA 2009**

Back to the Future: The New Vassar College Art Library

The Vassar College Art Library is a rare example of a complete modernist interior from the pre-World War II period in the United States. Built in 1937, the interior was designed by John McAndrew (\* 1904 New York - + 1978 Venice, Italy), an architect as well as educator, who taught architectural history and drafting in the Vassar College Department of Art from 1931 to 1937. The clarity, openness, and textured warmth of the space is in keeping with the American or what McAndrew termed a "naturalized" version of the machine aesthetic, which he would go on to promote in his role as Curator of the Department of Architecture at the Museum of Modern Art between 1937 and 1942. The design also has elements in common with the streamline style of Raymond Loewy and Norman Bel Geddes. McAndrew's Art Department colleagues referred to this dynamic and forward-looking space as the expression of a new functionalism in architecture.

As a learning environment it was exactly that, an elegantly-crafted machine in which every surface, volume, and element was shaped and illuminated for the efficient appropriation of a knowledge of the history of art through group and individual study.

McAndrew's space has now been carefully renovated to recover its original function through the introduction of new visualization technologies as well as through a restoration of the original interior on designs by another architect/educator, the late Paul Spencer Byard, and his partner Charles A. Platt (\* 30.08.1939-+ 15.07.2008), of the New York-based firm of Platt Byard Dovell White.

(<http://artlibrary.vassar.edu>)

The Vassar College Art Library is a rare example of a complete early modernist interior from the pre-World War II period in the United States. Built in 1937, the interior was designed by John McAndrew, an architect as well as educator, who taught architectural history and drafting in the Vassar College Department of Art from 1931 to 1937.

Of the recent renovation, Professor Adams noted that: "This is a rare example of a historically informed renovation of a modernist building. The architects have succeeded brilliantly in recuperating the past and adapting it to new functions for the present."

According to Art Librarian Thomas Hill, the clarity, openness, and textured warmth of the space is in keeping with the American or what McAndrew termed a "naturalized" version of the machine style, which he would go on to promote in his role as Curator of the Department of Architecture at the Museum of Modern. The design also has elements in common with the streamlined style of Raymond Loewy and Norman Bel Geddes. McAndrew's Art Department colleagues referred to this dynamic and forward-looking space as the expression of a new functionalism in architecture.

As a learning environment it was exactly that, an elegantly-crafted machine in which every surface, volume, and element was shaped and illuminated for the efficient appropriation of a knowledge of the history of art through group and individual study. McAndrew's space has now been carefully renovated to recover its original function through the introduction of new visualization technologies as well as through a restoration of the original interior on designs by another architect/educator, the late Paul Spencer Byard, and his partner Charles A. Platt, of the New York-based firm of Platt, Byard, Dovell, & White.

Nicholas Adams, the Mary Conover Mellon Professor of Art, worked with the architects on the recent renovation and his involvement, according to John Mihaly, director of Regional Programs, "ensured a close adherence to the fundamental principles and the integrity of the 1930s design." #### Hampton Library Addition and Restauration, Bridgehampton, NY – USA 2008 - 2010

11.000 sqf.

This renovation to a historic library and the addition of a modern glass-walled structure expanded the building while respecting its 1877-era character. The design also reoriented the complex toward its delightful backyard garden and brought a new sense of light and space to the interiors, along with numerous updated facilities.

While retaining the building's special character, the design practically doubles the space for patrons, staff and books. The design also addresses important structural issues and updates the library's overall accessibility and technical facilities.

To take advantage of the newly improved garden setting, LHPA designed a reading terrace at ground level and a "reading porch" upstairs facing the garden. The porch doubles as a speaker's platform for the library's popular lecture series "Fridays at Five." (Pomeroy)

#### Hampton Library Moves Back Home

Posted on 21 January 2010

By Marianna Levine

After exactly 16 months to the day of extensive renovations, the Hampton Library is once again open to the public at its original Main Street location. And it appears that the library has swiftly and successfully managed to blend the cozy and familiar with the strikingly new.

The library's executive director, Susan LaVista comments as she gives a tour of the new space "(the architect Lee Harris Pomeroy) did a nice job of blending the new with the old. The workmanship is quite beautiful. Although we are still awaiting some final finishing touches."

She points out the added public access to the second story loft, and the stairs to the children's library and media room in the walk out basement. The main floor's space has been opened up to reveal the natural wood beams of a cathedral ceiling. The outdoors has been brought in through the placement of a glass wall facing the library's back yard, making an old Norway Maple the centerpiece of the library.

"It was understood that under all circumstances we had to preserve and protect the tree. We consulted an arborist throughout the whole process. We put a fence around it and no one was allowed to enter. We knew the tree was over 100 years old as it was a survivor of a shipwreck near Bridgehampton."

LaVista points out some of the details from one of two floating, glass enclosed reading balconies overlooking the main floor's reading room, "All these fixtures are unusual. The architect's attention to detail was remarkable. He personally specified all the fixtures including our lamp shades that I think came from Italy."

These details, including the large lacey, white glass hanging lamps she is alluding to, give the library's interior a mid-century modern Scandinavian feel. And this continues to be true on the lower level, where the children's library, a gallery space, and a large media/project room are housed.

Although the children's area has been moved to what was once the basement, it has been opened up to a sloping backyard and is light and bright due to the natural light coming from the back wall of windows. The architect also designed a large yellow wooden circular structure, almost like a round ship, incorporating benches with the intention of creating an intimate and cozy space for the library's popular story time.

"We have this problem now that children are crying because they don't want to leave the library," said LaVista.

LaVista notes that there is even a large, modern elevator to accommodate strollers, to take parents and babies down to the lower level, or families can come around through the glass doors that lead to a backyard terrace and the garden. LaVista hopes, in good weather, the terrace will be used for story time and projects as well.

Other new features include 12 new computers including one for the visually impaired, a teen room on the main floor, a literacy class room, a main floor library dedicated to Bridgehampton history, and a state of the art media room which, when opened up to the children's library, can accommodate up to 130 people.

Although the main intention of the renovation was to increase the library's space, LaVista explains, "we have more than doubled our seating capacity", the idea was also to retain "cozy reading spaces and to make everything feel like you're in a comfortable room." Yet, despite all these changes several things have remained the same. The building's historic façade looks remarkably the same, although painted in a slightly warmer tone to blend in with the new natural wood exterior in the back. LaVista explains that is was always the intention of the board to keep the front of the building intact.

They also decided to keep the front check out area in the same location, although larger and modernized. The original fireplace facing the counter is still there, but has been opened up in the back and turned into a working gas fireplace.

"On the weekends people have been jockeying for seats by this gas fire," LaVista remarks.

With neighboring Sag Harbor just starting its renovation process, LaVista offers some encouragement and advice, "Although it has been an incredible amount of work, it has been just an amazing experience to do this renovation. It was well worth the wait. And we had a good team of people working on this."

She is grateful that "the community was patient and really behind us all the way."

La Vista, whose office is next to the front entrance, ends by saying, "You know I love hearing people's responses as they come into the building. Two people have burst into tears after looking around. They're so happy to be back in this space and are so pleased with the expansion."

### Libraries:

#### Lyman Beecher Brooks Library, Norfolk State University, Norfolk, VA – USA 2012

06.01.2009

#### GROUND BROKEN FOR NEW LIBRARY PROJECT AT NORFOLK STATE UNIVERSITY

ATLANTA, GA (June 8, 2009) John Portman & Associates, Inc. (PORTMAN) is pleased to announce the beginning of construction on the new Lyman Beecher Brooks Library and Campus Greens at Norfolk State University in Norfolk, Virginia. The firm created the design for this project.

Located at the geographic center of the campus, the positioning of the new library creates a new west "academic" quadrangle and a new east "student life" quadrangle. Plazas at both library entrances along the primary East-West pedestrian thoroughfare of the

campus provide gathering spaces and outdoor study areas with access to the campus' wireless data network. The new library is an important step in fulfilling the campus masterplan, also conceived by John Portman & Associates. The 132,000-square-foot library features a unique sinuous form that responds to the constraints of the site. The building is anchored by a dramatic 3-story, glass enclosed rotunda soaring over 90 feet in height and bringing natural light into the library's interior, a lively, activated and inviting space that will accommodate the University's growing student population. Conceived to be a distinctive signature building for Norfolk State, the new library will be state-of-the-art with a technology-rich Information Commons, Computer Resource Lab, e-Learning Center, and Internet Café. In addition to traditional book stacks and reading spaces, the building will contain 30 study rooms, a graduate student research room and a large meeting/instruction room that will accommodate up to 50 people and include the latest in audio-visual capabilities. The design team is pursuing Silver level LEED certification, as sustainability practices have been of utmost importance throughout the design process. The project team includes local architect of record Moseley Architects, library experts Jay Lucker and Tappe Associates, and technology consultants, Waveguide. The Fall 2011 opening of the new library will be followed by the completion of the new campus quadrangles in Spring 2012. (<http://www.portmanusa.com/newsitem.php?id=5537&category=archive>)

## **Antoine Predock Architect PC, Albuquerque, NM – USA**

<http://www.predock.com>

### **Libraries:**

#### **School of Architecture and Planning, University of New Mexico, Albuquerque, NM - USA 1999/2007**

In association with Executive Architect Jon Anderson.

The new School of Architecture and Planning at the University of New Mexico is driven by the necessity of making a building that inspires and teaches students about the potential of architecture. This notion is intersected with the desire to allow the building to be shaped by specific environmental, urban and campus forces. Additionally, the timeless relationships between building and environment from the cliffs of Canyon de Chelly to the mute, powerful walls of Anasazi architecture, conceptually and materially inform our project. The building optimizes envelope while still incorporating these forces.

Believing that a student can be engaged and actively learn from the intrinsic qualities of the spaces in which they work, the project accomplishes this on a multitude of levels. First, by revealing infrastructure and environmental systems such as the cooling tower/solar engine loop. Second, by demonstrating how plan and section are connected in a complex relationship linking light, spatial flows and structure. This is most clearly evidenced where the studios and seminar rooms form a layered canyon of modulated light. Third, places like the 'hanging' seminar rooms and the rooftop terraces call into question the conventional occupation and programming of space.

The articulated wall on Central Avenue becomes a new abstract sign along Route 66. Its solar apertures relate to moments of equinox and solstice throughout the year. Nomadic occupation of the studios and the possibility of student encampments on the terraces contrast the physicality and permanence of the concrete wall. Following the campus design directives, the massing and color of the building exterior relates directly to the stepped forms and the earth-colored stucco that define and bring cohesion to the UNM campus. (Predock)

Designed by world-renowned architect Antoine Predock, FAIA, the AIA 2006 Gold Medal recipient, George Pearl Hall is a state of the art learning and teaching facility. The 108,000 square foot building is the gateway to the UNM campus and home of the School of Architecture and Planning. With five levels of academic space, the building contains undergraduate and graduate design studios, a critique bridge, classrooms, computer labs, fabrications lab, exhibition gallery, and auditorium. The Fine Arts Library occupies the full fifth floor and has become a favorite study space for students from throughout the UNM campus.

(<http://saap.unm.edu/about/the-building/index.html>)

The UNM Fine Arts and Design Library supports the teaching and research programs of the University in the fields of architecture and planning, landscape architecture, art, music and photography. Over 200,000 items including books, periodicals, art exhibition catalogs, music scores, sound recordings, videos, as well as several collections of rare and unique works in the fine arts are housed on the top level of Pearl Hall. For details and hours, visit the Library website.

(<http://saap.unm.edu/about/the-building/fine-arts-library.html>)

#### **Green Valley Community Performing Arts and Learning Center, Green Valley, AZ – USA Phase I 2004.Phase II 2007**

### **Awards:**

**American Architecture Award 2005**

**Rome Prize 1985**

**American Institute of Architects Gold Medal 2006**

**Smithsonian Cooper-Hewitt, National Design Museum's Lifetime Achievement Award 2007**

**Green Valley Performing Arts & Learning Center Pima Community College Green Valley, Arizona 1996/2004**

Sited at the head of a small arroyo, the Green Valley Community Performing Arts and Learning Center (CPA/LC) is positioned in the landscape to maximize views to the Santa Catalinas, Santa Ritas, San Cayetano Peak and the distant Tumacacori Mountains while creating a shared Learning Center/Theater courtyard protected from dust laden prevailing southwest winds. A future 250 seat outdoor amphitheater also oriented for views anchors the theater complex to the site and expands out into the landscape. The amphitheater is accessed from the covered walkway and continues, to define the south edge of the courtyard. The procession begins with the approach to the Community Theater/Learning Center complex. Viewed from a distance, the shimmering copper clad theater nestles within the desert colored concrete forms of the stagehouse, rehearsal rooms and Pima College multipurpose space. The lower volumes of the theater-back of house and the Learning Center will be earth colored stucco. The larger volumes of the theater serve as wind breaks and provide shaded areas within the courtyard. A grove of Palo Brea trees creates an oasis within the courtyard while a covered walkway wraps the courtyard linking the Theater with the Learning Center. This basket-like layering of translucent glass defines a crystalline realm where visitors observe and participate in theater. Edge lighting of the glass broadcasts into a diffuse glowing light that also functions as house light. Glass at the ceiling screens catwalks and technical ledges while dissolving into acoustically shaped wall surfaces. This lining acoustically focuses sound in the manner of a Direct Reflected Sequence performance space. The Learning Center defines the northwest edge of the courtyard and creates its own internal protected courtyard for circulation. This allows classes to spill out into a protected outdoor area as well as encourage interaction between different classes. Future additions to the Learning Center would continue within this framework, further defining the main courtyard and providing protection from the sun and wind. Outdoor circulation takes advantage of Green Valley's climate and the views from the site. (Predock)

In association with Burns, Wald-Hopkins Architects as the Executive Architect

## Robert Hoag Rawlings Public Library, Pueblo, CO – USA 2000 – 2003

### **Awards:**

The AIA Western Mountain Region Honor Award 2004

Located in Southern Colorado, Pueblo is sited at the foot of the Wet Mountains where the Great Plains meet the Rockies. Pueblo is both a geographical and cultural crossroads. Native nomadic cultures gathered at the confluence of the Fountain and Arkansas Rivers living off of the rivers and the grazing buffaloes. Later farmers and ranchers settled the plains with domesticated livestock. In addition to the natural geography, Pueblo was also influenced by the railroad. A major north/south line crosses a major east/west railroad line, bringing industry to Pueblo, and resulting in a culturally diverse population. Pueblo's steel and brick industry brought migrant workers to the community adding to its demographic diversity. The new library is a careful response to this natural and cultural landscape. The new 109,000-sf library incorporates the existing site and a portion of the existing library as well as spanning across Bates Lane to additional property to the south. The new facility will rise five stories, taking full advantage of the views over the Arkansas Valley and historic Pueblo to the east, as well as distant mountain views such as Pikes Peak to the north, the Wet mountains to the west and Greenhorn and the Spanish peaks to the south. A south-facing courtyard greets patrons at the library entry. The new courtyard is planted with fruit trees and is bordered by a reflective pool referencing Pueblo's agrarian roots and relationships to water. The courtyard is overlooked by a lobby with glass elevators that extend past the full height of the building becoming a light beacon at night. Portions of the building are firmly grounded and expressed as a warm tone cast-in-place concrete analogous to surrounding topography. The sky wing that extends over Bates Lane is anchored by warm tone concrete walls that buttress both sides of the street which is spanned with a glazed bronze clad wedge that contains primary reading areas and popular book stacks. Entering the library one is presented with commanding views to the east over the Arkansas River and downtown through a 56' tall glazed lobby wall. The main floor contains book check in / check out, the children's library and a coffee/ juice bar that opens to the main lobby and entry courtyard. The children's library defines the north edge of the entry courtyard with a glazed wall greeting visitors with books and children's activity while passing through the courtyard to the main entry. Patrons ascend a grand staircase off the main lobby or take the glass elevator to the second level that houses the library's main collections. This large open floor radiates outward from a central hub. The information service desk along with computers and Internet access is located near the center. The non-fiction collection is housed to the east in a portion of the remodeled existing library. To the northwest, reference and fiction collections, comprised of new materials, magazines and audio/visual collections, open to planted terraces and the entry courtyard below, spanning over Bates Lane to the south. The third level houses the library's special collections as well as the library's administrative offices. The heavily used genealogy collection overlooks the courtyard below and is open to mountain views to the south. The premier Western History collections are open to a two story glazed opening aligned with Pikes Peak to the north. Administrative offices are located in the sky wing spanning over Bates Lane. Located on the south end of the skywing is a shaft lounge that opens to a private terrace that is covered by a tapered cantilevered trellis above. Employees have access to a secondary entry on the south side of Bates Lane. The upper level of the library occupies the highest part of the wedge over Bates Lane; a special meeting room and 'Infozone' are housed here in a penthouse fashion. The special meeting room contains a catering kitchen and opens to planted terraces both to the north and south with views of the Colorado Front Range. Cantilevered past the end of the wedge, the 'Infozone' is aligned with a view to the north and to Pikes Peak.

In association with Executive Architect Anderson Mason Dale. (Predock)

## Las Vegas Central Library and Childrens Museum, Clark County Library District, Las Vegas, NV –USA 1990

The fragility of both the desert and the communities which colonize it is apparent when one views Las Vegas, Nevada from the air. The Strip, Glitter Gulch, and the city form a thin, permeable membrane which keeps the desert marginally at bay. Where the desert relents, rectilinear grids of grass and asphalt parking prevail. The Las Vegas Central Library and Children's Museum are built at the cultural heart of the city where temporary Paiute shelters and later permanent Anglo-American settlements were sited. Visitors experience the library and children's museum as desert building and civic monument. These overlays surface immediately in the Palm Court which signals shelter and convenient automobile access. From this area one follows the water course and sandstone wall to the entry. Ceremonial elements of the complex impinge on this building forecourt: the conical Birthday Room, the Science Tower, and the Meeting Room. Access to these pieces is through the lobby fissure which delineates the programmatic bifurcation of the building — museum to the west and library to the east. The Children's Library physically bridges this architectural and conceptual break. Its blue sky metal vault spans from the massive landform of the two-level exhibition areas to the aggregated village form of the library below. The sandstone wedge which is lodged at the north end of the building houses the administrative areas of both the Museum and the Library District. From the shared Boardroom at the top level, visitors view a subtly intricate panorama. Fragments of mountain, desert, casinos, neighborhoods, and technology come into focus from perimeter openings. This visual confluence of nature, fantasy, urbanization, and science underscores the complexities of the desert environment and the task of making architecture responsive to its many faces. (Predock)

## Mesa Public Library, Los Alamos, NM – USA 1994

Located in the Jemez Mountains, the area is home to rich pine forests, grassy meadows, and dramatic rock formations. The historical cultural development of Los Alamos, New Mexico has no parallels. This alpine mesa has witnessed numerous settlements: Native Americans from nearby valleys had used the mesa for summer grazing and farming; late nineteenth century homesteaders established small ranches and farms there; the exclusive boys' ranch school of the town was appropriated by the federal government during World War II to become the home of the Manhattan Project. Most residents of the community today are affiliated with Los Alamos National Laboratory, an outgrowth of the original military research outpost. The new library is a sculptural abstraction of and a careful response to the surrounding natural context. Special care was taken in siting the building to minimize impact on existing trees and vegetation. The library sits low, spreading into a curve on the north side in response to the panoramic views. A tall wedge built of stone, analogous to the nearby Tufa stone ridges in the Los Alamos area, cuts through the building. Where the wedge intersects the building, a warm southfacing courtyard is created and serves as the main entry. (Predock)

### **Libraries:**

## Rochdale Branch Library Adult Learning Center, Renovation and Addition, New York, Queens, NY – USA 2013

Owner: Quens Library, NYC Department of Design & Construction, Jamaica, Queens NY, Budget \$ 2.200.000

Rochdale Village Library is a single story, 7,500 sqf. Building constructed in 1969. Queens Library is enlarging the existing Adult Learning Center with new 1,700 sqf. Addition to provide classroom space, a staff room, individual learning stations, and storage. The site is on the periphery of Rochdale Village along 137<sup>th</sup> Avenue in Jamaica. The 1969 existing building is “y” shaped, with a hipped Howard Johnson-styled roof with a spire in the center. Our trapezoidal shaped addition extends in plan the area of the existing ALC to the east and north up to these lot lines. A lower-roofed glazed “tube” connects the new addition to the existing building. The addition is treated as a “site wall” forming an enclosure to the site on the east. The wall is clad in Cor-Ten (weathering) steel plates, hung from the structural wall. The plates are arranged in a staggered pattern, with “slot” glazed openings placed within the pattern to reinforce points in the plan and to provide “peek-a-boo” views from the inside to the outside. A continuous skylight runs along the east side of the new roof to provide daylight into the learning center. A planter is located on the roof along this east side with plants spilling over and softening the east wall. The existing rear yard has several mature trees. The new addition looks out on (to the west) and enlivens this yard, giving it a new garden identity. A new cast-in-place concrete wall is located on the north property line to enclose and define this garden. (Predergast)

#### [Kingsbridge Branch Library, New York \(Bronx\), NY – USA 2011](#)

\$ 4,200,000

#### **Awards:**

NYC Art Commission for Excellence in Design 2005

The design for the new Kingsbridge Branch Library is a response to both the program and the unique features of the site. Located at the northwest corner of Corlear Avenue and West 231<sup>st</sup> Street, the site is 12 feet below street level. Heavy stone retaining walls define the east and south sides of the site, while the north side is level with the lower floor of the adjacent synagogue. The west side retaining wall abuts a commercial property. The library will provide approximately 12,000 sqf. on two levels. The building is set back about 14 feet from the east and south street lines creating a sunken courtyard defined by the new building and the field stone retaining walls. The library is reached by a bridge spanning this garden. To maximize natural light and to bring daylight to the lower level, our scheme proposes a 2-story 25' high glass window wall facing south and east. Sun is controlled by an external metal brise-soleil. The upper floor is set back about 8' from this wall, creating a two-story atrium. The main stair is located in this space, providing a pivotal point between the two levels. The elevator tower is incorporated into the entry bridge and vestibule creating a campanile-like element in the complex. The Community Room is expressed as a curved-face metal-clad rhomboid which anchors the corner and frames the primary glazed façade. The building also features a Green Roof, which provides not only heavy insulation for energy conservation to ease the load on the borough's overtaxed storm sewer system. (Predergast)

#### [Sedgwick Branch Library Addition, New York, NY \(Bronx\) – USA 2002](#)

\$ 1,600,000

#### **Awards:**

Architectural Record Magazine 2005,6

The Sedgwick neighborhood in the Bronx is an area in transition. Housing is being rehabilitated while University Avenue (Martin Luther King Jr. Boulevard) has been developed with a new park-like median strip. Businesses along the boulevard are also starting to thrive. The new branch library replaces a small existing facility and represents an important step in the neighborhood revitalization. The proposed library offers the community reading and reference material for adults and children, while also providing space for community activities. The site is triangular, at the corner of University and 176<sup>th</sup> Street. The design expresses the two main functions. The main reading areas are housed in a long rectangular volume fronting University Avenue. A long gallery faces the exterior plaza to the north and serves as a main circulation spine. Adjoining this volume is a conically-shaped stainless steel-clad multipurpose room housing community activities. The cone shape establishes the library as the focal point or beacon to the neighborhood. The site has been designed by artist Sandy Gellis. A series of stepped contour lines is punctuated by etched steel shafts, tipped with phosphorescent caps (which glow at night), in the pattern of the Signa Galaxy. Rock formations evocative of the native stone of the area form a counterpoint to the steps. In 1994, the new Sedgwick Branch Library building that our office designed for The New York Public Library opened to the public. The design was distinguished by a conical-shaped metal-clad community room and an environmental art exterior court design by artist Sandy Gellis. The building won acclaim for its innovative design, and was featured on the cover of Architectural Record Magazine. In 1998, the Library returned to Predergast Laurel Architects to design an addition to the building that would double the program capacity to accommodate neighborhood demand. The new program required the addition of a second story, thus separating and expanding the adult and children's reading areas. The scheme also provides additional staff offices, a new elevator, and a skylit public stair. A new steel-framed second story was built on top of the existing masonry first floor. The second floor is clad with cement panels on lightweight metal stud construction. A new steel bow-string truss canopy highlights the main entrance on University Avenue. A series of triangular-shaped monitor skylights were installed to illuminate the second floor reading room. The building has been completely upgraded with new finishes, lighting and furniture. The design expressed both the library and community functions. (Predergast)

#### [South Beach Branch Library, New York, NY \(Staten Island\) – USA 2001](#)

\$ 400,000

The New York Public Library's South Beach Branch in Staten Island is one of the system's newer facilities. The library leased space a concrete block commercial storefront facing Robin Road. This building houses small neighborhood branch for adults and children. Our design solution left the original building structure exposed, thus heeding the budget and making a virtue of necessity. The steel roof joists and block wall were blended with new ductwork and lighting carefully woven into the existing fabric. A new vestibule was created to define the entrance. The central feature of the scheme is the main circulation desk. The desk includes sloping galvanized steel-clad wall intersected by an elliptically shaped overhead grid and a synthetic stone counter. The materials used throughout are industrial grade, including MDF paneling, maple plywood window boxes and exposed steel. Color is used to enhance the spatial organization, including the areas surrounding the circulation desk and children's storytelling. (Predergast)

#### [Brooklyn Heights Branch Library, New York, NY – USA 1993](#)

\$ 4,500,000

The Brooklyn Heights Branch of the Brooklyn Public Library houses two libraries in one: the Business Library and the Brooklyn Heights Branch. The building was built in 1961 with two floors of approximately 30,000 sqf. The project involved the complete interior renovation of the building, including its reading rooms, staff facilities, entries and service spaces. The addition of two new wings has expanded the children's and adult reading rooms. In addition, a new auditorium was incorporated into the first floor. The design seeks to enhance the building's public image within Brooklyn's Civic Center. The new addition faces the intersection of Tillary and Fulton Streets. A new curved facade faces north with a small park space completing the corner, thus helping to define and punctuate this intersection. The original materials, limestone and granite, have been chosen for the addition, however, they are used in a more articulated way. The interior is redesigned to rationalize the layout, making reading materials more accessible. The Business Library's design addresses the newer forms of information retrieval and accommodates new microfiche and microfilm stations. (Predergast)

### **Libraries:**

#### **Texas A&M Sterling C. Evans Library Renovation, Galveston TX – USA 2011**

**Agricultural AND Mechanical College of Texas**

In June of 2007, the Texas A&M University Libraries embarked on a journey to "re-imagine" its physical spaces from the user's perspective. With a population of almost 50,000 students, the goal from was to design student-centered learning spaces on the first floor of the main facility — the Sterling C. Evans Library.

To ensure student input they began with an extensive outreach campaign. Large "If I ran the library..." posters and accompanying floor plans were hung in strategic areas on the first floor of Sterling C. Evans Library where the renovation was to take place. This information was also replicated on the Libraries' website. Students were encouraged to draw their ideas and comments on the floor plans. Based on the initial feedback, a series of increasingly focused questions were posted for additional input and clarification. The outreach campaign culminated with several focus groups.

The outreach campaign indicated, the students desired aesthetically pleasing group and quiet study areas, comfortable, ergonomic seating and work spaces, expanded access to our popular coffee shop and easier access to service staff and expert librarians. Design elements such as improved lighting, warmer colors, and soft textures were incorporated to create more "inviting", "comfortable", and "welcoming" spaces -words that regularly emerged from student comments and focus group discussions.

The newly redesigned first floor moves from highly interactive areas with the coffee shop, service desk and collaborative group areas to quiet and reflective study areas as a user moves further into the building. Overall design took into consideration the need for flexible furniture and collaborative areas, where possible, with intuitive access to services and expert help. The completed project includes the following highlights:

- A consolidated service area for one-stop circulation, interlibrary loan, and reference assistance.
- Custom designed research consultation workstations to better accommodate librarian and user collaboration adjacent to the new service desk.
- An expanded and integrated cafe with an additional 70 seats.
- Twelve new large study rooms for collaborative work and presentation practice. Seven of these rooms include wall-sized whiteboard areas.
- Flexible study booths for additional group study space.
- Comfortable and quirky lounge furniture in the form of human-shaped deck chairs.

Re-imaging the library from the user's perspective was our guiding principle throughout the project. We achieved this goal by actively encouraging student participation in the design process instead of making our own assumptions about student needs. Our new spaces allow for increased collaboration between students as well as between students and librarians. In addition, the comfortable, attractive spaces and furnishings offer a welcoming experience for all users. (Prozign)

#### **City of Houston, Jesse Jones Central Library, Houston, TX – USA 2008**

Prozign completed renovations to the Marston Building that were required by the City of Houston

Public Library as a means to permanently relocate their Administrative Departments and Facilities and Project Management Group from the Jones Central Library Building. The move allows the areas vacated by these departments to be reassigned as general public spaces for Children and Teen program areas, reading rooms, staff lounges and HPL staff work stations. The construction budget for this renovation project was \$1.3 million, and included demolition, new build-out for offices, toilets, meeting rooms, staff lounges and upgraded mechanical, electrical, and plumbing equipment. ADA compliance issues and conditions have been addressed for the new construction, as well as general building repairs. Services provided: Programming, master planning, design, documentation, and construction administration. (Prozign)

#### **Golden Gate University, Master Plan and Campus Modernization, San Francisco, CA – USA 2013**

##### **(Golden Gate University, School of Law Library, San Francisco, CA – USA)**

For over ten years, Ratcliff has been engaged at Golden Gate University (GGU) providing master planning and design services for numerous projects, ranging from small tenant improvements to more extensive renovations and additions in buildings completed as early as the year 1913 up to those completed in 1978. Starting in early 2000, when the firm was asked to produce a facilities master plan, the goals of the university included consolidating space and functions for streamlined facility efficiency, improving access and circulation for students and staff, upgrading building systems to support state-of-the-art learning environments and articulating a new professional identity to the local business community. When complete, the campus improvements will total over \$60 million in construction cost. The first phase of construction was the addition of a nine-level silo housing new mechanical and telecommunications equipment and infrastructure that fed the adjacent classroom wing in the main academic building at 536 Mission. The new building systems allowed for improved air quality in the existing classroom wing and supported the incorporation of new multi-media systems into the renovated 2nd floor auditoria and third floor classrooms creating state-of-the-art learning environments. The next series of projects addressed the expansion and renovation of the Law Library. The goals of the expansion were to increase stack capacity while also providing more study space for law students. The first step involved a 10,000 sf remodel of an existing lower level of the Library installing compact shelving systems and new study carrels while also updating finishes, lighting and mechanical systems. The goals of the expansion were to increase stack capacity while also providing more study space for law students. The first step involved a 10,000 sf remodel of an existing lower level of the Library installing compact shelving systems and new study carrels while also updating finishes, lighting and mechanical systems. In order to free up space for the remaining Law Library expansion, the firm then undertook the renovation of an adjacent historic warehouse located at 40 Jessie Street. The renovated space provided space for relocated university departments, allowing GGU to consolidate all school functions within its two main campus buildings. The concrete warehouse building, originally constructed in 1913 for the manufacture of ship boilers, was bequeathed to the University in 1990 and had been used primarily as a staging and storage area. The project increased the building's capacity to 50,000 s.f., adding three increased the building's capacity to 50,000 s.f., adding three levels, Floors 2, 5 and 6 and renovating existing floors to create a new Student Services Center and University administrative offices. Once the 40 Jessie Street renovation was complete, the Law library expansion could continue into newly vacated space which was then reconfigured to include a new reading room, new main entrance, a new reference desk and staff offices. The new reading room and entry enhance the Law School's visibility and overall campus profile in San Francisco's downtown

Financial District. Along with ongoing tenant improvements to fill out remaining space at 40 Jessie Street, the most recently completed work at GGU is the renovation of the sixth floor at 536 Mission. Existing classrooms were converted into an executive conference center and include new finishes, lighting, furniture and a state-of-the-art audio visual system that will allow events to be captured digitally and posted online. The President's offices, adjacent to the new conference center, were also renovated as part of the work. Upcoming projects include the design of a Litigation Center for the Law School, which will include a suite of Moot Courtrooms, Practice rooms, and conference rooms for use in litigation instruction and Moot Court competitions. Future renovation of remaining existing classrooms and faculty office spaces are also planned. Secure in its future in the San Francisco Financial District, Golden Gate University (GGU) is expanding its law library and renovating its facilities to meet the long-term needs of its students. GGU called upon Ratcliff, the architectural, planning and interiors firm, to update its ten-year facilities master plan that incorporates 328,220 square feet of both existing and new campus area. The resulting master plan solution provides a new, more inviting identity for the campus at street level and successfully accommodates all schools and departments within the existing campus locations of 536 Mission Street and 40 Jessie Street. "Golden Gate University is committed to being an adult-centered, urban university and this master plan provides the campus with the facilities to meet future facility demands for its students," says Jeff Bialik, GGU's vice president of operations and CFO. "Because Ratcliff engaged participants from every level of the university in an interactive collaborative process, the plan is enjoying a high level of support from the entire campus." While GGU embarked on the master planning process as a result of the sale of its 62 First Street property and anticipated relocation of the departments therein, the need to expand and improve GGU's Law School Library soon emerged as the key driver of the revised master plan. GGU's expanded Law School Library will occupy three floors in the 536 Mission Street building and will include seating for 400, shelf space for a collection of 175,000 paper volumes, computer lab stations for 60, and office space for 20. The new campus entry and front door presence of the Law School Library is viewed by the university as essential for serving the academic support needs of its law students. Overall, the GGU Master Plan consists of ten phases spread over a fourteen-year span, of which the first three phases were completed in 2002. The remaining seven phases, which are the focus of the revised plan that was approved in March 2004, are slated for completion in 2014. They include a two-story addition to a university-owned warehouse building at 40 Jessie Street that formerly housed Swallow Printing. This addition will allow GGU to completely absorb the departments displaced from the university's sale of the 62 First Street building by August 2008, as well as from the expansion of the law school library. Specific elements of the plan will evolve over time as the design process is completed for each phase. Founded in 1901 in San Francisco, Golden Gate University is California's fifth largest private university. GGU meets the needs of working adults by offering undergraduate and graduate programs in business and management, information technology, taxation, and law. GGU is accredited by the Western Association of Schools and Colleges. The School of Law is also accredited by the American Bar Association, the State Bar of California and the Association of American Law Schools. Headquartered in Emeryville, California, Ratcliff is a third-generation architectural, planning and interiors firm. Ratcliff's current higher education clients include the University of California, Berkeley, Vista Community College in Berkeley, California, and Saint Mary's College in Moraga, California. With a staff of 65 design professionals, Ratcliff offers a broad range of services for health care, higher education, and housing/hospitality clients throughout the Western United States. (<http://www.prnewswire.com>)

#### **University of California, Berkeley School of Law, South Addition, Berkeley CA – USA 2011**

UC Berkeley School of Law broke ground on an innovative South Pavilion Addition last month (November, 10, 2008), a 52,000-square-foot library and academic building that will accommodate the top-tier law school's programmatic growth. Architect of the project is RATCLIFF, of Emeryville, CA, who achieved the substantial building size within a modest footprint by placing two of the three building levels below ground. The building site is the law school's former courtyard and construction will occur over the next two and a half years. The project is anticipated to achieve LEED® Gold certification.

At the same time, the existing Berkeley Law facility will undergo renovation to provide new "smart technology" classrooms, seminar/teaching facilities, and expanded space for student activities.

In the past four years, Berkeley Law ([www.law.berkeley.edu](http://www.law.berkeley.edu)) has expanded its faculty by 25 percent, added a number of new research centers, and planned for continued expansion. Through a series of phased renovations and the new addition, RATCLIFF ([www.ratcliffarch.com](http://www.ratcliffarch.com)) is assisting the law school to meet the demands of a new generation of students, including access to cutting-edge technology. By January 2009, the existing Boalt Hall building will include a new state-of-the-art distance learning center, newly renovated classrooms including a moot courtroom, student organizations and law journal offices, and new faculty offices.

"We are excited about the new addition that RATCLIFF has designed for us and also pleased with their creative renovations of our existing building," said Kathleen Vanden Heuvel, Associate Dean for Capital Projects, director of the Law Library, and adjunct professor at UC Berkeley School of Law. "Our students and faculty are going to benefit greatly from having better equipped classrooms, more space for interaction and study, and well designed offices."

The new addition will house highly efficient library stack space and a combination of reading rooms, seminar spaces, computer labs, library staff offices, and collection services in the two light-filled underground levels. Large skylights and open stairways will introduce an inviting environment in the above-grade level, complete with a large classroom flanked by a café that will provide an interactive gathering and study space for students. A second level roof-deck garden above the South Pavilion Addition will provide plenty of outdoor seating with a connection to the library's main reading room and a footbridge to the Steinhart Courtyard. The newly landscaped east and west entryway courtyards will create a vibrant transition from the complex to Bancroft Way.

A key component of Berkeley Law's master plan is the relocation of the existing library collections out of the central stack area in Boalt Hall into the lower level of the courtyard addition. This will improve the circulation and flow of the building's existing levels 4, 5 and 6, which are interrupted by the isolated central stack core. A future phase would convert the existing stack area into clinic and research space. The renovation and construction projects will include improved site circulation and wheelchair accessibility improvements throughout the school and a new outdoor plaza on the western edge of the law school. RATCLIFF has teamed with Lynn Simon & Associates to help meet a goal of LEED Gold certification for the new structure. They will integrate sustainable features into many aspects of the design, including:

A green roof to provide a vibrant open space for students, faculty and staff; detain and clean storm water; and insulate the spaces underneath.

Low-flow faucets and toilets that will use 40% less fresh water (as compared to the standards of the Energy Policy Act of 1992).

Efficient lighting and heating, ventilating and air conditioning systems that will use 30% less energy than the California energy code allows.

Wood that will be certified as sustainably harvested by the Forest Stewardship Council - the most protective forest certification program in the country.

Healthy indoor air quality through increased ventilation strategies, advanced filtration, and the use of low-emitting materials including paints and carpets.

"We are excited to assist Berkeley Law in meeting its strategic goals," says Joseph Nicola, director of RATCLIFF's academic practice. "In partnership with the university, we are creating the law school of the future, complete with the latest instructional technology and a design that improves the educational experience for students and faculty alike." (Ratcliff)

The 55,000 square foot addition to the UC-Berkeley Law Library appears like an open and transparent one-story pavilion from the street, but it has a huge impact on the law library as well as the law school. That's because 44,000 square feet of library and connections to other parts of the law school are below ground. The 11,000 square feet above ground provide the perfect segue to the pedestrian scale of the streetscape.

Wedged between two courtyards, the pavilion-like structure is home to a café, student lounge, and lecture hall. Above it is a rooftop garden complete with dining areas, teaching and study spaces, and special-event capabilities. Indoor-outdoor social and academic activities are found elsewhere in the building, like the student lounge, whose movable glass walls open to a courtyard.

A clear set of project objectives—flexibility, shared spaces, appealing street presence, improved circulation, beauty, and materials that match the stature of the school—led to the stunning results.

**A site challenge**

Conquering constraints may be why this project is so successful. It was no easy task to fit the addition into a former courtyard surrounded by the law school. The creative solution—to put two floors under ground—led to extraordinary results. It resolved the pedestrian traffic jams in the former overly packed library stacks by moving the collection into automated compact shelving in the new addition's two underground levels.

Surprisingly, these underground floors are filled with daylight. An expanse of glass connects the addition to the original structure and, in the process, allows daylight into the lower levels. Glass paving in the courtyards and skylights in the planter beds serve as daylighting conduits to a very pleasant and open experience on the lower levels. That's ingenious.

**A wonderland**

Dark-stained cork flooring is a dramatic stage on which light and the neutral tones of the elegant materials and finishes perform. Along with the cork flooring, variegated cedar clads the ceilings above the reference desk to buffer sound and create the quiet needed for legal study. A monumental staircase of glass and granite is another conduit for light into the lower levels as well as a suggestive link between indoor and outdoor spaces. The backdrop of Indiana white limestone walls as well as figured eucalyptus walls makes this library a wonderland of beauty.

The building is on track for LEED Gold certification, and its sustainable strategies include an important symbolic gesture—restoration and reuse of the 100-year-old mahogany study carrels from the original building.

The addition becomes more open, airy, and public as it rises from floor to floor. At the lowest level is the least natural light, the most stacks, and some reader seats. The next level up has skylights, and it is used for staff offices, the service desk, reading rooms, conference space, and a student center. The third level up is dedicated to the café, lecture hall, lounge, and classrooms. Finally, the fourth level contains the main reading room, dean's conference room, classrooms, and a bridge. Visitors crossing over the bridge find a comfortable rooftop garden designed for outdoor learning and relaxation.

This addition, thoughtfully detailed to take advantage of the vista, including views of the Golden Gate Bridge, ties elegantly to the existing buildings and courtyard spaces. Who wouldn't want to walk by this building and, perhaps, stop and rest on its steps or in its café? A simple open and transparent box, it makes the most of the space to meet programmatic needs while creating a meditative experience for students and faculty.

"This is a wonderful diminutive project that ties to some real hulks of buildings in a delicate and beautiful way. It makes the existing buildings much richer, better," one of the judges wrote.

If buildings could talk, the ones surrounding this gem would sing its praises.

<http://lj.librariesjournal.com/2012/06/buildings/national-landmark-academic-library-2-berkeley-law-library-university-of-california-berkeley>

#### **Foothill-De Anza Community College District, Media and Learning Center, Cupertino CA – USA 2010**

RATCLIFF programmed and designed the new Media and Learning Center for De Anza College, a two-story synergistic environment where students, teachers and staff participate in state-of-the-art, technology-enhanced teaching and learning.

At the initial phase of the design, RATCLIFF provided feasibility studies to develop alternate site planning options to the original master plan. Based on the study recommendations, De Anza College made the decision to realign the existing loop road and turn the building 90 degrees to an east-west axis. This placed the building in an optimum solar orientation, maximizing the building perimeter for day lighting and harvesting solar energy. The new building is designed to attain LEED® Platinum certification. The new road alignment demarcated a larger building site, opening up an opportunity to create a new campus quad adding outdoor teaching/learning spaces and a landscaped gathering place for social interaction. The building contains classrooms, laboratories, TV studio and departmental spaces for Distance Learning, Staff Development and Tech Resources. Organized around a sky-lit atrium, the building integrates gathering spaces with circulation, creating converging crossroads where spontaneous encounters can take place. A modular planning approach ensures the flexibility to adapt the building to future changes in use and technology. Universal classroom modules can easily be re-configured to accommodate different seminar, lecture and small group settings. Adjacent pairs of 40-50 seat classroom modules can be joined to create larger 80-100 seat classrooms. (Ratcliff)

#### **Peralta Community College District Laney College, Computer Technology Center, Oakland, CA – USA 2006**

Ratcliff renovated a vocational educational space (formerly a welding shop), into a multi-use technology center serving as a general-purpose multimedia teaching laboratory for the Laney College campus. Located on the ground floor, the newly renovated space offers state-of-the-art technology, serves as a model of current trends in CIS technology and provides a new entry sequence and prominent new identity for the building. Developed in collaboration with local community business and educational leaders, the Center was designed to meet the varied needs of the diverse communities that the College serves and includes two 24-station laboratory classrooms, two 42-station specialized multimedia labs, offices and conference room all organized around a secure central control room/hub in an architecturally innovative and ergonomically engineered setting. The underside of the original welding shop offered an expansive atmosphere and allowed for the reflection of light from the suspended up-lighting. The perforated metal screen ceiling is shaped to reflect the concentric layout of training tables and creates a more intimate environment with the illusion of a lower ceiling. The judicious application of materials establishes a distinctive and lean aesthetic while also creating a feeling of openness. Developed in collaboration with local community business and educational leaders, the Center was designed to meet the varied needs of the diverse communities that the College serves and includes two 24-station laboratory classrooms, two 42-station specialized multimedia labs, offices and conference room all organized around a secure central control room/hub in an architecturally innovative and ergonomically engineered setting. The underside of the original welding shop offered an expansive atmosphere and allowed for the reflection of light from the suspended up-lighting. The perforated metal screen ceiling is shaped to reflect the concentric layout of training tables and creates a more intimate environment with the illusion of a lower ceiling. The judicious application of materials establishes a distinctive and lean aesthetic while also creating a feeling of openness that invites daylight and quality air flow. Oriented strand board is creatively applied and provides balance within the space, offering both hard surfaces and an organic texture from the natural world. This minimal approach toward finishing the space reflects our environmental philosophy to use only what is needed. (Ratcliff)

#### **Peralta Community College District: Berkeley City College New Campus: Berkeley City College, Berkeley, CA – USA 2006**

Peralta Community College District selected RATCLIFF to design a permanent campus for Berkeley City College. The new \$46 million, 165,000 s.f. facility, completed in 2006, accommodates all existing academic programs and administrative space, as well as providing flexibility for growth as programs evolve to meet the needs of the community in a "single building urban campus" setting. Located in downtown Berkeley, the college benefits from its proximity to local resources such as the Berkeley Repertory Theater, Public Library, the University of California, and public transit.

The new building design includes over 30 classrooms and computer labs; biology, chemistry, and physical science labs; and a 250-seat lecture hall. The lecture and classrooms spaces located on the lower level can be utilized as a conference center for outside entities. Library and Learning Resource Centers, with shared computer labs, are conveniently located on the main floor and are evident to passing pedestrians through a transparent glassy north façade. A central, six-story atrium serves as the interactive hub of the building and serves multi-purpose needs such as student lounge, exhibit space, registration surge space and pre-function lobby for conference functions. The atrium is topped with a monumental skylight that allows natural light to filter down through the building. Adhering to energy-efficient and sustainable design measures, the building received a LEED® Silver rating from the United States Green Building Council—the first academic building in the City of Berkeley to earn such a distinction. (Ratcliffs)

## **Ratio Architects, Indianapolis IN – USA**

**KEVIN HUSE, AIA: ASSOCIATE PRINCIPAL**

Previously with Woollen Molzan and Partners, Inc., Kevin's specialized focus is the programming and design of academic libraries and learning centers and public libraries throughout the country. He has worked with approximately two dozen libraries and is a strong advocate for the library as the technology hub for campuses and a thriving student destination for collaborative learning, research and socialization.

<http://ratioarchitects.com>

### **Libraries:**

#### **East Stroudsburg Keystone Academic Commons, East Stroudsburg University, East Stroudsburg, PA - USA 2018**

RATIO Architects: Library Programming & Planning / EwingCole: Architect of Record architecture / programming & planning, Sq. Ft.: 269,000, COSTS: \$ 118.6 million

While still early in the planning process, this project is projected to be a unique solution to the evolving roles and missions of Libraries and Student Centers on today's modern academic campus. The strategy is to plan and construct a single building at the heart of the East Stroudsburg campus that will bring together a contemporary Student Center and an innovative Library and Information Commons. The solution is expected to create a fusion of student life, student services, teaching and research, and technology in a bold response to the challenges of the digital academic world. All spaces will be modern, state-of-the-art and digitally-interactive with wireless capability. Classrooms, lab spaces, offices, conference and meeting rooms, as well as lounges will have data access; with many also having video conferencing capabilities. The "smart" classrooms will include instructor network stations, video capability, and electrically operated screens and smart boards. The complex will also house the campus computing center and an archival center for jazz recordings. It is to be built and occupied in two consecutive phases. (Ratio)

#### **Livingston Lord Library renovation and expansion, Minnesota State University, Moorhead, MN – USA 2013**

Sq. Ft.: 123,701, costs: \$9.3 million

The Livingston Lord Library renovation and expansion project began with an evaluation of the predesign scope to realign the project within a determined budget. Once approved, the design team continued to craft plans for a phased renovation.

Kevin Huse: Library Programming & Planning / BKV Group: Architect of Record

Originally constructed in 1960 with an addition in 1987, the Livingston Lord Library (Information Technology Center) is in need of a comprehensive replacement of all mechanical and electrical systems, as well as the necessary upgrades to meet the requirements and technological advances of today's academic library environment. Multiple phases are planned to minimize disruption to the academic schedule and to optimize costs. Presently, exterior work is complete; interior phased renovations will commence shortly. (Ratio)

#### **Andrew G. Truxal Library, Anne Arundel Community College, Arnold MD – USA 2012**

SqFt.: 75,080, costs : \$13.9 million

The Andrew G. Truxal Library, constructed in 1967, is one of the original buildings on AACC's eastern campus. The project began with the completion of a state-required programming process (Part I & II) and an Educational Specifications document. Successfully funded, bids for the construction of an addition to and renovation of the existing building were received and well under budget. Now complete, the complex houses an expanded Student Success Center—an integrated one-stop environment including the Technology Learning Center (a 100-seat computer commons); the Department of Reading Instruction; Honors Program; a Tutoring Center; Supplemental Instruction; Labs for Math, Computation, Reading, Writing; and the SASP program (a support program for first-generation college students). It will also provide 20 collaboration rooms, a learning commons, two information literacy instruction labs, and a specially designated 'quiet' reading room. All spaces will be tied together with the library by the Commuter Commons, a space for informal collaboration and socializing modeled on an urban hotel lobby. The Commuter Commons will feature vending, quick access computer kiosks, a fireplace, large screen TV, informal exhibit space, and casual seating. (Ratio)

#### **Ivy Tech Multimodal Facility & Resource Center, Ivy Tech Community College, Indianapolis, IN - USA 2011**

Architecture / interior Design / Landscape Architecture / urban design & planning, Sq. Ft.: 250,000, COSTS : \$9.5 million

Ivy Tech Community College tapped RATIO to design its new Multimodal Facility & Resource Center, a project that provides its campus community with improved vehicular and pedestrian wayfinding, a higher level of safety and parking availability, and enhanced student and information resources. With its access to a major arterial street immediately north of downtown Indianapolis, the project is the popular community college's new urban campus gateway. The project's architecture and streetscape elements blend the existing campus characteristics with a newer, lively contemporary identity. At street level, an active and transparent campus resource center will enhance the Ivy Tech student experience. The Multimodal Facility & Resource Center project also positively impacts the community, serving as an IndyGo mass transit bus transfer station along Illinois St. In the future, the facility will also provide local retail opportunities to the Fall Creek Neighborhood Community located nearby. (Ratio)

#### **Morris Library, Southern Illinois University Carbondale, Carbondale, IL - USA 2009**

Kevin Huse: Library Programming, Planning, Interiors & Furnishings / PSA Dewberry: Architect of Record, Sq. Ft.: 313,123, COSTS: \$56.5 million

Southern Illinois University Carbondale (SIUC) asked Kevin Huse and his team to renovate its existing 1956 Morris Library facility and create an a 53,830 square foot addition to accommodate the changing needs of its learning community. The project directly

addressed the client's vision for both a physical learning resource and a virtual one, essentially creating a hub for electronically-based information and knowledge. Morris Library, an ARL Member Library, plays a broad role in providing support to campus research and instruction efforts through distance learning, instructional development and evaluation, and technology to support all aspects of teaching and scholarship. In the same vein, the newly-expanded library became the home to the new Academic Technology Center. The renovated facility provides a variety of study spaces, improved access to the library collections and upgrades to technology systems. Designed to be a welcoming and comfortable facility, Morris Library is a modern center with electronic resources, numerous spaces for interaction and collaboration, high density shelving for material storage and a student cafe commons. (Ratio)

#### **John F. Kennedy Library, Muncie Public Library, Muncie, IN – USA 2009**

Experience prior to Kevin Huse's affiliation with RATIO, SIZE: 11,500sf Renov., 3,600sf Addition, COST : \$2.2M

The Muncie Public Library Kennedy branch first opened in November 1964 as a memorial to the late President Kennedy. Located on a major commercial thoroughfare, the popular branch library offers convenient access to nearby neighborhoods. Due to its proximity to residents, the facility's children's programming has always been a significant offering. Because the popular branch had outgrown its current facility and was in need of some updating, the Muncie Public Library system opted to expand and renovate the space. A new addition created a new lobby, public meeting rooms, an enlarged children's area, periodical areas and a coffee shop. In addition, existing spaces were reconfigured, which included transforming an underutilized storage wing into usable space. (Ratio)

#### **Monroe County Public Library, Bloomington, IN – USA 2009**

Experience prior to Kevin Huse's affiliation with RATIO, SIZE: 54,185sf Renov., COST : \$ 1.1M

The Monroe County Public Library's renovation helped improve library operations by consolidating service points so as to provide better services to library patrons; provided an updated look for one of the busiest libraries in the state; and made the building and its collections easier to navigate. As a part of the project, public computer access was moved out of a lab setting and onto the main floor level so that staff could better offer interaction and research assistance. This renovated space features comfortable seating and small group study areas with power and data connections for patron computer use. The updated first floor children's department comes alive with vibrant colors and child-friendly educational flooring. New shapes, patterns, colors and textures throughout the space increase learning opportunities for both parents and their children. (Ratio)

#### **Southwest Durham Library, Durham Public Libraries, Durham, NC – USA 2009**

sq. ft.: 15,000 add., 10,000 ren., COSTS : \$ 3,200,000

A welcoming, customer centered building was top priority for the project. An inviting new entry is the point of intersection and the hub of all library activities. The interior was reorganized into three bays lit by roof monitors with seating at the center of each. There is a clear separation between the adult and children's sections. The smaller scale of the existing building with lower existing windows and heights is dedicated to children's activities. The addition is a clear departure from the existing building form. It emphasizes approachability and accessibility, two qualities key to the overall goals of the library system. The addition takes advantage of daylighting by collecting natural light through southern oriented roof monitors. The perimeter spaces provide a place for staff workrooms and other activities while still allowing easy access to all parts of the library. The west side of the building features glass corners and glass enclosed workrooms. These workrooms will provide views to the wooded area. (Ratio)

#### **Leesville Community Library Wake County Libraries, Raleigh, NC - USA 2009**

Architecture / Preservation / Interior Design / Landscape Architecture, Sq. Ft.: 8,000, COSTS : \$ 2,900,000

The library was conceived as a pavilion in the trees, an elevated forest perch for reading and enjoying natural views. A solid brick-enclosed volume with punched openings for fenestration houses all the service related spaces. A much larger reading pavilion with uninterrupted views houses book stacks and study areas. Natural materials were utilized throughout the library to complement the natural setting. Red clay brick, natural patina zinc panels and honey colored woods create a welcoming and unified palette. Aluminum and insulated glass walls surround the pavilion with the continuous glazing along the tops of the walls. This creates the illusion that the wood roof is floating above the space. The lower portions of the glass walls are punctuated with zinc panels or brick to provide increased insulation to the building envelope. Day lighting was also a primary consideration. The long axis of the building is oriented to maximize southern and northern exposures. The overhang on the southern exposure controls solar gain and glare while the northern exposure brings indirect natural light deep into the building. The forest is thick enough to effectively shade the building year round. (Ratio)

#### **David L. Rice Library, University of Southern Indiana, Evansville, IN – USA 2006**

Kevin Huse: Library Programming, Design, Interiors & Furnishings / Hafer Associates: Architect of Record Architecture / programming & planning / interior design, Sq. Ft.: 155,000, COSTS: \$26.3 million

The initial phase of work involved a "Programming and Conceptual Design Document" for the existing 1971 library; however, after reviewing the budget, schedule and program needs, the campus came to the conclusion to build new. This new five-level library/ Classroom building—with approximately 18,000 square feet for classrooms and labs—is the tallest building on campus. In addition to circulation, reference, reading rooms, archives, and special collections, the Rice Library also contains a Starbucks and Coffee Commons—equipped with wired and wireless access as well as a variety of seating areas. Although located within this new facility, it is zoned outside of the security parameters of the library functions to allow for alternative hours of operation. The library has been profiled in numerous publications including Library By Design (a supplement to Library Journal), USA Today, and USI Magazine. (Ratio)

#### **Irwin Academic Services Center, University of Illinois, Urbana-Champaign, IL - USA 2006**

Sq. Ft.: 11,400, COSTS: \$4.6 million

The Irwin Academic Center at the University of Illinois Urbana-Champaign offers the best in academic services to more than 600 student-athletes. In the summer of 2006, RATIO completed a new, \$4.6 million, 11,400 sq. ft., four-story addition to the centrally located Tutor Revival style structure. The addition creates a more comfortable environment for student learning through new student resource areas. A presentation room, a multi-purpose room, individual tutoring and study rooms, and computer labs were all part of the addition. Along with these amenities, the addition also included building support areas such as administrative offices, a preparation kitchen and restrooms. (Ratio)

#### **Columbus Learning Center, Community Education Coalition, Columbus, IN - USA 2005**

RATIO Architects: Executive Architect / KPF-New York: Design Architect, Sq. Ft.: 123,000, COSTS: \$23 million

The Columbus Learning Center is a high-technology facility that makes it possible to expand the local programs of Indiana University, Purdue School of Technology, Ivy Tech Community College, Work Force Development, and Bartholomew County

School Corporation. The facility contains nine classrooms, a distance education classroom, an experimental classroom, six computer teaching labs, a 200-seat lecture hall, and a Center for Teaching and Learning (CTL), all shared by each institution. Other shared spaces include a 100-seat dining area, a bookstore, e-mail bars, and student lounges. Administrative offices located on the second floor. The building is designed for ultimate flexibility by incorporating a raised-flooring system on each level of the building. This flooring system contains HVAC distribution, as well as technology and electrical infrastructure. A two-story corridor runs the length of the facility to provide connection to the adjacent institutions. This corridor, referred to as the "street", faces the new quadrangle for the campus. (Ratio)

#### **Urbana Free Library, Urbana, IL – USA 2004**

Sq. Ft.: 40,000, COSTS: \$6,300,000

The project consisted of a complete renovation of the existing historic building, as well as an addition to house enlarged sections. Acting as Library Design Consultant for the project, RATIO's involvement included program analysis and preliminary design services, as well as being responsible for the façade design of the addition. The project included a new accessible entrance to the entire library that consolidated horizontal and vertical access. Though not a Carnegie Library, the historic structure provided its own set of challenges. The cladding of the addition that had been put on in the 1970's, was stripped and with the addition, the building was increased to nearly 2.5 times the original size. This allowed a dramatic increase in the library's collection while substantially increasing the useable space for the Adult and Children's spaces. Most importantly, the County archives that are a very important public service, were increased to allow better and more efficient access. The new circulation desk in the addition provides a better and central location to serve the public needs. The restoration of the historic areas of the original building maintained the character that has been so important to the community. The building was designed to accommodate another future addition to the West. The parking was completely renovated and increased to satisfy new needs. (Ratio)

#### **Library, Information and Alumni Center (UIUC) College of Agricultural, Consumer and Environmental Sciences, University of Illinois at Urbana-Champaign, Urbana-Champaign, IL – USA 2001**

Kevin Huse: Library Programming, Design & Interiors / PSA Dewberry: Architect of Record, Architecture / PROGRAMMING & PLANNING / interior design, aces library, information & alumni center Sq. Ft.: 83,683, COSTS: \$23 million

The ACES Library, Information and Alumni Center allowed the University of Illinois Urbana-Champaign's (UIUC) College of Agricultural, Consumer and Environmental Sciences to unify its agriculture and consumer/environmental sciences library collections, and centralize its information and computer services. In addition to stack space, the information center includes individual study space for 211 students, collaborative study rooms and a library office complex. The Alumni Center and the Career Center (also housed within this facility) each contain their own reception area, meeting rooms, offices, and support facilities as well as extensive technology resources. The Alumni Center also offers a multimedia conference facility with distance learning capabilities, and a student café and commons area. A key goal of the project was to create a unique architectural statement that enhances the visual unity of the University's south campus. ACES Library's uniquely shaped design achieved this goal. The University of Illinois at Urbana-Champaign Library is the second largest academic library in the country and a notable ARL Member Library. (Ratio)

#### **Park Library and Information Services Center, Central Michigan University, Mount Pleasant, MI – USA 2001**

Kevin Huse: Library Programming Planning, Design, Interiors & Furnishings / URS: Architect of Record, Sq. Ft.: 305,755, COSTS: \$51 million

The Park Library and Information Services Center (LISC) renovation and expansion created a complex that is the centerpiece of an emerging, technology-focused learning environment at Central Michigan University. The LISC contains client/server technology supported by infrastructure that integrates multimedia information into group and individual learning settings. The facility houses 1.3 million volumes, 90 percent of which is in nearly five miles of mobile ranges—one of the largest installations in North America. Additional amenities include specialized instructional areas, a 145-seat modern multimedia facility, an art exhibit and reception complex, and a 20,000 square foot environmentally controlled archival facility. Within just two years of its completion, the gate count to this facility increased 50 percent. (Ratio)

#### **Lawrence W. Inlow Hall & LAW Library, Indiana University, School of Law, Indianapolis, IN – USA 2001**

RATIO Architects: Architect of Record / Robert A.M. Stern: Design Architect Architecture / Interior Design / Landscape Architecture, Sqft. 120,000, Costs: \$ 27,000,000

Located within walking distance of downtown Indianapolis, Indiana, the Lawrence W. Inlow Hall and Library is highly visible along the east side of campus. Facing the downtown area, the building presents an identifiable entry to the campus. Gerald Bepko, IUPUI Chancellor, described the building as a gateway. "The new law school will enhance the educational experiences of students, not only through its state-of-the-art technology but also by its proximity to the city and the heart of state government." Project goals were many, and included the design of a facility for the new law school that would promote and foster excellent learning. The design incorporated spaces for student and faculty interaction, areas for school gatherings and events, and a 57,000 sq. ft. state-of-the-art library (the Indiana University Library is an ARL Member Library). Additionally, the 120,000 sq. ft. law building houses new classrooms, a moot court, as well as faculty and administrative offices. (Ratio)

#### **Brown County Public Library, Brown County Library Board, Nashville, IN – USA 2000**

Sq. Ft.: 18,250, COSTS: \$2,925,930

#### **2003 Indiana Library Federation "Library of the Year"**

The site selected for the Brown County Public Library features a sloping topography and vistas of the tree-covered hills for which Nashville, Indiana, is famous. Numerous windows permit patrons to observe and appreciate this surrounding natural spectacle, and north-facing clerestory windows allow indirect sunlight to filter into the spaces below. The main parking lot is terraced with plantings and retaining walls to minimize its visual impact on the natural beauty of the site. The building's design incorporates various materials indigenous to the area, including a fireplace fabricated with foundation stone. Foundation stones are typically large blocks of dressed local stone that have been used for the support of bridge pylons or as the foundations for significant structures. Local artisan works were incorporated into the interior and exterior design of the building, adding to the "Brown County Style." (Ratio)

#### **Kinlaw Library / Kirkland Learning Resources Center, Asbury University, Wilmore, KY – USA 1999**

Kevin Huse: Library Programming, Planning, Design, Interiors & Furnishings, Architecture / programming & planning / interior design Sq. Ft.: 75,312, COSTS: \$14 million

The Kinlaw Library / Kirkland Learning Resources Center is a new library and classroom facility located at the termination of a long brick pedestrian path—the main “spine” of Asbury University—linking the library with the chapel, main quad, housing, arts buildings and gymnasium. The three-story facility is built into a hill, with white columns respectfully complementing the existing university fabric. The Learning Resources Center is located on a lower level and features a separate after-hours keycard access. This classroom facility offers the University community several technology-driven classrooms with projection capability and audio visual resources. Asbury’s Information Services Department is located on this level to provide support to the 870 computer ports located throughout the building, as well as the administrative and academic computing needs of the entire campus. The main entrance to Kinlaw Library’s collections area is located on the second level of the facility with stacks located in the center of the second and third levels. The third floor includes a two-story conference/seminar room features a massive oval table with seating for 44, and sound and media equipment well-suited to hosting large meetings. (Ratio)

**Putnam County Public Library, Putnam County Library Board, Greencastle, IN – USA 1998**

Sq. Ft.: 25,500, COSTS : \$2,453,652

**1998 Indiana Library Federation “Library of the Year”**

The Putnam County Public Library project centered on the complete renovation and addition of this Carnegie library in Greencastle, Indiana. Constructed in 1902, the original two-story building contained 6,470 sq. ft. of space. The 18,000 sq. ft. addition provided expanded adult and children services, bookmobile garage, meeting room, enhanced technical services, staff support areas, and handicap accessibility. The addition was a contextual solution, sensitive to the original building without duplicating it. The original entrance was maintained and a second entrance was created adjacent to new on-site parking. The new brick and limestone were selected to complement the original brick and limestone on the Carnegie Library. To add to the complexity of materials selection, the original building utilized a roman brick with 1/8” wide joints, providing some unique challenges in finding a brick tie that could be properly incorporated within the new wall system. (Ratio)

**Lucille Stewart Beeson Law Library, Samford University, Birmingham, AL – USA 1995**

Kevin Huse: Library Planning, Interiors & Furnishings Architecture / Interior Design Sq. Ft.: 60,300 COSTS: \$6 million

The Lucille Stewart Beeson Law Library at Samford University is judiciously enriched with classical details and traditional materials and is sited to form a three-sided quadrangle with the Law School and Brooks Hall. The slope of the site allows the library to expose a two-story face to the north, while turning its grander three-story facade to the new quadrangle. It is connected to the Law School by a glassed-in colonnade that also serves as a weather vestibule to the new library. The new facility is a modern structure that meets the functional needs of a working library within a building that bespeaks of the dignity, majesty and tradition of the law itself. The interior organization is integrally related to its exterior massing with an open, airy central space flanked by denser, less publicly used functions. The grand reading room is located within the building’s inner core and is lit brightly by a large light monitor. From the third floor to the base of the light monitor, the walls lean slightly inward to exaggerate the sense of height. Ease of maintenance was also a consideration. A catwalk at the level of the monitor provides easy access for window washing and re-lamping of light fixtures. (Ratio)

**East Boston Branch Library, Boston MA – USA 2013**

SCHEDULE: Fall 2011 – Winter 2012: Design development, construction documents, and bidding, Spring 2012: Construction start-up, Spring 2012 – Fall 2013: Construction and moving, Fall 2013: Grand opening

By Jeremy C. Fox, Town Correspondent

Boston will push forward with plans for a dramatically modern new public library branch at the northeast tip of East Boston’s Bremen Street Park, despite being waitlisted for state funding.

The decision by Mayor Thomas M. Menino was announced Wednesday night at a public meeting in East Boston. City officials said that though the project was not among the eight municipal library improvement projects awarded grants by the Massachusetts Board of Library Commissioners last Thursday, Menino was committed to seeing the project completed on schedule.

“The mayor said, ‘Under no condition are we going to stop on this project,’” said Joseph I. Mulligan III, deputy director of the city’s Capital Construction Division. “He said, ‘We have to move forward on this.’ The mayor made a full commitment to moving forward on the project without hesitation, and if there’s an issue on reimbursement, we will wait the state out.”

The state board awarded more than \$27.4 million to the eight grant recipients, with the largest sum, \$6.3 million, going to West Springfield. Boston’s request for \$7.3 million for the East Boston Branch is dead-last among the 15 on the wait list. Another six were turned down by the state and will have to resubmit their proposals.

Christine Schonhart, director of branch libraries for the Boston Public Library, said the setback didn’t come as a surprise because the board tends to prioritize funding to main libraries over branch libraries. She said the same thing had happened to the Mattapan branch library several years ago, and it eventually received state funding.

If construction begins on schedule in the spring of 2012, the new branch could open as early as fall of 2013, according to Jim McGaffigan, the city project manager who will oversee the work.

The plan for the new library is worlds away from both the staid, Classical Revival East Boston Branch on Meridian Street and the squat, brick Orient Heights Branch. The design is light and airy, with a glass wall facing Bremen Street Park and the downtown skyline and a roof made up of undulating strips that wouldn’t be out of place on a building designed by Frank Gehry.

Designed to bring the park into the indoor space, the plan features distinct areas for adults, young adults, and children over its 14,870 square feet, but the spaces are delineated by color selections, furniture styles, and roof alignments rather than walls.

The wavelike strands of the roof allow for spaces in between where windows bring more sunlight in, and the side facing south into the park includes a 1,000-square-foot sheltered reading porch with low seating and space intended to be used as an “outdoor classroom” for children.

The entrance is at the southwest corner, with doors leading toward the park and toward Bremen Street itself. The 2,297-square-foot children’s area is positioned on the eastern edge of the space for safety, with clear sightlines across the space to allow librarians and parents to keep an eye on the children. A multipurpose room adjacent to the children’s area will accommodate up to 80 seats for a public meeting but can also be used for performances, children’s crafts, and other community purposes.

The design calls for a new sidewalk and plaza area along Bremen Street next to the library, which will range from around 20–26 feet in width. The sidewalk and plaza will include a continuation of the street trees that line the park, landscaping with native plants, stormwater management features, a book drop, and parking for bicycles. The current plan includes space for about 20 bikes, but at the suggestion of a resident at Wednesday's meeting, that number may increase.

The planners also hope to include in the plaza's paving some recycled stones from the Works Progress Administration wall that currently defines the lower edge of the site where the library is to be built. That wall is planned to be torn down so there will be no barriers between the library and the park.

Architects Mark Oldham and Carla Ceruzzi from William Rawn Associates worked closely with a community advisory committee on the design, which is planned to score Silver or better on the US Green Building Council's Leadership in Energy and Environmental Design, or LEED, rating system.

The plan met with a generally warm reception among the three dozen or so residents who braved the heat wave to attend Wednesday's meeting. But Susan Parker Brauner, owner of local real estate company Parker Associates, raised concerns over plans to display only a rotating selection of a historic set of paintings rather than the entire series.

The 14 paintings from the series "The History of Shipping" by Frederick Leonard King were another WPA project executed during the 1930s. The paintings hung in the Jeffries Point branch until that library was closed and they moved to their current home in the Meridian Street branch.

Mulligan told Brauner that the nature of the new building, with less wall space and more glass, made it difficult to hang every painting in the set and that it was the planners' intent to also leave some room for new works of art created by East Boston residents and students.

Though Brauner contended that the wishes of the community were not fully taken into account in the planning process, Mary Berninger, a member of the citizens' advisory committee for the project, commended city officials and the architects for their attention to residents' goals and desires for the library.

"Every single professional listens to this community," Berninger said, "and you may think that when we include so much information, how can they possibly retain it? The very next meeting every one of them come back, and it was clear that they listen to us. They listen to all the constituencies. Nobody was left out. And the best thing that happened in the process, everything was done through the consensus of the group."

**Awards:**

2012 AIA New England

2011 National AIA/ALA Library Award, National American Institute of Architects/American Library Association

Program: A 21,000-square-foot public library.

Design concept and solution: The Mattapan Branch of the Boston Public Library was designed to honor the mayor's initiative to bring important civic buildings to Boston's diverse neighborhoods. The design opens the library's front elevation with glazing to infuse the warm and inviting interior space with natural light. The welcoming transparency allows pedestrians to see directly into the wood-wrapped interior spaces and reading room. The children's and young adult's rooms are placed in the rear for privacy and protection. Sustainable features include daylighting strategies, water conservation, a cool roof, an on-site stormwater infiltration system, bike storage, and parking for alternative fuel vehicles.

Gross square footage: 21,000 sq. ft., Site size: 72,000 sq. ft. Total construction cost: \$10,000,000

The Library includes a striking new glass building of 76,700 square feet joined to the restored 27,200 square foot landmark, designed in 1887 by Van Brunt & Howe and listed on the National Register of Historic Places. The building has capacity for over 275,000 books, 90 computer stations, reservable meeting rooms and a 220 seat auditorium. The project includes an underground parking garage with a 33,000 sf green roof and the restored Joan Lorentz Park. The library is open to the public as of November 8, 2009. The Associate Architect is Ann Beha Architects. (see: [Ann Beha](#))

A commitment to sustainability, the building's main facade is a double-skin curtainwall. It is the first US example that incorporates all key ingredients of advanced European Double-Skin Curtainwall technology: · 3'-0" Deep Airspace, · Multi-story Thermal Flue, · Movable 1'-0" Deep Sunshades (Rawn)

## Awards:

### Highly Commended, AR MIPIM 2010 Future Projects Awards

Next to the improvement of public spaces we have also chosen to inject a shot of enterprises in the city centre by constructing a new inner-city shopping mall of 35000 square meters that will hold nearly 100 new shops. It was a conscious decision -not free of risk- to construct this mall in the city centre and in the existing pedestrian area and not in the periphery. The opening is foreseen for march 2010 and we hope it will give a new commercial boost to the city.

The city baseline is KORTRIJK, city of innovation creation and design. In order to develop this baseline we have created a platform of 5 stakeholders on regional level where we combine the public sector with the economic world and the educational institutes. Our University is leading our country in gaming , multimedia and product design. One of our urban development programs tries to change the BUDA Island into a creative nest for artists. An old cinema complex, brewery tower and factory building are adjusted to create space for creativity and art production. We are also home to the Flemish institute for Research and design in the field of plastics, and the Flemish competence centre for industrial design also known as Flanders in shape. The next big thing in Kortrijk is the construction of a modern knowledge centre -as a driver for the development of the railway station neighbourhood also in the centre of the city. We combine the library of the 21st century with life long learning and with multimedia and music institutes. We have selected the well-known American architecture office REX that constructed the library in Seattle. We are at the moment in the phase of financing the project. We are not unfamiliar with the concept of European project and networks. For example in E government we have been involved in some interreg projects. Most recently the inno festival project in the 7th framework program PRO INNO has been approved, together with our partner Barcelona , Milan, Lisbon, Vilnius and Talinn. We are going to organise the European innovation week called innovation festival for the next three years. Themes witch capture our interest are Life Long learning, innovation and entrepreneurship, library of the 21st century, waterfront development and E- government and E -care. October 18, 2012 (<http://eurotown.org/kortrijk>)

Natürlich. Auch das belgische Städtchen Kortrijk möchte die „Bibliothek der Zukunft“ haben, weswegen der Architektenwettbewerb auch gar nicht erst nach einer „library“ fragte, sondern nach einer „lllibrary“. Die neue zentrale Bibliothek soll eben nicht nur eine Lesehalle werden, sondern auch ein Ort für interaktives, mediengestütztes und lebenslanges Lernen. Außerdem sollte das örtliche Musikzentrum, dessen Gebäude sich bereits auf dem Gelände befindet, in das Konzept eingebunden werden. Diesen Wettbewerb hat jetzt das Büro REX Architecture (New York) – zusammen mit dem Landschaftsplaner Bureau Bas Smets (Brüssel) – gewonnen. Das der Chef von REX, Joshua Prince-Ramus, vor seiner Selbständigkeit lange Zeit bei O.M.A. in Rotterdam gearbeitet hat ist diesem Entwurf deutlich anzusehen: Die Bibliothek folgt dem inneren Organisationsprinzip der Spirale, bei dem alle Ebenen fließend ineinander übergehen und sich entlang einer weitgehend transparenten Außenhülle in die Höhe schrauben. Genialer Dreh im Entwurf von REX war der Vorschlag, eben nicht – wie vorgesehen – den Parkplatz neben dem Musikzentrum für den Neubau zu verwenden. Das hätte die Bibliothek in eine Randlage hinter dem Musikzentrum gebracht. Stattdessen werden Musik und Bücher zu einem neuen Haus vereint, welches sich als neue Hülle über Teile des bestehenden Gebäudes legt. Vor allem sollen alle Konzert- und Hörsäle des Konservatoriums weiterverwendet werden. Außerdem wird so der ursprünglich vorgesehene Bauplatz frei für eine kommerzielle Verwendung, deren Gewinne in die Realisierung fließen können. Im Inneren ist es wichtig, die Grenzen zwischen den Bereichen von Konservatorium, Bibliothek und Lernzentrum aufzulösen. Stattdessen schlagen sie eine Einteilung in offene und geschlossene Räume vor: Hier die öffentlichen Bereiche, Cafes und die Bücherregale und Leseplätze, dort die Klassenräume, Büros, Konzertsäle und Besprechungszimmer. Das Projekt soll rund 31 Millionen Euro kosten. (<http://www.baunetz.de>)

The project follows on from our 1st prize winning proposal for a new cultural city framework recently won in an open international competition The scheme consists of two public buildings; a new city library and a three auditorium concert hall for the Norwegian coastal City of Bodo. The two buildings have a figurative quality, two distinct but related characters engaged in conversation, with each other and with their urban and harbour side contexts. Collectively, they are understood as the new cultural heart of the City whilst, individually, they respond to the particular conditions of their sites and programmes. Both buildings contain public spaces around a central figure that sits at their heart. In the Kulturhus this central space is the internal world of the principal 1000 seat auditorium, whilst in the library it is the surprise of a planted exterior courtyard, placed on the top floor, above a black box theatre. The interior public spaces of the Kulturhus are planned to take advantage of expansive views across the harbour, forming a contrast to the interiority of the auditorium. From the principal foyer space, the lower volume and shaped roof of the Bibliotek forms a horizon to the sea and the mountains beyond. Within the Bibliotek itself, the scale of main library volume reflects that of the landscape. The grand scale of a columnar façade provides a rhythmic counterpoint to the powerful profile of the mountains beyond. Arriving on a boat, the buildings present themselves almost as a single piece; a ‘hill’ of gabled forms, perspectively receding like a theatre set yet glittering on a sunny day. The geometries of each building plan adjusts in response to variations in the grain of the city fabric. These moments announce principal façades and entrances. The main entrance façade of the Kulturhus is inflected to form a hinge in the shifting line of the street.. The waterfront façade of the library adjusts to the line of the harbour wall, recalling both the shed like nature of harbour-side structures and the civic qualities of a temple or basilica. (REX)

Architectural Record, Dec. 2007

Levimons, Nancy, Richärd + Bauer draws people through a rusting-steel canyon

Into Scottsdale’s Arabian Public Library, in: Architectural Record, June 2008

<http://www.richard-bauer.com>

### Libraries:

#### **Northwest Library, Oklahoma City, OK – USA 2011**

City of Oklahoma City, 35,000 sf / 8.1M / Scheduled Completion August 2011

The new library will have shelf space for 156,000 item collection. There will be meeting rooms, large spaces for children and teens, study areas and over 50 public access computer stations. The building will also be Wi-Fi compatible for wireless Internet access. concept

The iconography of Oklahoma is known for its burning sunsets, emblazoned sky over endless prairie grass, silhouetting the elements of industry and agriculture. The horizontality of the landscape permits extensive uninterrupted vistas of the sky, which produce spectacular fireworks of light and color as the daily cycle of the sun passes overhead. The native prairie grasses have gradually given way to agriculture, but the furrowed fields still provide the same effect; a uniform landscape under an all encompassing sky. The implements of agriculture and industry have become commonplace along the horizon. Both the iconic windmill tower and the ever prolific oil derrick can be found throughout the city, in sometimes the most contradictory of settings. The silhouette of the trussed tower against the horizon is a representation of the strength of the people of Oklahoma who have persevered in the face of adversity.

Borrowing from this unique sense of place, the design of the building integrates this iconography in the form of the library; the horizontal roof form, supported by a series of derrick like skylight monitors, bracketed by native grassed earthen knolls. (Richard)

### **South Mountain Community Library, Phoenix, AZ – USA 2011**

Client: Maricopa County Community Colleges District, City of Phoenix, Size: 54,600 sqf, Cost: 16.3M, Completion Date: August 2011

Sections – Courtesy of Richard+Bauer, Design Team: James Richard, AIA (designer + principal-in-charge), Kelly Bauer, NCIDQ, FIIDA (project manager + interior design), Stephen Kennedy, AIA, NCARB, Andrew Timberg, AIA, LEED AP (project architect + construction administration), Will Craig, RA (construction administration), Staff architects: Mark Loewenthal, LEED AP, Alex Therien, RA, NCARB, LEED AP, Brant Long, RA, LEED AP, Stacey Crumbaker, NCIDQ (interior design + signage), Claudia Saunders (interior design), Melissa Pulsifer, SEGD, AIGA (graphic design + signage)

This new 51,600 square foot facility combines the functions of a modern public library with the components of a state of the art central campus library. The library includes a 200 seat multifunctional meeting room, conference and multimedia center, high tech classrooms, computer center, quiet and interaction rooms, as well as all the components of both public and academic libraries. A children's library and storytime room are organized below the academic story telling institution with vertical connection to the exterior courtyard dedicated to the children's use.

The building is modeled after the architecture of an integrated circuit, providing insulation between disparate functions and promoting interaction and connection between like functions and spaces. Academic programs affiliated with those within the public library are organized around vertical interconnected spaces; providing a discrete connection while maintaining critical organization within each discipline.

Natural light is brought deep into the floors below through a series of triple insulated clerestory monitors and light shafts. The interior of the building is lined in an acoustical cedar wood, frosted and laser cut acrylic panels reflect patterned abstractions of the agriculture that once was an integral part of the community. An accessible flooring system allows for continual reorganization of the building, while all services are distributed by a continuous illuminated distribution circuit, accessible throughout its length for flexibility. The articulated skin of weathering copper is designed to provide a naturally ventilating skin, and triple layered insulated clerestories provide a high performance enclosure.

(<http://www.archdaily.com/291105/south-mountain-community-library-richardbauer/>)

### **Prescott Valley Library + Yavapai College, Prescott Valley, AZ - 2009**

Client Town of Prescott Valley, 55,000 sf / 20M / completed October 2009

The facility houses both public library and community college functions, creating a unique and diverse program for the building that includes adult, teen and youth reading spaces, common areas and multi-use facilities. The facility also utilizes advanced RFID and self-service technology throughout the Library.

Located in the high desert of northern Arizona and inspired from a regional lava dome, the design of the library becomes an eruption of the site. A folded corten skin and glass window wall wrap the outer shell, dramatic lava boulders fall into the courtyard spaces, organic flowing floor patterns extend inside/out. The skin detail wraps to the inside of the building and transfers into an exposed cedar ceiling surface that can be seen from the first and second floor of the library, forging an expansive reading room vista driven by the concept and client objectives. Within the interior, each programmatic element rises from the floor plate defining and transforming places into stimulating environments that the library patrons can experience as a reflection of the site.

The building is organized around the central community focus, the public meeting space, this is a place where the community comes together for public meetings, lectures and performances. The library is organized around the meeting spaces, flanked by the town's partner in the project Yavapai College, classrooms and offices. The building is adjacent to a new parking area to allow patrons to walk at grade into the building, and a series of terraces and an open walkway connects the new building to the existing city hall and amphitheater area, enlivening this relatively unused area.

The purpose is to capture that feeling of adventure and wonder, as the building unfolds to the visitor, with an overarching roof form providing shade and protection from the wind and rain, and the central meeting spaces rising from the library and community college, providing the same vistas to the public, reconnecting them with the environment and the amazing views. Additionally, with the height of the auditorium space, we created an open meeting space at the top of the building, that serves as a central beacon, a campanile, for the civic complex, capturing the drama of the eruption of Bald Mountain, that gave birth to the valley. (Richard)

### **Sunrise Mountain Library, Peoria, AZ – USA 2009**

Completion Date: January 2009, Gross square footage: 22,000 sq.ft., Total construction cost: \$7.7 million

By Jenna M. McKnight

In the political realm, Phoenix generally toes the conservative line. Fortunately, when it comes to civic architecture, the city takes a more progressive stance. A case in point: In 1995, residents celebrated the opening of Will Bruder's colossal Burton Barr Central Library, which quickly earned icon status in the Valley of the Sun. In the following years, as Phoenix expanded at breakneck speed, prominent Southwest architects were tapped to design a string of branch libraries, many of which have appeared in Architectural Record.

The Sunrise Mountain Library, conceived by the local firm Richard + Bauer and finished in 2009, marks yet another example of the city's willingness to embrace singular architecture. Constructed for \$7.7 million, the 22,000-square-foot building rises from a partly developed swath of land in Peoria, a municipality in northwestern Phoenix. Surrounded by rows of bland, beige homes, the library adds some much-needed pep to a suburban neighborhood.

This is familiar territory for Richard + Bauer. In addition to the Sunrise project, the 14-member practice has designed four other libraries on its home turf, including Desert Broom Library [RECORD, January 2006, page 96] and Arabian Library [RECORD, June 2008, page 96]. The firm, paired with Haydon Building Corp, won the Sunrise commission in February 2006. "We were rooting for them from day one," says David Hunenberg, Peoria's library manager. "Our residents had put up with a branch library in a high school for 10 years, and we thought they deserved the very best."

The design team was handed a blank slate: a flat, 4-acre dirt lot in a sprawling development still in the blueprint phase. A park was planned for a site bordering the library. In terms of existing reference points, the architects didn't have much to work with. "We were faced with this denuded piece of desert," explains James Richärd, firm principal. Also, the budget was tight. "This was a design-build project," he says, "which tend to be cost-driven and very sensitive to constructability."

In the end, the firm created an economical, distinctive landmark. The low-slung building comprises three shifted bars clad in glass and concrete. On the north, self-supporting 14-by-12-foot tilt-up slabs are spaced several feet apart, permitting views. In contrast, the southern facade, which fronts a road and drainage area, features a band of tightly stitched panels. All of the slabs have an attractive rough-hewn surface — a clever manipulation of a prosaic material.

The library's most striking feature is its undulating roof, which extends slightly beyond the exterior walls. The roof actually consists of three parts. Two rolling planes, supported by steel columns, float above the outer bars. A flat roof, held up by concrete masonry walls, covers the central bar and accommodates mechanical equipment.

The roof's wavy form was inspired by Lake Pleasant, a popular nearby attraction. This aquatic theme is evident in other parts of the building. Evoking boat portholes, circular cutouts are found in roof overhangs and concrete slabs. The designers also used blue-tinted glass throughout. Richärd notes that the library's cool color palette — charcoal, azure, sage — is a departure for his firm. "It's very different from our traditional Southwestern response," he says.

The building's layout is relatively straightforward. A recessed main entrance leads into the central volume, where visitors find just-released books, computers, and, at the rear, a teen zone. The south bar houses the adult area and multipurpose room, while the children's zone and administrative functions occupy the north volume. Shaded, Wi-Fi-enabled courtyards provide pleasant areas for retreat.

The facility has a hip vibe, due in large part to funky lounge chairs and bold artwork. It also boasts a number of green features, and its LEED Silver certification is pending.

Hunenberg says the library's new home is a hit with residents. Circulation is up 108 percent, and thousands of additional patrons are streaming in each month. "I've not heard one negative comment, not even from people who don't like contemporary architecture," he adds. The sole downer: The recession has stalled development in the area, and it's unclear when the planned park will be built. For now, the library overlooks a depressing vacant lot.

Despite the lackluster view, Sunrise Mountain Library is an exuberant landmark that serves a vital public function in a budding community. Richärd + Bauer has succeeded in creating another civic gem for the expansive Valley of the Sun.

([http://archrecord.construction.com/projects/Building\\_types-study/libraries/2011/sunrise-mountain-library.asp](http://archrecord.construction.com/projects/Building_types-study/libraries/2011/sunrise-mountain-library.asp))

### Harmon Library, Phoenix Public Library, Phoenix, AZ – USA 2009

#### **Awards:**

2001 AIA/ALA Library Building Awards

#### **Jury Comments**

Here is a powerful community space delivered through a simple, open, effective floorplan.

The uplifting, light, upper volume transforms the space into something more- something almost spiritual.

Elements like the simple furniture are consistent with the project's overall idea of resourcefulness— simple, humble details done right

Notable is the real economy here: a limited number of brushstrokes, each one done so very effectively.

This is a small library in the heart of an urban park in downtown Phoenix. Over time the diverse neighborhood has integrated the library as a key element within the community: a place to connect for adults and an important after-school resource for working families.

Celebrating the wide diversity and demographic of the community, the building is conceived as a kaleidoscope. The design involves a primary linear space framed on each end with a large expanse of saw-tooth glass. Colored linear skylights and slot windows along the upper skin refract light throughout the space, casting a dynamic and ever-changing play of color. The interior of the reading area's upper volume is lined in perforated metal, and lighting and color provide the kaleidoscope effect down the length of the building.

Establishing a core reading area, the 25' high central volume suspends graphic panels from the structural trusses, composing a lyrical play of texture and color reflecting across floor, walls, and furniture.

The library provides multi-purpose spaces for the vastly different age groups that make up the clientele. Exterior and interior spaces were organized to permit a variety of spatial opportunities without compromising divergent age groups needs. Large sliding doors open to provide flexible meeting space for community gatherings. Open courtyards are organized adjacent to each age group's spaces. The 12,500 square foot building includes a large public meeting room, dedicated study space and exterior garden courts.

### Wheeler Taft Abbott jr. Library, Marana, AZ – USA 2008

### City of Apache Junction Library, Children's Wing Addition, Apache Junction, AZ – USA 2008

Architect: Richard + Bauer, Location: Apache, Arizona, Construction Cost: \$5.5 Million, Project Size: 30,500 gsf

Convergent Technologies Design Group provided complete programming services for audiovisual systems for the expansion and renovation of the Apache Junction Library. Space plans include: Step Into the Story Experience Theater, Enchanted Book, a 3-D Projection Room, a Caf   and an Aquarium. Scope of work includes identifying performance features/minimum requirements on a per space basis for all A/V systems and cost estimating services for the planned A/V systems. In conjunction with Apache Junction Library officials CTDG identified the needs and space requirements for the project. The expansion project is expected to add an additional 10,500 square feet to the already 20,000 square feet building. The City of Apache Junction hopes to provide greater access to information and learning resources for library patrons and increase overall library visits through the expansion and renovation project. The expansion and renovations to the Apache Junction Library have been successfully complete since the summer of 2008.

### Arabian Library, Scottsdale, AZ – USA, 2007

#### **Awards:**

Award der AIA 2008

Richärd+Bauer draws people through a rusting-steel canyon and into Scottsdale's Arabian Public Library.

By Nancy Levinson

(This is an excerpt of an article from the June 2008 edition of Architectural Record)

In the far-flung suburban expanses of greater Phoenix, civic life can be hard to come by. Gated communities define—and depopulate—the street scene. Wide arterials make driving breezy and walking dicey. Social mixing happens mostly at malls. Yet metropolitan Phoenix has kept a hold on civic culture, and nowhere is the hold firmer than in the local support of that most idealistic and benevolent of municipal programs, the public library.

Rate this project:

Based on what you have seen and read about this project, how would you grade it? Use the stars below to indicate your assessment, five stars being the highest rating.

A major marker of this support is the consistent commissioning of first-rate architecture. The Burton Barr Central Library, by Will Bruder + Partners, set a rigorous standard when it opened in 1995, and since then a half-dozen or so branches—most recently the Palo Verde Library, by Gould Evans and Wendell Burnette [RECORD, October 2006, page 124], and the Desert Broom Library, by Richärd+Bauer [RECORD, January 2006, page 96]—have put public libraries on the itineraries of serious architecture tourists. The latest addition to the tour is the Arabian Library, another Richärd+Bauer project. The Arabian is located in exurban Scottsdale (and named, by that city's custom, for a breed of horse). The natural setting is stunning, with the 4,000-foot-high peaks of the McDowell Mountain Preserve dominating vistas to the northeast. The built environs are humdrum, with acres of resale-ready blandburbs stretching to the edges of the protected range. But it is precisely this contradictory context that has spurred the designers to produce a conceptually rich and ambitious building. As architect James Richärd says, "We struggled with the ordinariness of the surroundings, with the minimarts, the chain stores, the surface lots. How, in the midst of this generic development, do you make an authentic place?" Richärd and his partner, interior designer Kelly Bauer, answered this question by creating a place that looks inward—"that creates its own context," as Richärd says—and that connects strongly with the natural landscape. The designers were inspired in particular by the local geology of the slot canyon: the deep and narrow sandstone ravines, carved by rushing water, that are such striking features of the southwest. The challenge of the inspirational metaphor, of course, is to control it, and not the other way around. Happily, the designers have maintained command of their motivating image (as they did at Desert Broom, where a nurse tree informed the parti). At Arabian, the architectural experience of the canyon starts as you approach the entrance and are confronted by the Minimalist and elegant composition of weathered steel (architourists will be strongly reminded of Richard Serra, and forgiven for Photoshopping out the concrete-tile roofs of the nearby production homes). The experience continues as you wind along a narrow path defined by the reddish-brown walls, which angle slightly inward; a shallow channel, lined with smooth rocks and (sometimes) filled with water, runs along the edge of the building. A couple of turns and you arrive at the protected entry court, where a simple planting bed contains a specimen palo verde tree and hopbush shrubs. This indigenous landscaping sets off a site-specific artwork by Seattle artist Norie Sato, which consists of a steel-and-glass-appliqué relief and a freestanding sculpture, both based upon the skeletal structure of the prickly pear cactus.

[Cesar Chavez Library, Interior Design, Phoenix, AZ – USA 2007](#)

see: [Line and Space, Tuscon AZ](#)

[Quincie Douglas Library, Tuscon, AZ – USA 2005](#)

Client: City of Tucson

Richard + Bauer employs lean lines, brittle materials, and arcing forms to dramatic effect in a desert setting

When last we left Richärd + Bauer, an up-and-coming architectural office in Phoenix, Arizona, it had just completed the delicately limed Desert Broom Library in its hometown [Record, January 2006, page 96]. In the fast-growing sunbelt states, public libraries appear to be the building type du jour, and this firm, having completed five lean, Modern branch libraries, with four more under construction, could claim to have cornered the Arizona market. Its principals, James Richärd, AIA; Kelly Bauer, an interior designer; and Steve Kennedy, AIA, have now taken on Tucson, where their pavilionlike Quincie Douglas Library opened last year. The brittle materials of the one-story structure, marked by a Cor-Ten-steel roof and rusted steel fencing, blend in color and texture with the flat, dry desert backdrop, while the library's curved and angled planes stand out rakishly against the monotony of nearby suburban sprawl.

In 1999, the Tucson-Pima library system organized an anonymous design competition for a 10,000-square-foot branch that would be located adjoining the Quincie Douglas Neighborhood Center on the dusty outskirts of the city. Serving an area of about 70,000 people, many of whom are low-income and Hispanic, the library would provide a reading room for retrieving books (numbering about 50,000) from the open stacks, plus rooms for lectures, conferences, and computers. Financed through city bonds, the library was budgeted at \$1.3 million, or \$130 per square foot.

Since the 1.5-acre site occupies a quadrant at a heavily trafficked crossroads, Richärd + Bauer projected a pedestrian bridge that would cross a six-lane highway and connect residential development on the east to the one-story library and the existing community center.

Paralleling the extended arc of this steel-and-concrete bridge (which is still unbuilt), the firm designed the library's roof, clad in corrugated Cor-Ten-steel panels, to split in two long "petals" so that one portion lifts up slightly above the other. The architects filled in the space between the petals with polycarbonate resin sheets to create a clerestory that admits daylight to the library's interior.

A relatively simple structural system kept the costs down: A steel frame infilled with wood truss joists supports the roof, while concrete block, either stuccoed or sandblasted, constitutes the exterior walls, except where the Cor-Ten-steel roof slides to the ground at the entrance. The polycarbonate-resin sheets in the split roof reappear in the clerestories on the south and east walls and again in pyramid-shaped faux skylights over the meeting rooms.

[Desert Broom Library, City of Phoenix, AZ – USA 2004](#)

15,300 sf / 2.9M / Completed November 2004 LEED Certified

The library includes a collection of 61,000 pieces, which will expand to an ultimate collection size of 100,000. Additionally the building houses a meeting room, computer training room, group study, youth/teen space, periodicals living room and staff support spaces.

concept

Borrowing from the symbiotic relationship of a young saguaro cacti and its nurse tree along the arroyos edge, the expansive roof of this branch library creates a shaded microclimate, providing filtered daylight, shelter and a nurturing environment for intellectual growth.

The roof form extends above an adjoining arroyo 60' out into the natural desert, creating indoor/outdoor transitional spaces providing a seamless transition into the desert. These outdoor reading spaces are enclosed and shaded by a series of coiled metal screens, following the natural form of the arroyo, and are cooled by building relief air. The roof is penetrated by a series of openings allowing filtered light into the interior and exterior spaces. Each of the openings is treated with a fritted or colored glass creating an ever-changing series of colors and patterns throughout the space, culminating above the children's area.

Within the framework of the roof a series of volumes contain the meeting room, information cubes, staff and computer training areas. Mechanical systems are enclosed within these volumes completely eliminating ductwork and allowing for indirect lighting throughout. Above each of the primary service points within the building "Digital Information Cubes" display ever changing representations of digital information which can be seen from the exterior during the evening. (Richärd)

## [Library Media Center, Glendale Community College, Glendale, AZ – USA 2000](#)

Maricopa County Community College District, Glendale Community College, 40,500 sf / 2.8M / Completed: July 2000

The project program includes the modernization of the library to provide on-line research capability, “plug & play” technology at carrels, tables, distance learning classroom, audio/visual presentation, media viewing/instructional support room and collaborative classroom.

concept

Located at the heart of a mid-sixties community college, this project is the complete abatement, renovation and expansion of a dark and outdated library and classroom building. In addition to fully renovating the project included a 4,000 sf sky lit courtyard enclosure that houses the electronic resources area as its centerpiece.

Conceived as a series of layers within the existing concrete structure; a pair of opposing concave scratch plaster walls house the book collection, create a screen behind which the administrative functions occur, and reorient the entry toward the main pedestrian mall. Lighting and day-lighting features emphasize a warm interior study environment.

Experienced from the outside, the transparency of light and shadow changes dramatically from day to night, activating the center of the campus. An outdoor courtyard and sculpture garden is designed to the south of the building; this extends the program space of the reading room by accommodating a shaded seating area and secure space for outdoor reading. (Richard)

## [Mesquite Branch Public Library, Phoenix, AZ – USA 1998](#)

Client: City of Phoenix, 18,000 sf / 1.2M / 1998

This project represents a near doubling of a bustling 1978 branch library. The program called for an approximately 10,500 sf addition for expanded collection, new entry, meeting room and upgraded toilet rooms. Extensive renovation of the existing building includes expanded children’s storytime room, staff areas and circulation work areas.

concept

Integrating the building with its man made surroundings was a major design goal of the library. The building was conceived to blend seamlessly with the existing building, effectively creating a single, new library. The design incorporates a continual rhythm of materials and structure, which compliment and contrast the original building. The radial tilt slab concrete walls reflect the primary material of the existing building and serves as a marker for the entry. Weathered galvalume metal is utilized for wall and roof surfaces to contrast with the mass of the concrete walls.

Integrating with the natural environment also plays a critical role in the design of the building. Throughout the structure there are numerous “moments” which bind the building to its natural surroundings. Responding to the natural Phoenix climate an outdoor reading court was created on the West side of the building complete with shade trees and fountain. The interaction of light throughout the building captures the intensity of the southwestern sun while desert colors and ideas of reflection adorn the interior. Conservation of natural resources ties in closely with the buildings interaction with the natural environment. The outdoor lounge maximizes usable lounge space while limiting the building footprint and its impact on the environment. The building is not only designed to be playful with light but its organizing concept maximizes the benefits of natural daylight with minimal heat gain. Throughout the building materials are expressed in their natural state, demonstrating the intrinsic beauty of each and eliminating the need for additional materials and decorative coatings.

Contribution to environmental awareness is an underlying theme throughout the building. Each component of the building, from glazing and exterior enclosure to mechanical and electrical systems are exposed demonstrating the dynamics of the building environment. The extensive use of natural daylight and views allow the interior of the building to change with the moments of the day, sun, sky and cloud. (Richard)

## [RIM Architects / RIM Design, Anchorage, Alaska – USA](#)

<http://www.rimarchitects.com>

**Libraries:**

### [The Scott & Wesley Gerrish and Community Center, Girdwood, AK – USA 2008](#)

8,000 sq ft.

The Scott and Wesley Gerrish Library has seen record-breaking numbers since the Anchorage Public Library opened the new branch in late May 2008. Visits to the library have jumped 69% from January to June. In that same period, circulation of materials has risen 30% and attendance at children’s programs is up 57%. The library’s newfound popularity demonstrates the vital role that libraries play in bringing communities together and providing residents with important access to information and materials. “We’ve received numerous comments from the public that the new Gerrish Branch is beautiful, with a welcoming feel to it. More patrons are motivated to use the library now, because in addition to being more aesthetically pleasing, with the additional computers and expanded space, it has much more to offer than the old library,” stated Branch Supervisor Denise Dargan. The library and community room fills a big gap for Girdwood. Previously, the library operated out of a 1,500 square foot space in the Girdwood Elementary and Jr. High School. The new building provides 3,938 square feet for the library, 2,534 square feet for a community meeting room, and 396 square feet of office space for the Girdwood Board of Supervisors. The library has ten Internet accessible public use computers and the entire building has wireless capabilities, which allows visitors to the library and community room to access the Internet from their laptops. (<http://www.anchoragelibraryfoundation.org>)

### [University of Alaska/Alaska Pacific University Consortium Library, Anchorage, AK – USA 2004](#)

333,000 sq ft.

**Awards:**

2005 Drive By Jury's "Most Original" Award, American Institute of Architects (AK Chapter)

2004 Regional Gold Award for Complexity, American Council of Engineering Companies - awarded to Reid Middleton

2004 Top Construction Award/Meeting the Challenge of A Job Over \$5 Million, Vertical Construction

Associated General Contractors (AK Chapter) - awarded to Cornerstone Construction

**Literature:**

“Radius Walls For Library” : Pacific Builder & Engineer Magazine; December 6, 2002

The University desired to architecturally express the advancement of information technology with a "Library of the 21st Century". Thus, the impact of evolving information technologies was a point of focus for the program and design. Access was provided to the entire range of information resources, including print and audio visual materials held by local libraries, data accessible through the Internet, and digital libraries. A gracious nod to technology of the past was articulated by the installation of a Foucault Pendulum which anchors the facility’s grand stairway. While the architectural statement is drawn from a technological focus, the design incorporates natural elements of Alaska and its culture. The desire was to provide a visual gateway to the architecturally shy campus. Bold colors and patterns were utilized to enliven the interiors against a dark, northern winter. The pedestrian approach to

the entry plaza has a “braided stream” motif, a geometry prevalent in rural Alaska. Visitors enter the library through a 3-story “Great Room” where the supporting columns are reminiscent of oil derricks, a tribute to Alaska’s rich oil and gas history. The finish on the main stairway, surrounding the three-story high pendulum, represents the natural beauty of Alaskan ledge stone. The library’s design also provides magnificent views of the Chugach Mountain Range. Study areas were placed on a curvilinear wall facing these breathtaking views. To allow an optimal amount of daylight into the study area while minimizing the harmful effects of UV rays on the library’s collection, the exterior walls were tilted out 12 degrees. The high-tech coating for the glazing was also engineered to provide additional protection. Design attention was given to bringing natural light into the core portions of the facility through large sky lit areas. Artificial lighting was of similar concern. Rather than running parallel to the shelves, diagonal rows of indirect lights illuminate the book stacks. This innovative system eliminates shadows and provides consistent lighting levels across the face of the books on the lowest as well as highest shelves. To facilitate current and anticipated future technological requirements of a “Library of the 21st Century,” there is an abundance of varying sized group and private study areas equipped with both wired and wireless connectivity. And, finally, building on the desire to create a visual icon for the campus, a 60-foot LED light tower crowns the building as a beacon of knowledge, visible from miles away in the dark, northern sky. This project encompasses the development of a new 126,000 SF addition to the existing 87,000 SF existing UAA/APU Consortium Library. The project was designed to provide continued use of the current Consortium Library building, modified and upgraded to meet the requirements of future library operations. Construction of another component to the project—the 110,000 SF, 300 space parking structure and pedestrian link (skybridge) — was completed in early 2002. (RNL)  
General Contractor for Library Addition - Cornerstone General Contractors (\$22.6 Million; Completed Oct 2004)  
General Contractor for Parking Structure - Nesser Construction (\$9 Million; Completed Feb 2002)

## **RNL Design, Denver, CO – USA**

<http://www.rnldesign.com>

### **Libraries:**

#### **Lewis Library and Technology Center, Fontana, CA – USA 2008**

For years, the small, 13,000-square-foot County branch library on Emerald Avenue served the residents of Fontana adequately. But, when residential development started to take off in the mid-1990s, the little library found it was too small and under-equipped to meet the needs of the growing community. Today, with a patron base of over 200,000, it is apparent that a modern, more technologically advanced library is necessary to enhance personal, professional, recreational and lifelong learning goals. The new regional Lewis Library and Technology Center is the first significant new building in the Fontana Civic Center. Set in the new civic center park, the Library represents the new Fontana – proud of its past but looking toward the future. The community is looking to this regional Library to establish a new civic image for the City as well as provide a stimulus for the revitalization of the historic downtown. The Library fulfills the community’s desire for improved library services as well as establish an icon for a maturing and growing City. The new Library is a place for all generations, from the youngest child coming with his mother to a story-telling program, to the young student researching a school paper on the Internet, to an adult coming to explore new career opportunities, to a senior enjoying a newspaper in her native language. (<http://www.fontanalibrary.org>)

The Lewis Library and Technology Center has opened in Fontana, California. The Los Angeles office of RNL Design designed the \$65 million building with a mix of traditional Mission-style and contemporary architecture. Located on 2.1 acres (0.8 hectares) in the new Civic Center Park, the two-story, 93,000-square-foot (8,600-square-meter) center is framed by a large plaza with a clock tower, fountains, and rotunda. The facility includes a 330-seat auditorium, public meeting rooms, and a cafe. LEED certification is being sought for the building. The Los Angeles office of Heery International served as construction manager.

(<http://www.architectureweek.com>)

#### **Arvada Public Library, Arvada, CO – USA 2007**

The new library building is a cornerstone, focusing energy in redevelopment of the Olde Town Conservation Area. Located on the east portion of the site to gain maximum open space for the town square and best light, the two-story facility will be a distinctive signature destination. Features include a large meeting room, a drive-up book drop, study rooms, wireless internet access, many public-use computers, a large children’s area, and adult and teen reading areas. Rather than developing a new style, colors and materials for the project are based on the roots and materiality of existing Olde Town Arvada, a neighborhood already possessing distinct architectural character. Exterior materials include brick masonry veneer (two tones), a glass and aluminum storefront and curtain wall system and punched openings, and aluminum sunscreens. The structural system is comprised of steel framing and metal studs. An EPDM membrane is used as the roofing system. The project is a partnership between many entities, with funding for the new library, parking lot and renovation to Olde town square will come from Jefferson County Public Library, the City of Arvada, the Arvada Urban Renewal Authority and Jefferson County. (RNL)

#### **Talyn’s Reach Library, Aurora, CO – USA 2003**

27,000 sqf.

This focal point of the community is comprised of a Branch Library, Fire Station and Police Station. The architecture was reduced to a series of pavilions expressing various areas the complex. Materials were expressive of the surrounding plains environment: limestone, copper, wood columns, tan brick, rough field stone, etc. Natural light falls from the clerestory along the central gallery of the library; patrons are sitting by the stone fireplace enjoying coffee while reading. The children’s library, offers painting in the craft area, seated reading under the brilliant color of an authentic hot air balloon suspended above. Computers are humming as patrons throughout the library search the internet. New books are presented in a retail style on custom wooden display tables; along side the CD/DVD racks. A large center spine with high glass allows wonderful natural light to spill into the center of the library. Large views exist of the plains and Front Range of the Rocky Mountains from various locations, especially the bookstore. The library layout and mechanical and electrical design allows for adaptable change in the future, able to reconfigure without need for renovation. (RNL)

#### **Martin Luther King Library, Aurora, CO – USA 2001**

10,000 sqf.

The new 30,000 s.f. Martin Luther King Jr. Library and Municipal Services Center was designed as an inspiration, focusing on the energy of the redevelopment of Original Aurora. The two-story facility becomes a distinctive signature destination, identifying its community. The project acts as the design precedent for the surrounding redevelopment of a reemerging neighborhood, as the first step in rebuilding several city blocks on East Colfax Avenue. The design included the development of a new building and park, with the integration of a plaza for many daytime and evening activities for a continuously changing population. (RNL)

## **Rob Wellington Quigley, San Diego-Palo Alto – USA**

<http://www.robquigley.com>

### **Libraries:**

#### **San Diego New Central Library, San Diego, CA – USA 2013**

Construction Began August 2010, Construction Scheduled to be Complete, Summer 2013

Location 330 Park Blvd, San Diego, CA 92101, (Downtown - East Village, Park Boulevard at 11th Avenue, near Petco Park.)

Total Building Size 497,652 square feet (nine stories including a charter school on two levels, two levels of parking, an auditorium and a café), Parking Spaces 500 (250 on-site, 250 across the street), Cost \$185 million

#### **Special Library Features**

• Outdoor Library Plaza and café, • 355-seat auditorium, • Three-story domed reading room, • 333-seat, west-facing multi-purpose room, • 3,797-square-foot teen center, • 9,141-square-foot children's library, • Technology Center, • 163 square foot Coffee Bar  
Additional Unique Feature Co-located Charter High School for approximately 500 students on 6th and 7th floor of building  
Architect Rob Wellington Quigley, FAIA, Tucker Sadler & Associates

Plans for a long-awaited new central library in San Diego just got a boost after years of stagnation. The city council just voted to bid out the project, as the state threatened to pull its \$20 million contribution unless the action was taken, according to a local news report. Leaders of the San Diego Public Library (SDPL) and the library foundation both expressed optimism. "To our knowledge, San Diego is one of the last of the larger cities to build a new Central Library," SDPL director Deborah Barrow told LJ. Once begun, construction should take 36 months. The library, with 366,257 square feet (fact sheet), would represent an enormous change from the current building, which has 144,524 square feet. The auditorium capacity would nearly double, the number of volumes would increase 50 percent, and the space for children and teens would triple. Fiscal issues San Diego, like many cities, has its fiscal challenges, which have contributed to the delayed construction of the nine-story downtown centerpiece. SDPL four years ago released a construction estimate of \$185 million and private fundraising is still almost \$40 million short of the \$85 million needed. The funding formula calls for \$100 million from public funds, including \$80 million in city redevelopment taxes and \$20 million for a school. The bid process will cost \$500,000. Former San Diego mayor Dick Murphy (and 2004 Library Journal Politician of the Year), who resigned in the wake of a pension scandal that damaged the city financially, was a strong supporter of the library project. Current mayor Jerry Sanders is on record as being against using general fund money for the library's construction. Last December, LJ reported that the city was considering using \$20 million from a bond measure to include a school that would occupy two floors of the library; that plan is going forward. SDPL director, Foundation optimistic Barrow is thankful that the Council's recent action will result in "know[ing] for certain what the new central library will cost." She described just how necessary the new facility is for the city. "Just as our branch libraries are the heart of their communities, our new Central Library is the heart of our library system. We will serve our branches better with materials, programs and other support, and be a center of opportunity for all San Diegans." The SDPL Foundation's marketing director Charlie Goldberg believes that with the "mayor's visible leadership and Council's vote of support, this project is showing real momentum." Private donors already have contributed \$37.5 million, including \$10 million for operations, he told LJ. "We believe additional supporters will now be willing to step forward."

Mayor supportive, city councilor not Sanders earlier this year, in his annual fiscal message, expressed his support of the new library. Among his goals: to "recognize that economic cycles cannot halt our progress, by opening and operating long-planned library." Some city council members weren't as supportive. Council member Carl DeMaio issued a memo October 19 that itemized how much the city would save by abandoning the project (\$63 million as yet unspent from the \$80 million allocated to the project). He also pointed out the redirected funds could be applied to the \$179 million deficit projected for next year and beyond, according to the San Diego Union-Tribune. (<http://www.libraryjournal.com> Nov. 2009 )

#### **Bascom Library and Community Center, San José, CA – USA 2010**

This project involved creating a public building that, despite its location along a busy, 6-lane thoroughfare, would assert a strong civic presence while respecting the small scale of an adjacent single-story residential neighborhood.

Half of the building is devoted to a branch library, complete with a Tech Center and designated areas for children, teens, and families. The other half of the building houses a gymnasium, fitness room, game room, classrooms, community room, and kitchen. Because the community lacks public open space, the intent was to create a variety of gathering spots, both formal and informal. A focal point of the project is its plaza—a covered outdoor area providing sheltered entry to the facility. This 50-by-115-foot public space is enlivened by a retail cafe and by views to the second-floor fitness room and veranda.

The plaza can host a variety of outdoor events, from community barbecues to movie screenings (films can be projected on the outside wall of the multipurpose room). A patio located off the library's program room on the second floor provides a quieter, more contemplative, outdoor space. Even the building's 100-space parking lot is leveraged for outdoor activities such as a farmer's market or a neighborhood carnival.

Seeking to evoke a sense of dignity and permanence, tilt-up concrete is chosen for the gymnasium and multipurpose room walls. Economical and durable, concrete tilt-up construction allows for easy maintenance and better acoustical control while creating an appropriately modern aesthetic.

The project is pursuing a LEED Silver rating. Sustainable design features include LEED natural daylighting and ventilation; water- and energy-efficient fixtures and equipment; and recycled and regional materials. (Rob)

#### **Seven Trees Community Center & Branch Library, San José, CA – USA 2010**

Total Square Footage: 60,000 Projected Date of Opening: 2010 Services Provided: Complete architectural services from conceptual design through construction, coordination of multi-disciplinary consultant team and public artist, community meetings, LEED certification.

This joint-use facility represents a new building type for the city of San José: a combination library-community center that not only centralizes educational, fitness, recreational, and social programs in one place, but also creates a venue for community activities, special events, and celebrations.

Until now, public facilities for this low-income, multi-ethnic community consisted of several small, outdated buildings scattered throughout Solari Park and separated by public streets. The new plan creates a unified civic complex by sealing off part of a street, making the joint-use building the focal point, and installing pedestrian walkways to connect to the park and a nearby elementary school.

Visitors to the building will be drawn in through the "Town Square," an atrium-like lobby with canted walls, high ceilings, an information desk, and an Internet cafe. Designed to encourage public interaction, the Town Square becomes the symbolic heart of the community. As the hub for all circulation within the building, it is an ideal people-watching space; visual security is enhanced through the generous use of interior glazing and carefully aligned sight lines.

From the Town Square, visitors can enter the large banquet room or navigate to the other main floor attractions: gymnasium, fitness room, and weight room; spaces for classes, meetings, games, and crafts; a children's resource center; and a performing arts studio for music and dance.

A glass-enclosed staircase in the Town Square leads to the second-floor library. Community spaces within the library include the teen room, group study rooms, Tech Center, Family Place, children's and adult collections, and the Family Learning Center. The Quiet Room and Living Room, complete with a fireplace and surrounded by the periodicals collection, are glass boxes that overlook the Town Square.

The building's concrete tilt-up walls are meant to convey permanence and dignity. Economical and durable, concrete tilt-up walls allow for easy maintenance and better acoustical control while creating an appropriately modern aesthetic.

A commitment to sustainability helped guide the design process. Since artificial lighting is the biggest user of electricity in this type of facility, the goal is to provide adequate natural daylight so that no lights are needed in the gym or the library on sunny days. Sensors will be used to monitor lighting levels and water use. Slated to obtain a LEED Silver rating, the project will incorporate a variety of other sustainable strategies, such as the use of recycled and regional materials. (Rob)

### **West Valley Branch Library, San José, CA – USA 2003**

Libraries pose an interesting architectural dilemma. The library staff needs a large, featureless, infinitely flexible supermarket of a space. By contrast, the public prefers intimate idiosyncratic spaces with more residential qualities. This building seeks to address that paradox while providing clear circulation and abundant natural daylight.

The large central space of this library has only four columns. The circulation desk monitors the entrance, and the information desk is located at the center to provide visual supervision of the main space and small group rooms. The edges around this space are more personal and intimate in both scale and daylighting. They include areas for group study, periodicals, adult reading with fireplace, children's area, and a technology classroom.

Like many branch libraries, this building is a focus of community life and acts as a beacon from the street. The entry façade is canted to welcome both sidewalk pedestrians and auto users. The community room opens onto a patio at the front of the building to enhance public interaction and provide expansion for larger gatherings. The children's area, visible from the nearby intersection, is glazed to provide views and an invitation to passersby.

Designed to serve as a practical role model for ecologically responsible architecture, it is the City of San José's first LEED-certified building and the first LEED-certified library in the world. The design incorporated a variety of green strategies. The following are just a few examples:

Since electric lighting is the major consumer of energy in a library, the building is carefully designed to minimize the use of artificial light sources. Skylights above the woven screen ceiling diffuser provide even daylighting until sunset when sensors turn on the lights. Air conditioning is kept to a minimum through carefully shaded windows, efficient insulation, and an under-floor mechanical system. In addition, thick concrete block walls add thermal mass to the structure.

The site's mature, existing trees were preserved. Landscaping is drought tolerant, low water use and features high-efficiency irrigation controls to reduce use of water. Inside, the library features waterless urinals and automatic sensors for sinks and toilets. Materials are specified with a "green building" philosophy. All lumber is F.S.C. certified. Where possible, ceramic tile, thermal insulation, carpeting, and furniture are made of recycled materials. Low-emitting materials were also used, including low-VOC paints and adhesives.

The construction sequence prohibited re-using materials from the previous library structure. More than 90% of construction demolition and waste was recycled.

Among the most unique and innovative features of the library are the fanciful public art installations situated inside the building and outside near the entry. The artworks' plant themes reflect the area's agricultural past, and the artworks are made of green materials, including found/re-used objects, sustainable harvested wood, and low-VOC paint. The cabbage sculpture near the entryway acts as a passive water feature, fed by storm water and dew that flows from the roof. (Rob)

### **Rogers Marvel Architects, New York, NY – USA**

<http://www.rogersmarvel.com>

#### **Libraries:**

**New York Public Library Mulberry Street Branch (Soho), New York, NY – USA 2007**

#### **Awards:**

**AIA New York State Award of Merit, NY Art Commission Commendation**

Rogers Marvel designed the newest branch in the NYPL system. In a former chocolate factory, the 15,000sf library connects reading and circulation spaces at the ground level to collections, reading rooms, and computer facilities below grade. A prominent stair links the spaces and brings natural light downstairs. New materials of wood and metal provide a dynamic contrast to the existing fabric of brick, cast iron, and heavy timber beams. Creating unique spatial solutions from difficult sites, honoring historic found conditions, and weaving in new refined, modern forms are distinguishing characteristics of the work of Rogers Marvel Architects. (Rogers)

**Robin Hood Library at P.S. 105, The Bay School (Renovation), Queens, New York, NY – USA 2004**

### **Ross Barney Architects, Chicago IL – USA**

<http://www.r-barc.com>

#### **Libraries:**

**Champaign Public Library, Champaign, IL – USA 2008**

CLIENT City of Champaign, IL, PROGRAM 121,000 square feet Public Library, COST \$22.8 million, STATUS Complete 2008  
Associate Architect Gorski Riefstek, Engineer Henneman Engineering

Ross Barney Architects was commissioned to assist the Champaign Public Library in designing a new facility that responds to the needs of a high tech library for the 21st Century and one that responds to the community.

The design works within constraints of a small site, maintaining building operations throughout construction and a tight budget.

The proposed design of approximately 121,000 square feet located the new building North of their existing facility. The site is bisected by a new entry drive, creating separate zones for parking and the new facility. The building is raised on a monumental grass plinth presenting a civic image to the arriving patron, separating the building from the major vehicular thoroughfare along the south end of the site.

The library program is organized on two levels separating the youth and adult services with the administration located on a third floor mezzanine. The depth of the resulting floor plate was relieved by a series of lightwells and clerestories that allow natural light to reach the first level children's collection. A central two level atrium spine leads the patron from the entry lobby through the various collection spaces creating a dramatic gateway to library services. A conference center/multi-purpose facility is also planned

to flexibly accommodate day to day library activities while also providing a much needed space for public gatherings after hours. A cafe is located on the first floor to create a dynamic gathering space.

These functional organizations are expressed on the exterior by a balance of glazed surfaces and solids. The proposed materials are brick, limestone, copper and glass.

The \$22.8 million building was completed in 2008.

### **University of Florida, Library West Addition, George Smathers Libraries, Gainesville, FL – USA 2007**

Associate Architect Long and Associates

CLIENT University of Florida, Gainesville, FL, George Smathers Libraries, PROGRAM 60,000 square feet Addition 117,000 square feet Renovation, COST \$24 million, STATUS Complete 2007

Library West at the University of Florida is located on University Avenue in Gainesville. The design concept was to provide a north face transparent enough that activity and books are seen from vehicular or pedestrian traffic on this major Gainesville artery. This design strategy emphasizes the buildings essential purposes, and well as presenting a welcoming presence to the community. A transparent glass exterior wall at the first and second floors provides visual connection at the main entrance and creates a powerful connection between the library and the Plaza of the Americas.

The project creates a state-of-the-art library that holds 1.25 million volumes, seats approximately 1600 patrons, and adequately houses the library staff. The project included the construction of a three-story, 60,000 square foot addition, and renovation of the existing 117,000 square foot library distributed on six floors.

Mobile compact shelving was an integral part of the strategy to achieve project goals. The compact shelving, housed in the addition, is available to the general library user. The concept uses the available space efficiently for the proposed number of volumes while freeing up most of the remaining space for patron seating. The existing first floor is devoted to compact shelving since the slab-on-grade can support the loads. This strategy proved cost effective since it eliminated the need to structurally alter the existing building. Escalators were chosen to transport the library users from the first to the second floor to enhance the speed and ease of moving the estimated 1.5 million visitors a year into the facility. The design includes a 24 hour study space on the south west side of the library entrance, and an accompanying cafe/vending area. (Ross)

### **Glenside Public Library, Glendale Heights, IL – USA 2003**

CLIENT Glenside Public Library District, Glendale Heights, IL, PROGRAM 33,000 square feet Addition /Renovation COST \$6 million, STATUS Completed 2003

With patron needs expanding, the Glenside Public Library planned a major expansion to their 15 year old building. The design integrates a \$6 million addition of 13,000 square foot with the renovation of the original 20,000 square foot building. The design solution provided for a separate children's library, enhanced computer facilities in all departments, a larger adult services department with separate quiet study room and increased capacity for public meetings.

The addition extends the forms of the original building while opening the library to natural light through a dramatic clerestory windowed path. This path leads patrons from the front door through the adult services area culminating in the quiet study room. The library has been re-oriented to take advantage of views of public parkland to the South and East. From the entry lobby, patrons will have direct access to public meeting rooms, which can be used after normal library hours. The children's department is located in a new wing extending South toward the park. The Adult services library is housed in the original building and the library administration and technical services are located on the mezzanine overlooking the main reading room. (Ross)

### **University of Chicago, Regenstein Library Reconfiguration, Chicago, IL – USA 1999**

CLIENT University of Chicago, PROGRAM 125,000 square feet Reconfiguration, COST \$15.5 million, STATUS Completed 1999

The University of Chicago Libraries examined a number of options to solve the most pressing problems for their main facility. The 600,000 square foot Regenstein Library was in need of refurbishment and the collection capacity exceeded 90% of available shelving space.

The Regenstein, with a current capacity of 5.0 million volumes, is the largest facility in the University Library and serves all of the Humanities and Social Sciences. The Reconfiguration Project has sought to provide additional storage for books and journals, to make possible research that integrates digital resources and technologies and traditional paper-based media, to allow for the efficient and effective use of Library staff, and to upgrade and replace vital building infrastructure. The first phase of the Regenstein Reconfiguration Project comprised the installation of compact shelving to alleviate the severe collection overcrowding, the renovation of the building lobby, the reconfiguration and relocation of the Access Services Division, and all associated upgrades to electrical, mechanical and networked data systems. The first phase of the Regenstein Reconfiguration began in October 1998 and was completed in February 2000. The work accomplished includes:

Renovation of both the south and east entrances to the building

Redesign of the main lobby

Relocation of Circulation, Course Reserves, ILL and Privileges to the front of the building

Renovation of the main reading area on the 1st floor

Installation of compact shelving on A level to house Special Collections

Installation of compact shelving, with a capacity of 1.4 million volumes

The need for space was critical in both General and Special Collections areas. In addition, since the building was originally designed with staffing points on all floors and the library was interested in ideas which would allow staffing points to be consolidated for longer hours of service. The Library asked Ross Barney Architects to develop means by which the Library could improve the efficiency, operations and convenience of their flagship facility. Options were investigated which included both additions and renovations. Major additions were not able to be undertaken due to budget constraints, so the University is pursuing a phased approach to renovate their main library facility. The first phase will address the library's immediate shelving needs by installing compact shelving in existing below grade levels for nearly a quarter of the collection.

In addition, much needed infrastructure improvements were made to the mechanical, electrical, fire alarm and data distribution systems. To address the issue of the dated appearance, the main entrance lobby and adjacent reading room were renovated. This entrance retrofit allowed Ross Barney Architects to reconfigure the exit patterns by moving the circulation desk to the front entry area, improving distribution of reference materials and speeding check-out.

The first phase is complete, with future phases to follow as capital improvement budgets allow. 185,000 Square Feet, 6,116,978 Volumes, 280 User Seats, 45 Computer Stations, 150 Data Ports (2,400 patron seats in entire library), Compact Shelving for 1.4 million general collection volumes, Compact Shelving for 750,000 special collection volumes. (Ross)

### **Northwestern University Library Renovation, Evanston, IL – USA Master Plan 1999**

CLIENT Northwestern University, PROGRAM 76,600 square feet, COST \$630,000 Phase I, STATUS Completed 1999

University Library, is located on the Evanston Campus of Northwestern University. Built in 1972 in response to a growing collection and service base, the building is linked to the older Deering Library on filled land over the original shore of Lake Michigan. It serves

today as the physical, academic, and social focus of the University Campus and through its form, it reinforces the vistas, traffic patterns, and open spaces in which it is nested.

Ross Barney Architects was commissioned to develop several options for accommodating, within the library complex, two distinct components: expansion of compact book storage for the Library and relocation of computing and office spaces for Information Technology.

To address the overriding need for flexibility and adaptability, concepts featured the construction of spaces that are easily convertible between book storage and office use. The impact of additions was studied to minimize disruption of existing library operations as well as building and site elements. New access and traffic patterns were developed to integrate Information Technologies 24-hour public access computing facilities with Library departments that share similar hours and functions. (Ross)

#### **Oakton Community College, Library Addition, Des Plaines, IL – USA 1998**

CLIENT Oakton Community College, Des Plaines, IL, PROGRAM 30,000 square feet Addition Renovation, COST \$2.2 million STATUS Complete 1998

The Oakton Community College library was constructed in 1978 as part of the original campus. Since that time the campus has nearly doubled in size, yet the 19,000 square feet library remained largely unchanged.

The expansion and renovation project addresses lack of space, campus identity, functional interaction and adaptability to changing technology. The expanded facility includes library functions, instructional support and lifelong learning services. The new facility addresses changing technology as an instructional tool and information source by providing flexibility for current and future needs. Located at the entrance to the campus, the library is the hub of Oakton Community College. The addition provides needed identity for the library. Views were improved to the heavily wooded site, and opportunities for natural lighting in public areas were optimized. The expanded library is three levels and approximately 30,000 square feet. All infrastructure systems, electrical, mechanical and data systems were renovated. (Ross)

#### **Maywood Public Library District, Maywood (Chicago), IL – USA 1998**

CLIENT Maywood Public Library District, Maywood, IL, PROGRAM 30,000 square feet Addition Renovation, COST \$4.5 million, STATUS Complete 1998

Maywood, Illinois is an inner ring Chicago suburb. Economic depression and gang crime have plagued the town in recent years. The Library Board's decision to undertake a major expansion to their 7,000 square feet, 1908 Carnegie Library was a courageous attempt to create a catalyst for the revitalization of the community. After a true grass roots campaign that included enlisting every Church in Maywood, the library became one of the very few Library districts to pass a building referendum in Illinois in the early 1990's.

The design of the addition reflects the Board's hopeful and progressive outlook while maintaining the integrity of the historic Carnegie. A cylindrical lobby and stair carefully separate the much larger addition (30,000 square feet) from the original building. A masonry wall detailed to recall the Carnegie, forms the facade of the Addition. Behind this screen is a simple, and elemental interior that clearly distinguishes the Addition from the earlier structure.

Furniture designed by the Architect reflects the clean simple design. Reading tables, computer stands, and end panels on the shelving are made of plywood. The Children's furniture is of similar construction and detail, but finished in multiple colors. In the Children's Library, awning materials are used to create a more childlike scale and atmosphere. (Ross)

#### **Mabel Manning Branch Library, Chicago Public Library, Chicago, IL – USA 1994**

CLIENT Chicago Public Library, PROGRAM 12,000 square feet, COST \$3.2 million, STATUS Complete 1994

This new branch library serves the Near West Side community which has had inconsistent library service and has one of the lowest per capita income levels in the city. The library's collections and services will reflect the special needs of the neighborhood's inner city patrons.

With the redevelopment of the nearby Chicago Stadium and several public works improvements, the community is being revived. The library site is located on the area's main thoroughfare and is the first step in the development of a multi-block, campus-like park extending to several area schools. The library, with its beacon-like entry tower, will become the focus of the park.

The compact, efficient 12,000 square feet plan is organized around a clerestoried Reading Room. The Auditorium is designed to allow for after library hours use by community groups. (Ross)

#### **Barrington Area Library, Barrington, IL – USA 1994**

CLIENT Barrington Area Library, Barrington, IL, PROGRAM Addition 30,700 square feet, COST \$6 million, STATUS Completed 1994

In 1989, the Barrington Area Library recognized the need for a major building addition to their 10 year old facility. Besides generalized expansion, their program included a new large public meeting room.

The original library is a low profile brick and tile building which nestles into the heavily wooded site. The design seeks to maintain the original ambiance while improving views from the building into the site and enhancing the library's identity from the highway. The new plan joins the new and old building elements along an arcaded "street" leading patrons from the parking lot to a hospitality/welcome desk. The main "street" is intersected by a secondary axis directly in front of the hospitality desk. This "street" takes patrons to the major library service nodes; circulation, adult, reference and young people's services. Meeting rooms are also on the axis. The new entry space is enclosed by a wood structure. Closely spaced columns built from dimension lumber support light, wood framed joists. Daylight from clerestory windows filter through the branch-like structure to the lobby floor. Other building materials match the original. The \$6 million, 30,700 square feet addition was part of an expansion/renovation that doubled the size of the library. (Ross)

### **RSP Architects, Minneapolis, MN – USA**

<http://www.rsparch.com>

#### **Pierre Bottineau Community Library, Minneapolis, MN – USA 2003**

For nearly a half-century the public library serving a pocket of Northeast Minneapolis was housed in a leased storefront that, at 3,000 sf, was woefully inadequate for the number of patrons served. RSP was initially engaged by the Minneapolis Public Libraries to study the feasibility of reusing the former Grain Belt Brewery Gasthaus for a new community library. The original structures of the new library are on the National Register of Historic Places. They were a steel-supported 1893 wagon shed and a brick Millwright Shop built in 1913. In the years following World War II the buildings were converted to become the cornerstone of a community garden for visitors to the Brewery and attained iconic status within the neighborhood over time. We worked closely with community organizations and artists to make the library a special place for the many families with children, seniors, and neighborhood residents— many of whom are East-European emigrés—who are library patrons. The new facility opened in May 2003 and quickly

attained a pride of place status within the community. At approximately 9,000 sf the new facility effectively tripled the library's capacity. (RSP)

## **Rutledge Interiors, Nashville, TN – USA**

<http://www.rutledgeinteriors.com>

### **Libraries:**

**Clayton-Glass Library (interior design), Motlow State Community College, Tullahoma, TN - USA 2008**

Concerning the Library Building: **Kline** Swinney Associates, Nashville, TN – USA <http://www.ksarchitects.com>

### **Awards:**

**Silver Citation Rutledge Interiors for Interior Design AS&U (American School & University) 2008**

The new Clayton-Glass library on the main campus of Motlow State Community College in Tullahoma has received a Silver Citation, the highest post-secondary award from the 2008 American School & University Educational Interiors Showcase. The award will be featured in the August issue of the magazine. The jury making the award noted that the library interior is "Very well detailed with expressive materials. It represents the rural area beautifully." The library was built under the oversight of TBR's Facilities Development staff; the interiors were done by Rutledge Interiors in association with Kline Swinney Associates. (<http://www.tbr.state.tn.us>)

## **RWH Richard Wittschiebe Hand, Atlanta, GA – USA**

<http://www.rwhdesign.com>

### **Libraries:**

**Northlake-Barbara Loar Branch Library (DeKalb County Public Library), Tucker, GA – USA 2009**

This project is a 5,000 SF addition to an existing 10,000 SF neighborhood library. The existing library space was completely renovated to create a cohesive 15,000 SF library. The functions were reorganized to provide larger reading and stack areas, a larger children's library area, a new teen area, a new circulation desk, additional administration space, and a more functional multi-purpose community space. New lighting and mechanical systems will also update the existing space and connect the existing to the new. The existing site parking provides with new outdoor lighting for security. Landscaping was updated by thinning out a mature overgrown landscape and by replacing weak trees. Other sitework included providing a more accessible pedestrian path from the parking to the front entrance and reworking the vehicular traffic to provide easier access to a new bookdrop. The building addition reflects the ship metaphor of the existing design. The addition extends a prow towards the parking that will direct pedestrians to the entrance and create an interior children's library space within the prow. (RWH)

**Portsmouth Public Library, Churchland Branch, Portsmouth, VA – USA 2009**

A community project in its truest form, this new 20,564 square foot state-of-the-art library has been designed around the collective needs of its local civic groups, diverse neighborhoods, associations, and city-wide agencies. Adjacent to a recently renovated YMCA, this remarkable structure adds greater function and even more recreational/ educational opportunities for citizens of all ages. The white ground face CMU veneer and aluminum window systems exterior is sleek and contemporary, yet remains in perfect harmony with its immediate surroundings. Long, blue reflective glass in aluminum storefronts and curtain wall systems add depth and character to the overall dimension of the building, while reflecting the natural beauty of the new landscape. The design incorporates organic themes with an explosion of natural light. In keeping with the community hub concept, the unique semi-circular design houses over 7700 square feet of lobby and adult library space, 5900 square feet of space for a childrenfocused library and meeting rooms, and over 6500 square feet for young adults, library staff, and support services, as well as offices for the City Treasurer. Particular attention has also been paid to those details that further reduce exterior noise and seasonal glare from the sun. This huge community-wide project accomplished what few can. Strong partnerships with the city and neighboring communities helped create an exciting new place to gather. (<http://www.hbaonline>)

**Lane Library Renovation, Armstrong Atlantic State University, Savannah GA – USA 2006**

Client: Armstrong Atlantic State University/Board of Regents, Project DATA: renovation, circulation, media service, reference rare book collections, general collections, 50,000 sqf total, Cost: \$4,000,000, Date of Completion: 2006

The goal of Armstrong Atlantic State University was to renovate the interiors of their existing traditional main library building in order to provide an up to date environment The goal of Armstrong Atlantic State University was to renovate the interiors of their existing traditional main library building in order to provide an up to date environment for their student body. The renovation reorganizes traditional library functions, highlighting user functions and media on the first floor and stack space and increased group work areas on the second floor. The circulation has been simplified and visibility to all areas enhanced. An open communicating stair connects the levels. The project was a complete upgrade for mechanical, electrical, plumbing and windows. The design takes into account the student services and classroom building planned for the future. The interior quality of the space is in keeping with the traditional nature of the building. Soft, warm materials and tones are incorporated throughout the space. (RWH)

**Martin Luther Jr. Branch Library, Atlanta-Fulton County Library System, Atlanta GA – USA 2004**

Client: Atlanta-Fulton County Library System, Project DATA: renovation, adult reading area, children's library and story area, media area, administration offices, 4,124 sqf total, Cost: \$382,000, Date of Completion: 2004

The client's objective was to build a functional and durable neighborhood branch library with a hip feel to appeal to teenagers and children. The library space available was in a historic laundry building in the Martin Luther King, Jr. Historic District in downtown Atlanta. The programmed spaces are layered from the front of the space to the rear, with the circulation desk and children's area near the entrance, computer desks in the middle and the stack areas at the rear. An elevated floor area at one end of the space contains an adult reading area and administrative offices. Three carpeted seating levels at the floor elevation change were designed for use as a children's reading area. Library shelving with metal shelves and trim with frosted glass end panels were selected to provide a contemporary feel. Upholstered furniture uses a durable ultrasuede material in jewel tones of purple, green, yellow, and red to enliven the space. (RWH)

##### **Literature:**

**Impact of Historical Preservation on the Free Library of Philadelphia: Its Neighborhoods and Communities, A Thesis Submitted to the Faculty of Drexel University by Karen Frances Miller in partial fulfillment of the requirements for the degree of Master of Science in Science, Technology & Society. August 2010.**

<http://idea.library.drexel.edu/bitstream/1860/3375/1/Miller,%20Karen%20Frances.pdf>

**June 2, 1927, the massive Central Library – Architect: Horace Trumbauer \*28.12.1868 Philadelphia - + 18.09.1938 Philadelphia - opened for service at its present location on Logan Square. The building had been in the planning stages since 1911; however, various obstacles, including World War I, halted progress on the building.**

**Client Free Library of Philadelphia, Inception Date 2003-11-13, Total Area: Renovation: 170,000 sq. ft Expansion: 180,000 sq. ft. Costs: \$ ca: 185.000.000, Design Team Moshe Safdie and Associates Francis Cauffman Foley Hoffmann Kelly Maiello Architects Finegold Alexander + Associates**

The Free Library of Philadelphia located on Logan Square along the Benjamin Franklin Parkway, is a Beaux-Arts building dating from 1927. The objective of this project is to restore the existing building to its former glory and to add a new wing to accommodate expanded activity and the types of spaces not available in the existing library. The design strategy is to ensure that the addition and existing structure form a single integrated complex and to provide a unified spatial experience where the old flows seamlessly into the new, while maintaining the authenticity of the traditional and the contemporary architecture.

A new reading room is formed between the north façade of the existing library and the curved wall of the south face of the new wing. Two bridges connect the original building to the new wing, and glass-enclosed passageways are carved through the closed stacks in the original library, connecting its main entry to the new wing.

The “urban room”, lined with small shops, a café, meeting rooms and an auditorium, serves as the new north entry to the complex, complementing the existing south entry. It is contained by the north façade of the library’s new wing and a grat domelike glass-and-steel structure. A public garden extends north towards Callowhill Street, serving the surrounding community. (Safdie)

#### **United States Institute of Peace, Headquarters, Washington, DC – USA 2011**

**Client United States Institute of Peace, Inception Date 2001-01-01, Completion Date 2011-04-01, Total Area 125,200 sq. ft. (11,631 sq. m.), Project Cost \$186,000,000, Status Under construction; Estimated Opening Spring 2011**

Located at the intersection of 23rd and Constitution Avenues, the United States Institute of Peace headquarters occupies the last remaining site on the National Mall facing the Lincoln Memorial. The building will contain administrative offices, research facilities including a library and archives, a public conference center, and an interactive education center dedicated to the themes of international conflict prevention, management, and resolution. The building is organized around two atria fanning out from a corner entrance. The first, facing the Potomac, serves as the centerpiece for the spaces devoted to scholarly research, while the other, facing the Lincoln Memorial, acts as a focus of public activity and conferences. The public spaces in the building are roofed by a series of undulating spherical and toroidal segments, constructed of steel frames and white translucent glass. The roofs form a series of wing-like elements, white on the exterior during the day, and glowing from within at night, and will be visible from across the bridges from Virginia. (Safdie)

#### **Salt Lake City Main Public Library – Salt Lake City, Utah – USA 1999 – 2003**

##### **Awards:**

**2005 Outstanding Design Award – AIA/ALA Library Building Awards**

**2005 2<sup>nd</sup> Place – Theresa Bradley Spirit Award for Professional Interior Design – Salt Lake Design Awareness Foundation**

**2003 Best Utah Project of the Year Intermountain Contractor – Best of 2003 Awards**

**2003 Best Public/Institutional Building PCI ( Precast / Prestressed concrete Institute ) Design Awards**

The Salt Lake City Main Public Library features a triangular-shaped main building, an adjacent administration building, a glass-enclosed Urban Room and an exterior public piazza. A curving climbable wall weaves the site together and contains shops and food establishments as well as steps ascending to a roof garden above. The building’s glass-enclosed Urban Room and piazza flow together uniting interior and exterior spaces. The Urban Room is conceived as a space for all seasons, generously endowed with daylight, open to significant views and, since it extends the full height of the building, is a pivotal point of visual orientation. Multi-level main reading areas along the transparent southern façade of the building look out onto the piazza, the city and the Wasatch Mountains beyond. At night the glass façade, lit from within, is reflected in a crescent-shaped reflecting pool extending into the outdoor space. (<http://www.vcbo.com>)

#### **Hebrew College, Newton, MA – USA 1996 – 2002, Phase II on design**

**Client Hebrew College, Newton, Massachusetts, Inception Date 1996-01-01, Completion Date 2002-01-01, Total Area 110,000 sq. ft. (12,000 sq. m.), Project Cost Phase I, \$18 million, Status Phase I: completed, 2002; Phase II: in design**

The site for Hebrew College, Newton, incorporates the northern wooded slope below it, occupied by Andover Newton Theological Seminary. Several buildings are organized along the hillside and contain within them the heart of the campus - the green commons. Facing the green is a two-story linear library, viewed from the green as a continuous line of reading tables along a great glass wall, with the library stacks arranged as a backdrop, thus subtly evoking the theme of The People of the Book. An entry building/gateway to the west contains a lecture hall, museum, and administrative offices. Another linear structure, facing the library across the green, accommodates classroom and faculty offices, both of which face the wooded hillside. The interior heart of the campus is the level below the green, open to sky through sunken courtyards and skylights. This student center contains a cafeteria, bookstore, and computers. (Safdie)

#### **Rosovsky Hall, Harvard-Radcliffe Hillel, Cambridge, MA – USA 1992 - 1994**

**Client Harvard University Harvard-Radcliffe Hillel, Inception Date 1992-01-01, Completion Date 1994-01-01, Total Area 21,000 sq. ft. (1,950 sq. m.), Project Cost \$3,650,000, Status 1992-1994**

The Harvard-Radcliffe Hillel provides Jewish educational, cultural, religious, and social opportunities for students and faculty and is a center of Jewish life in the community. The building, named for the former dean of the Faculty of Arts and Sciences, is located off Harvard Square. The building's centerpiece is a circular courtyard defined by three skylit, vaulted spaces that open onto Plympton Street. The versatile green space, enclosed by load-bearing steel columns, can accommodate a 'sukkah' during festivals. On the building's ground floor is a student lounge, dining hall, and a multi-purpose room. **Upper floors feature a library, offices, and multi-purpose rooms for worship and meetings.** Clad with brick and precast concrete, the building has a leaded copper roof. (Safdie)

#### **Vancouver Library Square (Central Library), Vancouver, BC – Canada 1992 -1995**

Client City of Vancouver, Inception Date 1992-01-01, Completion Date 1995-01-01, Total Area 650,000 sq. ft. (60,400 sq. m.)  
Project Cost C\$109,000,000, Status 1992-1995

**Design Team Moshe Safdie and Associates with Downs Archambault & Partners, Associate Architects.** Consolidating Vancouver's Central Public Library, Federal Office Tower, and retail and service facilities, Library Square occupies a city block in the eastward expansion of downtown Vancouver. Centered on the block, the library volume is a seven-story rectangular box containing book stacks and services, surrounded by a free-standing, elliptical, colonnaded wall featuring reading and study areas that are accessed by bridges spanning skylit light wells. The library's internal glass facade overlooks an enclosed concourse formed by a second elliptical wall that defines the east side of the site. This generous, glass-roofed concourse serves as an entry foyer to the library and the more lively pedestrian activities at ground level. Public spaces surrounding the library form a continuous piazza with parking located below grade. (Safdie)

Vancouver Library Square is a mixed-use project--the largest capital project ever undertaken by the City of Vancouver--containing Vancouver's central public library, a federal government office tower, retail and service facilities, and below-grade parking. The Library Square occupies a complete city block and consists of a seven-story rectangular block containing stacks and services. The highlight of the project is a free-standing elliptical wall that contains reading and study areas accessed by bridges from the central pavilion. The roof of the library serves as a large public garden, an example of Safdie's efforts to introduce garden elements into urban settings. The library design was selected through an international competition and officially opened in May 1995. (<http://www.mcgill.ca>)

### **Sage and Coombe Architects, New York, New York – USA**

<http://www.sageandcoombe.com>

#### **Libraries:**

#### **New York Public Library Fort Washington Branch, Childrens Room, New York, NY – USA 2007**

2500 sqf.

#### **Awards:**

2007 AIA NYC Design Award

2009 AIA NY Award of Excellence

At Fort Washington, the children's room occupied the upper story of an historic Carnegie branch library. The room was grand but over scaled for its diminutive audience. The original casework at the perimeter had charm but was in poor condition. The circulation desk -- a large corral of sorts -- was no longer needed and had become more of an obstacle within the space. Finishes were tired and lighting in the 18' high space was inadequate. (Sage)

#### **New York Public Library Epiphany Branch, Gramercy Park, Childrens Room, New York, NY – USA**

2007

2500 sqf.

The Epiphany Branch of The New York Public Library, once part of the Cathedral Library Association founded by the Roman Catholic Archdiocese of New York, has served the Gramercy Park-Stuyvesant Town area since 1887.

The current Epiphany Branch building, an elegant Carnegie Library, opened on September 29, 1907. It was a major neighborhood cultural and educational source until 1982, when it was closed for nearly two years for an extensive expansion and renovation; the restored library opened on July 16, 1984. Today, the handsome three-story building, fully accessible to persons who use wheelchairs, houses adult, young adult, and children's collections. A modern auditorium, available for community group meetings and library programs, is located on the third floor.

In 2007, the children's room was completely renovated to increase shelving, add additional computers, and create a read-aloud area. The renovation was made possible through a generous gift from Felix G. Rohatyn in honor of his wife, Elizabeth.

(<http://www.nypl.org/locations/tid/24/about>)

#### **New York Public Library Hamilton Fish, East Village, Reading Room, New York, NY – USA 2007**

The many large windows in the tan brick facade of the Hamilton Fish Park Branch make the interior a bright and cheerful space. The air-conditioned branch, built in 1961, is arranged on one floor, with adult, teenage, and reference book collections to the right of the entrance and a Children's Room to the left. An auditorium, that seats 75, is available for community use by application to the librarian. The branch and its neighborhood park are both named for Hamilton Fish (1808-93), the distinguished American statesman who was Governor of New York and Secretary of State under Ulysses S. Grant. The original Hamilton Fish Park Branch was built in 1909, with funds from Andrew Carnegie. When Houston Street was widened for an approach to the FDR Drive, the original building was lost and replaced with the current.

(<http://www.nyc-arts.org/organizations/21498/Hamilton-Fish-Park-Branch-New-York-Public-Library>)

#### **New York Public Library Melrose Branch, Reading Room, Bronx, New York, NY – USA 2007**

3500 sqf.

It is the closest branch to Yankee Stadium and the borough's thriving court system. The branch opened its doors on January 16, 1914, and was one of the many libraries built with funds from Andrew Carnegie. The building was designed by Carrere and Hastings. Originally, the simple red-brick structure rose to four stories. The top two floors were removed during an extensive renovation and modernization in 1959. This air-conditioned library now occupies almost 10,000 square feet, and has separate rooms for children and adults. It serves an ethnically diverse population of approximately 50,000; almost 25% of the branch's users prefer to read and speak in Spanish.

(<http://www.nypl.org/locations/tid/44/about>)

## **Joel Sanders Architect, New York, NY – USA**

<http://www.joelsandersarchitect.com>

### **Libraries:**

#### **Education Commons, University of Pennsylvania, Philadelphia, PA – USA 2012**

Managed by Penn Libraries, it is a 168-seat, 6,400-square-foot, state-of-the-art study and information facility designed to support teaching and collaborative learning.

“A student who joined me for a tour of the Commons,” said Carton Rogers, vice provost and director of libraries, “was so excited about the new space, we half expected her to request season tickets to the collaborative study rooms.

“We’ll stop short of that,” Rogers said, “but students and faculty are certain to find this an inspiring place to work.”

Inspired by Weigle Information Commons in Van Pelt-Dietrich Library (see: [Ann Beha](#)), the facility features flexible, technology-rich work environments. A series of curved planes envelop the ceiling, and the monumental arched windows of Franklin Field visually join the interior space with the expanse of lawns and tree-lined walkways that will make up Shoemaker Green, now under construction.

The Commons offers a variety of visual design, publishing, math, geographic, math and statistics, Web development and digital management software as well as a multitude of media players, all supported with full wireless networking and color and black-and-white printing stations.

Within the Commons, students and faculty will have access by reservation to an 18-seat, glass-enclosed seminar room, equipped with a computer and an 80-inch video display. Four small and four large study rooms – each with a computer and large flat panel LCD screen – can accommodate groups of as many as 10 and are also reservable. Open seating for as many as 90 is offered in banquettes and in soft furniture, providing flexibility for individual or group use.

Librarians will be on hand to help students with technology and to work with faculty and University staff on program development. Also, the libraries are collaborating with academic-support services across campus to develop workshops and discipline-based programming geared to undergraduate students.

#### **NYU Bobst Library, New York, NY – USA 2012**

As reported by David W Dunlap for the NYTimes, the safety-restoration applied to Philip Johnson and Richard Foster’s Elmer Holmes Bobst Library on the NYU campus near Washington Square is close to completion. While the library, which was constructed in the early 1970s, remains intact, the tremendous atrium space – a soaring 150 ft void – is proving to be more of a safety hazard than the magnificent architectural experience the architects intended. Since 2003, the library has been marred by claiming the lives of three students who leaped to their deaths (even after the university installed 8ft polycarbonate barriers). Charged with the task of eliminating the possibility for such a future occurrence, Joel Sanders Architect responded with a perforated aluminum screen that completely walls off the atrium from the library’s levels.

Conceptualized as a random pixel design to compliment the building’s minimalistic aesthetic, the matte bronze 20-ft tall panels eliminate the vast panoramic views across the library and instead compartmentalize views into “scattered fragments“. The screen, in no way an “inconspicuous barrier”, completely alters the sense of space within the library. Dunlap explained, “They can — in the right light — look as gauzy as theatrical scrim.”

Yet, nothing can take from the initial effect of walking into Bobst at the ground level, ““You really don’t lose the visual qualities of the original atrium. This is almost like a beautiful piece of lace that’s been stretched taut against the balcony slabs,” explained Andrew T. Repoli, a director of construction management at NYU.

The new intervention adheres to NYU requests of transparency and permeability, and, according to spokesman John Beckman, the panels “Present an opportunity to enhance the quality, character and identity of this important NYU institution.”

Working with SHoP Construction Services, the 280+ panels were digitally fabricated from 39 different patterns modeled in Catia. Currently, the renovation is still underway, but as NYU students return for the semester in a few weeks, the library will be sure to play host to an entirety of critics. It will be interesting to see the opinions unfold, especially since the screens are purely intended to save lives. Based upon such a sensitive issue, will the screens still warrant the same kind of architectural criticism? Karen Cilento 24.0812 Archdaily (<http://www.archdaily.com>)

The Bobst Pixel Veil addresses dual design challenges: the creation of a secure yet visually porous membrane that is aesthetically compatible with the atrium designed by Philip Johnson in 1968. The Pixel Veil consists of laser-cut aluminum panels and vertical supports painted to match the existing bronze handrail. Each laser-cut panel is inscribed with a perforated pattern – the Pixel Matrix – composed using an underlying 4” grid whose spacing aligns with the vertical stanchions of the original railings while also complying with ADA building codes. Responding to the surrounding context, modular perforations gradually dissolve along the atrium perimeter from south to north, becoming visually more open towards the stacks and park. At the top level, the perforated veil terminates in a glass clerestory. The Pixel Matrix builds on the affinity between the original building and the language of digital information – both rely on the logic of the square matrix. Pixel Matrix references the building’s underlying square grid that Johnson expressed in the square coffered ceiling and concentric square reading lights, as well as the language of digital information that encrypts data through bar codes composed of square modules. (Sanders)

#### **Princeton University Julian Street Library, Princeton, NJ – 2011**

### **Awards:**

ALA IIDA Library Interior Design Award for Princeton Julian Street, 2012

Interior Design Best of Year Institutional: Library Honoree for Princeton Julian Street, 2012

The Julian Street Library, a newly renovated library in a 1960s modernist building at Princeton University, transforms a 3,100 SF reading room into a state-of-the-art multimedia learning environment. Situated between a residential college and the main campus center, the library acts as a hub for undergraduate students on their way to the central campus. Recognizing that with the advent of digital technologies libraries are multipurpose spaces that sponsor study and social interaction, our design reconceives the refurbished library as a wired environment where students can work, lounge, and socialize day and night.

## **SASAKI Architects, Boston, San Francisco – USA**

<http://www.sasaki.com>

### **Libraries:**

#### **Sacred Heart University Library and Humanities Center, Fairfield, CT – USA on design**

The new building, which will house both of the John F. Welch College of Business (COB) and the Isabelle Farrington College of Education (FCE) programs, will be a dynamic, iconic gateway building that signals the entrance to the university campus for students, alumni, visitors, and the Fairfield community. Together, the building and landscape achieve a synergy of design and

purpose that promotes Sacred Heart University's progressive and comprehensive approach to business management, career success, and global competition as well as preparation for the dynamic and creative educators of tomorrow. The building is also the starting point of a sequence of buildings and a network of open spaces that includes the Great Green, the chapel, and the Linda E. McMahon Commons—each also designed by Sasaki and tied together by pedestrian paths leading diagonally through campus.

Sasaki's design balances the traditional with the contemporary, creating a professional and collaborative environment realized through the various learning spaces and courtyards in and around the building and its connection to the main campus. The structure provides classrooms that support various pedagogical platforms of teaming, individual studies, and distant learning. The building also houses The Executive Leadership Institute, which gathers national and international speakers to address the contemporary issues confronting business and education. Technology is the backbone of the building, supporting learning at all levels. A food service and a dining area fosters discussions and collegial interactions. The building also houses support offices for both schools as well as the new deans' offices. A below-grade parking structure accommodates 138 cars.

The courtyard serves as a common open space and the nexus of student life. Green carpet alternates with crushed stone pathways and loose furniture provides flexible seating. Within the building, areas for group study overlook the courtyard through a transparent glass skin to provide a nearly seamless transition from the inside to the outside.

The courtyard also ties together the main entry court and lower entry court. The main entry court includes reflective water feature integrated with sculptural art. Seat walls in the landscape, shaded by trees, offer informal areas for gathering. The lower entry court provides a pedestrian connection to the campus to the south, and creates an iconic view of the archway for those approaching from campus. The lower entry court, the courtyard, and the main entry court at Park Avenue are all tied together by a series of sculptural trees.

Sasaki's proposed streetscape improvements along Park Avenue consist of a sidewalk flanked by rows of street trees that echo the building geometry. A stone wall is envisioned as a continuous element that ties the Sacred Heart streetscape to the golf course and larger context beyond. (Sasaki)

### **Dixie State College, Jeffrey R. Holland Centennial Common Building, St. George, UT – USA 2012**

Size 185,000 SF., Cost \$45 million, Status completed September 2012, Team VCBO Architects, LEED® Gold certification goal

#### **Awards:**

**Merit Award, International Interior Design Association Rocky Mountain Chapter, with VCBO Architects**

**People's Choice Award, International Interior Design Association Rocky Mountain Chapter, with VCBO Architects**

The Holland Centennial Commons (HCC) is the intellectual, academic, and social hub of Dixie State College. Centrally located in the heart of Dixie's historic Encampment Mall, this signature building houses the library, classrooms, academic offices, student services, and business services. The HCC is the keystone of Dixie State's overall campus growth and is described as a "student success center." At 170,000 square feet in five stories, the Centennial Commons provides the much needed space Dixie requires to fulfill its mission of student centered learning. Considered a top priority by Dixie administrators and the Utah State Board of Regents, the HCC is the largest state appropriation for the institution in its near 100-year history. The HCC is highly functional and symbolizes Dixie State's emergence as a four year academic college—a significant milestone on its trajectory toward becoming a regional state university.

A modern, technology-enriched library is the HCC's largest program element. At its heart is a digital commons. Visible and readily accessible from the entrance foyer, the commons is highly collaborative and socially stimulating. A monumental cascading staircase with views over the campus mall and to the peaks of Zion National Park in the distance circulates upward, allowing library users access to the increasingly quiet book stacks and private study areas.

Integrated at the top of the library space is the English Department. It includes flexible classrooms that facilitate innovative teaching and learning techniques as well as a variety of group and individual study spaces, areas suited to computer-based learning, a writing center, and tutoring services.

The HCC places all student services in a one-stop location at the lower entry level, including registration, financial aid, advising, and counseling. The split level design connects major functions with multi-story lobbies and ensures the building's arrangement is clear to visitors.

The building design responds to the region's geography and relatively harsh desert climate. Targeting LEED Gold certification, the design team carefully considered a climate-appropriate material palette reflective of the building's surroundings. Exterior shading devices introduce and regulate natural light. Calculated distribution of building openings depends on the building's orientation, maximizing daylighting conditions. (Sasaki)

### **UMKC Miller Nichols Library and Interactive Learning Center, University of Missouri, Kansas City, MO – USA 2010**

Size 14,000 SF, Cost \$14.5 million, Status completed October 2010, Team: Peckham Guyton Albers & Viets

This project proposes a new vision for the role of libraries in public universities, one that supports and encourages the major transformations in learning that have characterized higher education in recent years. Fundamental to this vision is an integration of social and academic life on the campus in a dynamic new library that will serve commuter students and the local community, while creating a campus crossroads for an expanding residential student body. The Miller Nichols Library and Academic Commons project consists of renovations to the existing library along with a major addition that doubles the footprint of the facility. This new addition sits on structured parking for 550 cars. Throughout the library there will be a programmatic blending of spaces dedicated to classrooms, collection materials, research, and social interaction and collaboration. Central to this arrangement will be a dramatic four story high academic commons that looks out over the Kansas City skyline. Situated at the heart of the campus, the Miller Nichols Library and Academic Commons will be immediately adjacent to the new student center, also being designed by Sasaki. By combining collection space with instruction and social space, this project will transform the academic experience at UMKC and put the University at the forefront of developing an approach that improves quality while containing cost. (SASAKI)

### **Morris A. Soper Library and Information Technology Centre, Morgan State University, Baltimore, MD – USA 2009**

**In association with Design Collective, Incorporated and FON Architects.**

Size 220,000 SF, Cost \$60 million, Status completed April 2008, Team Design Collective, Inc., FON Architects, PA

Morgan State's new library and student center form The Commons, the campus's new center and a point of mediation between the older academic section and a newer residential precinct. As one of the two new signature buildings on campus, the library had to balance a sense of importance and renewed pride with an equal sense of transparency and welcome – "impressive, not oppressive," in the client's words. Flexibility was also key. After extensive study and testing, a system of 12' by 27' modules was arrived at as a basis for the entire interior layout. Divisible by three, these modules match the three-foot shelving modules and allow stack areas to be easily converted into classrooms, seminar rooms, open group study, etc., as well as back to stack space as collection needs require. To the east, the library serves to strengthen and animate the pedestrian mall with a glass curtain wall. A curvilinear wing wraps around the northern and western edges and is partially topped with a sedum green roof, which can be viewed from key interior

spaces. Along a broad interior loggia set behind the glass façade, student reading areas are placed against the glass and connect to the rest of the building via bridges that penetrate a wood wall punctuated with windows and display cases in an orthogonal but playful geometric pattern. The glass display cases, visible inside and out, will accommodate the institution's collection of African and African-American art and add further visual interest to the façade. (SASAKI)

#### **Lorain County Community College/Elyria Public Library, Elyria, OH – USA 2008**

Size 89,000 square feet, Cost 29,000,000, Status completed July 2008, LEED® NC 2.2 Silver

Like many community colleges, Lorain County Community College has seen its mission grow in scope and complexity as it meets the demands of an increasingly diverse student body. At the same time, a fiscally conservative environment has forced it to seek more innovative and cost effective ways to meet these challenges. Through creative programming, planning and design, the new Learning Technology Center and Campus Center at Lorain will support and enhance the educational mission of Lorain County Community College. By taking advantage of the current pedagogical trend of blending social spaces and learning spaces, the Learning Technology Center, in adjacency with the Campus Center, will offer students and faculty the ability to easily access hardbound and electronic collections and work together in spaces that foster interdisciplinary, collaborative team-based projects. (Sasaki)

#### **University of Balamand Library/Learning Center, El-Khoura, Tripoli – Lebanon 2012**

Client: University of Sacred Heart, Fairfield, CT - USA

##### **Awards:**

##### **ASLA 2007 Professional Awards (University of Balamand, Campus Master Plan**

The University of Balamand was established after the Lebanese civil war by the Orthodox Church. It occupies a spectacular site in North Lebanon on a steep hillside overlooking the Mediterranean Sea. The university is committed to developing a secular education based on dialogue, transparency, and resistance to dogma and fundamentalism. Already the university enrolls over 3,000 students in nine faculties. The campus master plan identifies a new Library Learning Center as part of the first group of buildings intended to jumpstart a campus-wide transformation.

The building replaces an outdated library building located at a far end of the campus, thereby consolidating the various schools' collections into a central location. The Library Learning Center is both an infill and addition to an existing academic building complex. The design had to re-route a number of key utilities, close a vehicular street, convert it into a major pedestrian promenade, resolve a full level change in topography, and connect to and provide egress for two wings of the existing building that constituted dead end conditions.

The new Library Learning Center is a new hub of activity and a portal to the academic center of the campus, turning what was the back of the existing complex into a front. The building introduces a new kind of learning environment on campus that is open, visible, spatially fluent, and more accessible to its users—radically transforming the character of the existing complex to which the building connects. The new programs located in the building complement those of the traditional library and include a learning commons, experimental classrooms, a remedial and distance education center, a series of group study and meeting spaces, and a café and lounge. Taking advantage of an underutilized courtyard space, the building forms an atrium around existing and new building wings, creating a heart to the complex and a major destination for student life for the campus. The project also pioneered the use of wireless technology and internet access to the library material and resources for the campus.

The building features many sustainable design attributes. Optimized building orientation and profile maximize daylighting and minimize negative sun exposure. Operable windows enable natural ventilation and the atrium clerestory functions as an air-flushing device. Fixed solar screens on all façades create passive shading. The campus is connected to the public transit system and parking is eliminated from the building's main public space, encouraging pedestrianization. A green roof on the building's terrace helps reduce storm water runoff and minimize heat island effect, and also provides greater thermal insulation values to the roof. Pervious paving used throughout the new outdoor promenade with wind breaking planting barriers helps mitigate the effect of the powerful southwestern winds. The project reuses existing limestone bedrock in all garden and retaining wall applications and uses of two types of locally quarried stone as part of the building's facade veneer. Similar to other buildings on campus, the building incorporates photovoltaic panels for hot water and site lighting provision. (Sasaki)

#### **University of New Brunswick, Hans W. Klohn Commons, Saint John, New Brunswick – Canada 2011**

Size 38,750 SF, Cost \$20 million, Status completed September 2011, Team B+H Architects

LEED® Silver Certified by the Canadian Green Building Council

Dramatically sited at the entrance to campus, the Hans W. Klohn Commons physically and strategically transforms the University of New Brunswick, Saint John (UNBSJ). The highly flexible information commons seamlessly integrates library staff spaces, allowing for a reinvention of the way library services are provided on campus and providing copious spaces for study and collaboration. Situated on a former parking lot, the commons is a beacon that sits within a restored landscape of trees and plants native to the Atlantic Maritime Ecozone.

UNBSJ first asked Sasaki to assess instructional spaces to determine space needs and how they related to the anticipated renovation of the existing Ward Chipman Library. After a series of workshops and visioning sessions, it became clear that the reinvention of library services would be compromised if built within Ward Chipman due to its structural limitations. The preferred solution located a new library at the opposite end of the campus from Ward Chipman, converting the former library into classrooms, labs, and faculty offices.

Working with the university and library staff, Sasaki took advantage of the opportunity to design a building that enhanced an improved model for library services instead of limiting it. The second floor of the Hans W. Klohn Commons is suspended from the roof, allowing for a column-free ground floor. This, coupled with a raised floor infrastructure, grants maximum flexibility to move, add, or recombine the furniture and study spaces throughout the commons. A browsing collection is located on the second floor, but the majority of the university's collection is housed in compact shelving on the lower level, providing maximum space for study and collaboration. The highly flexible space allows for the library staff to test various service models and tailor the space to meet the needs of students and faculty.

A restorative approach to the landscape knits the original topography of the east end of the campus back into the site. The design reintroduces native species of plants and trees and redefines sightlines to frame views to the distant hills. Studying and collaborating in the commons takes on the experience of sitting in a pavilion surrounded by the rich Canadian landscape. (Sasaki)

### **Libraries:**

#### **Olympic College, College Instruction Center, Bremerton, WA – USA 2014**

The College Instruction Center houses a 270-seat theater and instructional space for Fine Art, Music and Health Occupations. It is a pivotal project in the realization of the College's master plan. Located at the main entry to campus, the building joins the new Library, Science & Tech and Humanities Buildings to create a central quadrangle. Two city streets will be vacated as part of the project to complete the campus pedestrian spine and create a formal vehicular entry and drop off.

The building's two-story atrium opens into the campus spine, serving as a lobby for the theater, providing student gathering space and creating a sense of community for the multiple programs housed in the facility. Student study and breakout spaces are arranged on multiple levels around the lobby to create a hub of spaces that foster student interaction, encouraging engagement and collaboration.

Active learning classrooms provide a state-of-the-art instructional resource based on an innovative model that was pioneered by the University of Minnesota. Round study tables with space for eight students are arranged so that each table has its own LCD wall display and white board. The configuration allows instructors to lecture to the entire class or assign group projects. The video displays are linked so that solutions and discoveries made by one group can be shared with the entire class. The room can accommodate 90 students or be subdivided into two, 45 seat spaces.

Innovative mechanical and electrical systems, including 90% heat recovery and a 100kw solar array, contribute to the building's ambitious sustainable design agenda. (Schacht)

#### **King County Library System, Auburn, WA – USA 2012**

Expansion of the Auburn Library transforms the 15,000 square foot building to serve contemporary KCLS programs. The glass walls of the 5,000 square foot addition wrap around two sides of the original building, increasing the visibility of the library and opening up to views of Les Gove Park.

Inside, the changes start at the front door, where the entry is modified to increase access. A new central reading area provides a place for people in the heart of the library. Reconfigured collections shelving improves sight lines. The addition contains a new children's area and a flexible meeting room that is contained by operable glass walls that allow it to be used for a wide range of programs. The project includes new parking facilities as well as structural and electrical improvements. (Schacht)

#### **Library Media Center & Faculty Administration Building, Peninsula College, Port Angeles, WA – USA 2007**

27,000 sqf., \$ 12,500,000

### **Awards:**

AIA WA Council Civic Design Award, Merit Award, 2010

American School & University Louis I. Kahn Citation Award, 2009

AIA Seattle – what makes it green ? 2006

The new Library and Administration Building create a gateway to the Peninsula College campus, inviting people to engage in the life of the academic community. The one-story, 27,500-square-foot library is organized around a spacious reading room that has a commanding view of the Strait of Juan de Fuca and Vancouver Island to the north. Two-story, 7,500-square-foot Administration Building sits to the east of the library. The new buildings are linked by an existing concrete and brick arcade, which serves as a pedestrian bridge over the main entry. Originally, the arcade supported a wood-framed structure with eight small faculty offices. The offices were demolished in order to open up the view over the bridge, which is a local icon reflected in the college's graphic logo. The new buildings are designed in a contemporary design aesthetic of brick, wood, steel and glass that fits with the vernacular of the college's original wood-framed, 1960s structures. Sustainability is integrated into the design. Heating and cooling are provided by geothermal-well fields that supply an under-floor air distribution system. Daylighting reduces the need for electrical lighting. Rain gardens accept runoff from roof surfaces and create lush planting areas that line the pedestrian routes around the building. "The juxtaposition of the new and the old is very intriguing. The choice of materials, design of spaces and treatment of volumes create a light and airy learning environment." –2009 jury (<http://schoolbuildings.com>)

#### **Douglas-Truth Branch, Seattle Public Library, Seattle, WA – USA 2006**

Location: 2300 E. Yesler Way/Seattle, WA, Completion Date: October 2006, Gross square footage: 16,493 sq.ft., Total project cost: \$5.1 million

### **Awards:**

AIA Washington Council Civic Design Award 2007

AIA Seattle Project-of-the-Month, Fe. 2007

Seattle Magazine, Best of Architecture 2006

AIA Seattle both/and exhibit 2003

A sleek metal-clad addition complements a branch library's historic main building. Douglas-Truth Branch Library has served a diverse community in Seattle's Central area for over 80 years. Today, it has an annual audience of nearly 300,000 patrons. An expansion designed by Schacht Aslani Architects meets the needs of the library's current users and complements the character of its historic architecture. The bulk of the addition is located below grade to the east side of the historic structure. The green space to the west of the library, at the corner of 23rd and Yesler, and views of the library's most prominent facades were preserved. The historic main entry continues to provide access to the expanded library. Inside, the integrity of the original building, with its grand reading room, classical detailing and oak bookcases, was maintained. A curving grand stair takes patrons from the historic building down to the adult reading room in the addition. The city's African American collection is housed in this new space. The new reading room is covered by a light monitor that brings generous amounts of daylight into the new structure and frames views looking back to the historic building. A new meeting room, at the same level as the historic building, has windows that look out over the new reading room and a separate exterior entry for after hours use. The sloped roof of the light monitor covers both the meeting room and the lower level reading areas, tying together the spaces inside the addition. This form is separated from the historic building by a curved glass connector, which contains the grand stair. The exterior of the addition facing the historic library is glazed, reflecting the color and details of the landmark building by day and allowing light inside the addition to spill out at night, creating an inviting beacon for passersby.

#### **Spellman Library, Grays Harbor College, Aberdeen, WA – USA 2003**

Pre-design, architectural, site & interior design for expansion of 17,000 sf building to 25,000 sf including library, art gallery, computer labs & classrooms.

### **Awards:**

## AIA Washington Council Civic Design Award 2003

The Spellman Library at Grays Harbor College was a 1960s concrete and brick structure with multiple inaccessible levels that was inwardly-focused and separated from the campus quadrangle by a moat of inaccessible open space. Schacht Aslani designed an L-shaped addition that wraps around the original building, opening up the interior space of the library and connecting it to a reconfigured central quadrangle. The building's multiple levels were reduced to two major levels with an intermediate lobby at the level of the quadrangle. The lobby provides space for the campus art gallery and access to an elevator that connects the two major reconfigured levels of the building. The addition integrates the library with the campus and provides needed additional space for library functions and flexible spaces for both individual and group learning. (Schacht)

### [Squaxin Island Tribe Library & Museum, Shelton, WA – USA 2002](#)

Predesign, site, architectural & interior design for 13,000 sf building providing integrated library & exhibit space, classrooms, offices & gift shop.

The MLRC brings together the best features of libraries and museums as places for culture and community. In a contemporary interpretation of the plankhouse archetype, the museum and library are located together in a single, great hall that integrates the two functions. The design marries the visual, experiential qualities of an exhibit gallery with the accessible, educational characteristics of a reading room. The individual components of the museum and the library - displays, bookshelves, reading areas, computer stations and information center - are woven into an integrated whole. Book collections are organized in relation to subject matter so that a display of baskets, for example, is accompanied by related reading materials. Supporting these activities are adjacent classrooms, which provide space for crafts and language classes, seminars and lectures. The librarian's desk is next to the front door and serves as a central point of orientation for the entire facility - providing a place where visitors can go for information and resource materials or just to talk about Squaxin Island culture. (<http://www.squaxinislandmuseum.org>)

## [Schwartz / Silver Architects, Inc., Boston, MA – USA](#)

<http://www.schwartzsilver.com>

### **Libraries:**

#### [Billings Library, University of Vermont, Burlington, VT – USA on design \(2016\)](#)

Billings was designed by Henry Hobson Richardson (\*29.09.1838 Priestly Plantation, Louisiana - + 27.04.1886 Brookline, MA) as the university's library and was expanded in similar style by Richardson's partners the year after his death in 1886 (Like the Crane Library in Quincy Massachusetts, designed a few years earlier, this library is Romanesque in style. Unlike some of Richardson's works, however, this is reddish brown sandstone, without contrasting trim. See also: [Childs, Bertman, Tseckares](#)) (H.H.Richardson: Winn Memorial Library, Woburn, MA 1876-79, Ames Memorial Library, North Easton, MA 1877, Crane Library Quincy, Quincy, MA 1881, Converse Memorial Library, Malden, MA 1885 – AJW). Following the construction of a new library building in 1961, Billings was renovated as a student center, with a major addition in 1984. Schwartz/Silver is now returning the building to something close to its original function, as the University's Special Collections Library. (Schwartz/Silver)

#### [Main Historical Society Library, Portland, Maine – USA 2009](#)

The expansion of the Alida Carroll and John Marshall Brown Library, the research library of the Maine Historical Society, is the first phase of Schwartz/Silver's master plan for the institution. The 1907 library has been restored and linked to a future museum by a corridor under the garden. At the rear of the old building, a 1960's addition has been removed, and a new three-story wing takes its place. The new wing houses rare books in compact storage and a temperature and humidity controlled conservation environment. Behind the glassy west façade, offices and meeting rooms overlook the restored garden.

Program: Reading rooms, open stack areas, collection storage in conservation environment, offices, meeting rooms, staff work spaces, and administrative offices. (Schwartz)

#### [Burke High School and Combined Public Library, Boston, MA – USA 2006](#)

The Jeremiah E. Burke High School is located in Dorchester, Boston's largest and most diverse neighborhood. The renovation and addition to the school includes a combined public and school library, a community center, and a gymnasium. The Boston Public Library's branch library stretches along the street with a two-story-high glass façade. An open stair connects to the high school library above. And at the top of the new wing is a competition-sized school gymnasium, with special floor construction to isolate noise. (Schwartz)

#### [Milton Central Library, Milton, MA – USA 2006](#)

Like many towns in New England, Milton has a main public library built at the turn of the 19<sup>th</sup> Century under the influence of the reformers of the "City Beautiful Movement". The Schwartz/Silver expansion is behind the original structure. The entrance to the historic library is maintained, but the new construction provides an opportunity to offer a more permeable, "friendly" library experience. (Schwartz)

#### [Andlinger Center for the Humanities, Princeton University, Princeton, NJ – USA 2004](#)

### **Awards:**

Preservation Honor Award of the Historical Society of Princeton

Schwartz/Silver was engaged to develop an integrated Humanities Center at Princeton, in two of the university's earliest examples of gothic revival architecture: Chancellor Green and East Pyne. The two buildings, completed in 1873 and 1897 by the architect William Appleton Potter (\*08.12.1842 Schenectady, NY - + 19.02.1909 Rome, Italy), has served as Princeton's library for 50 years. After another 50 years, the decision was made to convert the buildings into the Humanities Center, comprising departments in cultural and language studies, comparative literature and linguistics. The architectural challenge was to significantly enlarge the buildings, and create important new entrances to the Center from the surrounding campus, while preserving their landmark historic character. Like many nineteenth century libraries, East Pyne was built without integrated structural floors. Walkways for librarians were installed as part of the library stacks, which rose the full height of the building. In 1948, when the building was converted for office uses, steel floor framing was added, but in the north wing of the building the floor elevations did not align with neighboring floors in order to accommodate a cafeteria above the unexcavated basement level. To eliminate this misalignment, the 1948 structure was removed and replaced with new steel to create consistent floor levels throughout the building. Once that was accomplished, the lower level was dug out. A major feature of the original gothic revival structures was their leaded glass windows. After a century of exposure, many windows were leaking or damaged. The original lead "comes", which held the individual panes of glass in place, were sagging. Lead has little strength and is very soft and malleable, so a continuing stress of even relatively small proportions will give rise to continuing creep. All of the building windows were removed for restoration. Within the shop, each piece of glass was dismantled and cleaned, broken pieces replaced with similarly colored and textured hand-made glass, and new lead comes soldered into place. The restored windows were then reinstalled. (Schwartz)

### [Boston Athenaeum, Boston, MA – USA 2002](#)

Edward Clarke Cabot American architect. He became a leading figure in the Boston architectural world from the time his Athenaeum (1846–9) was built. This, his greatest work, was influenced by Charles Barry's Italianate club-houses in London. In the 1850s Gilman was his associate. During the 1870s he produced several distinguished Queen Anne houses, and some of his later designs shared affinities with those of H. H. Richardson.

#### **Awards:**

**2003 American Architecture Award, Chicago Athenaeum Distinguished Buildings Award**

**2005 Preservation Achievement Award, Boston Preservation Alliance**

The Boston Athenaeum, one of America's oldest private membership libraries, is housed in a National Landmark building designed in 1846 (1847-1849) by Edward Clarke Cabot (1818-1882). Schwartz/Silver has served as the institution's architect since 1990, preparing and executing a 25-year master plan. The major renovation and expansion created new public spaces and reconfigured existing ones, relocated book and art collections, and established a museum-quality conservation environment. The result is dramatically changed and reassuringly familiar. (Schwartz/Silver)

### [Charles Chu Asian Art Reading Room, Connecticut College, New London, CT – USA 2001](#)

#### **Awards:**

**2007 Honor Award for Interior Architecture, Boston Society of Architects**

The opportunity to create a special reading room for quiet study at the Shain Library at Connecticut College arose from the need to display a significant collection of Asian Art. The artworks are predominantly Chinese scrolls, and the verticality of this particular form is made a counterpoint to the essential horizontality of the space as a whole. Specially designed bronze and wood cabinets display the scrolls individually, and provide organization for groupings of comfortable armchairs and tables. (Schwartz)

### [Hyde Park Branch Library, Boston, MA – USA 2000](#)

#### **Awards:**

**2006 William D. Smith Memorial Award for Best Accessible Design. Massachusetts Architectural Access Board and the Boston Society of Architects**

**2000 National Honor Award, AIA**

A branch of the Boston Public Library the Hyde Park Library was built in 1899 in the Classical Revival style. Schwartz/Silver's renovation and expansion doubled the size of the facility, to over 28,000 square feet. To maintain the balance and symmetry of the historic structure, the original brick fabric was extended with "bookend" additions that flank it on either side, giving the original building sufficient extra mass to allow its two story portico to remain the dominant visual element of the expanded building. (Schwartz)

### [Rotch Library, Massachusetts Institute of Technology, Cambridge, MA – USA 1990](#)

#### **Awards:**

**Harleston Parker Medal, City of Boston and the Boston Society of Architects 1993**

**National Library Award, AIA and ALA 1993**

**Honor Award, Boston Society of Architects 1991**

**Merit Award, New England Regional Council of the AIA 1991**

The expansion of MIT's Rotch Library (Originally built in 1938 as part of the William Barton Rogers Building designed by William Welles Bosworth – 1869 -1966 - with Harry J. Carlson, MIT's Rotch Library of Architecture and Planning is one of the premier architecture libraries in the United States, supporting the first architecture program in the country, with the first professor hired in 1865 and the first classes taught in 1868 at the original Boston campus. (<http://info-libraries.mit.edu>), with collections in architecture and planning, has an unusual programmatic condition: the site proposed for the building had to continue to function as a truck loading area. In order to provide 14 feet of vehicular clearance below, and to fit six floors of book-stacks within a height limit defined by the base of MIT's entry dome on Massachusetts Avenue, the new floors were hung from the steel roof structure above. (Schwartz)

collaboration with:

**HMR Architects Architects, Princeton, NJ – USA** <http://www.hmr-architects.com>

**Frederick Fisher and Partners Architects, Los Angeles, CA – USA** <http://www.fisherpartners.net>

**Firestone Library 1946 – 1948, Architects: Robert B. O'Connor (\*1886 - + Nov.1993, Mount Kisco, NY) and Walter H. Kilham (1868\* - 1948+), New York**

**TO FURTHER THE ADVANCEMENT OF LEARNING: A HISTORY OF THE HARVEY S. FIRESTONE MEMORIAL LIBRARY**

Jennifer S. Kron Class of 1995

...In contrast to the thoroughly modern interior, the library's exterior is the Gothic style. Firestone is one of the earliest examples of Gothic with a steel frame. The architects decided on Gothic for the purposes of architectural harmony on the campus, especially because of the new building's proximity to the University Chapel, the old Pyne and Chancellor Green Libraries, and Green Hall. Planners briefly considered Colonial style instead of Gothic, but Colonial would have formed a sharp contrast with the Gothic surroundings; and to the architects it presented extremely difficult problems of design in meeting the functional requirements of the internal plan. ... Firestone is not a stellar example of collegiate Gothic in America. "Barely passable Gothic" is how Professor Clark has referred to the building's appearance; but to the architects and planners, the exterior was unimportant. The spirit of the humanistic library lies in its stacks, reading nooks, carrels, and offices, not in massive towers or stone gargoyles. Firestone proved to be the last gasp of Gothic architecture at Princeton. Following its completion, the University decided that Gothic construction was no longer practical...Possibly the most unusual feature of the new library was its policy of open stacks. Open stacks are exceedingly rare in a library this size. When Firestone was built, Librarian Julian Boyd wrote that it was the largest open-stack library in existence. Open stacks were crucial to the library's purpose, however, since they provide students immediate contact with books and other materials. (Google.com: Firestone paper)

**Firestone Library Addition 1989, Architects Koetter Kim Associates, Boston, MA see:** <http://www.koetterkim.com>

**complete renovation 2010-2020:**

In 1948, the Harvey S. Firestone Memorial Library

(Lit.: von Kamp, Anne, Die bauliche Entwicklung der Firestone Bibliothek, Berlin 2003 – <http://www.ib.ha-berlin.de>) opened door, and Chancellor Green and East Pyne were converted to office uses. (Princeton University Library is the main library of Princeton University. It is headquartered in the Harvey S. Firestone Memorial Library building, named after tire magnate Harvey Firestone. Firestone Library opened in 1948, as the first large American university library constructed after World War II. Roughly 1.5 million volumes were moved during the summer of 1948 from East Pyne Hall, which until then had served as the University's main library. The library building was expanded in 1971 and again in 1988 – see: <http://koetterkim.com> - and currently has over 750 miles (1,210 km) of bookshelves. The Firestone building itself does not appear very large from the outside, because most of its books are stored in one of the three partially-underground levels and 20 underground levels that extend beyond the footprint of the main building. Firestone has four smaller above-ground floors, the second and fourth of which are accessible only to library staff. Princeton's book collection has outgrown Firestone's present capacity. Therefore, volumes relating to many academic subjects are no longer housed at Firestone, but at more than a dozen other library buildings or spaces located around the campus. In addition, two annexes in the Princeton University Forrestal campus are used to store volumes and materials that are less frequently used. Though it is not the largest university library in the world, Princeton librarians boast that the library has the most books per student of any university in the country. Firestone is one of the largest open-stack libraries in existence. The library contains many study spaces, most prominently the Trustees Room (an open study space bounded on one side by glass panels containing the names of all present and past university trustees and presidents) and the atrium. It also has hundreds of carrels (offices about the size of a large closet) that are reserved for faculty, graduate students, and undergraduate seniors working on their theses. In addition, the library has a social science reference center and a reserved books area, and many departments have their own private seminar and study rooms. The University's interlibrary loan services and most staff librarians have offices in Firestone. (<http://en.wikipedia.org>)

In light of the library's importance in teaching and research at Princeton, the University has begun planning for a complete renovation of Firestone Library. The renovation architects, Shepley Bulfinch, are working with a late September 2010 deadline to submit a set of plans for a total renovation. During the fall 2010 semester, the library will host an open house to give the entire campus a chance to see and comment on the overall design, which to date has been informed by meetings with the Faculty Steering Committee on the Firestone Renovation, focus groups with library users, and meetings with library staff. Project goals: The planning for the renovation of Firestone is focused on creating a building that is well-suited to support modern library services and contemporary approaches to scholarship while also providing the proper environment for one of the world's great book and manuscript collections. Principles guiding the renovation include:

- Improving navigability and wayfinding throughout the building, especially in the open stacks.
- Improving the quality of user spaces, including graduate study rooms, carrels, quiet public reading rooms and seating in the stack areas.
- Creating more efficient shelving layouts.
- Creating a larger and consolidated space for the Department of Rare Books and Special Collections.
- Concentrating exhibit spaces on the first floor.
- Consolidating library service points into more efficient and effective groupings.
- Designing efficient and comfortable staff spaces.
- Bringing the building into compliance with current building and fire codes and accessibility standards.

Timeframe: The renovation and reconfiguration is conceived as a long-term phased project taking more than 10 years, during which the library will remain open and occupied. Efforts will be made to schedule the most disruptive work at times of the year when the library is not as heavily used, and to create temporary spaces to keep noise and dust to a minimum. Some preparatory work began in summer 2010 primarily in limited areas on floors A, B and C. Isolated areas on floors A and B are being improved to serve as temporary office space. This work will be completed by August 2010. Space on C floor will be renovated to provide more shelving; this work will be completed by fall 2011. The existing stairway in the northwest corner of Firestone, which currently connects level C through the first floor, will be extended from the first through the third floors. This work also will be completed by fall 2011.

(<http://www.princeton.edu>)

### [Georgia State University, New Law School Building, Atlanta, GA – USA on design](#)

This facility for Georgia State's College of Law will create a gateway for the central campus and transform the surrounding precinct in urban Atlanta. With the law library as its intellectual hub, the facility will strengthen the College's internal sense of community. The design emphasizes flexibility and adaptability as a way to accommodate program growth and curricular change. With courtroom and library space that supports the legal community and event space for the campus as a whole, the facility supports the College's expanded interdisciplinary collaboration with clinical programs and policy centers. New outdoor gathering spaces and strengthened connections to Hurt Park are central to the design, as are the use of daylighting and other visible sustainable design elements. The project's 2010 conceptual design study explored ways to fulfill these aspirations, together with budget and design implications. Shepley Bulfinch is the design architect in association with Collins Cooper Carusi Architects of Atlanta. (Shepley)

### [George Mason University, Fenwick Library Expansion, Fairfax, VA - USA 2015](#)

150.000 sqf.

The Fenwick Library expansion redefines the central library as the intellectual heart of George Mason's distributed campus and promotes the University's aspirations for growth as a major research institution. The focal point of the expansion is a new research commons, supporting student scholarship with integrated resources, including sample access to technology, specialized librarians, special collections, writing tutors, and data services. The new research-focused expansion is designed to reinforce the library's connection with the adjacent Johnson Center Library, serving the undergraduate community, and designed by Shepley Bulfinch in 1994. Stewardship to the environment is expressed in the building's design to LEED silver standards, including cooling with chilled beams, external shading devices, a naturally irrigated rain garden, roof garden, and preservation of a natural grove of trees at the south of the site. (Shepley)

### [City of Austin, New Central Library, Austin, TX – USA 2015](#)

180.000 sqf.

The New Central Library gives Austin an iconic landmark and a flexible facility that reflects the city's rich cultural and social fabric. Located next to Shoal Creek, the library will help define the western portal to downtown and provide a welcoming community gathering place.

Reader seats wrap the sunlit perimeter, spilling onto screened outdoor reading porches that overlook Lady Bird Lake. In addition to a reading room and dedicated areas for children and teens, the library features a mix of lively and contemplative spaces that support imaginative programming. This includes a 350-seat event forum for presentations and performance; display and demonstration areas; community meeting rooms of varying sizes; and collections displays that encourage discovery.

The library embraces Austin's environmental commitment: in addition to the generous use of natural light, the project includes energy-efficient systems focused on reducing water use and the building's overall footprint. These include rainwater harvesting and

a vegetated roof. The facility offers a 200-car garage, a dedicated bike porch, and proximity to public transit, a hike-and-bike trail, and the Lance Armstrong Bikeway. It is pursuing LEED certification.

The joint venture Lake|Flato Shepley Bulfinch of San Antonio and Boston is the architect. The library's inclusive planning, programming, and design process has engaged city and library staff as well as a wide range of Austin residents. (Shepley)

**[Ringling College of Art and Design, New Library, Sarasota, FL – USA 2015](#)**

50,000 sqf.

Ringling's new library creates a vibrant locus for learning at the heart of its expanding campus, an iconic form that embodies and supports the College's creative community. The library's form defines the spaces that surround it, with a robust program that engages and animates them.

The library is an integral partner in the creative process at this design school, where its collections offer value both for visual inspiration and as cultural artifacts. Open and transparent, the library's ground floor is a hub of activity, revealing the life within. Internally, the building is organized by layers of activity, progressing from most active to quietest as users move from ground floor to upper floors and along the east-west axis from campus edge to bayou. A series of outdoor terraces on the upper floors offer views and vantage points of the campus, providing sources of inspiration and different perspective.

This milestone project is quadruple the size of the existing library. The caliber of Ringling as an institution and the quality of its students' work had outstripped the capacity of Kimbrough Library.

Shepley Bulfinch is designing the project in association with Sweet|Sparkman Architects of Sarasota. (Shepley)

**[Salem State University, New Library and Learning Commons, Salem, MA – USA 2013](#)**

128,000 sqf.

The Library defines a new academic quad for Salem State's North Campus and meets an urgent need for a replacement library to serve the University's five campuses.

A vibrant and welcoming academic crossroads, the Library has clear wayfinding and spaces for scholarship and collaboration, and is designed to accommodate changes in technology and pedagogy. The learning commons, rich with academic resources, is integrated with library services to provide a comprehensive and supportive learning environment. The library is sited to define the new quad, strengthening the identity of the North Campus as the University's academic heart, establishing a sense of place, and strengthening institutional identity. While the first level of the four-story Library offers an entrance facing College Drive, the second-floor main entrance faces the quad.

Designed with a range of environmental features, the project is targeting a minimum of LEED Silver certification. (Shepley)

**[Arizona State University, Hayden Library – Master Plan, Tempe, AZ – USA 2012 \(2013-2016\)](#)**

360,000 sqf.

The master plan for Arizona State's main research library defines an exceptional research and learning environment for the 21st century, at the heart of the Tempe campus. The plan re-envisioned the library as a dynamic intellectual hub for the University's growing population, giving physical form to the vision set forth in its ambitious institutional strategic plan.

The plan reorients the space from a collection-intensive facility to a patron-focused learning environment, with enhanced research and study spaces, a robust technology and instructional hub, consolidated staff space, and newly prominent and accessible special collections. Strategic decisions about the location of portions of the collection were addressed.

The plan also leverages the library's location at the crossroads of two key pedestrian axes to address a dearth of open space on the campus. A proposed expansion reclaims the sunken courtyard and moat surrounding the library for new, programmable space with a green roof that becomes an extension of the campus' central quad. A new entrance pavilion along one axis will serve as a beacon for the University community.

The phased five-year renovation and expansion will permit uninterrupted library operations. (Shepley)

**Hayden Library Repurpose and Renovations Phase 1**

Hayden Library Repurpose and Renovations Phase 1 will create a new main entrance pavilion, enclose the existing "moat" that surrounds the building to capture both above ground and below ground usable space, and install required infrastructure to support the master plan repurpose for existing and additional space. In order to accommodate subsequent Hayden Library building renovations, a building module expansion will be constructed at the University Library Archives at the Polytechnic Campus, which allows for the relocation of collections from the Tempe Campus to the Polytechnic Campus.

State Appropriation (SAP) \$ 35,000,000

<http://www.sheeo.org/sites/default/files/Arizona%20response%20CIP%20ASU%20FY2014-2016.pdf>

**[Johns Hopkins University, Brody Learning Commons, Baltimore, MD - USA 2012](#)**

40,000 sqf.

Brody Learning Commons furthers the Eisenhower Library's role as the intellectual, social, and physical heart of the Homewood campus and gives users a portal to the physical and virtual resources of the Sheridan Library system. The technology-rich Learning Commons includes group study spaces, seminar rooms, and a state-of-the-art lab designed to integrate the role of scientists into the field of paper and manuscript conservation. The Rare Books and Manuscripts collection is on prominent physical display, supplemented by digital presentation of materials that allows users to compare and contrast different editions of rare documents in virtual and physical form. An atrium, which provides a transition between Brody and the Library allows natural light to reach the lower levels of the Library while providing a civic space for the Learning Commons and the library community. The highly sustainable project is being designed to LEED Silver standards. (Shepley)

**[Austin College, Woodruff Library \(Science Building\), Sherman, TX – USA 2011](#)**

103,000 sqf.

In a celebration today attended by Atlanta Mayor Kasim Reed and other dignitaries, the Atlanta University Center (AUC) rededicated the renovated Robert W. Woodruff Library, unveiling its interactive and technology-rich 21st century learning environment. Shepley Bulfinch's completion of the first phase of this major renovation included more than 130,000 square feet of the Woodruff Library's 220,000 square foot facility. The renovation replaced many solid interior walls with glass panels, drawing natural light deep into the space. The inviting and dynamic main floor, with its media creation and presentation space and digital resources, is visible through a series of folding glass panels that separate group learning spaces and an extended-hours e-café from the rest of the library. Bleachers in the extended-hours area convert existing stairs into seating. The new Woodi Learning Commons supports collaborative, interactive, and technology-rich teaching, learning, and research. The Learning Commons was conceived as a space that integrates digital, and print information resources with classrooms, private spaces for reference consultation, learning labs, open seating, and collaborative study rooms. The library's upper level houses Archives Research Center and its re-designed reading room, together with seven group study/meeting spaces. The first phase of the renovation opened for student use in January

2010 and was completed in May. Plans for the second phase include upgrades to the library's exhibition hall; long-term protection for the Library's valuable archival collections; and integration of energy-efficient and environmentally sustainable elements. The two-phase renovation project was the first major interior upgrade since the building's dedication in 1982. Shepley Bulfinch completed a master plan for the Library in 2005. (Shepley)

**[Xavier University, Conaton Learning Commons and Williams College of Business, Cincinnati, OH - USA 2010](#)**

172,000 sqf.

Conaton Learning Commons and Williams College of Business transform Xavier's learning environment while defining Hoff Academic Quad and creating a campus gateway. Energy-efficient features and sustainable materials demonstrate Xavier's commitment to a campus that is socially responsible and environmentally sustainable. The 88,000 s.f. Williams College of Business is a technology-rich environment emphasizing innovative programming and integration with the business community. The open layout emphasizes collaborative work areas such as the trading room and business center as important assets. Adjoining the University's main library, the 84,500 s.f. Conaton Learning Commons' service model reaches beyond the integration of library and technology support with a range of faculty and student development centers, including career services, international student services, academic skills and community engagement, and the Center for Teaching Excellence. Co-locating faculty development facilities and technology support creates a shared learning experience for students and teachers, complemented by a 200-seat auditorium and gallery. The project is being completed in association with MSA Architects of Cincinnati. The two buildings, supported by a new central utility plant, follow recommendations made in Shepley Bulfinch's 2007 Master Plan. (Shepley)

**[Atlanta University Center, Robert W. Woodruff Library, Atlanta, GA - USA 2010](#)**

100,000 sqf.

This phased renovation creates a vibrant, learning-centered library for the Atlanta University Center and provides a new public face for the Library's prestigious special collections. The inviting and dynamic main floor houses media creation and presentation space and robust digital resources. The design preserves and energizes the Library's monumental marble stair with texture, light, and color, significantly improving acoustics by enclosing the stair in glass. An extended-hours area with informal study spaces and café can be separated or combined with adjacent library spaces through a series of glass doors. New adjacencies consolidate the central reference and circulation desk near Information Resources staff, group work, and instructional spaces. The Center serves a consortium of four of Atlanta's Historically Black Colleges and Universities (HBCU). The renovation implements strategies set forth in Shepley Bulfinch's 2005 Library Master Plan. (Shepley)

**[City of Show Low, New Public Library and City Hall Renovation, Show Low, AZ - USA 2010](#)**

45,000 sqf., \$ 8,000,000

The new Public Library is the first of two major projects and streetscape improvements that are transforming the community, creating a sense of place with the establishment of a pedestrian-oriented, environmentally friendly downtown. The 20,000 s.f. library offers a 50% increase in capacity, with a second phase designed to accommodate future expansion. Its form reflects the tradition of lodge construction in the White Mountains with an environmentally conscious approach. A 150-foot clerestory window brings daylight deep into the main hall. Following completion of the new library, its former home will be transformed into City Hall. The two buildings' entrances will be aligned in a direct axis to create a civic portal. The 25,000 s.f. City Hall's highly flexible interior will accommodate future technological and service needs. These projects follow Merzproject's study of Show Low's long-term major public facilities. (Shepley)

**[Marquette University, Ray and Kay Eckstein Hall, Marquette University Law School, Milwaukee, WI - USA 2010](#)**

200,000 sqf.

Eckstein Hall advances Marquette's aspiration for a law school that ranks among the best in the country. The Hall offers a physical metaphor for the University's emphasis on civic leadership, public service, and the common good and, with it, the clarity and accessibility of learning and the law itself. Its innovative glass wall construction makes visible the building's activities to the public and passersby, while the columns revealed behind the glass and the structure's brick base emphasize the building's stature and verticality. The design places an emphasis on the building as a complete learning environment that seamlessly integrates the prominently sited library and its two-story reading room. Among its facilities are two courtrooms, a conference center, and cafe. Eckstein Hall was designed by Shepley Bulfinch in association with Opus Architects and Engineers. (Shepley)

**[Duke University, Link Teaching and Learning Center, Durham, NC - USA 2008](#)**

sqf. 23,900

The Link Teaching and Learning Center is a part of the phased renovation to Perkins Library, providing Duke with an innovative, technology-rich academic environment. Taking advantage of existing space on the lower level of Perkins, the Link is a lab that expands the boundaries of the physical classroom, facilitating education in a flexible, collaborative setting rich with new media technology close to library resources. It is one that is fitting for Duke, a leader in the integration of technology resources, including the distribution of iPods to complement classroom learning. The Link provides classrooms, seminar rooms, and group study spaces equipped with state-of-the-art audio/visual systems, flanked by interactive areas and the nearby IT helpdesk. The media wall at the Link entrance helps define the space and promotes technology as a valuable tool that fosters the exploration of innovative teaching and learning methods. (Shepley)

**[Colgate University, Case Library and Geyer Center for Information, Hamilton, NY - USA 2007](#)**

152,000 sqf.

This expansion and renovation reestablishes Case Library as an academic hub and social crossroads at the base of Colgate's hilltop campus. An addition of 51,000 s.f. to the original 101,000 s.f. facility allowed Colgate to modernize and expand its library services. Clearly delineated entryways, a grand stair, and interior "Main Street" improve navigation and access to staff. An automated book storage and retrieval system for approximately 500,000 volumes is nestled into the hill. With its captivating views of the campus, the new 5th floor is a dynamic academic and social space, complete with a cafe, 24-hour study areas, a videoconferencing room, multimedia production suite, and seminar rooms. The plaza outside creates a gathering point and connects to the upper campus. The project was designed in association with Kendall/Heaton Associates. (Shepley)

**[Rice University, Fondren Library, Houston, TX - 2006](#)**

74,000 sqf.

**Awards:**

"Best in Renovation - Private" award, Texas Construction Magazine, 2007

The revitalized Fondren Library fulfills a vision set forth in the University's Library Master Plan, integrating emerging technologies and supporting new patterns of activity and scholarship. Located in the center of campus, Fondren is at the crossroads of the historic quadrangle and new campus development, creating the opportunity for it to be not only an intellectual focal point, but also a link between the two zones. Visitors now arrive in a double-height entry area flanked by technology services, a cafe, and an information commons. The library provides a GIS laboratory and enhanced special collections area, while a penthouse reading room offers views of the campus. Completed as a phased renovation, the library remained open throughout construction. Shepley Bulfinch designed the project in association with Bailey Architects. (Shepley)

#### **Cornell University, African Studies and Research Center, Ithaca, NY – USA 2005**

6,000 sqf., \$ 2,600,000

#### **Awards:**

Citation, 2007 Awards for Excellence in Architecture, National Organization of Minority Architects (NOMA)  
2006 Gold Award, Brick in Architecture Awards

The award-winning Africana Studies and Research Center gives Cornell a highly visible emblem of the history, values, and culture of African peoples. Two pavilions, totaling 6,000 s.f., were added to a 11,600 s.f 1950s building to create a village complex with a shared exterior courtyard. The exterior brick patterns were inspired by the earth tone palette and rich textures of traditional African textiles. Large windows provide abundant natural light and views, creating a sense of openness and invitation. Circulation paths connect individual program spaces, each of which represents a core value of the Center: scholarship (the library pavilion); community (the multipurpose pavilion); and leadership (the faculty office and classroom pavilion). This integrated learning community reflects the Center's commitment to support collaborative education techniques as well as focused, individual research. (Shepley)

#### **Duke University, Perkins Library Complex, Bostock Library and von der Heyden Pavilion, Durham, NC – USA 2005**

133,000 sqf., \$ 34,200,000

Working with Duke University over the last eight years, Shepley Bulfinch has completed the program, planning, design, and construction for a multiphased designed an expansion and renovation, of the Perkins Library. The original library was designed in 1928, with successive expansions in 1948 and 1968, all reflecting the Gothic tradition of Duke. This design repositions the Library as the centerpiece of a dynamic learning and research community, creating a balance of spatial types and environments that will support the University's evolving needs and uses. It redefines the research and learning environment by integrating library resources, services, and users in spaces commensurate with the expectation and quality of intellectual work at Duke. As the central library for the University, Perkins Library commands a place of prominence on the West Campus quad beside the Chapel. The Library addition responds positively to this historic context and contributes to the campus's unique sense of place. (Shepley)

The Perkins Library complex was built in three stages—in 1928, 1948, and 1968. By the late 1990s it was clear that it was time for the library to renew and grow again. A master plan for Perkins Library included a goal of redefining the research and learning environment of the University libraries by integrating library resources, services, and users in spaces commensurate with the nature and quality of the intellectual endeavors at the University. Shepley Bulfinch Architects out of Boston was hired for the master plan as well as interior renovations to the existing library, and the design of two new buildings: Bostock Library and the von der Heyden Pavilion, which were completed and opened to the public in 2005. Bostock added 125,000 square feet of library expansion, and the von der Heyden Pavilion provided a popular coffee house and social space for Perkins. The site design for the project included the West Campus Pedestrianway, which was coordinated with the design for Fitzpatrick Center.

#### **Boston Public Library. Renovation and Restauration, Boston, MA – USA 2005**

236,000 sqf., \$ 50,000,000

#### **Awards:**

Harleston Parker Medal 2001, Boston Society of Architects  
Preservation Award 2000, Massachusetts Historical Commission  
Modernization Award 1999, Buildings Magazine  
Architectural Design Honor Award 1995, Boston Society of Architects/AIA  
Design Excellence Award 1995, ASID and Boston Magazine  
Preservation Award 1994, Victorian Society of America

The project presented the formidable task of determining the appropriate treatments for these historically significant architectural spaces with their rich adornment of murals and sculptures. At the same time, all building spaces required extensive reorganization and upgrades for contemporary use. This included replacing all major M/E/P systems and enabling the installation of technology systems and infrastructure while preserving the historic interior. The design team collaborated with hundreds of consultants specializing in fine art conservation; historic finishes, lighting and stone work and other restoration expertise. The project included restoring the original McKim Main Entry Lobby and Grand Stair to their original grandeur, reopening architecturally significant spaces for public use, and reclaiming the Lower Level, previously used for storage. The library remained fully operational throughout the renovation. In 2001 it received the Harleston Parker Medal, the Boston Society of Architects' highest honor and the first ever awarded for a renovation project. (Shepley)

The Boston Public Library McKim Building (built 1895) in Copley Square contains the library's research collection, exhibition rooms and administrative offices. When it opened in 1895, the new Boston Public Library was proclaimed a "palace for the people." The building includes lavish decorations, a children's room (the first in the nation), and a central courtyard surrounded by an arcaded gallery in the manner of a Renaissance cloister. The library regularly displays its rare works, often in exhibits that will combine works on paper, rare books, and works of art. Several galleries in the third floor of the McKim building are maintained for exhibits.

Bates Hall has a coffered ceiling in a wide catena-arched barrel vault. Internet and power connections are discreetly beneath the large wooden research tables.

Charles Follen McKim's design shows influence from a number of architectural precedents. (Charles Follen McKim (August 24, 1847, Chester County, PA – September 14, 1909 St.James, NY) was an American Beaux-Arts architect of the late 19th century. Along with Stanford White, he provided the architectural expertise as a member of the partnership McKim, Mead & White.) McKim drew explicitly on the Bibliothèque Sainte-Geneviève in Paris (designed by Henri Labrouste, built 1845 to 1851) for the general arrangement of the facade that fronts on Copley Square, but his detailing of that facade's arcaded windows owes a clear debt to the side elevations of Leon Battista Alberti's Tempio Malatestiano in Rimini. The open-air courtyard at the center of the building is based closely on that of the sixteenth-century Palazzo della Cancelleria in Rome. McKim also exploited up-to-date building

technology, as the library represents one of the first major applications, in the United States, of the system of thin tile vaults (or catalan vaults) exported from the Catalan architectural tradition by the valencian Rafael Guastavino.

([http://en.wikipedia.org/wiki/Boston\\_Public\\_Library\\_McKim\\_Building](http://en.wikipedia.org/wiki/Boston_Public_Library_McKim_Building))

### **Lake Forest College, Donnelly and Lee Library. Renovation and Expansion, Lake Forest, IL – USA 2004**

72.000 sqf., \$ 14.000.000

#### **Awards:**

2007 Bronze Award - Excellence in Masonry, Illinois Indiana Masonry Council

The award-winning Donnelly and Lee Library renovation and addition establishes a new academic identity for Lake Forest College. The 45,000 s.f. renovation and 27,000 s.f. addition transform the original library into a vibrant technological and educational resource, providing a flexible and interactive learning environment. The building was constructed with few fixed walls to allow spaces to be reconfigured as programmatic needs evolve. Instructional computer labs and a full-service IT department educate patrons about the use of technology within the library. A 24-hour cafe and computer lab provide space for casual gatherings and give students complete flexibility in their study schedules. Brightly colored interiors, glass-walled group study rooms and a two-story lobby encourage creative collaborative work and foster a sense of intellectual possibility. (Shepley)

### **University of Denver, Sturm College of Law, Denver, CO – USA 2004**

190.000 sqf., \$ 50.000.000

The nation's first LEED certified Law School, the Sturm College of Law has LEED Gold certification. Since Natural Resources Law has been taught here for more than one hundred years, the construction of new facilities provided the opportunity to put into practice the principles the University teaches. The building uses 40 percent less electricity, gas, and water than conventional construction. Electricity is conserved with the use of natural light, energy-efficient fixtures, and daylight and motion sensors. Water is conserved through sensor-activated faucets, native plantings, and a storm water collection system for irrigation. Green materials include a recycled copper roof, low gas-emitting paint and carpet, and lockers constructed out of recycled straw board. (Shepley)

### **Princeton University, Marquand Library of Art and Archaeology, Princeton, NY – USA 2003**

46.000 sqf.

This project transforms an important Princeton research facility that was built in 1966. The 29,000 sf renovation and 17,000 sf addition expand open study areas, improve circulation, and increase access to technology. The Rare Book Room is wrapped by a glass wall, enhancing a sense of openness and creating transparency between interior and exterior spaces. A new third level accommodates seminar rooms. This light-filled floor is a favorite study space, with inspiring views of the campus. A below-grade level covered with a green roof houses compact shelving space and skylit study areas that encourage the use of non-circulating materials such as folio and elephant volumes. Users now have access to progressive digital resources and work spaces that are transforming visual arts education and research. (Shepley)

### **City of Eugene, Eugene Public Library, Eugene, OR – USA 2003**

127.000 sqf., \$ 26.500.000

#### **Awards:**

People's Choice Award 2003, Public, Institutional and Commercial Architecture, AIA/Southwestern Oregon Chapter Excellence Award 2003, Oregon Hammurabi Awards, The Masonry and Ceramic Tile Institute of Oregon Second Place, Government/Institutional, International Excellence in Masonry Awards 2003, Mason Contractors Assn of America

The Eugene Public Library incorporates classical proportions while embracing contemporary technology and sustainable design ideals. The new facility, which is quadruple the size of the city's previous library, includes a conference rooms, media center, and a cafe. Behind the scenes, a mechanized conveyor belts eases the sorting and shelving of books. Double-height reading areas; a graceful, skylit spiral stair; and a three-story, glass "winter garden" create open, light filled spaces that contributes to the building's energy efficiency, which is thirty percent higher than required by codes. By locating the parking garage below ground, the Library was able to develop ample green spaces around the facility, including a walled children's reading garden, which help to minimize heat islands and reduce storm water run-off. The library was designed by Shepley Bulfinch, in association with Robertson Sherwood Architects. (Shepley)

### **City of Memphis, Central Library and Information Center, Memphis, TN – USA 2001**

330.000 sqf.

The Central Library for the city of Memphis reflects its educational mission as a library for all people. A welcoming and inviting center of information and learning, its accessible reading and meeting facilities sustain the community today and provide for generations of future learners and leaders. The Library responds to the diverse demands of three key constituencies: library staff, with needs for flexible and adaptive spaces; the city, seeking a civic landmark that harmonizes with a growing metropolis; and residents, looking for a library that is both an open source of information and a welcoming community center. The facility, which adapts to evolving technologies and patron use patterns, has wireless technology throughout. The Library was featured in the 2007 book "Heart of the Community: Libraries we Love." Shepley Bulfinch was the design architect in association with Looney Ricks Kiss of Memphis. (Shepley) see: <http://www.lrk.com>

### **Yale University, Irving S. Gilmore Music Library, New Haven, CT – USA 1998**

#### **Awards:**

Regional Award of Merit 2001, International Illumination Design Awards, Illuminating Engineering Society of North America Award of Excellence 2000, GE Edison Award Competition Gold Citation 2000, American School and University Educational Interiors Honor Award 1999, AIA Connecticut

Yale University's Gilmore Music Library incorporates an existing open-air courtyard and adjacent floor space to form a graceful "building within a building", within the Collegiate Gothic Sterling Library. Shepley Bulfinch's 1992 Master Plan for the Sterling Memorial Library had identified the courtyard as a suitable site for the new Music Library. Contemporary, Gothic-inspired, arched trusses lift the gently curved roof some 60 feet above the Reference Reading area and are anchored to the Library's existing steel frame construction. Clerestories on all four sides provide reflected indirect light onto the lightly-colored ceiling and into the space below. The Library's "Grand Reading Room" is on the mezzanine level. Among other specialty spaces are the soundproof Historic Sound Recording Workroom; two acoustically-isolated Seminar Rooms. In addition to allowing the Sterling Library to remain open throughout construction, other challenges included building and installing the trusses; and weaving new mechanical, electrical and life safety systems into the existing building. This adaptive re-use of space helps to reduce energy loss in the existing library building and minimizes the "footprint" of the overall complex. (Shepley)

## Queen's University, McClay Library, Belfast – UK 2009

196.000 sqf.

A model of sustainable design, the new Library positions Queen's as an international leader in education and sustainability. The Library is expected to meet the stringent standards of the UK's Building Research Establishment Environmental Assessment Method (BREEAM). Natural light sensors and automatically operated windows reduce electricity consumption and a rainwater recycling system for greywater conserves water. A natural ventilation system throughout much of the building and the strategic use of chilled beams to cool classrooms and computer-intensive spaces significantly reduce energy costs. To meet the needs of Queen's expanding enrollment the library has 2,000 reader places and houses 1.5 million volumes, including the University's special collections. Facilities include exhibition space, a cafe, and language lab. Shepley Bulfinch designed the project in association with Robinson Patterson Partnership and Buro Happold Engineers. (Shepley)

## University College Cork, Boole Library – Expansion and Renovation, Cork – Ireland 2008

102.300 sqf., \$ 39.300.000

### **Awards:**

**International Architecture Award, 2008**

**Chicago Athenaeum: Museum of Architecture and Design**

This addition and renovation creates a new postgraduate research library while expanding and upgrading the Boole Library, Ireland's leading research institute. New space includes the 37,700 s.f. renovation of two floors of the existing building and a 64,600 s.f. addition. The project adds reading spaces while providing technology for all reader seats and accommodating the expansion of campus collections, including special collections and archives. The revitalized facility provides a consultation area for library staff, as well as group study rooms and instructional spaces. Built on the site of an ancient settlement, the Library's red sandstone exterior is a contemporary continuation of the settlement's stone wall. Shepley Bulfinch was the design architect in association with Wilson Architecture. (Shepley)

## SHKS Architects, Seattle, WA – USA

Snyder Hartung Kane Architects

<http://www.shksarchitects.com>

### **Libraries:**

#### Ferndale Library, Ferndale, WA – USA 2018

The Ferndale library combines emergent ideas about 21st century libraries with long-standing traditions of community gathering. Developed in collaboration with community members, City, and Library staff, the 15,000 sf library affirms the continuing relevance of libraries in rural communities. The library enhances the city by extending and reinforcing pedestrian activity on Main Street and preserving a large natural wetland area.

Community meeting rooms and display spaces are visually connected to library staff and resources.

A generous seating area is oriented towards views of Mount Baker and the wetlands, taking advantage of abundant natural light and breezes.

Roof monitors provide diffuse natural light throughout the main library space.

Planning aims at integrating parking and service access to reduce site impacts, using native plants to strengthen the habitat.

(SHKS)

While cultivating a romance with both agriculture and the pioneer spirit, Ferndale is a residential community with growth in both industrial and commercial activity. The new library will make an important contribution to the life of Ferndale, preserving Schell Marsh, a large natural area and reinforcing pedestrian activity on Main Street. The new, 15,000 square foot (1560 m2) library represents a symbiosis of town and marsh within the floodplain

of the Nooksack River. Drawing on the quiet simplicity of local agricultural buildings, the library is sheltered by a slightly sloping roof relieved by saw-tooth monitors introducing light and air. The street front is treated as a site-wall demarcating the threshold from Main Street to the library. A figural

public meeting room dominates the view from town as it opens toward a view of Mt. Baker. The meeting room expands to include a platform for the annual

poetry festival. Beneath the roof is an expansive community room opening toward the marsh toward the south. The large room will accommodate a wide range of collections and activities.

([http://2010honorawards.aiaseattle.org/sites/default/files/J\\_V\\_Ferndale%20Library\\_0.pdf](http://2010honorawards.aiaseattle.org/sites/default/files/J_V_Ferndale%20Library_0.pdf))

#### Vancouver Mall Library Connection, Vancouver, WA – USA 2013

Many library visitors come from outside the immediate community. For new residents, the mall library is often the first connection they have to the library system. Patrons who use other FVRL libraries often combine shopping trips with a chance to drop off books or check email on library computers. A connection with district resources. The Mall Library Connection's condensed space will provide a sampling of and connection to the wide array of services available throughout the library district. The name Vancouver Mall Community Library is a remnant of the original name of the shopping center when the library opened in 1983. The updated name reflects this location's new look and special role in the district.

([http://www.fvrl.org/homefiles/VM\\_FAQs\\_112012.pdf](http://www.fvrl.org/homefiles/VM_FAQs_112012.pdf))

To maintain a popular branch at the Vancouver Mall, the Fort Vancouver Regional Library had to provide twice the service in half the area. SHKS Architects was chosen by the Fort Vancouver Regional Library System to work with library patrons and staff to re-imagine and reinvent the library. Taking advantage of a highly visible retail location, the Library Connection welcomes new library patrons of all ages, especially teens.

Comfortable reading spaces, public computers, books, and other library amenities are visible through a frameless glass storefront, supported on round glu-lam columns. Automated book handling equipment dramatically reduces staff work area requirements and repetitive tasks, freeing librarians and space to serve patrons better. Library amenities are intuitively organized for self-help, empowering new and lifelong users.

A lower ceiling and wood storage wall define a flexible program area for readings, presentations, teen, and children's programs. Moveable shelving allows this space to expand into the adjacent children's area. Fixtures, partitions shelving, and furnishings are designed for reconfiguration and future reuse.

Public space for gathering, reading, and learning anchors the library plan in the center. Collections, computers, and other resources enclose this modestly scaled civic space, inverting conventional retail planning principles.

Books are celebrated in a continuous shelving display which wraps the storefront social area and connects to a quieter reading area at the back. Ramps provide universal access to a raised platform: an elevated prospect for browsers and readers. (SHKS)

#### **Fife Library, Fife, WA – USA 2011**

The Pierce County Library System is building the first library to open in the City of Fife, to serve a small community hungry for a community gathering place and a facility with all kinds of connectivity. To meet a tight funding timeframe and budget the Client opted for a factory-constructed modular system, to be constructed off-site as transportable sections, finished and ready for installation on a conventional concrete foundation. Located along a busy commercial arterial, the new library establishes a vital street presence, encouraging pedestrian and bike access. A landscaped urban sidewalk and a compact terrace invite patrons to gather at the entry. The design offers patrons comfortable seating, natural light, a warm and inviting social scene and spectacular views to Mount Rainier. Designated areas for children and teens are distinctly designed with the users in mind: bright and pleasant spaces gather the community's kids and young adults for reading, doing homework, socializing and learning. The broader community is served with multiple computer stations, a variety of shared reading areas and cozy nooks, and a spacious meeting room for events and lectures. Slated to open in the Fall of 2011, the Fife branch will be the first new library built as part of the PCLS 2030 Vision Master Plan.

(<http://2011honorawards.aiaseattle.org/nude1501>)

#### **Milton-Edgewood Library, Milton, WA – USA 2011**

The Pierce County Library System's Milton Edgewood Library opened in January 2011. It serves a small community hungry for an updated library: a community gathering place and a facility with all kinds of connectivity. The welcoming entry includes a rotating display of new collections, giving visitors a clear view into the library.

A self-service desk for easy check-out and digital catalogue provides quick access to library resources. A meeting room that seats 65, two conference rooms, and a study room provide additional resources. The fixture designs form a landscape of color and texture suited to the groups of adults, teens and children using the library. Sustainable building practices include low-flow toilets and faucets, and energy efficient lighting.

The reception area includes a desk for library staff to answer questions and facilitate patron access to collections. Comfortable chairs provide a cozy place to sit and read or visit with neighbors.

The reception area includes a desk for library staff to answer questions and facilitate patron access to collections. Comfortable chairs provide a cozy place to sit and read or visit with neighbors.

Teen patrons have a place of their own. A semi-circular seating area creates a comfortable nook for homework; three computers provide internet access. The custom-designed furniture adds a lyrical touch to the well-ordered space.

The children's area has kid-size shelving and a "book tunnel" that leads to the audio-visual section. Children have access to two computers with internet access and one AWE station – a children's learning computer. A small, "secret" door opens from the children's area directly to the meeting room for special activities and story-time. (SHKS)

#### **Magnolia Library, Seattle, WA – 2010**

The Seattle Public Library's Magnolia Branch presents a quintessential example of twentieth century Northwest architecture. Designed by Seattle architect Paul Kirk and landscape architect Richard Haag, the branch opened in 1964; in 2003 it was designated a Seattle landmark. The renovation and expansion, part of the Libraries for All bond measure, create new architectural relationships with the original structure, and repair and upgrade the original building and its systems.

The renovation and expansion honor the existing building and site, and create warm, inviting spaces served by state of the art energy, computer, and library systems. The project received a 2009 Washington State AIA Civic Design Award, an award from Historic Seattle and was an AIA DJC Project of the Month.

The new meeting room shares a level of design clarity with the existing building while departing from its frame structure. The flexible space provides a dignified civic gathering area and an intimately-scaled window seat for children's story time.

The new meeting room and a group study space are joined to the original library through the after-hours entry. A board-formed concrete wall forms a narrow addition that expands the staff work area. High windows and a carefully sculpted ceiling admit and control daylight.

The new meeting room is intimate and open, sheltered and visually connected to the landscape. Carefully placed windows bring in daylight and frame views to landscape elements. (SHKS)

#### **University of Washington, Gould Hall Digital and Architecture Library, Digital Commons, Seattle, WA – 2006**

Gould Hall, built in 1971, is the main building for the Department of architecture. It is named after Carl F. Gould (1873-1939), founder and first Chair of the Department of Architecture. Architect Gene Zema and Professor Daniel Streissguth were the lead designers of Gould Hall, in association with Dale Benedict and professors Grant Hildebrand and Claus Seligmann. Einar Svensson and Professor Robert Albrecht were the structural engineers. The building is reinforced cast-in-place concrete. A large central skylit atrium serves as a gathering place for the college. Gould Hall houses shared college facilities including the library, digital commons, shop, visual resources collection, classrooms, and the dean's office, as well as spaces for the Departments of Urban Design & Planning and Landscape Architecture.

(<http://arch.be.washington.edu/school/facilities>)

The Digital Commons replaces 6,600 sq ft of unused storage space in Gould Hall's sub-basement with unconventional, flexible, instructional space meeting a College-wide need. The design process reflects the College's collegiality by inviting students and faculty into the design conversation about the character of learning space in the digital age. The design includes the range of perspectives on a new learning environment, balancing flexibility and structure and creating informal learning spheres.

The mezzanine overlooks the Commons and helps the user orient to the space before entering. The focus is on optimizing resources for students and faculty.

The Commons provides flexible areas for collaboration and individual study. Small group workspaces have their own lighting controls, supporting the objective of student control. Moveable furniture and fixtures were chosen to make it easy for students to use and adapt the space.

Whiteboards provide places for sharing ideas. Not a typical computer lab, this space reflects changes in social and learning behavior – a place to hang out and use technology during and after class hours. Extensive light modeling studies were used in developing the design to mitigate the feeling of being underground. The bright surfaces reflect light and color; clarifying the spatial organization.

A forty-student computer classroom is used for digital course instruction.

Students staff the "help desk" and equipment repair shop located beneath the mezzanine. The new blue elevator provides color and accessibility. (SHKS)

#### **King County Library System at Southcenter, Tukvlla, WA – USA 2004**

The King County Library System Connection at the Southcenter Mall reflects the Library's approach to literacy outreach - going where the people are. In collaboration with library staff, SHKS combined retail and library expertise, bringing merchandising concepts to the library context.

Branding graphics, bright interior finishes and comfortable contemporary furniture reinforce the retail-library fusion. The project, sponsored by the King County Library Foundation, is welcoming and user-friendly.

The Library opens onto the mall on two sides. From the mall, the space invites entry through light, color and depth. Herman Miller office systems furniture, adapted for computer use, commands the center of the space. The work stations accommodate one to three people.

Books cover the side walls; people and computers share the middle ground, and the librarian has a view of the entire space. The interior restoration and repairs will extend the life of this community landmark. Interior improvements increase operational efficiency, providing a cozier, more comfortable space for patrons. The design conveys the Library's identity within the mall. Content choices introduce the library system to the consummate retail environment.

The Library is as a refuge: family members sit, read and surf the internet, waiting for shoppers in a relaxed setting. This is not a "fast food library": visitors are invited to linger.

A specific design vocabulary defines the children's area. The Library's commitment to young readers continues at Southcenter – distinctive carpeting and low shelving provide a protected area for children. The circular bookcases help identify their special area. (SHKS)

### **Green Lake West Seattle Library, Seattle, WA – USA 2004**

Green Lake and West Seattle Libraries, two of Seattle Public Library's seven Carnegie libraries, were built in 1910. Both libraries are listed on the National Register of Historic Places. As part of the Libraries for All bond measure, SHKS Architects worked with the Library and community to renovate and protect these treasured community assets.

At Greenlake, a redesigned circulation desk and patron 'holds' area reflects changing trends in library use. Windows were either replaced or restored based on a thorough window survey. Original woodwork was restored. SHKS designed a light diffuser to reduce glare improving the skylight's function; maintaining historic character.

Exterior restoration and repairs will extend the life of this community landmark. Interior improvements increase operational efficiency, providing a cozier, more comfortable space for patrons.

The West Seattle Library received a full exterior upgrade including brick and terra cotta preservation, seismic anchorage and window renovation. The project also improved mechanical, electrical and communications systems, adaptively reused a basement storage area, converting it to a new meeting room and rehabilitated the interior.

Changes in the reading room incorporate new technology needs while maintaining the original finishes. Cabinets designed to deal with the technology of the past – books, record bins and cassette tapes – were modified to accommodate new technologies. (SHKS)

### **SHW Group, Plano, TX – USA**

<http://www.shwgroup.com>

#### **Libraries:**

### **Grand Valley State University – Library of the Future (Mary Idema Pew Library Learning and Information Commons), Allendale, MI – USA 2013**

A model for the new 21st-century digital learning environment, the Grand Valley State University Library of the Future is a student and user-focused design highlighting concepts of retail, exhibition and interactive technologies. Located along the main campus axis and framing the campus icon - the clock tower - the library is replacing an award-winning Zumberge Library constructed in 1968. The siting and design of the new building focuses on valuable sustainable concepts, such as a green roof and natural lighting, and the landmark is currently seeking LEED certification. To achieve this new higher-education learning model, SHW intensely investigated social work patterns: group, casual, serendipitous and formal. These social patterns, in addition to learning patterns, were integral drivers in the design of this facility. Ease of access to information, books, catalogues and technology were also critical considerations for the SHW architects involved in the project. The resulting design provides a variety of learning and interaction spaces, including bibliographic training, a café, and individual large-group and small-group study and instructional spaces. The large group area and circulation space transition to flexible study space and glass partitions are used to provide privacy, sound control and interaction space for up to 10 people. Concepts of retail, interactive technology, display and workstations work harmoniously to provide this interactive and functional space. (SHW Group)

### **H.D. Woodson STEM High School, Washington, DC – USA 2011**

241,700 sqf.

Intended to become the flagship of the District of Columbia's public school system, High School 2008 will reflect the highest standard of architectural design for education and it will serve as a model of heightened expectation throughout the District. SHW Group and its educational strategist, Cambridge Strategic Services, worked with High School 2008 staff to establish a shared understanding of the meaning and the facility's design implications of the instructional vision of Science, Technology, Engineering and Mathematics (STEM). SHW evaluated a variety of options to renovate and/or demolish the existing school structure and developed alternative timelines for delivery, including phasing plans for an occupied facility. The design firm also established sustainable design criteria and implementation strategies while facilitating staff and community dialogues. High School 2008 will employ state-of-the-art technology for instructional programs, building security and energy performance-monitoring systems. The 214,700-square-foot project is being developed as a LEED-Gold facility and incorporates geothermal wells, rainwater harvesting, vegetated roofs, and solar energy collection for domestic hot water. (SHW Group)

### **Needville High School, Needville, TX – USA 2010**

Located in Fort Bend County and approximately 30 minutes southwest of Houston, the Needville community and its school district officials have a 20-year partnership with SHW Group. They trusted the firm to develop a design for the high school that will arise on a 250-acre site, defining the area's independent and agricultural nature. Envisioned as an assembly of smaller structures integrally connected with the landscape, the desire for the facility was a design that avoided the conventional brick-box style of most schools, evoked the agrarian traditions found throughout Needville, and allowed students to be in grade-level, small learning communities. These goals allowed the design team the opportunity to explore Needville architectural character from Main Street to the rural countryside and to study, document and photograph the different elements that make up its community. In this exploration, the design team noted in the structures the emphasis on function over aesthetics that is prevalent in rural life. From this came the inspiration of Needville High School's design – a machine aesthetic with an agrarian theme. At the facility's heart is a central student gathering space designed as a silo feature and flanked by two academic wings housing the small learning communities. These communities are organized around a courtyard that frames the view to the science building – a distinctive campus feature with exhaust hoods and a green screen in the form of latticework and vines on the west façade. Transparency is carried throughout the facility's interior spaces, with ample glass framing the landscape and serving to acknowledge the land's integral role within the community. Other agrarian-themed features: a field wall of stacked stones in the library corrugated metal panels on the curved auditorium walls that along with natural light, frame the auditorium stage exposed steel trusses in the gymnasium, which is flooded

with natural light and features a glass encased weight room on the second floor overlooking the basketball courts a cupola and exposed trusses in the dining room reminiscent of a pavilion (SHW Group)

### **Career and Technical Education Center, Frisco, TX – USA 2008**

125,000 sqf.

In one of the fastest growing school districts in Texas, the Career and Technical Education (CTE) Center is the visionary product of two bond elections and a 10-year effort by the Frisco school district, community members, business professionals and students. The vision for the center is to attract and accommodate the district's brightest students, and allow them to explore courses consistent with their chosen career field or field of interest; whether it's technology, agriculture, culinary arts, veterinary medicine, criminal justice, business or other specialized fields. Envisioned as a state-of-the-art facility that prepares students for college and the 21st-century workforce in a competitive global economy, the center combines academics with real-world spaces and hands-on experience. The design team's challenge was to create a facility that supports curriculums, activities and learning spaces that are vastly disparate in nature, yet achieves unity and encourages collaboration and interdisciplinary study. The facility's design also needed to compliment the traditional-style architectural fabric of Frisco while presenting a future-minded appearance for the unique environment. With mature trees and 27 feet of fall across the terrain, the building site itself presented challenges. Stepping down in several places to conform to the site's natural descent and oriented to be visually prominent, the building presents a sleek exterior of transparency and clean lines with a dramatic primary entry façade of metal panels and extensive glazing. With a palette of metal, glass and terrazzo made from recycled glass and porcelain, the interior features a two-story entry atrium with a back-lit glass elevator at its heart. A large panel system of flat screens instantly provides entrants with pertinent information and direction while color-coded fins and backlights are also used for wayfinding and allow each suite its own identity. Other unique spaces include: a mock courtroom, forensics center, nursing facility, full-sized television studio, a kennel for small animals and a corral for large animals, full-service credit union, Apple and PC computer testing centers, a working greenhouse and a fully operational and student-run restaurant. Outdoor features include a dining area and jogging trail, as well as the native plants surrounding this innovative facility now garnering nationwide attention for its progressive model. (SHW Group)

### **Andy Dekaney High School, Spring, TX – USA 2007**

486,000 sqf.

#### **Awards:**

**The Caudill Award, 2008; Texas Association of School Administrators/Texas Association of School Boards**

The new award-winning Andy Dekaney High School needed to provide a learning environment not typical of most large schools, in which size impacts learning and affects students' sense of community and belonging. A design was envisioned that would break the large school down into smaller learning academies and grade-level housing. As a result of the SHW visioning process with the designers, school committee members came up with general concept words such as "attention-getting" and "natural looking" rather than "institutional" and "low maintenance." In addition to the design concept of a small academic environment within a large school was the client's desire to preserve the balance of the school's needs for decreased maintenance and lower operating costs with its strong value of aesthetic features. The project design team met this request through a thoughtful design and the careful selection of high-value materials. Inspired by the natural setting of the site, and taking into consideration the committee members' general concept words, the team then developed the design concept of a mountain lodge theme. Lodge theme features include an entrance sign made of cedar and planks, local hand-molded bricks harkening back to another era, and galvanized stairs and handrails that wear and age richly while connecting each generation of students to the next. Connected by a "main street corridor," the academic portion of the school is divided into four houses with distinctive features such as wainscoting and varying wood types and door surrounds to foster each student group's own identity. Other spaces along the corridor include a large group instruction area, auditorium, coffee shop, music, choir and arts halls, a black-box theater with traditional marquee, administration spaces, two practice gymnasiums, a practice pool, library and cafeteria. (SHW Group)

### **Carl Wunsche Sr. High School (Library), Spring, TX – USA 2006**

273,178 sqf.

#### **Awards:**

**2007 Caudill Award Winner, TASA TASB Exhibition of School Architecture**

**2007 MacConnell Award Winner, Council of Education Facility Planners International**

**2008 Education Design Showcase Grand Prize Winner, School Planning & Management**

Located on approximately 22 acres dotted with mature oak trees, the Carl Wunsche Sr. High School was required to accommodate core curriculum classes and specialized areas of study that prepared students for business industries. With existing buildings on the site for the Wunsche School and the previously existing Sayers Elementary School, the project also required a major renovation and addition to the campus, as well as some demolition. The new facility was envisioned as interactive, exciting and with a special focus on the career academic studies. A design that provides connectivity and openness was the key challenge. Though the various career academic studies include training and curriculum for such diverse fields as criminal investigation, veterinary medicine, dental technology, and news reporting and producing, an additional challenge was to make their spaces connected and interactive. Fostering a sense of community among the students was also a major consideration. The facility is designed around three academic pods with technologically advanced classes and learning spaces that resemble dentist offices, crime labs, newsroom studios and other professional areas, which are all glass-encased so that other students can observe what is happening inside, creating openness and fostering mutual pride and respect of students' academic activities. The pods are supported by adjacent overlooking core curriculum spaces that connect and interact with other activity areas, including a media center, large group instruction areas, dining, museum, coffee shop, bank, fitness center, administration and other ancillary spaces all organized along an interactive and elevated glass corridor known as the Learning Street. Student response to this engaging, exciting and attractive learning environment has been so overwhelming that the facility always has a waiting list. (SHW Group)

### **Duncanville High School (Library), Duncanville, TX – USA 2005**

884,479 sqf.

The new Duncanville High School was envisioned as a facility that would join the district's student population in a collegiate campus atmosphere while bringing the ninth through twelfth grades into a single high-school facility. The school was designed to offer a broad range of electives and superior athletic facilities, and to attract high-caliber educators through its progressive technologies, extremely functional learning spaces and an increased level of community involvement. The challenge was the project's scope, which consisted of six bid packages and 14 phases of construction to connect the existing 11 separate buildings and bring the campus under one roof. Additionally, 14 phases were completed while classes were still in session - an extraordinary feat that was successfully achieved through careful planning from the project's conception. The fifty-year-old school was rebuilt by replacing the materials back to the original foundation, structure and exterior wall, as well as all systems, including the roof, HVAC and site utilities, resulting in a new 50-year life span for the building. With abundant natural light throughout, the new school houses a ninth-grade community and an upper-grades community divided in four neighborhoods. Both communities are separated by a central elective and academic core called the Central Academic District, and along the school's main corridor are situated state-of-the-art elective

opportunities for all students, including culinary arts, agriculture, building trades, photography, auto body/technology and more. The building also has electronic whiteboards, an innovative wireless network that connects the school to other buildings in the district, a Category Six voice and data network, and projection systems with 100-inch diagonal screens in all of the classrooms. Also incorporated in the campus are impressive athletic and fine arts facilities, including a premier gymnasium, large stadium, baseball and soccer fields, a modern black-box theater, and large group instruction areas. Multi-purpose lecture rooms and instructional resource centers overlook the **campus library**, as well as other features, all serving to prepare and propel Duncanville High School students forward to careers, college and beyond. (SHW Group)

## **SJA Architects, Duluth, MN – USA**

<http://www.staniusjohnson.com>

### **Libraries:**

#### **Lac Courte Orielles Ojibwa Community College, Library Addition, Hayward, WI – USA 2007**

9,300 sqft., \$ 1,500,000

Traditional Ojibwa imagery and sacred symbols adorn the new library at the Lac Courte Orielles Ojibwa Community College campus in Hayward, Wisconsin. In addition to traditional library functions, the building offers up a space for the tribal community to gather, grow and learn. The new library provides approximately 9,300SF of accommodation with a children's library, two study rooms and a gathering/story-telling area evoking the feeling of a traditional wigwam dwelling, with and fireplace and featuring a framed open-latticed ceiling with wooden walls resembling bark and sapling latticing. The natural wood building exterior compliments surrounding campus buildings and the new SJA designed campus entrance. The children's library evokes the feeling of growth with an emphasis on seedlings felt throughout in the chair's playful fabric and wooden bench with sapling carvings. The Sacred Tree and Circle are felt throughout the design from the new grand campus entrance to the carpet inlays in the wigwam. Everything from the porcelain tile to the oak desks and book shelves were inspired by nature and the beautiful rural site of the college. (SJA)

#### **University of Minnesota, Duluth Campus Library, Duluth, MN – USA 2000**

The new campus library, which combines print collections with state-of-the-art electronic information resources, has been hailed as a landmark building symbolizing UMD's dedication to excellence and learning. The new \$26 million facility opened in the fall of 2000. The northern entrance to UMD's academic core and pedestrian concourses, the new library is highly visible to users, day or night. It also ties the building visually to its natural northwoods setting and creates "gracious spaces" inside that offer comfort, appealing views, natural light, and flexibility in use of space. To make the new library architecturally distinctive, designers decided to break the linear pattern of neighboring buildings. The new library's projected exterior forms and expressions contrast with the boxy nature of nearby buildings. Sheathing is solid red brick, unlike the exterior of surrounding buildings. The library's most prominent architectural feature is a rotunda marking its main entrance. The rotunda form, used nowhere else on campus, gives the building landmark status. Its hemispheric copper dome, with a skylight, serves as a beacon to draw students to the library, day or night.

Inside, the library is equally special. Patrons entering it encounter a sweeping view upward into a two-story circular area that imparts a feeling of drama and openness. On the building's south side, a sheltered courtyard with plantings and furniture invites students to study or socialize outside during warmer months. Rotunda reading rooms, each two stories high, give users 270-degree views of Lake Superior and the surrounding area. The main reading room, on the north side, has large vertical windows that face scenic natural areas. Internal balconies allow daylight to penetrate each floor and provide views from study and collections areas. To save money on construction and operation, the design team chose a simple rectangular form for most of the building and a modular concrete joist and beam structural system. The system, inherently fire-resistant, made it relatively easy to build irregular shapes, circular forms, cantilevered areas and openings in the floor. Windows were chosen to fit with regular brick and block coursing and have limited size variations to minimize construction costs. To allow flexibility, designers left ample open floor space on each floor, concentrating mechanical/electrical and building service spaces on the east and west sides. The modular structural system will accommodate a variety of planning options. The five-inch-thick concrete structural system was easy to penetrate for voice, data and power connections. The new library is one of the most high-tech libraries in the country. Study tables and carrels have power and data connections for laptop computers. All floors have on-line computerized catalogs for quick information access. In-depth research on the on-line catalog may be done at computerized study carrels. The library's digital resources include over 555,000 volumes with access to 4,700 journals; two computer labs; three electronic classrooms, one with interactive television; and 15 group study areas with network connections. (SJA)

## **Slade Architecture, New York, NY – USA**

<http://www.sladearch.com>

### **Libraries:**

#### **Montessori Progressive Learning Centre, New York, Queens, NY – USA 2006 – 2007**

3,000 sqft., \$ 7,434,000

This interior renovation of the Montessori Progressive Learning Center in Queens, NY was part of the NYC RFP for 24 Firms, Design Excellence Initiative. The work included the creation of a library, renovations of a teachers' lounge, renovation of all bathrooms and play sinks in the classrooms, renovation of two kitchens, and a new reception area. This project was subject to the NY City Sustainable Building Guidelines. The renovation was completed while the building was occupied--the Montessori School has no periods of closure longer than a four day weekend. Renewable, low-toxicity products and methods were specified for the highly sensitive environment of a functioning nursery school. Working with the school and contractor, we coordinated the phasing to minimize the impact the on school operations. The original scope called for the conversion of a small basement storage room to provide shelving for a small library. By imaginatively capturing underutilized and overlooked space including two circulation corridors, we created an amenity that exceeded everyone's expectations within the original budget. The space we created provides the required library shelving and a reading area that can be used for larger school gatherings and presentations. The library is now programmed for various functions by the administration and individual teachers: It has become the central hub for teachers, students and parents in the school. Because the area designated for the new library is below grade, we strove to create a sense of openness and brightness by incorporating a reflective ceiling, bright murals and lighting. (Slade)

#### **Chungmuro Intermedia Playground - Seoul, South Korea 2000**

3,400 sqft. Renovation

in collaboration with Minsuk Cho and Kwang-soo Kim

New media, communication technology and virtual space have transformed social and economic interaction, physical space, the relationship between public and private space and generated new spatial typologies. Restaurants are used for work, offices for leisure, homes for shopping, etc. Mass transit is no longer just a line connecting two functions; technology allows

the extension of these functions into the line transforming it into a new entity. The businessperson going to work can begin working on the subway, making phone calls, responding to email and writing reports as if already in the office. We were charged with designing a center for new media art within an existing 500 square meter passageway in the Chungmu-ro subway station in Seoul, Republic of Korea. The choice of the subway passageway as a center for art is a manifestation of the overlap of multiple functions into spaces that were previously mono-functional. The operation of the subway station demands that the passageway be maintained at all times. The spaces in the media center are open to the public but secured after hours. We had to maintain the passageway while simultaneously creating a destination. Exploiting the linear quality of the existing corridor, we created a kaleidoscopic space. The kaleidoscope offers a model of a physically limited space that simultaneously creates a changing, perpendicular, deep space through movement and reflection. The experience of depth and amplitude allows both the idea of passage (travel) and destination (arrival) to exist simultaneously. The compositional elements in a kaleidoscope move to create different mirrored patterns. In our project the occupant provides the movement; elements reconfigure themselves in relation to the viewer's movement creating a multi-direction, boundless and dynamic interactive experience. The entire space is a mediating device. Projection and reflection physically mediate the activities in the space in, juxtaposition to the electronic mediation represented by the institution. Glass, mirrors, polished surfaces and reflective membranes interact with the occupant to create multiple images or views of both the occupants and the space. The viewer is constantly made aware of his/her position within the space and of the relationship between reflected spaces and physical spaces. The coexistence of electronic and physical mediation enriches the experience and brings to the forefront universal questions of location, time and point of view. The project includes a lounge/library, a private screening area, office, editing facilities and editing classroom, a theater/auditorium and an exhibition space. All of these spaces are open to the public at different times allowing the entire space to be used at once or for different areas to be used independently. This flexibility also allows users to move through the entire institution sequentially, to pop into individual rooms, or to bypass the whole institution. It provides the client with a very flexible space that can be used in many different ways at different times or simultaneously. The auditorium theater also opens completely to the main exhibition space to form one large space for parties or other big events

### **SLCE Architects, New York, NY – USA**

<http://www.slcearch.com>

#### **Libraries:**

**Cardozo School of Law Yeshiva University, New York, NY – USA 2003**

Building Area: 13,800sf

The 7th floor is the main entrance to the four story library and provides essential library services such as circulation desk, reference desk, computer work areas, reading rooms, publications and video playback. Statistics for the 7th floor: 13,800sf, 233,528 volumes of books (physical), 476,812 in micro form. 34 student computer work stations. 64 seats for reading activities. (SLC)

**Port Richmond High School, Staten Island, NY – USA 1996**

Building Area: 62,500sqf.

The Port Richmond High School addition is a 4 story 62,500 sq. ft. structure containing 20 classrooms, administrative and counseling offices, 7 state-of-art laboratories, studios and shop, and a new double height entry lobby. The building's detailed exterior combines flamed granite, brick and limestone colored precast concrete with iron fencing to compliment the richness of the adjoining Georgian buildings. The new addition provides the school with a new entrance portico and a double height entrance lobby. Additionally, corridor links connect the old to the new school allowing level circulation on all floors. (SLCE)

### **Smalwood Reynolds, Steward Steward Associates Inc., Atlanta-Tampa, FL – USA**

<http://www.srssa.com>

#### **Libraries:**

**Nova Southeastern University, The Library (Alvin Sherman Library) and Information Technology Center, Fort Lauderdale, FL – USA 2001**

44,000,000 €, 500,000 – 600,000 visitors/year

This 325,000-SF building, Florida's largest library, is a joint-use facility funded by Nova Southeastern University and Broward County. It provides traditional and advanced electronic library services to all age groups. A 500-seat performing arts center, 20 electronic classrooms and a 1,500-car parking structure allow this project to meet many educational and cultural needs for the University and community. (Smalwood)

### **Smith & Company Architects, Houston, TX – USA**

<http://www.sc-arch.com>

#### **Libraries:**

**The African American Library at the Gregory School, Houston, TX – USA 2009**

20,000 sqf.

#### **Awards:**

**2010 AIA Houston Chapter Design Award**

The restoration and redevelopment of the historic Gregory School (1926) as an African American Museum & Library has opened the door to an opportunity to create an interpretive experience that will profoundly connect the school with the surrounding Houston community as the new center for interpreting African American culture through history. This building is an amazing artifact, vacant for years, that has just managed to stand the test of time. Now it will function as a new resource for interpreting history and preserving the history of the African American experience in Houston. The restoration will include a Museum, Library and Archives and a Black Box Theater. The classroom will be restored with as much of the original finishes and furniture as possible to create the voice of the place. There will be some original students' desks where visitors will be encouraged to sit as well as additional seating for adults. Visitors will discover that the classroom is actually a theater where they will experience their introduction to the primary storyline. (Smith)

### **Libraries:**

#### **Durham Main Library, Durham, NC – USA 2012**

Bill Bryson returned to Durham University on Tuesday November 27, to rename the main library and open its new wing. The opening of the £11m East Wing at the Bill Bryson library makes the main library building 42 per cent bigger and provides 500 new study spaces across four floors.

The development is part of Gateway, Durham University's major £60m estates project which incorporates a new Law School and a dedicated building for student support services, The Palatine Centre.

The new East Wing has been designed to produce a light and spacious study environment, including 21 individual and six group study rooms.

It has enabled the library to rearrange its collection of 1.5m books into one sequence and to make 120,000 books previously in storage available in open access shelving for the first time.

#### **New York Law School, New York, NY – USA 2010**

New: 200.000 sqf., € 80.000.000 / Renovation: 150.000 sqf., € 30.000.000

### **Awards:**

**Best Project Management, (submitted by Pavarini McGovern), New York Construction, 2009**

**Project of the Year--Higher Education/Research, (submitted by Pavarini McGovern), New York Construction, 2009**

Founded in 1891, New York Law School is one of the oldest independent law schools in the country. In recent years, its fundamental mission has been outreach and exchange. Located right in the hub of New York City's legal and financial districts in lower Manhattan, the school's bustling site is a key component of its identity. SmithGroup's new building features a transparent envelope that will both enclose the space and display to the outside the high degree of activity taking place within. The new wing contains classrooms, a large auditorium and a multipurpose space, allowing the law school to host a wide variety of events. The increased opportunity to interact with members of the outside community underscores the school's interest in sustaining its outreach and exchange. New York Law School's current facilities consist of disparate structures including several early 19th-century cast iron buildings that do not contain appropriate spaces for a contemporary legal education. This new design, which features a five-level, 200-foot glass façade, will give the school new clarity and visibility. Phase 2 will create innovative centers for advanced scholarship and research. (SmithGroup)

#### **Sam Garcia Western Avenue Library, Avondale, AZ – USA 2009**

12.000 sqf., € 6.200.000

### **Awards:**

**Citation Award, AIA Arizona, 2009**

**Honorable Mention, Best of the West Awards, Westmarc, 2009**

**Best of Show, PRIDE (Professional Recognition in Interior Design Excellence) Awards, IIDA (International Interior Design Association), Southwest Chapter, 2009**

**Design Excellence Award (Public Facility), PRIDE (Professional Recognition in Interior Design Excellence) Awards, IIDA (International Interior Design Association), Southwest Chapter, 2009**

Marking the launch of the revitalization and rebirth of Old Town Avondale, the new library provides a touchstone for one of Arizona's fastest growing communities. The City requested a new facility that was open and inviting, a catalyst to spur redevelopment of the historic area. Located adjacent to an existing police station and fire station, the library is sited on a previous car wash. The facility's clean lines provide an eye-catching addition to the streetscape, while improvements to the outdoor Sernas Plaza next door create a flexible community gathering space within the Old Town city core. The ground floor is dedicated to children and community with a story time reading room. Adult and teen reading interests are located on the second level, capturing scenic views of the Valley, Estrella Mountains and the Old Town neighborhood. Transparency and openness were key design goals for the City. The glass façade connects activity inside the library with passing pedestrians and retail shopping across the road. Highlighted by a vibrant and colorful interior, agile floor plates maximize exposure to natural light and support flexibility. The SmithGroup|Sundt design-build team solutions improved outdoor lighting, pedestrian and vehicular circulation as well as access to advanced technologies and upgraded City support facilities. Completed several weeks ahead of schedule, the new library welcomes a diverse patron population and sparked renewed interest in the City's public library system. (SmithGroup)

#### **University of California, Hastings College of the Law, San Francisco, CA – USA 2005 – 2007**

Library Cost: 80.000 sqf., € 4.000.000

For over a decade, SmithGroup has partnered with UC Hastings College of the Law to renovate and modernize their campus, balancing their historic roots as California's first law school with the current trends in law education and amenities attractive to today's students. Most recently, Hastings turned to SmithGroup again to reinvent their library, while simultaneously executing a full seismic retrofit of the building -- creating an accessible, comfortable and safe learning environment. The existing library, burdened with squat ceilings, limited daylight and disorganized wayfinding, lacked energy, imagination and interaction. Promoting a sense of community and pride, the renovation supports visual connectivity, revives vitality and heightens operational efficiency. Thoughtful use of color invigorates collaboration and organizes spatial relationships. Flexible spaces accommodate large and small gatherings of students, faculty and staff. Housed within the urban fabric of the civic community, the library has become a social hub for camaraderie and enhances the student experience. Hastings, while affiliated with the University of California system, is a small institution autonomous from the larger UC system. Addressing the goals, aspirations, and concerns of multiple user groups, the design process challenged library and university staff to think long-term and plan for future changes within the legal profession and education. Conscious of the financial constraints governing the overall cost of the project, the design team executed a uniquely fitting design in a timely and sensible manner. The result: a vibrant and dynamic library that complements the energy of San Francisco while accommodating the needs of all who use the space. (SmithGroup) "The collaborative nature of the project team was a major component to the success of this project... On behalf of the Dean, Board of Directors, and students, faculty and staff, we express our collective appreciation for the creative, functional and visually stunning design of the dramatically upgraded facility. We couldn't be more pleased with the positive outcome." David Seward, Chief Financial Officer, Hastings College of the Law

**Center for Integrated Learning and Information Technology (CILIT), Michigan Technology University, Houghton, MI – USA 2005**

182.000 sqf., € 26.300.000

With careful campus planning, the library expansion and renovation and new computer science building became an academic student center for MTU. A mix of study areas and social spaces provide integrated instructional and information systems for both graduate and undergraduate programs. Key features include wireless networks, high-tech classrooms, a digital studio and flexible labs and research spaces. Its prime location allowed the creation of a visibly inviting gateway to the campus. From outside, the drama and function of the grand reading room is visible to all through its large wall of curved glass. An enduring, modern palette of limestone, slate and copper harmonizes with neighboring facilities. Providing a literal "window into the university" and supporting self-directed study were twin client goals. The library was reconceived from a knowledge center to a platform for group and individual learning. Prominence on the campus was vital, both to recognize donors and create a new front door to the university. An enclosed pedestrian walkway links the library and computer science building, beginning a system that will be extended throughout the campus. Library usage was up 105% in the first year after the opening of the renovated library and the reading room had become a 24/7 space by the second year of use. The design was geared toward the requirements of LEED Silver certification. Key features include green materials, reuse of the library, special lighting systems, natural ventilation and facilities for bicycle commuters. Full commissioning services completed a functional test of all systems and enhanced the operations of the facility. (SmithGroup)

**Rose and Robert Skillman Branch Library, Detroit Public Library, Detroit, MI – USA 2004**

30.000 sqf., € 7.300.000

**Awards:**

Honor Award - Historic Preservation, AIA Michigan, 2007

Honor Award - Historic Preservation, AIA Detroit, 2006

Honor Award, Michigan Historic Preservation Network, 2004

An award-winning preservation of a 1931 building designed by SmithGroup's predecessor firm - Smith, Hinchman & Grylls - now serves as an up-to-date library and neoclassical landmark. Carefully restored elements include the exterior of limestone, bronze entrances, and copper roofing and fascia. Inside, the library was reprogrammed to include a business center, children's library, "cyber-café" and the National Automotive History Collection. Then historic painting and light fixtures were preserved and marble floors, furniture, plaster and millwork were restored. Key upgrades to the building are new stairways, bathrooms and an elevator, as well as all-new and state-of-the-art mechanical, electrical, security and telecommunications systems. To meet code while preserving a landmark, SmithGroup creatively located new stairs and removed outdated central stacks to allow new bathrooms and an elevator. A handicapped ramp was added indoors near the lobby area and new custom storm windows were added inside on the interior side - both moves preserving the original façades. (SmithGroup)

**Sheila and Walter Umphrew Law Center, Baylor University, Waco, TX – USA 2001**

120.000 sqf., € 32.000.000

**Awards:**

Outstanding Construction Award, Association of General Contractors (Texas Branch), 2002

SmithGroup provided the programming, site selection, architectural and interior design services for this new law school. The form and character of the building is based on both the "Baylor style" -- simple red brick and white trim -- and an archetypal Texas courtyard. For clarity and ease of orientation, the dominant east and west sides of the courtyard represent the two primary components of the school: the classrooms and the library. A clearly identified practice court serves Baylor's central trial advocacy program. The library integrates the rapid shift from hard copy to a mix of electronic resources. Expansive, over-sized windows featured on the building's traditional exterior tie the interior with its unusual Texas riverfront location. Baylor has a strong teaching and practice-oriented mission, and emphasis was placed on creating responsive classrooms, principally for Socratic and case study methodology. The practice court suite is clearly identified and central to the building layout and reflects its status as one of the strongest trial advocacy programs in the Southwest. (SmithGroup)

**Lawrence W. Inlow Hall, Indiana University School of Law, Indianapolis, IN – USA 2001**

185.000 sqf., € 34.000.000

**Awards:**

Monumental Award for Excellence in Design, Keep Indianapolis Beautiful, 2001

Honor Award for Excellence, AIA Indianapolis, 2001

Bronze Award, International Interior Design Association, 2002

Outstanding Building, Post-Secondary, American School & University Portfolio, 2002

Indiana University's award-winning law school is a significant gateway to the University's Indianapolis campus. Situated on a historic park and located just two blocks from the state capitol, this campus landmark reflects the modern character of the university while blending seamlessly into its locale. Designed to accommodate 800 law students -- as well as members of related communities such as the bar and the state legislature -- the facility is an ideal, highly interactive environment for studying the law. The varied teaching spaces accommodate Socratic, seminar, case study and other methods of instruction. Advanced, integrated technologies allow instructors and administrators to communicate with ease and draw on international resources. The 70,000-square-foot law library, located on busy West Street, comprises large scale elements including a stair tower and a strong masonry expression. Inside, cutting-edge technology allows users to access an increasing array of hard-copy, electronic and interactive resources. The academic quad anchored by a central atrium features a more human scale and provides an easy means of orientation and a focal point for the school community. "The architects have been inspired and creative while remaining cooperative and responsive to our needs and desires for the building. The result is the magnificent and, indeed, monumental structure that now graces the southeast corner of the IUPUI campus." (SmithGroup)

**Moss Landing Marine Laboratories, San José State University, San José, CA – USA 2000**

60.000 sqf.

**Awards:**

Excellence in Construction Award, Best Project over \$10 million, Golden Gate Chapter, Associated Builders and Contractors, 2002

Excellence in Construction Award, Best Project Overall, Golden Gate Chapter, Associated Builders and Contractors, 2000

Set upon a sloping bluff overlooking the Pacific Ocean, this award-winning research facility's long, low and curving shape and redwood siding complement the delicate, rustic site. Native American artifacts and legless lizards were present on the site, requiring further sensitivity to its unique character. Public functions, including a marine library and seminar room, occupy its southern entry end. From there, a corridor illuminated by clerestory links student and faculty areas. Technically complex, the building provides areas for staging oceanographic expeditions, as well as adaptable and modular laboratories. Support areas include administrative

offices and classrooms. The building's low profile stays below the crest of the dune to protect views at the site and to meet special coastal regulations. Material choices were made with the coastal salt air in mind: redwood siding, stainless-steel nails, vinyl-clad windows and corrugated-concrete roofing panels. Teaching labs were linked visually to the ocean. Overall, attention was paid to integrating the high-tech contents of the building with its unique site. Legless lizards were discovered on the site prior to construction. About 2,000 of the species were captured and maintained in the university biology department until construction finished. Also during the construction, the archaeological contents and use of the site were monitored closely. Since it was completed, the project has been rated LEED-EB for an existing building by the U.S. Green Building Council. (SmithGroup)

#### Catholic University of America, Columbus School of Law, Washington, DC – USA 1994

188.000 sqf., € 24.000.000

##### **Awards:**

Louis I. Kahn Citation, Architectural Portfolio, American School & University Magazine, 1996

From its traditionalist design to its modern electronic communication arteries, Catholic University's Columbus School of Law reflects the changing patterns of legal study and research. The exterior freely borrows from the campus' Collegiate Gothic and Romanesque Revival styles to create a contemporary building that is contextual yet distinctive. Inside, the entire facility features state-of-the-art voice, data and audiovisual technologies. The building is organized around a central atrium, a place where it is easy for faculty and students to connect on their way to the library, student lounges, café and moot courtrooms. An exterior courtyard connects classrooms with the new academic quadrangle, sited above a 600-car garage. SmithGroup provided a campus-sector master plan and complete programming, as well as architectural and interior design services. To enhance functionality, one of the three flexible-use teaching courtrooms can be adapted for up to five appellate judges, a trial court, a legislative hearing room, or a city council dais. The state-of-the-art library can accommodate up to 220,000 volumes and 500 patrons. (SmithGroup) Testimonials "When I think of the entire project, the first adjective that comes to mind with respect to [SmithGroup] is patience. Many other words are applicable: professionalism, care, creativity, attention to detail, courtesy, good humor -- but in some ways, I think it is the patience that I valued most." Leah Wortham, Associate Dean & Associate Professor of Law Catholic University of America

#### Tae-Joon Park Digital Library, Pohang University of Science and Technology, Pohang – South

##### **Korea 2003**

269.000 sqf., € 35.000.000

##### **Awards:**

Merit Award for Architecture, Washington (DC) Chapter AIA, 2003

Honor Award for Architecture, Virginia Society AIA, 2003

Honor Award for Institutional Architecture, AIA Northern Virginia Chapter, 2004

This award-winning digital library and computer center for a major university in coastal Pohang provides a state-of-the-art resource for students. Its high-tech expression, in metal panels and insulating glass, announces the cutting-edge activities within. Numerous uses are programmed into the facility, including social spaces like the rooftop cyber-café and work zones like the digital laboratory. This lab greets users and visitors at the lobby, showing off the school's development of emerging 2-D and 3-D visualization formats. With dramatic topography and views, the university is split into upper and lower campuses, separated by a steep hillside. The digital library connects the zones through visual cues and pathways. Capitalizing on its visibility, a ceremonial, full-height portico creates a memorable entry image. Knitting together the university's two main campuses by bridging a dramatic hillside site, the building and its connecting pathways provide new connections via stairs, walkways and landmarks. In the building, large ceremonial spaces such as the soaring entry portico and curved atrium contrast with comfortable niches and carrels for quiet study. The library's media infrastructure -- as well as supporting architectural and M/E/P systems -- are designed to adapt to rapid technology changes, especially true for the University's central computer and computing center, sharing this building. (SmithGroup)

#### **SMRT Architects & Engineers, Portland, MN – USA**

<http://www.smrtinc.com>

##### **Libraries:**

#### University of Southern Maine, Glickman Family Library, Portland, MN – USA 1997

Before SMRT began design, The University of Southern Maine's library filled the lower four floors of a converted commercial bakery. USM's wish list for the vacant top three floors included a suite for sapecial collections; archival and computer labs; a student café; and a special events room. The library's archives are safely housed in a state-of-the-art environment. The reading rooms offer spectacular Back Cove views. The renovated Library is an attractive, and gighly functional part of USM's Portland Campus. (SMRT)

#### **SMWM (Simon, Martin-Vegue, Winkelstein, Morris) joins Perkins + Will, San Francisco, CA – USA**

San Francisco, October 17, 2008 – San Francisco-based SMWM, one of America's premier, award-winning women-owned architecture, urban design and planning practices, has joined forces with Perkins+Will, a global integrated design practice with 18 North American and 3 International offices. SMWM will relocate its 40+ people to Perkins+Will's China Basin Building offices, bringing Perkins+Will's San Francisco staff to over 100. SMWM's New York staff will move into Perkins+Will's Manhattan location.

#### Cupertino Library, Cupertino, CA – USA 2004

€ 15.300.000 , 60.000 sqf.

Maximizing views and light and relating to both landscape and climate, the library is designed around a distinctive outdoor courtyard that functions as an outdoor reading room or program area. The library incorporates sustainable design practices from all LEED® categories, including reducing water and energy consumption. The project not only opened on time, but also well below the official budget. As a result, the team implemented a program of enhancements added to the project scope, including one of the largest aquariums in California. (SMWM)

### [Lick-Wilmerding High School Library, Arts Building, San Francisco, CA – USA 1997](#)

€ 3.600.000, 17.000 sqf.

Establishing a new space at the heart of the campus, this building's orientation and stretch of windows take advantage of the views of San Francisco. The second-floor library includes group study rooms, capacity for 25,000 volumes, and special exhibit space. Studios for design/drafting, photography, and fine art are located on the first floor, as well as classrooms, faculty offices, an electronics shop and a computer lab. (SMWM)

### [San Francisco Main Library, San Francisco, CA – USA 1996](#)

SMWM with Pei Cobb Freed

€ 94.000.000, 381.000 sqf.

SMWM designed the new library to be a vital link between the Civic Center and the commerce-centric Market Street. Inside, the library is organized around a 5-story skylit atrium, bringing sunlight into its center. Housing a vast collection of media, providing the latest information technology and adaptable to future needs, this sustainable building welcomes all the community to visit, enjoy and use it. (SMWM)

### [Newport Beach Central Library, Newport Beach, CA – USA 1994](#)

€ 8.500.000, 55.000 sqf.

This facility serves the community as a cultural, intellectual and civic landmark. The design balances the need for an affordable, functional library with aspirations for a civic building by blending premium and modest materials such as long-lasting copper roofs and green slate with simply detailed stucco. Solar orientation influenced the design of the façade to balance the need for views with energy-conserving day lighting opportunities. (SMWM)

### [Clayton Community Library \(Sacramento Public Library\), Clayton, CA – USA 1994](#)

€ 2.800.000, 15.000 sqf.

Marked by a sycamore grove and a field of native grasses, the site design and simple forms of the library recall the agricultural buildings that dot the northern California landscape. The library is organized around an outdoor courtyard that serves as an overflow space for the meeting room. The vaulted ceiling acts as an indirect lighting system, reflecting both artificial light and natural daylight that enters through the clerestory off the light shelf. (SMWM)

### **Awards:**

2008 Chicago Building Congress – Best New Construction

2008 IBS Award Highly Commended Honorable Mention

2007 Leaf Award Best Use of Technology

The Richard J. Klarchek Information Commons is a 69,000 sf **completely digital research library** that occupies a magnificent site on the shores of Lake Michigan at the University's Lake Shore Campus. The site is directly between the existing land-marked Madonna Maria Della Strata Chapel and the Cudahy Library. The new Information Commons creates a dynamic and transparent eastern edge to a new quadrangle that will be formed once an existing Jesuit residence is demolished. Solomon Cordwell Buenz (SCB), in conjunction with Stuttgart, Germany-based Transsolar Climate Engineering, has implemented a number of natural and mechanical building systems and strategies that result in a totally integrated design. The result of this innovative and collaborative work is a building that achieves a 52% energy reduction below ASHRAE-90.1-1999 minimum requirements. The Loyola Information Commons shows fore-thought and innovation by the design team and the University. It is a flexible 24/7 library facility that will serve the students and faculty with a high quality, energy efficient space for many years to come. It is a Silver LEED certified building. (Solomon)

#### [Loyola University, Museum of Art \(LUMA\), Chicago, IL – USA 2005](#)

The Loyola University Museum of Art provides the University with a splendid new facility which promotes the exploration, promotion and understanding of art and artistic expression. The museum is located in an historic building on Loyola's downtown Chicago campus. The entry hall, which directly faces the Water Tower Park on Michigan Avenue, is a dramatic vertical volume and strong visual cue which draws visitors up and into the museum proper on the second and third floors. The galleries provide flexible space to display LUMA's curated shows, traveling exhibits and the Martin G. D'Arcy permanent collection. Complementing the galleries are seminar spaces, workshop rooms for students of all ages, and a library as well as administrative and curatorial spaces. (Solomon)

#### [The New School University, University Center, New York, NY – USA 2013](#)

New Building Will Maximize Current Footprint, Serve as Focal Point for Student Life

May 6, 2010 (New York, New York) — The Board of Trustees at The New School endorsed a plan yesterday to create a major campus hub at 65 Fifth Avenue, a university-owned site between 13th and 14th Streets. The University Center, as the building will be known, will add 354,000 square feet for an array of uses including new academic space, an auditorium for public programs, a central university library, and a 612-bed dormitory with a separate entrance on Fifth Avenue. "The University Center embodies The New School's evolution," said President Bob Kerrey. "This institution is in the midst of a transformation, amplifying its urban campus to serve degree-seeking students who now make up the majority of our enrollment. Reflecting the interdisciplinary nature of our curricula, the University Center provides space for students across all of The New School and its programs to interact and collaborate." Designed by Roger Duffy of Skidmore, Owings & Merrill (SOM), the University Center will serve as a focal point for student life at this quintessential Greenwich Village institution. The building has been carefully designed to complement its eclectic surroundings, affording the university a signature architectural presence that respects the massing and scale of neighboring buildings. In addition to SOM, The New School's partners on the project are developer The Durst Organization, Tishman Construction and SLCE Architects, which designed dormitory interiors. Construction is scheduled to begin in August. The building will open for the Fall 2013 semester. "Moving forward with a project of this distinction and scope augurs well for the fiscal and intellectual health of the university," said Michael J. Johnston, Chair of the university's Board of Trustees. "If a single design can affirm a great university's faith in the future, this one does it." The New School, which has experienced increased enrollment over

the last ten years, has long sought opportunities to secure additional space to meet the needs of a greater number of full-time students. In his design, the architect was inspired to foster seamless interaction of the building's circulation and learning spaces, mindful of the ways students, faculty and the community intersect. "In every way, this new building will become the new heart of The New School," said Roger Duffy. "Its location, innovative design, and bold programming will encourage the face-to-face, spirited inquiry that is a characteristic of this university." The 16-story building will replace a structure designed as a department store in 1951, which the university outgrew years ago. Two floors below grade will house several lecture halls, a cafe and extension of street-level retail space. An at-grade auditorium will feature moveable walls to accommodate different seating arrangements and a retractable runway for student exhibitions. The dormitory, which will have a secure 24-hour entrance and sit atop the academic floors, will enable more students to be housed within walking distance of campus. "Urban universities face special challenges, particularly in a space-starved city like New York," said James Murtha, New School executive vice president. "To accommodate the growth of important programs within our limited footprint, we convened students and faculty over a period of years for a design that embraces the culture of dialogue and debate that is a New School hallmark." Because environmental sustainability is a core value of The New School, the University Center has been designed to earn at least LEED Gold certification, a voluntary standard and certification program that defines high-performance green buildings. It will employ state-of-the-art energy, water, and waste efficiencies. Classrooms maximize daylight harvesting through clerestory windows and light shelves, which substantially reduce energy use. The single-phase construction project is a departure from the university's original plan for a much taller building. Responding to community concerns, The New School's more modest "as of right" project complies with existing zoning, including a dramatic setback from the street at the seventh floor. Taking advantage of relatively low current construction costs, the building will be financed through a combination of bonds, gifts, federal grants and asset sales. "With this building, The New School's academic profile can be fully realized," said Tim Marshall, the university's provost. "The University Center will have the breadth and technological sophistication our current programs demand and the flexibility to accommodate new degree programs that will lead our students to the next level of discourse." (SOM)

### **University of California – Merced Library and Information Technology Center, Merced, CA - USA 2005**

Project Facts: Completion Year: 2005, Site Area: 46,000 ft<sup>2</sup>, Project Area: 177,000 ft<sup>2</sup>, Building Height: 62 ft, Number of Stories: 4

The design of this project was influenced by the nearby air force base with its industrial hanger buildings. The plan is separated into two wings, one for the public reading areas, conference areas, a public meeting room and the children's area. The other wing houses staff areas and book storage. The building is oriented to maximize natural light, capture breezes and to better define an existing green space to the north. The front plaza area welcomes patrons with a series of curved cast-in-place concrete walls for sitting and reading. (Sprinkle)

## **SRG Partnership, Portland, OR – USA**

<http://www.srgpartnership.com>

[Lenn and Dixie Hannon Library, Southern Oregon University, Ashland, OR – USA 2005](#)

The library and learning center improvement cost \$23.5 million. Senator Hannon led the process to secure \$20 million in state bonding. He was assisted by many colleagues, in particular the local delegation including Senator Jason Atkinson, Representative Alan Bates, Representative Rob Patridge, and former Representative Cheryl Walker. The University and its SOU Foundation are raising \$3.5 million in private support.

The Lenn and Dixie Hannon Library is scheduled to be completed in March 2005. It will increase the academic and public resources of the only research library between Eugene and Chico. Almost doubling the size of the existing library, the addition will add much needed space to store and expand publications. In addition, the technological advancements will create long-term value for the community. By utilizing wired and wireless technology, spaces will be created for interactive teaching and learning on site and via distance delivery. Advancements include two wired classrooms, a media center, an expanded Information Technology Center, and study rooms with computer connections. (<http://hanlib.sou.edu/about/hannon.html>)

The Valley Library is the primary library of Oregon State University and is located at the school's main campus in Corvallis in the U.S. state of Oregon. Established in 1887, the school built its first library building in 1918, what is now Kidder Hall. The current building opened in 1963 as the William Jasper Kerr Library and was expanded and renamed in 1999 as The Valley Library. The library is named for philanthropist F. Wayne Valley, who played football for Oregon State.

One of three libraries for Oregon State, The Valley Library stores more than 1.4 million volumes, 14,000 serials, and more than 500,000 maps and government documents. It is designated as a Federal Depository Library and is also a repository for state documents. The six-story library building is of a contemporary, neoclassical style with a red-brick exterior highlighted by white sections along the top and on part of the eastern side. The eastern side includes a white-faced rotunda that includes a two-story atrium on the main floor. [Lewis D. Cannell Library, Clark College, Vancouver, CA – USA 1990](#)

CLARK COLLEGE CANNELL LIBRARY VANCOUVER, WA

Architect GouldEvans

THE CHALLENGE To pull off a renovation of a two-story, 40,000 square foot library serving 16,000 commuting students (up from 7000) who arrive and stay and are always “on,” said Michelle Bagley, dean of libraries, e-learning, tutoring, and faculty development. Oh, and bring together the library with e-learning, tutoring, and writing after a recent merger. With tight competition for every inch of the first floor for PCs, staff, IT support, and printing, the second floor—with its shrinking collection footprint—might yield to options. Needs? Group study rooms and quiet study areas, multimedia equipment, and a Kinko's tech center on the first floor.

THE BRAINSTORM Sparked by the Idea Kits created by GouldEvans, participants got busy. They suggested working with movable walls, including powered collaboration walls, to build in flexibility. Dismantle the elongated service desk and replace it with a reference kiosk in the center of the first floor. Check out laptops. Shift shelving to compact units. Perform an ethnographic study to understand users—but avoid “analysis paralysis.” To the mix of ideas, GouldEvans's Tony Rohr and Steve Clark (above, l.) added zones of seating, phasing from quiet to social, with quiet near windows, and content creation rooms complete with green screens and audio recording equipment. Among the missions met: fresh ideas for Bagley to take home.

### **Libraries:**

[Golden West College, Learning Resource Center, Huntington Beach, CA – USA 2011](#)

Cost \$32,000,000, Size 55,000 sq. ft., Program computer labs, faculty & staff offices, library, media resource center, study areas  
Services programming, design through construction, sustainable design, furniture selection & specification

### **Awards:**

AIA Santa Clara Valley, Design Award Honor

The Golden West College Learning Resource Center incorporates 50,000 square feet of general collection space for approximately 65,000 volumes, an information commons for tutoring and instructional support, a new media wing, and community-accessible spaces for meetings. This state-of-the-art facility consolidates campus resources, but also supports the learning process by providing increased computer access for both students and staff. Working with college leadership, administrative staff and building user groups, the project team completed program verification. The new facility is located at the west edge of campus, a site chosen for its prominence at the entry of the college and its potential to connect with the Huntington Beach community. Orientation and layout of programmatic elements facilitates views to an adjacent California native garden and interaction with a primary pedestrian pathway that links students to the center of campus. Interior organization focuses on the juxtaposition of zones of quiet, contemplative spaces with collaborative and social areas. (Steinberg)

#### **Crafton Hills College, Learning Resource Center, Yucaipa, CA – USA 2010**

Size: 58,500 sqft., Program: auditorium, gallery, library & learning centers, multi-purpose rooms, teaching & learning center, technology & AV services, Services: programming, FPP, design through construction

#### **Awards:**

CCFC Professional Design Award, Award of Excellence, Award of Merit,  
Illumination Engineering Society AIA Santa Clara Valley, Design Award Citation

Subsequent to the development of a full campus master plan, programming was provided for a number of buildings on the Crafton Hills College campus, including the Learning Resource Center. The building combines current library, Learning Center and campus data center components into a single structure. Within the Learning Resource Center, students have access to open labs of wired carrels, computer workstations, and reader tables as well as breakout spaces for tutoring and group study. A teaching center for faculty and staff allows users to improve lecture techniques and receive training on utilizing smart classroom components and incorporating technology into their curriculum. Integration of a gallery and a 100-seat auditorium finalizes the building's program, furthering the relationship between the college and the growing community of Yucaipa. (Steinberg)

#### **Los Angeles City College, MLK (Martin Luther King Jr.) Library, Los Angeles, CA – USA 2008**

64,000 sqf., € 22,000,000

Los Angeles City College will soon embark on the construction of a new library on its East Hollywood campus. It will replace the old one on the quad which was built in the mid-30s, with additions from the 60s. The new library will be located on the north end of the campus, along Willowbrook Avenue near Vermont, on the site of the current men's gymnasium and former athletic field. It will be conveniently located near the Santa Monica-Vermont Metro stop. Designed by Steinberg Architects, the building will be three stories high. The building is being funded with approximately \$20 million from the State and \$1.8 million from Prop A funds.

Groundbreaking will occur in the fall of this year and the building should be completed by early 2008. "The new library will be much more pleasant for the students," said Barbara Vasquez, library chairperson. "It will be a lot more intuitive as to where things are, with more outdoor light from expansive windows. Because of its shape, all interior spaces will be near windows, even the study rooms. And the second and third floors will have nice views of downtown. There will be improved safety features. And the furniture will be more ergonomic. Also there'll be more study rooms to accommodate the demands of the students." The new structure will have a long and narrow shape, 300 feet long and 60 feet wide, with 64,000 square feet of space, which is equivalent to the old one.

With a staff of 14 librarians and library technicians, the library will house 150,000 books, with computerized databases for newspaper and magazine research. The college newspaper, The Collegian, will also be on line. There will be ample internet connections, both for hardwired and wireless computers. The first floor will house the circulation desk, periodicals, the reference desk with 36 adjacent computers, an archive room, and a computer classroom. The second floor will house 126 computers, one third of the book stacks, eight group study rooms, plus individualized study areas. The remainder of the books will be housed on the third floor, with nine group study rooms, an additional computer classroom, a conference room and individual study areas with carrels and tables. The new building will have a faux-brick facade that will complement the look of the nearby brick-clad communications building. It will also have many windows. The interior decorations will include blue carpeting, furniture made of light wood with a deep navy inset that will resist marring, and ergonomic chairs. The book stacks will have metallic gray shelving and the lounge chairs will be lime green with navy accents. The building will have state-of-the-art air conditioning and the ceilings are being designed to expose the ductwork and lighting. Two public elevators, a separate elevator for book carts, as well as a number of stairways will also be incorporated into the design. The new library building will take the name of the old one with it: the Martin Luther King, Jr., Library. An engraving of the text of Dr. King's "I Have a Dream" speech will be placed on a first floor window next to the entrance. The lead architect is Gilbert Rocca. Steinberg Architects has offices located in Los Angeles, San Jose and San Francisco. The firm has designed other buildings for the LA Community College District, as well as libraries throughout the world, including one in New Zealand. To prepare the site for construction, the men's gym will be taken down later this summer. During the construction phase, the old library will still be in use. (<http://www.lacitycollege.edu>) (<http://www.mwwlaphotoserver.com>)

Steinberg Architects is providing programming and design services for the Martin Luther King Jr. Library at LA City College, one of nine campuses within the nation's largest community college district. This new facility will define the northwest corner of the college's urban campus, and is designed to house state-of-the-art electronic classrooms, computer clusters, study spaces and administrative offices in addition to special collections areas. Strategically located service and reference desks are easily located and highlighted with color to address staffing and wayfinding, while flexible classroom and gathering spaces address student needs for study areas. Individual study areas are interspersed throughout the building and group study rooms have been located to take advantage of sweeping views of the Hollywood Hills. Each floor maintains maximum flexibility because the structural design removed all interior shear walls. The planning and design process for the MLK Library was a collaborative one, and included input from district, campus, library and community representatives. Additionally, the facility incorporates a variety of sustainable strategies such as large windows on the north and south elevations for maximum daylighting. (Steinberg)

#### **Evergreen Valley College Learning and Technical Center, San José, CA – USA 2004**

76,700 sqf., € 25,000,000

#### **Awards:**

2005 Best Higher Education Project  
Best of 2005 California Construction  
2004 Award of Honor Community College Facility Coalition

As the pivotal component in a highly cohesive campus environment, the 76,000 sqf. Evergreen Valley College Library and Educational Technology Center combines three formerly disparate departments into a singular gateway facility accentuated by outdoor rooms and plazas. Through an exploration of shared program opportunities for the three primary departments, Steinberg Architects developed a design that promotes crossfertilization between staff, students and curriculum. Smooth transitions between adjacencies ensure the greatest possible use of space. A shared main entrance permits easy access to each of the departments, and the lobby and conference room can be utilized by the community for special events. By placing the computer lab on the ground floor and lowering its ceiling, the library serves as a focal point featuring high ceilings, large windows and dramatic exposed structural

support “branches” that reference the Tree of Knowledge and surrounding evergreen trees. The stature and overall volume of the library’s location conveys its importance as a center for learning, socialization and community. (Steinberg)

#### **Libraries:**

### **George W. Bush Presidential Library Foundation, Southern Methodist University, Dallas, TX – USA 2013**

The George W. Bush Presidential Center carries forward the tradition of Southern Methodist University’s Georgian-style campus, with simple wall planes faced with Texas limestone and red brick relieved by rhythmically disposed divided-light windows. The building presents three distinct facades. On the north, the public entrance to the museum and Presidential archives stands at the head of a colonnaded court. To the west, the entrance to the George W. Bush Institute is through a portico that concludes the important Binkley Avenue axis of the campus. To the south, the Institute faces university recreational fields, with the Dallas skyline visible in the distance beyond. On the east side service areas help buffer the Center from the noise of an adjoining freeway. A large lantern atop Freedom Hall, the museum’s central atrium, identifies the Center from the campus and from the city. (Stern)

### **North Instructional Building and Library, Bronx Community College, City University of New**

#### **York, Bronx, NY – USA 2012**

Bronx Community College is blessed with an 1892 master plan by Stanford White for what was originally New York University’s University Heights campus atop a bluff above the Harlem River in the Bronx. The ambitious plan included the grand domed Gould Memorial Library (1900) and the arcing open colonnade of the Hall of Fame (1912) at the head of a quadrangle framed by more restrained classroom buildings, many of which remained unrealized. Marcel Breuer created a second master plan for the campus in 1956 and completed a number of buildings on the campus in the 1960s. In 2006 we completed a new space plan for the campus, proposing a combination of historic preservation, adaptive reuse, and new construction.

The first building within the 2006 master plan, our 98,600-square-foot North Hall and Library, provides state-of-the-art classrooms and a new double-height library in a three-story structure that completes the north side of the College’s main quadrangle. The south facade facing the quad is an elegant foil both to the exuberance of Gould Memorial Library and to the severity of Breuer’s Meister Hall across the lawn. A recessed porch marks the entry while allowing the rhythm of pilasters to continue uninterrupted across the facade. A wing conceived as an annex responds to the lower scale of Havemeyer Hall across the quadrangle. Buff Roman brick and light gray cast-stone trim carries forward the palette of White’s buildings. A granite rubble base at the lower level of the north facade expresses the change in grade as the site falls away toward the river.

On the ground floor, classrooms are organized along an east-west corridor that extends the axis of the Hall of Fame. A monumental stair climbs to the library above and captures spectacular views to Upper Manhattan across the river. The library features a double row of barrel vaults supported by slender columns inspired by Henri Labrouste’s St. Genevieve Library in Paris. Faculty offices and a special law collection library are accommodated in the upper levels of the annex.

North Hall and Library will be a sustainable building: the project is on track for LEED™ Silver certification.

RAMSA Partner Graham S. Wyatt served as Project Partner. RAMSA Partner Augusta Barone served as Project Partner. RAMSA Partner Alexander Lamis served as Project Partner. (Stern)

### **Calabasas Civic Center, Calabasas, CA – USA 2008**

The Calabasas Civic Center gives the City of Calabasas its first opportunity to express in architectural terms the civic ideals of community and environmental stewardship. Calabasas, located in the northwest corner of Los Angeles County, was incorporated in 1992, and city offices and the library have been located in rented space for the past decade. The new Civic Center is situated on a gently sloping site, near arid hills that are a gateway to the Santa Monica Mountains. The arcaded library and city hall are contemporary interpretations of the Mediterranean style architecture prevalent in Southern California, and are sited informally to create a variety of outdoor spaces, including a grove of olive trees, a civic plaza, and an amphitheater, that together will form the public heart of Calabasas. The City Hall contains a two-story Council Chamber, seating 125, which is the focal point for city activities. It combines traditional wood paneling, beams, and decorative lighting with up-to-date audiovisual and communications systems. The City Hall also includes a public counter for day-to-day interaction with local government, as well as offices for elected officials, the city manager, department heads, and workplaces for city staff, all infused with natural light and a close connection to the outdoors. The Library has a tall central hall, with clerestory windows illuminating the center of the large one-story space. Together with traditional library functions, the library contains an acoustically refined 200-seat multipurpose meeting room, which will serve as a venue for spoken word as well as small-scale musical events. Underground parking will accommodate 230 cars. The City of Calabasas is committed in the city charter to a high level of stewardship of its attractive natural environment, and the Civic Center is designed to achieve Gold LEED™ certification from the U.S. Green Building Council. Environmentally sound design strategies include the use of local and recycled materials, drought-tolerant landscaping, natural daylighting, and low energy lighting and environmental control systems. (Stern)

### **Lakewood Public Library, Lakewood, OH – USA 2008**

The renovation of the 53,000-square-foot Lakewood Public Library (Edward L. Tilton, 1916) and a 40,000-square-foot addition created a well-organized state-of-the-art library that is a great public place, with rooms both grand and intimate, a destination that attracts Lakewood’s vibrant community in all its diversity to return again and again for education and inspiration. Our design continues Lakewood’s rich tradition of civic buildings in the Classical architectural language. The addition is located to the east of the existing building; a monumental entry porch provides a civic scale that the current library lacks and enlivens Detroit Avenue. From the entry porch, and also from the second entrance from the parking lot, patrons move to a two-story skylit lobby at the building’s center. This central lobby serves as an orientation point and opens to the circulation desk, the popular materials room, and the children’s department, which offers storytime, computer, and homework rooms along with a double-height arts and crafts room. At the end of a main hall are elevators and a grand stair with another skylight to bring natural light down to the main level. Upstairs are reading rooms, the general collection stacks and the technology center, along with a large audiovisual department to accommodate the library’s fast-growing collection of videos, CDs, and DVDs. The paneled Grand Reading Room, located just above the main entrance, is elegantly scaled – 50 feet long by 30 feet wide, and 30 feet high – and furnished with wood tables and carrels. Alcoves north and south offer lounge chairs for casual reading. Hidden skylights will filter natural light throughout the room. An intimate Quiet Reading Room is located to the south, away from the bustle of Detroit Avenue. The original building’s mechanical

and electrical systems have been completely replaced with modern energy-efficient systems. The parking lot has been expanded and the landscaping around the new building blends with the handsome existing garden. (Stern)

### **[Baker Library / Bloomberg Center, Harvard Business School, Boston, MA – USA 2005](#)**

Baker Library was designed by McKim, Mead & White and completed in 1927 as the centerpiece of the Harvard Business School campus. Our renovation and addition reconceives the building as a 160,000-gross-square-foot center for research and group study, with greatly expanded meeting facilities, faculty offices and their support services, and archival storage for the Library's one of a kind collection of historical business materials. Central to the reorganization is a second front entrance at what was originally the back of the building to address the reorientation of the campus to the south, making the building an easily accessible crossroads of the HBS campus. Our design provides for pedestrian movement through the building from north to south through the original portico and lobby, and secondary circulation from west to east, all on the first floor. The exterior facades and important interior rooms of the original building are restored and the original self supporting stacks replaced with faculty offices, seminar rooms, and lounges. A skylit atrium brings natural light deep into the building and provides an informal meeting place for students and faculty. The Baker Library | Bloomberg Center is our second project at the Harvard Business School, following on the completion of the Spangler Campus Center in early 2001. (Stern)

### **[Columbus Public Library, Columbus, GA – USA 2005](#)**

The new Main Library in Columbus, Georgia, merges 21st-century library technology with traditional library services to create an institution that will serve the needs of the Columbus community for many years to come. Located on a central 42-acre site formerly occupied by the abandoned Columbus Square Mall, the library and the park surrounding it provides the community with an important cultural amenity in a landscaped setting. The three-story library rises to a lantern that has become a beacon for Columbus, visible from I-185 and from surrounding neighborhoods. The library's dignified architectural character respects the red-brick Classicism of Georgia in a contemporary way. Sloping roofs give it a welcoming appearance, and a large gentle curve on the southwest of the otherwise rectilinear building captures panoramic views while echoing the circular lantern above. High-quality materials are used both inside and out to create a lasting and appropriate new civic building for Columbus. The brick and limestone front facade of the building faces north towards Macon Road with a two-story-high covered porch at the main entry. Ample parking for 339 cars is provided in front of the library building, with a convenient drop-off area and book drop. Inside the main entry there is an active lobby space with direct access to the popular materials section, the children's library, and the conference center; and, overhead, an oculus to the rotunda space beneath the sixty-foot-diameter lantern above. Just inside the entrance, readers have access to the popular materials section, an informal browsing area modeled on successful large bookstores and featuring best-sellers, books-on-tape, CD and video rentals, as well as a coffee shop serving light refreshments. Also on the first floor is a section devoted to teen readers and the children's library, arranged in distinct sections for children of different ages, from picture book collections for preschoolers to homework areas for older children. A separate dedicated room is provided for children's story hour and arts and crafts activities. In good weather the children are able to enjoy a secure and supervised outdoor garden for casual reading and storytelling hours. Many libraries now provide full conference facilities, and the new Columbus Library is no exception. On the east side of the first floor, the conference center includes a 124-seat auditorium, a 2,700-square-foot multipurpose meeting room, and small conference and training rooms. The conference center has state-of-the-art technology including teleconferencing capabilities that allow for hook-ups to Muscogee County schools, Columbus State University, and other, more remote locations. The conference center has its own dedicated entry, so that it can be used even when the library is closed. Also on the first floor are work spaces for library staff and a service yard that can accommodate the substantial materials delivery needs of a modern library.

A broad, grand stairway directly off the lobby rises to a circular gallery space on the second level where the work of local artists and photographers can be displayed. Alternatively, library patrons may ascend in one of three elevators. The main collection of the library, both fiction and non-fiction, is located on the second floor, laid out in one continuous sequence for ease of retrieval. Patron seating areas face the large north and east windows that run along the front of the building. Quiet study and group study rooms are also provided. Computers for internet access, which play an important role in the new library, are grouped together in "e-commons" adjacent to the reference desk so that the reference librarian can assist in searches and other patron queries. A significant architectural feature on the second floor is the arced double-height grand reading room, a 50 foot by 100 foot room in the tradition of great American public libraries. There is significant opportunity in this space for artistic enhancements both now and in the future. The grand reading room opens onto to an outdoor balcony for social events. The third floor of the library contains public conference rooms, services for library patrons with special physical needs next to the elevators, and offices for library administration, all accessible from the central rotunda. (Stern)

### **[Jacksonville Public Library, Jacksonville, FL – USA 2005](#)**

300.000 sqf., € 101.700

A public library is the most democratic of our institutions: it has the capacity to draw in the young and old, from every ethnicity and background. A great library must be much more than a depository for books or a facility for information exchange: it must be a great collective civic place. Our aspiration for the Jacksonville Main Library is to build a highly efficient, state-of-the-art facility that is also a great public place, with intimate and grand rooms, garden courtyards, conference areas, cafes, and the like, designed to attract the community in all its diversity and, by virtue of its exterior forms and interior spaces, to become a destination without peer in the city, a place to which people will return again and again for education, inspiration, and the pleasure of a beautiful environment. Our design for the Jacksonville Main Library continues the city's rich tradition of civic buildings which speak in a version of the classical language adapted to the particulars of local climate and culture. Seen from Hemming Plaza and from Main Street, it presents a distinctive, iconic civic appearance that renders the Library readily identifiable as a welcoming and ennobling public place. Facing Hemming Plaza, a generously-proportioned main entrance leads past a Cafe and Popular Library, each with large windows facing the street, to the Entry Hall and circulation desk, where a monumental stair begins its rise through the building, connecting the various departments. The stair culminates at the Grand Reading Room, a place of civic proportions, 100 feet square and rising 46 feet to a handkerchief-vaulted ceiling, bathed in natural light from clerestory windows, with balconied windows overlooking Hemming Plaza. At the second floor, a courtyard provides a fountained and planted oasis shared by readers and staff, around which are grouped the intimate reading areas of the various departments, many of which open onto it directly. (Stern)

### **[Miami Beach Library and Collins Park Cultural Center, Miami Beach, FL – USA 2004](#)**

In designing the new Miami Beach Library we have carried out our commitment to place and tradition with a building that recalls and reinforces the stylish yet relaxed modernism of Miami Beach's architecture, capturing not only its clear shapes that work so well in the intense sunshine but also the garden-like sense of oasis of shaded courtyards that provide a welcome refuge from busy streets and cloudless skies. The creation of a new cultural arts campus surrounding Collins Park offers the opportunity to redefine and reinvent this strategically located park as a town square for Miami Beach, which currently has no commensurate civic gathering place or community green. This plan, re-establishing the historic connection of Collins Park and the Bass Museum with the Atlantic Ocean, draws additional strength from the location at its periphery of the new Library and the new home for the Miami City Ballet, which together will attract a large and diverse population. While the Collins Park Cultural Center improvements and Library design alike build upon the past, they look forward to a vital future. They are each in their way open stages for the public — for special celebrations, festivals, and concerts that can be held in the park; for lectures, readings, and story hours in the Library.

Moreover, the art park and the Library are the front yard and the living room for the City — places where residents and visitors can gather to give and share the special pleasure of the place and its culture. (Stern)

#### **Clearwater Public Library, Clearwater, FL – USA 2004**

The Clearwater Public Library had a special responsibility to become a locally recognizable landmark, a source of civic pride, and a community-wide learning resource. It also represents an anchor in the redevelopment of downtown Clearwater. The design takes full advantage of the unique site, on a bluff overlooking Coachman Park and Clearwater Harbor, to create a building that looks optimistically to the future while respecting the building traditions of Clearwater and the region. The principal street facade, along North Osceola Avenue, presents an urbane and dignified civic building, using traditional local materials like cream-colored local stone and stucco, bracketed projecting roofs, and a civic-scaled, deeply shaded entry porch. The garden facade, which opens onto Coachman Park and the waterfront, has large windows to capitalize on the magnificent views, and a broad canopy to screen out excessive sunlight. A terrace with a trellis and plantings is at the top of the building for civic social events. The gently undulating roof creates a memorable profile for the building appropriate to its location near the Gulf of Mexico. The interior of the 90,000-square-foot building provides for greatly expanded and enhanced services: a children's library nearly four times the size of the one in the existing building; state-of-the-art audiovisual and conference room facilities; greatly expanded internet and other computer services, to augment the enhanced collections of paper materials; and a specially-designed Clearwater Room, which will showcase a city-wide resource for local history and genealogy. The new building offers a much more efficient and user-friendly layout, replacing the confusion of the previous library, which was made up of four separate buildings and additions that have been cobbled together over a period of 90 years. Great care was taken to use durable materials to create a library that is efficient to maintain and to operate. Controlled natural daylighting supplements and reduces artificial lighting requirements, and rainwater is captured and reused for irrigation, reducing overall water use. Building materials were selected for their appropriateness to local conditions and sustainability, as well as their beauty and utility (Stern)

#### **Morningside Heights Branch, New York Public Library, New York, NY - USA 2001**

Located at the northeast corner of 113th Street and Broadway, on the edge of Columbia's historic McKim, Mead & White campus, the 14-story, 371-bed undergraduate Broadway Residence Hall largely faces away from the campus to engage the Morningside Heights neighborhood to the south and west. The building is clad in cast-stone-trimmed tawny-colored brick selected after extensive discussions with both the University and members of the surrounding community, which preferred a design in the spirit of the residential apartment buildings which line Broadway to one that matched the red brick and limestone of the Columbia campus. The two lower floors of the building are largely devoted to retail and to the 17,000 square foot Morningside Heights branch of the New York Public Library. The interior of the library was inspired by the restrained Classicism of early 20th century Carnegie branches, with paneled columns and ceiling beams, decorative metal railings, built-in wood bookshelves, and a slate floor in the entrance lobby. RAMSA Partner Alexander Lamis served as Project Partner. (Stern)

#### **Manzanita Hall, College of Arts, Media, and Communication, California State University, Northridge, CA – USA 2001**

Manzanita Hall on the California State University campus at Northridge houses the College of Arts, Media and Communication, including departmental and faculty offices, classrooms, television studios, and editing suites for three departments: Journalism; Communication Studies; and Radio, Television, and Film. It also contains two galleries, a 120-seat screening room, and a 120-seat lecture hall. Part of a larger effort to rebuild the California State University campus after the 1997 Northridge earthquake, the AMC Building addresses the structural and technical demands of a state of the art teaching facility and complements the modern traditions of the 43-year-old Northridge campus with a 98,000 square foot building that defines the southwest corner of Sierra Quad. Facing the quad, the building's galleries look to the north through a two storey high glass and metal curtain wall raised on a single story buff colored brick base and capped with an upward curving metal roof carried by a double-height colonnade of tripartite metal column bundles, echoing the design and the scale of the Oviatt Library, toward which it opens across Sierra Quad. At the northeast corner of the building, the last bay of the colonnade is open to shelter a triple-height roofed entrance plaza, bounded to the south by a smooth-finished concrete wall which encloses the screening room. Inside the north wing, in addition to the galleries, screening room, and lecture hall, there are nine multimedia classrooms and offices for the student newspaper, The Sundial. On the second floor, behind the double-height gallery and lounge overlooking views of Oviatt and Sierra Quad, are seminar rooms and specialized spaces for the Journalism and Communication Studies departments. Faculty offices and computer labs are located on the third floor. Stretching to the west and south behind the glass and brick facade, the majority of the building is a stucco-clad L-shaped mass, the wings of which form two sides of a landscaped green. The south wing houses the Radio, Television and Film department offices, television and film studios, editing suites, and computer labs. The main hallway of the south wing runs along its east edge, with views to the green. Bounded to the north and west by the AMC building, the outer edges of courtyard green are marked by allees of eucalyptus trees, creating a grassy plaza that will serve as a focal point for the School of Arts, Media, and Communication. (Stern)

#### **Nashville Public Library, Nashville, TN – USA 2001**

83,000,000 \$

ENashville is "Music City USA"; it is also, and has been for much longer, the "Athens of the South," with a strong, distinct classical tradition that permeates its architecture, from William Strickland's Tennessee State Capitol to modest houses. Our library design, which won a national design competition, recognizes that tradition, not only in its exterior massing and formal language, but in the clear, axial organization of its most symbolically significant public areas – the Main Entry Lobby; the Nashville Room, housing the local history collection; the Gallery; the Grand Reading Room; the skylit Grand Stair; and the Courtyard – all of which are located on the axis of the Capitol, helping to strengthen the dangerously frayed fabric of the civic center complex as a whole. The library is fitted into a steeply sloping site, with portions of the upper two floors built atop an existing parking structure. The building is complex but designed to make way-finding intuitive. The main spaces are uniquely suited for social interaction, from the grand figural spaces of reading and circulation to the quiet eddies of informal seating that are distributed throughout the open stack areas, especially around the courtyard. Our building is both functional and grand; it is definitely not a shopping mall for books. The three story height along Church Street was derived from a practical desire to retain the existing parking structure and take advantage of its structural capacity to locate above it two large floors that look outwards to the surrounding townscape and inwards to a landscaped courtyard, which, with its central fountain, pool, and covered arcade, will provide an oasis and a setting for special readings and events. As the Library is the flagship of a public library system which serves the diverse Nashville population, the project involved an extraordinary amount of community input. The most visible benefit of this involvement is the Public Art Program, which brought in local graphic artists, authors, photographers, painters, sculptors, and metalworkers to enrich the building with artwork. The building also incorporates the work of nationally known artists including Richard Haas and Kent Bloomer. (Stern)

#### **Bangor Public Library, Bangor, ME – USA 1998**

This project includes a 27,000 square foot addition to and 40,000 square foot renovation of the 500,000 volume Bangor Public Library, a brick and stone neoclassical building by the architectural firm of Peabody and Stearns and completed in 1913. The building is set in a downtown public park adjacent to City Hall and the main shopping district. The addition nearly doubles the

available stack space for the library as well as creating for the first time open stacks for public use. Enlarged and technologically upgraded reading rooms, a new children's library, and a community room are included. Outmoded mechanical and electrical systems were replaced, and a new garden entry allows for access at grade by disabled persons. The project includes repair and replacement of exterior cast stone, brick repointing, replacement in kind of historical windows, and rebuilding the sweeping granite steps to the existing library. Our design respects the primacy of the Peabody and Stearns building by setting the addition back from Harlow Street, and carrying forward the classical detailing of the original building. (Stern)

#### [East Hampton Library, East Hampton, NY - USA 1997](#)

During the course of this century the East Hampton Library has grown in a gradual and thoughtful way to accommodate a growing community and expanding collections. Since 1992, we have been engaged by the Library to design two additions. The first, completed in 1997, accommodated expansion of the Long Island Collection and archives, new staff areas, and an expansion of the adult fiction collection. Currently under construction is a new wing that will accommodate an expanded children's collection.

The 1997 addition created a courtyard for the west building by adding two new intersecting wings. This courtyard scheme makes circulation within the library continuous and creates a quiet and charming outdoor space in which to read or view from the indoor reading areas. Similarly, the new Children's wing will create a smaller courtyard for the east building.

Both the 1997 addition and the current project allow for the reorganization of the collection in the existing building. This reorganization restored comfortable reading and work areas to the library, created distinct and recognizable areas for each collection, and provided clear, accessible circulation throughout.

The exterior architecture of the additions respects the vocabulary established by Aymar Embury II in the original 1910 structure. The design of both the west and east wings create a second front for the building facing the greensward to the west. The facade facing the historic Main Street was restored. (Stern)

The Library moved to its present location at the corner of Main Street and Buell Lane in 1912, on land donated by Mary Lorenzo Woodhouse. The architect Aymar Embury (\*June 15, 1880 New York, NY - + November 15, 1966 Southampton, Long Island, NY) designed the building, which was also donated by the Woodhouses. The Library was designed in a neo-Elizabethan style since many residents of that time wanted East Hampton architecture to conform to that of a pre-seventeenth century Kentish village, similar in looks to the one the original settlers had left behind. (<http://www.easthamptonlibrary.org/about/history.html>)

#### [Brooklyn Law School, Brooklyn, NY – USA 1994](#)

The new campanile-like tower provides the ninety-year-old school with expanded facilities and an image more appropriate to its long history and growing reputation. Located directly across from the recently renovated Brooklyn Borough Hall (Gamaliel King, 1846-1851), our design visually establishes the law school as a component in the borough's traditional civic center which also includes on an adjacent site, the Municipal Building (McKenzie, Voorhees & Gmelin, 1926), from which we have taken many cues in designing the law school's tower. The first nine floors of the new tower are connected to those of the existing building. They provide upgraded and expanded student and faculty facilities including lecture and seminar rooms, libraries, and a cafeteria. A formal dining room is located on the tenth floor and there is a faculty library on the eleventh. In addition to the 85,000-square-feet of new space, the project includes the renovation of 65,000-square-feet in the existing building, including the redesign of classrooms and the moot court.

(Stern)

#### [Ohrstrom Library, St. Paul's School, Concord, NH – USA 1991](#)

In 1985-86, Robert A.M. Stern Architects studied ways to add on to the St. Paul's School's existing Sheldon Library, designed for the school by Ernest Flagg in 1901. The proposal for the addition would have expanded Sheldon to twice its original size while maintaining its inherent spatial and formal qualities. When the school's trustees subsequently decided to build a new library, a prominent site at the center of the village-like campus was selected. This design for the Ohrstrom Library forms the boundary wall for two quadrangles: to the south it joins a residential group to create an intimate courtyard; to the north it is the edge of a larger space that is both the symbolic and the actual center of the campus, serving as a counterpoint across time and space to the school's original chapel (1859) and Henry Vaughan's masterly essay in the Gothic, the Chapel of St. Peter and St. Paul (1888). While H. H. Richardson's Crane Library, Quincy, Massachusetts (1880-82), inspired the plan and the handling of the red brick and Briar Hill stone used for the exterior, the synthesis between traditional form and modern abstraction in the library C. R. Mackintosh designed for the Glasgow School of Art (1907-09) was also an influence. This is apparent in the tall oriel windows, the abstraction of detail, and the mediation between the small scale of the residential buildings and the buttressed structure of the Chapel of St. Peter and St. Paul. On the inside, the principal point of reference was James Gamble Rogers' School House (1937), until Ohrstrom the last building in St. Paul's chain of Gothic-inspired buildings. Ohrstrom Library incorporates the most up-to-date computerized information retrieval technology into traditional reading rooms and more intimately scaled niches that provide a variety of places for quiet individual or group study within easy reach of the bookstacks. The nave-like plan is entered at the crossing that separates the stacks from the specialized reading rooms, the primary one being a two-storey-high vaulted room that opens to a view of Lower School Pond. (Stern)

<http://www.straughntrout.com>

**Libraries:**

[Sarah D. & L. Kirk McKay Archives Center Library, Southern College, Lakeland, FL – USA 2009](#)

(side by side with Thad Buckner Building originally E(dwin) T(imanus) Roux Library: Nils Schweizer/Frank Lloyd Wright 1945/1968)

**Program & Purpose:**

Originally intended as an expansion to Nils Schweizer's Roux Library (Schweizer was Wright's student and campus architect for the 25 years following Wright's death), the Archives Center materializes the enduring collaboration between the Florida Southern

College and the Florida Methodist Conference. This project signifies in a tangible way the bond between the two organizations and will allow the rich history of both to be preserved and shared for future generations. The new two-story facility houses the College's Frank Lloyd Wright documents, drawings, photographs, and other memorabilia from Wright's time at the College. Other collections that are tied closely with the history of the two groups will also find a home here, as well as Florida Southern College's Center for Florida History and the Florida Citrus Archives. The facility provides state-of-the-art archival space for invaluable College & Conference materials making them available to students and patrons through research and exhibits.

#### Historical Context:

The McKay Archives Center is the first new building on the Frank Lloyd Wright-designed, west portion of the historic Florida Southern campus in twenty-five years. In a location originally designated by Wright as a dense grove of citrus trees, the new facility's form takes inspiration from the natural topography and influence from the immediate architectural context, including several Frank Lloyd Wright-designed structures. One of the campus's most distinguishing characteristics is the 1.5 miles of covered walkways, or esplanades. The esplanades, abstracted from the campus site's original citrus groves, operate as a network of spines connecting the academic nodes of each unique campus structure.

#### Orientation & Form:

The owner initially proposed that the Center be built as an addition or "wing" to the existing library. By designing the Center as a stand-alone structure, a courtyard was developed between the two buildings. Flanked on the east by the library and the west by the Center, the existing library stair towers stand guard on the north and south ends of the courtyard enclosing this valuable outdoor public space. The cast-in-place concrete details that characterize the adjacent library were abstracted and integrated into the north and west elevations of the project. This was imperative to the owner in efforts to portray the programmatic relationship.

As an extension of the constructed landscape, the project continues the intrinsic trajectories of pedestrian circulation and trademark diagonal vistas across the historic campus. The building's curved form preserves such a vista from one of the College's primary entrances to several Wright structures, including the recently restored Water Dome and trademark Annie Pfeiffer Chapel. This view is also framed for occupants of the interior by the south glass façade from the first floor classroom as well as the primary reading, research and exhibit space on the second floor. The ten-foot overhangs reflect those of Wright and Schweizer, fitting appropriately into a campus covered in esplanades and shade-making architecture.

#### Module & Materiality

Materiality is paramount to the success of the project's design. Exterior finishes weave this new building into the existing campus fabric while the glass curtain walls and aluminum sun shades reveal the contemporary nature of the interior. Two forty-foot high, cast-in-place concrete walls delaminate the layers of the southwest façade and operate as passive cooling devices shielding the afternoon sun. These somewhat brutalist concrete "shields", free of ornament, stand juxtaposed with the scale and detail of Wright's administration buildings. The façade behind the curved concrete walls echoes the material parti of the Wright buildings throughout the campus: textile block at the ground floor and cement stucco above. The ground floor rustication for this new building was accomplished with textile block concrete panels precast by a local master mason and based on Wright's original molds, borrowed from the College's collections. The panels will avoid the failures of the original student-cast coquina stone, sand and cement masonry units that are deteriorating due to water ingress that corroded the interior reinforcing bars. This "textile-like" pattern on the panels connects the building's module and material texture to the nearby Wright structures. The campus module established by Wright was derived from the spacing of the original citrus grove that flourished on the site until the 1950's.

## **StruXture Architects, Waterloo, Iowa - USA**

<http://www.strustructure.com>

### **Libraries:**

**Conrad Public Library, Conrad, IA – USA 2008**

#### **Awards:**

Community design Excellence Award 2009

**Cedar Falls Public Library, Cedar Falls, IA – USA 2004**

The Cedar Falls Public Library is housed in the Adele Whitenach Davis building located at 524 Main Street. The 47,000 square foot (4,400 m<sup>2</sup>) structure, designed by StruXture Architects, replaced the Carnegie-Dayton building in early 2004.

**Hawkeye Community College, Library, Waterloo, IA - USA 1999**

26,000 sqf., \$ 3,037,000

Originally founded as a technical institute, recently Hawkeye Community College has shifted its focus and added a liberal-arts program that designates it as a community college. With an expanded knowledge base and the school's growth, the library quickly outgrew its space. The library needed not only more space, but also an image of its own. The architect, working a site committee from the campus, chose to place the library adjacent to the circular student center, a campus icon. Creating a library with its own distinct image and locating it next to the campus signature building presented the designers a challenge that led to many of the design's features. In juxtaposition to the circular glass student service building, the new library uses gently curved precast concrete walls that echo and reflect the neighboring form. The use of large glass expanses to the south and north on the library not only creates a lively interior, but also pays respect to the adjacent materials. The building's interior creates its own unique challenges. The college also wanted the library to house classrooms and faculty offices. Adding those spaces while meeting the library's security needs gave rise to the building's layout. The facility also was built for the eventual expansion of the library into all portions of the building. ( <http://schooldesign.com> )

## **Studio Ma – Phoenix, AZ – USA**

<http://www.studioma.com>

### **Libraries:**

**Yuma Heritage Library, Yuma, AZ – USA 2008**

21,000 sqf., \$ 3,500,000

#### **Awards:**

Yuma Heritage Library is the recipient of a 2010 AIA Honor Award.

Originally the Main Library, a Carnegie town library and square that underwent a major addition in the 1960's, the goal of the project was to restore its once prominent standing as a social destination and focal point for all ages in downtown Yuma. The renovation provides 21,000sf of new library space including a large, central reading room with flanking meeting rooms of specifically

programmed areas for Children, Teens and Elders, a cafe and retail space for the Friends of Yuma Library. Studio Ma created a daylighting strategy that transformed the scale and quality of the interior and exterior of the library by adding four double height light 'monitors'.

The design of this state of the art facility reflects the community's desire for a contemporary library that acknowledges its historic standing in Yuma. Local points of pride such as the Colorado River, the Gila Trail and the local tale, 'Roxaboxen' are woven into the project through physical and representational references providing a lens through which to understand the changing nature of the community. Yuma Crossing, the legacy of the Colorado River and the Santa Fe Trail in the history of Yuma inspired the plan of the library, organized along this 'crossing' in quadrants with curvilinear screen walls made of coiled metal fabric designating the Teen's area and the Children's area. Studio Ma drew inspiration from 'Roxaboxen' by author Alice McLerran, a native of Yuma, Arizona, in the selection of furnishings, manipulatives, interactive lighting and a magnetic screen wall - all elements to foster interactive place making. (Studio Ma)

## **Studio Meng Strazzara, Seattle, WA – USA**

<http://www.studioms.com>

**Daniel J. Evans Library, The Evergreen State College, Olympia, WA – USA Phase I 2007, Phase II 2009**  
330,000 sqf. total for Phase I and II, Project Cost: Ph I \$ 14,000,000, Ph II \$ 15,000,000

The Phase I modernization began with a complete renovation of the north end of this main campus building. The entire existing TESC library was gutted to its concrete structure and the new remodeled Library constructed within 3 different floors of the existing 1970's building. Phase II completely reworked all of the major divisions in the existing structure. These office areas include the President's Office and Boardroom, College Advancement, College Relations, Business Offices, Enrollment Services, and many other administrative areas. One exciting new feature is a 3-story, glass-walled exterior stairway, which replaces the functionally obsolete existing lobby stairway at the building's main entry. It visually connects the three main student access floor lobbies and makes the main building lobby much more functional for gatherings and events. (Studio Meng)

## **Studios architecture, Los Angeles, Beverly Hills, CA – USA**

<http://www.studiosarchitecture.com>

**Libraries:**

**Santa Teresa Branch Library, San José, CA – USA 2010**

21,000 sqf

The new Santa Teresa Branch Library features high ceilings and abundant daylighting with large window walls and skylights. The materials palette includes cork flooring, curved metal ceilings, and exposed structural elements such as steel columns and beams. A marble wall and a two-story sculptural glass tower mark the main entryway. The outdoor public area along the east side of the building features an exposed steel overhang as well as art installations, planters, and views into the library. This building integrates many sustainable design measures, and anticipates LEED certification. The design of the new building incorporates a high level of transparency, with library operations visible to both vehicular and pedestrian traffic. The interior spaces of the library draw from retail merchandising display principles and employ residential scaled components to create a comfortable and welcoming community destination. (Studios)

**University of Cincinnati Care/ Crawley Building (Library), Cincinnati, OH – USA 2008**

SIZE: 1,100,000 sqf.

The University of Cincinnati - known for its use of signature architects - selected STUDIOS to design the renovation and expansion of its health sciences complex. The project creates a one building campus for the Schools of Medicine, Pharmacy and Nursing, as well as a Student Commons for use by the general university population. STUDIOS designed a 246,000 square-foot, multi-story addition, providing the interaction space lacking from the original 900,000 square-foot 1970s concrete high-rise structure. The addition is connected to the existing building through a full height atrium, enveloping the exterior open space to create a large, urban room that encourages socialization and collegiality. (Studios)

**Evergreen Branch Library, San José, CA – USA 2006**

21,000 sf

The City of San Jose selected STUDIOS to design the Evergreen Library, part of a public bond-funded group of city branch libraries. The architecture of the new onestory library -- which is sited adjacent to a public park amid a largely residential area -- conveys a distinct civic presence without disrupting the scale of neighboring structures. A pronounced canopy supported by a large concrete column marks the building's entryway. STUDIOS' concept for the interior spaces draws from retail merchandising display principles and residential design paradigms. The latest releases in technology and literature are showcased in the library's foyer. A warm, welcoming reading lounge -- the "Living Room" -- features two fireplaces and looks out onto a small sculpture garden. Wood-slat ceilings bring warmth to the space. Clerestory windows provide diffused natural light and help articulate the library as an approachable community destination rather than a traditional "book fortress." (Studios)

## **Studiotope Design Collective, Denver, CO – USA**

<http://studiotope.com>

sDC was commissioned to create a program document establishing design guidelines for DPL branch libraries tailored to current and future trends in contemporary service. After half a dozen focus groups, researching relevant theories in other disciplines, and data collection from numerous case studies as widespread as facilities outside the United States, sDC identified the guiding principles and building DNA of a theoretically new type of library. An entire culture is emerging surrounding contemporary public libraries and the customers they attract. This culture is rooted in diversity and creativity. The contemporary customer wants immediate gratification, social interaction, and an environment where they can touch and try new things. There currently exists a great opportunity to attract and satisfy the demanding needs of this person, and subsequently turn them into a library customer. The Contemporary Service Style library has before it this great challenge, a challenge that can be satisfied with the right mix of materials, programs, and services. A mix that will be in constant flux and must always be responsive to the contemporary culture it exists within.

**Libraries:**

**West Denver Branch Library, Denver, CO – USA 2014**

The west side of Denver is culturally diverse and known for its large immigrant population. After several community meetings an architectural concept was generated; Library as Greenhouse — an incubator for growth.

In addition to vibrancy and strength, this library must exhibit and celebrate the community it exists within. As such the building will embrace its urban setting by establishing highly active zones along the historic Colfax Avenue thoroughfare, while simultaneously creating private and secure gathering areas for those who explore deeper into the branch.

One of the primary goals of the project is to set a new standard in sustainability. The “Greenhouse” concept led to the establishment of a three-story plenum WALL that behaves like a light, water, and air filter for the building and its occupants. The WALL, in combination with a raised floor system, will safeguard water, facilitate a passive displacement ventilation system, invite and filter natural daylight into the library, and showcase the building’s automated systems.

In response to the local cultures and as a complement to the gritty urban setting, the building will feature an interior courtyard on the second floor to invite daylight into the middle of the building and provide a respite from the city. (Studiotope)

#### **[Colorado State University, William E. Morgan Library, Fort Collins, CO – USA 2012](#)**

Centrally located on campus the Morgan Library has the opportunity to be a study beacon, inducing activity and heavy use, attracting and expanding the interests of both individual scholarly pursuit and shared knowledge via group study. The existing entry sequence was intimidating and difficult to navigate, discouraging many students and faculty from using or even entering the facility. The new addition respects its location at the center of campus and imbues a revived presence, an approachable entry, and an indoor/outdoor connection. The architecture showcases sustainability and efficiency, order and simplicity. The primary use adjacent to the entry is iconic and representative of the new academic paradigm, that of serendipitous knowledge. Coined the "Energy Chamber," this primary space is an aesthetically impressive, iconic study venue that gives students and faculty a strong sense of connectivity to each other and to the CSU campus. (Studiotope)

#### **[Ross-Cherry Library, Denver, CO – USA 2012](#)**

Ross-Cherry Creek Library is one of six Denver Public Library branches designated as a Contemporary Service Style. After completing the program for this service style, sDC was commissioned to implement the new design guidelines and reinvent the interior of this branch.

Selective re-configuration has resulted in a rebirth of the interior spatial relationships, creating ultra-flexible open spaces. Furnishings and wayfinding have been integrated into the overall retrofit in a manner that lends to self-help and self-discovery. The vertical circulation components have been improved so customers can explore the entire facility without guidance.

A component of the program unique to the Contemporary Service Style is the ‘beehive’, a space that will beckon and intrigue customers to stay in touch with current trends and the latest information. Furnishings in and around the beehive cater to an intensified customer-staff interactivity, encouraging information seekers to mix with information providers. (Studiotope)

#### **[Spanish Peaks Library, Walsenburg, CO – USA 2010](#)**

studiotope Design Collective was commissioned to rehabilitate the abandoned Huerfano County High School, which was on the National Register of Historic Places, into the new Spanish Peaks Main Library. The newly formed District chose to take an aggressively innovative approach to expanding the building into a new type of community incubator; a Library and Learning Center combined. Studiotope was chosen first to study the feasibility of rehabilitating the abandoned relic and second to help define and create the multi-use community center. The rehabilitation of a property on the National Historic Registry required acute sensitivity towards the historic defining characteristics of the existing architectural features and context. The finished building is a direct response to these characteristics as it celebrates the unique qualities of the past century and showcases today’s technological advances.

Publications:

A Brilliant New Chapter (Studiotope)

#### **[Council Tree Library, Fort Collins, CO – USA 2009](#)**

Located in the recently developed Front Range Village in Fort Collins, the new 17,000 square foot Council Tree Library provides a progressive, modern interior coupled with services tailored to a new library experience. Taking advantage of its location in a mixed-use development, the new branch reinvents the traditional public library while simultaneously enhancing the adjacent shopping experience. This synergistic relationship between a public library and private sector commercialism is rarely as apparent as exists at the Council Tree branch. The cross-pollination between ‘Village’ shoppers and library patrons is palpable and makes a profound statement about the role of a public library in contemporary society. All of the signage and most of the furnishings were also designed by studiotope. This approach ensured a highly functional interior without sacrificing distinctiveness.

Publications:

New Colorado Library Second Nationwide To Gain LEED Platinum (Studiotope)

#### **[Bear Valley Library, Denver, CO – USA 2009](#)**

Bear Valley Library is one of six Denver Public Library branches designated as a Contemporary Service Style. After completing the program for this service style, studiotope was commissioned to implement the new design guidelines and reinvent the interior of this branch. Looking back to history of the site we found images of Native Americans living near a small creek where trees were clustered along the water. This led us to think about how important the tree was in this environment: shelter; tool making; security; warmth, etc. We also began to look at the tree as an abstract form to examining the pattern of their rings and color variations. Along with that we looked to incorporate water and how it reflects its surroundings and the journey of the bear in the valley. Furnishings and wayfinding have been integrated into the overall retrofit in a manner that lends to self-help and self-discovery. A component of the program unique to the Contemporary Service Style is the ‘beehive’, a space that beckons and intrigues customers to stay in touch with current trends and the latest information. Furnishings in the beehive cater to intensified customer/staff interactivity, encouraging information seekers to mix with information providers. (Studiotope)

### **[Swanke Hayden Connell Architects, New York, NY – USA](#)**

<http://www.shca.com>

**Libraries:**

**[Open University Library and Learning Resources Centre, Walton Hall, Milton Keynes – UK 2004](#)**  
68,900 sqf., \$ 19,332,000

In recent years, libraries have changed beyond recognition in response to the challenges of new technology. They are now the springboard for a wide variety of information sources. This was the driving force behind the design of the new library at the Open University, a world leader in distance learning. The new building creates 68,890 square feet for collections, areas, reader spaces and an interactive open learning center. The three-story library has two wings on either side of a central open space or atrium. This distinctive space provides lighting into the heart of the building and orientation for the students. The simple plan and building form create the best value for the client and provide maximum flexibility. The design reflects the dignity and quality associated with a significant academic building for an important national academic institution. The

structure incorporated exposed precast concrete on the exterior and interior. The result is a simple, yet attractive design that supports the low-energy approach. The design incorporates an efficient ratio of external wall to floor area, and the area of glazing was a direct product of thermal models.

The library has been planned using space standards and enhanced floor loadings to generate flexibility. The emphasis is on bright, open spaces that support a modern learning and research environment, but also provide for the future. It also incorporates an extensive artwork program. ( <http://schooldesigns.com> )

Library are no longer simply places to study the traditional written word. The open university stressed this important shift when it appointed SHCH to design a new library on its Milton Keynes campus. Utilising the latest technologies, the new Open University Library must host a wide variety of information resources. This new 6,503 sq m (70,000 sq ft) facility houses collections, staff offices, and an interactive open learning centre on three floors. SHCA applied the experience gleaned from its corporate projects to the tight program established by the University. A detailed appraisal of space standards for offices and collections achieved full flexibility and effective departmental relationships. The simple, dignified design integrates a low energy approach. Collections were located on the south side of the building and offices to the north to minimise the effects of solar gain. A highly efficient plant, together with metering and monitoring systems, enable impressive energy use targets to be met. Efficient lighting linked to occupancy sensors reduces electricity use while low-flow fittings restrict water consumption. ( <http://www.shca.com> )

## **SWBR Architects, Rochester, NY – Syracuse, NY – USA**

<http://www.swbr.com>

### **Libraries:**

#### **Spruce Street School, PS M 397, New York NY – USA 2009**

Spruce Street School opened in fall of 2009 with three kindergarten classes and a goal to serve East Tribeca's growing family community. In 2011 it moved to the new Beekman Tower building at 12 Spruce Street after being housed for two years on the ground floor of Tweed Courthouse, the Department of Education headquarters. At its permanent location, Spruce Street will expand to serve grades pre-k-8.

**Building and location:** The 76-story Beekman Tower, designed by Frank Gehry, features a five-story wing of tan brick that houses Spruce Street. The building features a large cafeteria, library, two-story auditorium, gym, art studios, and technology labs. It also houses rental apartments, the New York Downtown Hospital, and street-level stores. The fourth floor has a roof deck with 5,000 square feet of outdoor play space.

**School environment and culture:** Principal Nancy Harris, a former assistant principal at CASTLE Middle School, believes that learning is an "active process" and that schools are the pillars of strong communities. "Schools are shaped by their community, but the community also benefits from the school," she told us. As a new school with a small population, parent involvement at Spruce Street is strong. "Everyone's got the same mission," said one parent, "to build an excellent school for our children."

( <http://insideschool.org/elementary/browse/school/1623> )

#### **Oswego School District Public Library, Oswego, NY – USA 2008**

### **Awards:**

**2009 Build New York Award**

Founded by prominent abolitionist Gerritt Smith and originally constructed in 1855, the Oswego Public Library was the first in the nation to be open to all residents regardless of race. The library is one of the only known abolitionist-founded institutions to remain open to this day, and therefore is considered a historic landmark. It is on the National Register of Historic Places. In the late 1990s this status became jeopardized. The structure was becoming fragile due to age and the facility itself was just too small for the community. The options were few – move to a newer facility or try to revitalize what already existed. After much support from the community, it was decided that the existing structure should be renovated. LeChase Construction Services, LLC was tasked with removing the entire interior of the building, leaving only the four exterior clay brick walls, the 70-foot-tall tower structure and the front staircase standing, restoring the interior and adding an 11,700-square-foot addition. Since this was a historic building, there were many intricacies associated with dismantling and rebuilding the existing structure. Many constructability issues were not known until demolition work progressed. A major challenge for the LeChase team was the development of a support system to hold the exterior walls in place while the interior walls and roof were removed. Once the building was gutted, new structural steel frames were inserted, enabling the 150-year-old façade to remain in place while the interior of the building was renovated. When it came time to shore up the building, the LeChase team realized that the original shoring system would work on only three sides of the building. There was an adjacent building on one side, and the support posts would not work within the limited space available. The team quickly devised a plan to shore up that side of the building from the inside, while still allowing for the removal of the old interior structure and the build-out of the new interior. As LeChase's team began the arduous task of securing the inner four layers of bricks together with masonry screws, it was discovered that the bricks were no longer lined up and uniform, but rather had shifted over time. Major gaps needed to be filled with concrete mortar in order for the walls to be solid and secure. The original tin ceiling was reinstalled in its original state once the renovations were completed. LeChase did a complete video survey of the ceiling, cataloguing each individual piece of the ceiling to facilitate its precise and accurate reconstruction. Other challenges to the LeChase team were the restoration and historic re-creation of the building's windows, and significant structural and cosmetic repairs to the exterior brick and stone base. The original entrance foyer with its curved, wood-railed staircases remained structurally sound but underwent a complete architectural restoration. The Oswego School District Public Library reopened to the public in late October 2008, complete with additional space for library programs, a children's room and staff offices, state-of-the-art technology and high-speed internet access. LeChase Construction and its team met the challenges of this complex project with teamwork and a can-do attitude. ( <http://www.gbcnys.agc.org> )

#### **Roberts Wesleyan College, Robert B. Golisano Library, Rochester, NY – USA 2007**

### **Awards:**

**Rochester Chapter AIA, Citation of Merit Award**

**2008 American School & University Educational Interiors Showcase - Outstanding Design**

**Illuminating Engineering Society of North America Lighting Design Award**

Situated on a highly visible and prominent corner of the campus, the proposed Golisano Library will offer to Roberts Wesleyan College a symbol of higher learning and an image to build upon. The site, located between Minor Hall and the Quad Residence Halls, is highly visible from both the campus green to the South, and the Administrative "Front Door" of Rinker Hall to the East. The added verticality of a tower element to the library enhances the image of the entire campus as an institute for higher learning and religious education. Sustainable design techniques and materials will be considered throughout the entire design process and

ultimately contribute toward our goal of a LEED Silver Certification. The B. Thomas Golisano Library, dedicated in the fall of 2007, has been awarded Leadership in Energy and Environmental Design (LEED) Silver Certification by the U.S. Green Building Council. The \$13M building is the first Silver-certified building on any college campus in Upstate New York and the first library in the state to achieve the Silver certification. (SWBR)

## **Tai Soo Kim Partners, Hartford, CT – USA**

<http://www.fskp.com>

### **Libraries:**

**Somers Public Library, Somers, CT – USA 2009**

Client: Town of Somers

The existing 10,000 sq. ft. library building was built in 1988 and had become deficient in many ways. Doubling the size of the library, our design wrapped part of the existing structure, providing a new entry system, a new multi-purpose room and a new courtyard in a seamless and harmonious design. The other benefits of the project entailed resolution of HVAC, energy loss and lighting problems along with a complete reorganization and definition of separate program areas within the library, such as a new juvenile and pre-school area, a teen space, new small quiet-study rooms, staffwork rooms and storage areas. Careful planning of the library interior has resulted in a highly functional and modern library. (Tai)

**Wilton Library, Wilton, CT – USA 2006**

### **Awards:**

**Connecticut Excellence in Public Library Architecture 2008**

**Chicago's Atheneum's America Architecture Award 2007**

**Northwestern Community College, Learning Resource Center, Litchfield, CT – USA 2003**

## **Tappé Associates, Inc., Boston, MA – USA**

<http://www.tappe.com>

### **Libraries:**

**Pequot Public Library, Litchfield-Southport, CT – USA 2006**

### **Award:**

**Connecticut Preservation Award, Award of Merit 2007**

This project includes the complete restoration of a wonderful Richardsonian style library constructed in 1890. In order to restore the interior, a number of ornate details were recreated including antique book stacks and hand carved fireplace surrounds that had been destroyed and were rebuilt using photographs taken four decades earlier. Not only did this project include a careful exterior and interior restoration, it also included designing custom furniture to match historic furniture known to be in the original building when it opened. Planning is ongoing for a future addition to expand the overall capacity of the library. ( Tappé )

**Worcester Public Library, MA – USA 2004**

As the second largest public library in Massachusetts, the Worcester library is a significant civic building. Located on the perimeter of Worcester Common across from City Hall, the building helps define a major public space within the city and as one of the cities most important institutions, has contributed to the revitalization and rebirth of the downtown area. The new stone façade is defined by the extension of a pre-existing arcade with glowing translucent stone cladding above and by an oval shaped bay. The interiors integrate public art through the use of elements such as art glass panels and decorative metal gates. ( Tappé )

**MIT 24 Hour Study ( Hayden Science and Humanities Library ), Cambridge, MA – USA 2002**

The 24 hour study space inserted into the Hayden Science and Humanities Library is a prototype for MIT. This facility allows students access to a quiet space for independent and group study both during regular hours and after hours. Integrated into the design is technology reflective of MIT's focus and culture. The project scope includes the redesign of the circulation, reserve, and reference areas of the Hayden. The 24 hour space is an innovative and effective model that MIT and other institutional libraries can adopt to support the changing needs and work habits of their student users. ( Tappé )

**Eldrige Public Library, Chatham, MA – USA 2001**

This expansion doubles the volume capacity and triples the reader seats of the existing library and also provides a new multi-purpose room available for after hour use. The design of the addition respectfully reinterprets the existing historic Richardsonian Romanesque library that is listed on the National Register of Historic Places. Attention to detail, fenestration and selection of materials creates a seamless expansion including a new fully accessible front entrance. The project also includes a careful restoration of the historic interior of the existing library. Interiors of the addition refer to the existing building through the use of materials and scale elements. ( Tappé )

**Morse Library, Natick, MA – USA 1997**

This design features the Victorian Gothic heritage of the existing 1873 library. A three level atrium wraps the former exterior, creating a dramatic entry sequence that is lit from above by a large skylight lightly touching the old building. This new space bathes the walls of the existing library in daylight and creates a new indoor civic space for the town of Natick. The interior design of the addition takes design cues from the existing architecture, creating a unified composition. Daylight is introduced into the lower level of the library through the atrium and into the children's room from skylights that are located at the sidewalk above. ( Tappé )

## **tBP Architecture, Newport Beach, CA – USA**

<http://www.tbparchitecture.com>

### **Libraries:**

**Citrus College, Learning Resource Center, Renovation and Expansion, Glendora, CA – USA 2008**

Addition Renovation 1968

### **Awards:**

**2004 Award of Excellence Community College Facilities Coalition**

Client: Citrus Community College District, Services Provided: Programming, Design and Architecture, Project Location: Glendora, CA, Project Size: 34,156 sf, Completion Date: April 2008, Sustainability: Sustainable Features Included Functions: 76 Faculty

Offices, Multi-Media Classroom, Control Room, Telecommunications/Lecture Space, Conference Rooms, 6 Dean Suites, Collaborative Work Areas and Faculty Support Spaces.

The new Center for Innovation provides Citrus College with a 34,156 square-foot, 3-story, high-tech center for faculty development. It contains a multi-media center for the creation of teaching and research presentations by faculty. This facility includes 76 new faculty offices with office space for part-time instructors, scholars/artists-in-residence, and 6 suites for academic deans. Open spaces are equipped with workstations at which a variety of on-going, innovative projects may be created by collaborative teams of faculty and students. The teleconferencing center holds 100 seats for the hosting of academic and community conferences. The facility also houses the Distance Education, Study Abroad and Student Honors programs. (tBP)

#### **Los Medanos College Learning Resource and Community Center, Pittsburg, CA – USA 2008**

##### **Awards:**

**2009 AWARD OF MERIT** Community College Facilities Coalition (Los Medanos College Quadrangle Complex)

Client: Contra Costa Community College District, Services Provided: Master Planning, Programming, Design and Architecture  
Project Location: Pittsburg, CA, Project Size: 55,935 sf, Completion Date: June 2008, Sustainability: Sustainable Design Features  
Included Functions: Biology, Chemistry and Physical Sciences Laboratories and Classrooms, Large Tiered Lecture Hall, Computer Laboratories, Faculty Offices and Astronomy Rooftop Observation Deck

The Science Building is one of three new buildings Los Medanos College has developed in the new College Quad. The Science Building joins the new Library and Math Buildings. The architectural language of the new facilities reflects the original vocabulary of modern design but also provides a contrast. The expression is one that is consistent with the College's mission of projecting a progressive and technology-based image. The Science Building incorporates a flexible, state-of-the-art laboratory environment for the teaching of the Physical and Biological Sciences, which includes classrooms, one large tiered classroom, faculty offices and rooftop observation deck for astronomy classes. (TBP)

#### **Orange Coast College Library and Learning Resource Center, Costa Mesa, CA – USA 2007**

##### **Awards:**

**2008 AWARD OF HONOR** Community College Facilities Coalition

Client: Coast Community College District, Services Provided: Programming, Design and Architecture, Project Location: Costa Mesa, CA, Project Size: 87,000 sqf, Completion Date: December 2007, Sustainability: CHPS Guidelines, Functions: Computer Carrels, Reading Areas, Bookstacks, Group Study Rooms, Reference, Media Center, Periodicals, Bibliographic Lab, Computer Presentation Lab, Acquisition, Cataloging, Circulation, Archives and Bookstore.

The new two-story Library/LRC now serves Orange Coast College's desire for a state of the art, digitally enhanced Learning Resource Center set within the center of the academic campus. The new LRC provides a structurally safe accessible facility replacing the now closed structurally unsafe library. It corrects deficiencies in the library function demand/capacity ratio, provides needed space and program expansion, modernizes the digital delivery of instructional and research media, centralizes learning resources within the academic core, and frees up campus space for the future consolidation of student services programs. (tBP)

#### **Cypress College, Library and Learning Resource Center, Cypress, CA – USA 2006**

Client: North Orange County Community College District, Services Provided: Programming, Design, Architecture and Interior Design, Project Location: Cypress, CA, Project Size: 62,500 sf, Completion Date: April 2006, Sustainability: Sustainable Design Features Included, Functions: LRC: Computer Commons, Distance Learning Center, Teaching Learning Center, Math/Science Center, Foreign Language Center, Tutoring Rooms and Support Offices; Library: Central Stacks, Reading Areas, Study Rooms, Computer Area and Orientation Room.

The Cypress College Library/Learning Resource Center is the new focal point to draw activities to the east end of the campus. 24 hour access / 7 days a week was a critical aspect to the design of the facility. The Library/LRC includes a central 2-story entry lobby leading to the LRC – a central computer learning commons, surrounded by a math/science lab, a foreign language lab, a teachers learning center, a distance learning lab and group study rooms. The LRC promotes interdisciplinary support on campus. The library, with more limited access, is located on the second floor with central stacks, reading areas and study rooms taking full advantage of the campus view. An orientation room is included, and a service elevator connects to the second level service areas. (tBP)

#### **Hartnell College Library and Resource Center, CA – USA 2006**

68,000 sqf.

The 68,000 square foot state-of-the-art Library and Learning Resource Center is designed to meet the information and research needs of students in the 21st century. Featuring a unique building design that is innovative, yet functional, flexible, and timeless, the library is the hub of campus information and learning technologies. The two floor facility houses traditional college library resources and services including Circulation Services, Reference Services, Technical Services, an Information Competency Center, and Computer and Media Services. Also within the library are a Faculty and Staff Resource Center, 22 collaborative group study rooms (11 with plasma screens and/or smart board technologies), a state-of-the-art Distance Learning & Video Conference Center, a Community Room, campus Computer Equipment Services, AV Equipment Services, and a beautiful lobby/ atrium equipped with a four plasma multimedia wall. (<http://www.hartnell.cc.ca.us/library/LIB8/intro.html>)

#### **Fullerton College Library and Resource Center, Fullerton, CA – USA 2005**

68,000 sqf.

##### **Awards:**

**2006 JURORS' AWARD** Community College Facility Coalition

**2006 CONTEXTUAL INFILL AWARD** The Fullerton Heritage

Client: North Orange County Community College District, Services Provided: Programming, Design, Architecture and Interior Design, Project Location: Fullerton, CA, Project Size: 67,680 sf, Completion Date: September 2005, Sustainability: Sustainable Design Features Included, Functions: Interdisciplinary Study and Tutorial Center, Math Lab, Skills Lab, Adaptive Computer Lab and Instructional Development Center

The Fullerton College Library/LRC is a new facility designed to replace the college's former library and to develop a comprehensive Learning Resource Center. The facility is designed as a focal centerpiece to the historic 1930's Work Projects Administration (WPA) campus and is a tribute to the Hispano Moorsque style of the original campus architecture. The library portion of the facility fronts

the main campus quad and includes a 2-story grand lobby connecting the central computer commons to the quieter reading areas and study rooms upstairs.

The Learning Resource Center is an interdisciplinary study and tutorial center. Multiple entries support this facility to establish expanded access to portions of the facility. Flexibility is built into the facility to allow for future changes in the delivery of instruction and technology. (TBP)

#### **Dougherty Station Public Library, San Ramon, CA – USA 2005**

Client: City of San Ramon and Lennar Communities/BLC, Services Provided: Master Planning, Programming, Design and Architecture, Project Location: San Ramon, CA, Project Size: 11,800 sf, Completion Date: September 2005

Functions: Stacks, Information Commons, Circulation, Reference, Periodicals, Reading Area, Quiet Study Area, Children's and Story-Telling Area, Community Room, Computer Study and Training Room, Offices, Staff Room and Support Areas.

This 11,800 sq. ft. Public Library is part of the new "Village Center". A partnership between the City of San Ramon, Private Developers and the Contra Costa Community College District has created a new 200,000 sq. ft. "Village Center". The Center integrates the Library and a community center, police sub-station, child care center, as well as housing and retail/office functions with college functions.

The Library is designed to be flexible and expandable. This aids in its unique mission to serve the needs of both the community and the college. The building's adjacency to the college will allow future inclusion of a Learning Resource Center. (tBP)

#### **Riverside Community College, Digital Library and Library / Resource Center, Riverside, CA – USA 2003**

**Awards:**

**Project of Distinction Council of Educational Facilities Planners International (CEFPI)**

Client: Riverside Community College District, Services Provided: Programming, Design and Architecture, Project Location: Riverside, CA, Project Size: 108,000 gsf, Completion Date: May 2003, Sustainability: Sustainable Design Features Included  
Functions: Reading Lobby/Lounge, Library/Biblio Orientation Center, Group Study Rooms, Periodical Stack, Display & Reading Area, Microfilm Area, Staff Prep and Work Areas, Computer Public Access Center, Electronic Carrels and Media Service Group Viewing, Multi-Media Rooms, Teleconferencing, Archives, Faculty Research Room, Tutorial Lab, Student Center, Public Service Office, 5 Librarian Offices, Staff Meeting Room, Staff Lounge/Kitchenette, Technician Processing Services, Photo Copy Center, Printing Center and a 200 fixed seat Telecommunications Auditorium.

The new four-story Digital Library and Learning Resource Center is a technology nexus for the Riverside Community College District. It is a seamless blend of technology, media, production and library functions offering the community and students of the Riverside, Norco and Moreno Valley campuses, services via Interactive Telecommunications and Distance Learning Systems. (tBP)

#### **San José City College Library and Resource Center – San José, CA – USA 2003**

Client: San Jose-Evergreen Community College District, Services Provided: Master Planning, Programming, Design, Architecture and Interior Design, Project Location: San Jose, CA, Project Size: 54,000 sf, Completion Date: June 2003, Sustainability: Sustainable Design Features Included, Associate Architect: Sugimura & Associates, Functions: Interdisciplinary Learning Resource Center - Central Information Commons, Math Lab, Reading Lab, Writing Lab, Academic Tutoring, DSPS Lab and Offices; Library – Information Commons, Circulation, Reference, Periodicals, Reading Area, Quiet Study Area, Conference Rooms and Staff Offices

The Library/Learning Resource Center is the first building in a newly revised master plan. It is one half of a planned gateway to the campus formally facing the community. It presents an identifiable face to the community and descends into the central campus quad. The three level building houses an "interdisciplinary" Learning Resource Center that will be open 24 hours and includes a central computer plaza surrounded by math, reading, writing labs, academic tutoring and a self paced learning lab. On the upper two levels is the Library which houses 75,000 volumes and a computer carrel mezzanine. Considerable importance was placed on the provision of natural light and quality of space for readers, as well as sheltering the quiet interior from the adjacent freeway. Each reading and study areas has unique qualities; some seats have window views to the distant hills, some have internal vistas across the reading room, others are entirely enclosed and private. (tBP)

#### **San Diego City College, Library Resource Center, San Diego, CA – USA 2002**

Client: San Diego Community College District, Services Provided: Programming, Design and Architecture, Project Location: San Diego, CA, Project Size: 67,000 sqf., Completion Date: September 2002, Sustainability: Sustainable Design Features Included  
Functions: Library: 200 Internet-connected Computers, Complete Reference and Circulation Collection; Independent Learning Center: 132 computers including Adaptive Technology Stations; Multimedia Center: Primary Collection of Multimedia Technology for Instructional Support. (Center delivers, sets up and services sixty classrooms for faculty and administration and includes General Instrumental Digital Satellite receiver and video collection); CitySITE: Support for Integration of Technology in Education 15 Computers (allow faculty and staff to learn new and existing computer technologies)

The San Diego City College Library/Learning Resource Center (LRC) reflects the College's commitment to the building's role as the "heart" of the campus. The new 67,000 square foot, 3-story facility, perched on a hillside, commands dramatic 180 degree views of downtown San Diego and the harbor beyond. Key design considerations included organizing the library functions to allow minimal staff to operate and control it; bringing natural light into all three levels of the LRC; and creating sustainable, environmentally friendly building that was focused on low long term energy costs by employing sun-shade grills and a unique in floor heating and cooling system. (tBP)

### **Tetra-IBI Group Architecture Planning, Los Angeles, CA – USA**

**<http://www.tetra-ibigroup.com>**

**Libraries:**

#### **Hellen Miller Bailey Library, East Los Angeles College, Monterey Park, CA – USA 2012**

October 25, 2012 (Monterey Park, California) – East Los Angeles College today celebrated the opening of the college's renovated and expanded Dr. Helen Miller Bailey Library, paid for by the Los Angeles Community College voter-funded Building Program. The Library has been expanded by nearly 12,000 square feet and features extensive new resources to facilitate learning. The Library has further been renovated to high sustainability standards.

"Our expanded and modernized library is a fitting tribute to Dr. Helen Miller Bailey, who was one of ELAC's most gifted and inspiring professors," said Mr. Farley Herzek, interim president of East Los Angeles College. "In addition to the traditional library functions, the renovated Bailey Library's resources and technology will help our students prepare for the next successful stage of their lives."

The original library was built in 1979 and was 45,500 square feet. The new building, at 57,241 square feet in size, will accommodate increases in student population, library collections, a campus archive and demand for new technologies, such as computers. The project was paid for with funding approved by voters as part of the \$6 billion Los Angeles Community College District Building Program. ELAC is one of nine colleges that make up the LACCD, and is located in Monterey Park, east of downtown Los Angeles. ELAC is in the midst of a \$667 million program to renovate and modernize the campus to better serve East Los Angeles and surrounding communities.

“The renovated and expanded Bailey Library is a flagship project at one of our flagship campuses, and is a great example of how taxpayer dollars are funding improvements that our students can use right away,” said Board of Trustees member Scott Svonkin. “In these times of reduced support from Sacramento, we are carefully using voter-approved construction dollars to do more with less.”

The renovated Bailey Library now houses approximately 150,000 volumes, and provides reading and study facilities of various sizes and types from individual to small and medium group study rooms as well as two general classrooms, conference room, library offices, campus archives and library support areas. The project’s sustainability features include strategies to increase water efficiency, reduce energy consumption, and reduce the “heat island effect” with a reflective roof. The project used regionally manufactured materials wherever possible, and diverted 75% of construction waste away from landfills. Indoor air quality was enhanced through the use of low VOC emitting finishes and increased controllability of lighting and ventilation.

“I’m pleased to honor the memory of Dr. Bailey and see her legacy extended through the opening of this expanded and modernized library,” said Daniel LaVista, chancellor of the nine-college LACCD. “This project is yet another successful example of the District’s Building Program to remake our colleges to better serve our students and the communities surrounding our colleges.”

After the formal ribbon cutting, tours of the renovated building were conducted for attendees.

**About East Los Angeles College**

East Los Angeles College has an international, multicultural student body that complements the 14 communities comprising its primary service area. The college offers both academic transfer courses which prepare students for admission to four-year colleges and universities, and occupational programs which prepare students for careers in two years or less. The college is located in the suburban community of Monterey Park, California, ten miles east of downtown Los Angeles.

**About the Los Angeles Community College District**

The Los Angeles Community College District, the nation's largest community college district, serves one-quarter million students a year in more than 36 cities in Los Angeles County at its nine colleges. The District covers nearly 900 square miles and has educated and trained the region's diverse workforce since 1969.

**About the LACCD Building Program**

LACCD’s Building Program is a 14-year, \$6 billion program funded mostly by taxpayer-approved bonds, supplemented by additional funding from the state of California. With approximately \$3 billion spent so far, the LACCD’s nine colleges are benefiting from brand new and renovated academic buildings, sports facilities, arts complexes, administrative buildings, child development centers, and parking structures. The Building Program has completed hundreds of separate projects, with hundreds more in the planning or construction stages. For more information on the LACCD’s construction program and a list of awards the District has received for its environmentally responsible projects, visit [www.laccdbuildsgreen.org](http://www.laccdbuildsgreen.org).

The scope for the proposed library modernization.

(<http://www.laccdbuildsgreen.org/mediacenter/index.php?item=220>)

The scope for the proposed library modernization is based on the newly developed library program identifying the functional space requirements and provides recommended usable square footage for all operations and functional areas. The existing building will go through an expansion of 60,000 sqf. Designed to LEED Silver Rating. Tetra-IBI Group provided a detailed building evaluation for the modernization and addition to the two-storey library. The detailed review and analysis once implemented will bring a complete building upgrade and addition. (Tetra)

### **[Exposition Park Dr. Mary McLeod Bethune Branch Library, Los Angeles, CA – USA 2008](#)**

14,500-square-foot

Exposition Park – Dr. Mary McLeod Bethune Regional Branch Library used the LEED (Leadership in Energy and Environmental Design) new construction rating system developed by the U.S Green Building Council. There are four certification levels (Certified, Silver, Gold, Platinum) awarded according to achievement as evaluated by points using the LEED scorecard. The following outlines design measures were employed to attain Gold certification in the construction of the library:

1. **Landscape & Exterior Design to Reduce Heat Island:** Additional shade trees and less thermal-absorbing “white concrete” pavement and “white coating” on the roof were used to reduce the heat absorbed by the site during the day and radiated at night. This helps avoid raising the ambient temperature and disturbing the microclimate of the surrounding park.
2. **Water Use Reduced by 30%:** The installation of low-flow plumbing fixtures as well as highly efficient landscaping irrigation system will reduce water consumption by 30%.
3. **Optimize Energy Performance:** The building is designed to be 27% more energy efficient than a standard building, by utilizing efficient mechanical systems, double glazing with high efficiency glass coatings, and naturally lit reading rooms with automatic light fixture dimming.
4. **Recycled & Environmental Safe Content:** At least 10% of the materials and products used in this project were from recycled materials; rapidly renewable materials were also used such as bamboo flooring and cotton insulation; and low volatile organic compound content paints and coating.
5. **Regional Materials:** At least 10% of the total materials used to construct the library were from sources within 500 miles of the project site, thus reducing the greenhouse gases emitted by transporting materials over greater distances.
6. **Solar power:** DWP donated a large number of photovoltaic panels, which were placed on the south side of the building and on the roof to generate electricity from the sun.
7. **Transportation Alternative:** The library is located close to community transportation such as the bus line and train station.
8. **Additional Commissioning:** An independent commissioning agent has been retained to verify that the building systems are calibrated and performance meets the LEED requirements. The commissioning agent will also provide maintenance personnel with training and will be available for re-commissioning and verification services. (<http://thegreenlibraryblog.blogspot.com>)

Sensitive site planning of the Library’s relationship to the park and neighborhood are key to the successful influence the Library will have on both the park and surrounding neighborhood. The programmatic spaces will take advantage of an abundance of natural light through high volume spaces with generous clerestory lights. Major views from within the library will focus on the park with the Children’s Reading Area leading the design statement of a shop’s prow pointing the park. (Tetra)

### **[Joyce Ellington Branch Library, San José, CA – USA 2008](#)**

15,500 sqf.

Responsive orientation of building elements support sustainability and is a natural outgrowth of the Library’s location and relationship to its surroundings by providing maximum natural light. Large amounts of glass is used to achieve the transparent quality of the Library, but is also used as a means of energy conservation. Large overhangs are incorporated to reduce sun

penetration and also to bring light into the space. The use of day lighting will reduce the amount of lighting during periods of the day and reducing the energy consumption for lighting, reducing heat gain from lights and education in cooling. (Tetra)

#### **Banning Branch Library, Huntington-Beach, CA – USA 2007 Concept Master Plan**

12,500 sqf.

Tetra Design was commissioned to analyze the existing conditions and develop a specific program and Conceptual Design for the Banning Branch Library. Specific Goals were developed with the Library staff. Context and Imagery were analyzed based on discussions with the Library staff. Because of the library's close relationship to the park, a concept of "Library in a Park/a Park in a Library" was conceived. Concepts of indoor and outdoor relationship and flow utilized in Tetra Design's recently completed study for the Huntington Beach Central Library were integrated into the Banning Branch Library design. The specific forms selected mean to suggest surfing, lifeguard stations, the beach and maximum glazing of the reading rooms complete the suggestion of the library as part of the park. (Tetra)

#### **Huntington Beach Central Library, Huntington-Beach, CA – USA 2007 Concept Master Plan**

Libraries are sanctuaries of silence...places to find peace amongst the bustle of our every day lives. Lose yourself in thought as the sound of water cascades over fountains. Central Library is a treasure enjoyed by all who visit. Famed architect Richard Neutra and his son, Dion, attempted to blend the library and surrounding park into a happy place for relaxation, contemplation and study when they designed Central Library on a hill in Central Park overlooking Talbert Lake nearly 30 years ago. With invention of the cell phone, the peaceful library turned quite noisy until the Huntington Beach City Council approved an ordinance in September 2004 that brought media interest to this quiet sanction. The library system does not allow use of cell phones inside the library buildings. What you will find inside the library: - 300-Seat Theater - Genealogy Library - Magazine and News Section - Art Gallery - Gift Shop - Media Center - Computer stations - Sound Booths, Meeting Rooms - Children's Wing - Food Court

(<http://www.stockteam.com/hulib2.html>)

117,000 sqf.

The Central Library resides in a 350-acre (1.4 km<sup>2</sup>) park and features a beautiful theater, spacious reading areas, and indoor fountains surrounded by a spiral ramp. The Central library has seven meeting rooms and a 300-seat theater available for rental. The building was designed by the architectural firm of **Richard & Dion Neutra**. Shortly before the actual signing of the agreement, Richard Neutra passed away while on tour and his son, Dion, completed the original building on April 5th, **1975**. In the mid-1990s, the architectural firm of **Anthony (1997 †) & Langford** were hired to design a 43,000-square-foot (4,000 m<sup>2</sup>) expansion. The building was expanded to enclose an outdoor spiral ramp and fountain area. The new wing opened in **1994** and included a new Children's area with its own story time theater. The lower level featured 7 new meeting rooms and a theater. In **2007**, the architectural firm of **Tetra Design** was commissioned to design a renovation of the Central Library that saw a return of the neutral brown and green color scheme that was originally envisioned by architect Dion Neutra. More historical information is available on the library history webpage. (<http://www.ci.huntington-beach.ca.us>)

Tetra Design was commissioned to develop a Conceptual Master Plan of Finishes for the Huntington Beach Central Library. Guidelines were developed for the Huntington Beach Central Library to be utilized for their interior and exterior refurbishment. The Guidelines include Final Conceptual Space Plans. Acoustical Materials for major skylights though the Library. Specifications for Materials, Furniture Selections, Building Graphics and Building Architecture which includes suggestions for the Library Approach and Entry, and Theater Approach for a community theater housed in the 1994 addition. (Tetra)

#### **Acton / Agna Dulce Public Library, Acton, CA – USA 2006**

10,875 sqf.

Located in a rural community in the Santa Clara River Valley, the Library will serve five area schools in a joint-use agreement that knits the school's curriculum with the library resources. This technology based homework and learning center provided for school age children will also become the heart of the community, housing a multipurpose room and catering kitchen for community needs. With an emphasis on California native and environmental concerns this project will become a demonstration on sustainable design. (Tetra)

#### **Northridge Branch Library, Northridge, CA – USA 2003**

**Award:**

City of Los Angeles Public Designs Exhibit 2004 A + D Museum

12,500 sqf.

The Northridge Branch Library announcing its presence with an inward tilted transparent plane of glass that welcomes its patrons with an abundance of both air and light. The interior of the Library continues the theme with a conical skylight featuring a mobile of books in flight. Flooded with natural light the interior is articulated to maximize solar access and daylighting for internal functions. (Tetra)

#### **Mark Twain Branch Library, Los Angeles, CA – USA 2002**

**Award:**

Los Angeles Cultural Affairs Commission Award 2000

10,000 sqf.

"The Mark Twain Branch Library, with its thrusting planes of eggplant and tangerine colored stucco, would stand out in any part of town ...It's the sort of welcoming haven that Susan Kent, The City librarian, envisions as the front porch of the community...Since reopening, branches have seen their circulation soar- at the Mark Twain Branch, it's up 300% from prereconstruction levels". (Los Angeles Times Magazine; July 13, 2003) (Tetra)

### **THA (Thomas Hacker) Architecture, Inc., Portland, OR – USA**

<http://www.thaarchitecture.com>

**Libraries**

#### **State of Alaska Library Archives Museum, Juneau, AK – USA 2013**

120,000 sf

The State of Alaska Library Archives Museum consolidates three agencies, integrating their functions for greater efficiency and responsiveness to the public, and providing a state-of-the-art facility to house Alaska's history. THA Architecture is partnering with Alaskan architecture firm ECI/Hyer for master planning, programming and design of the building.

The facility will occupy a site near the State Capitol, serving the needs of state agencies locally and a broader network of sister agencies throughout the state. It will act as the central repository for the exceptional historical collections of the State Library and Archives, as well as the State Museum's diverse collection of cultural artifacts – a major public attraction during the summer tourist season.

The facility's design is rooted in state history and Alaska's wildlife. The site layout reflects the fan of the docks that historically occupied this site, and the roof form is reminiscent of the wing and feathers of a bird in flight. (THA)

#### **San Francisco Public Library Bayview Branch Library, San Francisco, CA – USA 2013**

9,000 sf

San Francisco Public Library's new Bayview Branch Library replaces the existing 1969 branch library with a new one-story building. The library will meet increasing program needs and provide an open, inviting, and secure confluence for this urban community. It is designed around an inner courtyard that will bring light and natural ventilation to the center of the building. The light illuminating the corner entry from within will serve as a beacon for the neighborhood.

The library design has been inspired by both the multifaceted history of Bayview/Hunters Point and African and African America art and architecture. The exterior includes etched panels with images related to the neighborhood's history. The floor plan is designed to create distinct areas for adults, teens and children, while maintaining good visibility throughout the building. A community room with an after-hours entry opens up to the children's area with a large moveable wall, providing an option for larger children's programs. (THA)

#### **University of Washington, Tioga Library, Tacoma, WA – USA 2012**

40,000 sf

The new Tioga Library Building connects the current UW Tacoma Library by a pedestrian bridge across the old railroad corridor that runs through the middle of the UW Tacoma campus. It houses an expansion of the Library on the basement, first and second floors. The program also includes general education classrooms on the first floor and offices on the second floor.

The new building shares a staircase with the Tioga Building to the north. The exterior is clad with a terracotta rain screen, a unique and highly sustainable building product. (THA)

#### **Parkside Library, San Francisco, CA – USA 2011**

6,000 sf renovation / 1,000 sf addition

San Francisco Public Library's Branch Library Improvement Program includes the Parkside branch's renovation and addition. THA and Karin Payson Architecture + Design have taken great care to preserve and restore the architectural beauty and character of the existing library. The design of the addition complements this fine example of midcentury architecture, while adding space for ADA restrooms, improved staff areas and a discrete teen area.

The existing building was brought up to current ADA, seismic and other codes, and the interiors returned to the original design intent. In addition, the project adds landscape improvements and opens up views into the courtyard from a new teen area. New plantings and outside seating in the courtyard provides an area for programs. (THA)

#### **San Francisco Public Library System, West Portal Branch Library, San Francisco, CA – USA 2007**

The West Portal Branch Library was the second branch to be renovated as part of San Francisco Public Library's Branch Library Improvement Program (BLIP), a 2000 bond which called for 19 branches to be renovated. THA and Karin Payson Architects + Design took great care to preserve and restore the architectural beauty and historic character of the library throughout this renovation and addition. Inside the branch, ceiling stencils and woodwork were restored and lighting fixtures consistent with the building's WPA-era style were installed. Other significant improvements include WiFi internet; ADA accessibility; a new addition with an elevator, staff work rooms and restrooms; a new ground-floor book drop; and seismic upgrades. (THA)

#### **Alameda Free Library, Alameda, CA – USA 2006**

49,000 sf

LEED Silver

The new Alameda Main Library enhances the civic nature of Alameda's historic downtown, expressing the basic order of historic elements while utilizing advanced building technologies. Large windows and window bays provide expansive views of the city and its surroundings. A walled garden forms a backdrop for public meeting rooms and a café. Additional program elements include a generous reading room, a large children's section, a children's story and craft room, study rooms, a young adults' homework center, computer labs, private reading areas, work areas and conference rooms. (THA)

#### **Spokane Academy Center, University of Washington, Spokane, WA – USA 2006**

106,000 sqf.

The Spokane Academic Center is a signature building for this Washington State University campus and will cultivate interaction, creativity and collaboration between faculty staff, students, alumni and the Spokane community. The five-story building includes the campus library, classrooms, administrative offices, academic offices for various university programs, a "Cyber" cafe and computer labs. The first three floors of the Academic Center contain the more public program elements, with the fourth and fifth floors housing administration and academic program offices. The campus library, located on the second and third floors, is primarily set within a "drum" form along the north side of the building, providing grand views of the Spokane River. Transparency and connection to the surrounding campus are achieved by a three story space with a connecting stair located at the south building entry. The Academic Center is the focus of the new campus development and the first step in implementation of the Riverpoint Campus Plan. (THA)

#### **Sherwood Civic Building, Library – City Hall, Sherwood, OR – USA 2006**

30,000 sf

Located 15 miles south of Portland, Sherwood is one of the fastest growing communities in Oregon. This 30,000 sf mixed-use building houses a 10,000 sf single-story library and a two story City Hall and library support area. The City Hall includes a large municipal courtroom intended for up to 80 people, which will also function as a city council room and a community room. Other program elements include the administrative and financial support spaces for the City Hall and a small retail component. A public plaza is located at the front of the building with the children's area of the library relating directly to a garden space at the rear. The building is a major element in the City's Urban Renewal Plan, which is intended to preserve and enhance the historic downtown district. (THA)

#### **Hillsdale Branch Library, Multnomah County Library System, Portland, OR – USA 2004**

12,000 sf

LEED Gold

#### **Awards:**

2009 AIA Northwest & Pacific Region Citation Award,

## 2006 AIA Portland Chapter Merit Award, a 2005 AIA Portland Chapter People's Choice Award

The Hillsdale Branch Library is one of four new branch libraries that THA designed for Multnomah County. Located on the edge of the commercial center for a residential community, the library's cedar shell reflects the nearby wooden houses and clerestory windows banding the top transform the building into a nighttime beacon. The main staircase leads from the corner entrance to the reading room above, where colored glass panels lining the wall provide beautiful light patterns throughout the building. The reading room is defined by alternating glass and wood walls, framing views out to the valley while forming bookcases to the interior. The building's sustainable design elements include natural daylighting, the use of materials with recycled content, native vegetation with no installed irrigation and bioswales for stormwater management. (THA)

### [Library and Administrative Building 9 PCC, Rock Creek Campus, Portland, OR – USA 2004](#)

THA was the architect for the expansion and renovation of Portland Community College's Rock Creek Campus, adjacent to an environmentally-sensitive Urban Growth Boundary. The project included two new buildings (Buildings 7 and 9) and renovations and additions to existing Buildings 2,3 and 5, including a new entry plaza.

THA's addition to Building 7, the science building, develops the west and south exterior elevations to present a welcoming public image from the main student parking lot. The courtyard was re-landscaped and is now a more defined area for informal gatherings and smaller campus events. The 34,000 sf expansion increases PCC's Science and Technology Building to a total of 94,000 sf and unites all of the college's previously disparate science-based programs into one building.

In addition to Science Building 7, THA programmed and designed the Library & Administrative Building 9 and renovations to Buildings 2, 3 and 5. Building 9 houses the campus library, campus bookstore, classrooms, the registrar, counseling offices, financial aid, testing rooms, additional student services and administrative office space. Building 9 provides a dramatic and active presence along the entry drive, heightening the visitor's sense of arrival and creating an energized "front door" for the college. (THA)

### [Hollywood Branch Library and Bookmark Apartments, Multnomah County Library System, Portland, OR – USA 2002](#)

13,000 sf library, 44,000 sf housing

Recognizing and supporting goals for increasing density in Portland's Hollywood neighborhood, Multnomah County viewed the replacement of the existing Hollywood Branch Library as an opportunity to demonstrate the benefits of mixed-use in-fill development in a mature urban neighborhood that is well served by transit. THA designed a building that makes a civic statement for the library and provides quality design and a unique identity for the mixed-income housing.

The building celebrates the history of the Hollywood District – a wall along the east side of the library reading room honors the work of local children's book writer Beverly Cleary. Responding to the unique characteristics of the Hollywood neighborhood, the colors of the materials reinforce both the civic and residential scale of the building. The building is designed with a series of setbacks to ease the transition from the single-family neighborhood to the higher-density commercial district.

The Hollywood Library received a 2002 Governor's Livability Award, which recognizes exemplary projects that reinforce Oregon's quality of life and support its transportation and land use goals. It was also featured in Metropolis Magazine, praised for being "an energy-efficient mixed-use library complex" and being "the latest in the region's well-known and often pioneering efforts to prevent sprawl and increase urban density." (THA)

### [City of Beaverton Library, Beaverton, OR – USA 2000](#)

69,000 sqf.

#### **Awards:**

AIA Portland Chapter Merit Award 2002

Wood Design Award 2002

AIA Portland Chapter People's Choice Award 2001

The City of Beaverton's goal was a library with a strong civic character that is the key element in a new urban center for the City. The building's position in the heart of Beaverton allows the library to be an information resource center as well as a community center. The library is designed around a significant public room constructed with graceful wooden columns arching upward into a wooden web of roof framing, which invokes the town's nickname of the "City of Trees". The setting of this elevated rop-lit public space is a new three-block park and parking area that is designed to accommodate a festive public market during warmer months. (THA)

### [St. John's Branch Library, Multnomah County Library System, Portland, OR – USA 2000](#)

The main effort for the renovation to the 1913 St. John's Branch Library was to restore the entry columns' original design, while a tactful ADA ramp was added to provide patrons universal access. At the rear of the building, a simple administration annex was added that complimented the design of the main structure. (THA)

### [Woodstock Branch Library, Multnomah County Library System, Portland, OR – USA 2000](#)

7,500 sqf.

#### **Awards:**

American Institute of Steel Construction IDEAS Merit Award 2003

Chicago Athenanem American Architecture Award 2002

AIA Regional Honor Award 2002

AIA American Library Association Award of Excellence 2001

AIA Portland Chapter Honor Award 2000

Portland General Electric EarthSmart Award 2000

Conceived as a light filled room for the community, the new Woodstock Library occupies a prominent commercial corner in this southeast Portland neighborhood. The goal in designing this new 7,500 sf. Multnomah County branch was to create a feeling of openness and availability: an airy pavilion where the focus is on books and people. The exposed steel structure of the room's large overhanging canopy is cantilevered out of the ground with intricate bundled columns that eliminate the need for supporting walls, allowing an unusual transparency between inside and outside. (THA)

### [Belmont Branch Library, Multnomah County Library System, Portland, OR – USA 2000](#)

The colonial style Belmont Branch Library was originally completed in 1924. The renovation involved expanding on the geometric brick masonry and sensibly responding to its historic nature. A 2,000 sf addition was added to provide an area for a meeting room and to allow for a reconfiguration and expansion of the functional spaces. The interior finishes were upgraded in a manner fitting to this historic building. Structural considerations included bringing the building up to current seismic compliance, as well as hazard reduction on the original structure. (THA)

### [Penrose Memorial Library, Whitman College, Walla Walla, WA – USA 2000](#)

67,000 sqf. renovation, 24,000 sqf. addition

## **Awards:**

**AIA Portland Chapter Merit Award 2003**

The Whitman College Penrose Memorial Library expansion and renovation in Walla Walla, Washington is a 67,000 sqf. renovation and 24,000 sqf. addition that creates an open and inviting facade to Ankeny Field, an increase in student seating and access to technology and allows for growth of the collections. The new addition has large expanses of glass opening onto Ankeny Field. The new entrance aligns with a path that runs along the south side of the field. A large reading room, looking out to Memorial Hall, sits to the south of the entrance. The south end of the addition is built of brick with a palette of materials that compliment Memorial Hall and other historic buildings on the campus. (THA)

### **North Portland Branch Library, Multnomah County Library System, Portland, OR – USA 1999**

8,500 sqf.

North Portland Library began as the North Albina Reading Room in 1909. The current Jacobethan-style library was built in 1913 and renovated in 1999.

This historic branch was completed in 1913. The 8,500 sf library renovation includes seismic upgrades and a historic renovation to rejuvenate the long-neglected building. The updated building boasts new light fixtures based on photographic evidence of the original lighting; new shelving and help desks designed to complement the old library as well as improve check-in and check-out functions; new mechanical and electrical systems; new computer stations; and updated staff and service areas. (THA)

### **Bend Main Library, Deschutes County Library System, Bend, OR – USA 1998**

40,000 sf

## **Awards:**

**Bend Public Library received a 1999 AIA Portland Chapter Merit Award.**

THA Architecture provided building design and interior furnishings for this public library in Central Oregon. The building serves as the technical service center for the entire Deschutes County Library system and provides full library services to the public. The two-story building is a simple basilica form, and has played a key role in the rejuvenation of Bend's historic downtown area. The first floor houses a generous public lobby with circulation desk, a meeting room, staff work rooms and a large children's library. A grand stair leads to a single large open space on the second floor, with open book stacks, reference desks and a variety of public reading and study areas. The space features a high wood ceiling, clerestory lighting, exposed wood beams, columns and large windows which overlook mountains to the west. (THA)

### **Watzek Library, Lewis & Clarke College, Portland, OR – USA 1996**

50,000 sf addition / 54,000 sf renovation

The Aubrey R. Watzek Library, part of Lewis & Clark's three-building Signature Project, integrates the information technology department, media services, archives, an art gallery and the library into one building. The complex program builds on the relationships needed to fit into the expanded and remodeled building.

The existing cast-in-place floor and ceiling structure had proven exceedingly difficult for the College to wire for new technology. With strategic placement of book shelves in the most inflexible areas, an infrastructure of ducted telecommunication and power wiring in all new construction, and a perimeter power/data/telecom raceway in many areas of the existing building, THA transformed the Watzek Library into a building that successfully integrated information technologies throughout. (THA)

### **Midland Regional Library, Multnomah County Library System, Portland, OR – USA 1996**

26,000 sf

Midland Regional Library is a bridge between a suburban commercial strip on the east and a quiet pocket park to the west. Based on a simple basilica form, the core design concept is to express the duality of nature and culture, in a modern vocabulary grounded in classical proportions and principles. The 26,000 sf library faces busy SE 122nd Avenue with cast stone tablets incised with quotes from famous authors ranging from Willa Cather to Amiri Baraka. At the opposite end, the building opens to the park with a large glass wall. The long central room receives daylight from a continuous clerestory. The tall clock tower serves as an archetypal beacon welcoming today's community of readers and their families. (THA)

### **Spokane Public Library, Spokane, WA – USA 1994**

124,000 sf

The City of Spokane's Main Library occupies a powerful and dynamic site connecting the dense urban fabric of downtown Spokane with a dramatic view of the Spokane River and Falls. The building's prominent site and the importance of the library as a center of cultural life make this building a focal point for the City. The library is recognized for its integration of dynamic public spaces and carefully planned information technology. This library was designed by THA Architecture in collaboration with Northwest Architectural Company of Spokane. (THA)

### **Biomedical Information Communication Center (BICC), Oregon Health & Science University, Portland, OR – USA 1991**

81,000 sf

## **Awards:**

**The BICC received the 1991 AIA Portland Chapter Award of Excellence and the 1995 AIA Northwest and Pacific Region Award of Merit.**

The BICC was the first fully-computerized research library in the United States. The 81,000 sf facility was funded through the National Library of Medicine's program for linking worldwide databases. It incorporates a fully computerized network with state-of-the-art telecommunications facilities creating an environment which is humane and comfortable, connecting the library patron with generous views of the wooded ravine to the south. The BICC received the 1991 AIA Portland Chapter Award of Excellence and the 1995 AIA Northwest and Pacific Region Award of Merit. (THA)

## **Thomas, Miller & Partners, Brentwood, TN – USA**

<http://www.tmpartners.com>

## **Libraries:**

**James E. Walker Library, Middle Tennessee State University, Murfreesboro, TN – USA 1999**

Middle Tennessee State University, the region's oldest and largest public university, approached Miller & Partners to design a new library for the campus. TMP designed the James E. Walker Library as the focal point of the academic quadrangle, while housing state-of-the-art technology, additional research capabilities and a quiet refuge for student and faculty to study and work. Key aspects of the library include:

Vertically stacked staff areas to minimize walking distance and time

Cost-efficient construction materials that were resistant to vibration, noise and fire

Interior design capitalizing on natural light and structural simplicity

Reading and study areas along the building perimeter to take advantage of the windows and campus views

Deep-cell parabolic fixtures in study areas to eliminate glare, with the wiring contained within built-in furniture

Strategically located telecommunication spaces and pathways above lay-in ceilings (Thomas)

#### [The Eskind Biomedical Library, Nashville, TN – USA 1994](#)

##### **Awards:**

Award Excellence for Library Architecture AIA / ALA 1999

Honor Award AIA Gulf State 1994

Excellence in Design AIA New York State 1995

Honor Award AIA Tennessee 1994

Thomas, Miller & Partners worked as architect of record in association with **Davis, Brody and Associates** of New York to design The Annette and Irwin Eskind Biomedical Library. The five-story library is considered the "crown jewel" of the medical campus by Vanderbilt University Medical Center officials. Key aspects of the new library include:

Integrated information systems, academic research, medical archives, classrooms, workstations and laboratories

A transparent glass curtain wall outside the facility that serves as a structural highlight while infusing light into interior sections of the library. (Thomas)

#### [Doris and Harry Vise Library, Lebanon, TN – USA 1989/1990](#)

In October of 1989 a new library building opened its doors on campus. It is named the Doris & Harry Vise Library after its principle benefactor Harry Vise, founder of the Texas Boot

Company and a Trustee Emeritus of the University. Mr. Vise, who currently lives in Nashville, is a Jewish immigrant who barely

escaped Nazi Germany in 1939. Shortly after its construction, the building was selected as a winner of the Middle

Tennessee Excellence in Development Award. The Library is 18,000-square-foot and houses meeting rooms and study areas,

computer and audio-visual facilities,

the University Archives, and special collections in Tennessee History, Nobel Laureates, Women's Studies, and Children's

and Young Adult Literature.

(<http://www.sitemason.com/files/gjYbBK/The%20Vise%20Spring%202010.pdf>)

#### **TKDA, St. Paul, MN – USA**

<http://www.tkda.com>

##### **Libraries:**

#### [Lac Courte Oreilles Ojibwa Community College, Campus Library, Hayward, WI – USA 2007](#)

Traditional Ojibwa imagery adorns the new library at the Lac Courte Oreilles Ojibwa Community College campus in Hayward,

Wisconsin. In addition to traditional library functions, the building offers space for the tribal community to gather, grow and learn.

The natural wood building exterior compliments surrounding campus buildings and the new TKDA-designed campus entrance. The

Sacred Tree and Circle are felt throughout the design from the new grand campus entrance to the carpet inlays in the wigwam.

Everything from the porcelain tile to the oak desks and book shelves were inspired by nature and the beautiful rural site of the

college. "This library has been a dream for a very long time," said Dr. Dannielle M. Hornett, LCOCC's president. "It has finally

come to fruition and will be wonderful for our students and the LCO community at large." (TKDA)

#### [Concordia University, Library & Technology Center, St. Paul, MI – USA 2003](#)

40,000 sqf., \$ 6,400,000

Concordia University, a private Lutheran college set on an urban campus in St. Paul, Minn., was interested in designing a library and technology center to support and serve the educational needs of the Concordia community for the next millennium. Responding

to the mission of the university, a bible verse is inscribed on the building's exterior: "How much better to get than gold, to choose

understanding rather than silver."—Proverbs 16:16. The new Library Technology Center provides a link between the existing

library and theater. This 40,000-square-foot, three-level building (two floors above ground and a lower level) became an important

link in the campuswide, weather-protected pedestrian circulation system. The building, together with a new vehicle turnaround,

provides a redesigned campus entrance. Architectural precast concrete replicates the limestone masonry of the historic campus

buildings. Expansive glass areas enclose the building and open the activity of the facility to the campus, particularly at night. Cherry

wood interior trim and casework, along with warm colors, provide visual excitement. The interior architecture and furnishings were

developed and selected to support technology. (<http://www.schoolsdesigns.com>)

#### [Campus Library, University of Minnesota, Duluth, MN – USA 2000](#)

The landmark \$26 million Main Campus Library at the University of Minnesota-Duluth kicked off a decade-long building program

that elevated the quality of the school's architecture and transformed the campus. As Lead Designer, TKDA Principal Ken Johnson

collaborated with Stageberg Beyer Sachs Architects on library planning, programming and design. A sawtooth western elevation

and a two-story curved reading room on the north side of the building soften the square exterior form. On the building's south side,

a sheltered courtyard invites students to study or socialize outside during warm weather. Rotunda reading rooms, each two stories

high, give library patrons 270-degree views of Lake Superior and the surrounding area. The main reading room, on the north side,

has large vertical windows that face scenic campus vistas. Internal balconies allow daylight to penetrate each floor and provide views

from study and collections areas. (TKDA)

#### **TLCD Architecture, Santa Rosa, CA – USA**

The role of libraries has evolved dramatically over the last ten years. No longer just a place for books, a new library becomes the

heart of the community or campus, a study center, a meeting place. Our new library designs include learning centers, bibliographic

instruction centers, media centers, group study rooms, classrooms, distance learning facilities, art galleries, public meeting rooms

and cafes.

<http://www.tlcd.com>

##### **Libraries:**

#### [Library & Learning Resource Center, Mendocino College, Ukiah, CA – USA 2012](#)

The new Library and outdoor spaces clearly mark the focal point of the Mendocino Community College campus. The new buildings

and landscape weave into the existing campus structure and bring life to the library while still respecting the scale and structure of

the current campus. Using innovative practices, standards, and technology, the building also meets challenges of reducing greenhouse gases and preserving energy resources.

Visioning for this project allowed major campus decision makers to look beyond their immediate needs to consider plans for the future. The process resulted in a new campus Master Planning phase which considered possibilities of overall campus growth and appropriate site, building, and infrastructure development.

The quadrangle connects the new Library and Learning Resource Center to the Bookstore, Student Activities Center, and Food Service with sunny south-facing views and a shaded grove for the hot Ukiah summers. The design concept strongly emphasizes bringing the outdoors into the built Library environment. Sun control systems, north-facing clerestory windows, a natural ventilation system, and installation of a "green" (vegetated) roof system are incorporated into the design to achieve the goal of creating a sustainable and energy efficient building. (TLCD)

#### **McCarthy Library, Napa Valley College, Napa, CA – USA 2010**

The Library at Napa Valley College inspires student learning and welcomes the community to share its resources. The project is situated in the scenic Napa Valley and is the hub of the College's southern campus. The building and plaza are a new center for study, cultural events, and training in information literacy.

The new Library is designed to bring people together. The Plaza acts as gathering space where guests arrive from both on-campus and off-site. From the Plaza, students, teachers, and visitors are directed toward the glassy entry façade. The transparent façade creates a strong inside-outside connection and offers a symbolic invitation to enter. The day-lit interior is airy and expansive, and enables visual connections throughout.

The Library provides the latest technology, wireless, and multi-media learning environments. Print and electronic resources are fully integrated. The raised access floor system provides flexible space below the floor for electrical connections and delivers high-efficiency air conditioning to students and staff. Automatic lighting controls and sustainable finishes are additional environmentally friendly features. (TLCD)

#### **Harold Mahoney Library, Petaluma Campus, Petaluma, CA – USA 2008**

As part of the Phase II campus expansion, the Herold Mahoney Library becomes the cultural and architectural heart of Santa Rosa Junior College's Petaluma site. The 37,000 square foot library is the centerpiece building on a new eastern quadrangle. Facing the quad is the Community Reading Room, a multipurpose facility connected to the main reading room by a gallery walk. The Community Reading Room provides a venue for expanded cultural and civic events that have been the hallmark of the existing library.

Tall glass curtain walls open to the east to capture the view across a new campus green to Sonoma Mountain. The Library has 400 reader seats including more than 50 public access computers and 24 Media Viewing stations. The new library provides four times the library space of the previous Mahoney Library, adding eight new group studies, a library instruction classroom, and a full scope Media Services department. (TLCD)

#### **Frank P. Doyle Library, Santa Rosa Junior College, Santa Rosa, CA – USA 2006**

The new Main Library for Santa Rosa Junior College sits at the heart of the oak studded brick campus. Working with Shepley Bulfinch Richardson and Abbott Architects of Boston, this new 145,000 s.f. Library comfortably fits into the historic campus.

Student use of the Library has increased three to four times since opening in the fall of 2006.

This library design focuses on an environment for teaching and learning information literacy. Collaborative work environments such as group study rooms, a coffee bar, and Center for New Media for faculty and staff make the library the social, cultural and symbolic center of the campus. A museum quality Art Gallery and bustling Tutorial Center reinforce the vibrancy of the building. Furniture selection and interior design for collaborative work were a paramount concern in the design of the new library.

The Frank P. Doyle Library incorporates a number of strategies to make the facility more sustainable. To accomplish this, and to increase the long-term efficiency in operational costs the building employs a variety of strategies including Thermal Energy Storage Ice Banks and a 58 Kilowatt photovoltaic array on the roof. (TLCD)

### **Tom Eliot Fisch, San Francisco, CA – USA**

<http://www.tomeliotfisch.com>

#### **Libraries:**

#### **North Branch Library, Berkeley Public Library, Berkeley, CA – USA 2012**

Tom Eliot Fisch in association with Architectural Resources Group was selected to rehabilitate and expand the Berkeley North Branch Library, a Berkeley City Landmark designed by architect James Plachek in the California Spanish style and constructed in 1936. Maintaining the majority of its historic features, the library is a cherished centerpiece of the Solano Avenue neighborhood and the busiest of Berkeley's four existing branch libraries.

The 5,000 sf one-story building was expanded with a two-story, 4,200 sf addition. The LEED Silver project restores the historic central rotunda and reading rooms, including decorative finishes and original furnishings and adds staff work areas, a teen library, a community room, accessible restroom and other support spaces. (Tom)

#### **Glen Park Branch Library, San Francisco, CA – USA 2007**

An uplifting double-height space filled with natural light, a grand stairway, and public art beckons neighborhood residents from the street to the public library above. Located on the second level of a residential mixed-use development, the new 9,200-sf branch features a separate teen area, a multipurpose activity room, children's area, and main reading room with computers and adult and non-fiction collections. Ample floor to ceiling windows along the perimeter of the library offer panoramic views to the Glen Park neighborhood and nearby Mt. Davidson.

Interior Architect: Tom Eliot Fisch

Building Architect: Sternberg Benjamin Architects, Inc. (Tom)

#### **Marina Branch Library, San Francisco, CA – USA 2007**

Perched on the edge of a public park adjacent to tennis courts, a playground, community center and public school, this well-loved mid-century neighborhood library needed updating and a little more room. Working with the local community, the architects preserved the building's original residential character and generous daylight, while enhancing library functions and adding a new reading room, children's area, additional space for stacks, and state-of-the-art technology.

Joint Venture Architects: Tom Eliot Fisch and Field Paoli. (Tom)

### **Trahan Architects, Baton Rouge, LA – USA**

<http://www.trahanarchitects.com>

#### **Libraries:**

#### **Baton Rouge Downtown Library, LA – USA 2009 on design**

Louisiana based [Trahan Architects](#), a firm with expertise in institutional design and religious architecture (check the [Holy Rosary Church Complex](#), remarkable project), recently unveiled conceptual design for the renovation and expansion of the River Center Branch Library. The project stands at the intersection between civic buildings and the city's arts and entertainment district, overlooking a new town square. This new building becomes an urban piece, exposing the interior activity to the outside with a rippled translucent skin. But also the library takes care of the exterior, with reading areas and a urban patio. As with changes on how people consume information, the typical library approach as a storage/reading facility gets obsolete. In response to this, the project is a public place for gathering and sharing around information, with circulation patterns that place stationary structures in the center of the floors and create space for staff and patron interaction, with movable parts and multiple paths along the perimeter. During this days, the changes of information trough technology challenge library designs, while offering an opportunity to become important public spaces among our cities. In this way, I think this concept has a good start. (archdaily)

## **Bernhard Tschumi Architects, New York NY - USA, Paris –France**

<http://www.tschumi.com>

### **Libraries:**

#### **Institut Le Rosey, Rolle, Vaud – Switzerland in construction (2013)**

Le Rosey is located on the shores of Lake Geneva, near Rolle. Among the most prestigious educational institutions in Europe, the school is alma mater to diplomats, business leaders, and royalty. The existing campus has a cohesive, traditional architecture marked by mansard roofs and a wedge-shaped campus plan that opens onto the site, defining an open-ended court. The design began with the question of how to expand the campus with a contemporary building, fostering a dialogue between tradition and modernity, while updating the arts and performance facilities for a new generation of students. The winning scheme proposes a low, stainless-steel dome that defines the site and spatially organizes the disparate parts of the program: an 800-seat concert hall, a black box theater, conference rooms, a learning center joined to a library, a teaching center, practice rooms for music and the arts, and several relaxation spaces featuring a restaurant, a cafe, a student lounge, and other amenities. A series of side openings articulates the periphery of the dome, and a terrace is cut into the center near the apex, offering views of Lake Geneva. The main interior space is the concert hall, with programmatic zones around its periphery that are articulated into an architectural promenade. From the campus, the keystone-shaped terminus of the quadrangle forms a ceremonial entrance to the project and the slope of the dome echoes the undulating landscape near Rolle. The reflective steel will provide a distinctive identity and a landmark for the school and the region. The building's compact shape minimizes its external surface area, acting as a thermal shield. This provision reduces energy consumption and shelters the large interior spaces under the dome with a minimum of material. The reflective polished steel offers additional energy savings over traditional cladding materials and shelters the glazed areas from sun and inclement weather. (Tschumi)

## **URS Corporation, San Francisco, CA – USA**

<http://www.urscorp.com>

### **Libraries:**

#### **Auburn High School, Auburn, MA – USA 2006**

### **Awards:**

**Winner of the 2007 Award for Design Excellence from the Boston Society of Architects**

URS provided project management, construction management and commissioning services for a new, \$39.5 million high school in Auburn, Massachusetts. The 175,000 square foot facility—including athletic fields—was built to serve 800 students. The building's architectural elements include an innovative terracotta rain-screen cladding system with aluminum sun shades to control daylight into the classrooms, an atrium with continuous clerestory and circular skylights, and a dramatic arc of classrooms which open to the dining commons. The athletic complex is comprised of three infill turf fields—football/soccer with track, lacrosse/field hockey and baseball, and a natural-surface softball field. The project is adjacent to a brook, which made attention to conservation issues critical. URS' early involvement contributed to the project's success. The company conducted constructability reviews during the design phase and contributed to post-bid value engineering following an increase in steel prices. ( URS )

The overall program for the new 800-student high school project was vast and encompassing. The town was interested in openness, daylighting and technology for both the classrooms and the building as a whole. The central atrium is the heart of the school, linking the various academic spaces. Continuous clerestory glazing floods this area with daylight, and a copper wall reflects this incoming daylight. When daylight levels drop, sensors in this space switch on the ceiling lights. The projecting balconies, situated along the east wall of the atrium, provide an ideal spot for student observation, and teachers can see the entire length of the building from this vantage point. The new high school is a technologically rich environment. Several classrooms are equipped with interactive whiteboards. This technology is gradually being worked into the educational program throughout the high school. In addition to several computer labs, the project included seven laptop carts, which remain charged and can be checked out by any teacher, essentially making any classroom an interactive computer lab. #### **Cuyahoga Community College, Technology Learning Center, West Campus, Parma, OH – USA 2002**

54,000 sqf., \$ 13,000,000

Note: Area: 35,000 sq. ft. (Technology Learning Center); 30,000 sq. ft. (Library renovation); Cost/Square foot: \$180 (new construction); \$46 (renovation)

The metro campus of Cuyahoga Community College (CCC) was designed in 1967, and features a series of instructional buildings on a downtown/midtown 27.5-acre site atop a parking garage at grade. As an response, students, faculty and visitors access the main level walkway/plaza system via steps and elevators to reach their intended destination. Daylight was not a key ingredient in the original campus design on the elevations facing the community, and the views to and from the community beyond the campus are few and unrevealing of the occupants, as many buildings feature perimeter corridors. Most buildings are two and three stories in height, with the original Library Building rising to six levels as a central landmark. The challenge was to develop a Technology Learning Center (TLC) that “will be a national model for technology learning.” Administrators also asked for a design that respected the campus' architectural vocabulary, but was less Brutalist in its design. The resulting program analysis identified a need for a program area of 35,000 square feet for the TLC, as well as expanded administrative and student service space. The essential program elements of the project include six electronic classrooms (accommodating 26-40) and a TLC with study/workstation areas for 150, as well as areas for staff support, staff curriculum development, equipment storage and maintenance, and accessible restroom facilities. The design delivered an addition on the north, east and south sides on the annex that respects the campus vocabulary, while developing a facility that admits controlled daylighting for instructional benefit and visibility to the community. Plaza-level occupancies feature six electronic classrooms, two of which feature high-resolution, large-screen videoconferencing capabilities, as well as state-of-the-art technology learning tools and systems. The other four classrooms have high-resolution

monitors and LCD projection for media display, video projection cameras, integrated touchscreen controllers of video and data media, and flexible seating over raised flooring systems. The second level features the TLC—a 17,000-square-foot room with workstations for individual and team learning, and interaction with dispersed faculty and staff workstations, also on raised floors for flexibility to reconfigure settings quickly and cost-effectively. The facility's interior features height-adjustable work surfaces, ergonomic seating and distributed technology for full accessibility. In addition to the animated window mullion configurations, the technological nature of the elements housed is expressed on the interior with perforated metal balcony and stair railings, sleek furniture and colorful textured fabrics. Learning space integrates a high-tech infrastructure to support a variety of teaching platforms required to "up-skill, re-skill and re-deploy" the workforce. (<http://schooldesigns.com>)

#### **Central Michigan University, Park Library and Information Center, Mount Pleasant, MI – USA 2002**

see also: **Woolen, Molzan and Partners**  
305.755 sqf., \$ 36.004.000

The 40-year-old library was crowded and lacked efficiency and modern resources. The plan included the removal of the existing skin and dissecting a large hole within the rectangular building to create an open, central atrium. A new sculpted masonry exterior unfolds to reveal a blue glass curtainwall. An abundance of sunlight penetrates the building, and the interior an array of vivid color. The Library and Information Services Center (LISC) contains client/server technology supported by ATM infrastructure that integrates multimedia information into group and individual learning settings. The facility accommodates 1.3 million volumes, 90 percent of which is in 33 miles of electronically operated, compact shelving—one of the largest installations in North America. The Clarke Historical Library, situated within the LISC, is a large archival facility containing one of the finest children's collections in the United States. It is a secure temperature-, humidity-, dust-, mold- and gas-controlled 20,000-square-foot facility containing rare collections of documents, books, photographs and paintings. Additional amenities include specialized instructional areas, multimedia labs and classrooms; an auditorium (a 145-seat high-tech, multimedia facility); the Baber Room, an art exhibit/reception complex; and a cafe. (<http://schooldesigns.com>)

#### **Lake Orion High School, Lake Orion, MI – USA 1997**

377.756 sqf. , \$ 48.900.000

The community's vision for the Lake Orion High School was to provide a state-of-the-art research facility that internally preserved the small, traditional, student-oriented high school of the past, while accommodating growth pressures that promised to propel the 900-student body to more than 1,600 by the year 2000. This facility would be the ultimate center; therefore all resources such as the auditorium, swimming pool and the gymnasium would be readily accessible from the main entrance. Second, the 1,600-student body would be divided into four, 400-student houses that could function independently, but also would have access to shared community facilities. Finally, the administrative area would be referred to as the student-services center and would occupy the central position in the academic floor plan, typically reserved for the library. Because traditional library resources are accessible by computers from every classroom, the library was reconceptualized as a decentralized reading room and group-research activity center. The tech-ed labs, studio classroom and science labs are located near the media center to create a high-tech resource center that supports the integration of critical thinking, research and mechanical skills. Each of the four, 400-student classroom units includes computer rooms, research areas, student lockers and faculty offices. The steep slope of the site allows two classroom units to be stacked adjacent to the centralized student services area and the skylighted student commons. All four houses function independently, yet also share academic resources. Two large-group instruction rooms are provided to hold lectures and presentation for groups as large as 80 students. The school cafeteria evolved into a central commons space with a dramatic cone-shaped roof, topped with a skylight that floods the space with natural light. The steeply sloping site selected for the new facility was half-covered with protected wetlands. These wetlands and the adjacent forestlands serve as outdoor classrooms for environmental science classes. The auditorium, gymnasium and pool are placed adjacent to the parking areas to allow easy access. The two-story facility is stepped into the natural slope, allowing public access to community facilities to be vertically separated from student access and permitting classroom spaces to have sweeping views of the adjacent Bald Mountain State Forest.

#### **Libraries:**

#### **Yuma Main Library, Yuma, AR – USA 2009**

The Main Library in Yuma, Arizona is a 76,000 sqf. facility in the center of this fast-growing community and the anchor of a six-facility Country-wide Library system. The facility has a capacity of over 250,000 volumes. WI FI services, self-check, unique study areas, and specialized lighting at the stacks make the library user friendly. The Youth Services area, Children's area, and a space for "Twins" are uniquely designed for their respective age groups. Four community rooms with flexible layout and the central administration are also included in the design. Two items stand out as key design factors. One was a simple and a common request: abundant natural light. Through the use of an innovative floor plan the design team was able to maximize the amount of eastern and northern light while almost eliminating exposure to hotter southern and western sun. Emulating the grand reading rooms of another area, the central space is a 2-story atrium flooded with natural light. Spaces where natural light is not desired, situated along the southern facade, serve as a thermal buffer. The building's northern facade is dominated by a series of outdoor reading and activity spaces that visually flow to the interior through the use of floor-to-ceiling glass that virtually eliminates solar heat gain and glare. The second request was to create a plan that would allow for a drive-through return slot that could use the same sorting machine as the walk-up return slot. And just to make it interesting could VCBO please add a drive-through pick-up window as well? These functions have been incorporated in the final design without the need for complex, expensive conveyors or increased staff. (VCBO)

#### **San Luis Library, San Luis, AZ – USA 2008**

The San Luis Complex comprises a new 22,000 sqf. Library, 60,000 sqf. Meeting rooms, and a 20,000 sqf. Satellite facility for County services. Both buildings share the site and are joined by a common community plaza and amphitheatre. The satellite facility includes the county Assessor, a Court facility, Clerks', Probation, Board of supervisors and Sheriffs offices, and a Community auditorium. The County Health Department has a large presence in the new facility with spaces specifically designed for W.I.C programs, inoculation, and programs tailored to Seniors' needs. (VCBO)

#### **The City Library, Salt Lake City, UT – USA 2003**

2003 Best Public/Institutional Building-PCI (Precast/Prestressed Concrete Institute) Design Awards

The Salt Lake City Main Public Library features a triangular-shaped main building, an adjacent administration building, a glass-enclosed Urban Room and an exterior public piazza. A curving climbable wall weaves the site together and contains shops and food establishments as well as steps ascending to a roof garden above. The building glass-enclosed Urban Room and piazza flow together uniting interior and exterior spaces. The Urban Room is conceived as a space for all seasons, generously endowed with daylight, open to significant views and, since it extends the full height of the building, is a pivotal point of visual orientation. Multi-level main reading areas along the transparent southern façade of the building look out onto the piazza, the city and the Wasatch Mountains beyond. At night the glass façade, lit from within, is reflected in a crescent-shaped reflecting pool extending into the outdoor space. (VCBO)

### **Libraries:**

#### **[Darla Moore School of Business, University of South Carolina, Columbia, SC - USA 2014/2015](#)**

We are pleased to announce that the University South Carolina celebrated the “Topping Out” of the new building for the Darla Moore School of Business in a ceremony held at the construction site on February 4, 2013.

The Darla Moore School of Business, globally renowned for its international business program, has until now been housed in a small, 1970s-era building located near the university’s historic Horseshoe, site of the original campus established in 1801. The new building—designed by Rafael Viñoly Architects and commissioned by alumna and namesake Darla Moore through a \$ 70 million donation—will provide an environment well suited to answer the challenges of a 21st century business school.

The building program effectively provides the school’s curriculum and stimulates learning through the most up-to-date means of technology. The building also features a green rooftop terrace, which coupled with a courtyard and perimeter terraces areas, work to promote interaction and collaboration between faculty, students and community members. (Viñoly)

#### **[City College of New York, Bernard and Anne Spitzer School of Architecture, Urban Design and Landscape Architecture, New York, NY – USA 2009](#)**

12.170 m<sup>2</sup>.

Having worked successfully on previous projects for the City University of New York (CUNY) system, Rafael Viñoly Architects PC was chosen to design, construct and select the site for this new CCNY building. The firm explored a variety of relocation sites and renovation options before determining that overhauling an existing structure – a five-storey, modernist glassblock building designed and constructed as a library in the late 1950’s – would be most conducive to the college’s needs. RVA gut-renovated the poorly maintained building, preserving only the structure of reinforced concrete columns and floor slabs. The renovation has provided a 135,000 sq ft facility housing administrative offices, classrooms of varying sizes, an exhibition space, an architectural library, design studios, faculty offices, a model shop, mechanical rooms, a rooftop open-air amphitheatre and a separate facility for the City College Architectural Centre - an outreach group that provides advocacy and planning and design assistance to community organizations. The new structure is highlighted by its central atrium, which allows daylight to illuminate the building from the roof down to the ground floor. The atrium features an intersecting series of steel staircases and pedestrian bridges, facilitating circulation throughout the building and establishing connectivity and sightlines between floors. The striking walkway system promotes interactivity and spontaneous encounters among students and faculty. Additionally, partial mezzanine levels are inserted above the studio floors to provide space for faculty offices. These offices look over the open-plan design studios through interior glazing to a space along the building’s perimeter that maximizes daylight in the studio areas. The corridors on the studio levels are wide, double-height areas that accommodate lounges for informal discussion, while narrower balconies overlook these lounges and provide circulation on the office levels. In what has become a trademark of Rafael Viñoly Architects’ institutional and educational projects, this layout promotes interaction and fluidity of movement through innovative design solutions. The building’s exterior is clad in pre-cast concrete, with deep shelf-like openings that on installation will feature aluminum sun-shading louvers. Oriented vertically on the east and west facades, and horizontally on the south façade, the louvers are designed to balance outward views with maximum shading to reduce heat gain to the interiors. On the roof, an open-air amphitheater overhangs the atrium, with a full-height clerestory around three sides that admits natural light into the building. The amphitheater provides additional teaching and program space, with wide, unobstructed views to the south over Central Park and the skyline of Midtown Manhattan. This south-facing orientation also reduces direct sun exposure and thermal heat gain on the clerestory glass, even as the auditorium’s contoured underside creates a funnel to scoop natural light down into the atrium. On the building’s periphery, Landscape Architect Lee Weintraub’s design accentuates the main entrance, creating another accessible congregation point for students. ([www.worldarchitecturenew.com](http://www.worldarchitecturenew.com))

By the late 1990s, the School of Architecture, Urban Design, and Landscape Architecture (SAUDLA) at the City College of New York (CCNY) had outgrown its home in Shepard Hall and needed a new facility. Having worked successfully on previous projects for the City University of New York (CUNY) system, which includes CCNY, Rafael Viñoly Architects was chosen for the site selection, design, and construction administration of this new building.

The firm explored a variety of relocation sites and renovation options, before determining that overhauling an existing structure—a five-storey, modernist glass-block building designed and constructed as a library in the late 1950s—would be most responsive to the college’s needs. Decades of evolving academic and administrative needs had transformed the original site into a fractured, generally inadequate collection of administrative offices, which were relocated prior to the renovation.

Rafael Viñoly Architects completely renovated the poorly maintained building, preserving only the structure of reinforced-concrete columns and floor slabs. The firm cut a large opening in each floor plate to create a central atrium that directs daylight down from the roof to the ground floor. A series of stairs and pedestrian bridges pass through the atrium to facilitate circulation through the building and to establish connectivity and sightlines between floors so as to promote interactivity and spontaneous encounters.

Additionally, partial mezzanine levels were inserted above the studio floors to provide space for faculty offices. These offices look over the open-plan design studios, through interior glazing, to a double-height space along the building perimeter that maximizes daylight in the studio areas. The corridors on the studio levels are wide, double-height volumes that accommodate informal lounge areas for relaxation and socializing, as well as pin-ups for studio “crit” spaces. Narrower balconies overlook the lounges and provide circulation on the office levels.

The exterior is clad in precast concrete with deep, shelf-like openings into which are set aluminum sun-shading louvers scheduled to be added in late 2010. Oriented vertically on the east and west façades, and horizontally on the south façade, the louvers are situated to balance outward views with maximum shading to reduce heat gain to the interiors. On the roof, an open-air amphitheater overhangs the atrium, with a full-height clerestory on three sides that admits natural light into the building. The amphitheater provides additional teaching and program space in temperate weather, and wide, unobstructed views of the midtown Manhattan skyline. (Viñoly)

### **Brown University, Watson Institute for International Studies, Providence, RI – USA 2002**

2002 5,017 m<sup>2</sup>

The Watson Institute evolved from Thomas J. Watson Jr.'s vision of a research and teaching center that would address the most pressing global problems of the day. It promotes the work of students, faculty, visiting scholars and policy makers who analyze contemporary global problems and develop initiatives to address them.

The program includes offices for researchers, an extensive library, classroom space for international relations courses, and larger conference spaces for seminars and lectures.

The latest telecommunications facilities have been designed into the building in order to integrate its users with events occurring around the world. Initial space assessments for the new structure allowed for a significant increase in available square footage to accommodate research programs and growth in the number of visitors to the Institute.

Originally dispersed across five locations on the Brown University campus, the Watson Institute is now consolidated on a site near its center. It is the first building in a new academic quadrangle being developed by the university. The design seeks to maximize interaction among research groups, mainly by organizing circulation in a triple-height atrium that runs nearly the entire length of the block-long site and bathes the interior in natural light.

The spaces that make up the shared resource “pods” of the program are on one side of the atrium. (Viñoly)

### **Oxford University Masterplan, Oxford – UK 2009**

In the heart of Oxford, the oldest university in the English-speaking world has created what one don calls a “desert”. Apart from three listed buildings, the former Radcliffe Infirmary site has been razed, leaving an expanse of bare earth interrupted only by mounds of rubble, danger signs and yellow mechanical diggers. But next Wednesday, the first three elements of the site's rebirth — as envisioned by masterplanner Rafael Viñoly — go to Oxford City Council's strategic development committee. The old outpatients wing is to be remodelled for the Ruskin School of Drawing & Fine Art, the main infirmary building will be refurbished — probably for the university's central administration — and a new housing block, designed by Niall McLaughlin, will be built for the adjacent, Somerville College. It should be an exciting moment, yet amid the quads and manicured college lawns, many of Oxford's congenitally sceptical dons fear the university may be embarking on an expensive folly. Occupying a 4ha slice of central Oxford, sandwiched between Somerville and Green Templeton colleges, the site has long been on the university's wishlist. In 2003 it finally bought the land from the NHS and the last of the health facilities moved to the new John Radcliffe Hospital in Headington. A masterplan by Viñoly followed, aimed at opening up views of the 18th century Radcliffe Observatory at the northern end of the site and creating new buildings for maths, a newly created humanities division and a new Institute for Public Policy paid for by a secret billionaire donor, who BD can now reveal is the Russian-American oligarch Leonard Blavatnik. William Whyte, a fellow of St John's College who is writing an architectural history of red brick universities, accepts that some of the new buildings are necessary. “It's a funding issue,” he says. “The university gets more and more of its money from research and the only way you can increase that is through more space.” But, he adds, this only takes one so far. “They've got a huge yawning site and need to find ways of filling it. So they've folded in a whole number of other things like library space and seminar rooms which are already well provided for.” Another reason for the expansive Viñoly masterplan was to avoid the horrors of Oxford's post-war science buildings, which are an “absolute mess” due to bad planning. But masterplans can create their own problems, Whyte warns. “You wonder about combining architects and masterplanners as you can end up with something extremely homogeneous. You can promise that the masterplan is going to be infinitely flexible but it's never quite true.” Like many of his fellow dons, Whyte says that symbolism is just as important as practical considerations. He thinks that Oxford has looked enviously to Cambridge where the university departments matter more than the colleges, thanks to modern campuses like the Sidgwick site which houses the arts faculties. Partly as a result, Oxford University, for so long in a losing battle for recognition with its well endowed colleges, is hitting back with the Viñoly masterplan. “It's a public demonstration — we are a modern university with modern departments,” Whyte says.

But what of the buildings themselves? Insiders says that the Viñoly-designed maths building has been changed into a series of smaller “pavilions”. Meanwhile the humanities building designed by Bennetts Associates has raised eyebrows because of its underground library. Rick Mather, who has a project across the road at Keble College, will not be drawn on the Viñoly plan's overall merits but describes the humanities building as a “shopping centre”. The chairman of the council's strategic development committee, Roy Darke, wonders about the lack of architectural flair. “It could end up being very boxy, uniform in height, undramatic architecturally. You could end up with monotony and the worst case scenario is a sixties office block.” He is pushing for changes to be made to the building's atrium. “They're trying to create a big atrium that will go down two storeys and look towards the observatory and have a library in there. I think they could be more sculptural and thoughtful about what that's like.” Geoffrey Tyack, a fellow of Kellogg College and author of *Oxford: An Architectural Guide*, says there have been few successful modern buildings in Oxford, with most of the adventurous ones coming not from the university but from the colleges. “There's a tendency in any big organisation to cut themselves off from what going on, and build castles in the air,” he says. “I think there's a little bit of this going on here. Like so much contemporary educational architecture it could be very dull and ordinary.” Richard Wentworth, outgoing head of the Ruskin school of art, believes Oxford is in thrall to a faux ancientness which is actually Victorian in origin. He believes it has once again missed an opportunity to be modern: “Finding the content for the infirmary site should be a major European project, celebrating the fugitive or migratory experience of ‘now’, not clutching at old cushions and trying to plump them up,” he says. The most secretive and controversial element of the site is the Blavatnik-funded building for the new Institute of Public Policy. The building is mired in uncertainty and paranoid secrecy after a design competition shortlisted five architects: Dixon Jones, Make, John Simpson & Partners, Stanhope Gate and Wilkinson Eyre. Insiders say the university had narrowed it down to two but was unable to decide between the traditionalist design of John Simpson and the more modern Dixon Jones proposal. Amid growing confusion, a public exhibition of the designs was cancelled at the eleventh hour before it emerged that Robert Stern, dean of Yale's architecture faculty, had been parachuted in to bring fresh thinking — a move greeted with incredulity by many of the shortlisted teams. The plot has since thickened further.

“Oxford hated his designs and Stern is now being presented as a political rather than architectural figure,” one architect comments. Another says: “I'm hopping mad because you put a lot of time, money and effort in and hear nothing.” He adds that the delay has been caused because Blavatnik is more preoccupied by the world's money markets than “a series of designs that he isn't getting particularly excited by”. Sadly no one at Oxford's estates department or at Stern's architecture practice in New York will comment on the competition. Rafael Viñoly Architects also declined to comment, and the

architects on the shortlist have not been told what is happening or when a decision will be taken. Oxford's academics say they have become used to such a lack of transparency under outgoing vice chancellor John Hood. Nicholas Bamforth, a fellow at Queen's College, says the entire Radcliffe Infirmary scheme has been "very much a fait accompli" rather than something that has been openly debated. "It's all the brainchild of the outgoing vice chancellor and those around him," he says. "So it has been rather steamrollered through. [Hood] likes big building developments but whether that's what's needed remains to be seen." David Adamson, head of estates at Cambridge University between 1998 and 2007, will not comment directly on Oxford's controversies. But he does make one point that wittingly or not carries implied criticism of the approach taken to the Institute of Public Policy. "We said straight away we were never going to have an RIBA [type] competition," he says. "We would appoint architects on their ability to design, their track record and on their initial ideas." He believes that, all too often, design competitions force architects into sticking to flimsy early designs that they would much rather revise. In contrast the Cambridge approach "means you don't get a quick snapped scheme", he says. Perhaps when the new vice chancellor Andrew Hamilton — who, like Stern, is heading over from Yale where he has been provost — looks at the books, he will call for the scheme to be scaled down, particularly with rumours that the Estates Department lost £30 million in the Icelandic banks. Even dons like Robin Briggs, at All Souls, who are optimistic about the designs, have doubts about the cost of a scheme fashioned at the height of the economic boom. "There is already a financial crisis in the humanities at Oxford with a structural deficit of between £6 and £8 million a year," he says. "At the moment the university is receiving very large amounts of money from the Oxford University Press but it can't be guaranteed in the future. So just how much of this can be done remains to be seen." William Whyte puts it more bluntly still: "Whether the Radcliffe Infirmary site scheme is ever built is a good question."

### **University of San Andrés Library, Province of Buenos Aires – Argentina 1999**

3.000 sqm

The campus of the University of San Andrés in Buenos Aires employs a distinct architectural vocabulary, with extensive use of brick, exposed concrete, and broad eaved overhanging roofs. The main shortcoming of its master plan had long been an open-ended circulation scheme lacking any apparent conclusion. The new building, besides meeting strictly functional criteria related to its purpose as a library, was also meant to provide a circulation terminus and to serve as a visual focus for the campus. The brick and steel of the trapezoidal building's main volume echo the surrounding buildings, as do the broad eaves of the roof, which enhance the reading environment within by allowing only diffuse light to enter the building. Emerging from the metallic roof is the library's main architectural gesture, an elevated cube of double-glazed translucent glass that admits light during the day and emits a soft glow at night. The cube, besides allowing the introduction of natural light into the heart of a building much larger than those surrounding it, also acts as a campus landmark: whether reflecting or emitting light, it accentuates the profile of the library, defining it as the center of university life and as the meeting place of the academic community. The library roof is formed by four non-identical trapezoids defined by the line segments joining the corners of the central cube with those of the main volume. A notch cut into the roof sheltering the principal façade defines the building's entrance. (Viñoly)

### **VSBA Venturi, Scott Browns & Associates, Inc., Philadelphia, PA – USA**

VSBA, LLC, is the successor firm to Venturi, Scott Brown and Associates, Inc., which was founded by Robert Venturi and Denise Scott Brown. Our principals and staff build on our founders' philosophy — an ethic rooted in social planning, contextual design, and responsibility to our clients — to offer design that's sensitive, pragmatic, and creative.

After over fifty years as two of the world's preeminent architects, Robert Venturi has retired from practice while Denise Scott Brown continues to publish and present her work.

#### **Libraries:**

### **Dumbarton Oaks New Library Building, Washington, DC – USA 2005**

Dumbarton Oaks recently celebrated the opening of its new library, designed by Venturi, Scott Brown and Associates, Inc. The 42,960 sq ft, \$18,000,000 facility was created to house the institution's noted collections in a state-of-the-art environment and provide additional research space. The project was directed by Principal Daniel McCoubrey and managed by Senior Associate James Wallace. The 5-story library is part of a complex of three McKim, Mead and White buildings amidst the Beatrix Farrand landscape at the edge of the formal estate gardens. The library's form is derived from the landscape: the red brick and limestone east façade connects with the complex's neo-Georgian structures while the west façade is terraced in relation to Farrand's wooded "Dell" landscape. The library mediates between the ordered court and the Romantic landscape. Our extensive site work helped to knit project components within the existing landscape and to protect and restore original features of the gardens. Across from the library, the original chauffeur's house long served as home for Dumbarton Oaks' directors. It will now contain dining and kitchen facilities for fellows and staff. Renovation of the original "Cool House," a greenhouse, provides primary reading space, library services, and archives storage. Across the Dell, VSBA designed the Gardeners' Court building to house a new central plant. We're also renovating the original Main House for gallery use and administrative purposes. (Venturi)

### **Schlesinger Library Renovation, Radcliffe Institute for Advanced Study, Harvard University, Cambridge, MA – USA 2004**

VSBA programmed and designed a renovation of the Arthur and Elizabeth Schlesinger Library for the History of Women in America, one of a group of buildings at the head of historic Radcliffe Yard. Built in 1907 and originally home to the Radcliffe College Library, the building became a research library in 1967. It's now an important component of the Radcliffe Institute for Advanced Study.

Over time, the building became more intensely and densely used to meet the needs of a modern special collections library. In the process, most of the character, grace, and generosity of the original building interior was obliterated. Our challenge was to help the Library recover some of its character while meeting the 21st century needs of an important collection and contemporary caretakers and users. We:

- improved building systems to ensure security and long-term preservation of collections
- facilitated library staffing and function by consolidating service points and public access
- improved building entry sequence and enable connectivity between public spaces in Radcliffe Yard buildings
- reclaimed some of the building's historic significance and ethos.

This project was the first increment of the Radcliffe Institute's campus plan, completed by VSBA in 2002. Our renovation supports the goals of the overall plan, with exhibition and meeting space on the first floor and a newly accessible entrance from Radcliffe

Yard. An area of the second floor was returned to double-height reading room space, and existing original building elements — such as the ornamental stair and the Sarah Wyman Whitman Room — were refurbished and maintained in public view. The renovated Schlesinger Library has been LEED Certified for its efficiency, environmental sensitivity, and sustainable approach to interior environments. (VSBA)

#### **Baker/Berry Library and Carson Hall, Dartmouth College, Hanover, NH – USA 2000 / 2002**

10,000 sf new, 25,000 sf renovated, \$ 7,525,000

#### **Awards:**

**National Honor Award, AIA, 2002;**

**Illumination Design Award, The Illuminating Engineering Society of North America, 2000**

Baker Library, the College's beloved humanities and social sciences library, has been the center of academic life at Dartmouth College. The Berry addition doubles the size of the existing facility and accommodates new public functions, technical services, reading areas, a café, and the computing services and History departments. The original Baker Library building, essentially unchanged since its construction in 1929, was renovated to accommodate new mechanical systems and comply with current fire and life safety codes. Certain traditional reading rooms and gracious public spaces were carefully restored.

The expanded library occupies a pivotal site between the proposed academic row on one side and the College's New England commons — the College Green — on the other, thus becoming a focal point at the heart and crossroads of both old and new campuses. The Berry addition extends the library north, anticipating and helping to generate orderly campus development in that direction. Its linear form and imageful north facade terminate the axis of the new row and identify it much as the existing south facade of Baker Library defines the College Green to the south. (VSBA)

#### **Rauner Special Collection Library in Webster Hall, Dartmouth College, Hanover, NH – USA 2000**

VSBA's challenge was to transform an underutilized building on an important site into an accessible, functional, and visually evocative library for rare books and manuscripts with a secure and carefully controlled environment. The scope of the renovation included a reading room, study and seminar rooms, offices, and technical support spaces.

Our design preserves the monumental interior hall as the reading room. As the original exterior walls of the building could not effectively provide thermal and moisture protection for the controlled collections space without substantial modifications, an aluminum and glass curtainwall enclosure was designed to create a transparent "building within a building." This glazed "lantern" of book stacks maintains temperature and humidity levels for the sensitive collection, protecting them in a vapor-tight environment while making them more visually accessible.

The reading room accommodates 36 users and is surrounded by shelves of reference materials. Office and seminar rooms beneath the balconies are acoustically isolated to allow groups the use of collections with contemporary audio and visual media. Above, the mezzanine provides students with a comfortable and quiet study area, with views from the large windows to the surrounding campus, lending an outward focus to a building that had formerly been oriented towards an interior stage. Additional book storage is accommodated in an adjacent underground area with vegetative roof to blend seamlessly into the surrounding landscape. The new Special Collections Library is a dialogue between the original neoclassical and the new. The machine-like curtainwall is juxtaposed with gentle detailing on the walls, ceiling, and balcony front, while the millwork and curtainwall relate to the original building's variety of scales. (VSBA)

#### **Historical Society of Pennsylvania, Philadelphia, PA – USA 1999**

35,000 sf, \$ 5,343,000

VSBA prepared a phased plan for extensive renovations to assist this venerable Philadelphia institution in achieving its goal: "To be the most important place for studying four centuries of Pennsylvania and family history with the best special collections library in its field." Earlier additions and renovations resulted in inefficient and inappropriate use of spaces, labyrinthine circulation patterns, unclear separation of back-of-house (staff) and front-of-house (public) spaces, inadequate environmental controls, and historically compromised interior spaces.

We moved public functions — reader services, the reading room, browsing stacks, and microform study — from the second floor to renovated and restored spaces on the ground floor. The original balconied assembly room, largely demolished when interfloored in the 1970s, was restored as a reading room. Collection storage capacity has been significantly increased by fully utilizing a available space and adding compact shelving. Patrons can now use OPAC terminals for catalogue searches and computer data terminals are available at every seat in the reading room.

Renovated public spaces and collection storage areas are served by a new chilled water plant and humidity control system designed to maintain environmental conditions within strict ranges needed for collection conservation. UV shielded lighting and fire suppression equipment were added to renovated areas, and the security system was upgraded throughout.

Future work includes improvements to collection storage, work areas, and other spaces made available by the relocation of public functions to the ground floor, plus extension of the new environmental control systems to those spaces.

Venturi, Scott Brown and Associates, Inc. (VSBA)

#### **Restoration of the Furness Building / Fisher Fine Arts Library, University of Pennsylvania, Philadelphia, PA – USA 1991**

Date Constructed: 1888-90, Architect(s): 1991, Frank Furness; restored, Venturi Scott Brown and Associates with Clio Group and Marianna Thomas Architects

Participating AIA Philadelphia Members: VSBA, LLC, Marianna Thomas Architects

The library is one of the finest remaining examples of the work of Frank Heyling Furness (\*November 12, 1839 Philadelphia, PA – +June 27, 1912 Nether Providence Township, PA). When completed it was the most innovative library building in the country. It was one of the first to separate the reading room and book stacks. Books were kept in a separate wing, which was designed so that the rear wall could be removed on jack screws and new bays added as additional space was needed. Within the book stacks, translucent glass floors allowed light to penetrate from the sloping glass roof.

The most impressive interior spaces are the catalog room and the reading room. The catalog room is dominated by a monumental fireplace. The reading room is surrounded by study alcoves and lit from windows above. Curved iron beams radiate from the center of the ceiling to delicate terra-cotta leaves on top of the brick pilasters.

Like most of Furness' buildings, the exterior was highly controversial. It contains a rich use of brick and stone with terra-cotta panels, short heavy columns and unusual details, such as the scalloped crenelations on the tower and gargoyles on the north end.

Robert Venturi was one of the first contemporary architects to recognize the importance of Furness's work. It was fitting, therefore, that Venturi, Scott Brown, and Associates was chosen to restore the building.

#### **Fisher and Bentheim Halls, Princeton University, Princeton, NJ – USA 1990**

Architects: Venturi, Scott Brown and Associates, Inc., Location: Princeton, NJ, Client: Princeton University, Area: 54,000 gsf  
Construction Cost: \$16,800,000, Completion: 1990

Fisher and Bendheim Halls contain Princeton's Economics Department and Center of International Studies in a single building. Structurally, they connect at every floor level to the existing red brick Corwin Hall; they also connect to the 1960s Woodrow Wilson School via an underground tunnel and by the extension of the grade-level plaza and pedestrian steps. Though most of the building houses faculty offices, there are also larger classrooms, a library, seminar and computer rooms, and graduate study and meeting areas. Extensive site design and massing support Fisher and Bendheim Halls mediation between the domestic scale of the private, historical Eating Clubs along Prospect Street and the main campus's larger, stylistically varied institutional structures. The building has distinct entrances, giving each department a separate identity, permitting close interdepartmental collaboration, and promoting economical facility sharing.

The durable interior and exterior relate to Princeton's rich campus traditions while remaining within contemporary economic and maintenance constraints. Through surface design and symbolism it combines contrast and analogy: its brick echoes Corwin Hall, and in combination with limestone trim it relates to '79 Hall and other buildings in the campus's southeastern precinct. The building's limestone-trimmed strip windows, big bay window, and ornamentation adapt the Princeton's Gothic-Elizabethan architectural vocabulary but as a stylistic abstraction, a representation rather than a substantiation of the whole. It promotes a generic and comforting order emanating from its complex academic program, while accommodating artistic contradictions to form a tense, exciting, complex whole. ### **Libraries:**

#### **Bentalou Elementary School Library, Baltimore – USA 2005**

To meet the Baltimore Elementary School's goal of improving literacy through independent study in a more flexible space, W's "learning landscape" incorporates adventure and discovery. A large "park bench" doubles as a casual reading area facing the window and a docking area for computer workstations. Nine wall clocks show the time in Baltimore and in eight sister cities around the world. Behind the librarian, a former door to the space becomes a corridor display window, highlighting special reading materials, and enticing curious passing students to visit. Much of the existing furniture and shelving is adapted for reuse, while the design also adds important new storage space hidden behind the green wall. New lighting, solar shading outside the windows and a new more efficient HVAC system help save energy.

Coordinating with Baltimore Head Librarian of Schools, W Architecture & Landscape Architecture also met challenges for supervision and visibility requirements in the 2,016 square foot space completing the renovation within the budget of \$132,000. (W Architecture)

### **Libraries:**

#### **Seattle Public Libraries, Montlake Branch Library, Seattle, WA – USA 2006**

The new Montlake Branch at 2401 24th Ave. E. opened Saturday, Aug. 12, 2006. The branch is the 19th project completed under the "Libraries for All" Building Program

The building was designed by Weinstein Architects + Urban Designers and built by Graham Contracting Ltd. The architects designed the contemporary brick and cedar-clad branch to relate to the adjacent commercial structures and residences in the area. A vertical glass entry on 24th Avenue East creates a strong civic presence and an entry plaza provides an outdoor gathering space for patrons.

#### **HISTORY**

Public library service in Montlake dates back to September 1944, when The Seattle Public Library teamed up with the Montlake Community Club to open a small library to serve the area.

The community club raised money and leased a former grocery store on what is now 24th Avenue East, and the Library provided a librarian and books. The Library assumed financial responsibility for the space in 1947.

In 1979, the library moved into the adjacent 1,574-square-foot space formerly occupied by a drug store. In 1991, the branch closed for 21/2 years while the building owner upgraded the structure, during which time a bookmobile served the neighborhood.

#### **LIBRARIES FOR ALL CAPITAL PROJECTS AND THE MONTLAKE BRANCH**

In 1998, voters approved the \$196.4 million "Libraries for All" (LFA) bond measure and The Seattle Public Library Foundation pledged to contribute privately raised money to improve the Library system. The plan included replacing the small space in Montlake with a full-sized branch.

The Library bought property at the northwest corner of 24th Avenue East and East McGraw Street for the new branch. Construction began in August 2005. The branch opened Saturday, Aug. 12, 2006.

### **Libraries:**

#### **PS 42 Robin Hood Foundation Libray, New York, Queens, NY- USA 2002**

This renovated library for a public elementary school in Queens rethinks the place and purpose of the library within the school. Organized and funded by the Robin Hood Foundation, this pro-bono project is part of a 10 school pilot study. A curvilinear wall thick with books winds through the library. A curtain printed with a large word search can be drawn shut to enclose a storytelling area. Rolling bookshelves stack to one side of the library creating one large space. Custom-designed rolling ottomans can be arranged in a variety of playful settings. The design envisions this environment as an interim landscape: a fluid series of adaptable settings. (Weiss)

### **Libraries:**

#### **Scottsdale Civic Center Library Teen Center, Scottsdale, AZ – USA 2006**

The Scottsdale Civic Center Library Teen Center opened to enthusiastic teens in February of 2006. It is the result of a direct interactive public process with the teen community of Scottsdale, a historically overlooked segment of library patrons. Participants for instance, were asked to imagine the finished space, to list their favorite qualities of their respective imagined spaces and to photograph their favorite spaces. Following the structural lines of the existing building the overarching concept to unify the new teen space, “KNOWASIS”, became a segmented sky, informed by the various images brought back by the teens. Respectful of the original 1968 building by local legend Benny Gonzalez, the installation transformed the existing space into an appealing hangout for teens, while functionally solving the issues of lighting and acoustics. (Wendell)

#### **Palo Verde Library / Maryvale Community Center Show/Hide, Phoenix, AZ – USA 2006**

with Gould Evans Associates

### **Awards:**

2007 National AIA Honor Award

2009 ALA / AIA Award of Excellence

The City of Phoenix proposed to re-invigorate the heart of Maryvale [the Western version of Levittown, NY] with a new Library / Community Center inside its original 14-acre Park. The Urban Design approach first brokered key parking variances to preserve the large ball field and other recreational amenities, insuring Maryvale Park would remain the “green heart” of this 54-year-old community. Additionally, the new Library / Community Center aligned with the existing pool such that all civic programs would front 51st Avenue, a major North / South arterial. Parking lots were separated and fully shaded by native Palo Verde trees to reinforce the park setting and diminish the urban heat island effect. Lastly, a small corner of the old park was preserved as a contemplative buffer for the Library and as a window into this historic site. (Wendell)

#### **Phoenix Central Library, Phoenix, AZ – USA 1995**

with bruderDWL architects prior to forming W with Gould Evans Associates BA,

Wendell Burnette’s eleven-year association (1985-1996) with the studio of William Bruder culminated in a six-year design collaboration on the landmark 28 million dollar Burton Barr Phoenix Central Library as co-designer, project architect and field architect. The library is conceived as a Mesa Landform, an abstraction of the mythical southwest landscape housing a one million volume collection within its 280,000 square feet. The “top of the Mesa” is a given over to the citizens of the city as the largest reading room in North America. It is widely cited as an early touchstone of “green” environmental design before LEED was established by the U.S. Green Building Council and this was recently confirmed with a LEED – EB (Existing Building) Silver 2.0 rating in 2011. LEED – EB (Existing Building) 2.0 Silver. (Wendell)

#### **Tyler Museum of Art, Tyler, TX – USA 2007 - 2012**

Established in 1952, the Tyler Museum of Art moved into its present home, a 15,000 square foot building adjacent to Tyler Junior College, in 1971. As part of their continuing mission to enliven the cultural landscape of East Texas, the new TMA will be situated adjacent to the University of Texas at Tyler on a densely wooded site bisected by a flood plain. Meant to be both iconic and respectful of its unique surroundings, the first phase of construction will more than double the existing facility’s square footage and contain 6,000 square feet of gallery space to attract traveling exhibitions and continue in its tradition of highlighting up-and-coming Texas artists. The new facility will also house 3,000 square feet of educational programming, including classrooms, a library and children’s gallery. Upon completion of future phases TMA will house over 15,000 square feet of gallery space and more than triple the existing facility’s square footage. (wHY)

#### **Grand Rapids Arts Museum, Grand Rapids, MI – 2004 - 2007**

Timeline: Design 2004-2005, Construction 2004-2007, 125,000 sq. ft.

In Grand Rapids im US-Bundesstaat Michigan eröffnete der Neubau des Grand Rapids Art Museum (GRAM) im Oktober 2007 seine Pforten. Entworfen wurde das Museum von dem kalifornischen Architekten Kulapat Yantrasast (wHY Architecture), einem ehemaligen Büropartner von Tadao Ando. Das GRAM ist eines der ältesten Kunstmuseen im Mittleren Westen der USA und für seine Sammlung amerikanischer und europäischer Malerei und Skulpturen des 19. und 20. Jahrhunderts bekannt. Der 75 Millionen teure modernistische Neubau aus Sichtbeton und Glas, der ein wenig den Anschein erweckt, als wolle er Tadao Ando in das Land Louis I. Kahns importieren, befindet sich inmitten eines aufstrebenden Stadtviertels in Grand Rapids in direkter Nachbarschaft des Skulpturenparks der Architektin Maya Lin. Das neue Museum mit seiner Grundfläche von 1.200 Quadratmetern bietet nun für temporäre und Dauerausstellungen dreimal so viel Fläche wie das alte Gebäude. Neben den Ausstellungsräumen bietet das neue GRAM außerdem ein Auditorium mit 285 Sitzplätzen, ein pädagogisches Zentrum, eine Bibliothek, ein Café, einen Museumsshop sowie Studienräume. (<http://www.baunetz.de>)

The Grand Rapids Art Museum in Michigan is home to one of the oldest museums in the Mid-West. The new museum is designed through the integration of the arts and technology, and with a mission in obtaining a high-level certification from the Leadership in Energy and Environmental Design (LEED), thus making it one of the first art museums with such recognition. The Grand Rapids Art Museum features a unique design that compliments its prominent location with a grandeur urban gesture while offering an intimate atmosphere to enjoy the arts. (wHY)

### **Libraries:**

#### **Hicksville Public Library, Computer Center, Hicksville, NY – USA 2006**

The new Hicksville Computer Resource Center is a unique “bookless” library facility created within a compact state-of-the-art design on a tight 4 acre corner site. The compact structure was designed to take a partial second story when funding became available. The building area presently incorporates approximately 7,440 square feet of interior space, featuring a central located multi-functional circular rotunda area, a computer/meeting room and a computer room. The balance of the interior space comprises of a centrally located reception/lobby area, offices, conference rooms, computer maintenance work room, along with support space. There are two areas presently utilized as storage rooms located at opposite corners of the triangular shaped building, which will be used to house future stairs when the second floor is added. A third centrally located storage area off the main corridor will be used for an elevator when required. The dramatic front elevation of the Center provides a combination of unique architectural features, blending a curved tinted-glass wall recessed behind a white-paneled structural columns system of the Multi-functional Rotunda. The primary entrance into the facility is located from the rear parking area at the northeast side of the building. ( Wiedersum )

#### **Connetquot High School, Bohemia, NY - USA 2004**

115,400 sqf., \$ 26,947,000

A major component of the Connetquot Central School District’s recent \$97 million referendum was the expansion and renovation of its high school, which has been a focal point for community activities for many years. The expanded high school accommodates 2,100 students in grades 9 to 12, along with a teaching staff of 105 members. The high School building sits on 60-acre site, of which 43 acres will be used as athletic fields and computer facilities. The focal point of this addition was the new 10,000-square-foot library and media center on the second level. The modern facade articulates and frames the newly relocated main entrance to the high school. This new technological, iconic entrance has created a much-needed focal point for the school complex, which is almost 300,000 square feet. The southern exposure glass curtainwall uses a strutted aluminum sunshade system. This allows natural light into the media and reading areas without causing sun glare or heat gain. The existing cafeteria doubled in size, and a diversified cafe-style food court was added to enhance the food offerings available to the students and staff. Another addition provided a new band and choral music suite with special acoustical treatments. The final addition was a new 8,350-square-foot gymnasium complex, which included new team rooms, a wrestling room, weightroom and locker facilities. ( <http://schooldesigns.com> )

#### **Sherwood Elementary School Library, Islip, NY – USA 2002**

9,400 sqf., \$ 2,000,000

At the Sherwood Elementary School, the school board decided that a new library/computer facility and four additional elementary classrooms were needed to meet educational and program goals. The architects and the administration envisioned that the library should have a defined character and atmosphere that would encourage elementary students to use the library and computer facilities for schoolwork and after-school activities. The result is a two-story library reading room with an architectural pitched metal roof. This creates a unique exterior elevation, compared with the one-story classroom addition. It also allowed for an attractive open interior environment. The vaulted ceiling of the reading room offers 360 degrees of natural light from the bank of windows that are on all four walls of the upper portion and two sides of the lower reading area. The reading space features low-profile perimeter seating that is used for teaching lessons and reading sessions. The balance of the air-conditioned library space contains bookshelves, work areas and a librarian station. A computer room adjacent to the library offers direct accessibility. Flexibility in the design allows for the computer room to be used as an independent classroom. ( <http://schooldesigns.com> )

### **Wienczek + Associates, Washington, DC – USA**

<http://www.wienczek-associates.com>

#### **Libraries:**

#### **Francis A. Gregory Neighborhood Library, Washington, DC – USA 2012**

Client: DC Public Libraries

#### **Awards + Recognition:**

**Certified LEED Gold**

Working with design architect Adjaye Associates, Wienczek + Associates Architects + Planners solved a battery of complex technical challenges to bring world-class architectural design to a deserving community. Set on a terrace, the new glassy pavilion surrounded by a park is a balance of transparency and reflectivity. A continuous 2-story high custom glass curtain-wall folds over as a glass roof. The crowning canopy’s cantilever dimensions were refined by shading studies to reduce cooling loads and soften the natural day lighting within the space. Energy conservation principles in this LEED Silver project inspired the balance between vision glass and mirrored glass at insulated panels which sandwich a concealed, prefabricated modular system. (Wienczek)

#### **William O. Lockridge / Bellevue Neighborhood Library, Washington, DC – USA 2012**

Client: DC Public Libraries

Building a neighborhood involves all aspects of community life. On a small, steeply sloping site at the nexus of a residential and commercial neighborhood, Wienczek + Associates Architects + Planners worked with design architect Adjaye Associates to create a modern and dynamic 3-story community library. The concrete structure is enveloped by a timber curtain wall. The manipulation of views and natural day lighting defines the interior character of the spaces. Stairs meander up through the space flanked by translucent glazing panels to provide a sense of movement to the sociable spaces. Pavilions dedicated to activities for children, youths and adults adjoin the main building in much the same way as porches and additions articulate the scale of the adjoining homes. The forward-looking design creates multiple indoor and outdoor gathering spaces to foster community. Imagery courtesy of Advanced Media Design, Inc. (Wienczek)

### **Tod Williams Billie Tsien Architects, New York – USA**

<http://www.twbta.com>

#### **Libraries:**

#### **C.V.Starr East Asian Library University of California, Berkeley, CA – USA 2008**

#### **Awards:**

**AIA / ALA Library Building Award 2009**

This is a symmetrical box broken by light. It is a repository for rare books, character language texts and a sanctuary for study. The C.V. Starr East Asian Studies Library faces Memorial Glade, the heart of the Berkeley campus and is cut deeply into a steep hillside. The entrance on the third level is reached by a pedestrian bridge from the top of the hill and a monumental stair from the Glade. The stairs and bridge meet at an overlook to view campus and on a clear day the Golden Gate Bridge in the distance.

University design guidelines for the “classical core” required a pitched clay tile roof, symmetrical façade and use of white granite. The screen, an important element of Asian architecture, was reinterpreted using both a traditional cracked ice and contemporary grid pattern. Sand cast in China, this monumental bronze screen (120 x 35 feet) is the building’s expression of its Asian identity. It unifies the exterior and creates the illusion of symmetry from the asymmetrical fenestration. From the exterior, the façade is solid, powerful and mysterious. From the interior, the screens offer a dynamic and filtered view of the surrounding landscape. Perforated metal screens behind the bronze grilles, prevents direct sunlight from entering the building and minimize cooling loads. Energy consumption is lowered by embedding the building mass into the land. Occupancy sensors, bamboo flooring, native plantings, and storm water recharge basins reduce the buildings environmental impact. Constructed of rough concrete and clad in stone from China, the exterior is massive and dense. This sense of solidity is transformed upon entering. Filtered natural light from a linear north facing skylight fills a long, central void cutting through the building and brings light to the lowest level. Every floor is animated by changing light. A stone stairway cantilevered from a structural spine wall rises through the four floors. Connected by bridges, stacks to either side of the opening clearly display the books and the building’s organization. The use of concrete and stone is balanced by various materials that add texture and delight to the interiors. American cherry desks and reading tables provide places to study. A large slab of Claro walnut, with a natural edge serves as the circulation desk. Bronze plaques, embossed with the Library chop, mark the entry to each room. Walls contain recesses for artwork and vitrines have been designed to hold artifacts. 15 tapestries, which are jet ink screened low cost “walk off mats,” were designed using images from the library’s rare book collection. They add color to the concrete walls. Cherry wood battens backed by fuchsia fabric help to provide sound dampening. Black-and-white landscape photographs taken in China by Coleman Fung hang in one of the media rooms. Everywhere one looks inside there is something interesting and beautiful to be found. (Todd Williams)

### **PS 101 Robin Hood Foundation Library, New York, East Harlem, NY – USA 2002**

#### **Awards:**

**NYC AIA Design Award 2003**

#### **Robin Hood Libraries**

Four rooms were designed as magical places for children. As part of a larger non-profit initiative, four elementary school libraries, located in difficult neighborhoods throughout New York, were transformed into vital resources for children and their parents. The four reinvented libraries are located at PS 1, PS 28, PS 32 and PS 101. Custom wood bookshelves serve as meandering walls, creating spaces where the readers are surrounded by books. Inviting and intimate spaces for reading are adjacent to larger, open areas for instruction and learning. The walls also house private reading alcoves. Large glass windows are cut into the existing hallways, announcing the library to the rest of the school and creating a place to look out from within. Lines of sight and movement are maintained throughout the library. Vibrant spaces in the different locations are created with a variety of vivid materials. Bold colorful planes float above the shelves. The dropped ceiling creates more intimate areas scaled for children and unifies the space. A continuous light cove traces around the stacks illuminating the shelves. Sculptural lamp shades hang from the ceiling like large paper hats. White walls and shades are enlivened with images culled from the Encyclopedia of Diderot and d’Alembert. Natural cork tiles serve as durable flooring and vivid custom designed wool rugs contributed by V’soske invite the children to sit and read and dream. 222 Central Park South, New York, NY (Tod)

### **Woollen, Molzan and Partners, Inc., Indianapolis, IN – USA**

The venerable Indianapolis architectural firm that designed many of the city’s most recognizable buildings has closed and two of its leaders have joined a local competitor.

Woollen Molzan and Partners Inc. leaders Lynn Molzan and Kevin Huse started new jobs with Ratio Architects Inc. on Monday after the closure of their 56-year-old firm.

Woollen Molzan was one of the oldest and, despite its small size, more prominent architectural firms in the city. Its significant projects include Clowes Hall, the Minton-Capehart Federal Building, the Central Library addition and the White River Gardens Conservatory Complex at the Indianapolis Zoo.

In addition to partners Molzan and Huse, Woollen Molzan architect Mike Brannan also joined Ratio Architects.

“I’ve known Lynn and Kevin for a number of years, and obviously they’re very talented architects,” Ratio Managing Partner Bill Browne said. “They do a lot of higher education [work], and we thought that would meld well for our clients.”

Reasons for the closure are unclear. Browne declined to comment, and neither Molzan nor Huse returned phone calls from IBJ. Reached at his home in Colorado, firm founder Evans Woollen said he sold his interest in the firm 10 years ago, but had been informed by Molzan that it had closed.

“I am proud of 50 years of work with the firm. I cherish everything we did together,” Woollen, 83, said. “It was a collaborative effort, and we’ve left many [designs] on the landscape.”

The recession was a likely factor in the closure, said Wayne Schmidt of local firm Schmidt Architects.

Schmidt serves as president of the Indianapolis City Market Corp., which hired Woollen Molzan last year to design the \$3.4 million renovation under way at the historic structure.

“They’ve done a lot of significant work over the years, and they did a great job on the City Market project,” he said. “But, I tell you, the economy is just a wreck yet, and there’s still not enough work to go around.”

Schmidt said he was “shocked” to hear of the closing and found out through “word of mouth.” Though Woollen Molzan finished its design work at the City Market, building managers will need to hire another firm to observe construction, Schmidt said.

Woollen Molzan employed four licensed architects in 2006 and had local billings of \$1.4 million, the most recent year it submitted information to IBJ. The firm had as many as nine licensed architects in the late 1990s.

Specializing mostly in libraries and religious buildings, its designs are sprinkled throughout the city. In the 1980s the firm designed additions to The Children’s Museum of Indianapolis, as well as renovations to Christ Church Episcopal Cathedral on Monument Circle and to the historic Union Station.

“There’s no question they’ve had a very storied career as an organization,” Browne said.

But perhaps its most notable—and controversial—project is the design of the Central Library expansion.

In 2006, Woollen Molzan agreed to pay the Indianapolis-Marion County Public Library \$580,000 to settle a dispute over construction problems that plagued the \$150 million project.

In turn, the library paid Woollen Molzan \$130,000 in fees.

The library fired the firm and sued it and others in U.S. District Court in Indianapolis related to design-flaw issues.

The architects filed a countersuit asking the court to order the library to reinstate them or prohibit the library from using the firm’s design in the new building.

The expanded Central Library reopened in December 2007, more than two years late and roughly \$50 million over its original \$103 million budget.

Woollen Molzan was founded by Woollen, who opened an office on Monument Circle in 1955.

In 1980, firm leaders purchased the historic Majestic Building at 47 S. Pennsylvania St., where Woollen Molzan operated for several years. It most recently was located at 600 S. Kentucky Ave. between Lucas Oil Stadium and the White River.

With \$9.9 million in local billings and 22 licensed architects in 2009, Ratio is the city's fourth-largest architectural firm, according to the most recent IBJ statistics.

#### **Libraries:**

##### **Indianapolis-Marion County Public Library – Central Library Indianapolis, IN – USA 2007**

476,448 sqf.

Woollen, Molzan and Partners served as the library programmer and designer for this downtown landmark facility. The existing Central Library has many significant interior and exterior architectural elements. The Beaux Arts structure (designed in 1914) (1913-1917 Zantinger, Borie, Medary – Philadelphia, with Paul Philippe Cret, Philadelphia) has a grand front entrance and exterior details. Interior features include the majestic main delivery room with its ceiling paintings, and the two great reading rooms flanking it. The design of the addition compliments but does not mimic the original building. Its new north entrance provides a second access to the overall complex anticipated to house 1,000,000 volumes. The project included the historic renovation of 56,224 square feet; addition of 237,069 square feet of library space; and a 183,155 square foot underground parking garage. Two particularly important features of the new library are its high-technology/multimedia facilities and the advanced Family Information Center. Technology facilities include instructional labs and individual user labs totaling 200 seats, multimedia systems, a 325-seat auditorium, and comprehensive on-line services. The Family Information Center will include innovative children's event facilities, craft rooms, tutorial areas, multimedia facilities, theater and interactive exhibit areas. The role of the Central Library in serving downtown businesses and residents, and the community as a whole, is being redefined as Indianapolis' downtown renaissance continues. Indianapolis' Central Library can now be added to the list of significant core city library expansions in major cities across the United States. (Woollen)

##### **North Central Student Faculty Library – Purdue University, Westville, IN – USA 2007**

32,000 sqf.

This project began with a study to assess the feasibility of phased renovations to the Library. The goals were to develop a series of manageable projects that would update the physical appearance of the library and entrance, create more contemporary and relevant library space, and develop a unified Learning Center by integrating functions currently housed elsewhere on campus. The Learning Center functions continue to evolve with campus goals, but may include a Writing Center, Language Lab, Tutoring, Testing Services, or similar functions. The long-term goals include updating the physical appearance of the facility; increasing visibility and functionality of a reference commons and information literacy instruction lab; providing additional computers access; and adding a variety of collaborative study spaces including group studies. Accessibility via elevator for the public is currently difficult and challenges library security. Therefore, improvements to vertical circulation and public/staff zoning are also long-term goals. Phase One, which created the spaces for the Learning Center, replaced floor and wall finishes, improved the library entrance, repainted the public spaces, and modernized the service desk, was successfully completed by the fall semester. (Woollen)

##### **Linton Public Library, Linton, IN – USA 2007**

19,000 sqf. , \$ 1.300.000

The Linton Public Library (formerly Margaret Cooper Public Library) was housed in a 1908 Carnegie structure. In 2001, the Library arranged to purchase a three-acre site in downtown Linton and contracted with the library designers at Woollen, Molzan and Partners to create the new structure. The program calls for a 19,000 square foot building to include community meeting spaces as well as collections, reading, and processing spaces. The new facility is designed to house approximately 100,000 volumes to include: • 60,000 volumes: adult collection (fiction & non-fiction), • 15,000 volumes: media collection, • 6,500 volumes: genealogy and local history, • 10,000 volumes: children's, • 7,500 volumes: young adult. (Woollen)

##### **Paul Sawyer Public Library, Frankfort, KY – USA 2005**

38,560 sqf.

The library programmers and designers of Woollen, Molzan and Partners led the process to design this new facility in downtown Frankfort. The former Paul Sawyer Public Library was housed in a historic building which was once the US Courthouse and Post Office. Although an impressive structure, it became apparent that it was impractical for use as a library and could not meet the needs of the growing system. The new facility will be almost triple the size of their current facility. This new main library is located within Frankfort's downtown Historic District. Therefore, it was critical that the design weave into the fabric of its 19th century surroundings. Because of the owners' interest in incorporating civic character into the building, inclusion of stained glass, a public art display area, and a "Kentucky Collections Room" for Kentucky authors was integrated into the design as well. The steeply sloping riverbank site, located within the floodway of Kentucky River, required that the first floor be raised above the 500-year flood level. This allowed for the design of under-building parking, making the parking level completely "floodable." (Woollen)

##### **Rice Library – University of Southern Indiana, Evansville, IN – USA 2006**

155,000 sqf.

Woollen, Molzan and Partners' library programmers and designers served on the design team for this new five-level library/classroom building. It is more than twice the size of the current campus library. As noted in USA Today, "it will be the tallest building on campus. . . [featuring] a rotunda and a curved rear facade with floor-to-ceiling windows." The lower level of Rice Library contains sixteen classrooms and a 125-seat auditorium, with a separate outside entrance for secure 24/7 access. The first floor houses the circulation and reference areas, media and listening rooms, two computer labs, a commons area, and a two-story reading room. A Starbucks is located on this level. It is equipped with wired and wireless access as well as a variety of seating areas. Although located within this new facility, the cafe is zoned outside of the security parameters of the library functions—allowing for alternative hours of operation and any special events. University Archives and Special Collections are located on the third floor. Stacks, reading rooms, and a variety of study areas—including approximately 30 group study rooms—are located on the second, third, and fourth floors. (Woollen)

##### **Park Library and Information Services Center – Central Michigan University, Mount Pleasant, MI – USA 2004**

see also: **URS Corporation**

305,755 sqf.

Woollen, Molzan and Partners' library designers served on the design team for this newly expanded complex. It is the centerpiece of a new, electronically-supported learning environment emerging at Central Michigan University (CMU). The LISC contains client/server technology supported by ATM (Asynchronous Transfer Mode) infrastructure that integrates multimedia information into group and individual learning settings. The facility accommodates 1,300,000 volumes, 90% of which is in nearly five miles of mobile ranges—one of the largest installations in North America. Additional amenities within this facility include: • Specialized instructional areas, multimedia labs, and classrooms • Auditorium (a 145-seat high-tech multimedia facility) • Baber Room (an art exhibit complex) • Café • **Clarke Historical Library** (A large archival facility containing one of the finest children's collections in the

U.S. It is a secure temperature/humidity/dust/mold/gas-controlled 20,000 square foot facility including documents and rare books from the 17th and early 20th century, photographs, and paintings.) (Woollen)

#### **Carnegie Library – Muncie Public Library, Muncie, IN – USA 2002**

15,500 sqf.

The renovation of the Carnegie Library was part of a master plan process led by Woollen, Molzan and Partners that evaluated the needs of the community and executed changes to meet those needs. To make this project financially feasible, Muncie Public Library closed four existing facilities including three branch libraries and their technical support center, initiated creative management of its tax income, and undertook a major private fund-raising campaign that was embraced by the community. The Carnegie Library was the second phase of a two-phase master plan. The renovation of the Maring-Hunt Library was the first phase that allowed for the Carnegie Library to be vacated and renovated. Carnegie Library is a very well portioned Neo-Classical building. It is an equal combination of Greek and Roman Revivals, blended as a whole. The building exterior has a Greek Doric portico—above which is a Roman Classical dome. Built in 1902, it has not undergone major renovation in fifty years. The Greek Revival Building has a grand entrance and a large central art glass dome. The interior contains handsome green faux marble columns consisting of scagliola plaster, a large fireplace, and other decorative features. Now complete, the library is fully accessible, provides updated technology systems, and meets all current code requirements—in time for its centennial celebration. (Woollen)

#### **Kinlaw Library & Kirkland Learning Resource Center, Asbury University, Wilmore, KY – USA 2001**

75,312 sqf.

This new facility is located at the termination of a long brick pedestrian path—the main “spine” of the university—linking the library with the chapel, main quad, housing, arts buildings, and gymnasium. The design is a three-story facility built into a hill, with white columns respectfully complementing the existing University fabric. The Learning Resources Center, which is open extended hours, is located on a lower level with a separate after-hours keycard access. The Center is a classroom facility that contains several technology-driven classrooms with projection capability and audio/visual resources. Asbury’s Information Services Department is located on this level to provide support to the 870 computer ports located throughout the building as well as the administrative and academic computing needs of the entire campus. The main entrance to Kinlaw Library’s collections area is located on the second level with stacks located in the center of the second and third level. The third floor includes a two-story conference/seminar room featuring a massive oval table with seating for 44. This expansive space, housing sound and media equipment, is host to large group meetings. (Woollen)

#### **ACES Library, Information and Alumni Center – University of Illinois, Urbana-Champaign, IL – USA 2001**

##### **Awards:**

IAI – Award of Excellence Library Architecture

Woollen, Molzan and Partners served as the designer for this new multi-use facility that now enables the College of Agricultural, Consumer and Environmental Sciences to unify its agriculture and home economics library collections (200,000 volumes), as well as its information and computer services, into a centralized location. The Alumni Center and the Career Center—also housed within this facility—each contain their own reception area, meeting rooms, offices, and support facilities. Both centers also contain extensive computer network facilities. A key goal of the project was to create a unique architectural statement that enhances the visual unity of the University’s South Campus. The uniquely shaped design of this facility achieved this goal. Because of its shape, it has affectionately been termed the “jewel of the ACES campus” and it has been noted that it “will stand as an information and architectural landmark on the University of Illinois campus.” Barton M. Clark, Associate University Librarian, said of this facility: “The building needed to serve as a focal point for the College of ACES to bring together a disparate clutter of buildings. . . the architects were marvelously successful. Great challenges and a greater success.” (Woollen)

#### **Harwell Goodwin Davis Library, Samford University, Birmingham, AL – USA 1998**

109,700 sqf.

Although handsome from the exterior, the neo-Georgian building, originally constructed in 1956, had been the victim of numerous ad-hoc interior modifications over the years. This had resulted in a cramped, low ceiling maze of small offices and partitions. Woollen, Molzan and Partners (library programmer and designer) stripped the building back to its exterior walls and added back functions carefully to maintain the refreshing openness of the new space. The three-story main stairwell was redesigned and made more monumental, becoming a vertical reference point in the building, and tying together the old and new spaces. Included in the renovation portion of the building is a new climate-controlled special collections complex for the University's religious, state and city archives. The Special Collections Complex is expected to become a regional center producing microform for institutions across Alabama. Construction of the second phase was completed in May, 1998. Davis furnishings include chairs, and solid cherry tables and carrels, all custom-designed by WMP architects, as well as steel cantilever shelving, with custom-designed red gum end-panels. (Woollen)

#### **University Library – St. Ambrose University, Davenport, IA – USA 1996**

58,500 sqf.

Woollen, Molzan and Partners assisted the University in the design of this new main library that forms the end facade for the long axis of the existing campus quadrangle. The square configuration allows the building to rest naturally among its neighbors and creates a compact, efficient layout. The building was designed for future expansion. The three-story design has an open arcade on the entry side that faces the quadrangle. Natural light is a key feature of the design—from the great skylight to the large windows. The gable forms break the static quality of the plan and address the campus in a sympathetic manner. The library tower, which encloses the main stair, serves as counterpoint to the entry tower of the University Chapel. The 268,000 volume library is fully networked and the furniture, which was custom-designed by WMP, is fully wired to provide connections for laptops. Oversized floor boxes accommodate future technology. The library also contains a climate-controlled special collection room, which contains a large collection of Catholic archives. (Woollen)

#### **Lucille Stewart Beeson Law Library – Samford University, Birmingham, AL – USA 1995**

60,300 sqf.

The new Lucille Stewart Beeson Law Library at Samford University, judiciously enriched with classical details and traditional materials, is sited to form a three-sided quadrangle with the Law School and Brooks Hall. The slope of the site allows the library to expose a two-story face to the north, while turning its grander three-story facade to the new quadrangle. It is connected to the Law

School by a glassed-in colonnade (pictured to the right) that also serves as a weather vestibule to the new library. The new facility is a state-of-the-art structure that meets the functional needs of a working library within a building that bespeaks of the dignity, majesty, and tradition of the law itself. The interior organization is integrally related to the exterior massing: an open, airy central space flanked by denser, less publicly used functions. The heart and soul of the library is the grand reading room, which soars sixty feet from the first floor to the light monitor above. Fluted Greek columns support and define the space up to the third floor, where arched openings overlook the reading room. The grand reading room is located within the inner core of the building, lit brightly by a large light monitor through which the sunshine pours. From the third floor to the base of the light monitor, the walls lean slightly inward to exaggerate the sense of height. Ease of maintenance was also a consideration. A catwalk at the level of the monitor provides easy access for window washing and re-lamping of light fixtures. (Woollen)

### **Grainger Engineering Library Information Center – University of Illinois, Urbana-Champaign,**

**IL – USA 1994**

133,000 sqf.

Woollen, Molzan and Partners is proud to have served as the library designer for this facility that, as Chancellor Michael Aiken commented: "...introduces a new era for the library as a tool for scholarship. There is little doubt that it will mark Illinois as a leader in information technology for some time to come." The library houses cutting edge computer and multimedia laboratories, a digital imaging lab, instructional services labs, and electronic classrooms. It also contains the more traditional reading rooms, seminar rooms, faculty offices, group study rooms, and stacks for 300,000 volumes. The new library's classical architecture is respectful of the surrounding buildings. Its structural engineering design is a major feature of the interior, particularly appropriate in view of the library's users and the great tradition of structural engineering at the University of Illinois. (Woollen)

### **Work AC (Architecture Company), New York, NY – USA**

**<http://work.ac>**

#### **Libraries:**

#### **Kew Gardens Hills Library, Flushing, Queens, New York, NY – USA 2014**

This is an expansion and replacement of an existing library. The building is organized around a perimeter of open rooms for adults, teens, children and staff. This band is capped with a green roof, completing a continuous "loop of green" with the building's side gardens.

The façade is a literal "lifting up" of the library's exterior walls to broadcast its activities to the outside. The apex is the main reading room at the most public corner, with a second "mini peak" at the children's room. Between these two peaks, the façade dips to provide privacy at the staff areas. This concrete beam is also structural, requiring only two columns along its length.

The exterior facade is made from GFRC in a curtain-like pattern of vertical folds. An awning is created by folding a section of this façade over the street, as one would mark one's place in a favorite book. (Work)

A rendering of the renovated Kew Gardens Hills Library, expected to reopen in 2014.

A plan to renovate the Kew Gardens Hills Library, a project civic leader Patricia Dolan made a priority before her death last month, was recently approved by city officials.

The \$7.3 million expansion will add 3,000 square feet to the library and include separate areas for adults, teens and children.

Construction is expected to start late winter or early spring of next year.

As head of the Kew Gardens Hills Civic Association, Dolan had argued for years that the current facility was overcrowded and outdated.

She was struck and killed by a motorist while crossing Hillside Ave. on the way to a meeting last month.

"That library was one of her closest and dearest passions," said Marc Haken, chair of Community Board 8's Youth, Education and Library Committee.

One of Dolan's earlier victories was convincing the Queens Library to rename the facility, located at 72-33 Vleigh Place, to reflect the neighborhood. It was previously known as the Vleigh Branch.

While Kew Gardens Hills is known for its large Orthodox Jewish community, the library draws customers from a number of different ethnic groups.

"Queens Library at Kew Gardens Hills serves so many people who have a diverse range of educational and informational needs," said Queens Library CEO Thomas Galante.

He said the renovation and expansion will also include a quiet room for study, self-service check-in and check-out, a "dramatic façade" and an environmentally-friendly "green" roof.

"It will be like a new library for the community," Galante said.

Harold Baron, chairman of the Kew Gardens Hills Civic Association, said he and Dolan stepped up their efforts in recent years after hearing the library renovation would not happen until sometime after 2020.

"We set up a meeting with the Borough President (Helen Marshall) and had expected to make all kinds of arguments about why it needed to get done and much to our surprise she was completely with us," said Baron. "The Borough President has been an ally."

Marshall ended up funding the lion's share of the project.

The renovation is slated for completion by the end of 2014.

While the library is closed, a temporary facility will open on Main St. in early summer 2012.

Officials said Dolan and her work will be honored at the library through a plaque or other memorial.

#### **Libraries:**

#### **Haverford Township Free Library, Haverford, PA - USA on design**

This new library, to be located on a long-abandoned brown field site, is envisioned as an instrument of awareness and discovery. The environmentally-compromised site will be restored to health and reintegrated with the neighborhood. The facility is designed around a dynamic and fluid program of uses aimed at making the place come alive as a vibrant community center. Conceived as an open and flexible space that can easily adapt to evolving conditions, the new library's design is targeted toward a LEED Platinum rating.

(WRT)

**Saint Charley Seminary Ryan Memorial Library, Wynnewood, PA - USA 2005**

In order to meet Vatican requirements necessary to grant a papal degree, the St. Charles Seminary needed to expand its collection by 100,000 volumes, and their historic library facility along with it. WRT explored different approaches to renovating or replacing the existing Ryan Memorial Library, and a plan for renovation and expansion was selected. Realization of the project consisted of the complete renovation of the existing library facility, the conversion of a large gymnasium into additional library space, and the overall functional reconfiguration of the historic two-story building. Particular emphasis was placed on seamlessly reconnecting the library to the architecture and the activity patterns of adjacent buildings. (WRT)
