

# **Library Buildings around the World**

Compiled by Andreas J. Werner

Frankfurt am Main, 2013

© Dr. Andreas J. Werner

## **Introduction**

„Library Buildings around the World” is a survey based on researches of several years. The objective was to gather library buildings on an international level starting with 1990. Completeness was neither possible nor intended, but nevertheless a comprehensive compendium has been accomplished.

The countries included are listed in alphabetical order as well as the architects’ offices within each country. The index is arranged according to countries, places, libraries and architects’ offices.

The buildings of each office are listed according to the date of completion. Included are individual buildings as well as libraries integrated into bigger sites serving different purposes.

All kinds of libraries are considered.

The year 1990 has not been selected by chance. The German reunification, the collapse of the so-called Eastern Bloc and the rapid development of electronic communication channels have changed the world effectively since then.

One can say that library buildings were booming starting with 1990, above all in the Anglo-American countries. In Western Europe especially France and the Netherlands are to distinguish. The survey reveals the outstanding role of these countries as far as library buildings are concerned.

It is my pleasure to thank Berndt Dugall, Director of the University Library J.C. Senckenberg, Frankfurt a.M. and Ursula Kleefisch-Jobst, Executiv Curator, M:AI (Museum für Architektur und Ingenieurkunst NRW), Gelsenkirchen.

Andreas J. Werner

## **Preface**

Computers and the Internet have revolutionized the flow of information in a similar way to Gutenberg’s printing press in days of old. Today, e-books, digitally available periodicals and networked databases for rapid research are just as valid as books and printed periodicals. The latter have forfeited neither their importance nor their significance, despite the fact that claims to this effect have been made repeatedly from time to time. However, the reverse is true. Every year the Frankfurt Book Fair reports increased publication figures. Accordingly, the age-old task of building libraries is not yet obsolete. Quite to the contrary: Dr. Andreas Werner’s impressive survey of new library buildings throughout the world erected over only the last 20 years demonstrates that the construction of libraries is currently experiencing a boom the likes of which has not been seen in the preceding centuries.

The task of building libraries has become more varied. From the scholars’ “hortus conclusus” to the place where documents were stored, libraries have become educational and cultural establishments, meeting points and leisure-time amusements for all kinds of social strata. Today, new library buildings are seen as driving forces behind the development of districts and towns and, with their sometimes extravagant architecture, a number of these new edifices are considered “signature buildings”, on an equal footing with other cultural buildings such as museums and theaters. Nevertheless, looking at the situation internationally, the social standing of libraries, particularly that of public libraries, does vary greatly from country to country. This is visible not only in the number of libraries per capita but also, and especially, in the amounts of money spent on individual new buildings, and I am not talking about prestigious national libraries, funded by monies raised from sponsors or even financed by a specific tax levied for the library project in question. On this count the English-speaking countries and in particular the United States are world leaders.

Basically, we can distinguish between two kinds of libraries. On the one hand there are academic libraries for universities, central or specialist libraries, as well as the libraries belonging to research institutions, schools and educational establishments and on the other the wide range of public libraries. Private libraries represent a class of their own; most of these are specialist libraries, since the documents they contain reflect their owners’ tastes.

Since the 1980s, scientific libraries have experienced a major upswing as the ever-growing number of students has required a rapid growth in university establishments. This has been accompanied by the change in the way

the academic environment operates because of computers and the Internet. This being the case, new infrastructures – particularly, electronic workstations – have needed to be created or existing facilities expanded. Academic libraries are still characterized by the existence of a central reading room at their heart in the tradition of the great 19<sup>th</sup>-century libraries. In many cases this central hall extends over several stories in the form of “levels” with open workstations directly adjacent to the open-access areas. However, the newer libraries increasingly boast open, flowing spatial continua interwoven, island-like, with working and communication areas of varying sizes, media stations and bookshelves. Two of the most radical examples are the learning center in Lausanne by Tokyo-based SANAA and one of the earliest instances of the black box by Wiel Arets on the University of Utrecht’s campus (2004). In this open-plan entity noises are muffled by means of special materials and by the furniture. Elaborate façades that not infrequently reference the subject of “books” featuring artistically printed glass panels, dyed concretes, natural stone or high-tech materials allow these libraries to step out of the shadow of the respective institute’s other buildings. Now and then, they have even become hallmarks of particular campuses (IKMZ, University of Applied Sciences, Cottbus, Herzog & de Meuron, 2004).

Public libraries have undergone the greatest transformation in recent years. The thinking behind this is not only to make electronic media accessible to the general public but, more especially, to improve the range of educational and cultural services on offer. Germany has long since gone down its own special route in this respect with its public libraries, the “Büchereien”. In the past, one of these institutions’ most important functions was to lend out books and media. But today, public libraries and “Büchereien” are places of culture and leisure-time activities which are enjoyable to spend time in and whose influence radiates out into the surrounding urban districts. Accordingly, the previously prevalent type of public library has undergone fundamental changes. Within an open, flowing space often extending over several stories, various designs and different furnishings make for individual “islands”, not only for the different media, alongside books, periodicals, videos, CDs and access to the Internet and to databases, but also in terms of various groups of users. Different materials and colors have found their way into the libraries, most especially in the sections for children and young people. In the Netherlands, a studio going by the name of AEQUO BV Architects has focused entirely on library interiors, handling the interior design for the library projects implemented by a large number of well-known architectural firms. Spacious entrance areas that entice visitors in from the outside, impressive staircases and escalators providing access to all stories show that new-style libraries have taken their lead from department stores (Joe Coenen, Centrale Openbare Bibliotheek, Amsterdam, 2004). Here, library users are clients and the objective is to keep them in the library as long as possible. One of the first libraries to stage a “path” along the bookshelves was Rem Koolhaas’ library in Seattle in 2004.

Yet it is not only their wide range of media that makes present-day libraries attractive, but also educational and cultural offers. For instance, it is not infrequently the case that libraries include lecture halls, seminar rooms, sometimes small cinemas and theaters and very often restaurant facilities. A more recent development, particularly in English-speaking countries, France and Scandinavia, attaches libraries to other public institutions and commercial enterprises. In the Netherlands it has even been the case that what is known as the kulturhus (house of culture) has become a new focal point of a downtown area or urban district. The new city hall, home to The Hague’s municipal administration and designed by Richard Meier, which opened in 1994, also housed a public library, an innovative idea at the time. One of the rare examples in Germany is the newly opened Forum Mittelrhein in downtown Koblenz, a mixture of shopping mall and cultural edifice (Bentham Crouwell Architects, 2012-13). In Australia, a leisure pool with a library was recently opened in a single complex. Although at first glance this seems bizarre, the idea has its roots in antiquity; after all, Roman baths always included libraries, as well.

The idea of combining the use of libraries with educational programs and access to the media has resulted in libraries being established in socially disadvantaged urban districts. For instance, in London David Adjaye created something known as idea stores in districts largely inhabited by migrants. One of these “stores” was even situated on the roof of a department store. In France, in 19XX, the government introduced a publicly-funded program for what is known as médiathèques. A large number of small and medium-sized libraries are being set up throughout the country, often in districts in need of revitalization or on the outskirts of towns between McDonald’s and rest stops (médiathèque in Troyes, DBL du Besset-Lyon architects, 2002).

However, alongside the construction of new buildings, in many cases – particularly in Europe – abandoned buildings, indeed entire industrial complexes have been reinforced and converted into libraries. In such cases the challenge for the architects is to adopt a sensitive approach to the existing material. One example: MANSILLA+TUNON Artistas created a new home for the regional library and the City of Madrid’s municipal archive on the former site of the Aguila brewery (2004). A firm of Berlin-based architects, raumbewegung, joined forces with ff-architekten to redesign and extend the small station at Luckenwalde, converting it into a

lively municipal library (2008). Mongiolo&Plisson transformed a former foundry into a cultural center with a library. At the beginning of the year, Bibliotheca Hertziana opened its “book garden” by Navarro Baldeweg.

Since time immemorial, especially prestigious buildings have been chosen for the various national libraries as they are considered as important as museums, theaters and opera houses and evidence of a particular country’s culture. Accordingly, over recent decades a number of outstanding library buildings have been erected. One of the prime examples is the French Bibliothèque Nationale by Dominique Perrault which opened in 1995, designed as four glass bookshelves grouped around a central entrenched reading room. The purpose of this stellar building on a former industrial site was to act as the symbol of a new district of Paris. The same applies to the “black diamond” in a one-time dockyard area of Copenhagen, following a design by schmitt/hammer/lassen architects. And in the port of Oslo the experts are presently eagerly anticipating the Deichmann Main Library, designed by Atelier Oslo Architects (currently under construction). In 2008 in Beijing a Frankfurt-based firm of architects, KSP Jürgen Engel Architekten, designed the new national library of China, the third-largest library in the world. In 2002 in Alexandria the once-legendary library of antiquity reopened after 2,000 years in a new building designed by a Norwegian studio, Snohetta, in the form of a flat disk which appears to be swimming in a basin of water.

As far as the architectural design and stylistic vocabulary of the individual libraries is concerned, even a comprehensive survey reveals no distinct trends. On the contrary, a look at what is happening throughout the world reveals the entire breadth of the current repertoire in terms of architectural shapes and designs, something that it is difficult to place into specific categories. Indeed, it becomes clear that a kind of universal architectural style is coming into being under the influence of globalization. Alongside the examples inspired by classic modern European architecture is everything from architecture with a postmodern feel to an internationalized style, from buildings that very much take their lead from technology to sculptural edifices. At the same time, the smaller library buildings in particular tend to clearly reflect local building traditions, shapes and materials, a kind of regionalism – in the positive sense.

Compiled over a period of many years and with an admirable meticulousness, Andreas Werner’s survey is thus also one of the current status of architecture and architectural culture. By profession a librarian, Werner has, over the course of his research, become a connoisseur of architecture. And the survey has developed into a veritable corpus – in the classical sense – on contemporary library buildings.

#### Literature:

Carlos J. Vial. “Biblioteca Central Universidad Moron / Estudio Borrachia“. En: Plataforma Arquitectura (19 diciembre 2011)

La Biblioteca és una obra de l'equip d'arquitectes argentí Estudio Borrachia, ubicada a la ciutat de Moron, a la província de Buenos Aires. Té 1.000m2, distribuïts en dues plantes, en un solar estret i llarg. Les dues plantes superiors ocupen només la meitat de la planta, longitudinalment, deixant un gran espai buit, on hi ha les comunicacions verticals i la llum zenital que entra a la Biblioteca mitjançant la coberta. Una coberta d'estructura metàl·lica i corba, i que fou muntada abans que la resta de l'edifici. Es planteja la Biblioteca com un gran espai únic, sense límits ni separacions entre usuaris i documents. Al mateix temps, aquest espai resulta flexible per a futurs canvis, ampliacions o modificacions. Un espai amb un aire de fàbrica, industrial, en què es troben a la vista tant materials constructius, com les instal·lacions elèctriques, la il·luminació, etc. (<http://www.bauenblog.info>)

### Clorindo Testa, Buenos Aires – Argentine

\* 1923 Naples, Italy

#### Libraries:

[Biblioteca de la Camera de Diptados, Prov. De la Pampa, Ciudad de Sanata Rosa – Argentina 2005](#)

<http://deu.archinform.net>

Arquitectos: Clorindo Testa y Miguel García

Ubicación: Centro Cívico, Ciudad de Santa Rosa, Provincia de La Pampa, Argentina, Superficie: 565 m2

El nuevo edificio para la Biblioteca Anexa a la Cámara de Diputados de la Gobernación de La Pampa, construye un lenguaje arquitectónico que se desplaza hacia cierta estética de la imagen, y que en la concepción plástica de Clorindo Testa y Miguel García, vigoriza la relación entre forma, uso y tecnología y ubica así la arquitectura dentro de la producción del arte contemporáneo. Una premisa fundante del proyecto consistió en la necesidad de diferenciar su escala respecto de la monumentalidad del núcleo urbano. La plasticidad de la implantación quiebra las normativas racionalistas del conjunto, cuando el despliegue curvilíneo de la cubierta cae sobre el parque, y el color amarillo del edificio remite al paisaje invernal y al jardín de girasoles pampeanos. El edificio se organiza en dos plantas en doble altura y un subsuelo destinado al depósito de libros. En la planta baja se ubica la sala de lectura, el acceso general del público y un sector de lectura para niños. Desde el entrepiso, un puente cubierto y rampado hacia el exterior vincula directamente la biblioteca al edificio de la Cámara de Diputados. El efecto escultórico del edificio impacta por la diversidad de distintas geometrías. El ángulo recto, en las plantas de los pequeños volúmenes, se forma con el encuentro entre una curva y una recta para diferir en el desarrollo volumétrico. La exaltación de las partes disímiles produce una discontinuidad que deriva en la sorpresa, así como efectos contrapuestos en las miradas desde el parque y la ciudad. La analogía del caparazón de un animal prehistórico, es reconocida como referente por Clorindo Testa. En el subsuelo, donde se encuentra el depósito de libros, se dispone de una sala de lectura para investigadores y un sector de restauración de libros antiguos, con acceso del público. Los conciertos al aire libre desde la pequeña promenade o las exposiciones interiores, tales como la exhibición de fotos de los desaparecidos de La Pampa, transforman el espacio de quietud de la lectura hacia una forma de lenguaje capaz de integrar la memoria de la historia y la experiencia plástica de la arquitectura. (<http://bibliotequera.blogspot.com>)

[Biblioteca Nacional, Buenos Aires – Argentine 1992](#)

with cooperation Alicia D. Cazzanica and Francisco Bullrich

The National Library of the Argentinean Republic was founded September 1810. In 1960, according to law 12.351, the library got the permission to construct a new building on three hectares in the area enclosed by Avenida Libertador San Martín and Las Heras and the streets Agüero and Austria. A national competition was organised to select the architect, won in 1961 by Clorinda Testa, Alicia D. Cazzanica and Francisco Bullrich. The building however, was not inaugurated until 1993. The library is built in the Brutalist Style, exposing an excessive amount of concrete. The public library is situated in a volume lifted on top of four concrete cores, each containing 13 piles with a diameter of 1.2 metre. The view from the interior of the library towards the city of Buenos Aires is magnificent. The book deposit, a school for librarians and the machine room are located in the basement.

(<http://www.mimoa.eu>)

Municipal public library of Grosuplje is located in the heart of the city and represents one of the most vivid parts of public life in the community with 18.500 inhabitants. Nowadays library members represent 35% of regional population and the percentage grows noticeably every year. Library activity in the community started before the Second World War with social and trade union libraries. Independent public library was established in 1962 and later in 1967 the first professional librarian was employed. The development of the new library information system, technology, social and economic relations resulted the need for a modern library building. Library with modern technical facilities, better access to the library collection and more spacious reading room. In 2003, municipality of Grosuplje started the renovation and in 2007 the new library has been opened. With a quality ICT equipment and services and adequate respond on demanding requirements of modern learning the library fulfilled its role as a knowledge provider. Today library employs nine librarians who provide professional librarian service for each and everyone that grounds in personal

and trusting relation between users and services. Library has approximately 750 visitors per day. It provides large amount of contemporary literature, electronic journals, free access to the internet and comfortable reading and studying areas. The latter are sufficiently equipped with a well chosen collection of key literature, reference material and journals. Visitors can also visit exhibitions in the gallery, drink a cup of coffee in cafeteria or join evening cultural events. For the youngest members library organises special storytelling hours. The image and identity of this library arise also from tight cooperation with local schools, kinder-gardens, cultural and other associations. ( <http://www.librarybuildings.info> )

#### Libraries:

#### Rouse Hill Town Centre, Rouse Hill Library, NSW – Australia 2008

In association with Rice Daubney and Group GSA

Library: 2.500 m<sup>2</sup>, \$ 2.500.000

In towns and cities, public space has traditionally served as a meeting place, marketplace and traffic way. Enjoyable towns and cities find a comfortable balance between these three demands, without forfeiting their links with the natural world. The starting point for the design of Rouse Hill Town Centre was a desire to achieve this balance, responding at the same time to the climatic environment of Rouse Hill, and the principles of ecologically sustainable design.

Rouse Hill Town Centre, sits at the heart of the 120-hectare New Rouse Hill site in northwest Sydney, which has been identified by the state government as a major corridor for Sydney's expansion, and will account for 20 per cent of the city's population growth. The New Rouse Hill is a joint venture project between GPT and Lend Lease, and was developed within the context of a masterplan prepared by Civitas Urban Design and Planning in partnership with the NSW Department of Planning and Landcom. The GPT Group is the developer, owner and manager of the \$470 million Rouse Hill Town Centre, which has all the facilities of a small town, including a shopping-centre precinct, commercial space, a nine-screen cinema complex, education, library and community facilities, a health and medical centre, and good transport links. The design of Rouse Hill Town Centre was delivered by a consortium of three architectural firms – Rice Daubney, Allen Jack+Cottier and Group GSA. (Allen)

#### Libraries:

#### State Library of Victoria, Melbourne, VIC – Australia 1990 – 2007

The Melbourne Public Library was established in 1853. Library Trustees were appointed and they immediately announced a competition to design the building. The competition was won by Joseph Reed (\*23.02.1823 Constantine, Cornwall, England - + 29.04.1890 Melbourne-Borondaara), the architect of many of Melbourne's notable buildings. Under his design the Library buildings were to be built in several stages. The first Library building opened in February 1856, during the Victorian gold rush. The famous Dome (now called the La Trobe Reading Room) opened in 1913.

(<http://guides.slv.vic.gov.au/slvhistory>)

\$ 120.000.000

The SLV project's restoration and adaptive reuse work has involved 13 adjoining buildings erected on the site between 1856 and 1965. These historic buildings form one of the most significant heritage groups in Australia and are important for having been the principal educational and cultural centre for the people of Victoria over the past 150 years. Of particular significance in AMW architectural work, is the interior restoration of the Domed Reading Room, Queens Hall (future work), McCoy Hall, & reinstatement of the glass rooflights to the dome and the other major toplit former gallery spaces.

The first major buildings on the site, designed by Joseph Reed, are significant as the first purpose built, free public library in Australia and one of the first in the world. Successive buildings are important as the first homes of the National Gallery of Victoria, the Industrial and Technological Museum and its successor the Museum of Victoria. Many of these buildings are now well known and culturally significant icons, such as Queens Hall for its elaborate interior and as an early example in library design; the Domed Building designed by NG Peebles, for its impressively proportioned, high interior space and for the technical construction of its reinforced concrete dome roof which was the largest in the world for its time; and the McCoy Hall with its flanking galleries and clerestory rooflight. (Ancher)

...At the time the main project commenced, in 1989, it was envisaged that the Victorian State Library Redevelopment Project would be completed in five stages over a minimum period of seven years. However, the work has involved significantly more stages and when construction of Stage 6 is completed in Mid 2006 will have taken over 16 years to complete. During this period, the project has seen many changes, including five State Librarians and three changes of State Government. The current project is for the redevelopment of the State Library of Victoria with refurbishment, adaptive reuse and the restoration of the heritage buildings, and the construction of new infill buildings and courtyard enclosures. Restoration and adaptive reuse has involved the 13 adjoining buildings erected on the site between 1865 and 1965. These historic buildings form one of the most important heritage groups in Australia. Of particular architectural significance is the interior restoration of the Domed Reading Room, Queens Hall (future work), McCoy Hall, & reinstatement of the glass rooflights to the dome the other major toplit spaces. ....

## **ARM, Melbourne, VIC – Australia**

<http://www.a-r-m.com.au>

### **Libraries:**

**Albury Library/Museum, Albury, NSW - Australia 2007**

€ 8.000.000

“Albury Library/Museum has revolutionised the reading and borrowing habits of the city in the past year. More children are borrowing more books, and the adults are following them. Staff are reporting “a phenomenal increase across a range of services” Border Mail. 26 July 2008. ARM is proud to have provided the architectural services for the Albury Library/Museum. After being appointed in early 2003, ARM began working with Albury City Council to create the combined facility of the Albury Public Library and the Albury Museum. Council’s vision was for a single civic facility to provide a library, museum, community and new IT facilities for the Albury region, all co-located as a new type of public building. Our architectural vision for the building was to bring together reminiscences and almost familiar elements from the Albury region; the giant webbing of the railway bridge over the Murray, the banks, levees and trees of the surrounding landscape, the river course itself, the streetscape of the Civic precinct, the coved cornices of a railway carriage, even the types of materials that one sees on the buildings in Albury. (ARM)

**St. Kilda Library + Town Hall, Melbourne, VIC – Australia 1994**

€ 7.600.000

Vividly aware of the St Kilda context, using associations and symbols of the area, the building architecturally develops the deconstruction of the cargo culture of the ex-colonies. The fetishised culture of world architecture is tested in a local setting. The open space in Carlisle Street has been redeveloped as a civic plaza, establishing a link to the library. The extension of the existing library, originally designed by Dr Enrico Taglietti, involved an upgrade of existing facilities, providing additional book stacks, main desk, entry and public face. Much effort was undertaken to retain the original, and in adding to it, in order to positively extend the fine brutalist work. The new street façade of the addition is a curved bluestone clad “book”, with a flush S curved picture window, an “illustration page” with overtones of a video screen, a simple and evocative image providing an obvious focus for the community. This is symbolic architecture. It is a building which plays a strong role in an important civic space. The monumental idiom of the project continuously tests the proposition of the death of the book, while in stylistic terms the form contests another neo Baroque. (ARM)

## **Brewster Hjorth Architects, Surry Hills, Sydney, NSW – Australia**

<http://www.brewsterhjorth.com.au>

**Rockdale Civic Centre and Library, Sydney-Rockdale, NSW – Australia 2012 (final design report)**

(<http://www.rockdale.nsw.gov.au/Pages/pdf/BusinessPapers/21141-4.07-120723-RCCDesignReport.pdf>)

**James Cook University ICU, Eddie Koiki Mabo Library, Townsville-Douglas, QLD – Australia 2012**

Size: 3.500 m<sup>2</sup>, Cost: \$ 9.000.000, Completed: July 2012

The Eddie Koiki Mabo Library of Townsville’s James Cook University is the landmark and built focus of the Campus which was laid out by the prominent Queensland Architect James Birrell. He also designed the original library building which was to become his Master-work.

The 1966 building had an ‘organic’ plan form and sculptured section and off-form concrete envelope reminiscent of Corbusier’s later work.

This redevelopment reinforces the importance of Birrell’s concept minimising the impact of later additions, to create modern, open, technology rich learning environments. The redevelopment has been designed in three stages.

### **Conceptual Framework**

The completed work is the first stage of a concept design that re-organises all 3 floors of the building: The original undercroft is opened up to create a series of open, interconnected public spaces with the introduction of a new central circulation spine at each level of the building aligning with the Masterplan axis of the campus, incorporating a new south entry to the building, and a re-organisation of its functional zones arranged along the new spine.

Student Reading and Study spaces are positioned to the northern edge of the original building where the full drama of the architecture is revealed.

The new concept responds to the digital-age approach to information access. The physical collection is relocated along the southern side of the building as a permanently accessible resource leaving more space for interactive and collaborative learning.

The conceptual approach to the interior design is to reveal the original robust design of the building with powerful, off-form concrete walls, voids and striking structure, and respond to this in the design of the new interventions.

The spatial arrangements, functional planning and detailed design of spaces and furniture incorporate a light and unconstrained language of curves which relate to the original structure.

### **Program Resolution**

The integration of new “student commons” with 24 hour access, and teaching spaces dedicated to new modes of group and interactive learning were core of the brief requirements for this stage of the redevelopment, Stages 2 and 3 relate to the collection and passive learning spaces on the building’s upper levels.

### **Integration of Allied Disciplines**

The reduced height of the original undercroft necessitated complex underfloor services and HVAC ducting. The work required detailed co-ordination of the architecture with the Building Services engineering. Structural interventions were limited but highly sensitive given the exposed nature of the off form concrete envelope and structure.

### **Public and Cultural Benefit**

The new Eddie Koiki Mabo Library re-asserts its importance at the core of the University and gives new life to a marvelous building. It provides the student body with new spaces for shared and interactive learning, reflecting modern pedagogies, supported by pervasive access to electronic data technology.

The new interior street, along with the adjacent Southern Entry and Landscaping, supports the planned re-organisation of the campus Masterplan towards its original Jeffersonian intentions, with the University Library as the head and centre of the campus.

The Eddie Mabo Library at the Townsville Campus of James Cook University is the landmark building of the University. It was originally designed by the prominent Queensland Architect James Birrell in 1966, with an original and organic concept. The building was built as the centre of the university Masterplan, with Construction being staged over several years. The building was extended in 1991 to its present size of 9,500m<sup>2</sup>.

The redevelopment of the Library aimed to bring it into the 21st century with the creation of technology rich learning environments of various formats to bring North Queensland University education to the forefront of developments in Tertiary education.

#### Design Innovation

The redevelopment will create learning and research environments that build on the advantages of electronic data access and the trend to shared and interactive learning.

The redevelopment includes student "commons" which give up to 24 hour access to students to study for study and research with computer and data access as well as study booths and reading areas that support group learning and research. (Brewster)

#### [Ashfield Civic Centre, Sydney-Ashfield, NSW – Australia 2011](#)

Costs: \$ 15.500.000

Ashfield Civic Centre is a revitalisation of the Ashfield Town Centre led by Ashfield Council with the creation of a new Civic Centre and Public Library on the site of the old Ashfield Council Offices.

The redevelopment of the site includes the 2 original council buildings, and a new 3 level building which integrates all levels of the facility via new lifts and a 3 storey atrium. Facilities include a new Public Library of approximately 2,000m<sup>2</sup>, modern customer services facilities housed in a grand public foyer, new public meeting rooms for 200, as well as Youth Centre, Early Childhood Centre, Council Offices, and an upgraded Town Hall with the seating capacity for 300.

#### Design Innovation

The design of the new Civic Centre extends the benefits of co-location of council facilities by providing a seamless connection to all facilities. The Public Access to all of the facilities are provided within an open and united space where it is possible to speak to council officers, return library material, attend a public meeting or access community services at the one address. Multiple access points are provided from Liverpool Road, the adjacent retail mall and public carparking facilities.

By using electronic book tagging, security is limited to the building perimeter only with the public free to move between facilities in the Centre. The Centre has the feel of a modern department store where services may be accessed electronically, through self service points or by open contact with council staff. The library facilities include for IT access to the public throughout the facility with no separation between the physical collection and electronic services. Checkout and return can be done completely independently of library staff, freeing staff to provide individualised service to users in accessing the collection.

Council offices have been amalgamated onto a single level with an open plan design providing for ease of access of staff with extensive meeting rooms and informed meeting spaces creating a relaxed and interactive environment. (Brewster)

#### [Cooroy Library and Digital Hub, Cooroy, QLD – Australia 2010](#)

Physical Size: 1,650 m<sup>2</sup>, Cost: \$ 8.500.000, Completed: September 2010

The Cooroy Library and Digital Information Hub was developed as part of Mill Place Master Plan for Cooroy, which created a new vibrant link between the existing Art gallery, housed in the Butter Factory Building, and the upgraded rural industry areas, vacated by the closing of the local Mill Place timber mill.

The new Library and Digital Hub creates a bridge between the Butter factory Art Gallery and the main city street, opening up to the recreational park created within the site of the Mill Place timber Mill. The link has been achieved by digging the new library in into the existing slope, bridging level difference of 6 m between the Art Gallery and the recreational park.

The building includes a large new public library design for the Cooroy community and capturing the larger community living in the hinterlands surrounding Cooroy. The library includes a technology rich hub, with digital training rooms, community rooms, community lounge, reading areas and café that can open onto a large covered verandah visually and physically connection it to the recreational park.

#### Building Form

The building was designed a two curved opposed pavilions. The western pavilion is dug into the slope of the site, and is covered by an earth sheltered grass roof. The grassed roof provides the setting link to the art gallery, and extends the grounds and the park and the gallery. A prominent sculpture has been placed at a pivotal junction between the library and the art gallery to unite the creative, cultural and recreation precinct created.

To the east, the library opens to a sunken internal courtyard, edged by a large stonewall, providing much needed cooling in the summer from the stone mass and shading.

To the north the eastern pavilion rises out of the ground, with a beacon lantern positioned at the junction between the two pavilions. The lantern brings in southern diffused daylight into the library, and provides high internal cathedral space where community lounge, café, and reading areas are located. The form of the lantern has been designed with prominent angled elements, continuing the sculptural form and connection to the site. (Brewster)

#### [Yeppoon Library, Yeppoon, QLD – Australia 2009 -](#)

Physical Size: 1.750 m<sup>2</sup>, Cost: \$ 6.500.000, Completed: Stage 1 2009

New Central Library of 1750 m<sup>2</sup> located in the town's central park. The Library incorporates an active lending collection based on a bookstore principle with an internal/external café. The building is designed to be occupied in stages over the next 10 years

#### [Rockhampton Library, Rockhampton, QLD – Australia 2009](#)

Client: Rockhampton Regional Council.

New Regional library of approx 2,500m<sup>2</sup> incorporating a café, exhibition area, large auditorium youth library, and business services centre. The new building links to the heritage school of arts building which is to be upgraded as Council offices and to the existing library building, which will be returned as stack. Together with our Graphic Design Team, BHA developed a river theme, incorporating Rockhampton's high flood mark by hanging bright red buoys at the water level and the quintessential "river tinny" from the roof. In keeping with the local theme, a feature of the library is the "faces" wall, which incorporated images of significant writers who originate from the region. (There have been quite a few well-known names!) The wall creates a historical feature, one that the region is very proud to share. (Brewster)

#### [Ingleburn Library, Ingleburn \(Sydney\), NSW – Australia 2008](#)

Physical Size: 2,150 m<sup>2</sup>, Ccost/Budget: \$ 9.500.000, Client: Campbelltown City Council.

The new Library and Community Centre for the Campbelltown Council incorporates the heritage School of Arts Building, which is to become the central Gallery Foyer. A flexible auditorium to seat up to 300 people as well as a number of smaller activity rooms located off the central gallery. Designed with a line which bends smoothly over the roof and the curved walls. This curved geometry extends into the landscaping. The internal trees extend into the exterior parkland to carry the indoor/ outdoor theme. Both the Library and Community Centre are arranged to address the existing community parkland that is to include a complex child's playground, formal park and amphitheatre. The facility is designed as a 4.5 ABGR facility with complex energy systems including a

night purge system, solar hot water collector, high performance glazing and a displacement air-conditioning system which allows the cool air to be introduced through the floor grills. All of which create an efficient and peaceful environment for users. (Brewster)

**Concord Library Centre, Concord (Strathfield, Sydney), NSW – Australia 2008**

Physical Size: 2,300 m<sup>2</sup>, Client: Canada Bay City Council.

The new library is set to become a new standard of excellence in community facilities. The building's striking design is born from its strong environmental focus with its prominent glass thermal chimneys and gently spinning stainless steel cowls glistening in the sun. The new Library is arranged on 2 levels facing over playground and parkland, looking towards the river and bays. It includes an internal café, community meeting rooms, youth area and business facilities. The internal graphics are strong and intended to work with the building layout to produce an inspiring open light filled environment. The large thermal chimneys work as passive solar powered engines to quietly draw fresh air through the building. Outside air is taken in by the large blue swan necked ducts positioned in the landscape and their drawn through the underground labyrinth where the air is naturally cooled and then gently vented into the public space through floor ducts. (Brewster)

**University of Western Sydney, Campus Campell Library, Campelltown City (Sydney), VIC – Australia 2008**

cost: \$ 8.500.000, completed: June 2008

Major Adaptive Re-use and upgrades to the original Phillip Cox Campus Library building including a complete internal redesign. The original building included exposed off form concrete waffle slabs with a complex triangular pattern. (Brewster)

**University of Western Sydney, Campus Bankstown Library, Bankstown, NSW –Australia 2007**

The Bankstown campus is situated in the suburb of Milperra in the Bankstown Local Government Area.

Costs: \$ 4.500.000

Major upgrade of the Bankstown Campus library and student services area carried out while the facility remained operational (Brewster)

In late November 2006, work commenced on refurbishing the Campbelltown library—in part to accommodate the new medical collection and support the Medical School. Library staff were temporarily relocated to an adjacent area to ensure continuity of services and to enable builders to create a state of the art library. Due to the goodwill of staff and building contractors, library services were available throughout the refurbishment and the building was completed in time for the commencement of Autumn Semester. Brewster Hjorth Architects, the successful tending architectural design company, worked closely with a Library and Capital Works & Facilities project team to plan the client and technology focused refurbishment.

(<http://librarv.uws.edu.au/FILES/report/2007/AnnualReport.pdf>)

**Wallisend Library, Newcastle-Wallisend, NSW – Australia 2006**

Size: 1.750 m<sup>2</sup>, Costs: \$ 7.500.000, completed: February 2007

**Awards:**

**RAIA Hunter Design Awards 2006: ESD, Civic Design & Major Design Award.**

The new Wallsend District Library building is designed to act as a seed or focus for the growth of a sustainable community for Wallsend. It provides exhibition, meeting, library and childcare facilities and links them to the neighbouring Wallsend Plaza Shopping Centre across the street. Since the new Library opened in May 2006 the building has created a large amount of public and industry interest. It also won all major awards for Design, Excellence, Civic Design and Sustainable Design at the Hunter Civic Design Awards for 2006.

The design was evolved to create an open, light and light filled internal space, that provided a range of exciting locations for various facilities, and uses, that could be accessed individually as separate addresses within a single simple structure. The form of the building is created from two curved pavillions that are linked by a central linear atrium. The curves of the building flow from its curved sheet frontage Each pavillion has a 'skillion roof' sloping down towards two large 1.5m high 'v shaped' curved steel box gutters that define the central linear spine of the building.

The building's site runs north/south along the curved sheet frontage; the Wallsend Plaza located behind a large open carpark occupies the opposite frontage. A central walkway 'spears out' from the retail centre towards the new Library. To the north, south and behind the site to the west lie a range of single storey residential scale cottages and a stormwater floor line bisects the site.

The sites flood level required a floor level that was elevated about 1.5m above the ground, this was used to create a large podium for the building with a larger curved flight of steps running almost the full frontage of the building. The podium continues the level of surrounding residential boundary fences forming a base above which rises the high glazed façade of the building to create a form with a more civic scale responding to the intersection of the curved street with the new pedestrian cross axis.

The line of the Plaza's walkway was continued as a cross axis over the road with a new pedestrian crossing and then as the line of the buildings entry.

The intersection of this axis and the central atrium positioned the main public service desk and defined a quadrant of the building, which became the exhibition and meeting rooms. (Brewster)

**Swansea Library, Swansea (Lake Macquarie), NSW – Australia 2006**

Physical Size: 800 m<sup>2</sup> (Library), Cost: \$ 5.600.000, Client: Lake Macquarie Council.

The project provides a home for a range of public facilities over 2 levels. The library on the upper floor sits under the saw-toothed roof and overlooks the 50m long foyer to the community rooms below. Reading areas are located in pod-like balconies suspended over the void. The 4 large meeting rooms are arranged under the library, they can be combined in different ways to suit various uses. They are accessed either from the long foyer or from the large landscaped court running along the western façade. The linear building with long eastern and western 2 storey glass louvre facades is designed to maximise its access to the prevailing north-eastern cooling winds to reduce and eliminate requirements for air conditioning. The saw-toothed form of the building is inspired by the rows of lakeside boat-sheds of the old village, their scale has been enlarged to be viewed at 80km/hour. The curved timber screens along the east and western façade recall the sails on the lake and the waves along the beach. The building is constructed of raw materials; off-form concrete, exposed steel structure, corrugated iron cladding and bleached timber screens with panels of unedged plywood lining to continue the boatshed analogy. (Brewster)

## [Mona Vale Civic Centre, Sydney-Mona Vale, NSW – Australia 2005](#)

Size: 1.700 m<sup>2</sup>, Costs: \$ 7.200.000 m<sup>2</sup>

The common conception of libraries is that of warm, cosy and quiet nooks where readers can sit undisturbed for hours on end, engaged not in the activities of this world, but in those which unfold in the pages before them. With the new Mona Vale Civic Centre and Town Library, however, Brewster Hjorth Architects were required to negotiate this concept with a very different one, for the Centre was to serve as the heart of the community, a place of interaction and involvement, not isolation.

Not just a library, the centre is also the new home for Pittwater Council- a refurbished and refitted space for the Council Customer Service Centre, Meeting Room, and Offices for Planning and Compliance officers. Accompanying the refurbishment of the existing buildings came the birth of a number of refreshingly new spaces. The library, an outdoor café, a parkland amphitheatre, an early childhood centre and an integrated pedestrian path linking the two halves of the village have all provided a refreshed civic focus for the Mona Vale Village, in keeping with the aim of its inception.

The adjacent parkland played an integral role in determining the form and structure of the library, which was to be constructed below it- an underground, earth-sheltered structure. It was conceived as two opposing curved pavilions, arranged around and linked by a central sunken garden between the two halves of the building. The opening to this void is surrounded by a garden of ‘dune’ grasses on the plaza level, which defines the customer access as well as enclosing and containing the café. The curves of the two pavilions create the amphitheatre on the eastern side addressing the park and the curved line walkway on the western side, thus providing light and outlook as well as an external reading area for library users. This latter function was a direct response to the client’s brief.

The relationship between the site and its context that proved so influential on its form and structure also had non-material implications. It actually worked to define and refine its intended function. Because of its relationship to the park, the council desired maximum use of the outdoor public space, to make it the metaphorical as well as actual civic “centre”.

To this end, Brewster Hjorth blurred the distinction between inside and outside by large glass windows that accompany the reading and studying areas. These intimate internal spaces enjoy an external outlook and are brilliantly lit by natural light from the courtyard and the long curved lantern that encloses the main entry ramp. Casual arrangements of outdoor furniture beneath these windows imbue the area with a relaxed, interactive, social atmosphere. The new café located on the plaza level further enlivens this shared pedestrian experience.

Furthermore, in the existing community hall, the eastern wall was replaced with a row of new glass doors to provide the hall with a spill out area along its long side, and to create a more connected space for community and public meetings. Principles of openness and interaction consistently defined the project at every level.

The new structure is entered via a wide, 25 metre long curved ramp, which not only provides public access but also gives a wide dramatic introduction to the open areas of the library. A curved glass lantern runs along the western perimeter of the library and encloses this ramp, defining the pedestrian walkway and utilising natural light. The ramp serves an integral function, as users are first introduced to the nature of the library by their procession down it.

Brewster Hjorth prides itself on its incorporation of various innovative and unique ESD initiatives that take advantage of the building’s location to dramatically cut energy use. Again, the underground form was influential. Preservation of the parkland was just one such advantage. The building’s immersion in soil created a high level of protection from the external environment, preventing transmission of excessive solar radiation during summer and heat loss in winter. When coupled with the high levels of thermal mass inherent in the structural design of the exposed concrete ceiling system, the building enjoys high thermal stability and avoids the effects of diurnal temperature fluctuations. This reduces reliance on artificial temperature control methods. To complement this, the largely consistent ground temperatures were utilised to provide ‘free’ cooling and heating. In an outdoor air tempering system, air is brought inside via an underground masonry duct along the building’s perimeter to naturally maintain comfort levels of its occupants. Consciousness of ongoing maintenance and running costs was determinative of the material selection. Finishes, fittings, lighting and building services were chosen accordingly.

In addition to their traditional roles, work by Brewster Hjorth Architects included design of special shelving, furniture, signage and graphics to create a completely integrated facility. Hence the new building visually and physically connects all the public facilities on the site and provides new important links which allows the village to operate as a unified whole. BHA believe that the public facilities now realise their full potential as a community focus for the village, for they have been successfully linked not only to the rest of the integrated complex, but have also linked that complex to the community at large.+

Top. The external architectural expression was derived from discussions with the original designer, Colin Madigan. The existing form is typical of its period - a sculptured arrangement of simple forms with high pitched roof sections terminating in dramatic half gables

Second. Brewster Hjorth designed special shelving, furniture, signage and graphics in addition to their traditional roles. This helped create a fully integrated and aesthetically consistent facility.

Third. The building form consists of two pavilions linked by this sunken garden which provides light and outlook to its inhabitants. The open courtyard below imbues the internal reading areas with brilliant natural light, challenging the perception of libraries as dark, forgotten nooks.

## [Avalon Centre, Library, Sydney-Avalon, NSW – Australia 2005](#)

Avalon Recreation Centre

This Centre is located in the Avalon Shopping Centre and is next to Dunbar Park. It has a sports hall, meeting room and four activity rooms available for hire, one including sinks for art classes. The Centre is suitable for functions, classes, meetings, workshops and exhibitions. The centre also houses the Avalon Community Library, the Avalon Early Childhood Centre and a Pittwater Council Customer Service Centre. (<http://www.pittwater.nsw.gov.au>)

## [Castle Hill Hub, Castle Hill \(Sydney\), NSW– Australia 2004](#)

Physical Size: 2,250 m<sup>2</sup>, Cost: \$ 12.000.000, Client: Baulkham Hills Shire Council.

The new Castle Hill Library and Community Centre were designed to be Australia’s most advanced Library and Community facility. Council invested in a long-term research program of many international facilities before embarking on the project. The library has set new standards in the display of its collection and its integration of reader areas and digital access areas. The new library includes a large ‘bookstore style’ lending library, a café, a fully equipped research oriented reference library and digital research facility as well as a large children’s and youth library. The internal café, which is leased to an external operator is very successful. It is located adjacent to an external secure courtyard. The library is designed to allow food and drink to be consumed inside and for books to be taken outside. The library collection has been arranged by “Genre” rather than by the Dewey System, lounge areas are located around the library in conjunction with the various “lifestyle” collections. Environmental graphics have been

used extensively to create an exciting internal atmosphere, the internal fitout is designed to evoke the feeling of an upscale book store. (Brewster)

#### **Strathfield Library, Strathfield (Sydney), NSW – Australia 2004**

Physical Size: 2,000 m<sup>2</sup>, Cost: \$ 4.750.000, Client: Strathfield Council.

##### **Awards:**

The project was shortlisted for the RIAA 2004 Awards in the Public Building Category  
MBA Public Building Award 2004

The beautiful new Strathfield Library and Information Centre is a striking, modern building which sits on the same site and replaces the old 1970's Homebush Library. The new 2,200m<sup>2</sup> building is designed to sit comfortably in the tree-lined streets of federation style Homebush residential village and consists of a central lending library, a reference library, a local history library and a children's library. BHA were engaged to develop and document the building's design and follow the process right through to obtaining Planning Approval and assisting during the Construction Phase. The design phase involved intensive consultation with Council and Library staff as well as a series of public and neighbourhood consultation meetings. The building's design introduces a number of features in relation to efficiency and connectivity of the various spaces. The internal design is laid out around a central atrium that visually connects the major facilities of the building over both floors. The atrium also acts as a thermal chimney and lies at the heart of the building's natural ventilation and energy conservation system. A large array of photovoltaic cells are arranged on the building's roof and provide supplementary power for the Centre's operation. (Brewster)

#### **Mona Vale Library, Mona Vale (Sydney), NSW – Australia 2004**

Physical Size: 1,700 m<sup>2</sup> (library) 1,550 m<sup>2</sup> (council admin + childcare), Cost/Budget: \$ 7.200.000, Client: Pittwater Council engaged BHA to design and administer the construction of their new Central Library under the Mona Vale Village Park.

##### **Awards:**

RAIA Commendation Award for Civic Design 2005

RAIA Commendation Award for ESD 2005

MBA Public Building Award for ESD 2005

The project includes a new 1,700m<sup>2</sup> library constructed below ground and connected to the existing heritage library building. The new library is lit by an open central atrium and accessed by a curved ramp which descends through a linear glazed lantern. The existing library building is reconfigured as a new Customer Service Centre for Council and connected to the library by ramp, stair and lift. The Village Park extends over the Library with a new amphitheatre, public plaza and café. The building capitalises on the reduced diurnal temperature variations found below ground to minimise energy consumption. Air intakes use the earth to pre-cool the air supply which is then distributed below floor with a displacement air system. (Brewster)

#### **Five Dock Library, Five Dock (Sydney), NSW – Australia 2004**

Physical Size: 1,800 m<sup>2</sup>, Cost/Budget: \$ 2.500.000, Client: Canada Bay Council, The BHA Design Team wanted to create a memorable, yet state of the art library facility for the new Five Dock Library

From the cosmopolitan café/bookstore to the busy street life of Five Dock village, a feeling of Avant Garde was devised to complement the libraries urban surroundings. Essentially two distinct schemes overlap each other to create a dramatic, vibrant and enticing composition. Brightly sculptured walls make an exciting basis for the library fitout with colours defining various sections of the library. Dividing walls are lined with translucent acrylic and lit from above with bright blue lighting. Highlighting the space is a 28 metre long red wall which runs from the main entry, deep into the heart of the building. The graphics are coloured to match the Library's paint scheme and work with the full palette of internal finishes to create a co-ordinated, exciting and unique internal environment for this important public facility. (Brewster)

#### **Erina Fair Centre, Erina, NSW – Australia 2003**

physical size: 1,200, cost: \$ 4.500.000, completed: 2003

New Branch Library of approx 1,200m<sup>2</sup> built as a tenancy within the new Erina Fair Shopping Centre. The project also included a large Community Meeting facilities & Youth Centre. (Brewster)

#### **University of Western Sydney (UWS), Faculty of Arts and Social Sciences (FASS), Milperra Campus, Sydney Parramatta, NSW – Australia 2001**

Size: 2.500 m<sup>2</sup>, \$ 5.000.000

The UWS FASS Project is a new building located on the Milperra campus of the University of Western Sydney – Macarthur for the Faculty of Arts and Social Sciences. Three departments were to be housed within the building. These included the Department of Aviation, Department of Psychology and a research space for use by the Pro-Vice Chancellor. BHA were engaged to prepare a detailed brief, develop a design, obtain Development Approval and assist during the construction phase.

The briefing and design process involved extensive consultation with the Building Committee, faculty representatives and senior university management. A number of intensive consultative design workshops were held. The project was completed on time and budget. The new building enhances the university campus. The building replaced existing temporary accommodation within demountable buildings. The new building follows the natural topography of the site and is two storeys high at the eastern end, stepping down to three storeys at the western end. A heavy masonry wall on the southern façade of the building wraps around the eastern and western facades, opening up to lightweight profiled metal cladding and glazed curtain wall on the northern façade. An exposed concrete frame on the northern façade reflects the surrounding buildings. Solar protection in the form of sun shading has been incorporated in the design on the northern and western facades. A new covered walkway similar to the existing walkways on campus connects to the existing covered walkways. (Brewster)

#### **Woy Woy Library, Woy Woy, NSW – Australia 2000**

#### **Parkes Library, Parkes, NSW – Australia 1999**

#### **Port Macquarie Library, Port Macquarie, NSW - Australia 1997**

#### **Bowral Town Health Centre, Library, Bowral, NSW – Australia 1997**

physical size: 1750 (library) 1500 (health centre), cost: \$ 6.500.000, completed: July 1997

## **Brown Falconer Group, Maylands, SA – Australia**

<http://www.brownfalconer.com.au>

### **Libraries:**

#### **Mount Gambier Library, Mount Gambier, SA – Australia 2010**

Mount Gambier Library is an exemplar project. It contributes significantly to contemporary architectural design practice by demonstrating that public libraries can positively connect with and appeal to all age groups within a diverse community. This is evident in a major cultural shift where ‘meet you at the Library’ is the new catchcry spread throughout this regional city. Collaborative design has been the core strategy for delivery of an architectural and interiors outcome which is fully integrated from a macro to the micro scale. The branding ideas evolved from the initial concept designs for the ‘lattice of letters’ feature screens. ...

## **Gregory Burgess Architects, Richmond, VIC – Australia**

<http://gbarch.com.au>

RAIA (Royal Australian Institute of Architects Gold Medal 2004)

### **Libraries:**

#### **Castlemaine Library & Theatre, Castlemaine, VIC – Australia 2004**

This refurbishment and extension of an existing library and theatre is situated within and around a heritage listed building, and underwent a process of extensive collaboration with the local community, the staff and the council. The tight budgetary constraints demanded an innovative and economical approach and the resultant design is an excellent re-use of an important historical building, ensuring its ongoing role and value in the community. (Burgess)

#### **Phoenix Park Community Centre & Library, Stonnington, VIC – Australia 2001**

This community facility including a library, galleries, multi-purpose hall and cafe, involved the re-use of a disused high school building and a newly built wing. The sensitive handling of the interface between the old and the new was central in establishing the new facility in its site. (Burgess)

#### **Eltham Library & Community Centre, Eltham, VIC – Australia 1995**

The Eltham Library is an innovative building in a historic precinct, comprising of a library, gallery, cafe and multipurpose areas. Since the 1930s Eltham has developed a vibrant artistic and cultural community, with a strong environmental focus. The design of the building pays homage to and celebrates this spirit with its extensive use of natural materials, low energy consumption and its sympathetic response to people and the environment. The library has recently been placed under a Heritage Overlay by local Council, in recognition of its outstanding value to the local community. The Eltham Library is known architecturally as one of the best in the state and an icon for Nillumbik Council. It receives visitors from around Australia and the world to view its innovative architectural style. The Shire recently commissioned Gregory Burgess Architects to improve the library’s future trends in service delivery. Part of the brief was to create a secure children’s activity area. It can also be used by parents to read stories with their children in the lovely outdoor setting. (Burgess)

## **BVN ( Bligh Voller Nied ), Brisbane, QLD – Australia**

<http://www.bvn.com.au>

### **Libraries:**

#### **Kingston Library, Kingston, ACT – Australia 2010**

### **Awards:**

2010 RAIA Interior Architecture Commendation ACT Chapter

Located amidst Kingston’s bustling shopping strip is the new Public Library, a contemporary take on a traditional community institution. It contains in excess of 20,000 items and is linked into the ACT Libraries network. This is a modern library; a bustling, energetic, open and engaging space. Patrons are encouraged by its location, tactility and welcome nature to drop in. The philosophical approach to the project and its design is to make it as easy and as desirable as possible to visit. A simple diagram of a joinery spine contains the library functions including borrowing, membership, magazine and newspaper reading, internet access, and computer game consoles; occupying a strip down the centre of the space. Fixed shelves are located along the periphery with movable shelves located centrally. This diagram is reinforced with linear light fittings, air conditioning duct and power/data cable trays. Adjacent to the new entry is an intimate reading area, slightly separated from the library proper. A curved, up-lit plywood ceiling above the entry and joinery spine enhances the warmth of the face bricks, timber floor and joinery. The scheme integrates and exposes all of the functions required to run the library with a sense of delight and honesty. (BVN)

#### **St. Edmund’s College, Library Extension, Canberra-Griffith, ACT – Australia 2009**

The extended junior and senior library at St Edmund’s College, Griffith, provide a vital addition to the College’s infrastructure—both physical and intellectual. It provides diverse teaching environments that go beyond the ‘shhh’ of an earlier age. The new library contains different types of spaces; an open stair links the junior and senior library, the sawtooth façade creates enclosed and open spaces as well as providing solar protection, and the corners or ‘ears’ of the implied triangular plan create unofficial gathering areas. The stair, located in the space between the new and old, reveals the original brick façade and allows natural light penetration, fostering the notion of a shared environment between the junior and senior students. The library has a rich tectonic for student and staff use, using simple, robust materials conducive to a sense of warmth and welcome.

(<http://www.architecture.com.au/i-cms?page=14328>)

#### **Civic Square Library and Theatre Link, Canberra, ACT – Australia 2007**

Civic Square is significant in Canberra’s planning history, being encompassed in Walter Burley Griffin’s 1911 award winning design for the National Capital, centred on his axis from City Hill to Mt Ainslie. Adjacent on the podium at the head of the Square are the Canberra Theatre and Playhouse. These were originally linked with an open colonnade, which was later enclosed to form a ticket office, an enlarged theatre foyer and exhibition space. Popularly referred to as “The Link”, this building had numerous design inadequacies – of particular concern was the inequitable access to the building with no ramp to the podium. A decision to relocate the Civic branch of the ACT Library to a new combined Library and Link building enlivened the project to proceed into detailed planning in 2001. The building was completed in 2006. It was recognised early that the briefed accommodation requirements

considerably exceeded the building envelope prescribed in the development conditions, particularly the height plane limit which had been prescribed to maintain the integrity of the vista along the Axis. The solution was found by an encroachment of the building into the Square. This was approved when it was demonstrated that the roof terrace connecting the Square and Vernon Circle contributed a genuine bonus to the public realm and that the integrity of the highly regarded vista was preserved. The new two-storey building provides an expanded foyer for the adjacent theatres, enhanced box office and patron amenities including additional toilets, bar and catering facilities. Space for the relocated Library is provided at the level of Civic Square and under the Link. A long held criticism of the Square has been its perceived lack of life – the asymmetrical form of the building allows continuity of use of the Square for periodic large gatherings; and the glass frontages support the presence of activity in the Square itself. The conservation of the sculpture Thespis, its relocation into the Link, and the incorporation of the new public art Fractal Weave at the head of the Square are integral to the design and together with the adjacent buildings enhance the wider recognition of the Square as an arts precinct. The design engages ecologically sensitive sustainable design strategies including selection of materials with low embodied energy, provision for rainwater harvesting for toilet flushing, and roof-lights that provide filtered natural light to both levels. The building, with its coloured glass sunshades, prominent axial staircase to Vernon Circle and City Hill beyond and its high level of lively public use by both day and by night, is an eye-catching and valuable addition to this prominent and historically significant sector of central Canberra. (BVN)

#### **Library, University of Technology Sydney, Sydney, NSW – Australia 2000**

The extension to the UTS Library make it the largest in the city centre and give the University's metropolitan campus a natural place for students to congregate. The changes, which have been meshed into the existing building via a new elevation to the west, mean that the library is now spread over five levels, with two new multi-purpose levels for reading, shelves and student work spaces. The stack is positioned in the middle of the library floor plate, with reading areas placed near the windows to offer natural light. A wall of louvred windows cut out the western sun and allow light to filter through from the south. Circulation through the building has been improved as a result of a new stairway which links the ground and upper levels. The entrance to the building has also been re-designed so that it is prominent and easy to find, and includes the re-located loans/information desk. Work is underway to provide easier thoroughfares from the library to other parts of the campus. The designers have also made allowances for future expansion: additional shelf space has been factored in for Level 3 and 4. The floor plans for the UTS Haymarket Campus Library are large - almost 3,000 sq.m. - which has assisted the transformation process. (BVN)

#### **National Library of Australia, Executive Offices, Foyer and Mezzanine Refurbishment, Canberra, ACT – Australia 1999**

##### **Awards:**

2000 RAIA ACT Award

1999 MBA, Highly Commended Commercial Interior Award

1999 Wools of New Zealand, Highly Commended Award for Use of Wool

The National Library of Australia was opened in August of 1968 and since its completion has remained one of the National Capitals most prominent buildings within the Parliamentary Triangle. The National Library's Chief Architect - Walter Bunning (\*1912 - +1977) stated that his aim was to design a building that was a contemporary derivation in the spirit of Classical Design. This phrase was adopted for the concept for the refurbishment of the mezzanine level, including the new visitors desk in the foyer. The brief called for a design that both acknowledged the existing architectural features displayed in the foyer while creating a timeless space that took advantage of the prime location. The refurbishment essentially provides new executive offices for the National Library's General Director and Deputy General. It was important to the client to open up the executive suite to encourage communication and visual interaction between the executive staff and visitors to the National Library. The new Ferguson Room which operates as an exhibition space for the Ferguson Collection and lecture room is accommodated on the opposite side of the Mezzanine to the Executive Offices. The brief was extended to include the visitors reception desk in the main foyer. The new materials have been selected to complement the existing elements within the foyer and mezzanine area, while injecting it with new life, reinventing it to equal modern design ideals. The final result of the design is a space which succeeds in expressing the design language of the building with a fresh interpretation, achieving a contemporary derivation of classical design, which will ensure for years to come. (BVN)

#### **Collins Caddaye Architects, Canberra, ACT – Australia**

<http://www.collinscaddaye.com.au>

##### **Libraries:**

#### **Merici College Library + Classroom Refurbishment, Braddon, Canberra, ACT – Australia 2009**

Merici College is a large Secondary Catholic Girls' school in Braddon ACT. The original school buildings date back to the 1960s and they have been added to and changed constantly as the school's operational requirements have evolved. The existing school library and administration areas were identified as in urgent need of expansion and modification. Collins Caddaye Architects were charged with bringing this project from idea to reality and the new library and administration precinct at Merici College is the result. The original accommodation was out of date, lacking in natural light and operationally inadequate. By making clever use of the existing structure and by expanding to the north to create additional space and gain access to northern light, CCA have been able to transform the old 1970s style accommodation into a vibrant, light, up-to-date facility that will meet the school's needs well into the 21st century. Intelligent use of materials and thoughtful landscaping has created an entirely new and consolidated address to the school. The expanded library and administration areas now operate effectively and have added a dimension of joy and light to the original dull and uninspiring building. The new works provide a sound aesthetic foundation on which future redevelopment of the school can build. (<http://www.architecture.au>)

##### **Libraries:**

#### **City Library, Melbourne, VIC – Australia 2005**

The City Library, a joint venture between the CAE and the City of Melbourne as the first free lending library the CBD has seen in decades, is an exciting development in the life of Melbourne, operated by Melbourne Library Service and provides a range of services to CAE staff and learners as well as the workers and visitors to Melbourne. The rules of the traditional Library have been challenged, the design responds in the following ways. The philosophy of the project was to rework the typology of library in order to

create a new model, and to create a warm and welcoming environment that nevertheless sat comfortably with the 'gritty' Flinders Lane context.

The City Library represents the fusion of many different uses in the creation of a new integrated model. The City Library offers vibrant community spaces for everyone to enjoy including a cafe, gallery, information technology labs, and a conference venue, meeting rooms for community groups to hire; Gallery and projections; free Internet and word processing. These are all spatially woven together with more traditional elements such as book stacks, reading rooms and quiet study areas, organized around a central public space, housed together with the CAE learning spaces, fusing the public and institutional into a socially sustainable community. ## **DesignInc, Melbourne VIC – Australia**

<http://www.designinc.com.au>

### **Libraries:**

#### **Campbelltown Public Library, Campbelltown (Adelaide), SA – Australia 2010**

Client: Campbelltown City Council, Value \$ 9,000,000

DesignInc completed an extensive \$9M refurbishment of Campbelltown City Council's municipal library. Unveiled in September 2010, the new library resulted in an immediate increase in visitor rates by up to two thousand people per week.

DesignInc transformed the 1980s building into a contemporary facility which is now reflective of the shift in community use of these spaces as borrowers look beyond traditional use and seek additional comforts.

Campbelltown Library's Manager, Ursula Hickey said the brief for the project was very clear.

"We didn't want great innovation or grand ideas; we simply wanted a library that would cater for what is now a very mixed use by a wide range of demographics. It had to work for customers of all ages and the result has delivered that and more," she said.

"For me, the youth area is the highlight. DesignInc created a dual offering, where young people can study for a few hours and then relax and interact with friends in a safe and comfortable environment, has proved very popular. It's testament to the success of the overall design.

"From day one DesignInc were great to deal with and we worked really well together to continue operating throughout the refurbishment. They clearly understood the brief and were always available and quick to respond."

The library has more than doubled in size and incorporates a number of well-defined areas for users of all ages.

The children's area is overlooked by a striking feature – a story tree which was created by Showtrek under the art direction of DesignInc for children's story-telling. High quality audio-visual elements produce 14 different effects on the tree, from starry nights to bright pink ripples, with a range of music and sounds.

A number of other features have ensured the new library acknowledges modern demands yet still caters for traditional users. These include large audio-visual and computing sections, an outdoor reading area and a number of community meeting rooms accessible long after the library has closed.

A strong community connection has been maintained and is evident throughout the library. The local history archive is housed in a room purpose-built to fit an original Council board table and a large double-sided wall hanging – created by local residents – is now well displayed for all to enjoy.

Sustainability was a key focus of the project. Much of the existing building was re-used and an adaptable layout means the library will suit changing needs over the next two decades.

The overarching approach to this project was to create a central hub for the local community. The library now provides significantly improved facilities and a welcoming environment conducive to use by people of all ages.

The marked increase in visitor rates is a strong indication of the project's success. Delivered on time and under budget, the project has affirmed DesignInc's capabilities in the creation and execution of projects of social relevance. (DesignInc)

## **Donovan Hill, Brisbane, QLD – Australia**

<http://www.donovanhill.com.au>

### **Libraries:**

#### **State Library of Queensland, South Brisbane, Brisbane, QLD – Australia 2006**

Donovan Hill + Peddle Thorp Architects in Association

Cultural Precinct, Donovan Hill + Peddle Thorp Architects in Association Client: State Library of Queensland, Project Value: \$76 million, Status: Completed December 2006, Environmental Initiatives: No rating tool applied at the time however: - passive design principles applied to envelope, - providence of materials and off-gassing were vigorously pursued - carpet supplier offered product stewardship - low energy lighting solutions utilised throughout - chilled beam and other innovative mechanical solutions utilised.

### **Awards:**

- 2007 RIAA National Award 'RAIA Emil Sodersten Award for Interior Architecture'
- 2007 RIAA State Awards (Queensland) 'FDG Stanley Award for Public Buildings'
- 2007 RIAA Regional Awards (Brisbane) 'Building of the Year'
- 2007 RIAA Regional Awards (Brisbane)

## **\*Commendation - Public Architecture**

The existing Queensland State Library was redeveloped into a facility more than twice its original size through the reconfiguration of the existing building (10,000sqm) and provision of additional 12,000sqm of new space. In addition to expanding existing facilities the design contains a broad array of new specialist components including: an Indigenous Knowledge Centre, critically controlled repositories, auditorium, triple A exhibition gallery, cafés, business/conference centre, informal gallery and expanded car park. The Site Infrastructure Works for the northern expansion of the QCC includes 20,000 sqm of public open space, a new road system and underground car parking facilities. The briefing and design process spanned a large and complex client group incorporating community and indigenous consultation. The Library itself has over 1,000 differing rooms and delivers 50 service programs simultaneously. Appropriately it is an institution subject to constant change. As the building collects differing staff groups on a single site for the first time, the Architects have been actively involved with organisational restructuring and change management. Environmental Initiatives: No rating tool applied at the time however: - passive design principles applied to envelope - providence of materials and off-gassing were vigorously pursued - carpet supplier offered product stewardship - low energy lighting solutions utilised throughout - chilled beam and other innovative mechanical solutions utilised. ## **Dunn & Hillam Architects, Botany, NSW - Australia** **Workshop 1 Pty Ltd.**

<http://www.workshop1.com.au>

### **Libraries:**

#### **Junee Library, Junee NSW – Australia 2009**

**Dunn + Hillam Architects are the recipients of the Premier's Prize for Architecture 2010 for the Junee Library.**

**Master Builders Association awarded Nash Bros Constructions two Regional Building Awards in 2010 for Junee Library**

The Junee Library was part of a long term strategy of town centre renewal and occupies a site previously held by the local co-operative supermarket. It completes a row of storefronts built in the gold rush era and continues the pattern of the elegant curved glass entry, deep awning and parapet, much of which had been removed during its time as a supermarket. Though the long side walls and the beautiful roof trusses remain from the original building this was in other ways a completely new building incorporating the leading edge of sustainable technology and library best practice. The Library has been planned to meet the needs of the rapidly changing and dynamic role of a local library within this rural community, providing space to cater for the breadth of community needs in age, purpose and interest and to allow after hours access and flexible use. Junee Shire Council is leading the way with the Junee Library by investing in quality social capital and pushing resource efficiency.

The environmental systems employ radically simple night sky cooling air conditioning, chilled and heated slab, automated stack ventilation and southern natural lighting. All of this means a huge reduction in energy costs (75% less than a conventional building) and zero water use from the grid. The capital investment on this system was comparable to a conventional system and was funded in part by a DECC Climate Change Grant.

The building was opened in August 2009.

([http://www.architecture.com.au/awards\\_search?options=showaward&entrvno=2010022856](http://www.architecture.com.au/awards_search?options=showaward&entrvno=2010022856))

**A NEW LIVING ROOM FOR JUNEES – WORKSHOP 1 DUNN + HILLAM ARCHITECTS' EFFICIENT AND ENGAGING LIBRARY.**

Review Ian Martin

Architects Lee Hillam and Ashley Dunn of Workshop 1 tell a lovely story about the first public viewing of the new library in the small rural town of Junee in New South Wales. The locals were invited to walk through the building and ask as many questions as they liked. They were pretty quiet until they came to a shed at the back of the library, a room full tanks, valves, pipes and pumps. Then they started asking questions, lots of questions: about the contents of the room, their function, relations and size, their precise details and how they related to the building as a whole. ....

When Dunn and Hillam were invited by Junee Council to turn the dilapidated supermarket in the main street of Junee into a modern library, they set themselves some clear objectives. They wanted to respond with an energy- and water-efficient building, to recycle as much of the existing fabric as possible, and to source new materials from sustainably. They also wanted to respond very particularly to this community, and to this place. Lee was born and raised at Illabo, a few kilometres out of town, and so had a fair idea of the culture of Junee, and the people who sustain it.

Junee is part rail town, part wheat town. On the rail line halfway between Melbourne and Sydney, the township was built up over the last century for the servicing and fuelling of steam and diesel trains. When completed, the Junee Railway Roundhouse was the largest of its kind in the Southern Hemisphere, as was the Junee Wheat Silo. They are magnificent industrial structures, the kind that would have had Le Corbusier reaching for his camera. They tell a lot about the culture of the place and its people – their pragmatism, directness and, above all, their demand for economy of function. So how do you make a library work in this place – really work, like a steam train or a wheat silo?

Junee has an extreme climate. In summer, hot, dry days are followed by crisp, cold nights. The architects knew of a natural cooling system developed in the 1970s in Phoenix, Arizona, which has a similar climate. The system is ingenious. Rainwater is collected from the roof and stored in an insulated tank. The collected water is sprayed in a fine mist from the ridges of the roof into the cold night air, where it cools, falls back onto the cold metal roof, and then returns to the tank for pumping through the floor slabs during the day to cool the interiors. The chilled water is also used for cooling the air in the building, and in winter a heat inverter pumps warm water through the floor slabs, providing all the necessary heating.

Like a steam train, it works. When I visited the building the temperature outside was 42 degrees. Inside, it was a cool 24. If you want powerful first impressions, this is it – forget the photos. Not bad for a building using a fraction of the energy of a conventional airconditioned building. The concrete slab of the library, beautifully polished and inset with local Murrumbidgee river pebbles, is cool underfoot and, moreover, gives an impression of coolness, like a riverbed – a psychological underscoring that the architects are keen to stress.

Socially, Dunn and Hillam speak of the library as being a kind of living room for Junee. There are comfortable chairs and a big table just off the street, so passers-by can see their friends inside and drop in for a chat. People hang around here reading newspapers and from laptops, and there's a kitchen at the back where you can make a pot of tea. Some local women have even started to bring in ingredients to bake cakes to share around. There's a nice feeling to this room – it really is a place to just hang out.

The library plan has the reading room at the heart with the books at its centre, giving the room a satisfying weight. There is no attempt to create patronizing "zones" with colour coding, or to create dynamic geometries to give the impression of much activity where little exists. It is a calm space, a bit like my ultimate Sydney book room, the Reading Room at the Mitchell Library, albeit on a

much reduced scale. You can wander quietly among the books and take one back to a window seat, which are comfortable, secluded and well lit.

The approach to materials is direct and economical. The building was stripped back to reveal the structure, which is essentially a gable-roofed shed housed within brick walls. Fine Oregon roof trusses were repaired and, where necessary, replaced. Attempts to overtly distinguish original and new fabric were underplayed here, and the room is better for it. The ply ceiling panels complement the Oregon, and give the ceiling a warmth and scale in contrast to the monolithic floor. Victorian ash window joinery with matt black steel surrounds frames a dramatic series of glazed openings from the street into the library, and from the library into the ancillary rooms. This emphasizes the sense of the reading room being an extension of the street, telescoping sightlines from outside to the spaces within. It is a very stark, crisp detail. On the street the steel awning continues the street pattern, as do the ceramic tiles that form the dado. The curved glass announcing the entry to the street recalls similar patterns found locally and in neighbouring towns such as Gundagai. The new ramp to the entry doors provides a suitably scaled approach, and brings the seated eye-line within the building to the level of the standing eye-line on the street. It's a nice touch, making the connection back to the street from within the library very immediate.

There has been some debate over the years regarding the aesthetic of "the shed" and its place within Australian architecture. This building manages to avoid the pastiche often associated with the appropriation of this type, partly because it recycles an existing building, but also because this recycling has been handled so directly, with a keen eye to economy and mechanics, in the way that all good sheds do. Most importantly, it responds to its place in a highly water- and energy-efficient way, just like a Coolgardie. At a time when the planet is heating and we are all being asked to do our bit to draw off a bit of steam, this building repays serious study.

Ian Martin is the director of Patonga Design.

## **figure & ground, Brisbane, QLD – Australia**

<http://www.figureandground.com.au>

### **Libraries:**

**Central Queensland University (CQU), Mackay Technology and Information Resource Center, Rockhampton, QLD – Australia 2011**

Today's library has changed. It is at the ever evolving frontier of information resources. Be it in the form of books, journals, internet or other media, they all have one thing in common. Information. It is for this very reason the library is considered the nuclei of every good university. The Technology & Information Resource Centre at Central Queensland University's Mackay campus is at the heart of a master planned vision for the campus. While the activities of the library have evolved rapidly in recent times, the role of the repository as an anchor to the technical, academic, cultural and social operations of the institution has remained significant. In many ways university libraries are in a unique position to communicate the core values of the university. They are the most accessible and interactive facility of the institution, and service all members of the campus community. We recognise this in this project. The design team anticipated challenges and opportunities uncovered by exploring the role of the library in terms of the broader campus. The aim was to realize the influence of good design beyond the material scope of the project. This was achieved through ensuring that each element enhanced and resonated with the context and latent values there in. (figure)

## **fjmt (francis-jones-morehen-thorp), Sydney, NSW – Australia**

<http://www.fjmt.com>

### **Libraries:**

**Allen Library, Penrith Campus Library, University of Western Sydney, Sydney, NSW – Australia in design**

**Library, Law Precinct, University of New South Wales, Sydney, NSW – Australia in design**

**Macquarie University Library, Sydney, NSW – Australia 2010**

...an elegant and timeless design concept that responded to a 'new beginning' at Macquarie.— Judging Panel

Following a design competition, fjmt was commissioned to design this new campus library that will set a new sustainability benchmark for the University. The concept has been inspired by the beautiful landscape of the Macquarie University campus. It brings the landscape into the building, reflecting natural daylight and providing shelter in a way that is directly inspired by the forest of eucalypts on the campus. Currently in construction, the building will be a welcoming, transparent and inspiring landmark building for the university and represents a new generation of library design — full of dynamic, collaborative, open spaces for learning and knowledge exchange. It will include Australia's first automated document storage and retrieval system allowing maximum floor space for learning rather than for the storage of books. (FJMT)

**Faculty of Law Library (Freehills Library), University of Sydney, Sydney, NSW – Australia 2009**

The architects have designed an elegant and spacious structure that cannot fail to inspire our academic staff, administrators and students. A functional and beautiful environment respects those who use the spaces and motivates all who work in the building. — Professor Gillian Triggs (Dean, Sydney Law School)

Following an international design competition, fjmt was commissioned to design this noteworthy development that represented a unique opportunity to transform a key site into a powerful new campus identity and gateway. The design is uncompromisingly modern, providing state-of-the-art workplace, study and learning environments, general teaching spaces, lecture theatres, library, retail, basement car parking and integrated public domain. It incorporates significant sustainable innovation including a double-skin ventilated façade with occupant controlled timber louvres, to control solar gain and glare, mixed-mode, chilled-beam and displacement airconditioning, precinct stormwater collection and an iconic light tower which fills below-grade spaces with an abundance of filtered, natural light. The project has received numerous awards including AIA awards for Architecture, Urban Design and Sustainability. (FJMT)

FJMT designs new university library in Sydney: This international competition-winning proposal transforms the public domain of the heart of the University through the integration of architecture, urban design and landscape architecture. The project redefines the historic relationship of the campus and city to create a generous new public domain with the study of law balanced at its edge. An inventive aspect of the competition scheme was the division of the extensive building brief into podium and superstructures to create an extended new public ground-plane of gardens, squares, and lawns. Below this new civic domain are specialist teaching facilities, and library lit through the environmental and emblematic 'light-tower'. Suspended above are a series of innovative multi-layered glass and timber louvered superstructures that accommodate the remaining brief into fragments that define and frame new public

spaces. Library, teaching and workplace typologies are developed into a series of identifiable and interrelated forms with an emphasis on layered transparency, equity of access, openness, sustainability and collaboration. Emphasis is placed on informal teaching and collaboration spaces such as the 'social-hub' bridges that form an urban window framing the new campus entry. Here teachers and students are suspended in a transparent layer between city and campus, over new public spaces and a more open and equitable campus. Sustainability is infused throughout from siting and urban initiatives which reclaim public space from car-parking, reconnect the campus to Victoria Park and harvest and reuse rainwater, through building wide energy efficient infrastructures and services, passive thermal control, natural light and ventilation systems and environmentally sustainable material selection. (<http://www.worldarchitecture.news>)

The Faculty of Law, Library and Teaching Complex was twice honoured at last night's **Australian Timber Design Awards**. The project won the national Interior Fitout and Best Use of Decorative Wood Veneers categories. The project's distinctive use of timber products made it a prime contender for the awards. Its most prominent feature is the occupant-controlled timber louvres on the east and west façades. These louvres are part of a triple-layered system that provides thermal control through a combination of high performance glass, automated stack effect natural ventilation and automated sun-shading louvers. The system allows individual offices to choose passively tempered natural ventilation, mixed mode air conditioning, degree of sun penetration, views and natural light and provides acoustic screening. Throughout the complex's interiors are other innovative uses of timber veneers. Key areas include the 300-seat lecture theatre, which features folded timber walls, and the Law Library, where the curved profile timber ceiling adds a warm dynamic to the subterranean volume. All timber products were sustainably sourced and certified. (FJMT)

#### **Surry Hills Library and Community Centre, Surry Hills, NSW – Australia 2009**

*The Centre has been designed to achieve excellence in sustainable design and set new high standards in environmental performance for multi-purpose public buildings. [It] will be a starting point for the development of a green rating system for public buildings... [and] an innovative example of design and sustainable design possibilities. — Lord Mayor Clover Moore MP*

This innovative new building provides specific services tailored to community needs and includes an integrated local library, community centre and child care centre. Establishing a new Australian standard of excellence for environmentally sustainable design in civic buildings, the building includes: use of planting together with a thermal labyrinth for passive filtering and tempering of air; incorporation of extensive natural light; solar-tracking timber louvre systems; automated fabric shading; mixed mode ventilation; extensive photovoltaic array; geothermal cooling bores; green roof; rainwater collection and recycling; and sustainable material selection. The project has been rapidly embraced by the community and well received by industry being awarded UDIA Excellence in Sustainable Design award and the Australian Timber Design Awards Public Building high commendation. (FJMT)

This project is prominently located in the heart of Surry Hills, an inner-city suburb of Sydney whose community is characterised by a diversity of age, income and cultural backgrounds. The architectural context is also diverse: residential apartments, terrace housing, shops and commercial/industrial premises vary in scale though their architectural style is predominantly Victorian. The site is very constrained, measuring just 25 by 28 metres and bound on three edges by roads: Crown Street, the main street of Surry Hills, to the east and two residential streets to the south and west. The project's brief was developed in close consultation with the very active local community. The key approach that emerged from these discussions was that the community wanted a facility that everyone could share. Rather than only a library or a community centre or childcare centre, it became clear that it was important to have all of these facilities together in one building, in one place. In this way the building became a truly shared place where the whole community could meet and use in different ways. Important, too, was for the building to represent and reflect the community's values. In response we developed what for Sydney is a new type of public building. It is not a singular typology, for which there are many precedents, but a hybrid public building that is many different things in one: a library/resource centre, community centre and childcare centre all integrated into one modest building and accessible by all. Transparency became an architectural theme at many levels, allowing an inviting and welcoming building that is accessible and open to public view. At the same time it was important that the building was not merely 'transparent', or only expose what is accommodated within, but that it represented and embodied the values of the community. Accessibility, openness, transparency and sustainability were key values as was a general sense of aspiration. (<http://www.archdaily.com>)

#### **Hawthorn Community Hub and Library, Hawthorn, City of Boroondara, VIC – Australia 2008**

#### **Max Webber Library, Blacktown, NSW – Australia 2005**

<http://www.libraries.blacktown.nsw.gov.au>

*[The library] is both heroic and intimate, civic space and community space – respectful of both the books and their readers.*

— Tom Heneghan

The new library at Blacktown re-establishes a sense of place and reinforces the public realm within a city environment. It is an open and inviting public building; transparent and welcoming; an expression of the sense of equitable access to information that the contemporary library offers; as well as creating a place for a broad range of activities and gatherings. The library caters for a culturally diverse population and incorporates children's areas, youth areas, technology service areas, flexible function spaces, exhibition areas and a café creating a welcoming centre for community engagement. The project has been embraced by the local community and general public, with four-hundred per cent increase in patronage upon opening and has received many awards including the AIA Premier's Award. (FJMT)

#### **Stamford American International School, Singapore – Singapore 2009**

fjmt's design concept balances functionality and flexibility to create best practice environments for teaching and learning with the iconic aspiration of Cognita's first greenfield "Centre of Excellence" within Asia. The new campus is a significant facility accommodating a population of 2,700 students ranging from ages two to 18. The architectural form is an evolution of the response to the design principles, the brief and the site. A rectilinear series of functional forms is rationally arranged to create a balance of built form and open space, reaching out and integrating with the symbolic heart of the school campus, the oval and associated lawn or assembly area. A full range of educational facilities is provided including classrooms arranged in learning clusters, specialist learning including foreign language teaching environments, music, art, library, theatre, gymnasiums, swimming pool, sporting field, and undercover parking and bus bay. (FJMT)

## **Fulton Trotter, Brisbane, QLD – Australia**

<http://www.fultontrrotter.com.au>

### **Libraries:**

#### **Kiama Library, Kiama, NSW – Australia 2009**

1.062 m<sup>2</sup>, \$ 3.000.000

Kiama Library is a sensitive refurbishment and major extension to a popular existing public facility, resolved on a difficult site with significant constraints. The exiting Library was positioned off the main street in a converted squash court centre. The site overlooks the south coast railway line to the scenic coastline of lofty Norfolk pines and jagged basalt outcrops. This distinctive coastal environment and historic public buildings inspired a refreshing extension to the existing Library, providing a unique place for the community to meet, learn and explore. The two-storey brick squash court building, nestled into the northern corner of the site is bound by two blank-walled neighbours. To the south, an enormous 140 year old heritage-listed fig stands, its massive canopy shades the site and street and its roots breach the existing landscape and footpaths. The popular library and Kiama Family History Centre have shared the confines of the brick building since 1989 and desperately needed to extend. The Council completed an initial feasibility with the NSW State Library and elected to redevelop and remodel the existing Library. The building needed to double in size and provide appropriate areas for children, young people, adult and specialized groups. It required modern administrative facilities and improved access, all within a limited budget. The solution was to expand the Library at the upper level and locate tenants, the Family History Centre and the Kiama Community College, at the lower level. The existing shell of the squash court 'box' would be the cornerstone of the new expanded facilities. The design would include a single storey and two-storey extensions that exploit the existing site gradient and wrap around the formidable fig tree. Lightweight materials and structure were used in the extensions to minimize footing costs in the difficult ground conditions. The design is articulated as a series of 'boxes' which accommodate the different areas. The existing squash court 'box', for adults, is lined with rich dark timber shelving that focus toward a theatrically lit raised reading and performance platform. In contrast, the new light filled children and young people library 'box' has a glazed wall that frames the enormous volume of the site's majestic fig. From the car park a series of light-weight timber walkways and decks wrap below the embracing fig canopy to the elevated entry deck and a colourful glazed Reading Lounge 'box'. The entry deck offers views and a popular sculptural chair by local artist Jon Goulder. The entry is signalled by a large timber stair tower, inspired by the town's historic Post Office tower and Norfolk pines. The tower signage by artist Ian Tremewen reflects the patterning of the lorikeets in the pines. (Fulton)

#### **Hay Library + Community Centre, Hay, NSW – Australia 2009**

690 m<sup>2</sup>, \$ 2.000.000

Hay Library + Community Centre embraces the local precinct with it's visually interesting, energy efficient and it's local characteristics of the expressive community. Commissioned by Hay Shire Council with support from Government funding, it is a place for community gathering, education and for memory and reflection. The design is formed by local inspiration such as the Murrumbidgee River, bringer of life and commerce to the area (the surrounding veranda represents this movement), the vast Hay Plain which gives the building it's elevation and strong horizontal elements and the harsh outback sun, provider of energy and light which is made up of the roof by providing shelter from the heat of the sun whilst controlling the level of light entering the spaces within. (Fulton)

#### **Broadbeach Library, Broadbeach, QLD – Australia 2008**

2.500 m<sup>2</sup>, \$ 6.100.000

The extension to Broadbeach Library for Gold Coast City Council increased the size of the existing library three fold. The substantial new part of the building was built over the existing library to allow for the existing building to remain operational for as long as possible. The building was seen as an opportunity to establish an integrated precinct with the existing community building. The form and details for the extension were taken from historic images from the area and included reference to the once plentiful casuarinas in the surrounding water courses, the previous inland sand hills and the colourful 60's beachside architecture. The colourful end walls give the building an iconic presence in the community. The interior is bathed in indirect southern natural light from a series of skylights reducing the reliance on artificial lighting. A neutral internal colour scheme and natural material palette has been adopted. Building services such as air conditioning have been designed to minimise ongoing running costs. Since opening there has been a significant increase in the number of people using the library. The new café, pedestrian link to Pacific Fair shopping centre and the open forecourt which includes the existing community building entry provides a defined activity zone at the entry to the new building. (Fulton)

#### **Tamborine Mountain College Library, Tamborine Mountain, QLD – Australia 2008**

Tamborine Mountain College is a small independent school in North Tamborine. In 2007 the school appointed Fulton Trotter Architects to prepare a masterplan for their school, to accommodate an increase in enrolments from 125 students to 250 students over a number of years. Existing demountable buildings will in time be replaced with new purpose designed buildings to better suit their educational needs.

The Library Building is the second stage of the masterplan and continues the design language from the Stage 1 – Science Building completed in 2009. The school masterplan is inspired by the local topography and the beautiful rainforest environment of the Tamborine plateau. The buildings represent the solid, basalt rock of the plateau, contrasted by lightweight connecting walkways which evoke a sense of walking through the rainforest. The buildings are of a small intimate scale, in keeping with the school's philosophy, and are arranged around a central play space, providing a buffer to neighbouring properties.

Future stages will be constructed to complete the masterplan, dependant on student enrolments and funding availability. Future facilities include a purpose built art + music building, specialist technology spaces, new administration building, and a new sports hall. (Fulton)

#### **Kingscliff Library, Kingscliff, NSW – Australia 2000**

450 m<sup>2</sup>, \$ 1.200.000

"The site for this building is in an area of wetlands close to the eastern Australian coast. The building was designed so as to have minimal impact on the existing landscape of Melaleuca (Paper Bark) trees, ferns and grasses. The architect chose the colours of the window frames and entry wall to represent the brightly coloured parrots of the region."

2012 Sunshine Coast Regional Council Living Smart Glossies – Resource Saver Award

Montessori pedagogy requires place to be a cultural resource for human development and learning. Therefore the library building aims to show students how it is put together with the authentic expression of materials and structure – revealing the “skin and bones” of the architecture and contemporary building practices/technology.

This aim worked hand in glove with the programmatic need for future disassembly of the building when the College relocates to its future campus. A steel structural frame and modular plywood wall and floor panels provides the generating principle for organising the library into two spaces - a small library pavilion housing the most valuable resources and a larger learning commons in the form of a luminous verandah.

The library fits comfortably in a highly constrained site amongst trees and built infrastructure. The shimmering zincalume cladding on a simple box with skillion roof recalls memories of the local cane shed whilst at the same time establishes a contrasting image of evolution and change for the College. The library verandah’s polycarbonate screens open to visually connect to the surrounding landscape and informal gathering area and like sails can be operated to capture breezes. The small library pavilion offers a generous volume with southern clerestorey capturing daylight and expansive sky views.

### **Libraries:**

#### [Mornington Branch Library, Rosebud, VIC – Australia 2005](#)

### **Awards:**

RAIA (Royal Australian Institute of Architects) Victorian Architecture Award 2005

Our process of mapping the lines of the site for the new Mornington Branch Library resulted in an abstract composition comprising overlaid topographical contours; the direction of prevailing winds; site boundaries; established pathways; the edges of impacting adjacent buildings; compass points and, in deference to the centenary of Matthew Flinders’ 1802 discovery of Port Phillip Bay, a line replicating the drawn description of Flinders’ local navigational path tracing the headland at Mornington. The built library retains the site lines. Paths of travel are marked by directional skylights, nodes and points of discovery within the wide floor plate are highlighted by a detail, an item of geometric joinery or an event on the ceiling. The articulate ceiling proposes spatial control without impacting the permeability of the interior. A glass facade stretches along Vancouver Street, shifting with the navigation line and gesturing to the sea, its transparency showcasing the library’s book collection. All windows are carefully screened with a secondary layer of built shading, providing depth to the facade, ensuring a constant reference between interior and exterior and imbuing the library with a subdued ambient natural light. The new library is physically separated from its existing built context on two planes. Horizontally, spaces are left between the library and adjacent existing municipal offices – resultant courtyards provide outlook, light, and a margin between new and old constructions. In the vertical plane, the library exploits the natural fall of the site, hovering above the walls of its undercroft carpark. In lieu of signage, text annotates the architecture, and information is entwined in narrative. (Garner)

Architects develop ideas differently. Some rely on dogma; others investigate and research; some reproduce previous architecture; and some just dream. Philosophies for design develop from literature, theatre, myths, industry and technology. Exploiting these options, architects imagine a building, which they then attempt to document and have built. But there are some fundamentals that stick. One is the idea that a building is a machine for living in. The modernist creed suggested that the function of a building would suggest its form, spaces and aesthetics – giant ocean liners and rockets were models for architecture. It was found over time - when the expression of architecture became so reduced that it became a simplistic accounting spread sheet - that modernism failed. It did not account for the greater complexities of living, such as emotion, the senses, history, references and faith. The young architects practising as Garner Davis have followed closely this development from modernism to a more complex architecture. Their generation is not weighed down by the dogma of “less is more”; nor does it contain a given set of rules for designing. This makes their work all the more interesting because, on the face of it, their buildings are modern, (most notable their Wagga Wagga offices), yet closer inspection shows how they have given their buildings a contemporary context. This subtle shift is realised in their design for Mornington Branch Library. Not only does the building illustrate a personal architectural philosophy, but also ideas about what makes a small local public library. Garner Davis have realised that there has been a new definition of what constitutes libraries over recent years, so they have used Mornington to exhibit functional changes in library design, but also to define a personal architecture attitude. Like museums, libraries have become more like shopping malls than contemplative places. Main streets, “shops”, big signs, computer screens and hectares of open public “interactive” space have replaced the shelves, nooks and carrels of the past. Garner Davis’ building is on an old municipal site, one that may have discouraged mere mortals, but they have invigorated it with complex ideas and historical connections that imbue the building with layers of meaning, and give it a richness not normally associated with modernism. Not to labour the point, but, at face level, it seems to be a crisp, neat, cleanly detailed building. You could be forgiven if that is all you understood of the architecture. And that is reason enough to marvel at, and enjoy, the richer experience that Mornington offers. The library building is effectively designed as a novel. It has chapters, structure, passages and sentences - all comprising a language that expresses intentions - but without the preaching that often accompanies this style of architecture. The plot centres on a need to assemble more than 50,000 books, plus computers and reading spaces, in a building that is not all new, but modified. The site is almost hidden from public view, and it was to be an open, flexible space - meaning little specificity given to individual spaces. Drama unfolds when we realise part of the design device was to use Matthew Flinders’ navigation course diagrams

as planning set-off points. Walls have two layers that provide depth and reduce sun heat build up, while also allowing cool air to rise through the skins and cool the building naturally. A bonus is that the library remains transparent from outside, and inviting; and from inside, people can associate with the neighbourhood. So the story unfolds of a place with translucent walls, all planned using historical information. It is in the language of the detailing that we realise fully the architects' intentions: eventually, we comprehend the story. Garner Davis exploits modernity in the detail. They use perforated metals, seamless glass, modest steel frames and an almost-all-white palette. There are sheets of glass, some clear some partially white, and abstract open spaces inside and out. Corners and edges of walls are uncomplicated by trims, beads, cover plates and architraves: it is clear, clean expression. A terrace with a metal sunshade roof has the qualities of Mies van der Rohe's Barcelona Pavilion - a study in abstract reduction - and internal joinery is spare, sculptural and understated, like so many words arranged on a printed page. External walls seem to evolve from their smallest part, so the "word" is the "novel", and ceilings are sculptured so they create a second interval in the architecture, a sub-plot if you like, that allows for an expression of light and space that is additional and supportive of the main story line. In summary: well worth the read. (<http://www.theage.com.au> – Norman Day, 23.05.05)

## **Group GSA, Sydney, NSW – Australia**

<http://www.groupgsa.com>

### **Waurm Ponds Library, Waurm Ponds (Geelong), VIC – Australia 2011**

see: Whitefield, McQueen, Irwin Alsop <http://archive.wmia.com.au>

Client: City of Greater Geelong, \$ 5.300.000, 1.000m<sup>2</sup>

A new library and community hub of Waurm Ponds on the outskirts of Victoria in south-east Australia by WMIA. A steel laser-cut solar skin pierced with holes in a range of sizes was generated to wrap the building supplying the necessary solar protection and a strong statement for the new library.

Entrance stairways have been replaced by timber boardwalk ramps and the repeated circular motif ensures a memorable image for the facility's visitors whilst retaining a sense of respect for the surrounding architecture and community amenities. The clean lines and simple silhouette act in direct opposition to the swirling footprint of the established leisurelink centre and promote integration for all users regardless of age, gender or background. (Group)

### **Rouse Hill Community Centre and Library, Rouse Hill, NSW – Australia 2008**

The development of the town centre concept and the architectural design was delivered by a consortium of three architectural firms – Rice Daubney, Allen Jack+Cottler, and Group GSA.

Client: Lend Lease, Site Area: 54.000 m<sup>2</sup>, Contract Value \$ 9.000.000

In towns and cities, public space has traditionally served as a meeting place and traffic way. Enjoyable towns and cities find a comfortable balance between these three demands, without forfeiting their links with the natural world. The starting point for the design of Rouse Hill Town Centre was a desire to achieve this balance, responding at the same time to the climatic environment of Rouse Hill, and the principles of ecologically sustainable design. These principles did not result in a series of add-ons, but were embedded in the design of the building forms themselves. Whilst maximising a feeling of openness within the public realm, the forms control solar penetration of the spaces between them, reducing shopfront heat loadings, and minimising energy loadings. At the same time, pedestrian amenity is ensured – there is always a shady route and the architecture responds directly to the climate. It has all the facilities of a small town, including a shopping-centre precinct, commercial space, a nine-screen cinema complex, education, library and community facilities, a health and medical centre, and good transport links... (Group GSA)

### **West Footscray Library, Melbourne-Maribymong, VIC – Australia 2006**

see: Whitefield, McQueen, Irwin Alsop <http://archive.wmia.com.au>

Client: City of Maribymong, Costs: \$ 1.900.000

A new multi-purpose community facility and a first floor childcare centre in one of the Melbourne's most socially diverse neighbourhoods. -harking back to the days when Footscray was the transport hub for Melbourne's early growth, WMIA have taken the language of transport, trains and containers to create this starting new facility. Using perforated street cladding, the front double void appears solid during the day and when it is at night the facade sparkles. Interesting use of recycled timber sleepers provides solar shading and facade protection. Lighting is hung on wires over the approach to the main entry reminiscent of lights over the nearby train marshalling yards. At the first floor, simple devices such as a floor level window gives the children a window onto the activities of the library below... (Group GSA)

### **Narellan Library, Wollongong, NSW – Australia 2005**

NARELLAN LIBRARY, REVIEW Laura Harding

Laura Harding is an architect with Hill Thalys Architecture + Urban Projects.

Group GSA's Narellan Library and Community Centre is a generous beginning to a new civic centre in an area undergoing rapid change. In Complexity and Contradiction in Architecture, when Robert Venturi expressed a liking for "hybrid rather than 'pure', compromising rather than 'clean', distorted rather than 'straightforward', ambiguous rather than 'articulated', perverse as well as impersonal, boring as well as 'interesting', conventional rather than 'designed'", he could not have anticipated its relevance more than forty years later to the developing character of the burgeoning regional centres of Australia's towns and cities. The township of Narellan on the south-western fringe of Sydney is a case in point and the site of a recently completed library and youth centre by Group GSA Architects. The library is the first architectural component of an ambitious reworking of the town centre being undertaken by Camden Council. As such, it has become an important symbol of council's commitment to revitalization of the centre and the pursuit of change. But the building's presence has posed some particularly difficult questions for the architecture – what is an appropriate architectural expression for a project that will form the heart of a centre which does not yet exist, and how do we reconcile the pristine visage of revitalization with the quirky, lingering imperfection of the present? Narellan has seen considerable change over the past decade that has irrevocably altered the character of the former rural outpost. Ringed by rampant suburban development, it is now completely detached from its Arcadian rural setting. The white noise of passing traffic on the Camden Valley Way is punctuated regularly by the groaning deceleration of articulated vehicles and the hiss of air brakes. A major retail shopping centre has obliterated the block to the north of the library site, presenting a relentless wall of weary precast concrete and loading docks towards the library and a tangled mess of truck ramps and car parking to its remaining frontages. The ultramarine and red stripes of that now ubiquitous suburban landmark, the hardware depot, beckon to the east across a small natural watercourse which is marked by a mature stand of remnant Cumberland Plain woodland. So it is with a Venturian generosity of vision and a willing

suspension of the “pure”, “clean” and “straightforward” that Group GSA have found a foothold in the development of a new civic disposition for the township. Squinting past the dire retail wasteland opposite and drawing on the energy and ambition of a lively local working group and the evolving plans for the town centre, the library has selected its terms of reference carefully, identifying two elements as the points from which to stitch together an urban potential – the site’s strategic corner location on the future “main street” and its proximity to the adjacent eucalypts and parkland. The new library room is a pragmatically detailed glass prism with an overhanging silver cap that draws the adjacent eucalypts deep into the space, its vertical mullion pattern playing rhythmically against the scattered tree trunks in the park. Generous illumination is provided by industrial skylight units and a simple folded plasterboard ceiling that distributes a delicate, mutable light throughout the room. The library is well appointed and well used by scores of children – reading stories, browsing the internet or momentarily forgetting themselves while donning enormous headphones and singly loudly at music stations. ....

## **Paul Haar Architecture, Melbourne-Thornbury, VIC – Australia**

### **Libraries:**

#### **Candlebark School Library, Romsey, VIC – Australia 2011**

### **Awards:**

#### **Australian Timber Design Award 2012**

Sitting 4.5 metres below natural ground, this library provides cool, energy efficient shelter for students at Candlebark School. By Sasha Shtargot.

Children might have few better places to learn than in the foothills of the Macedon Ranges, north-west of Melbourne, on the edge of a messmate forest with kangaroos and koalas for school buddies.

Candlebark School, started in 2006 by children’s author John Marsden, has an innovative, free-spirited attitude to education modelled on Fitzroy Community School in inner Melbourne. So when it came to building a new library, the school wanted to display its particular style and approach to learning.

The earth-covered library is a striking example of environmentally sustainable design. It was opened in September last year and cost \$850,000—the money coming from the Federal Government’s Building the Education Revolution program. Why did Candlebark choose an earth-covered building? Architect Paul Haar says the school wanted to build in harmony with the sloping topography so as to keep the inspiring view of the valley below, and it needed a well-designed bushfire shelter.

#### **Location and load-bearing materials**

The library is on a south-east slope below Candlebark’s dining and meeting room, with a view into a valley of oak trees, elms and pasture. It sits on a concrete slab 4.5 metres below natural ground at its northern edge and meets natural ground level at its southern edge. The external retaining wall, made of 290mm core-reinforced concrete, is curved in a half circle. This shape more effectively resists the heavy horizontal forces placed by the earth on the wall. The south wall is curved to broader radius and consists mainly of tall counter-balanced double-hung windows and glazed doors that open to a terrace and the view beyond. Above the glazing, the south wall is framed in seasoned pine, sheathed both sides with structural grade seasoned pine plywood (to retain the edge of earth laid over the roof) and clad with fully compressed cement sheeting. Windows and external doors are framed in recycled Blackbutt hardwood and the pergola on the south terrace is made from salvaged exotic cypress pine.

About 500mm of soil covers the library roof. This depth of earth shields the building against radiant heat from sun and potential bushfire in summer, cold in winter, and stores enough moisture and nutrients to feed the grass and native ground cover plants that grow on the roof. To carry such a load of soil you would think the roof needed to be made of concrete or steel, but Paul says he stubbornly clung to the idea of an all-timber roof frame because of its sequestered carbon, easy workability and aesthetics. Massive post and beam portals of seasoned pine laminated veneer lumber (LVL) were made off site. LVL slabs were shaped and vertically screw laminated into roof beams that span continuously over posts of the same section. It took four men and a crane only 16 hours to erect the roof portals on site. Waste was minimised as off-cuts were used as purlins above the roof beams. Seasoned pine plywood was then laid over the roof purlins.

“In the end it turned out to be a really economical and attractive roof structure for an earth-covered building,” Paul says.

<http://renew.org.au/energy-efficiency/earth-covered-bushfire-resistant-library>

As a site of learning, reflection and refuge, this largely timber constructed school library resonates with its forested setting in the foothills of Victoria’s Macedon Ranges. Built into the side of a hill and with an earth-covered roof, the library preserves an exquisite outlook from the school dining hub above to the open valley below. The library’s siting and earth-covered timber construction also afford 245 students and staff safe shelter from possible wildfire.

Sustainably sourced timbers used throughout the project have engaged the hands and hearts of a school community living in harmony with its forest surrounds.

Large billets of laminated veneer lumber (LVL) have been profiled and vertically screw-laminated into massive portal frames exposed internally to form a visually dramatic and gently warped roof structure that fans out like an opening book to the view below. Together with LVL purlins (ripped from portal billet off-cuts), a Radiata Pine plywood roof substrate and some good waterproofing, this timber roof structure supports 500-600mm of earth, grass, a tractor-mower and students at play.

Ceilings are lined with Hoop Pine plywood and finger-jointed Hoop Pine trim. Windows and external doors are manufactured in recycled Blackbutt. A colossal pergola, chunky internal door frames and courtyard benches are of salvaged Monterey Cypress.

Modular bookshelves and study tables have been constructed using salvaged Blackwood, recycled Messmate and Hoop Pine.

Engineered timber products have been applied with elegance to address a massive structural challenge. They do this and much more in a context where many would think they shouldn’t - in a building that also provides effective wildfire shelter. Complemented by blonde plywoods and salvaged and recycled woods, engineered timber products elicit a warm but powerful architectural expression - a dance amongst the rustic and the refined - a place of strength and solidity that opens to a bright future.

## **Haskell Architects, Melbourne, VIC – Australia**

<http://www.haskell.com.au>

### **Libraries:**

#### **Altona North Community Library, Melbourne-Altona North, VIC – Australia 2010**

October 12, 2011

Stephen Crafti

This is not your normal library, with an open plan and much less formal atmosphere

...

The library, on the corner of Millers and McArthurs roads, inspired the architects to take their cue from the shape of nearby oil refineries, many of which are slowly disappearing from the area. Circular motifs are embedded in the library's precast concrete panels, as are circular windows. Haskell used Alucabond to clad the building, with striations of bright yellow. "Yellow is featured on the pelican's beak which forms part of the Hobsons Bay logo," Haskell says. "Yellow also links to some of the other buildings we've designed in the area, such as the Altona Meadows Library."

The northern elevation of the library was not only designed to create a presence, but also for sun protection. Haskell Architects angled this facade to protect the glazed windows and doors. And although not obvious from first inspection, this facade was designed like a stack of book, some with their "ends chewed off".

While the northern facade is relatively transparent, the western facade, which includes the entrance, is almost entirely finished in concrete with embossed circular motifs. And to protect the double-height glazed walled entrance, Haskell Architects designed an eight-metre-long "chunky" canopy. Clad in Alucabond, it appears to defy gravity. "We wanted to create a sense of arrival. But we also wanted to protect the interior from the western sun," Haskell says.

An irregular-shaped courtyard in the centre of the library provides for a more protected outdoor environment. "We wanted to bring light into the centre of the building. But we also wanted a place where students could come together outdoors," says Haskell, who included chairs and tables in this courtyard. Unlike many libraries, this one includes a cafe, servicing indoor and outdoor seating areas. "Cafes are becoming more popular in places such as libraries. But they're still fairly limited," he says.

With the courtyard in the centre of the building, spaces are loosely arranged around this point. On the northern side is the main library, with a variety of ceiling types, heights and angles. Part of the ceiling features acoustic panels.

"We wanted to animate the spaces, as well as offer different environments. Some people prefer to be in a more compressed space, while others like something more voluminous," Haskell says. Unlike traditional libraries featuring orderly rows of bookshelves and seating, the furniture in the Altona North Library is considerably less formal in arrangement. As well as bookshelves seemingly haphazardly arranged, there are arm chairs and tables. And to complement the open plan there are enclosed study areas, with glass walls and a coral-style arrangement. On the other side of the building are meeting rooms used by the community at large.

...

#### **Altona Meadows Library and Learning Centre, Melbourne-Altona Meadows, VIC - Australia 2006**

\$ 4,500,000

The library is sited in a shopping centre car park. Along with the provision of normal library facilities, a community centre is integrated within the building to maximise flexibility and minimise duplication. The project involves a complex integration of a steel structural system with a requirement to meet a tight institutional budget. (Haskell)

Completed in early 2006 the \$4.5m Altona Meadows Library and Learning Centre was delivered on time and to a very tight budget under a lump sum contract. The new facility is located on a carpark adjacent to the Central Square Shopping Centre and acts as both a library and meeting place for members of the local community. The building has a structural steel frame and is clad with a curtain wall façade with a dynamic roof and wall cladding design comprising colourbond steel. The curved corrugated iron roof and steel structure forms the shape of the building and internal precast feature walls using exposed aggregate line the main hall and rear façade. The centre accommodates a large collection of electronic and print resources, internet lounge, up-to-date information Altona North library design: one for the books

Extechnology training centre, several meeting rooms, and the traditional quiet study areas associated with a place of learning, and dedicated areas for children and young adults' activities.

Completed in early 2006 the \$4.5m Altona Meadows Library and Learning Centre was delivered on time and to a very tight budget under a lump sum contract.

<http://www.kaneconstructions.com.au>

Conceptual Framework The Altona Meadows Library and Learning Centre (AMLLC) combine the original Altona Meadows Library and the Altona Meadows Community House. The Centre had to be:

- a contemporary library serving far more than a reference facility to books and journals
- a hub of community services ranging from cooking, computer and art classes to counseling and support services
- the latest in library and community building technology and would attract patrons of all ages from all sectors. Public and Cultural Benefits The original library was housed in a dark retail tenancy and the community centre in cramped relocatable buildings.

## **Peter Hunt Architect, West Perth, WA – Australia**

<http://www.peterhunt.com.au>

### **Libraries:**

#### **Bunbury Library and Smart Building, Bunbury (Perth), WA – Australia 2009**

Costs: \$ 8,500,500

### **Awards:**

**RAIA Design Commendation**

The building comprises of a 1,500 m<sup>2</sup> state of the art library for the City of Bunbury on the upper level with non government tenancy space of approximately 600 m<sup>2</sup> on the lower level... (Hunt)

## Wanneroo Library and Cultural Centre, Wanneroo (Perth), WA – Australia 2009

Costs: \$ 16.000.000

The new Wanneroo Cultural & Learning Centre is located opposite the main Wanneroo City Council Building along Dundee Road in Wanneroo, with close proximity to the recently completed shopping centre.

The works consisted of the construction of a 5,000 m<sup>2</sup> fully serviced museum, office and library building for both the use of the students and public. The building has been designed and finished with a high quality—externally with pre-finished cladding works including zinc and alpic and internally with high specification, which includes fabric and veneered walls. The floors have been finished off with stone tiles.

The ground floor comprises of a new regional Museum and collection stores, complete with new grand entry from Great Court, Theatre and Museum exhibition. The public building is also equipped with a new café, administration offices and meeting rooms.

The first floor comprises of a new fully serviced Library with an adjacent children's library and garden area. The new library facilities also include group study rooms, business lounge areas with kitchen facilities and a server area.

PS Structures' scope of works also included the installation of the new main and side entry roads as well as the approach to the library with feature paving, car parking and landscape seating.

### **Libraries:**

#### Atwell College, Perth, WA – Australia 2009

Atwell and Kim Beazley School is an innovative and dynamic new school in Perth's Southern suburbs which is founded on the principles of inclusivity and diversity. This new education village brings together some 1800 students including 70 high needs students to share a vibrant educational environment. The village includes the Kim Beazley learning community for high needs students, 6 learning communities (Yr 7 to 12), science, arts, food technology and associated learning spaces, recreating facilities, administration, performing arts and media, a library and student services. *It is the library, the cafnd student services that form the heart of this learning community. Located in the centre of the village and equally distant from the other buildings this pavillon is a wonderfully unique and vibrant place with the flexible and voluminous library space speared by the long cafnd student services element.* The location and configuration of the cafelates strongly to the library as well as to the performing arts building which opens out to an outdoor stage. The library, cafnd student services building will bring a new dimension to the school concept in Western Australia focussing on diversity in learning and knowledge access. Communication, debate, technology, wireless access and mobility are principles of how this building operates. The building is agateway to the world for alle studens both physically ands virtually. This hub extends itself into all parts of the school and onward into the homes of the school community through IT and the creation of a want to gain knowledge and learn. (JCY)

Inclusivity and diversity at Perth's new suburban college. Atwell College is an innovative and dynamic new school in Perth's Southern suburbs which is founded on the principles of 'inclusivity and diversity' and is the flagship for the delivery of inclusive education throughout Western Australia. This new 'education village' brings together some 1800 students including 70 high needs students to share a vibrant educational environment. The village includes the Kim Beazley learning community for high needs students, 6 learning communities (Yr 7 to Yr 12), science, arts, food technology and associated learning spaces, recreation facilities, administration, performing arts and media, a café, library and student services. Located in the centre of the village, it is the library, the café and student services that form the heart of this learning community. This combination of pavilions is a wonderfully unique and vibrant set of elements which include a *flexible and voluminous library* space speared by the long café and student services element. The location and configuration of the café relates strongly to the library as well as to the performing arts building which opens out to an outdoor stage. The project is comprised of 8 buildings and external playing fields on a new large site. Primarily single storey except for one building the primary building materials are 'tilt up' (precast) concrete with patterns set into most panels, 'Vitrapanel' printed panels, metal cladding, roof and glazing. Structure is primarily steel with concrete used on the two storey building and steel roof systems. All roofs are metal and pods which protrude from some buildings are Alucabond. Paving throughout is concrete with patterns overlapped with proprietary paving 'paint' system. Due to tight timeframes the completion was required to be undertaken in two stages in order to open the Kim Beazley and Year 7 Learning Communities for the start of 2008. The rest of the school was opened for the start of the 2009 school year. (<http://www.worldarchitecturenews.com>)

#### ECU Library, Edith Cowan University, Perth, WA – Australia 2004 -2007

Far from the austere and silent libraries of the past the library at ECU responds to the diversity that defines university and student life. The building is as much a place as a combination of facilities. Book on shelves still exist, but they are just one of the resources within a building defined more as a marketplace for learning, communication and interaction. The building houses bookshop, internet cafcoffee shop, and integrated Japenese-inspired courtyard. Also inside is amaga-lab an interactive technology –based research and learning lounge, with a variety of workplaces like beanbags, ottomans, loungesites, booths and rooms. The design's fundamental premise is *that every one studies differently, and if the most comfortable way to study is at home with a laptop, a coffee, a friend and a snack, wy shouldn't that bepossible here ?* (JCY)

ECU Library is brought to life through the latest technology and architectural design. The ECU Library Building creates a new student and campus gateway hub and public domain for the campus, open and welcoming and providing a vibrant and diverse set of spaces for all users on a 24/7 basis (in some areas at this time). It recognises the many varied needs of its users and also embraces different ways of studying and learning, i.e. full time, part time, remote, group, individual, etc. This is a new generation library, as much a place to meet, share a coffee and a snack, buy a book or quietly read. It provides an integrated courtyard and features a full range of the latest technology as well as providing access to printed material, a coffee shop and a book shop. It is fresh, full of natural light and a living building. Built on a sloping site (4m gradient) on the west side of the campus, the building creates a new entry to the campus and brings together 4 major axes which cross in the centre of its foyer, located on level 2. The foyer level is the middle level of the library which has one level above and one below. The 4th level of the building is occupied by the directorate, IT services and an area for library expansion currently occupied by offices. The building is very carefully designed to exclude all direct sunlight whilst maximising the amount of natural light. The coloured aluminium fins play a 100% practical role while also creating a sensual and ephemeral skin. Colours are derived from pixilation of the green/blue of the bush of the area. The three fin colours mix to create a myriad of combinations and at the end of a summer's day the colours change to orange like the beautiful orange which ends all Australian days. Other interior and exterior colours are derived from the colours of native flowers of the region with the purple representing the Geraldton wax. A close interdisciplinary, architect, client and builder team relationship has created a wonderful, sustainable and high quality building that was procured in an amazing time of just over two years (in tie for the closing of the Churchlands Campus) and on budget even within a very volatile climate within the construction industry. For the Client and its users the building represents exceptional quality and value for money both in its capital costs and its life cycle costings which were analysed throughout the design process. For the community, the library provides another facility for the people of Joondalup. (<http://www.worldarchitecturenews.com>)

### **Curtin University, Miri, Sarawak – Malaysia 1999 – 2001**

In association with United Consultants, Malaysia)

The masterplan for the Miri campus describes a multi-use precinct inclusive of educational facilities and residential accommodation set against thriving tropical gardens and a lake. A joint venture between Curtin University in Perth and the Malaysian Government, the campus in Miri, Sarawak provides quality education to local residents as an alternative to studying about in Australia. Stage One is a sophisticated blend of Curtin University's red brick architecture with Sarawak's traditional longhouse forms. This juxtaposition creates a vibrant blend of administration offices, library, student and staff facilities, lecture theatres, laboratories, and general teaching areas in a lush tropical garden environment. #### **Port Pirie Community Library, Port Pirie, SA – Australia 2011**

A new community library in South Australian city of Port Pirie has now been completed, enveloping the country's longest single railway platform into its design. Composed by local practice Kirkbride Boyce Architects working with engineers Meinhardt, the public facility features large glass panels – no two equal in size or shape – in an effort to enhance natural daylighting and develop a relationship between inside and outside space. The main design challenge on this project was the incorporation of a railway platform into the development space. Andrew Kirkbride, Principal at Kirkbride Architects explains: "Keeping the platform meant building an 80m long façade. Creating interest over such length was a real challenge and the inspiration came from the curving, lineal nature of the Flinders Ranges that not only form the backdrop for the town but also the new library." Double glazed, high performance glass dominates the public-facing wall, with a curved roof overhang to protect the interior space from severe summer sunlight. Engineers Meinhardt took care to optimise internal conditions for those using the facility, as Bob Ellis, General Manager for Meinhardt South Australia reveals: "By using computer modelling during the early stages of the new Port Pirie Library project we were able to validate and optimise the air conditioning design. "The air conditioning system performs flawlessly in temperatures above 40°C. The air distribution system has been designed for low noise and high quality diffused air, to eliminate drafts and ensure good air circulation in both summer and winter. The grilles produce what's known as a coanda effect, forming rotational symmetrical radial jets which supply the air with high turbulence and a large induction effect. The result is high quality, even and draft free indoor air flows." The majority of spaces within the complex are designed to be extremely flexible by minimising circulation routes, providing clear signage and sightlines, and ensuring that the western circulation corridor can also be used as a display gallery, quiet seating area and social meeting spot. #### **Sydney City Library, Customs House, Relocation, Sydney, NSW – Australia 2005**

Customs House is one of Sydney's historic landmark buildings, which has featured in the working and cultural life of the city since it was constructed in 1845.

The driving force behind the construction of the original sandstone edifice on Circular Quay was Colonel John George Nathaniel Gibbes, the Collector of Customs for New South Wales for a record term of 25 years from 1834 to 1859. Colonel Gibbes persuaded the Governor of New South Wales, Sir George Gipps, to begin construction of the Customs House in 1844 in response to Sydney's growing volume of maritime trade. The building project also doubled as an unemployment relief measure for stonemasons and laborers during an economic depression which was afflicting the colony at the time.

The two-storey Georgian structure was designed by Mortimer Lewis (\* 1796 London - + 09.03.1879 Sydney) and featured 13 large and expensive windows in the facade to afford a clear view of shipping activity in Sydney Cove. Colonel Gibbes, who dwelt opposite Circular Quay on Kirribilli Point, was able to watch progress on the Customs House's construction from the verandah of his private residence, Wotonga House (now Admiralty House).

The Customs House opened for business in 1845

([http://en.wikipedia.org/wiki/Customs\\_House,\\_Sydney](http://en.wikipedia.org/wiki/Customs_House,_Sydney))

Client: City of Sydney, Architect: Lacoste + Stevenson in association with PTW and Tanner Architects, Completion: June 2005, Costs: \$ 6.500.000

The City of Sydney Library is relocating to Customs House, Circular Quay. Customs House is one of Sydney's finest colonial buildings. The new use of the building, combined with its central location creates a new public interior space in the heart Sydney.

The ground floor of the library appears as a large and comfortable public living room. The atmosphere is warm and the light controlled. The floors and ceilings are dark timber and the leather furniture, lush and inviting, sits on large rugs. The ground floor accommodates the large newspaper and magazine collection on one side, a media wall containing television broadcasting program from all over the world on the other side. It also houses 2 dozen computers available for online research and reading. At the centre of the building, an atrium cuts through 5 levels to the sky. A bright pit under the atrium houses the large city model, reinforcing the footprint of the atrium on the ground floor plane. The pit is covered with a trafficable glass floor. (Lacoste)

Customs House Library is one of the latest additions to the City of Sydney Library Network. Spanning over three levels of the venue, Customs House Library is one of the most stylised contemporary branches of the City of Sydney 9 libraries group, and is open seven days. It is the anchor of the Customs House building featuring bold and modern furnishings, as well as traditional library spaces. With access to this network of libraries holding over 400,000 items, Customs House Library has a collection of over 50,000 items. Highlights of the library include the largest range of local and international newspapers and magazines in an Australian public library, free internet access via library computers as well as unwired broadband, and a beautiful and quiet Grand Reading Room. One of the most coveted features of the library are the lounges on the ground floor and level 1 inviting you to meet, relax, read and absorb the unique Customs House atmosphere.

#### **Headley Bull Centre for World Politics, Australian National University, Canberra, ACT – Australia 2008**

...Adhering to the architectural firm's guiding philosophy 'form follows ideas', the Hedley Bull Centre is designed to enable and encourage dialogue between the staff and students of the various academic units who inhabit its corridors—interacting as parts of a whole for the common goals of rigorous academic scholarship and teaching excellence. Focused on these goals, the Asia-Pacific College of Diplomacy, the Department of International Relations, the Department of Political and Social Change, and the Strategic and Defence Studies Centre moved into the Centre over one month prior to its official opening. This means that more than 120 individuals (including academic staff, visiting fellows, doctoral students and academic unit support staff) will work in the Centre. Each unit also has its own large library/reading room with windows that look out into a central atrium space, whilst a café will adjoin the Centre. Large water retention tanks, a grey water system, double-glazing, high mass construction, and a 'mixed mode' climate control system have also been incorporated in the design and installed to ensure an environmentally sustainable Centre...

#### **Online Training Centre, Victoria University, St. Albans, VIC – Australia 2001**

3.700 m<sup>2</sup>,

### **Awards:**

2002 Australian Institute of Architects Victoria Architecture Medal

2002 Australian Institute of Architects William Wardell Award (Institutional)

The \$10 million multi award-winning Victoria University Online Training Centre was designed for the Business Studies, Arts Design and Multimedia Departments at the St Albans Campus in Melbourne's west.

Kane Construction's challenge was to not only to encapsulate the explicit architectural elements of the design, but to marry these with a commitment to the local environmental issues, extending to land care and wildlife management. Kane's implementation of strict control measures avoided any disruption to the local protected species and residing wildlife and their habitats.

Extending off existing facilities into a natural grassland area, the 3700m<sup>2</sup> building sits atop stonework batters constructed from locally excavated material. The structure consisted of a reinforced concrete ground and first floor edifice, with steel framed roof and facade.

The distinctive yet simple two storey building was clad in a aught skin of computer generated patterns on Vitrepanel -a first for this product. The reptile-like patterns reflected the flora and fauna of Melbourne's Western plains, and their manufacture expressed the work that the institution promoted - the virtual world from inside a computer flipped to the outside of the building.

The world class facility accommodates over 300 computers and a state of the art multi media lecture theatre. Victoria University students are training with the latest technologies in one of the most stimulating and encouraging learning environments available to design and online technology undergraduates.

The project was delivered under a fixed price lump sum contract in 2001 following a 12-month construction period.

Our working relationship with Kane Constructions has been a rewarding one. An open and professional approach has always been evident and this project was no exception.

Gary Carter, Victoria University

(<http://www.kane.com.au/project/online-training-facility-victoria-university>)

The building is located between a grassland and an established university campus. The building facades are conditioned to their local environs and orientation. The north facade is clad in corporate silver panels in response to the formality of the existing campus architecture. The other three facades are clad in custom imaged panels to form an identity for the building that in some way expresses the work of the computer environment within.

At a distance the building sits comfortably within the landscape. Upon closer inspection the facade is made of a repeated tiled image manufactured in the computer. Rather than attempting to represent digital space, computer technology is used to make a repeating digital tile whose technique and process is wholly of the computer. Constructed in Photoshop and 3D Max, the panel appears to have depth. When tiled the golden stripes/deep furrows form a continuity that wraps the box, an artificial digital landscape.

## **McBride Charles Ryan, Melbourne-Prahran, VIC – Australia**

<http://www.mcbridecharlesryan.com.au>

### **Libraries:**

#### **Monash University, Law, Business and Economics Complex (LBEC) (Central Library), Melbourne, VIC - Australia 2015**

Monash LBEC is a new and prestigious complex housing the Faculty of Law and the Faculty of Business and Economics - including its MBA program - together with a mix of retail in the Western Precinct of Monash University's Caulfield campus. The complex aspires to nurture brilliance in the academic community and to make this aspiration tangible to all those who experience the campus.

Central to this aspiration is the manifestation of a scholarly community through a building typology where teaching spaces are flanked by the faculties on each floor, increasing proximity and connectivity between academics, professional staff, students and the professions, and enhancing collaboration, accessibility and the quality of the campus urban experience. Faculty offices welcome informal spaces for meeting and small group learning, breaking down barriers between the disciplines and the research hierarchy. The complex mediates the interface with Dandenong road with a highly formed and articulated concrete panel cladding, protecting the northern aspect from acoustic and thermal considerations in a play of lightness and solidity. Facing the pedestrianised public realm of the Western Plaza, the wall exhibits a 3-dimensional complexity: it is permeable and fragmentary. At the western interface, the meshing of these two conditions integrates the heritage facades along Derby Road, providing Monash Caulfield with a street front address, as well as signifying a memorable 'gateway' to the precinct - a sentinel in the suburbs - acknowledging passing traffic and facing the Melbourne CBD. (McBride)

#### **Brownless Biomedical Library, University of Melbourne, Melbourne, VIC – Australia 2010**

This project involves a major refurbishment to the Melbourne University Bio-Medical Library to provide a 24 hr student learning hub and a one stop shop student service area. The project involves the architects working intensely with a diverse stakeholder group comprising over 20 participants and collaboratively with Melbourne University in the design and tailoring of a wide variety of new learning spaces. (McBride)

### **Project Brief**

Our role was to enliven the space – to take the Original 1960's John Scarborough and Partners building and bring it into line with the requirements of a modern library. In the case of the Brownless Biomedical Library, this meant integrating the traditional library with an IT hub, comprising all the computers and services necessary to work and research in today's university setting. The new library also required a whole spate of rich and varied learning spaces to accommodate the numerous, flexible learning modes. McBride Charles Ryan worked closely alongside both stakeholder groups and Dr. Peter Jamieson, a specialist in this field, to develop the form of these spaces. The result is sequence of outcomes ranging from more private places to read or study alone, workstations for small teams, right through to meeting rooms for large groups. A kind of reading 'lounge room' for students with tight living conditions was considered.

### **Project Innovation / Need**

The existing rectangular plan was disrupted solely by an off-centre expressive spiral stair which ran through the three levels of the library. In response to this circular element, McBride Charles Ryan developed a family of forms to counter-act the rigidity of the original floor plates. As part of the University of Melbourne's scheme, each library was to have its own personality, representative of its parent faculty. The curvaceous response therefore, reflects the organic qualities of bio-medical science.

Similarly the library's palette borrows from the medical faculty. The cardinal red from the robes of its graduates, as well as the white and pinks of the human body. The use of strong contrast and vivid colours helps enliven the space creating a 24-hour dynamic environment; while the blush pink cladding enhances the drum of the spiral staircase, the original design generator.

### **Design Challenge**

The largest challenge for the Brownless Biomedical Library was designing into the existing envelope, as this aspect of the building was unable to be modified. Therefore an economical solution needed to be provided to deal with the problems of a deficient ceiling height and deep floor plate. The radial tiling pattern which emanates from the staircase helps to counter-act these issues, by providing both light reflectance and acoustic dampening. The tessellated ceiling also further reinforces the circular geometry of the scheme while integrating services such as lighting and air conditioning into its pattern.

### **Sustainability**

The Brownless Biomedical library extends the lifespan of the building it occupies. By recycling the entire envelope, and updating the student hub to meet current needs, this project preserves the existing fabric, saving on both the economic and environmental costs of demolition. Furthermore by creating a series of flexible learning spaces, the library is set up to cater for the continuously changing requirements of the future university curriculum.

## **Paul Morgan Architects, Melbourne, VIC - Australia**

<http://www.paulmorganarchitects.com>

### **Libraries:**

#### **RMIT (Royal Melbourne Institute of Technology) – Computer Science Flexible Learning Centres, Swanston Library, Melbourne, VIC – Australia 2000 / 2003**

This project involved the provision of a Flexible Learning Centre to RMIT University's School of Computer Science and Information Technology. The Learning Centre provides three Syndicate Rooms (each with 37 workstations), an Oasis (7 workstations), Help Desk, Hot Desk Area, Research Room, Offices, Staff and Student Lounges, Thermal Zone and miscellaneous administrative office.

Here the directional 'chalk and talk' relationship between teacher and student - students as audience - gives way to self-learning from a computer terminal at a workstation. Students sit around large geometric tables of four to eight places, forming cells of activity that allow for an interactive learning context where flexibility and accessibility are important and information technology is maximised. The appended Oasis room is an elliptical space for seven students who wish to work in either a more interactive or silent, environment than their colleagues in the Syndicate Rooms.

In the competitive world of attracting students to computer science, this project recognizes that design innovation reflects the School's self image. (Morgan)

.....Flexible learning principles privilege self-learning as the key idea, where access to databases is critical to navigating the student's learning experience. FLCs are either centres of learning within a pre-existing facility – primary, secondary or tertiary (TAFE or advanced) – or a stand-alone facility. Remarkably, feasibility work for social infrastructure at Melbourne Docklands currently includes an early learning centre, previously known as a creche.

This provides a key into the overarching pedagogical drive behind FLCs, the idea of life-long learning. Life-long learning assumes that in the current “early knowledge age” (post-industrial) access to education and knowledge is critical to personal development, employment opportunities and social connections. As opposed to the previous linear progression from primary to secondary to tertiary education, with each stage clearly bounded, life-long learning assumes a seamless education whereby individuals select from a myriad of learning formats including short courses, distance education, workplace learning or visiting the internet. If life-long learning principles are not instilled early within demographic groups that are currently disadvantaged, these groups are likely to develop social and demographic problems later on.

At the time of writing Morgan McKenna is engaged in feasibility work for RMIT University's Flexible Learning Centre at Hamilton in Victoria's west, an example of an entire facility (an existing veterinary institution) labelled as a flexible learning centre.....

The Computer Science Flexible Learning Centre at RMIT University's city campus introduces a radical shift in the planning of the department's computer laboratories and introduces one of the first applications of the full potential of the FLC idea to the university. The centre provides a Syndicate Room and conventional Computer Laboratory (each with 37 workstations) and an Oasis (7 workstations). It applies several elements of the FLC model: a “think tank” open plan environment that encourages collaboration and cross-disciplinary exchange supported by “oasis” quiet spaces, information technology, teaching staff and resources such as technical support, security, reception and printing. .... A third project for the university was the provision of an FLC within the Swanston Library at RMIT's city campus. In this design 150 workstations, most with computer terminals, replaced stacks containing books and carrels within the Building 8 library designed by Edmond and Corrigan. It is a variation on the FLC theme and contains the requisite elements of open and syndicate space areas, oasis spaces, and resources (information and copy centre). This design assumes the importance of self-learning, through access to the internet, library databases, on-line syllabuses and the availability of computer programs. It responds to one of the top ten student concerns in a university survey and has proved outstandingly popular. ....

### **Libraries:**

#### **Samford Valley Steiner School Library, Samford (Brisbane), QLD – Australia 2010**

The library at the Samford Valley Steiner School seeks to be an appropriate and specific rendering of Kevin Rudd's 21C BER Building the Education Revolution. One generated to reflect the experiences and cultures contained within the site. Born as direct consequence of the Government stimulus, the opportunity was seized by the school to direct funds not to a single building, rather to create a 'cultural precinct' at the heart of the fledgling Samford Valley Campus. A precinct containing a library and multi-purpose Hall and incorporating essential infrastructure required to service and link the two halves of the school community.

From the foundational buildings designed and arranged by Greg Burgess in the 1980's through to contemporary counterparts, the ambition to build with the spirit of wood was initiated long ago. The library is from the stirrups up a wholly timber framed and clad building.

At the core of the plan is the loggia. A threshold territory receiving and distributing children and visitors alike. It provides a space for informal gatherings connected to the functions of the library/media room and the 'community gathering space'. Most importantly it links the experience of the library activities to the landscape and the broader campus. (pentArchi)

The Samford Valley Steiner School Library seeks to be an appropriate, site specific, bespoke rendering of the National BER stimulus program. The intention to imbue the building with the spirit of wood was an integral response to the landscape, community and material culture found within the Site. The library is from the stirrups up, a wholly timber framed and clad building. It has been designed as a contemporary counterpart to the foundational timber buildings initiated by Greg Burgess in the 1980's within the school campus.

Timber was selected as the appropriate, economic and sustainable material solution. The integrity of a timber framed and detailed building was consistent with the Steiner philosophy and the desire to deliver a building which would 'belong' to its bushland settings. Sustainability and self reliance are encoded in the design. The low embodied energy initially offered by a lightweight timber construction has been paired with solar energy generation and water harvesting, both in excess of the buildings immediate needs, to be utilised within the school.

The Loggia is a core external space additional to the original brief, creating entry and providing an informal gathering point. It is a threshold territory which is on equal terms with the interiors of the library and the landscape. The paired back resolution of this space, framed in timber provides an economic and memorable moment within the school campus.

The Library design is conscience of scale. The building's program, detail and palette of timber cladding systems have been apportioned to subtly generate 3 independent scales. The ultimate expression of which is the floating 'civic' canopy roof. The clearstorey permitting natural light into the library by day, inverting to a lantern set amongst the bush by night.

#### **Deakin University, Burwood Campus Library, Melbourne-Burwood, VIC – Australia 2013**

Deakin University was formally established in 1974 with the passage of the Deakin University Act 1974. Deakin was Victoria's fourth university and the first in regional Victoria; it was named after the leader of the Australian federation movement and Australia's second Prime Minister, Alfred Deakin.

Project Value: \$ 6.100.000 ,Client: Deakin University, Completion Date: April 2013

The modern university library has become the default meeting, and socializing space for students. Part of our brief was to remove the “shhhh!” factor from the Library while still facilitating traditional uses and quiet study.

We pursued the concept of the Library as a “village” where main ‘streets’ take most of the traffic, and secondary circulation paths lead people to different pockets of activity. We designed a series of key village destinations including the ‘village green’ – a central, informal meeting space and group study area; ‘Active squares’- housing various uses such as computer labs, a gallery & checkout, and ‘Pocket parks’ - providing eddies away from the main study area and lounge spaces for relaxation

The intention was to provide a range of possible spaces for students to choose from depending on their need to study needs within an environment that is welcoming, comfortable and dynamic. (SixDegree)

#### **Deakin University, Waurn Ponds Campus Library, Geelong-Waurn Ponds, VIC – Australia 2010**

### **Awards:**

2011 AIA (Vic) Public Architecture (Alterations) Award, Deakin University Waurn Ponds Library

This project aimed to deinstitutionalize Deakin University’s Waurn Ponds Library to improve the student experience and better meet their evolving learning needs. The new library offers more diverse studying and meeting options, it is a social place, a place to exchange ideas and engage actively in learning.

The building comprises a series of spaces including group and individual study spaces, a moot court, an IT training space and a 24 hour access computer room. The new layout encourages interactive study by providing open, booth style group study spaces, influenced by our hospitality work. A café has been introduced into the ground floor, serving on two sides - into the library and out onto new stepped landscaping.

The library is opened up by a new façade to its eastern side, gaining more natural light and providing views over the University Green to Corio Bay. The building edges are integrated with the surrounding external landscaping, so the re-fitted library sits comfortably within the existing central campus precinct. (SixDegrees)

## **Suters Prior Cheney, Pyrmont (Sydney), NSW – Australia**

<http://www.sutersarchitects.com.au>

### **Libraries:**

#### **Churchill Community Hub, Churchill, VIC – Australia 2009**

....The Churchill Community Hub is a contemporary model for a community centre that houses a diverse range of user groups and activities, each with differing aims and clients but sharing common facilities whilst improving the interconnectivity of these services within the rural community. It co-locates services within the larger complex. The number of user groups that were to inhabit the completed Community Hub and the process of user group negotiation and participation greatly affected the development of the design. Literally tying competing needs and uses together into one facility was expressed metaphorically in built form with the building being wrapped by a series of built elements; block work, fascia, roof and fence. The Latrobe City Council requested an iconic building that reflects their policy for Environmentally Sustainable design to be used as a learning tool for the users. The design incorporates photo voltaic cells, rain water collection, passive cooling and air flow, zoned a/c spaces and natural ventilation.... All of the community functions are grounded to the site by a Library. The traditional form of a Library has expanded, it is no longer just a repository for books, it is no longer a quiet space. It acts as a service centre operated by the Latrobe City Council where clients can use the library and its facilities and the local council services which operate out of the hub ie paying rates, Centrelink etc. Having different user groups occupying the one building allows for cross over of services, engages the casual visitor in areas that they would not have been exposed to and creates a visibility for groups in the community....

([http://www.e-architect.co.uk/australia/churchill\\_community\\_hub.htm](http://www.e-architect.co.uk/australia/churchill_community_hub.htm))

#### **Blacktown Leisure Centre, Sydney-Blacktown, NSW – Australia 2009**

....The library was to be located to the west of the existing leisure centre and was designed to form a forecourt between the new building, existing building and carpark to help create a ‘civic’ presence and entrance to the facility.

Suters designed the project on the concept of ‘layering’, which was drawn from the site’s several transformations over time, from pre-settlement to farmland to residential development.

“The built form of the library represents these layers. The façade depicts these periods like the pages of a book — a type of three dimensional timeline. The façades wrap around the rectangular form of the building and splay open to the south to create openness within the space,” says Shane Wood, senior associate at Suters Architects.

“The themes are also expressed internally in the library fitout. The library addition continues the grid-like pattern that is expressed in the existing building, which was designed by Cox Group, and explores the edges of structure, technology and entertainment using the spirited colours of the Australian landscape....”

(<http://www.bpn.com.au/features/bpn-reports/read-all-about-it>)

#### **Patterson Lakes Community Hub, Melbourne-Patterson-Lakes, VIC – Australia 2009**

The old Patterson Lakes Community Centre has been re-worked to improve public facilities, with a new library, kindergarten, a refreshed community hall and parking, adjacent to an existing primary school and on busy Thompson’s Road. A sound attenuation wall adjacent to an old age home becomes a barcode translation of ‘Patterson Lakes Community Centre’ with White-trunked Eucalypts planted in rhythm and complicity with the barcode pattern. Permeable surfaces and swales carry runoff into the new trees. Plantings carefully mass vegetation as a sun screen to the library, and existing mature trees have been retained wherever possible. The manipulation of the forecourt ground plane levels is a response to the constraints of road crossing; wheel chair access to the book chute; provision of universal access; and heights of underground piping revealed during construction. Inadvertently then, the forecourt became the place where the rigidity of the suburban footpath was re-invented as a sculpted gathering place.

(<http://saala.com.au/projects/patterson-lakes-community-centre#img-1>)

### **Sacred Heart Primary School Library, Kew (Melbourne), VIC – Australia 2008**

The new Library is in the Sacred Heart Primary School, located on the corner of Glenferrie and Cotham Road in Kew. It was an urban infill exercise with the site being a playground between two impressive nineteenth century buildings, the Sacred Heart Parish Church and the adjacent School Hall. The new Library is respectfully located between these two prominent architectural features, balancing an autonomous presence while maintaining the continuity of the site. The form of the Library is a response to the existing built fabric. The adjacent church is curvilinear, red brick and Renaissance inspired, made up of circular vestibules and a domed roof. These curves are mimicked on the east façade of the Library facing the church. Juxtaposed to these curves is an Edwardian Baroque Hall with pediments and pilasters that intensify the negative space that form the boundary to the children's playground. These angular shapes are replicated on the west façade. The geometric resonances of the existing buildings shape the new insertion, providing courtyards and passages in which the children can play. The school's identity manifests on the exterior of the building via imagery of the schools name sake The Sacred Heart. This provides the building with a sense of place particular to the client group. The literal expression of the bleeding heart of Jesus is represented in plan as a morphed series of traditional heart shapes. Images of the Human Heart bisected by a Love Heart form the base geometry for the layout of the exterior walls. This produces a distorted plan which does not address the polite ideas of scale or proportion but rather a fantastical urban condition. The building acts as a sign. The patterned brickwork spreads along the curved love heart wall, graphically representing the motif, literally drawing a fragment of the Sacred Heart. Entwined thorns are emblazoned like a bill board on Glenferrie Road visually announcing school's identity. Further still the heart shaped building is gripped by an abstracted representation of the Crown of Thorns. A metal clad clerestory with triangular pink, red and rose colored windows punched through, wraps the blood red brickwork tightly. The client required a multi-functional space that functioned as an I.T. classroom, Library, Reading Recovery and a Learning Centre. The multi disciplinary space is large and column free, dissected with a double volume clerestory roof formed from the overarching Crown of Thorns. The clerestory encourages the reliance on natural light and natural ventilation. Further sustainability measures were employed such as zoned lighting and energy saving fixtures and fittings throughout. The materiality of the Library was budget driven. The economic palette selected was brick, painted fibre cement sheet, and metal cladding. All consultants were committed to producing an innovative cost effective outcome. The new library is a unique building shaped by the existing conditions, not fighting for attention in an already star studded composition. (Suters)

### **Caroline Spring Civic Centre / Library, Caroline Spring, VIC – Australia 2008**

As part of an integrated development for the Caroline Springs Town Centre, the Shire of Melton commissioned the development of a 2,500sm library and civic centre. The design for the Caroline Springs Library was inspired by the local geological features of the area, from which the Organ Pipes National Park derives its name. These distinctive columnar basalt formations only occur in a few locations in Victoria and are reflected in many elements of the building, such as: - Tessellated/ Randomised pre-cast walls throughout the building - Large supersized hexagons which formed the main entry elements to both buildings and were created using stepped concrete columns with infill pieces - Cranked glass external façade which extends the visual language of the pre-cast The technical production of these elements was particularly challenging and could only have been possible with teamwork between consultants, suppliers and architects. In geological terms, when one material overlays another this phenomena is referred to as a layer of unconformity. a material no mans land. This layer of unconformity- a noble metaphor for a library and the pursuit of knowledge- became a stylized figuration that framed the horizon of the building as an alpolie edge. This was further articulated by a soft and canopy to the exterior of the building and a light shelf and edge to the clerestory. The layer of unconformity is broken through by an internal north facing clerestory that runs the length of the building. The interior design, which was created in association with Alex Hotchin Design, was similarly inspired by the organ pipes basalt formations. The main internal corridor of the building is punctuated by a alpolie soffit that extends from outside to inside. Feature walls within the main circulation spaces are punctuated with the same hexagonal profile. Given the dual uses for the building- library and civic centre- there was a strong need for zoned areas. This was achieved by predominantly using the ceiling to infer the enclosure of space. Concrete blade walls became key elements within some of the main internal spaces. The floor furnishings utilize interface carpets with a series of treford highlights. These highlights also follow another moment (referred to as the Rosette Stone) in the area's geological history. Within the building our design seeks to explore the experience of knowledge and learning, and importantly the modalities of learning. There are social spaces such as a café adjacent to a magazine and library reading areas, ICT room for school groups, the community and the University of the Third Age. At the western end of the internal street a cohort learning space, coined 'the Bat Cave' by school groups, provides a more private environment for group study and IT presentation preparations. The design team sought to integrate furniture fitout and equipment, signage and library shelving as part of the overall scheme with many items designed as one-offs. In designing the Caroline Springs Library we were conscious of the need to provide constant re-readings of the same building. (Suters)

### **Rouse Hill Library (Rouse Hill Town Centre), Rouse-Hill, NSW - Australia 2008**

<http://www.taylorrobinson.com.au>

#### **Libraries:**

### **Scotch College, Science, Technology & Learning Centre, Swanbourne (Perth), WA – Australia 2009**

The \$11 million Science, Technology and Learning Centre combines a number of disciplines in one state-of-the-art facility allowing closer collaboration between two important learning areas for the College. The design incorporates a number of key sustainable principles that will enable students and staff to engage with the technologies at work within the management of the building. (Taylor)

### **Edith Cowan University, Mount Lawley Library, Refurbishment, Perth, WA – Australia 2009**

The upgrade of the library on the Mount Lawley campus sees acclaimed university architect, Gus Ferguson's early 1990s building brought into line with contemporary architecture recently completed on other campuses. Major rearrangement of spaces and the addition of a glazed entry foyer have opened the building to the campus to improve visual, physical and functional accessibility. Flexibility is created via a generally open plan consideration with areas for quiet individual study, group learning, casual meeting and gallery. (Taylor)

### **iZone Robertson Library, Curtin University of Technology, Perth, WA – Australia 2008**

This refurbishment involved the creation of a contemporary self-learning area within the context of a traditional library on the Bentley campus. With a focus on the exchange of information, it is a 'technology rich' zone, providing opportunities for study on various levels within a more relaxed, cafe-style environment. Individual work, group work as well as more formal presentations can occur in the largely open area. Zones are created via permeable screens, moveable glazed writing screens and through space-defining floor and ceiling treatments. This project received a commendation from the WA Chapter of the Institute of Architects, won the sustainability award by InterfaceFLOR, and the Innovative Lighting award by Monduluce. (Taylor)

## **Terroir Architects, Sydney, NSW – Australia**

<http://terroir.com.au>

### **Libraries:**

#### **New Town Primary School, Hobart, TAS – Australia 2010**

TERROIR's classroom extensions, new kindergarten and library refurbishment at New Town Primary School (Tas) were completed in August 2010. The vibrant colour scheme used in the classroom extensions is reflective of the School's colours, mediating from yellow to green externally. (Terroir)

## **TKD Architects (Tanner, Kibble, Denton), Mittagong, NSW – Australia**

<http://www.tannerarchitects.com.au>

### **Libraries:**

#### **Frensham Esther Tuckey Library, Mittagong, NSW – Australia 2009**

The Esther Tuckey Library provides contemporary reading and study facilities for the students of Frensham. Replacing an earlier library the new building has become the key hub for the school and includes a spacious reading and study area; book stack facilities; staff offices and work rooms. A simple rectangular masonry form with face brick and render walls, the new building's form, scale, and materials complement its surrounding buildings and presents to the northern courtyard as an elegant formal colonnade, linking the West Wing Building and the School Hall - traditional buildings from the 1920s and 1930s. The new library has a classical and timeless character, while meeting the functional requirements for a contemporary school library. (TKD)

#### **Eagle Vale Central Library/Community Centre, Sydney-Eagle Vale, NSW – Australia 2003**

Eagle Vale Central a new Branch Library integrated with an existing Leisure Centre to provide a Community Cultural Centre consisting of 3 recreational pools a gymnasium, councils administration services, an internet Cafe, adjoining the Library, a Cafe serving the whole of the Centre and a public Meeting Room. Here bold architectural elements, environmental controls and refined detailing help define a new cultural hub and the rise of computer and internet facilities as a resource for research and general browsing. On the western façade a solid masonry wall curves in plan and tapers in section following the contour of the landscape. A higher lighter framed vertical glazed structure interrupts this wall thus defining the entry. In plan the Library fans out providing views over the reserve to the lake and natural non-direct sunlight through large areas of southern glazing. High level clerestory glazing over the centre of this space and the new entrance to the Gymnasium provides further natural light with wide overhangs to avoid direct summer sun. On the east façade splayed shading devices allow light and views to the south whilst screening summer sun. Similar detailing is found on the glazing of the Entry Lobby structure where louvres are constructed outside the glazing with space between for air movement screening out direct sunlight and reducing heat gain.

#### **John Foss-Russell Building USYD (University of Sydney), Sydney, NSW – Australia 2009**

"The jury found that the scheme by John Wardle/Wilson Architects/GHD was the clear winner for USYD Central, with no commendations awarded to the other proposals." Andrew Mackenzie

John Wardle Architects won an International Design Competition for the USYD Central Building for the University of Sydney. Located on City Road this \$50 million project creates a new gateway for the University and contains a 3500sqm Public Plaza, 4500sqm Sciences and Technology Library, 1000sqm of Specialist Retail and 7500sqm of Student Services spaces and a bridge linking the Camperdown and Darlington Campuses. (Wardle)

#### **Melbourne Grammar School, Melbourne, VIC – Australia 2008**

### **Awards:**

Victorian Architecture Medal AIA

Premier's Design Mark Award, State of Design 2008

National Award for Public Architecture AIA

The Emil Soderstan Award for interior Architecture AIA

William Wardell Public Architecture Award AIA Victoria

"We believe the contemporary library is a place of study open to the world outside, full of noisy discussion of new ideas while still providing space for quieter contemplation." John Wardle

In May 2004, Melbourne Grammar School announced John Wardle Architects as the winner of a design competition for a landmark building on Domain Road, establishing a new front door for the school. The Centre for Learning and Leadership will integrate library and information technology functions, and include a 240 seat lecture theatre and administration centre. The subject of learning becomes the face of the campus through a transparent library envelope. The emphasis is on providing an active space with access to knowledge in a variety of media, electronic as well as traditional forms. The library elevation is an open glass façade that exposes rows of books as well as thriving companion activities, symbolically representing both a repository of knowledge and a shift to a more open and engaging institution. The entry on Domain Road will be expressed as a slice through the new building that reveals the West Quadrangle's 1858 facade. (Wardle)

#### **Hawke Building, South Australia University, Adelaide, SA – Australia 2007**

Client: University of South Australia Partners John Wardle Architects - Design Architects & Joint Project Delivery Hassell Architects - Joint Project Delivery

### **Awards:**

Public Architecture Commendation. Property Council of Australia RLB 2009 Innovation and Excellence National Commendation for Public Architecture. Australian Institute of Architects National Architecture Jack McConnell Award of Merit for Public Architecture.

RAIA SA Awards 2008. - Award of Merit for Interior Architecture.

"It is a facility that communicates architectural distinction...The pre-cast concrete panels with inserted copper accents are designed to weather gracefully to signify the persistence of the institution over time."

This definitive building marks the gateway to the civic expression of a university.

Located on the western end of the city and following a period of the self-assessment, this building reveals the value of the university whilst re-establishing its social standing in the civic realm. It's one of three buildings commissioned by the university to form part of its strategic revitalisation.

With its series of significant public programs - the Anne and Gordon Samstag Museum of Art, Bradley Forum, and former Australian Prime Minister Bob Hawke's complete political archive (**Bob Hawke Prime Ministerial Library**) - the building celebrates the university, student life and learning as well as signalling the institution's connection to the city.

Finding expression on both the exterior and interior and unlike the previous opaque university structures, this building is open and transparent with views from Fenn Place up and into the civic spaces and interior. The facade features a rich pattern of misaligned concrete panels and fine copper detailing. It recalls both traditional ideas of the civic institution and the contemporary expression of a future-focused university.

An intertwined two-stranded stairway – one black and one white - becomes an emblematic signature for the entry. From within vistas open up across programs and circulation spaces and then back out into the campus centre. (Wardle)

### **Catherine Helen Spence Library, University of South Australia, City West Campus, Adelaide, SA – Australia 1997 (2003/2007/2010/2011)**

Client: University of South Australia, Partners: John Wardle Architects - Design Architects & Joint Project Delivery Hassell Architects - Joint Project Delivery

Constructed by the University of South Australia as part of the new City West Campus in 1996, the Catherine Helen Spence Building was officially opened in January 1997. The four storey building housing the Library at City West Campus was extended on two floors in 2003 to accommodate the collections moving from the Underdale Campus when it was closed in 2004. The ground floor was extensively refurbished in early 2007 to accommodate the growing demand for study space. Further refurbishments in early 2010 and 2011 have created more study spaces. The building also housed the Bob Hawke Prime Ministerial Library during its inception before it relocated into the Hawke Building in 2008.

Catherine Helen Spence was born in Scotland in 1825 and emigrated with her family to South Australia in 1839. She opened her own school and campaigned for education for women, resulting in the establishment of the first government secondary school for girls. This led to women being accepted in Teacher Training Colleges and eventually into universities.

Catherine Helen Spence was Australia's first truly professional woman journalist and first female political candidate, as well as a fearless social and political reformer. Her influence on suffrage, culminating in South Australia being the first state in the world to give women the right to stand for Parliament, extended beyond Australia. She died in 1910. Considering her work as a writer, educator, journalist, speaker, and reformer it is apt that the Library was named in her honour.

“The library extension ... picks up the concrete grid of the original building, partially inverts its colour scheme, and then works both within and around the grid. On one elevation, aluminium panels provide a colourful infill alluding to the shelves of books within, while on another, precast concrete panels are suspended over the laneway making reference to the building opposite. To the south, the double-storey window reconnects the library to Hindley Street, making a display for pedestrians out of the activity of study groups and their reading materials and, in turn, giving students a view of the very context in which their knowledge ought to find application.” Scott Drake, Architecture Australia (Wardle)

### **Whitefield McQueen Irwin Alsop, Collingwood, VIC – Australia**

<http://archive.wmia.com.au>

**Libraries:**

#### **Waurin Ponds Library, Geelong-Waurin Ponds, VIC – Australia 2012**

Size: 1000 m<sup>2</sup>, Costs: \$ 5.800.000

This golden punctuated shell is the glistening new Library and Community Hub at Waurin Ponds on the outskirts of Victoria in south-east Australia by Whitefield McQueen Irwin Alsop. The firm's concept arose through a simple Wikipedia search of the Waurin Ponds area which confirmed that the region's name originated from a series of interlinked, cascading ponds. Whitefield McQueen Irwin Alsop generated a steel laser-cut solar skin pierced with holes in a range of sizes to wrap the building, supplying the necessary solar protection and a strong statement for the new library.

Besides this shimmering Library and Community Hub, Waurin Ponds is also home to Peddle Thorp Architects and Davis Langdon's Leisurelink complex, a bold, curved waterpark in close proximity to the new scheme. There is also a baseball field nearby which formed a tight site footprint for the design team at Whitefield McQueen Irwin Alsop: “Our experience with other libraries told us people would come, what we needed to do was make the destination worth the visit. The site is a leftover portion of land wedged between two significant sports venues. Our approach was to pull the elevation forward to ‘stick its head around the corner’.”

Entrance stairways have been replaced by timber boardwalk ramps and the repeated circular motif ensures a memorable image for the facility's visitors whilst retaining a sense of respect for the surrounding architecture and community amenities. The clean lines and simple silhouette act in direct opposition to the swirling footprint of the established Leisurelink centre and promote community integration for all users regardless of age, gender or background.

([http://www.worldarchitecturenews.com/index.php?fuseaction=wanappln.projectview&upload\\_id=18951](http://www.worldarchitecturenews.com/index.php?fuseaction=wanappln.projectview&upload_id=18951))

#### **Bachus Marsh Library, Bacchus Marsh VIC – Australia 2012**

Architects Whitefield McQueen Irwin Alsop have designed a new library and community building for the rural community of Moorabool Shire, located in Main Street, Bacchus Marsh about 45 minutes outside Melbourne.

The first new building in Main Street for almost 30 years, the design team, looking for inspiration, turned to the nationally recognised and iconic Avenue of Honour, the elm trees planted along the main road in 1918 to honour those who served in World War I, landmarks the arrival in Bacchus Marsh.

“We quickly realised the full palette of design ideas was available to us in the trees that form the Avenue, the buildings structure, skin and openings were all inspired by the Avenue, a fitting way to add to the Urban fabric by honouring the past and connecting to the future”

The exposed steel frame is a refined ‘trunk and branch’ structure. The skin of the building is dark and finely ribbed, taking the fine lines in the leaves and the darkness generated when the Avenue is in full leaf. The buildings openings are a stripped down representation of the Avenues negative space in the canopy, where sun penetrates the openings, even the green on the steel was colour matched from the green hues of the leaf canopy with full sunlight behind.

The building is part of a precinct master plan and broader cultural strategy for the town. As well as providing a new language to the streetscape, including street furniture and low maintenance planting, the building also acts as an environmental beacon, advertising Councils commitment to positive climate change initiatives.

Council were instrumental in the integration of sustainability initiatives such as Ground Source Heat Loop technology for heating and cooling, an automated night-purge ventilation system, and rainwater harvesting to service the amenities.

([http://www.worldarchitecturenews.com/index.php?fuseaction=wanappln.projectview&upload\\_id=18004](http://www.worldarchitecturenews.com/index.php?fuseaction=wanappln.projectview&upload_id=18004))

### **West Footscray Library Community Learning Centre, Melbourne-West Footscray, VIC – Australia 2008**

West Footscray Community Learning Centre is located at the east end of the West Footscray shopping strip, housing the West Footscray branch library on its original bequeathed site, and co-locating the Neighbourhood House, Occasional Child Care, community rooms and council offices. Conceptual Framework: West Footscray CLC is the result of a close consultative process from inception to completion. Key to the success was the formation and enthusiastic contribution of the Community Reference Group, comprising local residents, traders, users and staff. Public & Cultural Benefits: Catering for the diverse cultural and ethnic mix of local area the facility is designed to provide a forum for the exchange of ideas and views in a positive environment. Additional local benefits are expected; by centralizing diverse community activities, the anticipated increase in patronage (which is already occurring) is hoped to reenergize the local shopping strip. Relationship of Built form to Context: Early in the process the community defined for the design team what makes West Footscray, the importance of Footscray as a major transport, container and industrial hub; rail yards, container depots, and factories were strong markers in the collective memory. A series of iconographic images depicting the local urban and transport context were applied both literally and abstractly to the plan, form, mass and detail of the final design. Program Resolution The competing functions' of the program needed to be squeezed' on to the land locked site posing fundamental planning questions. By pushing the entry deep into the site, accessed via a new laneway', the conflicts of long internal corridors and different out of hours access were overcome. The new laneway created a new active edge, promoting accidental meetings' of friends and neighbors. This new front' elevation increase opportunities for naturally lit spaces. Early in the design process the decision was made to push the kids upstairs, the need for access to an active outdoor space allowed the design form stacked containers' to be reinforced, using the play space as a hole' in the stacked boxes. Integration of Allied Disciplines The structural and services solutions have been integrated to create a robust and flexible building, adaptable for future uses, large spans, perimeter location of services, where possible services left exposed, enabling the building to grow, change and morph according to the community's demands. Working in conjunction with local artist Jos Van Hulsen, a front gate, library furniture and internal screening design, built from found' objects were incorporated into the final design. Cost/Value Outcome The construction budget was \$1.9m. Needing to absorb challenging latent conditions of the site and accommodating scope creep, the original budget was closely maintained. Sustainability Low-technology and low-cost solutions were adopted to meet capital budget constraints. The siting and layout of the building uses passive solar design, Lowe glazing is used throughout to minimise demand on the VRV zoned AC system. Response to Client and User needs The response from library patrons, staff and the broader community has been overwhelmingly positive.

([http://www.architecture.com.au/awards\\_search?option=showaward&entryno=2007030253](http://www.architecture.com.au/awards_search?option=showaward&entryno=2007030253))

### **East Melbourne Library, Melbourne, VIC – Australia 2006**

In the realm of the world wide web and digital information and technologies, the relevance of the library has been widely questioned. The new East Melbourne Library and Community Centre shows there is still plenty of relevance left in the local library. This new facility is a striking and inviting building. Designed with much local community consultation. it is an open, relaxed and transparent institution. Since opening, this new facility has exceeded all predictions for visitor numbers. The demographic also seems to have changed, with many younger people and students using the facility. The inclusion of public PC access, along with wireless internet access has been well received. As well as a new library and community centre, East Melbourne has also gained valuable public urban space in the form of a small, open plaza that forms the main street entry to the building. New public seating (using re-cycled timber blocks), paving, landscaping and bike racks have improved the amenity of this part of George Street greatly. Consistent with the City of Melbourne's zero emission by 2020 target, the new facility includes a number of ground breaking ESD strategies to minimise its environmental impact during construction and over the life of the building. The building fabric has been optimised by addressing issues of insulation, shading, daylighting, glazing, thermal mass, natural ventilation and heating and cooling. The incorporation of a Ground Heat Exchange system is the major heating and cooling strategy for the new building, displacing the usual reverse cycle air-conditioning ...

The building is naturally ventilated. Air is drawn through a sub-floor plenum space into the building through perimeter vents in the ground floor. As this air warms and rises, roof ventilators open and exhaust the air. In ESD and daylighting terms, this was a challenging site, with its north-south orientation. The striking form of the building, with its overlapping roof 'shells', is a direct result of this challenge. Shaded perimeter glazing between the various shells gives a beautiful diffuse light throughout the main library hall. Artificial lighting in the library is regulated by sensors, to switch off when sufficient natural light is available. ....This small building, completed in August 2006, is functioning to a remarkably high standard of indoor comfort and has become very popular with the local community.

([http://www.architecture.com.au/awards\\_search?option=showaward&entryno=2007030343](http://www.architecture.com.au/awards_search?option=showaward&entryno=2007030343))

### **Wilson Architects, Spring Hill, QLD – Australia**

<http://www.wilsonarchitects.com.au>

#### **Libraries:**

### **Armidale Dumaesq War Memorial Library, Armidale, NSW – Australia in design (2018)**

Our vision for the Armidale Dumaesq Library stems from the following observations we believe are fundamental to this project. Not only should the building perform as an exemplar for environmental sustainable design but as a library environment, it needs to reinforce the town community as an important social space, recognise its history and celebrate its natural heritage. We have drawn out the human dimensions of this facility and reflected them in the design. Visitors and staff are invited to interact with reading and the IT environments. (Wilson)

### **University of Queensland, Science and Engineering Centre, Gardens Point Campus, Brisbane, QLD – Australia 2012**

\$ 200,000,000

Wilson Architects + Donovan Hill were selected as winners of a design competition in December 2008. The \$200 million dollar project is for 16,000m<sup>2</sup> of bookable Teaching, Learning and generic Research space for Queensland University of Technology's Science and Engineering Faculties.

The site is located in a significant part of QUT's inner city Gardens Point Campus and will involve the removal and remaking the Campus's key communal facilities (refectory, pool, retail and book stores). The brief also requires the project achieve a 5 Star Green Star rating for design and as built under the educational tool V1.

The proposed teaching, learning and research environments will involve innovative collaborative, structured and unstructured student directed learning spaces with strong emphasis on adaptability and space sharing. The SciTech Precinct is due for completion 2012. (Wilson)

#### **John & Alison Kearney Library, Bond University, Gold Coast-Robina, QLD – Australia 2010**

The John & Alison Kearney Library, located within the southern wing of the main arch building at Bond University provides an environment that is inclusive and recognises and supports different types of learners.

Furniture was selected to ensure comfort and support a broad variety of learning modes, and to encourage collaborative work where students can gather as large or intimate groups. Technology is embedded in various ways within, dependent upon the type of zone and the furniture. Wireless connectivity is ubiquitous, and laptop use is extended within and beyond the facility. The study booths zones form the most technology rich spaces within the dynamic lower floor level include large screen LCDs to enable students to effectively and appropriately scale information for display to a group, with laptop connectivity and integrated PCs. Booths are further equipped with document visualizers to assist in student presentations, assignment preparation and the translation of ideas. (Wilson)

#### **Axon Learning Lab, University of Queensland, St. Lucia, Brisbane, QLD – Australia 2010**

The Axon Learning Lab is a fully interactive teaching and learning lab for the Electrical Engineering Faculty which supports a range of pedagogical modes. The theatrical set quality of the space encourages students to engage with the alternative modes and to value creative solutions. Groups of 3 students clustered in tables share interactive tablet PC's linked with wall mounted screens. A continuous strip of whiteboard supports creative unstructured group work.

The Lecturer retains control over individual tables through a linked room AMX system that enables switching from group work to didactic mode. (Wilson)

#### **The “Lilly Centre”, Brisbane Grammar School (GBS) Integrated Learning Centre, Spring Hill, QLD – Australia 2010**

The Lilley Centre that located in Brisbane, Australia, is new integrated learning facility for The Brisbane Grammar School. The Lilley Centre was designed by Wilson Architects to transcend the constraints of traditional learning spaces. This education building, represents a significant physical transformation, symbolic and pedagogical shift from the School's 19th century roots. Over the last 10 years, pedagogy has been undergoing significant change particularly in light of the ubiquitous use of information technologies. Aligning the architectural design of these spaces to meet this change globally has not been slower. Much of the organisational framework of The Lilley Centre was built upon the Practice's two-year critical research under an Australian Learning and Teaching Council grant in conjunction with the University of Queensland. The premise of the architecture design is that all space can support learning through a range of learning modalities. As such, strategies to embed this range of didactic, active, discursive and reflective modes are considered throughout the Centre, where students are encouraged to logically extend learning from the teacher-led spaces into the student-directed study areas. Visual and physical thresholds between spaces are climacteric. Access into the architecture building recognises population movement with multiple entries and a high degree of transparency. There are a number of significant and innovative spaces within the Centre. The two-storey active learning space at the entry not only spatially organises the educational building but was also conceived as an extension to the historic Boarders' Lawn and is emblematic of an open access to learning. Extensive use of glass blurs these boundaries as do the external perforated aluminum sunshades which fold back into the space and also critically attenuate noise. Students are encouraged to work collaboratively in groups using the furniture design and technology tailored to replicate and extend classroom learning. The Forum revisits the traditional lecture theatre and enables up to 150 students to break into small groups, collaborate and to then discuss as whole group. The library is integrated into the overall learning landscape. The print collection is secured but is encouraged to be used across the whole building. The arrangement of space allows for logic in the partitioning of noisy active spaces from the quiet reflective study and reading spaces. It is at this quiet extremity that the students enjoy impressive views of the Great Hall and are reminded of the School's heritage. #### **Bond University Multimedia Learning Centre (MLC), Gold Coast-Robina, QLD – Australia 2008**

The Balnaves Foundation Multimedia Learning Centre (MLC) sets new standards in student services. It enables students to communicate remotely with other lecturers and students, create multimedia presentations and attend seminars and workshops. The MLC features a laptop bar, study booths, digital art displays, wireless Internet, iLearn, printers, plasma screens and a 'collaborative learning room' equipped with a Smartboard, high-definition projector, video conferencing technology and game consoles. The facility was made possible by the extraordinary generosity of retiring Bond University Councillor Neil Balnaves, who donated \$1.5 million towards the \$3.4 million cost of the centre. The MLC is open 18 hours a day, and the extended hours ensure it is well used. A recent survey of student use of the facilities found they were using it for extended or transitional learning between lectures. Of the students using the space, 93 percent said they would recommend the MLC to other students. One responded, "We are so privileged to have the use of such amazing facilities," and said they were "designed in the students' best interests and are world class." Others said they preferred to study in the MLC rather than at home, "because I love the environment," and for some, "it's gorgeous and luxurious, a pleasure to study there." (<http://bond.edu.au>) see also: (<http://epublications.bon.edu.au>)

#### **University of Queensland, Hawken Learning Centre, St. Lucia, Brisbane, QLD – Australia 2006**

The Hawken Learning Centre is a hub for first year engineering students, providing a place to gather and meet, work in groups and interact in a self directed learning environment.

The Hawken building is a series of multi storey buildings connected by atrium circulation spaces. The Learning Centre is placed at the confluence of the main circulation route, and opens up views through previously enclosed tutorial rooms. The room is controlled by swipe card access, but can be opened up with large sliding doors for events and open days. (Wilson)

#### **University of Queensland, Biological Sciences Library, St. Lucia, Brisbane, QLD – Australia 2006**

Wilson Architects were engaged in 2003 to undertake an upgrade of the Biological Sciences Library to provide additional floor space to accommodate increased student numbers and changes in the nature of service delivered by the library/ 'cybrary' and upgrade the building to comply with current building codes, including equitable disability access. The project also explores the potential links between the building and the adjacent Qld Biological Sciences Precinct. (Wilson)

### **Collaborative Learning Centre, University of Queensland, St. Lucia, Brisbane, QLD – Australia 2005**

The commission for the Sir James Foots Building included the development of a new genre of teaching facility developed for Academic Services for the University. The Collaborative Learning Centre (CLC) has been developed through a series of workshop events in conjunction with University teaching personnel and key stakeholders. The design workshops were facilitated by Wilson Architects and have encouraged the users to consider alternate methods of teaching by analysing and abstracting the existing teaching models. The outcomes of this method of abstraction led us to develop a series of structured and unstructured, organic teaching spaces able to offer a flexible choice of teaching method, be it relaxed, collaborative, group or individual based. A variety of spatial treatment has been proposed to each of the teaching spaces to further aid in the variety of teaching methods. A combination of loose and fixed benching combined with loose lounge and desk furniture is configured to facilitate individual focused work and/or encourage group interaction and discussion between desk arrangements. The major teaching spaces each cater for between 80 to 100 people.

Wilson Architects also promoted the idea that learning and the process of understanding information usually happens beyond the classroom, and a series of social interaction and contemplative spaces have been created adjoining the teaching spaces, including a coffee shop, student lounge area, loose occasional soft furniture inside with sculptured landscape terraces and gardens outside. Access to wireless internet and email and also large format plasma information displays throughout add to the dynamics of the space. (Wilson)

### **University of Queensland, Resource Centre Ipswich, Ipswich, QLD – Australia 2003**

The Resource Centre Building at the University of Queensland Ipswich Campus was designed to function as a united shop front, a place for interaction between students and the Ipswich Community to be associated with printed and digital technologies and support resources. The facility comprised three buildings interconnected by a two story landscape which stitches the variety of spaces together whilst also providing separation between high energy electronic based group activities and quieter reference library study.

The landscape comprises trees and ground covers with a recirculating water rill as the source of humidity required to sustain plantings in air conditioned environments.

The return air vents for this building are located in the library up stand bench ensuring that recirculated air is drawn through and over the planting medium.

This internal landscape is featured in the 2012 Bloom Exhibition in Canberra which acknowledges the important research being carried out at the University of Technology in Sydney, into the capacities of plant/soil to remove harmful substances from indoor air and the important positive contribution that interior landscape plays to the health and well being and productivity to building occupants. (Wilson)

#### Libraries:

#### AHS (Allgemeinbildende Höhere Schule), Bibliothek, Wolkersdorf, (Niederösterreich) – Austria 2003

Bauherr: Bundesimmobiliengesellschaft m.b.H., Wien, Wettbewerb: 04/2000, 1. Preis, Planungsbeginn: 06/2000, Baubeginn: 07/2001  
Fertigstellung: 10/2003, Bebaute Fläche: 3.600 m<sup>2</sup>, Nutzfläche: 7.400 m<sup>2</sup>, Umbauter Raum: 35.000 m<sup>3</sup>, Gesamtkosten: 8 Mio Euro

Der Forderung nach größtmöglicher Wirtschaftlichkeit und optimaler Funktion führte zu einer klaren Gesamtkonzeption der mit 20 Klassen ausgestatteten AHS. Den Mittelpunkt des Schulgeschehens bildet die 3geschossige, glasüberdachte Eingangshalle, um die sich in übersichtlicher Form sämtliche Funktionen der Schule gliedern und die wesentlich zu einer angenehmen Atmosphäre im Haus beiträgt. Von hier aus lassen sich alle Ebenen der Schule überblicken, drei massive, Nord-Süd orientierte Trakte mit Klassen-, Lehrer- und Sonderräumen nehmen die charakteristische, schmale Struktur der örtlichen Bebauung auf. Die Fassadentafeln aus rötlichem Ton harmonisieren mit der umgebenden Natur, die sich in den großen horizontalen Fensterbändern widerspiegeln. Architektonische Akzente setzen die in einem scheinbar schwebenden Glaskörper über dem Eingangsbereich untergebrachte Bibliothek und der fast 8 m hohe Turnsaal, der halb in die Erde eingegraben wurde, und dessen Flachdach als Referenz an die Weinviertler Landschaft begrünt wurde. Der als Sportplatz genutzte Freiraum bleibt so in maximaler Größe erhalten und wird, einem ökologischen Konzept folgend, sanft in die Naturlandschaft integriert. (ArchConsult)

#### RESOWI Zentrum (Fachbibliotheken:Recht, Sozialwissenschaften, Wirtschaft), Karl-Franzens Universität Graz - Austria 1996

Planungsbeginn: 1986, Baubeginn: 02/1994, Fertigstellung: 09/1996, Grundstücksfläche: 21.100 m<sup>2</sup>, Nutzfläche: 38.946 m<sup>2</sup>  
Umbauter Raum: 192.180 m<sup>3</sup>, Gesamtkosten: 80.739.518 Euro

Das RESOWI-Zentrum besteht aus Fakultätseinrichtungen für über 14.000 Studenten mit 32 Instituten, einer Fakultätsbibliothek, 11 Hörsälen und einem EDV-Zentrum. Das Grundstück ist 350 m lang und 50 m breit, ist dreiseitig von Straßen eingebettet, südseitig schließt es an das Universitätsgelände an. Das Gebäude ist allseitig vernetzt und ist zentral von Bewegungsadern durchzogen. Sie nehmen die Hauptverbindungen des Universitätsgeländes und der umliegenden Straßenzüge auf. Das gesamte organisatorische Programm wurde in einem langgestreckten Körper aufgenommen. Dieser Körper ist in einzelne architektonische Elemente gegliedert: Die Universitätsbibliothek wurde gegen Osten in Richtung Neubau Resowi erweitert. Der Zubau ist unterirdisch mit der Fakultätsbibliothek verbunden. In den beiden Untergeschossen liegen die Büchermagazine, in den beiden ersten Geschossen die Leseräume und im 2. und 3. Obergeschoß die Bibliotheksverwaltung. Die Wahl des konstruktiven Grundgerüsts erfolgte in Hinblick auf ökonomische Herstellungskosten und auf kurze Bauzeit. Herkömmlicher Stahlbetonbau in den unteren Geschossen und Stahl-Stahlbetonverbundbau in den zwei Obergeschossen sind die gewählten Bauweisen. Die Vertikalkerne sind in Ortbetonbauweise realisiert. Jeder der 7 Bauteile bildet für sich eine eigene statisch-konstruktive Einheit. Die konstruktiven Teile der UB-Erweiterung bestehen zur Gänze aus Stahlbeton, in herkömmlicher Ortbetonbauweise hergestellt. Generell kamen hinterlüftete Aluminiumfassaden zur Ausführung. #### Neubau einer Bibliothek, Dalian - China in design

Bauherr Stadt Dalian, Architekt Architects Collective, Geladener Wettbewerb 1. Preis, Grundstücksfläche 50.000 m<sup>2</sup>  
Baukosten €50.000.000

Die neue Bibliothek wurde als Zentrum für die örtliche Gemeinde mit einem starken Bezug zur nahegelegenen Bucht und dem offenen Meer entwickelt. Das Gebäude wurde in einen Park eingebettet und stellt eine neue Landmark für Einheimische und Besucher dar. Die Bibliothek dient als Symbol für eine kreative und umweltfreundliche Zukunft Pulians. Sie ist ein öffentlicher Ort zum Lesen, Treffen und zur Besinnung. Die zugrunde liegende architektonische Form stellt eine Rose dar, die gleichzeitig traditionell die Blume der Stadt Dalian ist. Die neue Bibliotheksabteilung Pulian ist eine von mehreren Abteilungen der Region Dalian. Jede Abteilung wird durch ein eigenes Blütenblatt symbolisiert und vereinigt sich in der neuen Bibliothek zu einer Rosenblüte. (Architects)

vienna-based practice architects collective has designed the 'dalian library' for the city of dalian, china. the curving exterior shell is conceptually derived from a rose, the city's flower, blossoming towards the sky revealing a focal garden. with a triangular footprint, the transparent structure creates a strong relationship with the nearby ocean. positioned within a park setting, the center will become a landmark for both residents as well as visitors while serving as a symbol for creativity and environmental harmony to the community. all programmatic areas will provide contemplative atmospheres with visual connections to nature within a central courtyard and the encompassing landscaped grounds which continue a petal motif. the undulating building profile will allow views towards the bay from the upper level reading room. circulation will occur through a grand spiraling stair which wraps the central void while stacks are placed at the outer perimeter.

#### **Oberlandesgericht, Zentralbibliothek, Graz – Austria 1995 - 1998**

Dem Raumgefüge des klassizistischen gründerzeitlichen Justizpalastes - 1995 durch die Belegung aller vorhandenen Flächen vollständig ausgereizt und ohne Möglichkeit für zusätzlichen Raumbedarf - ist durch einige Massnahmen, welche das dreidimensionale Potential des Gebäudes gebrauchten, eine Konzentration der inneren Nutzung und eine Vergrößerung und Klärung des räumlichen Angebots überlagert worden: Im ersten Obergeschoss Konzentration der Bibliothek, die als einziger grosser und öffentlicher Raum im freigelegten umlaufenden Korridorsystem mit einer inneren Fassade dem Benutzer sich zu erkennen gibt. Als Meublage im breiten Gangbereich des Hochparterres eingestellte Desk-sharing-Arbeitsplätze für Rechtspraktikanten, von der Wirkung so konzipiert, dass die Wahrnehmung des gewölbten Flurs nicht gestört ist. Über dem - bis dahin nur seitlich durch den davorliegenden Gang belichteten - Hauptstiegenhaus eine Lichthaube, deren Form aus den Randbedingungen des darüber befindlichen Dachgespärres generiert ist. Infrastrukturmassnahmen wie Sicherheitsschleuse in der Eingangshalle und Beleuchtungskonzept und Brandschutzmassnahmen im gesamten Erschliessungsbereich des Gebäudes. (ARTEC)

#### **Multifunktionales Zentrum Meidling, (Bibliothek), Wien – Austria 2002 – 2004**

see: Mascha & Seethaler, Wien - Austria

Das Objekt im 12. Wiener Gemeindebezirk Meidling wurde in Planungsgemeinschaft (Architektur) mit den Wettbewerbsgewinnern Mascha + Seethaler, Wien, realisiert.

Die Arcade Meidling ist ein innerstädtisches Einkaufs- und Bürozentrum mit ca. 5.600 m<sup>2</sup> Handels- und 6.000 m<sup>2</sup> Bürofläche, einer öffentlichen Bibliothek und Musikschule sowie einer Tiefgarage. Verkehrstechnisch günstig gelegen (U- und S-Bahnanschluss) trägt die markante Architektur zur visuellen und funktionalen Aufwertung des Stadtteils bei. Die markante, dreigeschossige Passage schafft eine fußläufige Verbindung zwischen der Meidlinger Hauptstrasse und der U6-Station Philadelphiabrücke. Damit wird eine städtebauliche Lücke geschlossen und der lang ersehnte Wunsch des Bezirks nach einer Erweiterung der Fußgängerzone ermöglicht. (AT.P)

#### **Fachhochschule Hagenberg (Bibliothek), OÖ . Austria 2002 - 2005**

Zwei Wege – ein Platz: Beginnend im Ort wird ein neuer Weg angelegt, der Ort – Schule – und Wohnheime verbindet. Am Schnittpunkt dieses Weges mit der Ost-West Verbindung entwickelt sich ein städtischer Drehpunkt. Der „Vierkanter“: Der Baukörper folgt augenscheinlich in seiner Grundstruktur dem klassischen Typus des Vierkanters. Die vier Seiten werden von den Labortrakten und einem Büroflügel gebildet. Der gesamte Baukörper ist jedoch leicht angehoben, um von der Mitte den Blick auf die Umgebung freizugeben. Anstelle des geschlossenen Hofes eines Vierkanters entsteht ein städtischer Raum mit vielfältigen Beziehungen zum Umfeld. Der neue öffentliche Platz bildet ein städtebauliches Gravitationszentrum für das Leben im gesamten Campus aus. Vom campus aus wird die FH erschlossen. Im Westen befindet sich die Eingangshalle mit dem Shop und der Bibliothek. Am Durchgang nach Norden, sozusagen im Drehpunkt, befindet sich die große Cafeteria. Trotz der zentralen Lage ist die Cafeteria als selbständiger Körper angeordnet. So kann der Betrieb auch außerhalb der Schulzeiten geführt werden – das Lokal als Treffpunkt wirken. Eine eigene Verbindungstreppe zwischen Café und großem Hörsaal ermöglicht abends Kulturveranstaltungen wie Filme oder Vorträge. Die Räumliche Gliederung der Schule: Entsprechend dem starken Gefälle des Bauplatzes stellt die vertikale Gliederung des Gebäudes ein wesentliches Merkmal des Entwurfes dar. Der Haupteingang am Campus befindet sich „auf halber Höhe“. Laboratorien und Büros sind in zwei kompakten und übersichtlichen Ober-geschossen untergebracht („Vierkanter“). Die Ebene der Hörsäle befindet sich hingegen unter dem Eingangsniveau. Diese Bereiche werden in der Gestaltung deutlich unterschieden. Der schwebende Körper der Labors wirkt mit seinen langen Fensterreihen im weißen Putz betont ruhig und geometrisch klar und leicht. Demgegenüber erscheinen die Körper der Hörsäle mit Ihren Wänden aus eingefärbtem Sichtbeton schwer und monolithisch, so als wären sie aus dem felsigen Boden gewachsen. Die Abstände zwischen den Hörsälen lassen natürliches Licht in das Hörsaalfoyer dringen. Die Erschließung: Eine Hauptstiege mit Lift erschließt von der Eingangshalle aus alle Geschosse. Eine zweite Stiege im Norden führt am Weg vom Labor zur Vorlesung über die Cafeteria. Die Stiege im Süd-Osten dient lediglich als Fluchtweg. Das Parkdeck: Die Parkplatzebene ist in dieses Gefüge exakt eingepasst. Um die thermischen Eigenschaften des Gebäudes nicht zu belasten, wurde darauf geachtet, die unbeheizten Bereiche direkt übereinander zu stapeln. So liegt unter dem Parkdeck der unbeheizte Technikbereich und darüber der Campus (Außenluft). Text: Architekten. Für den Beitrag verantwortlich: [architekturforum oberoesterreich](http://www.architekturforum-oberoesterreich.at), 10.01.2006 ( <http://www.nextroom.at> )

#### **British Council Austria, Bibliothek, Wien – Austria 2003 - 2004**

Das in den Räumlichkeiten einer ehemaligen Bankfiliale neu eingerichtete British Council Austria lässt schon von der Straße aus tief blicken und gewährt den Passanten freie Sicht in den offen zonierten Raum bis hin zum Garten. Auch die farbkompositorische „Wärme“ (der Braunton von Boden und Wand und die pastelligen Deckenfarben, die zugleich funktionale Raumzonen definieren, sind fein aufeinander abgestimmt) trägt dazu bei, dass im vielgestaltigen Spektrum städtischer Erdgeschosszonen dieses Lokal besondere Sogwirkung besitzt. Und tatsächlich hat das Glasportal einer trichterförmigen Mündung, die mitten ins Geschehen des Info Centres führt: Hier – in der sogenannten Virtual Zone – können an sechs Internet Terminals einfach und ohne zwingenden Kontakt mit dem Personal Informationen der „Visit Britain Information“ abgerufen werden. Die Rezeption bildet die Schnittstelle zum nächsten Bereich, der multifunktionalen Lifestyle Zone, dem räumlichen wie funktionalen Mittelpunkt des gesamten Zentrums. Hier weitet sich bei offenem Wandsegment der Raum zu doppelter Breite, Deckenfarbe und Beleuchtungskonzept wechseln (vom Punktlicht zu „Lichtinseln“), Bibliothek und Sitzgelegenheiten laden zu längerem Verweilen ein, und dank des abtrennbaren / zuschaltbaren Bereichs sind unterschiedlichste Veranstaltungsformate und -größen leicht umsetzbar. Der Studienbereich am Ende des Raums öffnet sich als Ort der Konzentration zum „Englischen Garten“, steht aber auch zu den Teamoffices in gewünschtem visuellen Bezug. Die feine Klinge der Gestaltung: In der Subtilität des Wechsels von Farben, Materialien und Lichtregie lassen sich

sowohl das Raumprogramm als auch dessen „Auflösung“ in ein zwar zoniertes, aber nutzungsaffines Ganzes unmittelbar kommunizieren. (Text: Gabriele Kaiser) (<http://www.nextroom.at>)

#### **Fachhochschule (Bibliothek) Bad Gleichenberg, Steiermark – Austria 2002**

Das Fachhochschulgebäude liegt direkt am Kurpark, in unmittelbarer Nähe des Bahnhofes und unweit der Bad Gleichenberger Therme. Es bietet mit seinen 4.500m<sup>2</sup> Nettouutzfläche Platz für 400 Studierende und verteilt die für ein Hochschulgebäude benötigten Räume wie Hörsäle, Unterrichtsräume, Bibliothek, Büros und ein Auditorium Maximum auf drei Geschosse. Der Baukörper soll als Filter zwischen dem Wald am Hügel und dem Kurpark am Fuße des Hügels im Grünraum schweben. Die gesamte Erdgeschosszone ist zum Park hin verglast und lässt die Parklandschaft in das Gebäude einfließen. Die Transparenz in horizontaler Richtung wird in den Obergeschossen in eine vertikale transformiert: Durch ein durchgehendes Oberlicht mit nordseitiger Belichtung fällt das Tageslicht über Öffnungen für Verbindungsstiegen und einen langen Deckenschlitz im Vorbereich der Bibliothek bis ins 1. Obergeschoss und im Foyer bis ins Erdgeschoss. Der gesamte Baukörper profitiert durch seine Lage im Grünen. Alle Unterrichtsräume nutzen den Ausblick in den Wald, während für die Büros der Lehrkräfte und der Verwaltung Durchblicke in den Kurpark im Süden geschaffen sind. Großzügige Lufträume schaffen einen Raumfluss vom Foyer im EG bis zur Vorzone der Bibliothek im 2. Obergeschoss. Die Fassaden sind je nach Orientierung und innerer Funktion verschieden geschichtet. Eine Glasfassade im Erdgeschoss wechselt mit bandartigen Fensterelementen und Stahlblechpaneelen in den Obergeschossen ab. Die Hörsäle und das zentral eingebettete Audimax heben sich durch die rote Putzfassade vom langgestreckten Baukörper ab. (Nach einem Text des Architekten) (<http://www.nextroom.at>)

#### **Science Park, Johannes Kepler Universität Linz, Bibliothek, Linz – Austria 2012/2013**

Der Science Park der Johannes Kepler Universität Linz wird bis zu seiner Fertigstellung aus 5 einzelnen Gebäuden bestehen. Sämtliche Teilgebäude wurden so konzipiert, dass sie, im Grundriss wie im Schnitt, durch Höhenversprünge und Knick auf Nachbarn und Umgebung im höchsten Maße eingehen. dadurch entging man zum einen einer starren Gebäudestruktur und schaffte, durch die Versenkung im Hang und dem unter Straßenniveau liegenden Eingangsbereich, eine ebenerdige Anbindung zum bestehenden Uni Areal. Der erste Bauabschnitt, die im Oktober 2009 eröffnete Mechatronik, lässt bereits erkennen, wie die Landschaft zwischen, über und durch das Bauwerk hindurchfließt mit seinen, teilweise schwebenden Bürotrakten, sich in das Areal verzahnt und letztendlich mit dem Gebäude zu einem neu interpretierten Campus verschmelzt. Die großzügigen verglasten Innenatrien verbinden die Geschosse miteinander, lassen Licht bis in die unteren Ebenen fallen und verlangen somit gleichsam nach einem neuen Science-Arbeitsklima der Kommunikation. Wegen der immensen Spannweite und der daraus resultierenden Durchbiegungen ist das Tragwerk als Brückenkonstruktion konzipiert. zwei massive Kerne tragen ein Stahl-Hängewerk von annähernd 160 m Länge. diesem statischen System ordnet sich auch die Gestaltung der Fassade unter. Nicht zufällig sind die Parapete angeordnet, sondern genau an den Punkten der größten Durchbiegung in ihrer stärksten Dimension platziert. dadurch entsteht eine diversifizierende Wirkung nach außen und mehr Individualität im Inneren. ein Spiel, das durch Lamellen verschiedener Tefen und Abstände verstärkt wird. (Caramel)

#### **Science Park Bauteil 2, 3 & Juridicum**

Mit dem Neubau Projekt "Science Park Linz" ging im Mai 2007 eines der herausragendsten universitären Zukunftsprojekte Österreichs in Bau. Auf Grundlage eines mit der Johannes Kepler Universität und den Behörden der Stadt Linz abgestimmten Masterplanes wurde im April 2005 ein städtebaulicher Wettbewerb ausgeschrieben, der von Caramel Architekten aus Wien gewonnen wurde. Der erste Bauteil, das Mechatronik-Gebäude, wurde bereits im Oktober 2009 eröffnet. Das 143 Meter lange Gebäude beherbergt die Mechatronikinstitute sowie zahlreiche Labors und Seminarräume. Der zweite Bauteil mit Gesamtinvestitionen von 26 Millionen Euro wird planmäßig im Sommer 2011 fertiggestellt. Schon im Juli 2009 erfolgte der offizielle Spatenstich für Bauteil 2 und 3 sowie die Erweiterung des Juridicums. Das bedeutet mehr Platz für Forschung und Lehre und die Errichtung der modernsten juristischen Bibliothek Österreichs. Die Bauarbeiten für Bauteil 2 des Science Parks sollen planmäßig im Sommer 2011 abgeschlossen sein. Untergebracht werden hier u.a. die Kunststofftechnikinstitute, das RADON-Institut der Österreichischen Akademie der Wissenschaften, das K1 Zentrum Wood, die Industrie- mathematik und die Recendt GmbH (vormals Abteilung Sensorik der Upper Austrian Research GmbH – UAR). Mit dem Ausbau des Juridicums entsteht die modernste Rechtsbibliothek Österreichs. Durch die Erweiterung werden überdies die meisten Institute der Rechtswissenschaftlichen Fakultät in einem Gebäude untergebracht sein und zusätzlich Räumlichkeiten für neue Lehr- und Forschungsschwerpunkte der Rechtswissenschaftlichen Fakultät zur Verfügung gestellt. In Bauteil 3 werden die Institute der Informatik, Wirtschaftsinformatik, Mathematik und Statistik auf rund 16.000 Quadratmetern Nettogrundfläche Platz finden. Ausführungszeitraum: Bauteil 1 2009, Bauteil 2: Baubeginn: 3. Quartal 2009 Fertigstellung: 3. Quartal 2011, Bauteil 3 Baubeginn: 2. Quartal 2010 Fertigstellung: 2. Quartal 2012, Juridicum Baubeginn : 3. Quartal 2009 Fertigstellung: 4. Quartal 2010 (<http://www.big.at>)

#### **ZMF Zentrum für Medizinische Grundlagenforschung, Bibliothek, LKH, Graz – Graz 2004**

Landeskrankenhaus Universitätsklinikum Graz

Cooperation with Arch. DI Ernst M. Kopper, Wien

Bauherr: AG Steiermärkische Krankenanstalten GmbH, BGF: 11.330 m<sup>2</sup>, HK € 26.400.000

Das Medizinische Forschungszentrum beinhaltet sowohl Funktionsbereiche der medizinischen Forschung als auch Bereiche des medizinischen Lehr-, Lern- und Informationsbetriebes. Die wesentliche Idee des Entwurfskonzeptes ist die Splittung von Lehre und Forschung, nicht im Sinne einer nicht wünschenswerten Trennung, sondern im Hinblick auf einen hochtechnischen Forschungsapparat einerseits und den medizinischen Lehr-, Lern- und Informationsbetrieb andererseits. Die nach außen ablesbare Funktionstrennung manifestiert sich in den beiden langgestreckten Baukörpern, die im Erdgeschoss durch eine dachverglaste Bibliotheksstraße miteinander verbunden sind. Das zweigeschossige Bibliotheks- und Lernzentrum gliedert sich im Erdgeschoss in drei Funktionsbereiche: studentische Einrichtungen (ÖH), Bibliotheksbereich mit Basisliteratur, sowie Lese- und Lernbereich und eine audiovisuelle Einheit. Im Obergeschoss Bereiche für Multimedia und das Bücherdepot. Das Laborgebäude ist zweihüftig konzipiert. Eine Raumschicht mit vorwiegend Laborräumen, diesem gegenüberliegend sind die Nebenräume, Aufenthaltsräume, Ver-/Entsorgung und Diensträume situiert. Funktionell ist es in 6 Arbeitseinheiten unterteilt; diese reichen von Speziallabors für Biomedizin, Zell- und Molekularbiologie bis zu Nuklearmedizin und Radiochemie. Zusätzlich sind eigene Raumeinheiten für Werkstätten, Spezialgeräte und Tierlabors vorhanden. (Croce)

#### **BG/BRG Lichtenfelsgasse, Bibliothek, Graz – Austria 1991**

Bundesgymnasium Bundesrealgymnasium

Bauherr: Zubau und Sanierung AG, Land Steiermark RA 14, HK € 1.640.000

Die Aufgabenstellung war, einen ehemals nach einer Seite ganz offenen Innenhof (durch einen späteren Zubau aus den sechziger Jahren teilweise geschlossen) zweigeschossig zu überbauen und einen bereits stark veränderten Bestand (Ende 19. Jahrhundert) im Erdgeschoss und im Untergeschoss auf diese neue Funktion hin zu adaptieren. Das Raumprogramm für den Neubau sah folgendes vor: Eine Zentralgarderobe im Untergeschoss der Hofüberbauung (Hofterrain) und im Erdgeschoss derselben (Niveau Lichtenfelsgasse) eine Pausenhalle – sowie als Zentrum der Schule eine Bibliothek und ein Buffet. Dazu wurde der ehemalige Haupteingang an der Lichtenfelsgasse wieder aktiviert. Dieser führt nun in die Zentralgarderobe auf Hofterrain und von dort über die bestehenden Treppenhäuser in die Obergeschosse. Während die alten Mauern des Bestandes wieder in ihrer Originalität sichtbar wurden, wurden die neuen Eingriffe mit unterschiedlichen Materialien zum Ausdruck gebracht. Die Anlage lebt vom gegenseitigen Dualismus zwischen Alt und Neu, wobei beide autonom bleiben. (Croce)

#### **University of Applied Sciences – FH Campus (Bibliothek), Wien – Austria 2009**

Bauherr: FH Campus Wien, Planungs-, Finanzierungs- und ErrichtungsGmbH, Competition 2005 1st Prize, Completion 2009, GSA 36.000 m<sup>2</sup>, MFA 20.000 m<sup>2</sup>

Ein sanft nach Süden abfallender Hang als Teil eines übergeordneten Grüngürtels und zwei Hauptverkehrsachsen prägen das Grundstück zwischen weitem Landschaftsraum und inhomogenem Straßenraum. Der Entwurf von DMAA reagiert darauf mit einer eigenständigen Form des Objekts, in die beide Raumkomponenten einfließen. Einerseits artikuliert der horizontal gegliederte Baukörper die Präsenz im Straßenraum und andererseits umfassen die Baukörper zwei hofartige Räume, ehe sich diese zu den Freiflächen hin öffnen. Der Baukörper ruht auf einem teils zweigeschößigen Sockelgebäude, in dessen Inneren sich die Prinzipien der Geländeform des Landschaftsraumes fortsetzen. Seine variierende Grundrissgestaltung und gestalterische Maßnahmen im Außenraum gliedern den weiten Raum und durchziehen diesen mit öffentlichen Aufenthaltsbereichen, ohne die Großzügigkeit der Landschaft und die Weite des Ausblicks zu beeinträchtigen. Im Sockel befinden sich die übergeordneten gemeinsamen Nutzungen wie Aula, Bibliothek, Festsaal und Hörsäle. Eine weitläufige Erschließungszone durchquert auf unterschiedlichen Ebenen das Gebäude und führt zu den Räumen in den beiden darüber liegenden linearen Gebäudeschenkeln. Deckenschlitze versorgen diesen internen Weg mit Tageslicht, die tiefer liegenden Ebenen sind über Lufträume mit den darüber liegenden Ebenen visuell verbunden. Brücken, Sitzstufen, Lufträume und unterschiedliche Raumdimensionen schaffen hier einen abwechslungsreichen Erschließungs- und Kommunikationsraum. Die großen, naturbelichteten Hörsaalbereiche sind zur besseren Orientierung und Übersichtlichkeit über die Außenseite des Baukörpers erreichbar. Beide Riegel in den Obergeschossen verfügen jeweils über einen Mittelgang, dessen unterschiedliche Gangbreiten stellenweise bis zur Fassade reichen, um natürliche Belichtung und Außenraumbezüge bis in den Kernbereich der Baukörper zu ziehen. Die Verwaltung der einzelnen Lehrgänge ist auf die Geschoße verteilt und befindet sich jeweils in direkter Nähe zu den Vertikalerschließungen. Auf diesen Geschoßen befinden sich auch die Seminarräume. (<http://www.oegfa.at>)

Mit einem Neubau am „Alten Landgut“ im 10. Wiener Gemeindebezirk wurde kürzlich der neue Stammsitz der FH Campus Wien fertig gestellt. Das Gebäude wird am 25. November 2009 offiziell eingeweiht. Der Entwurf für den Fachhochschulbau stammt von dem Wiener Büro Delugan Meissl Associated Architects und ist aus einem Wettbewerb hervorgegangen. Der Neubau hat eine Bruttogeschossfläche von 36.000 Quadratmetern, er beherbergt 3.000 Studenten und 220 Lehrende und hat 45 Millionen Euro gekostet. Die Architekten erläutern den Entwurf: „Teils gegensätzliche äußere Faktoren greifen an der Lage des Bauplatzes ineinander: Zwischen einem weitläufigen, sanft nach Süden abfallenden Hang als Teil eines übergeordneten Grüngürtels und zwei stark befahrenen Verkehrsachsen (Südost-Tangente und äußere Favoritenstraße) oszilliert der Charakter des Grundstücks zwischen weitem Landschaftsraum und inhomogenem Straßenraum. An der Schnittstelle zwischen charakteristischen innerstädtischen Blockrandstrukturen und aufgelockerter Bebauung der Peripherie bestimmen architektonische wie topografische Komponenten die Leitidee des Entwurfs: Ein eigenständiger, horizontal gegliederter Baukörper, jedoch kein Solitär, dessen Einbettung und architektonische Gestaltung vorhandene Gegebenheiten aufnimmt und im Sinne seiner Bestimmung neu formuliert. Die Höhenentwicklung beginnt am Verteilerkreis moderat, um nach Süden hin einen markanten Abschluss zu finden. Der Neubau der

FH Campus Wien bildet ein Identität stiftendes Merkmal des Stadtquartiers im Süden Wiens. Zwei hofartige, west- bzw. ostseitig orientierte Freiräume werden von der Baustruktur des Hochschulgebäudes umfasst, ehe sich die beiden geknickten Gebäudeschenkel den großen, flankierenden Freiflächen hin öffnen. Diese markanten Gebäudetrakte ruhen auf einem teils zweigeschossigen Sockelgebäude, dessen funktionale und gestalterische Konzipierung in Grundriss und Schnitt vom sanft modellierten, umgebenden Außenraum begleitet wird. Übergeordnete Nutzungen wie Empfang, Aula, Bibliothek, Festsaal, Mensa und Cafeteria reihen sich in schlüssiger Abfolge entlang der variierenden Höhenschichtung dieses Zentralbereichs. Wegeführung und Nutzungsbestimmung bilden in ihrer Komposition ein leichtes Raumvolumen, durchzogen von visuellen wie atmosphärischen Beziehungen. In gestalterischer Entsprechung wechseln Brücken, Sitzstufen, zugewiesene Funktionsbereiche und Lufträume einander ab und ergeben in ihrer Komposition eine innerräumliche Struktur.“ (<http://www.baunetz.de>)

Mit Februar 2008 startet die FH Campus Wien den Bau ihres neuen Stammhauses auf dem Alten Landgut in Wien Favoriten. STRABAG, PORR und Siemens Österreich zeichnen für die Bauausführung verantwortlich. Das Studienjahr 2009/10 werden dann alle Studiengänge bis auf jene der Applied Life Sciences im neuen Haus beginnen. Bis dahin bildet die FH Campus Wien insgesamt mehr als 3.000 Studierende aus. Mehr als 50 Bachelor- und Master-Studiengänge werden zukünftig an der FH Campus Wien geführt. Die Anbindung des neuen FH-Gebäudes an die UI erfolgt bis 2015. Auf einer 13.600 m<sup>2</sup> Freifläche am "Alten Landgut" beim Verteilerkreis im 10. Wiener Gemeindebezirk entsteht mit einer Bruttogeschossfläche von insgesamt 36.000 m<sup>2</sup> der Neubau der FH Campus Wien und damit das modernste und größte Fachhochschul-Gebäude in Österreich. Von DELUGAN MEISSL geplant, von STRABAG, PORR und Siemens Österreich ausgeführt, besteht das Gebäude aus 6 Etagen mit rund 30 Hörsälen, 35 Seminarräumen, 90 Funktionsräumen wie etwa Labor- und EDV-Räume und Cafeteria, Mensa, Bibliothek/Mediathek, Festsaal sowie rund 150 Räumen für Forschung & Entwicklung und Administration.

Anspruchsvolle Architektur mit Impulswirkung für die Stadtentwicklung

"Das Gebäude reagiert auf die besondere Topografie des Ortes, wobei sich in der Dynamik der Form die FH Campus Wien widerspiegelt", streicht DI Dietmar Feistel, DELUGAN MEISSL ASSOCIATED ARCHITECTS, hervor. Die Gebäudeform wirkt wie die symbolische Verschmelzung zweier Gebäude in C-Form; die schwungvolle C-Form steht als Symbol für die FH Campus Wien. "Der Bau eines Fachhochschulzentrums gibt dem Bezirk bzw. dem Süden Wiens insgesamt wichtige Impulse. Die FH Campus Wien bietet wienweit als einzige Fachhochschule die Ausbildung für die medizinisch-technischen Dienste und Hebammen sowie die Soziale Arbeit als FH-Studium und ebenso als einzige in Wien die FH-Studiengänge der Biotechnologie und der Bautechnik an. Sie ist insgesamt einer der größten AnbieterInnen technischer Studiengänge in Österreich", führt Willy Behensky, Geschäftsführer der FH Campus Wien, die bildungspolitische Bedeutung des FH-Projekts aus.

Kompetenz in der Errichtung modernster Bildungsstätten

"Bei einem solchen Projekt ist die Zusammenarbeit mit kompetenten und erfahrenen PartnerInnen essentiell", so Behensky weiter. STRABAG, PORR und Siemens Österreich haben bereits bei Hochschul-Projekten wie dem Bau der Fachhochschule St. Pölten und STRABAG gemeinsam mit PORR auch beim Ausbau der Universität für Bodenkultur in Wien ihre Kompetenz in der Errichtung modernster Bildungsstätten unter Beweis gestellt. "Seit nunmehr fast 140 Jahren baut PORR Bauwerke für Forschung und Lehre. Jüngstes Beispiel, auf das wir sehr stolz sind, ist nun der Beginn der Bauarbeiten für das neue Stammhaus der FH Campus Wien, betont Wolfgang Hesoun, Vorstandsvorsitzender der PORR AG. Strabag-Vorstand Ing. Theodor Klais fügt hinzu: "Am Bau der FH Campus Wien eine wesentliche Rolle einzunehmen und durch Mitgestaltung einer modernen Lernumgebung den Grundstein für eine solide Ausbildung unserer Studierenden zu legen, bedeutet, für die Zukunft zu bauen. Unter diesem Aspekt ein Projekt zu realisieren ist für uns eine besondere Freude und Ansporn." Auch Brigitte Ederer, Vorsitzende des Vorstandes der Siemens AG Österreich ist überzeugt: "Eine fundierte und praxisnahe Ausbildung ist das A und O der heutigen Zeit. Darum freut es mich, dass unser Unternehmen auch am Bau dieser modernen Fachhochschule beteiligt ist."

Funktionalität und Nachhaltigkeit für den modernen Lehrbetrieb

Die optimale Funktionalität und technische Ausstattung der Räume für Lehre und Forschung, insbesondere auch der Labors und anderer Funktionsräume sind wesentliche Voraussetzungen für den modernen und praxisierten Lehrbetrieb. Neben diesen wird besonderer Wert auf den Einsatz hochwertiger, ökologischer Materialien und die energetische Optimierung des Gebäudes gelegt. Dazu gehört etwa eine umweltaugliche Kühlung über Betonkernaktivierung. Diese ermöglicht es, die nächtliche Kälte von außen aufzunehmen, zu speichern und damit die Räume tagsüber über die Decke zu kühlen; bei Bedarf wird die Kühlung maschinell unterstützt. Insgesamt stehen die anspruchsvollen Lösungen dieses Projekts in einem ausgewogenen Verhältnis zum notwendigen Kostenbewusstsein. Daten: Grundstücksfläche: 13.600 m<sup>2</sup>, Bebaute Fläche: 8.800 m<sup>2</sup>, Bruttogeschossfläche: 36.000 m<sup>2</sup>

#### **Fachhochschule Salzburg, Campus Kuchl, Bibliothek, Kuchl – Austria 2008 - 2009**

Erweiterung des Fachhochschulgebäudes in Passivhausstandard. Bauherr: Weco FH Holztechnikum Zentrum GmbH, Salzburg

Der Campus Kuchl liegt etwa einen Kilometer nordöstlich vom Zentrum Kuchl inmitten landwirtschaftlich genutzter Flächen. Der Campus umfasst zwei Baukörper, die L-förmig zu einander stehen. Das ost-westorientierte Bestandsgebäude aus dem Jahr 1995 ist ein Massivbau in zweihüftiger Bauweise. Der mittige Erschließungsgang mündet im Osten in die neue Passerelle, die als gläserner Gebäudeeinschnitt die Verbindung zum querstehenden Neubau herstellt. Dem Weitblick des Nutzers und der Salzburger Landesregierung ist es zu verdanken, das dieses Gebäude als erster universitärer Bau in Passivhausstandard ausgeführt werden konnte. Über das erdgeschoßige Foyer erreicht man den beidseitig belichteten Saal, der 200 Personen Platz bietet. In den Obergeschossen erschließt ein breiter raumhoch verlasteter Gang die Seminarräume und die Bibliothek. Ein feststehender außen liegender Sonnenschutz aus Weißtannenlamellen reduziert das einfallende Abendlicht und gibt einen gefilterten Blick auf den Vorplatz. Die drei oberirdischen Geschosse des Passivhauses schweben scheinbar über dem Gelände. Sie wurden in einem rahmenförmigen Baukörper zusammengefasst, der die Seminarräume Richtung Süden verschattet und nach Osten und Westen den Blick auf die umliegenden Berge freigibt. Das Gebäude deklariert sich innen wie außen klar als Holzbau. Die tragende Holzkonstruktion ist, wenn notwendig, mit geöltem Birkenperrholz verkleidet. Die Fassaden bekleidet ein offener Rhombenschirm aus unbehandeltem Weißtanne. (Dietrich)

#### **Bundesgymnasium Schoren, Bibliothek, Dornbirn – Austria 2000 - 2003**

Die Schulanlage aus den frühen 1970er-Jahren befindet sich in der Nachbarschaft des Dornbirner ORF-Gebäudes und grenzt mit der Rückseite an die Dornbirner Ach. Ihre dringend erforderliche Erneuerung in thermischer und haustechnischer Hinsicht wurde

begleitet von einer sorgfältigen Überformung und Präzisierung des architektonischen Ausdrucks. Notwendige Zubauten und Ergänzungen erfolgten in angemessener Weise als qualifizierte Fortschreibungen des Grundkonzepts unter Wahrung des Gesamtbildes. Der Hauptzugang von der Straße her erfolgt nicht ohne Pathos durch einen ansteigenden, schmalen, langen Ehrenhof, dessen Ausdruck gesteigert wird von drei Stufensequenzen, die ihn zugleich in distanzierende Abschnitte unterteilen. Gegenüber dieser Schwere wirkt die Leichtigkeit des transparent verglasten neuen Mehrzwecksaals, der linkerhand vorstößt, befreiend. Nicht zuletzt ist es das schlank gestützte Vordach der loggienartigen Stirnseite, die als gedeckter Außenraum über hohe Aufenthaltsqualitäten verfügt und den strengen Charakter des Zugangs entspannt. Das ursprüngliche Konzept ordnete die Nutzungsgruppen windradartig um eine zentrale, mehrgeschossige Treppenhalle, in der sich zwei gegenläufige Züge über ein Zwischenpodest tangieren, sodass eine attraktive architektonische Figur entsteht, die ein Begegnen in der Bewegung provoziert. Diese Qualität wurde erkannt und bewahrt. Der gesamte übrige Innenausbau der Standard- und Sonderklassen, der Bibliothek, der Mensa, der beiden Turnhallen und der Verwaltung wurde nach aktuellen Erfordernissen und mit gesteigertem gestalterischem Anspruch erneuert. Dabei verwendeten die Architekten eine kühl-rationale Formensprache, die auf ein gediegenes Ambiente als Hintergrund für die bunten Schülerscharen setzt. Und es gelingt den Architekten, den spröden Ausdruck der sorglosen Zeit vor der Ölkrise von 1973 nicht einfach zu verdrängen, sondern ihn in seinen technischen und formalen Mängeln zu korrigieren. Noch deutlicher kommt dies bei der Erneuerung der Fassaden zur Geltung, die heutigen Ansprüchen gemäß wärme gedämmt wurden. Die Öffnungen wurden entsprechend den dahinterliegenden Nutzungen differenziert. Der Putzcharakter und die horizontale Gliederung in Schichten mit tiefer liegenden Lüftungsflügeln sowie ausgewogene Proportionen von Fenstern, Rahmen und Gläsern verleihen der gesamten Anlage mit klassisch-modernen Gestaltungsmitteln einen noblen Charakter. (Dietrich)

#### **Hauptschule Wien-Essling, Bibliothek, Wien – Austria 1996**

Bauherr Magistrat der Stadt Wien Baubeginn 1994, Fertigstellung 1996, Nutzfläche 5263 m<sup>2</sup>

Ein Direktauftrag der Stadt Wien führt zur Planung einer Hauptschule im Stadtentwicklungsgebiet Essling. Im Bereich Simonsgasse/ Rosenbergstraße schließt an das zu bebauende freie Feld überwiegend heterogene Wohnbebauung aus Einfamilienhäusern an. Das Entwurfskonzept sieht eine Struktur vor, die eine in sich schlüssige und prägende Umraumwirkung ausstrahlt. Die Hauptachse des Projektes erstreckt sich von Norden nach Süden. Im Bereich dieser Achse befindet sich der "Balken" mit angehängtem Turnbereich, Bibliothek und zentraler Arena mit Speisesaal und Mehrzweckraum. Aus dieser Hauptachse entwickelt sich nach Norden (Haupttrichtung der Stadterweiterung) eine stark ausgeprägte Schwingung, in der sich die Klassentrakte befinden - zweigeschossig und leicht übereinander verschoben. Der erdgeschossige Klassentrakt ist einhüftig erschlossen und verfügt somit über natürlich belichtete Gangflächen. Der zweihüftige Klassentrakt des Obergeschosses erhält die natürliche Belichtung durch Glasdächer. Die barrierefreie Erschließungsorganisation ermöglicht auch außerschulische Nutzungen (z.B. im Turnsaal). (Domenig)

#### **RESOWI Zentrum, Graz – Austria 1996**

In Zusammenarbeit mit ArchConsult – Hermann Eisenköck

Der Neubau der Rechts- Sozial- und Wirtschaftswissenschaftlichen Fakultät der Karl Franzens Universität Graz beinhaltet 33 Institute, eine Fakultätsbibliothek, eine Aula, Hörsäle und ein EDV-Zentrum. Das Gebäude ist langgestreckt und weist eine Länge von 300m auf. Mit der Konstruktion eines Schwebebalkens, der das untere Geschoß trägt, entstanden Freiräume, in die zusätzliche räumliche Elemente eingeschoben werden konnten. Sie sind optisch erkennbar und ragen als skulpturale Baukörper aus dem Gebäude heraus. Materialien: Sichtbeton, Kunststeinfassaden für die auskragenden Baukörper, Stahl, Betonstein, Glas, Aluminiumlamellen als Sonnenschutz. Gegenüber dem Neubau befindet sich der Zubau zur Zentralbibliothek, der über einem verglasten Teil durch drei vertikale vorspringende Fassadenelemente definiert wird. (<http://www.nextroom.de>) sse:

### **Libraries:**

#### **Universitätsbibliothek Innsbruck – Austria 2009**

Nach Abschluss des Wettbewerbs, den das Architekturbüro Eck & Reiter zt und Rossmann für sich entscheiden konnte, steht die Errichtung einer neuen Fakultätsbibliothek mit einer Fläche von rund 5000 Quadratmetern für die Leopold-Franzens Universität (LFU) Innsbruck kurz vor dem Start. Geplanter Baubeginn ist Anfang 2007. Das Investitionsvolumen beläuft sich auf rund 33 Mio. Euro. Bauherr und Eigentümer ist die Bundesimmobiliengesellschaft (BIG). „Die Bundesimmobiliengesellschaft setzt im Universitätsbereich in den kommenden fünf Jahren Projekte mit einem Investitionsvolumen von rund 620 Millionen um. Damit steigt das jährliche Bauvolumen der BIG um rund ein Viertel. Die ‚UBI neu‘ ist eines der ersten großen Vorhaben der Uni-Bauoffensive, die umgesetzt werden“, so Christoph Stadlhuber, Geschäftsführer der BIG. Die neu gestalteten Flächen, insgesamt 25.000 Quadratmeter, sollen neben der architektonischen Aufwertung auch eine Restrukturierung der Organisationsform unterstützen. Das Gesamtprojekt umfasst die Errichtung einer an die Hauptbibliothek angebotenen Fakultätsbibliothek, die Neugestaltung von Seminarräumen, die Umgestaltung der Eingangssituation und die Restrukturierung der Bestandsobjekte Innrain 50 d-f. „Vor allem aber bedeutet die Zusammenlegung der beiden Bibliotheken in den Bereichen Service und Verwaltung ein deutlich verbessertes Angebot bei gleichzeitig optimiertem Personaleinsatz“, so Manfred Gantner, Rektor der LFU. Während die Neubaufächen hauptsächlich den Bibliotheksbesuchern dienen, ist die „Hauptbibliothek“ in erster Linie als Verwaltungszentrum geplant. Die Wettbewerbsjury begründete ihre Entscheidung für das Projekt der Architekten Eck & Reiter zt und Rossmann vor allem mit dem hohen Kommunikationspotenzial: „...Der Entwurf, so einfach er sich darstellt, befreit die Bibliothek aus vielen Zwängen... und schafft die notwendige Identität für eine so wichtige Einrichtung einer Universität wie sie eine Bibliothek darstellt...“ Aufgrund der neuen Flächen bedarf nun auch das vormalig als Bibliothek genutzte Restrukturierung. Die verschiedenen Institute sollen teilweise verschoben oder neu zusammengeführt und organisiert werden. (<http://www.big.at>)

**Fachhochschule Klagenfurt (Bibliothek) – Austria 2001 – 2003**

Cooperation with: Kurt Falle und Toralf Fercher

Der Bau der neuen Fach-Hochschule befindet sich im Süden von Klagenfurt, an der Peripherie der Stadt. In unmittelbarer Nähe dazu befinden sich auch die „Workstation“ von Ortner & Ortner und ein Bürogebäude von Volker Giencke. Dieser Baukörper ist der Erste eines Gesamtentwurfs, der im Laufe der nächsten fünf bis zehn Jahre erweitert werden soll. Der Gesamtentwurf sieht vier parallele Gebäude vor, mit unterschiedlichen, individuell gestalteten Innenhöfen. Auf Grund der unzureichenden Tragfähigkeit des Bodens wurde eine Pfahlgründung ohne Unterkellerung ausgeführt. Die Auskragung der Obergeschosse folgt der Unterkante des Hörsaals. Entlang dieser Neigung verläuft auch die einhüftige Erschließung, parallel zur Glasfassade über alle drei Ebenen. Sie schafft den direkten Bezug zwischen Innen und Aussen. Die Glasfläche sorgt für optimale Lichtverhältnisse im Inneren und bildet Aussen den Kontrast zur orangen Putzfassade. Die Innenräume sind stützenfrei ausgeführt, damit bei Änderungen an den Raumbedarf eine flexible Raumaufteilung möglich ist. **Pädagogische Akademie Salzburg, Umbau zu einer Bibliothek – Austria 2002**

Umbau der Schwimmhalle einer bestehenden Schule als Bibliothek und Informatikzentrum. Der Altbestand wird kaum verändert. Bauliche Eingriffe in die Tragstruktur und die Fassaden sind auf die Anbindungspunkte beschränkt. Die neuen Funktionen werden als offenes Raumgefüge auf vier Ebenen konzipiert. Zweigeschossige, begehbare Bücherwände wachsen aus dem unverändert belassenen Schwimmbecken heraus, verbunden mit dem Tiefspeicher im Keller. Über den Buchregalen ist durch eine Stahlkonstruktion ein Plateau für die Informatik eingefügt. Diese Ebene kommuniziert über eine Galerie mit in die Brüstung integrierten Lesepulten mit dem Gesamtraum. (Text: Otto Kapfinger, 25.04.2003)

**Campus Krems (Bibliothek), Krems, OÖ – Austria 2005**

#### **Der Campus**

Die drei Bestandteile des Ensembles Donauuniversität (DUK), Fachhochschule (IMC) und Zentrum für Film bilden einen zusammenhängenden Campus. Die architektonische und visuelle Übereinstimmung der Einzelbereiche dient der Campusede. Die neue Haupterschließungsachse Ost West mit einer Breite von 4m bildet das Rückgrat, an welchem die allgemeinen Bereiche wie Audimax, Mensa und Bibliothek angeordnet sind. Sie verbindet die DUK mit dem IMC und dem studentischen Wohngebiet sowie der fussläufigen Verbindung entlang des Alaunbachs. Das Audimax am westlichen Ende der Achse markiert den Zugang zum Campus von der Dr. Karl Dorrek Strasse. Er findet sein Gegenüber im bestehenden Kesselhaus, das als Kino ebenfalls der Öffentlichkeit zugänglich ist. Hier erweitert sich der Raum zu einem zentralen Platz. Das Hauptgebäude bleibt als solches klar erkennbar. Die Erweiterungsbauten der DUK folgen dem grundsätzlichen Prinzip von drei Ost-West ausgerichteten Bauteilen. Diese Bauteile nehmen die Gebäudeflucht des Bestands auf. Stege verbinden den Bestand und den Neubau im 1. OG. Es entsteht eine in Nord-Süd Richtung offene Struktur mit vielfältigen Ausblicken auf die Weinhänge. Die topografische Situation erlaubt die Errichtung einer zweiten Bezugsebene. Der Übergang dieses Niveaus zum bestehenden Gelände ist kontinuierlich. Diese Ebene ist als Freiraum mit begehbarem Holzbelag gestaltet, der den Instituts- und Gemeinschaftsbereichen (Bibliothek, Mensa) zugeordnet ist. Sie bildet die Decke der im Erdgeschoss angeordneten Bauteile. Einschnitte in Form von Höfen □ intime Gärten - ermöglichen eine gute Belichtung der anliegenden Räume.

#### **DIE BAUKÖRPER**

Die Institutsbereiche des DUK und der Laborbereich - in sich geschlossene Baukörper Die Institutsbereiche der DUK und der Laborbereich sind in sich geschlossene Baukörper, die auf der Struktur des zweigeschossigen transparenten Sockels liegen. Es handelt sich um in sich geschlossene Strukturen, die auf den Betonscheiben der Treppen sowie den Stützen auflagen. Das konstruktive System erlaubt die Auskragung der Bauteile im Norden. Das Hauptgebäude des IMC befindet sich auf der Wieden im Anschluss an das Studentische Wohnen. In seiner Ausformung entspricht dieser Baukörper dem Konzept der Gebäude der DUK: Eine transparente zweigeschossige Sockelzone für den öffentlichen Bereich, überlagert von einem Baukörper, der den internen Bereichen gewidmet ist. Weitere Bereiche des IMC befinden sich im östlichen Gebäudeteil der DUK, der auch die Labors beinhaltet. Dadurch wird der räumliche Zusammenhang zwischen dem der Fachhochschule zugeordneten Bereich, dem Institut für Biotechnologie, und den Labors hergestellt. Das Zentrum für Film stellt eine in sich geschlossene Einheit dar. Das Kesselhaus, das den Vorführsaal beinhaltet, und ein dem Kesselhaus gegenüber liegendes punktförmiges Gebäude, bilden die beiden Hauptelemente. Sie sind durch die Filmgalerie im Untergeschoss miteinander verbunden. Das Zentrum für Film und das Kesselhaus bilden einen gemeinsamen, diesen Bereichen zugeordneten Platz. Der Festsaal ist ein monolithischer Baukörper. Seine Aussenwände sind aus Sichtbeton. Dem filigranen Erscheinungsbild der Institute wird ein massiver Gegenpol am Eingang des Campusgeländes gesetzt.

#### **FASSADEN HAUSTECHNIK KONSTRUKTION**

Entsprechend der Gliederung der Baukörper sind die Fassaden zweigeteilt: Die öffentliche Zone Erdgeschoss und 1. Obergeschoss - ist zur Gänze verglast und somit einsehbar. Vertikale textile Sonnenstore schienengeführte Gegenzugrollen bilden den Sonnenschutz. Die offenbaren Fassadenelemente sind je nach Positionierung als Dreh- oder Kippflügel ausgeführt. Der Institutsbereich im Obergeschoss ist grosszügig verglast. Ein Viertel der Fassadenfläche ist opak. Diese Fläche entspricht den offenbaren Fassadenpaneelen, die als horizontale Ausstellflügel konzipiert sind. Dadurch kann eine gute Durchlüftung der Räume erreicht werden. Als Sonnenschutz sind vertikale Lamellen aus gelochten (Lochanteil 25%) stranggepressten Aluminiumprofilen vor die Fassade gesetzt. Diese Lamellen sind über eine elektrische Steuerung drehbar und können dem Sonnenstand nachgestellt werden.

Die übergeordnete Steuerung wird durch eine individuelle Steuerung (dem jeweiligen Raum entsprechend) ergänzt. In der Nacht stehen die Lamellen offen □ im Winkel von 90° zur Fassade □ um die Nachtauskühlung zu gewährleisten. Um 4h morgens schliessen sich alle Lamellen, um den Sonnenschutz des Gebäudes auch tagsüber bei Nichtbenutzen der Räume zu gewährleisten. Der Nutzer regelt die Lamellen nach Bedarf, wodurch der Effekt des Erwachens des Gebäudes und ein belebtes Bild der Fassade entsteht. Ein begehbare Steg zwischen Fassade und Lamellen dient der Fassadenreinigung. Durch die Vermeidung des direkten Sonneneinfalls ins Gebäude durch den aussenliegenden Sonnenschutz wird das ungewünschte Aufheizen des Gebäudes verhindert. In Übergangszeiten und im Winter wird die Sonnenenergie passiv zur Erwärmung des Gebäudes genutzt. Ein alternatives Energiekonzept als Antwort auf eine offene und transparente Architektur. Die Behaglichkeit in den Räumen wird durch das System der Bauteilkühlung erhöht: Wasserführende Schläuche sind an der Deckenunterseite in die Betonplatten der Decken integriert. Die Betondecken bleiben unverkleidet, um die Betonmasse als Speichermasse zu nutzen und die Deckenabstrahlung zu ermöglichen. Die Temperierung des Wassers erfolgt über Wärmetauscher Die Frischluft wird über Erdkollektoren konditioniert. Bei den Erdkollektoren handelt es sich um im Erdreich verlegte Betonrohre mit einem Durchmesser von 150cm und einer Gesamtlänge von ca. 600m. Diese Methode ist eine sanfte Lösung um das Gebäude zu kühlen und ergibt ein angenehmes Raumklima. Ein geringer zusätzlicher Energieeintrag ist zur mechanischen Kühlung/Belüftung der Seminarräume notwendig. Eine Konsequenz des Systems ist die sichtbare Leitungsführung an der Deckenunterseite. Dies stellt eine kohärente Ergänzung zu einer ablesbaren klar strukturierten Gebäudekonfiguration dar. Die Verbindungsbrücken sind als temperierte Pufferbereiche konzipiert. Grosszügige in die Fassade integrierte Schiebelemente stehen im Sommer offen. Im Winter sorgen Deckenstrahlheizungen für die Beheizung dieser Übergangsbereiche.

#### Die Konstruktion

Die Konstruktion der Gebäude ist in Betonstützen und Betondecken aufgelöst. Wandscheiben aus Beton und Stahlausfachungen im Randbereich steifen das Gebäude horizontal aus. Die Innenwände sind Leichtbauwände und ermöglichen eine grosse Flexibilität und Variationen an Grundrisskonfigurationen. Die Auskragungen werden von vorgespannten Stahlstützen getragen und im Gebäude rückverankert. Die Lützen sind aus Brandschutzgründen verkleidet. Die Verbindungsbrücken zwischen den Baukörpern sind als Stahlbrücken ausgebildet. Der Kräfteverlauf der konstruktiven Teile ist ablesbar (Zugstäbe massiv, Druckelemente mit statisch entsprechenden Dimensionen Abnahme der Stützdurchmesser nach oben).

#### DIE GESTALTUNG DES AUSSENRAUMS

Die Prädominanz der Landschaft, der Aussenbereiche und die örtliche ruhige Situation erlauben bzw. erfordern eine Miteinbeziehung der äusserlichen Bedingungen sowohl in topografischer Sicht wie auch im Umgang mit meteorologischen Gegebenheiten (natürliche Belüftung der Räume, offene, der Witterung ausgesetzte Verbindungswege und Plätze). Im Sinne eines offenen Campus werden keine Einfriedungen zwischen den einzelnen Bereichen vorgesehen. Der autofreie Campus ist fussläufig frei zugänglich, der Fahrverkehr sehr limitiert. Mehrere Parkmöglichkeiten sind um das Campusgelände vorgesehen: Die Oberflächen Versiegelte Flächen (Betonoberfläche) sind minimiert. Rasenflächen und mit Holzbelag befestigte Flächen (Lärche) dominieren. EG: Die Verbindungswege zwischen den Bauteilen sind befestigt Betonoberfläche gebürstet. Die restlichen Flächen, die Innenhöfe inbegriffen, sind begrünt. 1. OG: Die in diesem Geschoss zugänglichen Aussenflächen (Dächer der darunterliegenden Bereiche - Mensa, Bibliothek) sind im Bereich der Institute mit einem Holzbelag versehen. Die übrigen Bereiche sind bekiest. Der Abschluss zur Alauntalstrasse erfolgt über ein lineares, horizontales Element, eine Bank, die das Befahren der Fläche verhindert. Die ansteigenden Sitzreihen des grossen Hörsaals im Norden übernehmen den topografischen Höhenunterschied des Geländes. Zwei Biotope ergänzen die Aussenanlagen.

[Bibliothek BORG-HAK \(Bundes Oberstufenrealgymnasium u. \(Bundes\) Handelsakademie\), Perg, Oberösterreich – Austria 1998 - 2000](#)

Eine Bibliothek als Raumklammer und großmütiger städtebaulicher Ordnungshüter: Die neue Freihand- und Leihbibliothek zweier in den 1960er Jahren errichteter Schulen (Oberstufenrealgymnasium und Handelakademie) schafft als durchlässiges Bindeglied im einstige Niemandsland zwischen zwei Schulhöfen und einer Strasse einen nutzungsoffenen Freiraum, den man im beziehungslosen Nebeneinander der Baukörper bislang vergeblich gesucht hätte. Der Neubau ragt als verlängerter Schenkel des winkelförmig angelegten BORGs Richtung Straße, im Obergeschoss als weiß verputzter Balken definiert, im Erdgeschoss als semipermeables Raumgewebe aus Sichtbetonscheiben und Stützen, das sowohl Schutz bietet (in diesem Bereich sind etwa die Fahrradunterstände, Lagerplätze für Gerätschaften und die Garagen untergebracht) als auch den halböffentlichen, zuvor konturlos auslaufenden Raum locker strukturiert. Die Südseite der lichterfüllten Einraumbibliothek (mässig hohe Regale skandieren die geräumige Nutzfläche) wurde vollflächig verglast, fragile Sonnenschutzlamellen betonen die "dünne Haut", der im Norden und Westen eine betont massive geschlossene Fassade gegenübersteht. Der Architekt konnte mit dem neuen Baukörper gewisse konzeptuelle Mängel des Bestands beheben, die Schliessung allfälliger Wissenslücken bleibt jedoch dem Lehrpersonal und den Bibliothekaren überlassen... Die Ausbildung von Technikern hat in unserer jüngsten Vergangenheit neue Bedeutung erreicht, da ein neues Technikverständnis im Entstehen ist und somit die kulturelle Komponente der Ausbildung eines Technikers nicht zu kurz kommen darf. Wir wissen, daß in naher Zukunft gerade die Abgänger einer solchen Höheren Technischen Lehranstalt einen immer bedeutenderen Teil in der Bewältigung der anstehenden Probleme zugewiesen bekommen, und daß Facharbeiter und Techniker vermehrt in all unseren Lebensbereichen zur Lösung von Problemen herangezogen werden. Aus diesem Grund muß die Ausbildungsstelle für diese Schüler nicht nur in funktionaler Sicht entsprechen, sondern sie muß vielmehr auch einen kulturellen Beitrag leisten. Die Schule soll also als "Meisterstück" der Technik diese Intentionen vertreten. Es soll gezeigt werden, wie Architektur - gestaltet mit den Mitteln der Technik - welche vor allem sichtbar bleiben sollen, eine Integration in die Landschaft und auch eine Selbstdarstellung der Inhalte der Lehre dieser Schule sichtbar machen kann. Die Schule wird als öffentliche Institution einen besonderen Punkt in der näheren Umgebung von Kaindorf darstellen, und soll aus diesem Grund als architektonischer Akzent ordnend in die vorhandenen Strukturen eingreifen. Um den landschaftlichen Gegebenheiten der Lage des Grundstückes zu entsprechen, wird ein zweigeschoßiger Baukörper, in dem der Theorietrakt und die Verwaltung untergebracht werden, als dominierendes "Rückgrat" der Schulanlage konzipiert. Angeschlossen an diesen Baukörper ist der Werkstättenbereich und der Turnhallenbereich. Diese beiden Bereiche werden auch selbstständig formal ausgeformt, da gerade der Werkstättenbereich und somit die praktische Ausbildung ein Spezifikum dieses Schultyps ist. Der Turnhallenteil wird neben den schulischen Veranstaltungen auch Turniere etc. der Sportvereine der nahen Umgebung möglich machen und so besondere Bedeutung erhalten. Besonders wichtig ist die verkehrstechnische Erschließung der Schule, da ein großer Prozentsatz der Schüler als Fahrschüler zu erwarten ist. Aus diesem Grund wird in der Zone vor dem Eingangsbereich diesen verkehrstechnischen Notwendigkeiten formal auch entsprochen. Die Schule soll als architektonischer Akzent in die Landschaft gesetzt werden. Es wird jedoch vermieden, dies mit einer Konzentration und Massigkeit zu erreichen. Vielmehr soll die 2-Geschoßigkeit und die Aufteilung in Bereiche, die Integration der Schule in die Landschaft fördern. Wie schon erwähnt, tritt der Theorietrakt als Hauptbaukörper (als Rückgrat) der Anlage zweigeschoßig in Erscheinung. Die weiteren Bereiche wie Turnsaal und Werkstättenbereich sind diesem Baukörper untergeordnet und werden eingeschößig ausgeführt. Die formale Gestaltung der Fassade soll den technischen Charakter dieser Schule zeigen und so als Meisterstück der Technik den Schülern demonstrieren, wie mit Technik eine Verbindung von Natur und Bauwerk entstehen kann, und wie gerade durch diese technischen Mittel eine gegenseitige Steigerung der Werte möglich ist. Die Schule wird über einen repräsentativen Vorplatz betreten. Angeschlossen an diesen Vorplatz ist die 2-geschoßige Eingangshalle, welche als Herzstück der Anlage alle wichtigen Bereiche wie Werkstättenbereich, Verwaltungstrakt, Schulbereich und Turnhallenbereich verknüpft. Neben den funktionellen Notwendigkeiten wird diese Eingangshalle auch als repräsentativer Raum für die Schule ausgeformt, in welchem auch öffentliche bzw. halböffentliche Veranstaltungen durchgeführt werden können. Angeschlossen an diese Halle ist ein Schüleraufenthaltsraum und eine Bibliothek und das Konferenzzimmer, welches mit einer zweischaligen Verglasung Transparenz signalisiert. (Giselbrecht)

## Architekt Goltnik, Graz – Austria

Wladimir Goltnik

<http://www.goltnik.com>

### Erweiterung Vorklinik, Bibliothek, Karl-Franzens-Universität Graz – Austria 2001

gemeinsam mit Architekt DI Wolfgang Kapfhammer (<http://www.wolfgang-kapfhammer.at>)

Bruttogeschoßfläche: 1.688m<sup>2</sup>, Netto-Baukosten: € 5.500.000

Eine sinnvolle Erweiterung der Vorklinik war lediglich im Bereich des Labortraktes entlang der Harrachgasse in Form einer Aufstockung möglich, die nun als ein großer, silberner, flacher Keil eine Dynamik entwickelt, die sich in Richtung Universitätsplatz bewegt. Die Bibliothek, als Kopfteil schwebend, bietet einen repräsentativen, überdachten Eingangsbereich an, der dem Hauptgebäude bisher fehlte. Im Bereich der Erweiterung der Vorklinik galt es, ein eigenständiges Gestaltungskonzept zu entwickeln, das sich vom Bestand deutlich absetzt und trotzdem ergänzt. Der Nutzung entsprechend wurde die Materialwahl in Stahl, Aluminium und Glas getroffen. Durch von innen beinahe wie Vorhangnetze wirkende Sonnenblenden aus Aluminium wirkt der Baukörper wie ein schwebender Monolith, dessen Fassade bewusst als „keine Fassade“ mit den üblichen Fensterteilungen konzipiert wurde. Im Eingangsbereich lädt, durch Licht und Transparenz erreicht, das neue treppenartige Buffet zum Verbleiben ein. Dem Gebäude wurde durch lebendige Farbgestaltung mehr Sinnlichkeit verliehen, die sich im Kontrast zum Bestand abhebt. (Goltnik)

## Architekturbüro HALLE1, Salzburg – Austria

### Stadtbibliothek Neue Mitte, Lehen, Salzburg – Austria 2008

Das Projekt Neue Mitte Lehen ist ein dominantes Stück Architektur inmitten von größtenteils belanglosen Bauten. Stadträumlich ist das Projekt in der Lage dem Quartier eine völlig neue Identität zu verleihen bzw. die Ansätze für die Entwicklung eines neuen Selbstbewusstseins zu vermitteln. Die neue Anlage ist eine Reminiszenz an das ehemalige Stadion Lehen, bei der die Spielfläche eine ähnliche Fassung erhält und einen gewissen Erinnerungswert darstellt. Man könnte auch die Verwendung des schrägen hohen Turms mit der Panoramabalkon als eine zeichenhafte Unterstützung dieser Erinnerung werten. Das Programm beinhaltet im Bauteil West die Stadtbibliothek, Geschäfte und Dienstleistungseinrichtungen sowie Gastronomie. Im Bauteil Ost wurden 48 Mietwohnungen, ein Seniorentreff, ein Veranstaltungssaal und das Kulinarium, eine Cateringeinrichtung und Ausbildungsstätte für behinderte Menschen realisiert. Das Projekt wurde als Teil von Raum : Werk : Lehen, Salzburg – Strategien einer Stadterneuerung - von einer internationalen Jury mit dem 5. Otto Wagner Städtebaupreis ausgezeichnet. Im Dezember 2008 erhielt es auch eine Anerkennung im Rahmen des Architekturpreises Land Salzburg. Bauherren: Bauteil Ost: Gemeinnützige Wohn- und Siedlungsgenossenschaft „Salzburg“, Bauteil West: UBM – Realitäten Entwicklung Aktiengesellschaft, Außenraumgestaltung und Bibliothekseinrichtung: Stadt Salzburg. ### **Libraries:**

#### **Bücherei + Musikhaus Sarleinsbach, Oberösterreich – Austria 2009**

Bauherr: Marktgemeinde Sarleinsbach, € 1.400.000

Mitten in Sarleinsbach befindet sich das neue Musikhaus mit Bibliothek:

Ein Blickfang im Ortskern – denn es steht nicht zur Gänze am Boden, sondern bildet eine imposante Brücke über die stark frequentierte Durchfahrt des Marktplatzes. Dabei bricht das außergewöhnliche Gebäude in keiner Weise mit dem historisch gewachsenen Ortsbild, sondern gliedert sich vielmehr in die örtliche Struktur ein: Einerseits wird die bestehende, typische Langhofbauweise weitergeführt (der Eingangsbereich zum Marktplatz hin beträgt nur 2,5 m während das Haus m in der Tiefe misst), andererseits wird durch die Gebäudeform die Platzumfassung und damit die Geschlossenheit des Platzes erhalten sowie eine großzügige Durchfahrt (die notwendigerweise breit genug für Sattelschlepper ist) ermöglicht. Das Gebäude, dessen Form eine Reaktion auf die angrenzende Dachlandschaft ist, spannt sich über die Straße und schließt an das Nachbargebäude an – ein oft kritischer Punkt bei modernen Interventionen in historischen Beständen. Doch ist die Anlehnung in diesem Fall eine eindeutige, logische Schlussfolgerung, da es in Sarleinsbach lokal so gegeben ist, dass sich Bauten aus unterschiedlichen Epochen aneinanderreihen und gemeinsam das Marktplatzprospekt ergeben; dies wird bewusst fortgeführt. Der zum Platz hin verglaste, über dem Ortskern schwebende Musiksaal bietet ein unverwechselbares Panorama. Die raumhohen Fensterflächen sind komplett offenbar, womit bei Festen der Marktplatz von oben herab bespielt werden kann. Um die geputzte Fassadenstruktur des Marktplatzes durch zu starke Spiegelungen nicht zu zerstören, wurden verschiebbare Eisengitter angebracht, die Reflexionen vermindern und an die früher typischen Metallläden am Ortsplatz anknüpfen. Im Inneren des Musikhauses findet man vor allem robustes, langlebiges Massivholz, welches das Ländliche verkörpert. Innenhöfe und Glasflächen erlauben interessante Durchblicke und verschiedenste Blick- und Raumbeziehungen. Wie die langgestreckte Gebäudeform war auch ein langer, schmaler Innenhof bereits vorhanden. Dieser wurde wieder aufgenommen, löst sich durch die Verwendung von Glas und Holz allerdings zu einem freundlichen und großzügiger erscheinenden Platz auf. Da die Bibliothek, deren Form einem alten, vor dem Umbau bestehenden Schuppen folgt, vollständig zum Innenhof hin offenbar ist, können beide Bereiche je nach Bedarf erweitert werden und es entsteht ein atmosphärischer, intimer Freibereich in einer dörflichen Struktur. Der Musiksaal selbst ist mit einer Lattenstruktur aus dem gleichen Holz wie die Bibliothek ausgekleidet, die nicht nur eine akustisch bedeutende Mikrostreueung erzeugt, sondern gemeinsam mit der integrierten lattenförmigen Beleuchtung dem Raum auch seine ganz besondere Atmosphäre verleiht. Gleichzeitig verbirgt sie Schränke und Abstellräume, die ausreichend Platz für Musikinstrumente und Serviceeinrichtungen bieten. Neben Bibliothek und Musiksaal wurden weitere Proberäume eingerichtet, die mit den selben Akustikelementen ausgestattet sind, sowie ein öffentliches WC und ein Parkdeck mit 11 Stellplätzen untergebracht, das auf der Hinterseite des Gebäudes versteckt ist, um den Marktplatz autofreier zu halten. Beitrag von architekturforum oberösterreich. (Text: Architekten)

#### **Schule AHS (Allgemeinbildende Höhere Schule) Contiweg, Wien – Austria 2011**

Linsenformen umranken die gläserne Eingangsfassade und begrüßen die Schüler der Aspernstrasse. Die neue Schule in Hirschstetten wurde als Anlage mit zwei horizontal betonten Klassentrakten konzipiert. Das gläserne südseitige Atrium mit der Bibliothek im markanten Dachausbau schafft architektonische Identität in einer sonst baulich wenig akzentuierten Gegend. Der ‚Contistreifen‘ fungiert als Rückgrat zwischen öffentlichem Vorplatz und dem privaten Bereich des Innenhofs. (heiss)

Internationaler Schulcampus, Linz – Austria 2002 – 2008

1st. Prize

Elfenbeinturmartige Abgeschirmtheit gehört längst nicht mehr zum Selbstverständnis moderner Bildungseinrichtungen. Die vom Stadtrand ins Zentrum übersiedelte Fachhochschule Kufstein signalisiert Offenheit und setzt als kubischer „Lichtfänger“ einen markanten städtebaulichen Impuls, der sowohl in der derzeit realisierten Grundstufe funktioniert als auch für künftige Erweiterungen zum Campus mit Stadtbibliothek und Musiksaal gerüstet ist. Die glatte gläserne Außenhaut des Baukörpers, deren Durchlässigkeit und Farbton mit Blickwinkel und Lichteinfall ständig changieren, ist nicht nur in optischer Hinsicht reizvoll, sondern auch ein bauphysikalisches „Schulbeispiel“ von besonderer Art. Denn die zweischalige Klimafassade mit integrierter Raumlüftung (bestehend aus raumhohen Isolierglasscheiben, die zwischen den ebenfalls geschoßhohen Holzlamellen sitzen sowie steuerbaren Glaslamellen und Lüftungsklappen, die den Wärmetausch regeln) ist nicht nur energetisch innovativ, sondern dient den Studenten des an der Fachhochschule u.a. angebotenen Studienganges „Facility Managment“ zugleich als Forschungsgegenstand und unmittelbar vor den eigenen Augen liegendes Lehrstück. Die zentrale, zweigeschoßhohe Aula - nicht nur für Schulzwecke, sondern auch als öffentlicher Raum für externe Veranstaltungen zu nutzen - ist als nutzungsneutrales und allein schon in seinen Dimensionen luxuriöses Raumgefäß in schlichtem Sichtbeton ausgeführt und über ein Glasdach natürlich belichtet. In allen semi-öffentlichen Bereichen des Gebäudes, die nicht ausschließlich schulinterner Nutzung gewidmet sind (Aula, Café, Erschließungszonen) ist der Boden mit „kühlen“ Terrazzoplatten belegt, während die 28 Hörsäle und andere Schulräume mit einem

“warmen” Industrieparketten ausgestattet sind. In ihrem Dualismus von öffentlichem und schulisch genutztem Raum ist in der Fachhochschule Kufstein das “Prinzip der Offenheit” kein heres Bekenntnis, sondern schlichte Alltagswirklichkeit. (Text: Gabriele Kaiser)

### Eduard Wallnöfer Zentrum für medizinische Innovation ewz - Universitätsgebäude (umit, eurak, azw und tcc) Bibliothek, Hall, Tirol – Austria 2004

Bauherr: TCC Errichtungs- und Betriebs mbH / TCC Studentenheim mbH (<http://www.t-c-c.at>) Wettbewerb 2002, Planung 2002, Ausführung 2003 – 2004, Nutzfläche 17.994 m<sup>2</sup>, Umbauter Raum 71.437 m<sup>3</sup>

Die Idee für den Entwurf beruht auf der Auseinandersetzung mit einem außergewöhnlichen Kontext. Der Standort für die Privatuniversität befindet sich auf einem Parkgrundstück in leichter Hanglage mit wertvollem altem Baumbestand am Rande der Altstadt von Hall. Das städtebauliche Konzept definiert ein Gebäudeensemble, welches aus präzise gesetzten Solitärbaukörpern besteht. Die Stellung der einzelnen Gebäude zueinander erzeugt zum einen urbane Dichte, zum anderen bleiben der landschaftliche Zusammenhang und die Topographie des Geländes unverändert erhalten. Die Topographie bestimmt auch das räumliche Konzept der einzelnen Gebäude, die als Atriumhäuser konzipiert sind. Die Struktur dieser Gebäude bietet gleichzeitig maximale Flexibilität und räumliches Erlebnis. In einer ersten Baustufe wurden zwei Gebäude realisiert; im Universitätsgebäude sind die UMIT (Private Universität für Gesundheitswissenschaften, Medizinische Informatik und Technik), die eurak (Europa-Akademie für health professionals), das azw (Ausbildungszentrum West für Gesundheitsberufe / Krankenpflegeschule Hall) sowie das tcc (Tilak Competence Center) untergebracht, im zweiten ein Studentenheim (campushotel) und ein Kindergarten (kids). Das Erscheinungsbild des Universitätsgebäudes, ein Kubus von 60 x 60 m, ist geprägt von den geschosshohen Sonnenschutzlamellen aus gekanteten Lochblechen, die das gesamte Gebäude umhüllen. Der abstrakte Kubus steht im bewussten Kontrast zur „Dramaturgie“ der umgebenden Landschaft. Gezielte Einschnitte in den Baukörper definieren straßen- und parkseitig großzügig gedeckte Eingangsbereiche. Eine zweigeschossige Aula verbindet das Straßen- mit dem Parkniveau und bildet das räumliche Zentrum des Universitätsgebäudes. Dieser halböffentliche Bereich, um den sich Hörsäle, Seminarräume, Bibliothek und die Cafeteria gruppieren, kann auch als Veranstaltungsraum genutzt werden. Auf einem ähnlich räumlichen Konzept basiert der Entwurf für das Studentenheim. Die räumliche Mitte dieses Gebäudes bildet ein offener Innenhof, um den sich Gemeinschaftsräume mit großzügigen Freiterrassen gruppieren. Die einzelnen Zimmer mit jeweils eigener Sanitärgruppe öffnen sich ausschließlich zum großartigen umgebenden Landschaftsraum. In der bereits in Planung befindlichen zweiten Baustufe wird das Competence Center an der Milser Straße errichtet. Im Sinne einer Corporate Identity bilden UMIT und CC typologisch und formal eine gestalterische Einheit. Durch die Realisierung des zweiten Baukörpers an der Milser Straße gelingt im Sinne des städtebaulichen Konzepts in loser Form der bauliche Lückenschluss zwischen der Haller Altstadt im Westen und dem östlich gelegenen Siedlungsgebiet. (Text: henke und schreieck Architekten) (<http://www.nextroom.at>)

### AHS (Allgemeinbildende Höhere Schule), Heustadelgasse, Bibliothek, Wien - Austria 1999 - 2001

Bauherr: BIG - Bundesimmobiliengesellschaft mbH.

Zwischen Einfamilien- und Reihenhäusern, Gewächshäusern und Feldern, inmitten eines typisch vorstädtischen Milieus mit niedriger, offener Bebauungsstruktur steht (oder sollte man nicht besser sagen liegt?) das große gläserne Geviert der neuen Schule. An der Ecke Biberhaufenweg-Heustadelgasse ist sie (die mit ihren 30 Klassen doch ein wahres Ungetüm sein müsste!) noch kaum zu erkennen. Sie hält die Höhe der umgebenden Bebauung, öffnet sich zu ihr, geht in die Breite und Tiefe des Grundstücks und definiert ihren eigenständigen Ort. Sie schafft sich – gleichermaßen durchlässig wie in sich gekehrt – ihre eigene Umgebung und ihr eigenes Zentrum. Ein- und zweigeschoßige Riegel umschließen ein gegenüber dem Straßenniveau um einen Meter angehobenes Atrium, das räumlich an den an der Heustadelgasse liegenden Erdgeschoß-Vorplatz und die rückwärtige (zweigeschoßig verglaste) Aula sowie an den transparenten, teilweise ins Gelände gesenkten Turnsaal anschließt. Die großzügige Atmosphäre des offenen, mit dunkelgrauen Betonplatten ausgelegten Innenhofs wird durch ungebrochene Sichtachsen verstärkt, so dass man schon vom gedeckten Vorplatz aus einen Blick auf die Basketballkörbe der Dreifachturnhalle und sogar ins dahinter liegende Grünland werfen kann. Die räumliche Gliederung des Gymnasiums könnte klarer nicht sein: Schüler-Entree und Verwaltungszugang sind eindeutig separiert, Mehrzweck- bzw. Servicräume, der Speisesaal und die Lehrerzimmer sind im Ostteil des Erdgeschoßes untergebracht, die Klassenräume im Westen sind direkt an die Sonderunterrichtsräume im Untergeschoß angebunden. Die Klassen im Obergeschoß sind in ihrer ringförmigen Anordnung nord-ost-westseitig zum umgebenden Außenraum geöffnet. Breite Erschließungszonen mit Blickbezug zum Innenhof dienen sowohl als Pausenraum als auch als Garderobe. Den nördlichen Abschluss der Raumfolge bildet die an der Aula situierte Bibliothek mit herrlicher Terrasse auf dem Dach des Turnsaals.

Die großflächigen Verglasungen der Klassen, die Sichtbetonflanken der Erschließung, die holzbekleideten Untersichten der Baukörper, die lattenbelegten Wege und Terrassen, die Lamellenvordächer und die homogene Fläche des Atriums skandieren das weitläufige Gefüge auf unaufdringliche Weise in überschaubare Einheiten, lassen dabei aber zahlreiche Zonen frei, lose und undefiniert. Gerade jene unentbehrlichen "Lümmel-Punkte", die von den Schülern sicherlich mühelos in Beschlag genommen werden, können ein Schulgebäude von der Lernanstalt in einen belebten Ort verwandeln. (...)

### Sozial – und Wirtschaftswissenschaftliche Fakultät, Bibliothek, Leopolds-Franzens-Universität, Innsbruck – Austria 1996 - 1998

#### **Awards:**

**Auszeichnung Neues Bauen Land Tirol 1999**

**Österreichischer ZV-Bauherrpreis 1999**

**Mies van der Rohe Award (Finale) 1999**

Die SOWI-Fakultät liegt auf einem ehemaligen Kasernenareal, mitten in der Altstadt von Innsbruck, am Übergang von der historischen Bebauung zum Naturraum des Hofgartens. Der Neubau, bestehend aus zwei parallelen Riegeln - wurde von den Architekten quer zur gekrümmten und denkmalgeschützten Mauer des Hofgartens angesiedelt. Diese dient im Süden als eine Art Leitwand, die zum Haupteingang und weiter entlang durch das Gebäude in die grosse zentrale Erschließungshalle mit durchgehendem Glasdach führt, die die Verbindung zwischen den beiden Riegelbauten darstellt. Sie ist plateauartig angelegt und bildet so einen Kommunikationsbereich vor den Institutsräumen. Die Südseite weist eine elegant geschwungene, über zwei Geschoße laufende Fassade auf, die die Räume der Bibliothek beherbergt. Die Glasfassade wird von - die Schwüngen nachzeichnenden - Sonnenschutzlamellen begleitet, wodurch die Dynamik dieses Bauteils betont wird. Im Norden treten im Erdgeschoss drei Hörsäle plastisch in den Außenraum und erhalten ihr natürliches Tageslicht über Sheddächer. Hier krägt ein Bauteil als spitz zulaufender Körper in Richtung Osten aus und wird von Betonstützen getragen. Durch die Längs- und Querschließung und die grosszügige Transparenz ist das Gebäude maximal überschaubar. Die reizvolle Innsbrucker Umgebung mit ihren Bergen wird einerseits vom Gebäude durch die Verglasungen aufgenommen, andererseits in den Außenraum reflektiert, was dem Bau seine Monumentalität nimmt. Die vom Nutzer formulierte inhaltliche Idee einer „offenen Universität“ wurde in den Entwurf miteinbezogen und ein

Ensemble von SOWI-Fakultät, Wohn-, Büro- und Geschäftshaus geschaffen. Sie bilden einen Universitätshof, der das Prinzip der „Kommunikation zwischen Wissenschaft und Praxis“ umsetzt. (<http://www.nextroom.at>)

#### **Internationaler Schulcampus, Linz – Austria 2002 – 2008**

Ist. Prize

Ein bestehendes Internatsgebäude in Linz aus den 70er Jahren wird in seiner gesamten Struktur an die Anforderung moderner Beherbergungsbetriebe angepasst. Das Haus bietet in 51 Zimmern Unterkunft für über 200 Lehrlinge im Alter zwischen 14 und 20 Jahren. Die strenge Geometrie des Bestandes ist in Beton manifestiert, weshalb diese Struktur mit neuen Vokabeln zu einer klaren Formensprache übersetzt werden sollte. Hauptmaßnahmen dafür sind eine Neuformulierung der Fassade, der Ausbau der Baukörperprägnanz sowie die Neustrukturierung der inneren Funktionsabläufe. Die wesentlichen Eingriffe sind eine atriumsartige Öffnung des Kernbereiches mit Glasböden zur Förderung der internen Übersichtlichkeit und Belichtung, weiter die Öffnung und Bereinigung der Erdgeschosszone mit visueller und physischer Anbindung an die neue Turnsaaltribünenanlage. Darüber hinaus wird der Baukörper um zwei Geschosse ausgeweitet und das verbleibende Halbgewoss als Sportbereich auf dem Dach den Gästen und Schülern zur Verfügung gestellt. Eine Erweiterung der Großküche definiert einen Hof als Platz vorm Haupteingang. Diese Eingriffe tragen zur Verbesserung der Proportion des Gesamtbaukörpers bei. Das Atrium wird mit der neu formulierten Eingangssituation verbunden. In den Obergeschossen grenzen dann gemeinsame Aufenthaltsbereiche an, die zur Fassade hin geöffnet sind und Beziehungen zur Umgebung herstellen. Jede an einer anderen Position im Grundriss, um die Geschosse räumlich und atmosphärisch zu differenzieren. Auch geschoßbezogene Beleuchtungsvariationen und Gemeinschaftsnutzungen wie Bibliothek, Wohnzimmer mit Fernseher, Wohnküche und Internetlounge stiften Identifikation und regen den vertikalen Austausch unter den Schülern an. Farblich gibt es im Innenraum eine betonte Gliederung in drei Zonen. Die öffentlichen, die in Jadegrün kühl und elegant gehalten sind, weiters Sportflächen, welche mit himmelblauen Böden und Decken strahlen und letztlich die Internatszimmer, welche einen atmosphärisch gedämpften Bereich zur Regeneration der Schüler darstellen. Auf kleinem Raum in Vierbettzimmern organisiert, jedoch mit eigenen Sanitärräumen ausgestattet, sind sie in rubinroter Wandfarbe und kirschholzgetäfelten Decken gestimmt, die Konturen werden aufgehoben, um dem Raum die Enge zu nehmen. Gebürstete Aluminiumoberflächen an Betten und Schränken bilden einen Kontrast, sie schärfen die Grenzen der Privatsphäre. Die Schwelle zwischen diesen drei Welten wird sinnlich erlebbar. Drei funktionale Boxen mit Cortenstahloberfläche strukturieren die große offene Erdgeschoßfläche. Sie erzeugen gleichermaßen kontrastreiche Lichtstimmungen wie räumliche Abschlüsse für den Speisesaal, der an die Galerie der Doppelturnhalle andockt. Drei hier eingeschobene Pflanzhöfe sorgen nicht nur für Tageslicht, sie werden vor allem zur visuellen Attraktion im Saal, in ihrer Anmutung großen Aquarien ähnlich. Baumfarne erzeugen den Eindruck eines kleinen Stücks exotischer Landschaft, das hier eingefügt wurde. Die fassadengraue Decke des Erdgeschosses überzieht in Form von Lamellen auch die Höfe. Die Speisenausgabe erfolgt in einer der Cortenstahlboxen, eingefügt zwischen Saal und neu gestalteter Großküche. Ein Hauptaugenmerk liegt auf der Entwicklung eines energetisch wie gestalterisch hochwertigen Fassadentypus, der weiter Anwendung beim angeschlossenen Werkstatzentrakt und in Folge bei ähnlich gearteten Gebäuden finden soll und kann. Der Charakter der Fassade entsteht durch die streifenartig versetzte Anordnung der verwendeten Materialien, die seine strenge horizontale Gliederung unterstützen. Die den Baukörper beruhigende und alles überspannende Textur leitet sich von Steinmauerwerken ab, deren variierender Glanz aus unterschiedlichen Quarzanteilen in den Steinen entsteht. Je nach Sonnenlicht und Blickwinkel wird der Eindruck von verschieden stark kontrastierenden homogenen Flächen stärker oder schwächer sichtbar. Maßstäblich an die Großfläche angepasst werden ein Meter hohe Paneele aus Emailglas, Blech, Eternit und Solarkollektoren in einem immer ähnlichen Grauwert aneinandergesetzt, der Unterschied ist der Glanzgrad. Neben den deutlichen, energetischen Einsparungen aufgrund der hochdämmenden Fassade – der flächenbezogene Heizwärmebedarf liegt mit 37kWh/m<sup>2</sup>a um mehr als 20 Prozent unter dem gesetzlichen Standard – gelang es durch die in der Fassade integrierten Solarkollektoren wieder einen wirtschaftlichen Betrieb des bereits aufgegebenen Hallenbades im Untergewoss zu ermöglichen. Der extrem niedrige Raum unter der Sporthalle wurde durch Einfügen eines himmelblauen Tonnengewölbes, das die Konstruktion abdeckt, in der Wahrnehmung manipuliert und aufgeweitet. Mit zahlreichen Freizeitqualitäten, die an guten Hotelstandard erinnern, hebt sich das Schülerheim heute wieder ab, die Nachfrage von Schülern aus den benachbarten Berufsschulen ist groß. (Hertl)

#### **Pfarrheim, Bibliothek, Nenzing – Austria 1997**

Bauherr: Pfarrei Nenzing, Wettbewerb 1. Preis September 1994, Entwurf: cand.arch Andreas Cukrowicz/Anton Nachbaur-Sturm  
Ausführungsplanung: DI Arch. Hans Hohenfellner, Baubeginn: Februar 1996, Fertigstellung: April 1997

An Stelle des abgerissenen Vereinsparkhauses packten die Architekten das Raumprogramm in ein lapidares Prisma, das etwa den Hauptmassen der Kirche entspricht, jedoch im rechten Winkel zur Kirchenachse steht. Die Konstruktion ist im Sockel Stahlbeton, EG und OG haben Stahlstützen mit Randträgern, darauf liegen 10 m weit gespannte Betonhohldielecken; ost- und westseitig vorgehängte, vorgefertigte Holz-Glas-Fassaden, Aussenjalousien; leichtes Walmdach in Kupferdeckung. Der Saal im Erdgeschoss ist NW bis auf ein Oberlichtband geschlossen; Bibliothek und Musikraum darüber; Jugendräume darunter mit Zugang und Belichtung von der abgesenkten Nordwestseite. [Textilschule \(Fachhochschule\) Dornbirn, Umbau \(Bibliothek\) – Austria 1997](#)

Das beste Beispiel der Architektur der 60er Jahre in Vorarlberg wurde hier detailgetreu saniert und einer neuen Nutzung zugeführt. Trotz Erfüllung der bauphysikalischen Auflagen ist es gelungen, die elegante und spannungsvolle Architektursprache dieses Baues von Ramersdorfer und Meusburger zu erhalten. Fachhochschule, Kunstraum Dornbirn und das Vorarlberger Architekturinstitut bespielen die neu adaptierten Räume, die teilweise auf Grund der neuen Nutzung geändert wurden. Dort wo neue Eingriffe erfolgten, wurden diese im Sinne der vorhandenen Materialsprache und Detaillösungen umgesetzt. (Kaufmann)

Die „Bundeslehr- und Versuchsanstalt für Textilindustrie“, von Willi Ramersdorfer und German Meusburger 1954 - 1960 realisiert, war zur Entstehungszeit formal völlig „up to date“, bautechnisch eher sorglos. Nach 1991 funktionslos geworden, kam der schleichende Zerfall. Durch Initiative der Architekten, die in dem Bau nicht allein das historische Dokument, sondern die immer noch spürbare Frische des Ansatzes schätzten, wurde der Abbruch verhindert. Das Engagement der Stadt und schließlich auch der Landespolitik gab mit dem Entschluß zur Neunutzung als Fachhochschule den entscheidenden Impuls für die Revitalisierung. Bei der wärme-, schall- und brandschutztechnischen Sanierung waren äußerst knifflige Probleme zu lösen, u.a. wurde das Heizsystem auf Biomasse umgestellt. Es versorgt nun auch das Competencecenter und eine Wohnanlage in der Nachbarschaft. (Text: Otto Kapfinger in „Baukunst in Vorarlberg seit 1980, Hrsg. VAI / KUB“)

(<http://www.nextroom.at>)

This is what a minor miracle looks like. The new college in Vorarlberg is a perfect renovation that has emerged from the ruin of what once had been the textile school (the school moved out of the building a considerable time ago). An almost forgotten landmark in the re-emergence of modernism in Austria has returned triumphantly to the system of regional architectural culture. Politicians, the local economy and the planning authorities of the town of Dornbirn transformed the site through speedy, concentrated action into an excellent example of contemporary reurbanisation. The 1950s architecture by Meusburger/Ramersdorfer which has risen like a phoenix from the ashes now serves a well worked-out concept of use with a standard also reflected in the institution's corporate design that was recently awarded one of the internationally most significant prizes for graphic design in Tokyo.

#### **Bücherei / Mediathek / Archiv. Krems a.d. Donau – Austria 2009**

Bauherrschaft: Stadt Krems, Planung: 2006 – 2007, Ausführung: 2008, Eröffnung: 2008, Grundstücksfläche: 6.778 m<sup>2</sup>,  
Bruttogeschossfläche: 1.270 m<sup>2</sup>, Nutzfläche: 850 m<sup>2</sup>, Umbauter Raum: 5.080 m<sup>3</sup>, Kosten pro Quadratmeter: € 1.035

Im Jänner 2009 ist die Bibliothek und Mediathek der Stadt Krems in den bis auf das 13. Jahrhundert zurückgehenden Westtrakt des ehemaligen Kremser Dominikanerklosters übersiedelt. Vorgegangen ist ein aufwändiger Restau-rierungs- und Sanierungsprozess. Auf 435 Quadratmetern erstreckt sich die neue Bücherei in den adaptierten Räumlichkeiten. 31.000 Bücher, 720 Zeitschriften und fast 4000 audiovisuelle Medien stehen für die Büchereikunden zum Entleihen bereit. Eine gemütliche Lesecke lädt zum Schmökern ein, die kleinsten Leser können es sich in der Spielecke mit einem Bilderbuch gemütlich machen. Wer sich lieber mit den modernen Medien beschäftigt, kann an einem der Internet-Arbeitsplätze sei-ne Recherchen durchführen oder über ein eigenes Terminal seine Entlehnun-gen buchen. Eine Einschau in das städtische Archiv und die wissenschaftliche Bibliothek ergänzen das umfassende Informationsangebot. Der Zugang zu sämtlichen Bereichen ist barrierefrei – rollstuhl- und kinder-wagengerecht mit einem Aufzug erreichbar. Kunsthistorisch ausschlaggebend für die Planungen waren die Barockisie-rungsphasen um 1730 im Inneren und um 1740 an den Fassaden. In den Innenräumen war das Ziel – bis auf eine Ausnahme – die Raumschale des 18. Jahrhunderts zu präsentieren. Nach der Entdeckung von Wandmalereien und gemalten Inschriften ent-schloss man sich im Empfangsraum des ersten Obergeschosses einen Teil der Baugeschichte in didaktischem Sinn sichtbar zu belassen. Der Raum beher-bergte im Mittelalter vermutlich die Bibliothek des Dominikanerklosters, wor-auf die Inschriften mit Bezug auf das Alte und das Neue Testament schließen lassen. **Neubau Erweiterung BHAK / BHASCH (Bundeshandelsakademie / Bundeshandelsschule), Innsbruck - Austria 2009 – 2011**

Das Anfang des 20. Jahrhunderts von den aus München stammenden Architekten Arthur Ringler und Eduard Klingler im Innsbrucker Sagen errichtete Schulgebäude ist ein typisches Beispiel der sogenannten „Tiroler Gotik“. In den 1970er Jahren wurde der denkmalgeschützte Bau durch Ekkehard Hörmann um einen gerüstartigen, aus der Struktur der alten Fassade entwickelten Aufbau aufgestockt. Für die notwendig gewordene Erweiterung der Bundeshandelsakademie und Bundeshandelsschule wurde 2004 ein Architekturwettbewerb ausgeschrieben, den Daniela Amann und Florian Lutz mit ihrem Konzept eines Solitärs gewinnen konnten, der in seiner ruhigen und monolithischen Gestaltung einen klaren Kontrapunkt zur Feingliedrigkeit des Bestands setzt. Die Grundidee ihres Entwurfs bestand darin, nördlich der bestehenden Turnhalle und von dieser deutlich abgesetzt einen fünfgeschossigen Baukörper zu positionieren, dessen oberste Ebene über die Turnhalle auskragt. Darunter befindet sich eine geschützte Freifläche, von der aus eine Rampe auf das Dach der Turnhalle führt, das begrünt und als Pausenfläche nutzbar gemacht wurde. In den beiden Untergeschossen und im Erdgeschoss befinden sich jeweils in Dreiergruppen angeordnete EDV-Unterrichtsräume, im obersten, annähernd quadratischem Geschoss wurden die Betriebswirtschaftszentren und drei Klassenräume untergebracht. Bibliothek, EDV-Sammlung, ein Projektraum und Pausenflächen bilden im ersten Obergeschoss die sehr offen gestaltete zentrale Ebene des Neubaus, die als Bindeglied zwischen neuem Hof am Turnhallendach, den Sportanlagen im Norden und dem Altbau fungiert, an den sie mittels einer Brücke angebunden ist. Das in seinem Erscheinungsbild und in seiner Substanz erhaltene Bestandsgebäude erfuh eine sog. „Funktionssanierung“ – brandschutztechnische Mängel wurden behoben sowie die gesamte Gebäudetechnik erneuert. Die Unterrichtsräume im Altbau erhielten abgehängte Akustikdecken und neue Bodenbeläge, der große Festsaal und die Kreuzgewölbe der Gänge wurden in Abstimmung mit dem Denkmalamt restauriert. **Österreichischer Staatspreis für Architektur und Nachhaltigkeit 2010**

Die Volksschule Mauth ist ein Manifest für die umfassende Verantwortung der Stadt Wels und ein Beweis dafür, dass soziale, ökologische und pädagogische Nachhaltigkeit und höchste architektonische Ansprüche miteinander vereinbar sind. Wels ist nach Linz in Oberösterreich die Stadt mit dem stärksten Zuzug und hat einen hohen Anteil an Kindern und Jugendlichen. Aus diesem Grund war für den Stadtteil Laahen der Neubau einer zwölfklassigen Volksschule notwendig geworden. Dass diese Schule etwas Besonderes werden soll, war von Anfang an klar. Einerseits hat sich die Stadt Wels 2008 verpflichtet, in Zukunft alle Neubauten im Passivhausstandard zu errichten, andererseits sollte es eine sogenannte „Bewegte Schule“ werden, denn, so die Schulleiterin Monika Wiesmeyr: „Bewegung ist für die Entwicklung der Kinder wichtig, sie ist eine unerlässliche Form der Erkenntnisgewinnung und fördert die Gedächtnisleistung.“ Außerdem hat die Hälfte der Kinder in den Welsener Volksschulen einen Migrationshintergrund, deshalb sei es wichtig, meint die Bezirksschulinspektorin Barbara Pitzer, „dass die Schule viel Bewegung und Flexibilität ermöglicht, weil Menschen aus verschiedenen Ländern und Kulturen anders lernen.“ Die Architekten Marte.Marte, die den EU-weiten Wettbewerb für die Volksschule Wels-Mauth gewonnen haben, haben die Besonderheit der Schule schon von außen sichtbar gemacht. Das helle zweistöckige Gebäude mit goldfarbenen Fenstern und sonnengelben Jalousien steht selbstbewusst im neuen Siedlungsgebiet und signalisiert, dass man hier gut und gerne lernen kann. Ein Einschnitt an der südwestlichen Ecke markiert den Eingang und bietet Schutz und Geborgenheit für wartende Schülerinnen und Schüler. Der Platz vor und neben der Schule kann von den BewohnerInnen der umliegenden Häuser genutzt werden und ist bei Kindern und Jugendlichen beliebt zum Skaten oder Rad fahren. Viel Licht und Luft Im Inneren orientiert sich der nahezu quadratische Baukörper am offenen Atrium mit Pflasterung, zwei Bäumen und einer Bank. Rund um den Hof führt der Gangbereich mit großzügigen Glasflächen, der in den Bewegungspausen von hüpfenden, tanzenden und spielenden Kindern bevölkert wird. Vor der Bibliothek im ersten Stock, der „Lern- und Forschungsstation“ der Schule, gibt es zum Innenhof hin eine Terrasse zum Lesen. Im Sinne der „Bewegten Schule“ gibt es keinen starren Stundenplan, sondern verschiedene Lerneinheiten, die von längeren Pausen für Bewegung und Essen unterbrochen werden. Auch die Einrichtung der Klassenzimmer, die an der Außenseite des Gebäudes angeordnet sind, fördert die Bewegung: Statt einer großen Tafel gibt es fünf kleinere, die an Schienen nach Bedarf verschoben werden können. Die Tische sind dreieckig und haben an einem Bein eine Rolle, dadurch können sie in verschiedensten Formationen zusammengestellt werden. So kann eine Gruppe in der Klasse zum Beispiel rechnen, während die andere an einem gemeinsamen Plakat bastelt. Auch das führt dazu, dass sich die SchülerInnen mehr bewegen müssen und im Unterricht aktiver sind. Zwischen jeweils zwei Klassenzimmern gibt es einen gemeinsamen Gruppenraum. Zusätzlich stehen ein Werkraum, eine Schulküche mit Speiseraum, ein Turnsaal, die auch für Veranstaltungen nutzbare Aula und großzügige Räume für LehrerInnen und Schulleitung zur Verfügung. Die hellen, offenen Räume unterstützen das pädagogische Konzept, im Gang mit Ausblick können sich die Kinder (und LehrerInnen) gut entspannen, beobachtet Monika Wiesmeyr: „Es geht in der Volksschule ganz stark auch um menschliche und soziale Entwicklung. Wir stellen fest, dass das hier besser gelingt als in anderen Schulgebäuden.“ Die Schulfriedenheit sei dementsprechend hoch, und wenn es Probleme gebe, werde offen darüber gesprochen. Für hohe Lebensqualität sorgt vor den Fenstern verlegt wurde. Jede Klasse hat ein eigenes Lüftungsgerät; in jedem Raum wird der CO<sub>2</sub>-Gehalt gemessen und die Lüftung danach automatisch gesteuert. Die Wartung der Lüftungsgeräte erfolgt vom Gang aus, damit der Unterricht dadurch nicht gestört wird. Um eine Überwärmung an heißen Tagen zu verhindern, gibt es Außenjalousien, die zentral gesteuert werden. Gleichzeitig können sie aber auch individuell in der Klasse eingestellt werden. Eine 28 m<sup>2</sup> große Photovoltaik-Anlage und eine 50 m<sup>2</sup> große Solaranlage erzeugen Strom und Warmwasser. Weichenstellungen in der Bildungspolitik, lobt die Jury des Staatspreises für

Architektur und Nachhaltigkeit. „Hier wird vorweggenommen und räumlich manifest, was Schule sein soll und sein wird: eine differenzierte Welt an Lehr- und Lernangeboten, Raum für unterschiedliche Lernatmosphären, Lerngeschwindigkeiten und Gruppengrößen und für das ungehinderte, die Weiterführung unterstützende Bewegungsbedürfnis von Kindern.“ Die Volksschule Mauth beweise außerdem, dass eine kompakte Form nicht langweilig sein müsse und Erfordernisse der Nachhaltigkeit auch höchsten architektonischen Ansprüchen zu genügen vermögen. #### **Bücherei Schwendergasse, Wien – Austria 2004**

Auftraggeber: MA 19 Architektur und Stadtgestaltung, Wien, Nutzer: MA 13 Bildung und außerschulische Jugendbetreuung  
Wien, Baubeginn: Dezember 2002, Fertigstellung: März 2004

In einem Gebäude der 70er Jahre ist neben Volkshochschule, Musikschule etc. auch die Bibliothek Schwendergasse im 15. Bezirk untergebracht. Weder entspricht das Image einer modernen Bibliothek, welches sich immer mehr den jüngeren Benutzerschichten zuwendet, noch entspricht die Ausstattung dem radikalen Wandel der Medien vom Buch zur CD. Das Gebäude wird behindertengerecht adaptiert, auch Mütter mit Kinderwagen können jetzt die Bibliothek ohne Schwelle erreichen. Kräftige Zeichen werden gesetzt, um das Image zu ändern. Das Innere wird den neuen Anforderungen angepasst. (Mascha)

#### **Bibliothek u. Musikschule, Meidling, Wien – Austria 2002 - 2004**

Bauherr: Arcade Meidling Errichtungs und Verwaltung GmbH, Architektur: ATP Architekten und Ingenieure, Wien und Mascha & Seethaler Architekten, ATP Architekten und Ingenieure, Wien Gesamtprojektkosten: ca. € 34.000.000, Bauwerkskosten: ca. 22 Mio Euro, Kosten pro m<sup>2</sup> Bruttogeschossfläche: ca. 800,- / m<sup>2</sup>, Kosten pro m<sup>3</sup> Bruttorauminhalt: ca. 210,- / m<sup>3</sup>

Die Bücherei liegt im oberen Geschoss des Einkaufszentrums Arcade Meidling und öffnet sich mit einer großen geschwungenen Glasfassade zur Shopping-Mall hin. Die architektonische Dynamik wird auch im Büchereiraum selbst fortgesetzt, wo durch ein innovatives Einrichtungskonzept ein ebenso attraktives wie funktionales Ambiente geschaffen wurde. (Mascha)

Am 10. September 2004 konnte der Wiener Bezirk Meidling sein neues, multifunktionales Zentrum "Arcade" in Besitz nehmen. Über dem Einkaufszentrum und der Mall im Erdgeschoß liegt ein weiteres öffentliches Geschoss mit städtischer Bibliothek und öffentlicher Musikschule samt Veranstaltungssaal. Darüber befinden sich sechs Bürogeschosse, gekrönt von einem kecken Glaskubus in dreißig Meter Höhe am Dach mit schönem Rundblick über die Stadt. Die Planungsgemeinschaft Architekten und Ingenieure, Wien, und Mascha & Seethaler Architekten, Wien, fügten das unregelmäßige Vieleck der Arcade rücksichtsvoll in den umliegenden Baubestand ein, mit dem Höhen und Gebäudekanten eine Einheit bilden. Materialien und Formen sprechen jedoch nun eine deutliche Sprache der Gegenwart auf der ursprünglichen städtebaulichen Restfläche, einer Spätfolge des Wiener U-Bahn-Baus. (<http://www.bauinfo24.at>)

## **Architekt Ernst Mayr, Wien – Austria**

#### **Arbeiterkammer AK – Medienzentrum, Villach – Austria 2008**

Baubeginn: September 2007, Offizielle Eröffnung: 12. September 2008, Baukosten gesamt: 4 Millionen Euro

Als Sieger des Architektenwettbewerbs ist Architekt Mag. arch. Ernst Mayr aus Wien hervorgegangen. Er zeichnet bereits für die Gestaltung der Hauptbücherei der Stadt Wien verantwortlich. Die Jury unter Vorsitz von Architekt Mag. arch. Paul Katzberger kam zu dem Schluss, dass es Mayr gelungen ist, dem AK-Gebäude einerseits durch ergänzende Fassadenelemente und Betonung des Eingangs eine neue, sehr serviceorientierte Erscheinung zu geben und andererseits auch unterschiedliche Bereiche durch Sichtachsenverbindungen so miteinander verknüpft wurden, dass ein Ort der Begegnung nicht nur mit den unterschiedlichen Medien stattfindet, sondern vor allem auch als Interaktion zwischen den Benutzern untereinander beziehungsweise mit den Mitarbeitern des Medienzentrums. Manzenreiter bezeichnet das Projekt (Fertigstellung 2008) als weiteren wichtigen Baustein der mittlerweile voll angelaufenen Altstadtoffensive und dankt dafür in besonderem Maße AK-Präsident Günther Goach für sein Engagement im Sinne Villachs. Manzenreiter wies weiter darauf hin, dass dafür aus Mitteln der Altstadtoffensive rund eine Million Euro an Fördergeldern zur Verfügung gestellt werde. "Mit dem Ausbau der Musikschule wird jetzt der Kaiser-Josef-Platz zum neuen Medien-, Bildungs- und Kulturzentrum unserer Altstadt." Die Zahl der Musikschüler hat sich in den letzten Jahren verdoppelt. Deshalb wird die Musikschule um einen modernen Zubau erweitert. Der Baubeginn erfolgt bereits im Herbst. "Hauptaufgabe des Wettbewerbs war der Einbau einer modernen Mediathek in das bestehende Gebäude der Arbeiterkammer in Villach. Das ist aber nur Teil eines Gesamtbauvorhabens, im Zuge dessen die gesamte Bezirksstelle umgebaut und damit moderner und kundenfreundlicher wird", verweist AK-Präsident Günther Goach auf das umfangreiche Bauvorhaben der AK in Villach. "Wir wollen die Servicequalität durch raschere Verfügbarkeit der Informationen und Ansprechpartner auch in Villach verbessern und das auch durch bauliche Maßnahmen und optische Transparenz unterstützen", betont Goach. Die Arbeiterkammer werde – so Landesrat Ing. Reinhart Rohr – nun den Anforderungen der heutigen Zeit gerecht. Das neue Medienzentrum und die Konzentration der wichtigsten Arbeitnehmerorganisationen in der Altstadt sei ein Schritt in die richtige Richtung. Das neue Zentrum der Altstadt werde Kommunikation und Begegnung auslösen. Die Alpen-Adria-Mediathek in der Arbeiterkammer Villach wird die bisherige Stadtbibliothek um eine eigene Abteilung für Kinder- und Jugendliteratur erweitern und mit neuen Medien – Hörbüchern auf DVD und CD – sowie einem "Newsroom" mit Internet-Terminals ausstatten. Gleichzeitig wird der Bücherbestand mehrsprachig ausgerichtet. Literatur in englischer, italienischer und slowenischer Sprache wird in Buchform ebenso zur Verfügung stehen wie auf neuen Medien. Dieser inhaltlichen Neuausrichtung und Erweiterung soll auch das neue Architekturkonzept Rechnung tragen: Auf rund 1300 Quadratmetern wird inklusive Archiven und Buchbinderei die räumlich größte und modernste Freihandbibliothek Kärntens entstehen und optimale Bedingungen für die Besucher bieten: durch einen hohen Grad an Transparenz wird die Alpen-Adria-Mediathek schon vom öffentlichen Raum aus erkennbar sein, die Fassadengestaltung ist offen und einladend, Lichthöfe und Fensterfronten sorgen für Durchlässigkeit und natürliches Licht, Außen- und Innenbereich werden optimal verbunden die räumliche Trennung von AK und Bibliothek wird aufgehoben, "Damit wird die neue Mediathek ein Ort der kulturellen Begegnung, ein Treffpunkt für Kultur- und Literaturinteressierte in unserer Stadt, der österreichweit Vorbildcharakter ist", freut sich Bürgermeister Helmut Manzenreiter. Für die Bildungseinrichtungen Volkshochschule und Berufsförderungsanstalt werden in der neuen Arbeiterkammer weiters 27 modernste Schulungs- und Bildungsräumlichkeiten entstehen, davon vier nach aktuellen IT-Standards ausgerüstete EDV-Säle. "Gleichzeitig wurde vereinbart, dass die Stadt Villach so rasch wie möglich mit der Errichtung

einer Tiefgarage im Bereich des Burgplatzes beginnt", betont AK-Präsident Goach. Der AK-Umbau wird rund ein Jahr dauern. Der Spatenstich erfolgt noch im August dieses Jahres. ([http://www.villach.at/inhalt/29224\\_29948.htm](http://www.villach.at/inhalt/29224_29948.htm))

### **Städtische Büchereien Wien Filiale Liesing, Wien – Austria 2004 – Umbau und Erweiterung 2010**

Die neue Bücherei befindet sich in einer ehemaligen Bankfiliale, die Adaptierung des Lokals hat der Architekt der Hauptbücherei, Ernst Mayr, übernommen. Zentrales architektonisches Leitmotiv ist eine geschwungene Funktionswand, die dem Raum einen unverwechselbaren Charakter gibt. Besonderes Augenmerk wird auch dem Kinderbereich gewidmet. Er liegt gleich neben dem Eingang und besteht aus einer kleinen Raumgruppe, in der mit Nischen und verschiedenen Raumhöhen, aber auch durch ein fröhliches Farbkonzept Kinder aller Altersgruppen angesprochen werden sollen. Für Jugendliche wurde ein Raum mit ganz besonderem Flair gestaltet: die Jugendbücherei befindet sich im ehemaligen Tresorraum der Bank, der durch coole Gestaltung punkten wird. Außerdem wird es eine großzügige Zeitschriften-Lesezone geben, in der ganzen Bücherei wurde Wert auf gemütliche Plätze und Schmökerecken gelegt. Zahlreiche PC-Arbeitsplätze mit Internetzugang werden ebenfalls zur Verfügung stehen. (<http://ots.at>)

### **Hauptbücherei Wien, Wien – Austria 1999 – 2003**

Wettbewerb 1998 1st prize, Eröffnung 2003, Bauherr: Stadt Wien, Magistratsabteilung 13: Bildung und außerschulische Jugendbetreuung, Bruttogeschossfläche: 10.600 m<sup>2</sup>, Nutzfläche: 6.090 m<sup>2</sup>

"Energiespender am Gürtel" bezeichnet Bibliotheksdirektor Alfred Pfoser "sein" neues Haus am Urban-Loritz-Platz. Treffender könnte man das im Frühjahr eröffnete Gebäude der Wiener Hauptbibliothek kaum beschreiben. Es präsentiert sich nicht als elitärer Ort des Wissens, sondern als urbaner Treffpunkt, der auch solche Bevölkerungsschichten anzieht, die bislang mit der Institution Bibliothek kaum vertraut waren. Die Idee, inmitten der "Stadtautobahn", in Nachbarschaft zu zwielichtigen Etablissements die neue Bücherei zu errichten, stieß nicht nur auf Gegenliebe. Aber: Der Gürtel ist ein idealer Bibliotheksstandort. Die Anbindung an das öffentliche Verkehrsnetz könnte nicht günstiger sein und schließlich bedeutet der Bibliotheksbaubau außerhalb der noblen Innenstadt, wo die meisten Kulturbauten konzentriert sind, auch ein kulturpolitisches Signal. Geplant hat das von der Bevölkerung mit großem Zuspruch aufgenommene Gebäude der Wiener Architekt Ernst Mayr, der Anfang 1999 als Sieger eines zweistufigen Architektenwettbewerbes hervorgegangen ist. Signifikantestes Merkmal seines Entwurfes: eine Freitreppe zum Platz hin, die nicht nur signifikant ist, sondern auch das Potenzial hat, einen Mehrwert für den öffentlichen Raum anzubieten. Dass Freitreppe und Dachterrasse öffentlich zugänglich sind und den Platzraum in die Höhe erweitern, ist wohl das größte Verdienst des Bibliotheksbaus für die Aufwertung des Stadtraums. Die Flanken sind bis auf ein Fensterband im Bürogeschoß weitgehend geschlossen. Die Verkleidung mit Terrakotta-Paneelen wurde gewählt, um die Schallreflexion so gering wie möglich zu halten. Da Terrakotta schön altert und die am Gürtel unvermeidliche Schmutzbelastung optisch gut ertragen kann, war diese Entscheidung schnell getroffen. Außerdem sind die Paneele im Bedarfsfall unaufwändig auswechselbar. Ebenso wie das Tragwerk der Bibliothek leitete Ernst Mayr auch das Maß der Fassadenpaneele vom Maßsystem Otto Wagners ab, der seine Stadtbahnstationen auf einem Raster von 4,05 Meter aufbaute. Ihre Breite von 1,35 Meter entspricht wiederum einem gängigen Büroraster. Während sich das Gebäude auf den ersten Blick als geschlossene Kapsel darstellt, erschließen sich bei näherer Betrachtung und vor allem von innen eine erstaunliche Durchlässigkeit und Offenheit. Eine Serie von vertikalen Schlitzen gibt im Bereich der Eingangshalle sowie im Veranstaltungs- und Cafeteriabereich der beiden Bibliotheksgeschoße Ausblick in die Seitengassen des Gürtels und zur Stadthalle. Jeweils drei zweigeschoßige Erker stellen mit ihren verglasten Schmalseiten eine Blickverbindung nach außen her. Sheds über den Erkern bringen Oberlicht, drei Lichthöfe in der Mittelachse sorgen für die vertikale Blickverbindung bis auf die U-Bahn-Gelise. Nach Norden öffnet sich das Gebäude in allen Geschoßen über große Fensterflächen und gibt den Blick frei auf den Verkehrsstrom des Gürtels und bis zum Kahlenberg. Die Bibliothek steht mitten im städtischen Leben und lässt ihre Besucher das an vielen Punkten im und um das Haus spüren. Das nimmt dem Bildungsbauwerk jeden elitären Charakter, ist ein Anreiz für die Verkehrsteilnehmer – allein an U-Bahn-Passagieren gibt es hier täglich 35.000 – und eine Einladung, doch einmal die Bücherei aufzusuchen. Überall dort, wo Eleganz und Transparenz gezielt eingesetzt wurden, kamen Aluminium-Profil-Systeme, die die Marke ALU-FENSTER® führen, zur Anwendung. "Sowohl vom architektonischen Standpunkt als auch aus bauphysikalischen Gründen war die Alu-Pfosten-Riegelkonstruktion die einzig sinnvolle Lösung", so Architekt Ernst Mayr. ### **Nehrer + Medek und Partner, Wien – Austria**

Manfred Nehrer \*1944, Reinhard Medek \*1944 - + 2003

> 2004 NMPB Nehrer Pohl Bradic <http://www.nmpb-architekten.at>

### **BHAK – Bundeshandelsakademie / BHAS Bundeshandelsschule Gänserndorf (Niederösterreich) – Austria 2003**

Im Schulbau sind die Zeiten der großen Neubauten vorläufig zu Ende. Günther Domenig hat zwar im niederösterreichischen Walkersdorf gerade erst ein ziemlich großes Schulhaus für die BIG mitten auf die grüne Wiese gestellt, aber das ist inzwischen die Ausnahme. Denn erstens werden die grünen Wiesen langsam selten, und zweitens verlagert sich der Schwerpunkt der Aufgabenstellung zunehmend auf die Sanierung und Erweiterung bestehender Schulbauten. Man kann das in Gänserndorf an einem markanten Beispiel studieren, wo alles zusammenkommt, was solche Bauaufgaben charakterisiert: ein sehr knappes Baubudget, ein sehr enges Grundstück und die Notwendigkeit, die Bauarbeiten - abgesehen von den Ferien - bei laufendem Schulbetrieb durchzuführen. Einfach ist das nicht. Am Anfang stand ein Wettbewerb, den das Wiener Büro Nehrer + Medek im Jahr 2000 gewonnen hat. Aufgabe war, zwei bestehende dreigeschoßige Schultrakte, die durch einen ebenerdigen Gang verbunden waren, und einen eingeschobigen Mehrzweckraum im Hofbereich in die Planung einzubeziehen, vorhandene Behelfsbauten, die im Lauf der Jahre dazugekommen waren, wurden hingegen abgerissen. Angrenzend an das Grundstück: auf der einen Seite ein öffentlicher Platz, der hauptsächlich als Parkplatz genutzt wird, auf der anderen der Gemeindefestsaal, der auch als Turnhalle für die Schule dient. Es geht um eine Handelsakademie und eine Handelsschule, Einrichtungen also, die ein relativ großes Einzugsgebiet bedienen. Entsprechend war auch der Klassenbedarf. Nehrer + Medek haben diese Notwendigkeit mit einem Konzept bewältigt, das auf den ersten Blick unheimlich einfach erscheint: Sie haben als wesentlichste Maßnahme über den gesamten Bestand ein Brückenbauwerk - einen Virendeel-Träger - gespannt. Vorne, an der Straße, somit an der Schmalseite des Grundstücks, tritt diese Neubaumaßnahme nur durch eine dezente Auskragung, aber einen besonders freundlichen, sagen wir: kurbisgelben Anstrich in Erscheinung. In der Tiefe des Grundstücks wird dann die volle Länge dieser Neubaumaßnahme nachvollziehbar. Eine simple, aber auch sehr geschickte Maßnahme des Konzepts bestand im Absenken des Schulhofs zwischen den beiden Altbautrakten um ein Geschoß. So wurde großzügiger "Kellerraum" gewonnen - hier ist unter anderem die Bibliothek -, wunderbar belichtet und alles andere als ein Notbehelf. Schließlich wurde dem zweiten Altbautrakt, dem in der Grundstückstiefe, auch noch ein kleiner, relativ schmaler Neubau vorgestellt, der jetzt den attraktiven neuen Eingang in die große Halle flankiert - der alte Haupteingang, vorne an der Straße, existiert aber nach wie vor. Durch diese Maßnahme ergeben sich zwar ein paar Klassenräume, die nicht optimal natürlich belichtet scheinen, aber in einer Schule, in der EDV eine so große Rolle spielt, wird dieses Problem eigentlich nicht virulent, es entspricht eher

einem Bedarf. Denn Bildschirmarbeit bei strahlendem Sonnenschein ist sowieso nicht zumutbar. Nehrer + Medek haben den Altbestand praktisch nicht verändert, sie haben ihn lediglich saniert. Sogar die alten Holzfenster, wenn auch neu gestrichen, sind noch da. Ebenso die sanitären Einrichtungen. Man hatte ja nur ein sehr knappes Budget, Extratouren waren daher nicht möglich. Und dass das gesamte Bauvorhaben in diesem Umfang überhaupt realisiert werden konnte, das hat auch damit zu tun, dass das Büro alle Aufgaben - einschließlich Bauaufsicht und Kostenverantwortung - übernommen hat. Das ist deswegen erwähnenswert, weil heute immer weniger Architekturbüros in der Lage sind, eine so breite Aufgabenpalette zu erfüllen. In Gänserndorf sieht man aber, wie entscheidend es ist, dass alles in einer Hand bleibt, in einer Verantwortung. Denn je mehr Partnerbüros zugeschaltet werden, desto stärker verwässern sich die architektonische Idee, das Konzept, vor allem aber seine Umsetzung. Es kommt einfach etwas anderes heraus, wenn der Architekt selbst entscheidet, wo er sich welche Oberflächen leistet, wo er im Dienst der Sache mehr Geld ausgibt und wo er spart. Bei den Außenjalousien zum Beispiel haben Nehrer + Medek nicht gespart, da haben sie ein besonders robustes System gewählt, weil es hier im Weinviertel immer wieder zu einem ziemlich extremen Windaufprall kommt und ein filigranes Jalousiensystem dem einfach nicht gewachsen wäre. Dafür hat man sich andererseits bei den Terrazzoböden mit einem preisgünstigen Plattensystem begnügt, anstelle eines aufwändigeren Gussterrazzos. Räumlich stimmt alles. Wenn man vom unscheinbaren alten Haupteingang in die Schule hineinkommt, dann steht man zwar vor einem unheimlich langen Gang, aber der weitet sich perspektivisch auf - und vor allem: Man sieht durch bis ganz ans Ende und hinaus ins Freie. Sehr gelungen ist auch die Öffnung und Durchwegung des knapp bemessenen Freibereichs in der Grundstücks-tiefe. Die Einfassung mit einer teils hohen neuen, teils niedrigen alten Mauer ist so aufgeschnitten, dass die Schüler auch den angrenzenden öffentlichen Platz nutzen könnten. Was sie aber kaum tun, weil der zur Schule gehörige Freibereich bei aller Begrenztheit eben ziemlich gut strukturiert ist, auch durch den abgesenkten und von außen zugänglichen großen Hof, so dass offenbar gar kein Bedürfnis besteht "zu expandieren". Das Haus ist natürlich sehr energiebewusst geplant: Es hat Vollwärmeschutz-Fassaden, die zwar nicht zum Attraktivsten zählen, was sich denken lässt, aber das muss man in Kauf nehmen, wenn man auf niedrige Betriebskosten Wert legt. Nur im Bereich des vorgestellten neuen Traktes haben sich die Architekten an der Fassade emailliertes Glas geleistet, und der vorgesezte Windfang ist natürlich ganz gläsern und einladend transparent. Da es flächenmäßig keinen Spielraum gab, bedurfte es schon einer ziemlich minutiösen Tüftelei um das gesamte Raumprogramm unterzubringen. Aber das vergisst man, wenn man durch das Gebäude geht. Und dazu trägt die neue Halle mit ihrer Zweigeschößigkeit sehr wesentlich bei. Da entsteht Luftigkeit, Großzügigkeit, Offenheit, und das überstrahlt und relativiert alle räumlichen Engpässe. Für die Architekten war das Haus, obwohl der Neubauteil ja gar nicht so groß ist, keine leichte Aufgabe. Umbau und Neubau bei laufendem Schulbetrieb, das heißt: Keine lauten Arbeiten während des Unterrichts, und die Schulklassen umgesiedelt in Container, die draußen vor der Baustelle standen. Für Manfred Nehrer kam noch etwas hinzu: der völlig überraschende Tod seines Büropartners Reinhard Medek, in dessen Kompetenz dieses Projekt ursprünglich lag. Medek ist im Frühjahr gestorben, also noch vor den großen Sommerferien und damit einer Phase der intensivsten Bauarbeit. Da mussten im Büro letzte Kraftreserven mobilisiert werden, um diesen Verlust auszugleichen. Übrigens ist eines auffällig: Die Niederösterreicher haben nur wenig Grund, auf ihre architektonischen Aktivitäten stolz zu sein. Es gibt die Hauptstadtplanung, na gut. Es gibt in Krems immer wieder bemerkenswerte Initiativen. Es gibt Ernst Beneder. Und neuerdings gibt es in Wolkersdorf den erwähnten Schulbau von Günther Domenig, der allerdings vom Bund beauftragt wurde. Aber dann muss man, vor allem im nördlichen Niederösterreich, schon ziemlich suchen. Nur Gänserndorf scheint über ein etwas offeneres Architekturklima zu verfügen: Da hat immerhin das BKK-2 eine bemerkenswerte Musikschule gebaut, und da haben Nehrer + Medek schon vor Jahren eine Volksschule geplant, die sich auch heute noch sehen lassen kann. Eine kleine Boshaftigkeit kann ich mir in diesem Zusammenhang nicht verkneifen: Die Volksschule ist seit sieben Jahren in Betrieb und bis heute in tadellosem Zustand; die Handelsakademie/Handelschule wird erst seit wenigen Wochen bespielt - aber unter einem gepflegten Schulhaus stelle ich mir etwas anderes vor. von Liesbeth Waechter-Böhm (<http://www.nextroom.at>)

#### **Fachhochschule Wieselburg (Bibliothek) – Austria 2002**

Am Stadtrand von Wieselburg treffen – wie in Kleinstädten üblich – offene Agrarflächen unvermittelt auf Gewerbebauten und großvolumige Wohnbauten. Und so wie innerhalb der städtebaulichen Struktur Urbanes und Ländliches traut nebeneinander existieren, vereint auch die hier angesiedelte Fachhochschule für Produkt- und Projektmanagement – ein Standort der FH Wiener Neustadt – Elemente beider Welten. Außen Holz und Glas, innen High-Tech, Einsatz nachwachsender Rohstoffe und Transparenz: Das Gebäude spiegelt die Lehrinhalte der Schule wieder und kommuniziert die Beschäftigung des Studiengangs mit nachwachsenden Rohstoffen und Energietechnik in Forschung und Lehre nach Außen. Das architektonische Konzept geht Hand in Hand mit dem pädagogischen Ansatz. Die klare, kubische Gebäudeform sorgt für Ruhe und optischen Halt im heterogenen Umfeld und entfaltet so Wirkung. Offenheit ist sowohl im pädagogischen, als auch im architektonischen Konzept spürbar.

Die Anordnung der konstruktiven Gebäudestruktur ermöglicht maximale Freiheit für zukünftige Entwicklungen. Großzügige, flexible Raumsequenzen und übersichtliche Erschließungsflächen geben der inneren Organisation des Gebäudes eine besondere Qualität. Die nach Süd-Westen ausgerichtete verglaste Erschließungszone bildet das Entree und dient als Aufenthalts- und Ausstellungsbereich. Nach Nord-Osten sind die Unterrichtsräume orientiert, um eine blendfreie Belichtung zu gewährleisten, die Labors liegen im Keller. Das 1. Obergeschoß beherbergt Administration, Bibliothek und einen kleinen Hörsaal. Darüber befinden sich Einrichtungen für die Studierenden, wie ein offener Bereich für flexible Arbeitsplätze, Projekträume und EDV-Bereiche. Soweit es die NÖ Bauordnung für 3-geschoßige Holzbauten zulässt, wurde eine maximale Verwendung von Holzbauteilen angestrebt. Die tragenden Bauteile – Stützen und Decken – sind aus brandschutztechnischen Gründen massiv in Stahlbeton ausgeführt. Als Speichermaße gewährleisten sie ein ausgeglichenes Raumklima. Die Gebäudehülle ist aus vorgefertigten Holzelementen mit unbehandeltem, offener Lärchenholzschalung ausgeführt.

Die Dachkonstruktion bilden BSH-Träger mit aufgelegten hochgedämmten Holzfertigteil-Elementen und einem Gründachaufbau. Die Basis für hervorragende Energieeffizienz bildet die kompakte, schlichte Gebäudeform mit einer im Verhältnis zum Innenvolumen geringen Außenhülle. Die doppelschalige, teilweise begehbbare Glasfassade nutzt die passive Sonnenenergie in der kälteren Jahreszeit, im Sommer verhindert der darin integrierte Sonnenschutz sowie Lüftungsklappen im Dachbereich die Überhitzung der Innenräume. Zudem gestattet die Fassade eine Nachtlüftung und bietet einen Schallschutz vor dem Verkehrslärm der nahen Bundesstraße. Die großen Hörsäle und die Seminarräume im Erdgeschoß sind mit einem Lüftungssystem mit Erdreichkollektoren ausgestattet. Hierbei wird die Zuluft durch im Erdreich verlegte Rohre vorgewärmt bzw. gekühlt.

#### **Theoriegebäude der Universität Wien – Austria on design**

Neubau mit Hörsälen, Seminarräumen, Institute und einer Bibliothek

Bauherr: Universität Wien, 8.000 m<sup>2</sup>, 18.000.000 €

Der Schwerpunkt der Bebauung liegt an der Währingerstrasse, wovon auch der Hauptzugang zum neuen Institutsgebäude - durch eine großzügige Halle mit Durchblick in den gestalteten Innenhof - erfolgt. Von diesem Eingang ist einerseits das Hörsaalzentrum im Untergeschoss als auch direkt die Universitätsbibliothek und die Zugänge zu den Instituten und Seminarräumen in den Obergeschossen erschlossen. Dadurch ergibt sich eine optimale Orientierung im Gebäude zu den unterschiedlichen Hauptnutzungen. Die Universitätsbibliothek verfügt darüber hinaus über eine eigene interne Erschließung. Der Baukörper stellt an der Währingerstraße eine Baulückenverbauung dar, ist jedoch über ein internes Erschließungsgelenk (Erschließungs- und Versorgungskern) mit dem Hoftrakt L-förmig ausgebildet. Der Erker an der Währingerstraße verbindet die unterschiedlichen Gebäudefluchten der Nachbarhäuser und eine Zäsur in den Obergeschossen nimmt die unterschiedliche Gebäudehöhe der Nachbargebäude auf. (NMPB)

#### **Schule MONTE LAA (Bibliothek), Wien 10 – Austria 2009**

NMPB-Architekten in Zusammenarbeit mit AN-architects

Neubau (Pilotprojekt Campus Bildungsprojekt für 0-10Jährige) einer Volksschule, einer Ganztagesbetreuung, und eines Kindergartens, Bauherr: Stadt Wien vertreten durch Magistratsabteilung 19, Architektur und Gestaltung und Magistratsabteilung 34, Bau- und Gebäudemanagement, Bebaute Fläche 5.049m<sup>2</sup>, Grundstücksfläche 8.876m<sup>2</sup>, Umbauter Raum ca. 52.221m<sup>2</sup>, Bruttogrundrissfläche ca. 13.409m<sup>2</sup>, Herstellungskosten netto € 21.920.000

Das Projekt ist die erste Schule des sogenannten Campus-Schulmodells der Stadt Wien und stellt eine multifunktionale Bildungseinrichtung für Kinder von 0-10 Jahren dar. Die Situierung des Campusgebäudes erfolgt im Nordwesten des Bauplatzes entlang des sogenannten Central Parks. Die unterschiedlichen Funktionen der Ganztagsvolksschule und des Kindergartens sind in einer Gebäudeform zusammengefasst. Die Form des Gebäudes folgt der linearen, öffentlichen Grünanlage und wendet sich wie eine Schlange zum Nachbargrundstück. Dadurch entstehen große zusammenhängende Freiflächen: Im Süden (Garten) und Südwesten des Areals (Dachlandschaft auf den Turnsälen) mit Pausen- und Sportflächen verschiedener Nutzung und guter Besonnung. Diese gemeinsame Sport- und Freiflächen sowie Speiseräume ermöglichen besondere Synergien zwischen Schule und Kindergarten. Der Zugang erfolgt von einer gemeinsamen Arkade parallel zum Central Park im Norden. Durch die Zusammenlegbarkeit der Pausenhalle der Ganztagschule mit den Foyers der Turnsäle, der ihnen zugeordneten Bibliothek bzw. Mehrzweckraum sowie des Speisesaals entsteht für alle Campus-Kinder eine Zone des sozialen Austausches. Die Gestaltung der 6.500m<sup>2</sup> Freiraum-Gesamtfläche stammt von 3:0 Landschaftsarchitektur. (<http://www.oegfa.at>)

#### **Fachhochschule (Bibliothek) St.Pölten – Austria 2005 - 2007**

Frisch, fröhlich, farbig. Beinahe aufregend: die Fachhochschule in St. Pölten. Ein Architekturbüro hat sein Konzept belebt. Eine Besichtigung.

von Liesbeth Waechter-Böhm

Genau genommen, ist es ein riesiges Gebäude, die Fachhochschule in St. Pölten: 70 mal 70 Meter im Quadrat. Und es enthält schulische Einrichtungen zu den Themen Mensch/Wirtschaft/Technologie. Ausgerichtet war es in der Planungsphase auf 800 Studenten, dann auf 1.200 Studenten, jetzt sind 1.400 da. Es ist aus verschiedenen Gründen ein interessantes Projekt. Städtebaulich setzt es einen Akzent in einer heterogenen, überhaupt nicht attraktiven Umgebung. Längerfristig betrachtet, soll es aber der Auftakt für eine Bildungsachse sein, die sich bis zum Regierungsviertel hin fortsetzt. Außerdem ist es ein interessantes Errichtungsmodell. Es geht nicht auf einen Wettbewerb zurück. In diesem Fall hat sich der Bauherr einen Errichter und Investor gesucht, der sich verpflichtet hat, das Gebäude nicht nur zu erbauen, sondern auch 25 Jahre lang zu betreiben. Und in dieser Zeit wird sozusagen abbezahlt – dann gehört es wirklich dem Nutzerkonsortium. Das ist eine ziemlich bemerkenswerte Strategie, man nennt sie PPP – Private Public Partnership. Es lässt sich damit sehr zielgerichtet und effektiv, also auch rasch agieren. Im Jänner 2005 wurde mit der Planung begonnen, im August 2005 lagen Baugenehmigung und Ausschreibung vor, im November 2005 ist die EU-weite Ausschreibung erfolgt, am 15. Dezember hat das Bestbieterkonsortium den Bauauftrag erhalten, aufgrund der Wettersituation wurde „erst“ im Jänner mit dem Bau begonnen, im Juni 2007 wurde der Bau fertig übergeben. In der Regel träumen Architekturbüros davon, dass etwas so zügig vonstatten geht. Denn je länger ein Projekt dauert, desto unökonomischer wird es auch. Man darf Manfred Nehrer aber glauben, wenn er sagt, einen vergleichbaren Stress hat es im Büro nie gegeben. Außerdem hat diese Strategie einen Schwachpunkt: Wenn nicht von vornherein vertraglich festgelegt ist, dass gewisse qualitative Standards tatsächlich umgesetzt werden müssen, dann kann das gebaute Ergebnis unter Umständen nur sehr wenig mit der Planung zu tun haben. Nehrer & Medek haben seinerzeit in Vorarlberg, in Lustenau, unter ähnlichen Bedingungen ein solches Projekt realisiert. Das Büro – nach dem frühen Tod von Reinhard Medek und neuen Partnerschaften heißt es jetzt NMPB Architekten – wusste daher genau, worauf das besondere Augenmerk zu richten ist. Und es hat möglicherweise auch deswegen den Zuschlag erhalten – und sicher auch, weil es nachweisen konnte, dass die extrem kurze Bauzeit von der Bürokapazität her zu bewältigen war. Das Haus ist ein großes Geviert, ein riesiger Block. Man betritt es unter einem acht Meter stützenfrei auskragenden Vordach und kommt in eine viergeschoßige Halle. Diese Halle ist das Highlight der Schule, weil hier die räumlichen Voraussetzungen geschaffen sind, um aus einem „Spartenbetrieb“ mehr zu machen. Sie ist Verteilerfläche, aber auch Kommunikationsfläche für Leute, die sonst gar nichts miteinander zu tun haben. Alle Gemeinschaftseinrichtungen sind rund um diese Halle organisiert: die Hörsäle, die Bibliothek, der Festsaal, die Mensa, das Café. Die Haupttreppe, sicher aus Fertigteilen errichtet, ist überdies ein skulpturales Element, das einen spezifischen Akzent setzt. (Es ist übrigens nicht ganz nachvollziehbar, dass die Glasbrüstungen ein Problem sind; ich selbst bin nicht schwindelfrei, habe mich aber nicht verunsichert gefühlt; anderen Leuten geht es offenbar anders.) Und noch etwas Besonderes hat diese Halle: Durch eine Glaswand setzt sie sich in einen Patio fort, von dem die Architekten selbst sagen, dass seine Gestaltung, auch seine Grüngestaltung, bewusst artifiziell ist. Im Gegensatz zur glasgedeckten Halle ist es ein Freiraum. Aber einer, der wie ein Zimmer formuliert wurde. Die eigentlichen Unterrichtsräume sind durchaus bescheiden. Aber schon Nehrer & Medek hatten diese Qualität: Bei ihnen funktioniert immer alles. Das ist auch diesmal der Fall. Die Hörsäle, vom Erdgeschoß erschlossen, sind in die Erde eingegraben; Lichtkorridore davor sorgen nicht nur für die notwendigen Fluchtmöglichkeiten, man sieht immer auch den Himmel. Und das Mobiliar – die Bestuhlung stammt durchwegs von Jacobson – lässt in seiner farblichen Differenzierung tatsächlich die Sonne aufgehen. Farbe ist überhaupt ein Element, das zum ersten Mal in diesem Ausmaß eine Rolle in der Architektur des Büros spielt. Sie ist Leitlinie – übrigens von Ingeborg Kumpfmüller grafisch, auch künstlerisch gekonnt in Szene gesetzt – und atmosphärischer Mehrwert. Jeder Bereich – auch die Stiegenhäuser – ist durch eine eigene Farbe gekennzeichnet, man weiß gleich, wie man wohin kommt. Auch die Materialwahl hat ihre Qualitäten. Auf den großen Erschließungsflächen liegt brasilianischer

Schiefer, ansonsten anthrazitfarbenes Linoleum, es gibt überall sehr viel Holz, es gibt aber auch Eternit und Heraklit, außerdem Sichtbeton und – außen – hochglanzpolierte Aluminium-Paneele. Es hat sicher ein Wandel im formalen Ausdruck des Büros stattgefunden. Und der geht wahrscheinlich auf die neuen Partnerschaften zurück. Die Bauten sind frischer und fröhlicher. Nehrer selbst sagt, früher haben sie sich immer mit Rasterystemen abgequält, jetzt gibt es auch den „römischen Verband“. Die gesamte Außenfassade des Gebäudes ist so gelöst. Horizontale Regelmäßigkeit, aber vertikale Abweichungen. Es gibt einen eingeschnittenen Hof, es gibt eine Terrasse, die sich gegebenenfalls mit dem Festsaal und sogar der Kantine für spezielle Veranstaltungen nutzen lässt. Es gibt durchaus reizvolle Terrassen für die Raucher. Aber vor allem haben die Architekten eine Lösung für die Baukörper-Abwicklung gefunden, die wichtig ist. Es steht nicht einfach ein brutaler Block da. Die Fassaden haben einen Knick, eine leichte Kurve. Optisch verkürzt das die tatsächliche Länge sehr wirkungsvoll. Und solche Lösungen fallen einfach nur Architekten ein, die ihr Metier verstehen, die mit solchen Dimensionen umzugehen wissen. Früher konnte man sagen, dass aus dem Büro Nehrer & Medek immer sehr korrekte, aber auch etwas brave, zurückhaltende Lösungen gekommen sind. Funktioniert haben die Bauten allerdings immer. Jetzt werden sie langsam auch interessant, erfrischend, wahrscheinlich bald aufregend. Die neuen Partnerschaften sind offensichtlich ein Gewinn. Eines der nächsten Projekte aus diesem Büro wird die Erweiterung der Wiener Arbeiterkammer sein. Soviel man hört, ist die Umsetzung nicht ohne Schwierigkeiten abgegangen. Umso gespannter warten wir auf das Ergebnis. Für den Beitrag verantwortlich: Spectrum, 21.10.2007 ( <http://nextroom.at> )

#### **Konrad-Fiechtl-Schule, Bibliothek, Watten (Tirol) – Austria 1999**

Bauherr: Marktgemeinde Wattens , Grundstücksfläche: Umbau Nutzfläche: 670 m2 , Planungsbeginn: November1997 Baubeginn Fertigstellung: Jun. 1998 / März 1999, Baukosten: € 625.000

Der Dachraum blieb in der bestehenden Form erhalten, wodurch die Raumstruktur bestimmt wird. Die Erschließung zum Dachgeschoß erfolgt von der Halle im 1. Obergeschoß. um eine Raumfolge zu erzielen, die die Raumwahrnehmung des Dachstuhls (Gespärre) begünstigt, wurde auf Gänge verzichtet. als Verbindung fungiert eine Lesegalerie, die sich zwischen den Mittelstehern des Gespärres oberhalb der Kiehlbalken befindet. Die Dachgaupen auf der Nordseite wurden durch ein Glasband über dem Stiegenaufgang ersetzt. zusätzlich verläuft über die gesamte Ffirstlänge ein transluzentes Oberlichtband, das eine gleichmäßige Belichtung ermöglicht, wobei durch die Nordseitige Orientierung ein zu starkes Aufheizen der darunterliegenden Räume durch Sonnenein-Strahlung in den Sommermonaten verhindert wird. Die südseitigen Gaupen sind ebenfalls entfernt und durch Dachflächenfenster ersetzt worden. die Klassenräume wurden zur Pausenhalle hin mit Glaswänden abgetrennt. diese sind auf Augenhöhe mit Porträts von ehemaligen Schülerinnen bedruckt, um den ungestörten Unterricht zu gewährleisten.(Obermoser) (<http://www.nextroom.at>)

#### **Stadtplatz und Kulturzentrum (Bibliothek), Landeck – Austria 2010**

Bauherrschaft: Stadtgemeinde Landeck, Wettbewerb: 2007, Planung: 2007, Ausführung: 2008 – 2010

Im Zentrum von Landeck befindet sich das 1927 von Hans Illmer (\*1878 - + 1936) errichtete, unter Denkmalschutz stehende Gebäude des „alten Kino“, in dem seit Jahren ein intensiver Kulturbetrieb (Programmkino und Konzerte) stattfindet. Das Gebäude war in schlechtem Zustand, das angrenzende, aus dem Anfang des 20. Jahrhundert stammende Vereinshaus überhaupt abbruchreif. Über einen Architekturwettbewerb wurde nach einer Lösung gesucht, wie an Stelle des Vereinshauses ein Stadtplatz entstehen kann und zugleich das „alte Kino“ die notwendige funktionelle Erweiterung erhält. Das Projekt von parc.architekten umfasst den durch den Abbruch des Vereinshauses entstandenen Freiraum an drei Seiten mit einer einseitig verglasten Spange aus weißem Sichtbeton. Die Fassaden wurden so transparent wie möglich gehalten, die Rückwände sind über Oberlichtbänder tageshell beleuchtet. Damit werden nicht die Fassaden, sondern die Rückwände des neuen Gebäudes als Platzbegrenzung empfunden. Das Leben in den Bauteilen rund um den Platz – Büroräumlichkeiten an der Stirnseite und ein an das Kino angeschlossenes neues Café – findet quasi auf dem Platz statt. Der Platz selbst wurde komplett frei belassen und ist damit offen für unterschiedlichste Nutzungsmöglichkeiten. Das denkmalgeschützte Kino wurde saniert und von allen Zubauten befreit, in den zweigeschossigen Raum des neuen Kulturcafés wurden Podeste, Bar und Technikkabine als hölzerne Einbauten hineingesetzt – der Bezug zum Platz bleibt bis in den hintersten Winkel erhalten. Im Geschoß über dem Kino wurde der Dachraum freigelegt, die Nutzung dieses Raumes ist noch offen. Konzipiert wurde er für eine öffentliche Nutzung als Bibliothek oder Galerie mit eigenem Zugang, Lift und Nebenräumen. (Text: Claudia Wedekind nach einem Text der Architekten)

#### Stadtbücherei Biberach – Germany 1995

Vom Getreide zu den Büchern: Sechs Ebenen, durch einen Vertikalraum verbunden. In Biberach, Deutschland, wurde ein alter Getreidespeicher zur Stadtbücherei umgebaut. Boris Podrecca zeichnet verantwortlich für Entwurf und Ausführung, von Walter Zschokke

Hat sich schon jemand Gedanken gemacht über den Doppelsinn der Bezeichnung „nicht löschbarer Speicher“, mit der halb qualifizierend, halb abqualifizierend Bücher gemeint sind: daß das Feuer des Inhalts noch nach Jahrhunderten auf Leserinnen und Leser überspringen kann, daß die Erinnerung an ein Buch bis heute weiterlebt, auch wenn die letzten handgeschriebenen Exemplare schon zur Römerzeit verlorengegangen sind, und daß Versuche, durch massenhaftes Verbrennen die Existenz eines Buches auszulöschen, in ihrem Wahn kläglich gescheitert sind. Daß aber die elektronisch gespeicherten Informationen auf Band und Diskette, angeblich sogar auf CD, sich schneller abbauen als selbst jene Bestände der Nationalbibliothek, die leider nicht auf säurefreies Papier gedruckt worden sind, und vom Verfall bedroht sind. Es ist daher weder anachronistisch noch zukunftsfeindlich, wenn sich die Behörden von Biberach im Hinblick auf die Revitalisierung eines alten Speichers für die Stadtbücherei entschieden haben. Bei dem Bauwerk, das auf dem „Viehmarktplatz“ steht, handelt es sich um einen ausgesprochenen Solitär. Die schmalen, nur der Lüftung und einer minimalen Belichtung dienenden Fenster wirken nach außen nur mehr als Scharten und geben dem Bau ein geschlossenes, kompaktes Aussehen. Breitgelagert und an den Seiten zwei Geschoße hoch gemauert, wird das große Volumen von einem mächtigen Satteldach überragt, das an den Stirnseiten von hohen Giebelwänden gestützt wird. Daß der Winkel des Daches mit knapp 55 Grad dem pythagoräischen Dreieck mit den Seiten drei zu vier zu fünf entspricht, zeigt die universale Bedeutung dieser jahrtausendealten Handwerkerregel, mit der ein rechter Winkel fixiert werden kann und die bis heute auf Baustellen verwendet wird. Wen wundert es daher, daß der Rechteckgrundriß mit eins zu 1,63 ziemlich genau dem Verhältnis des Goldenen Schnitts folgt. Die schiere Größe und die autonome Geschlossenheit - neben der lebenserhaltenden Funktion als Getreidespeicher - haben den kulturellen Wert über die Jahrhunderte festgeschrieben. Die sorgfältige Proportionierung hat aber gewiß mit dazu beigetragen, daß das Bauwerk bis in unsere Zeit erhalten geblieben ist, denn als Speicher hat es schon länger ausgedient. Heute ist das Bauwerk denkmalgeschützt. Das Innere ist angefüllt mit Zimmermannsmerk: in der Breite dreischiffig, in der Länge über zehn Achsen mit kürzeren Stützenabständen. Die mit Bögen ausgesteiften Pfosten tragen kräftige Unterzüge, auf denen die breiten Balken der Schüttböden für das Getreide lasten. Das etagenweise hierarchisch aufgebaute Holzwerk bietet Raum für zwei Vollgeschoße und vier nach oben in der Breite abnehmende Ebenen im hohen Dachraum. Dieses Gebäude, das ein integrales Ganzes bildete, sollte für die Verwendung als Stadtbücherei adaptiert werden. Damit lag der Ball beim Architekten. Boris Podrecca, der bei zahlreichen Umbauten seine Sensibilität im Umgang mit bestehender Bausubstanz bewiesen hat, sorgte zuerst einmal für Licht: Im Bereich der mittleren fünf Rasterfelder wurden die Böden herausgetrennt und die insgesamt sechs Ebenen durch einen Vertikalraum verbunden. Um diesen neuen Raum architektonisch wirksam werden zu lassen, schnitt der Architekt im Firstbereich die geschuppte Haut aus Dachziegeln heraus und ersetzte sie durch Glas. Mit diesem Zenitallicht gab er dem bisher emotionslos geschichteten Gebäude eine Mitte, durch die von oben Licht eindringt, das in die angrenzenden Bereiche durchsickert. Folgerichtig wurden auch die Elemente der Vertikalerschließung in diesen hohen Raum hineingestellt: als gläsernes Prisma der Lift, der über leichte Stege zugänglich ist. Weiters für das feuersichere Fluchtstiegenhaus ein Rechteckprisma aus Sichtbeton. Mit den Arbeitsfugen des Betoniervorgangs verschränkte kleine Öffnungen beleben die Oberfläche und verweisen mit ihrer abgetrepten Anordnung auf den Inhalt. Vom Eingang her bis zum zweiten Obergeschoß zieht sich die Raumdiagonale einer regelmäßig von Absätzen unterbrochenen Kaskadentreppe. Diese erschließt und verbindet die drei als Publikumsbereiche genutzten unteren Geschoße. Die darüberliegenden Stockwerke sind nur dem Personal zugänglich. Der Lift und der obere Teil der Fluchtstiege dienen als interne Vertikalverbindung. Während in den oberen Geschoßen Regale und Einzelarbeitsplätze das Bild bestimmen, enthält das Erdgeschoß ein Foyer mit Depotgestellen für Taschen und Mappen. Informationstische, Karteien und ein computerisierter Katalog sowie Sanitäranlagen schließen sich an. Dazu kommt an der dem Eingang gegenüberliegenden Stirnseite ein Vortragsraum, der auch direkt von außen zugänglich ist. Podrecca hat die Mauerschale unangetastet gelassen. Er läßt ihr die Hauptrolle: Er hat keine neuen Löcher hineinstemmen lassen, keine trennenden oder durchdringenden Elemente zu ihr in einen provokativen Gegensatz gestellt. Der in sprödem Weiß verputzte Quader mit Satteldach wirkt derart unspezifisch, daß der Windfang, vor die eine Stirnseite gestellt, als eindeutiges Signal für den Eingang dient. Doch geht es Podrecca vor allem um ein räumliches Prinzip: Nach Durchschreiten des Portals, das heißt nach Passieren der dicken Mauerschale, soll man sich bereits im innenräumlichen Großraum befinden, der Windfangkobel darf den Raumeindruck nicht stören. Obwohl das materialmäßig wie räumlich präzente Zimmermannsmerk gitterartig den von der Mauerschale definierten Großraum füllt, bildet es zugleich ein integrierendes Element, das die Ganzheit des Innenraumes wahrt. Indem die gläserne Schleuse außerhalb steht, wird das räumliche Präludium vor die eigentliche Schwelle verlegt. Um aber den Übergang von innen nach außen weicher zu machen und zu vermitteln, hat Podrecca eine kurze Mauerscheibe in die Öffnung gestellt. Diese leitet den Eintretenden und erweitert den Schwellenbereich auf zwei, drei Schritte zur Übergangszone. Im Gegensatz zu einer richtigen Schwelle bildet diese Wandscheibe aber kein Gehhindernis. Selbst der Bodenbelag zieht sich vom Windfang bis zum Treppenansatz teppichartig durch. Mit diesen gestalterischen Maßnahmen wird die konzeptionelle Strenge des Bestands auf einer unteren Maßstabsebene durch Annäherung relativiert. In anderen Bereichen geht Podrecca dagegen zur Mauerschale auf Distanz, etwa mit den Dachwasserabfallrohren im Bereich der architektonisch empfindlichen Gebäudekanten. Das Freistellen dieser vertikalen Elemente autonomisiert den weißen Körper der Mauerschale. Der Gestalter will dessen Integrität nicht antasten. Für einen visuell sensiblen Menschen hat die Lage der Dachwasserrohre Einfluß auf die proportionale Wirkung der Fassade. Das Abrücken will beiden Teilsystemen formale Identität geben. Sie werden nicht vermischt, sondern säuberlich sortiert und nebeneinandergestellt, jedem wird explizit sein Recht und sein Platz zugesprochen. Das Bauwerk erzählt dem Auge des Beobachters seine Geschichte, aber auch noch andere Geschichten - jedoch nicht verbal, mit der gesprochenen Sprache als Referenzebene, sondern in der Sprache der Dinge, der Materialien, der Formen und der Bräuche. Manches läßt sich erst beim Benutzen, beim Angreifen erfassen, weil erst der unmittelbare Gebrauch den Grund für eine gestalterische Maßnahme erschließt. Boris Podrecca, in dessen Namen sich bereits die kulturellen Sphären mischen, der Vielsprachige, der sich nördlich und südlich der Alpen wie zu Hause bewegt, ist ein Meistererzähler und Vermittler zwischen den Kulturen und Zeiten. Wer bereit ist, sich auf seine Arbeiten einzulassen, gerät in eine Welt, die an die Erzählungen aus Tausendundeiner Nacht erinnert, an Aladins Wunderlampe - das Licht - und an das „Sesam öffne dich!“ zum Raum. Podrecca erzählt mit architektonischen Mitteln, unbeirrt von der bereits auslaufenden Modeströmung einer zur Manier verkommenen sogenannten neuen Einfachheit, aber auch unbeirrt von Entwicklungen, die die Architektur zur Gaudi machen oder sie für den Eintrag in das Guinnessbuch der Rekorde herrichten möchten. Nicht die vorschnelle Festlegung einer äußeren Form

oder die Übernahme eines Stils garantieren für architektonische Qualität, sondern die Tiefe der Auseinandersetzung mit der Aufgabe, dem Bestand, den Materialien, den Formen und den kulturellen Zusammenhängen. Daß man als Architekt dabei auswählen darf, sogar auswählen muß, macht die Aufgabe nur attraktiver, aber auch schwieriger. (<http://www.nextroom.at>)

#### **Arnold Schönberg Center, Wien – Austria 1997**

Bereits zweimal war Elsa Prochazka auf der Architekturbienale von Venedig vertreten: 1991 stellte die 51jährige Wiener Architektin im österreichischen Pavillon eine der «13 Austrian Positions» vor; 1996 repräsentierte sie eine der «Emerging voices». Die damals gezeigte Neugestaltung der Wiener Musikergedenkstätten stellt eine spezifische Version der Detailkultur der Stadt dar. Vom Beginn der neunziger Jahre stammt das museographische Konzept des Jüdischen Museums in Hohenems. Bei weiteren Installationen und Ausstellungsgestaltungen reflektierte die Architektin immer wieder das Thema der Präsentation. Die verschiedenen Entwürfe vexieren zwischen zurückhaltendem Minimalismus und eigenwilliger Expressivität. Das jüngste Beispiel in dieser Reihe von Arbeiten stellt die Ausgestaltung des im Vorjahr in Wien eröffneten Arnold-Schönberg-Centers dar. Parallel dazu entstand ein Büro- und Produktionsgebäude für Coca-Cola an der südlichen Stadtkante. Trotz den unterschiedlichen Massstäben kann man bei beiden Beispielen von der kalkulierten Umdeutung einer vorhandenen Bausubstanz sprechen.

#### **Das Arnold-Schönberg-Center**

Mit der Gründung des Arnold-Schönberg-Centers holte man den 1951 in Los Angeles verstorbenen Komponisten in seine Geburtsstadt zurück. Schönbergs gesamter Nachlass wurde von Kalifornien nach Wien transferiert, wo man einen Ort vielfältiger Aktivitäten schuf. Das dafür notwendige Engagement seitens der Politik wurde durch die Entscheidung für eine adäquate architektonische Gestaltung der Räumlichkeiten ergänzt. Diese befinden sich in einem neoklassizistischen Repräsentationsbau von Ernst von Gotthilf-Miscolczy und Alexander Neumann am Schwarzenbergplatz. Bei der Umgestaltung handelt es sich weniger um eine architektonische Interpretation des Themas; Prochazka schuf vielmehr eine der Funktion entsprechende Atmosphäre. Auffällig sind in diesem Zusammenhang die beiden Foyers. Die Räumlichkeiten erstrecken sich über 1300 Quadratmeter und damit über das gesamte Geschoss des ungewöhnlichen dreiflügeligen Baukörpers mit Innenhof. Von den beiden Treppenhäusern öffnen sich relativ schmale Gänge, die dennoch als repräsentative Empfangsräume fungieren sollten: einmal als Foyer für Ausstellungsbereich, **Bibliothek, Medienraum**, Handschriftensammlung und diverse Arbeitsräume, das andere Mal als feierliche Überleitung zum Veranstaltungsraum. Eine gekonnte Verwandlung der Raumatmosphäre gelang Prochazka durch die Einfügung von silbrig glänzenden, massiv wirkenden Wandelementen, die unmittelbar an weiss verputzte Flächen anschliessen. Integriert sind Türen, etwa jene zur Garderobe, die sich nahtlos schliessen lassen, aber auch eine indirekte Beleuchtung und Klappenelemente, die während der Pausen schmale Ablageflächen bilden. Die Wandstücke vereinen somit die Idee des intelligenten Möbels mit einer raumdefinierenden Funktion im architektonischen Sinn. Auch an anderen Stellen verwandelt sich das Möbel in Architektur und umgekehrt. Beim Schönberg-Center galt es, eine «Hybridnutzung» in einen Geschossbau zu integrieren. Zur Lösung dieser schwierigen Aufgabe situierte Prochazka die Funktionen mit besonderer Öffentlichkeit an den Eckpunkten; **die Bibliothek liegt in einem ovalen Raum mit weitem Blick über den Schwarzenbergplatz**, die Ausstellungsfläche bildet ein Rechteck, der Veranstaltungssaal eine ungewöhnliche V-förmige Konfiguration. Unterschiedliche Farben - Gelb, Grün und Blaugrau - visualisieren das Konzept. Für die Ausstellungen wurden nicht nur eigene Vitrinen geschaffen, sondern auch verschiebbare Wandelemente, die je nach den Erfordernissen offene Raumnischen bilden und die Fensterreihe abschliessen können. Beim technisch ausgeklügelten Konzertsaal in elegantem Blaugrau entsteht durch die V-Form eine unter den gegebenen Bedingungen erstaunliche räumliche Grosszügigkeit. Auf Grund der belassenen Glastüren wird die Überlagerung einer etwas älteren mit einer jüngeren Schicht ablesbar. Die spezifischen Raumstimmungen entstehen durch die Verwendung von Halbfertigfabrikaten, und zwar im Sinne einer offenen, lebendigen Ästhetik. Ein gewisser Verfremdungseffekt der Materialien kommt zum Tragen. Den Arbeitsräumen verliehen braune MDF-Platten also einerseits eine «werkstattähnliche» Atmosphäre, farbig differenziert schaffen diese andererseits eine gehobene Stimmung. #### **Wohnung für einen Bücherfreund, Wien – Austria 2010**

In einem denkmalgeschützten Ringstraßenpalais wurden Wohn-, Arbeits- und Laborräume ausgeführt. Aufgrund der vorhandenen Raumhöhe von mehr als 4 Metern konnte im Bibliotheksraum eine Galerieebene für die raumhohe Bücherwand verwirklicht werden. Diese erstreckt sich vom Essraum über den zentralen Bibliotheksraum bis zum Arbeitszimmer in einer Länge von 23 Metern. Die vorhandenen Innenwände zwischen diesen Räumen wurden auf der Fassaden- und der Kaminmauerseite raumhoch „aufgeschlitzt“, das dadurch entstandene Raumkontinuum erlaubt vielfältige Ein- und Ausblicke. Die Galerieebene wurde in einer zarten Holz-Stahlkonstruktion ausgeführt, alle konstruktiven Teile bleiben sichtbar. Die Sanierung der alten Kastenfenster mit den charakteristischen Fensterklappen erfolgte in Abstimmung mit dem Bundesdenkmalamt. Die Böden wurden in der Bibliothek aus geöltem Eichenholz und auf der Galerie und in den Labors als PU-Beschichtung ausgeführt. (Text: Architekt) Beitrag von **Az W** <http://www.nextroom.at>

#### **Literaturhaus, Umbau und Innenausbau, Wien – Austria 1992**

Auftraggeberin: Dokumentationsstelle für neuere österreichische Literatur, geladener Wettbewerb I. Preis Planungsbeginn: November 1989, Fertigstellung: November 1992, Veranstaltungsbereich 1998, Nett Nutzfläche: ca. 1500 m<sup>2</sup>

Im Hochparterre und Souterrain eines bestehenden Gründerzeithauses aus dem Jahre 1903 wurden ein Kommunikationszentrum für Literaturschaffende, eine **wissenschaftliche Freihandbibliothek** mit 30 Lesearbeitsplätzen, Büros, Veranstaltungsräume und Archive geschaffen. Unter den Prämissen eines engen finanziellen Rahmens und strenger raumklimatischer Auflagen geschah der Umbau nach den Grundsätzen der Überschaubarkeit und Offenheit der zu adaptierenden Räumlichkeiten. Entwurfsidee:

Zentraler, durch Oberlichter belichteter Bibliotheksraum mit Verbindung zum Souterrain. Vertikale und horizontale Durchblicke ermöglichen, durch Entkernen der Räume bis auf die wesentlichen Tragstrukturen, großzügige Raumzusammenhänge schaffen. Neue Einbauten als transparente Stahl- und Glaskonstruktionen. Tageslicht wurde über Deckendurchbrüche bis ins Souterrain geführt.

Raumorganisation:

Um den zentralen Bibliotheksraum werden kleinere Räume, wie Foyer, Lese- und Bearbeitungsräume, Kopierraum, Garderobe und Nebenräume sowie ein Expedit zur Anlieferung neuer Bücher situiert. Der Bibliotheksraum im Innenhof des Bestandsgebäudes wird über die Oberlichter natürlich belichtet. Weiters wurde eine Galerie als Stahlkonstruktion eingebaut, um die Regalfächen für die Bibliothek zu optimieren. Der unter der Bibliothek, im Souterrain, liegende Archivbereich wird über das Treppenauge der verbindenden Stahl-Glastreppe mit Tageslicht versorgt. – Ebenfalls im Souterrain befindet sich der Veranstaltungsbereich für ca. 100 Personen – für Ausstellungen, Lesungen und Konzerte geeignet mit separatem Zugang für Abendveranstaltungen. (Rataplan)

**Literaturhaus / Franz Nabl Institut, Graz, Steiermark – Austria 2003**

Umgestaltung des Kulturhauses, Wettbewerb 2000 - 1. Preis, Planung 2000 – 2003, Realisierung 2002 - 2003

Literatur in Graz. Diese Verbindung besteht seit Jahrzehnten und hat der Stadt nicht nur den Ruf eingebracht, Zentrum engagierten literarischen Geschehens in Österreich zu sein, sondern wurde auch auf gesellschaftspolitischer Ebene immer wieder thematisiert und diskutiert. Das bizarre Aufeinandertreffen lokaler Bodenständigkeit und avantgardistischen Schriftstellertums in einer Stadt, deren Selbstverständnis sich in hohem Maß aus ihrer südlichen, stark in den oberitalienischen Raum orientierten Lage ergibt, trägt immer noch Früchte und hatte zur Folge, dass im Jahr 2000 von der Stadtverwaltung ein Wettbewerb zur Errichtung eines eigenen Literaturhauses im Bereich des bestehenden "Kulturhauses", eines Palais aus dem 19. Jahrhundert, veranstaltet wurde. Das "Kulturhaus" verfügt über einen L-förmigen Grundriss, dessen längerer Flügel an einer breiten, stark befahrenen Strasse liegt, während der kürzere Teil in eine Seitengasse reicht. Es wurde auf diese städtebauliche Situation mit der Bebauung des Hofes reagiert, wodurch sowohl der Bestand als auch der dazugehörende, etwas tiefer liegende parkähnliche Garten südlich des Palais von baulichen Maßnahmen frei gehalten werden konnte und einer Verdichtung – in Analogie zur inhaltlich verdichtenden Funktion des Literaturhauses als Schnittstelle zwischen Praxis, Dokumentation, Forschung und Öffentlichkeit – der baulichen Struktur des Ortes. Der Neubau besteht aus zwei gelb pigmentierten Sichtbetonkörpern: Einem flachen Kubus, die den Grundriss des Bestandes, wo Büro- und Bibliotheksnutzungen untergebracht sind, bis zur Höhe des Eingangsgeschoßes zum Rechteck schließt und den Veranstaltungssaal, dessen Südfassade sich zu einem im Bezug zum Garten noch einmal tiefer gelegten Platz mit Sitzstufen öffnet, beherbergt. Sie dient als Sockel für einen schmälere, zweigeschoßigen Kubus, der das L des Bestandes bis auf einen schmalen Spalt, in dem ein gläserner Lift die Verbindung herstellt, zu einem U schließt und ein Cafe auf der unteren, sowie das Archiv auf der oberen Ebene beinhaltet. Auf dem Dach des Sockelgebäudes entsteht dadurch eine hochwertige Terrasse, die sowohl die äußere Verbindung zwischen höher gelegenem Palais und abgesenktem Veranstaltungssaal bzw. Garten herstellt, als auch Sitzgarten mit Parkblick für das Cafe-Publikum ist. Aus der klaren Positionierung der beiden neuen Baukörper, ihrer materiellen und farblichen Homogenität und den diversen Niveauunterschieden und Bezugsflächen ergibt sich vor dem Hintergrund des Bestandes und des städtebaulichen Kontexts ein genau ausbalanciertes Gleichgewicht, das das eingangs erwähnte Verhältnis zwischen der Stadt und der Literatur widerspiegelt – ein Verhältnis, das vom Aufeinandertreffen extrem unterschiedlicher Komponenten lebt und in Summe ein überraschendes, vitales Ganzes ergibt.

<http://www.altgasse21.at>

**Universität für Bodenkultur „Schwackhöfer Haus“ (Bibliothek), Wien – Austria 1999 - 2004**

Was sich im Ensemble der Wiener Universität für Bodenkultur farbenprächtig wie ein Neubau präsentiert, ist in seinem Kern ein Umbau: Das ehemalige Laborgebäude der BOKU, ein experimenteller Stahlbau von Anton Schweighofer und Wolfdietrich Ziesel aus dem Jahr 1974, war im Laufe der Jahre buchstäblich vom Rost aufgefrassen worden, dazu gesellte sich ein Asbest-Problem, sodass man sich zur schrittweisen Absiedelung des Gebäudes entschloss. Und so war dem 1976 mit dem europäischen Stahlbaupreis gewürdigte "Meilenstein der zeitgenössischen Architektur" (BIG-Broschüre) nur eine Lebensdauer von rund 20 Jahren beschieden. Zunächst war in der Folge Anton Schweighofer zusammen mit Schwalm-Theiss & Gressenbauer sowie Herbert Bohrn für die Sanierung und Erweiterung der Substanz beauftragt worden, wobei letztere für die Umsetzung zuständig sein sollten. Schweighofer wollte - in Reaktion auf den gestiegenen Flächenbedarf - den Stahlbau in eine raumhältige Glashaut hüllen und auf dieses Weise einen Dialog zwischen Einst und Jetzt aufnehmen, doch dieser Ansatz fand bei der unter Zeitdruck stehenden Bauherrenschaft keine Zustimmung. Und so wurde ein von Schwalm-Theiss & Gressenbauer und Bohrn erarbeitetes Alternativkonzept umgesetzt, wobei der Innenkern des Bestands mit sichtbarer Stahlkonstruktion erhalten bleibt und durch Anbauten aus Stahlbeton erweitert wurde. Vor allem die aus dem Vorgängerbau übernommenen Raumhöhen von 4,5 Meter verleihen dem Haus eine im heutigen Verwaltungsbau unübliche Grandezza. Nach außen hin ist vom rostigen Glanz vergangener Tage nichts mehr zu sehen, nur ein paar Stahlteile liegen wie dislozierte Kunst-am-Bau-Stücke im Rasen. **Literatur:**

Kroller, Franz, Sigrid Reinitzer, Von der Postmoderne zur Megastruktur. Neu- und Ausbauten der Karl-Franzens-Universität Graz und ihrer Bibliothek, in: B.I.T. Online, 1998,3,pp. 131 – 144

Das RESOWI-Zentrum besteht aus Fakultätseinrichtungen für über 14.000 Studenten mit 32 Instituten, einer Fakultätsbibliothek, 11 Hörsälen und einem EDV-Zentrum. Das Grundstück ist 350 m lang und 50 m breit, ist dreiseitig von Straßen eingebettet, südseitig schließt es an das Universitätsgelände an. Das Gebäude ist allseitig vernetzt und ist zentral von Bewegungsadern durchzogen. Sie nehmen die Hauptverbindungen des Universitätsgeländes und der umliegenden Straßenzüge auf. Das gesamte organisatorische Programm wurde in einem langgestreckten Körper aufgenommen. Dieser Körper ist in einzelne architektonische Elemente gegliedert: Die Universitätsbibliothek wurde gegen Osten in Richtung Neubau Resowi erweitert. Der Zubau ist unterirdisch mit der Fakultätsbibliothek verbunden. In den beiden Untergeschossen liegen die Büchermagazine, in den beiden ersten Geschossen die Leseräume und im 2. und 3. Obergeschoß die Bibliotheksverwaltung. Die Wahl des konstruktiven Grundgerüsts erfolgte in Hinblick auf ökonomische Herstellungskosten und auf kurze Bauzeit. Herkömmlicher Stahlbetonbau in den unteren Geschoßen und Stahl-Stahlbetonverbundbau in den zwei Obergeschoßen sind die gewählten Bauweisen. Die Vertikalkerne sind in Ortbetonbauweise realisiert. Jeder der 7 Bauteile bildet für sich eine eigene statisch-konstruktive Einheit. Die konstruktiven Teile der UB-Erweiterung bestehen zur Gänze aus Stahlbeton, in herkömmlicher Ortbetonbauweise hergestellt. Generell kamen hinterlüftete Aluminiumfassaden zur Ausführung. Insgesamt sind 242 Parkplätze vorhanden, 32 davon überdacht im Untergeschoßbereich des Resowi-Gebäudes sowie eine größere Anzahl von Fahrradabstellplätzen. Die verbleibenden Außenflächen wurden nach Plänen des Gartenarchitekten gestaltet, weiters wurde beim südseitigen Eingangsbereich ein Teich angelegt der gleichzeitig als Regenwasserretentionsbecken dient, Geh- und Verkehrswege wurden asphaltiert, Teilflächen gepflastert. **Studienzentrum (Bibliothek) Technische Universität Graz – Austria 2000**

Das von den Architekten im Herbst 2000 fertiggestellte Studienzentrum der Technischen Universität Graz auf den Inffeldgründen geht auf einen Wettbewerb vor mehr als zehn Jahren zurück, in dem die Jury mit den Architekten Feuerstein und Domenig die städtebauliche Konzeption des Projekts positiv bewertete. Den angrenzenden Solitärbauten einer Schule und mehrerer universitärer Einrichtungen setzen sie ein Bauwerk zur Seite, dessen zwei weit ausladende Arme einen geschützten Hof - und damit das Potential für ein kommunikatives Zentrum - bilden. Der Außenraum als städtischer Platz war als Ergänzung des heterogenen Raumprogramms gedacht, das eine Mensa, eine Bibliothek, studentische Arbeitsräume, einen Turnsaal und einen Hörsaal vorsah. Zum Zeitpunkt des Wettbewerbs war dieser urban definierte Freiraum der einzige als Treffpunkt und Verweilplatz geeignete Ort des weitläufigen Areals. Die nach außen gerichteten Fassaden des annähernd hufeisenförmigen Baus geben sich überraschend schlicht, ohne wesentliche Vor- und Rücksprünge, leicht gekurvt und in den beiden oberen Geschoßen mit einer Bänderung aus Industrieglas horizontal betont. Die Innenhoffassaden unterscheiden sich von der weitgehend unpräzisen Außenseite wesentlich, und zwar in Proportion, Farbe und Material. Sie weichen nach dem Erdgeschoß in einer sich öffnenden Geste in eine schräge Dachfläche zurück, um aus dieser im dritten und vierten Geschoß als eine Art zweigeschoßiger Erker wieder hervorzutreten. Zwischen der beidseits vierteiligen Gliederung in Blechverkleidung wird mit einem alle Etagen durchziehenden Lichtschlitz die schräge Rasterung, die den ganzen Bau durchzieht, verdeutlicht. Die Innenansicht, ganz in Dunkelorange, soll im Lauf der Zeit zusätzlich durch ein mit Glyzinien bewachsenes grünes Dach gefaßt werden. Die gerasterte Rankstruktur aus Stahlseilen ist allerdings in so großer Höhe installiert, daß fraglich scheint, ob damit der Effekt einer Laube erzielt werden kann. Beim Studienzentrum von einem Bauwerk "wie aus einem Guß" zu sprechen, wie dies in der Charakterisierung Szyszkowitz-Kowalskischer Arbeiten immer wieder geschieht, ist schon durch die unterschiedliche Behandlung der Fassaden nicht möglich, obwohl die Vermeidung allzu großer Kleinteiligkeit zum Ausdruck einer neuen Geschlossenheit beiträgt. Hier ist nicht mehr jede Gerade durch Knicken gebrochen, jeder Bauteil detailreich überformuliert, jeder Raum in einer amorph anklingenden Grundrißfiguration bis zur Penetranz überinterpretiert. Hier wird dem Nutzer Raum gelassen, Raum zur freien Entfaltung eigener Phantasie und zur Aneignung des Raums nach individuellen Vorstellungen. Mehr formale Strenge läßt - gar nicht paradoxerweise - mehr Freiheit. Formalismus tritt bedauerlicherweise dennoch auf, wenn etwa die vertikale Gliederung der Außenfassade durch übergeschoßhohe mattierte Glaselemente just in derselben Höhe und Breite durchsichtig belassen wird, wo daneben, im massiven Wandteil, bandartig Oberlichter eingesetzt sind. Oder auf der Schmalfront des Innenhofs, wo horizontale Fensterbänder mit U-förmig ums Eck geführten Scheinfenstern, die nur an der Außenwand in Erscheinung treten, zu einem dekorativen Element verkommen. Den zahlreichen Freunden dieser Architektur ist das vermutlich egal. Sie heben den unkonventionellen Gestus hervor, die phantasievolle Formenvielfalt, den abwechslungsreichen Einsatz von Materialien und Farbe. (<http://www.nextroom.at>)

<http://www.treusch.at>

### **Libraries:**

**Fachhochschule (Bibliothek) Oberösterreich, Campus Wels, Oberösterreich – Austria 2005** Bauherrschaft:

FH OÖ Immobilien GMBH, Wettbewerb: 2002, Planungsbeginn: 2002, Ausführung: 2003 – 2005, Grundstücksfläche: 5.900 m<sup>2</sup>, Bruttogeschossfläche: 23.900 m<sup>2</sup>, Nutzfläche: 15.800 m<sup>2</sup>, Bebaute Fläche: 3.980 m<sup>2</sup>, Baukosten: € 29.600.000

Die städtebauliche Einbindung der neuen Fachhochschule erfolgt in klarer und übersichtlicher Form: Die Schliessung der stadträumlichen Kante erfolgt durch den Baukörper entlang der Stelzhamerstrasse. Dahinter öffnet sich die Hofstruktur, welche um ein Geschoss abgesetzt ist und durch die grosszügige Halle erschlossen wird. Der Haupteingang ist von der Stelzhamerstrasse zurückgesetzt, um einen schönen Vorplatz zu bilden. Die Hofsituation ergibt ein ruhiges und angenehmes Ambiente, um konzentriert zu lernen oder sich in den Pausen gut erholen zu können. Eine klare Form mit ruhiger Fassadengestaltung vermittelt den nüchternen Eindruck einer zeitgemässen und zukunftsorientierten Hochschule. (Treusch)

Architektonisches Erscheinungsbild: Das Gebäude zeichnet sich durch eine klare Konzeption, Transparenz und hohe räumliche Qualität aus. Eine großzügige Halle stellt das kommunikative Zentrum der FH dar, Stege und Brücken verbinden die beiden Hallenseiten. Das offene Raumerlebnis wird durch Oberlichten in die angrenzenden Räume transportiert. Ein helles angenehmes Ambiente wird dadurch erzeugt.

### **Gebäudekonzeption**

Neben zahlreichen Hörsälen, Seminarräumen, Labors und Werkstätten bietet das Raumprogramm zahlreiche Sonderräume: die Mensa im EG, welche über großzügige Glasfronten den Blick von der Stelzhamerstrasse bis zum Pausenhof freigibt, großzügige Auditorien mit ansteigender Reihenbestuhlung, der Repräsentationsraum an der straßenseitigen Gebäudeecke, die Bibliothek, sowie das 2 geschößige CIM Labor.

### **Moderner FH Standort**

Der Neubau ist für ca. 1200 Studenten und 100 Mitarbeiter ausgelegt. Der Ausbildungsschwerpunkt des Standortes Wels liegt in den Bereichen Technik und Wirtschaft. (<http://www.bauinfo24.at>)

58 Millionen Euro für Neubau und Sanierungen – Gesamtfertigstellung 2015

In St. Pölten (Waldstraße) wachsen die HTL (**Höhere Technische Bundeslehr- und Versuchsanstalt**) und HAK (**Bundeshandelsakademie**) zusammen. Mit einem Investitionsvolumen von rund 58 Millionen Euro werden die nebeneinander liegenden Gebäude baulich verbunden, verlängert und generalsaniert. Dadurch entstehen ein neuer Eingangsbereich, in dem sich gemeinsam genutzte Räume wie Bibliothek und Mensa befinden, sowie ein neuer, 2.500 Quadratmeter großer barrierefreier Campus zwischen den Schulen. Das neue Verbindungsgebäude wird bereits Sommer 2013 nutzbar sein. Anschließend werden die beiden bestehenden Schulen generalsaniert, im Schuljahr 2015/16 sollen dann alle Arbeiten abgeschlossen sein. Die Gesamtnutzfläche des Neubaus wird 11.200 Quadratmeter betragen, die sanierte Nutzfläche im bisherigen Bestand 21.000 Quadratmeter. Außerdem wird ein neuer, von Lehrern und Schülern der HTL schon lange gewünschter Turnsaal errichtet. Die Gewinner des Architekturwettbewerbes, YF Architekten aus Wien, beschreiben die Funktionalität des Gebäudes: „Die beiden Schulen werden verlängert und fortgeführt. Der Neubau bildet eine Spange zwischen den Riegeln aus den 70-Jahren. Die Unterrichtsräume sind in den Obergeschossen angeordnet, öffentliche Funktionen befinden sich im Erdgeschoss, das dadurch offen und transparent wirkt. Der Campus ist offen und lädt zum Verweilen ein.“ Wolfgang Gleissner, Geschäftsführer der BIG, zur städtebaulichen Dimension des Bauvorhabens: „Die HTL – mit rund 2000 Schülern eine der größten Schulen Österreichs – wird optisch in den Vordergrund gerückt und mit der HAK gleichgestellt. Außerdem können durch die gemeinsam genutzten Räumlichkeiten im Verbindungsgebäude Synergieeffekte perfekt genutzt und Doppelgleisigkeiten ausgeräumt werden.“ Am 22. Juni um 11 Uhr nehmen Claudia Schmied, Bundesministerin für Unterricht, Kunst und Kultur sowie Wolfgang Gleissner,

**Geschäftsführer der BIG, Matthias Stadler, Bürgermeister von St. Pölten, Johann Heuras, 2. Präsident des nö. Landtages, Hermann Helm, amtsführender Präsident des Landesschulrates und die Direktoren der HTL, Johann Wiedlack und HAK, Günter Schraik, den feierlichen Spatenstich vor. **B.I.T. online, 2008,3 Motuleswskij, Roman, Stepanovitsch, Dietmar, Die Nationalbibliothek der Republik Belarus**

Viktor Kramarenko and Michael Vinogradov designed the National Library of Belarus as a gigantic diamond - a symbol of the knowledge stored in the books within. During the day, the 23-storey glazed building reflects the light and glitters like a true diamond. To maintain this image at night the architects teamed up with Walter Industries to design a lighting system that is as spectacular as the building itself. The system, which is integrated with the façade, consists of 4646 RGB colour-changing LED fixtures (custom-made), 1349 controllers, 54 splitters, a channel splitter, a converter and a computer that directs the light shows with the aid of custom-designed software. The result is visible from hundreds of metres away and ensures that the library is the new icon of Minsk 24 hours a day. (<http://www.mimoa.eu>) (<http://www.unusual-architecture.com>)

### **ABSCIS Architecten, Gent – Belgium**

<http://www.abscis-architecten.be>

#### **Libraries:**

#### **Universiteitsbibliotheek Antwerpen – Belgium on design**

Een bibliotheek is tegenwoordig meer dan alleen maar een plaats waar boeken worden ontleend en teruggebracht. Het is een knooppunt van informatie en een studielandschap dat uitgerust is met de allernieuwste digitale technologie op het vlak van multimedia en beveiliging. Met deze visie in het achterhoofd nam het team van ABSCIS ARCHITECTEN plaats aan de tekentafel en tekende het vernieuwende ontwerp van de universiteitsbibliotheek Antwerpen (UA).

#### **FUSIE DRIE UNIVERSITEITEN**

Door de fusie in 2003 van drie voorheen autonome universitaire instellingen, UFSIA, UIA en RUCA, tot de Universiteit Antwerpen, kwamen de plannen voor een nieuwe bibliotheek in een stroomversnelling terecht. De bedoeling was de menswetenschappelijke bibliotheken op één plaats in de Antwerpse binnenstad samen te brengen. Daarvoor werd de bestaande UFSIA-bibliotheek aan de Prinsstraat uitgekozen. Het plan behelsde de renovatie en uitbreiding van deze bibliotheek, het bouwen van kantoren, vergaderzalen en administratieruimten, en het creëren van een universitaire site voor de faculteit Rechten met de grote binnentuin van het aanpalende Hof van Liere als centraal structurerend element. Om dit te realiseren kocht UFSIA zeven aanpalende niet-beschermd 16de-eeuwse woningen aan de Venusstraat en, achter deze huizenrij, de zware betonnen constructie van de Fotogravure De Schutter. Een bouwhistorisch onderzoek in 2003 wees uit dat de panden niet beschermd bleken te zijn. Hierdoor ontstond de mogelijkheid de bestaande gebouwen integraal te vervangen door nieuwbouw, maar de gebouwen hadden zo'n rijke geschiedenis en het straatbeeld was te waardevol waardoor de architecten opteerden voor een renovatie. Om een architect te vinden besloot de gebouwencommissie van de UA eind 2002 geen architectuurwedstrijd te organiseren, maar te kiezen voor een Europese algemene offertevoorraag. De ontwerper moest zijn architecturale visie en zijn referenties als creatief en uitvoerend architect voorleggen. Vanuit de 12 inzendingen koos de commissie voor ABSCIS ARCHITECTEN uit Gent.

#### **CREATIE RUIMTE EN LICHT**

Vooraleer met de werken in de gebouwen werd gestart, moest de gevel aangepakt worden. "De bibliotheek bestaat uit zeven aparte huizen en elk pand had haar eigen karakteristieke gevel verbonden door een natuurstenen strook aan de onderkant. Om toch uniformiteit te creëren gaven we allen huizen een witte kleur door middel van kalkpleister. De natuurstenen onderkant van de gevel alsook het schrijnwerk bleven weliswaar behouden", verduidelijkt architect Johan Van Den Driessche van ABSCIS ARCHITECTEN. De diversiteit van de woningen bleek ook binnenin een grote uitdaging voor het ontwerpteam. "Om een optimale ruimte te bekomen, stripten we binnenin alles om zo met schone lei te beginnen. We braken alle binnenmuren uit en we zochten een oplossing voor de verschillende vloerhoogtes, ruimtes, gangen en trappen. Om de niveaus op te vangen, gebruikten we trappen en hellingen. We gebruikten de verschillende vloerhoogtes ook om eilanden te creëren waardoor er een niet al te uniforme structuur ontstaat. De bibliotheek speelt hierop in door er de collecties van een bepaald departement of faculteit in onder te brengen." Naast het creëren van ruimte, wilden de architecten ook licht brengen. Een aantal ingrepen droeg hiertoe bij. "Eerst en vooral braken we een deel van de constructie open om een grote lichtschaft te creëren. Hierdoor ontstond een vierkant openbaar plein waarrond de verschillende functies geschikt zijn. De gevels aan dit binnenplein krijgen deels een aankleding in baksteen, deels in glas. Door de circulatiegangen die gecreëerd worden naar dit plein, ontstaan doorsteken voor fietsers en voetgangers. Hierdoor werden de kelders onder het plein helaas onbruikbaar waardoor we besloten ze op te vullen. Binnenin creëren twee grote koepels en een vide tussen de gelijkvloerse en de eerste verdieping de nodige lichtinval."

#### **CIRCULATIE EN AKOESTIEK**

Daarnaast moest ook de circulatie aangepakt worden. Om alle verloop buiten de bibliotheek te houden, werd besloten de circulatie via een centrale trap- en liftkoker te organiseren. Op die manier blijft de circulatie van de eigenlijke bibliotheek en wordt de rust voor de bezoekers gegarandeerd. Om die rust te optimaliseren, besteedden de architecten voldoende aandacht aan de akoestiek in de diverse ruimtes. "We installeerden overal akoestische plafonds en in de studeerhoeken plaatsten we akoestische tussenwanden in hout. Daarnaast zijn er op de eerste verdieping enkele studeerhoeken die volledig omsloten zijn door akoestisch glas. Op de vloer legden we tapijt, dit in tegenstelling tot het parket in de circulatieruimtes. We installeerden ook een elektronische ruisverspreider die constant via een groot aantal luidsprekers vrijwel onhoorbaar een ruis verspreidt die ander geluid moet neutraliseren."

#### **STABILITEITSPROBLEMEN**

Ondanks het feit dat de paddenstoelvloeren in de constructie zwaar genoeg waren om de zware fotografermachines te dragen, waren ze niet voldoende voor een bibliotheek. Tijdens een controle kwamen een aantal tekorten van de constructie aan het licht en moesten we oplossingen zoeken om de structuur zowel horizontaal als verticaal te verstevigen. De vloeren werden versterkt met een bijkomende wapening: op het oppervlak van de betonplaat werden, zowel aan de onder- als bovenkant, koolstofstrips aangebracht om de weerstand en de trekkracht te verhogen. Dezelfde strips versterken ook de balken op de plaatsen waar nu de compactusrekken staan. Enkele kolommen werden nog eens extra versterkt met koolstofvezels."

#### **INTERIEUR**

Voor de inrichting gold de regel: daglicht in ruimtes waar gewerkt wordt, zoals de leeszalen, de open en gesloten studiecellen, de groepsworkshops, een aantal leslokalen en de vergaderzalen. In het meest gesloten gedeelte staan de compactussen. De open boekenrekken zijn gegroepeerd in blokken bij de leeszalen. Voor het interieur koos de architect consequent voordonkere kleuren zoals zwart en antracietgrijs. Het vaste meubelwerk heeft een wit tafelblad op een donker onderstel. "We integreerden op drie verdiepingen verlichting in ovaalvormige gaten in de tussenwanden, die heel subtiel en traag van kleur verandert. Daarnaast vroeg de faculteit Rechten om zoveel mogelijk individuele ruimtes te voorzien. Daarom organiseerden we alle kantoren dusdanig dat ze aansluiten op enerzijds een circulatie-as en anderzijds een open ruimte."

#### **RENOVATIE OUDE BIBLIOTHEEK**

Oorspronkelijk was het de bedoeling om de aanpalende voormalige UFSIA-bibliotheek te renoveren, maar dit plan werd tijdelijk op de lange baan geschoven. "Een van de aandachtspunten waar de bouwheer ons in het begin op wees, was de krappe timing. De studenten waren beloofd dat ze vanaf het academiejaar 2007-2008 hun studies konden starten en afronden op dezelfde campus. Daarnaast was het beperkte budget ook een doorn in het oog van de originele plannen. Ons eerste basisplan zou viermaal meer kosten dan het voorziene budget, plaats van de oude naar de nieuwe bibliotheek.

Bron: Renoscripto nr56 - maart -april 2009 (ABSCIS)

**UA (Universiteit Antwerpen) Faculty of Law, Library, Offices – Antwerpen 2010**  
18.415 m<sup>2</sup>, €14.427.705

De ontwerpogave bestond uit het herlokalisieren van de verschillende bibliotheken humane wetenschappen – die verspreid zaten over de campussen Drie Eiken (UIA), Middelheim (RUCA) en een deel van de binnenstad (Ufsia) – en deze te centraliseren in een stadscampus in de Antwerpse binnenstad, meer bepaald in de door de Universiteit Antwerpen aangekochte gebouwen van de Fotogravure de Schutter in de Venusstraat. Het ontwerp geeft ruimte aan de uitbreiding van de bestaande bibliotheek en aan kantoren voor de faculteit Rechten. De nieuwe universiteitsbibliotheek bestaat uit publieke leeszalen met open rekken en niet-publieke boekenmagazijnen in de kelderverdiepingen. Naast de zuivere bibliotheekfuncties zijn er ook onthaalfuncties zoals een praatruimte en een tentoonstellingsruimte, computer- en vergaderlokalen voor groepswork en de nodige sanitaire, logistieke en technische ruimten. binnenplein met zicht op de leeszaal en detail gevel Venusstraat BIBLIOTHEK EN kantoren RECHTEN UA | ANTWERPEN Om dit universiteitscomplex ruimtelijk te verweven met de omgeving werd getracht om de publieke ruimte door te trekken tot in het bouwblok. De nieuwe hoofdtoegang tot de bibliotheek bevindt zich dan ook op een groot open binnenplein, dat gerealiseerd is door een gedeelte van de gebouwen De Schutter te slopen. Het nieuwe binnenplein werd opgevat als een ruimte tussen diverse gebouwen, met elk hun historische eigenheid. Uniformiteit in de gevels rondom het binnenplein werd dus bewust niet nagestreefd. Sommige delen zijn voorzien van klassieke raampartijen (de oude panden en constructies), andere van lange horizontale lichtstroken (de “magazijn”-constructies) en nog andere werden helemaal beglaasd en voorzien van gegalvaniseerde roosters (de inkompartij van de bibliotheek). De gevels aan de Venusstraat zijn als beschermd stadsgezicht bewaard gebleven en als dusdanig behandeld en gerenoveerd. Inwendige patio's en speels uitgewerkte, ovale gaten brengen het daglicht tot in het hart van de bibliotheek. Voor de inrichting van de bibliotheek geldt de regel: daglicht waar gewerkt wordt: de leeszalen, de open en gesloten studiecellen, de groepsworklokalen, een aantal leslokalen en de vergaderzalen bevinden zich alle aan open ruimtes. In het meest gesloten gedeelte bevinden zich de compactussen. De open boekenrekken zijn gegroepeerd in blokken bij de leeszalen. Het gebruik van kleur is gekoppeld aan specifieke functies. De basiskleur is antraciet: vloeren, boekenrekken, stoelen, tafels, lockers, Het vaste meubelwerk (balies, studiecellen, kolomomkastingen, ...) is afgewerkt in finer. Enkele felle kleuren komen terug in publiekgerichte functies (balies, zitobjecten in vestiaire en krantenleeszone,...) en in de eivormige lichtkoepels in de bibliotheek. Een belangrijk aspect voor de kantoren van de faculteit Rechten is de vraag van de bouwheer om zoveel mogelijk individuele ruimtes te voorzien. Alle kantoren werden zodanig georganiseerd dat ze aansluiten op een van de twee circulatie-assen enerzijds, én op een van de open ruimtes zodat ze allemaal daglicht hebben. Ook hier is kleur gebruikt met een welbepaalde functie: de wanden langs elk van de assen hebben een kleur met de bedoeling zich overal snel te kunnen situeren. (ABSCIS)

**La Maison des Sciences Humaines – Mediatheque, Belval (Esch-sur-Alzette) – Luxemburg 2014**

Association avec Tatiana Fabeck Architecten, Koerich Luxemburg <http://www.fabeck.lu>  
23.415 m<sup>2</sup>, €39.500.000 Opdrachtgever Fondes de Belval

Le 19 novembre 2010, Claude Wiseler, ministre du Développement durable et des Infrastructures, a donné le premier coup de pelle officiel de la mise en chantier de la Maison des sciences humaines à Belval.

La Maison des sciences humaines accueillera les chercheurs et les étudiants en master de la Faculté des lettres, des sciences humaines, des arts et des sciences de l'éducation et du Ceps/Instead (Centre d'études de population, de pauvreté et de politiques socio-économiques).

Le bâtiment aura deux fonctions principales, à savoir l'enseignement spécialisé et la recherche dans le domaine des sciences humaines et sociales. Les activités d'enseignement se limitent aux séminaires de recherche pour les étudiants en master. Elles auront lieu dans des salles de séminaires et salles de travaux pratiques. Les activités de recherche ont pour objectif majeur d'analyser et d'accompagner la société humaine dans son développement. Une partie des recherches est effectuée dans des bureaux tandis que l'autre partie se déroule dans des laboratoires spéciaux comme les laboratoires multimédias ou les laboratoires d'observation, de cognition et de phonétique.

Le bâtiment a une surface brute de 26.500 m<sup>2</sup> et comporte des surfaces de bureaux et des laboratoires. Il aura une capacité de 850 places de travail. Une librairie universitaire et un bistro ouvert au public viennent compléter le programme. Les coûts pour la construction de la Maison des sciences humaines s'élèvent à 67.400.000 euros.

L'architecture

La Maison des sciences humaines est un volume simple et compact qui s'organise autour de deux cours intérieures. Les façades de l'immeuble reflètent l'organisation intérieure: le bâtiment se compose d'une partie supérieure qui se pose sur un socle. Le socle est dédié à des fonctions mixtes, accessibles au public. Il s'ouvre sur un portique et est ainsi perméable et en interaction avec la ville. La transparence des matériaux en façade reflète le caractère ouvert de cette partie du bâtiment. On y retrouve: l'entrée principale avec les structures d'accueil, des surfaces de commerce, notamment une librairie universitaire et une cafétéria, l'administration centrale de la Maison des sciences humaines et des salles d'enseignement. La cafétéria s'ouvre sur le portique et a une vue sur une cour intérieure qui est reliée au premier sous-sol à la médiathèque destinée aux chercheurs et étudiants.

La partie supérieure du bâtiment est affectée à des surfaces bureautiques sur quatre niveaux. La façade est revêtue d'une peau rugueuse et mate composée de panneaux en fibres de béton. Au premier étage se trouve une deuxième cour qui est accessible depuis les salles de laboratoires et les salles d'enseignement et de recherche. C'est un espace convivial pour les chercheurs et employés de la Maison des sciences humaines.

Le bâtiment a été conçu par le groupement de maîtrise d'oeuvre Tatiana Fabeck Architecte et ABSCIS ontwerpgroep et les

ingénieurs B.E.S.T. Ingénieurs génie civil et BETIC Ingénieurs génie technique ainsi que le Studiebureau r. Boydens n.v. qui était sorti lauréat du concours international d'architecture. L'architecture se distingue par la simplicité judicieuse des formes et des matériaux voire la subtilité des couleurs choisies pour les façades et les aménagements intérieurs.

Déroulement des travaux

Dans un premier temps les travaux consistent à stabiliser la fouille et à démolir les structures industrielles dans le sol. Ensuite les travaux de gros œuvre pourront commencer. L'objectif est d'achever l'ouvrage pour 2014.

Inauguration du centre de documentation de la Cité des sciences

Neuf ans après la décision du gouvernement de construire la Cité des sciences à Belval, le projet est finalisé, les premiers chantiers sont en cours. Un grand travail a été accompli depuis les études préparatives et l'élaboration des programmes de construction en passant par les concours internationaux d'architecture et d'urbanisme jusqu'à l'établissement des plans détaillés de construction. Dans l'ensemble, l'État prévoit la réalisation d'une vingtaine de bâtiments dont les infrastructures pour l'Université du Luxembourg et plusieurs centres de recherche publics, de "start up" et d'enseignement, de services et administrations de l'État ainsi que des espaces pour activités socioculturelles et sportives.

Le fonds Belval, chargé de la réalisation de la Cité des sciences, a mis en place le projet en collaboration avec les futurs acteurs et utilisateurs des lieux. Pour documenter les travaux réalisés au cours des dernières années et informer le public sur

L'état d'avancement des bâtiments en cours d'exécution, le fonds Belval a créé le centre de documentation de la Cité des sciences. Dans le cadre d'une exposition interactive permanente, le public est invité à découvrir en détail les projets de construction, les acteurs de la Cité des sciences ainsi que les concepteurs des bâtiments et des aménagements urbains. Le centre de documentation de la Cité des sciences est installé dans la halle de la masse noire au pied du haut fourneau A, en face de la Rockhal. Dans le temps, le bâtiment de la masse noire (600 m<sup>2</sup>) servait de lieu de production à la masse de bouchage du trou de coulée du haut fourneau. Sur son prolongement latéral, la halle comporte à l'extérieur une partie couverte (300 m<sup>2</sup>) contenant des séchoirs dont la fonction était de sécher les poches de fonte afin d'enlever toute trace d'humidité pour éviter des explosions lors du remplissage de ces dernières avec de la fonte liquide.

## **ARJM Architecture & Urbanisme, Brussels – Belgium**

Abdelmajid Boulaïoum

<http://www.armj.be>

**Libraries:**

**Public Library, Boechout – Belgium 2000**

Client : Gemeentekrediet nv / Gemeentebestuur, surface : 1240 m<sup>2</sup>, cost : 1.488.000 €

**Awards:**

**1er PRIX + Prix triennal d'architecture Charles Duyver 2002**

La commune de Boechout possède aujourd'hui sa nouvelle bibliothèque. C'est à l'issue d'un concours que le projet de l'atelier d'architecture ARJM gic fut retenu. Située sur la place Jef Van Hoof au centre-ville, la bibliothèque est le fruit d'une réflexion sur la volumétrie du bâtiment, sur l'aménagement des espaces extérieurs et la symbolique de l'entrée. Un grand auvent devant l'entrée crée une «frontière» entre la place, animée et très fréquentée, et un espace récréatif, plus au calme, que s'approprieraient la bibliothèque et l'école toute proche. La composition architecturale de ce bâtiment est très «vivante». Les architectes ont joué avec les matériaux de façades: briques rouges, briques noires et une fresque intégrée dans un mur de béton. Les murs de briques rouges aux joints colorés s'agrémentent de courbes, de décrochements, de percements et de jeux dans les formats de briques.

**Libraries:**

**Bibliotheek Dendermonde Library, Social Restaurant & Polyvalent Hall – Belgium 2003 – 2010**

6.300 m<sup>2</sup>, 8.500.000 €

The building site is situated between the main road of the city of Dendermonde and the green bank of the river Dender. Three urban strategies lead to the creation of a new connection of these two contrasting atmospheres. The historical fortifications are transformed into a greenbelt around the centre of the city. The green passage along the library completes the missing link in this structure. Within the urban fabric the complex introduces a new hangout-place, enriching the social network. The presence of schools and the diverse program will activate the site day and night. By creating a physical pedestrian walkthrough, connecting the main shopping axis and the recreational green area, a critical mass of people can penetrate the site. The passage gives the building four active façades. The literal implementation of the program would have been problematic on the building site, as the green passage would have become parking and the building itself would lack dialogue with its surrounding space. By shifting the parking onto the top of the building, the green area can become a pedestrian connection where the main entrance of the library is situated. The roof functions as a public and easily accessible square. The multifunctional hall (exhibitions, functions, lectures...) along the main road and meeting rooms on the "backside" are lifted and can function separately through the roofscape. The 'roof- square' acts as a transit space for the flux of cars and people. It folds to get natural light into the underlying spaces. The large open space of the library is formed by the folding planes of the roof and the floor, creating a space of varying volumes. By setting the book collections down, the occupant has an uninterrupted view of the library space. The central circulation-strip services the different collections and is naturally lit (garden, light- pavilion, skylight).

**Sustainability**

The folded concrete slab incorporates the lighting and the acoustic absorption. Since the building is very deep, the design a sustainable lighting system was very important: the concrete roof is folded in such a way as to allow natural light to penetrate into the core of the building, without causing glare. To realize optimal summer comfort, intensive night ventilation was integrated in the project. Although a library is a very busy and vibrant space, the lighting and acoustic design make it a very comfortable and quiet space. ArchDaily 26.11.12 (<http://www.archdaily.com>)

**Administrative Centre and library, Ternat – Belgium on design**

The new administrative site is given a strong structuring meaning in Ternat, and at the same time, it functions as a landmark within the city centre. The historically valuable castle is maintained, while the many extensions and outbuildings of the current administrative centre are being replaced by a new construction. Both buildings will start a dialogue with one another. The castle is on the visual axis, predominates and is reserved for ceremonial functions. The administrative functions and the library will be in the new building, which will serve as both a boundary and a transition to the rural area that lies behind it. A socle connects old and new, and structures the square. (Buro II)

## Administrative Centre and library, Veurne – Belgium 2008

### **Awards:**

Fidias Awards 2009 - AINB - nomination

The site of the former Augustine monastery, within walking distance of the Grand Place, houses the new administrative centre and the city library. The entrance is an open hall on the location where the old and the new building meet. From there, the internal circulation is organised. The three functions - library, administration and local government offices - can be used independently of one another and have their own internal circulation and access. The new construction itself is an open house with a library and public functions. The restored former monastery houses the trustees. Thanks to its morphology and the use of materials, this volume is rather closed. For the interior, contemporary, fresh materials and colours were selected, which want to reflect the open, contemporary vision and approach of the local government.

At the Peter Benoitlaan, the building is closed: a high solid wall, constructed in the typical local brick, hides the former monastery from the eye. This results in a reevaluation of the urban building block, in which the monastery is included, although it still remains to be seen as a separate entity. The contemporary design and the details make for an outspoken contemporary unit. (Buro II)

Dit administratieve centrum met bibliotheek is gevestigd op een oude kloostersite waarvan één vleugel werd behouden. Dit gedeelte werd in samenwerking met Monumenten en Landschappen gerestaureerd. Het huisvest nu bureaus voor de mandatarissen. De architecten hebben een passend antwoord gevonden op een context waarin men een zekere dualiteit kann gewaarworden, nl. hoe het open karakter uitdrukken dat een publiek gebouw moet bekleden en dit binnen een subtiele herinnering aan een klooster? De architecten hebben vervolgens een architectuur met twee gezichten ontworpen: zeer open aan de zijde van het plein en gesloten aan de straatkant. Aan de zijde van het plein hebben de architecten geopteerd voor een gebouw volledig in glas. Een ongewoon open en transparant beeld. Dit laat het gerestaureerde gedeelte toe om tot zijn recht te komen binnenin dit nieuwe geheel. Aan de straatkant is de toon volledig anders. Men vertoeft er in een totaal andere wereld. De verwijzing naar het oude klooster is haast voelbaar. Een lange muur opgebouwd uit baksteen, doorboord met nauwe, dieper liggende ramen, doet denken aan de beschermmuur van het klooster. Achter deze muren bevinden zich ruimten die rust en discretie vereisen: de bibliotheek op het gelijkvloers en de administratieve diensten op de eerste verdieping. De muur strekt zich uit over gans de lengte van het terrein en omringt het buitenterras dat voor het personeel toegankelijk is. Het massieve karakter wordt verder nog beklemtoond door het metselwerk met dunne voegen. De verwijzing naar de omgeving is ook alom aanwezig in de materiaalkeuze: een gele baksteen die doet denken aan de tinten van de streek. Het gebouw draagt de naam «Seylsteen» - wat een illustratieve naam is omdat het gebouw toch wel dient als een pool om het publiek aan te trekken, net zoals een centraal element in de werking van de stad. Bouwen met Baksteen 4/09 (<http://www.baksteen.be>)

## City Library and Archive “De Letterbeek”, Poperinge – Belgium 2006

Client: City Council of Poperinge, Surface: 1.639 m<sup>2</sup>

This new public building is open and transparent. It is a pleasant attraction point and a flexible workplace that hopes to anticipate on future evolutions. The brick volume connects the city centre with the large adjoining city park. Those who have the time can take a book into the park, which can also function as a location for literary and other events. (Buro II)

Buro II's design for the new city library and archive of Poperinge, is in essence a massive box with three façades in local materials. The inviting entrance is centrally located under the overhanging volumes. Together with a new bridge over the Poperingevaart, the "Letterbeek" forms a new link with the Viscount Frimoutpark. The building itself has an open and transparent character. It is an attractive stopping place as well as a flexible workplace. (<http://www.mimoo.eu>)

For the new municipal library and the new archive for the City of Poperinge, BURO II & ARCHI+I designed a solid box with three façades in local materials. The inviting entranceway is located in the centre of the flaring volumes. Along with the new bridge over the Poperinge River, the "de Letterbeek" created a new link with the Burggraaf Frimout Park. The building itself is open and transparent. It is a pleasant attraction and a flexible workplace.

By combining the architectural and interior design at the beginning, the final result has been taken to a higher level in both functionality and experience. Indoors and outdoors are in close relationship with each, an idea that had already been implemented in the preliminary design. One of the most significant consequences is the presence of the high windows on the north side of the building. The library thereby benefits from the constant northern light, not only a pleasant light, but also - and most important - light that will not damage the books. (Buro II)

### **Literature :**

“Puurs Public Library“. En: [Librarybuildings.info](http://www.librarybuildings.info) [Consulta: 16 d'octubre de 2011]

The public library of Puurs is located in the town centre. The remodeled library building is part of an urban renovation plan. The architect used a lot of glass for the front of the building to increase the feeling of openness and transparentness. The result is a library with a human-environment relationship where light and space are the dominant elements. Accentuating the main white with trendy colors brings out the library's bright design. (<http://www.librarybuildings.info>)

La Biblioteca Pública de Puurs és una obra del 2010, de l'equip format per Bossuyt i Van de Walle. Té una superfície total de 1.100m<sup>2</sup>, i va tenir un cost d'1,2 milions d'euros. Està ubicada al centre de la ciutat, i la mateixa biblioteca forma part d'un projecte més ampli de renovació urbana. L'edifici destaca per lús del vidre a la façana principal, que fa que augmenti la sensació d'obertura i de transparència, i de continuïtat visual entre l'interior i l'exterior de l'edifici. Tot plegat configura una biblioteca molt humana, molt abastable, en què la llum i l'espai són els elements dominants. Hi destaca el color blanc, que domina totes les zones de la biblioteca, i que convina amb altres colors, com ara el vermell, el blau i el verd. (<http://www.bauenblog.info>)

De bestaande bibliotheek was nodig aan een oprissing toe. Het volume had geen uitstraling naar de Hondsmarkt en stond niet open voor de nieuwe evolutie in het gebruik van de bibliotheek. Deze publieke gebouwen zijn niet langer opslagplaatsen voor boeken, maar moeten ruimte bieden om te werken met nieuwe media. De nieuwe uitstraling wordt gerealiseerd met een uitbreiding aan de Hondsmarkt. Het nieuwe volume uit glas reikt met de luifels naar het plein en zorgt voor een uitnodigend gezicht voor de aangepaste mediatheek. (studio plus)

### **Bibliotheek Tweebronnen, Leuven – Belgium 2000**

Conversion of the Rito RijksInstituut voor Technisch Onderwijs) to town library and archive.

Client: City of Leuven, Area: 9,000 m<sup>2</sup>

In cooperation with Arch. G. Baines , one of the last works of architect Henry van de Velde, Belgium outside a large Vermar enjoyed by the city of Leuven saved from degeneration. The building will have a new life as a city library and archive. The original concept of the building, based on space and transparency is enhanced by contemporary interventions. The introverted extrovert character of the school by bringing in urban life to the courtyard. The study for the renovation is done in collaboration with arch G. Baines. (Pyramid)

Between 1937 and 1940 increased as Urban Industrial, Commercial and Vocational School , but best known as the National Institute of Technical Education (RITO), after the state takeover in 1956. The school was designed by the internationally renowned architect **Henry Van de Velde (1863-1957)**, in collaboration with the Leuven architect **Vital Rosseels**, and is located in the block between Rijschoolstraat the Vaartstraat, the Diestsestraat and Vital Decosterstraat on an urban area where the First World War the monastery of the White Women was located. The modern professional school, made up of a rational concrete skeleton of three storeys, filled with concrete and metal joinery of industrial manufacturing on the outside and nursing preys metals and glazed bulkheads on the inside, is joined by a U-shaped layout with a spacious central courtyard, on an intelligent way, the existing historic urban fabric, respecting the urban pattern of the streets surrounding them to create the appropriate spatial conditions, the function requires. The main characteristics of the former school building, the rational logic of the structure and the consequent great clarity, openness and transparency of the architecture. The main facade of the complex Rijschoolstraat with its tight symmetry and rational play of planes and volumes, one of the few examples of modernist public architecture in the Leuven town. In fact, two close together, parallel walls. A first wall on the perimeter with a low middle section consisting of a ground floor and above a spacious terrace with metal railing, with left and right closed higher volumes connected to the adjacent buildings. In the middle of a large double glazed door into a rear horizontal portal and under a large concrete canopy, flanked on both sides by a low, curved, metal screen, which runs a row of three large rectangular glazed surfaces and always results in a large metal port under a small canopy. Above the window diagonally chiseled high plinth, stone panels, the closed gevelvlak completely lined with the characteristic rounded red light baked ceramic tiles (called "Parysche Plates"). Five feet receding is the cornice of the three-storey high building with a visible concrete skeleton and two regular stacked rows of five and seven monumental glass surfaces with almost square rod division, framed by a covering of red tiles and under a flat roof with concrete cornice. The much smaller wall in the Diestsestraat of two storeys and one bay designed to suit a terraced house and unobtrusively between the reconstruction architecture of the street, is identical materials conducted a similar entrance into a deeper portal, with a large glazed door between sloping sides in blue stone to the bottom of a large concrete canopy, surmounted by a nearly blank wall covered with red baked tiles, where a three-light stone frame, with upper and lower, respectively, the inscription " Technical School "and the shield of Leuven, both of sculptor Oscar De Clerck. Between the wings of the building at Rijschoolstraat and Diestsestraat, a U-shaped complex with a spacious patio sets, further provided with three open internal patios for lighting and ventilation concerns. Interior. The building features a variety of spaces, different of size and function, usually closed by movable metal and glazed walls, giving it a bright transparency and give clarity, enhanced by the spacious corridors and stairs on the inside of the complex against the walls of the courtyard there. These fronts, always under a three storey flat roof, showing a visible concrete frame with masonry and fill large glazed windows with metal surfaces, encased in concrete sections. In 1984, when the Leuven government vocational schools were concentrated in the Redingenhof, the complex was empty and was threatened with demolition. After a difficult protection procedure, which in 1986 was started, and after international protest from the world of architecture, was in 1990, the facades in the Rijschoolstraat and Diest Street as monuments and buildings of the Technical School in the inner area and townscape protection. The city of Leuven decided in the building of the Municipal Public Library and City Archives to accommodate and approved in 1996, good design of the temporary association architect **Georges Baines (\* 1925)** - Forma Nova (R. and J. Feyfer Ketelaer). From 1997 to 1999 were carried out heavy renovation: the 60 years-old concrete structure was not in line with the chosen destination and within the entire area was still destroyed, but rebuilt and adapted to the new function. Both the building and finishing materials have been completely renovated to modern comfort and aesthetic requirements, and internal organization by means of movable walls was completely deserted, so the original sferbeeld little rest. On the other hand, the street facades restored, the entrance door and recovered the original colors of yellow and green-blue cement tile, glazed wall tiles respected. The rebuilt structure conforms properly to its new destination but was modified as appropriate, the patios were roofed over and in the courtyard, on the trajectory of a public transit is, a cafeteria added in a contemporary idiom of steel and glass. Since June 2000 the home building - renamed the Two Sources - The Urban Public Library and City Archives of Leuven, the provincial documentation center, exhibition space, an auditorium, a cafeteria, a radio studio and offices for all related services.

### **Libraries:**

#### **University Library, Restauratie, Gent – Belgian 2007**

On 8 April 1933, Professor Henry van de Velde (\*03.04.1863 Antwerpen – + 25.10.1957 Zürich. University Library Gent 1932 – 1936) was officially commissioned to design the new library of the Rijksuniversiteit Ghent, together with buildings for the Higher Institute for Art History and Classical Studies (HIKO), and the Veterinary and Pharmaceutical Institute, the latter of which was

quickly replaced by an Institute for Mineralogy and Geology. Only the library and the HIKO were actually built on the Blandijnberg – the highest point in the city – on the location of the De Vreesebeuik, once a model neighbourhood for workers. Van de Velde's design for the Faculty of Letters and Philosophy was also never realised. Henry van de Velde designed a high-rise functioning as a book depot, 64 meters high, his 'fourth' tower of Ghent, and a symbol of knowledge. The concrete construction was developed together with his colleagues Gustave Magnel and Jean-Norbert Cloquet. Van de Velde took great care with the belvedere, the highest storey, which was first conceived as a museum of books, but later became a sober reception room for important guests. He himself selected several large interior-decorating firms to carry out the work. Malcorps from Brussels did the interior: the finishing with black marble, ceruse oak and wenge, a plastered ceiling, a parquet floor, the metal radiator covers painted black. At the end of 1939, the interior was almost complete. During the Second World War, the tower was occupied by the German soldiers. They built a look-out at the top of the water reservoir. Later came an anti-aircraft post, which was blown up on the Germans' retreat, resulting in damage to the reservoir. The belvedere, only completed in 1950, gradually deteriorated because of the damage. The construction of the engine room for the new lift in 1967 destroyed the harmony of the space. In 1971, the belvedere underwent not a restoration but a 'renovation', during which Henry Van de Velde's designs for the ceiling and the floor were not respected. This unfortunate intervention suffered rapid deterioration due to poor maintenance. Other parts of the complex were also poorly maintained, adapted and 'renovated'. In 2003, under the impulse of PROJECT2, the urgent need for a complete restoration of the whole building complex was recognised. On 16 September 2005, the board of the university took the crucial decision to borrow 30 million euros for the restoration and renovation. Within a few years, the Boekentoren can once again become a symbol of the Ghent University. (<http://en.scientificcommons.org/41677436>)

The Central Library of Ghent University, designed by Henry van de Velde in the 1930s, is being restored and geared to the current requirements of library use and conservation. To this end, an entrance will be built next to the HIKO, which is part of the original complex, that will generate a new sequence of spaces around the inner garden. This includes among other things a café/reading room, a canopied terrace (which Van de Velde had actually designed) and workspaces for handling digital data individually or in groups. Together with the necessary technical modifications, and making the observation room at the top of the tower fully accessible, this clear-up will restore the building's dignity as a place for study and reading. (Robbrecht)

### **Boijmans van Beuningen, Rotterdam – The Netherlands 1999 – 2003**

Die Anlage des Kunstmuseums Boijmans Van Beuningen am Rotterdamer Museumspark wurde nach den Plänen des belgischen Architektenduos Paul Robbrecht und Hilde Daem (Gent) umfassend umgestaltet, renoviert und erweitert. Neuer Blickfang der Anlage ist ein schmaler 124 m langer Neubau, in dem sich eine Reihe von Ausstellungssälen, eine neue Bibliothek, Arbeitsplätze und ein digitales Depot befinden. Der Neubau verbindet nicht nur die angrenzende Westersingel mit dem Museumspark, er fasst mit einer großen Geste auch die zu verschiedenen Zeiten gebauten Teile des Museums zusammen: das Hauptgebäude von Van der Steur (1935), den de Bodon-Flügel (1972) und den Van-Beuningen-de-Vriese-Pavillon (1991). Über einen Innenhof, in dem unter freiem Himmel Plastiken zu sehen sind, gelangen die Besucher in einen neuen Eingangsbereich, von dem aus die Rundreise durch die Kunstgeschichte vom Mittelalter bis heute beginnen kann. Neben dem Neubau wurde das Kupperstichkabinett renoviert und wesentliche Teile des Van-der-Steur-Gebäudes wieder in den Originalzustand gebracht. Das vormalige Restaurant mit Museumsladen und die Notbüros am alten Eingang wurden abgerissen. Glas: Die Front des Neubaus ist mit Feldern aus Kathedralglas, einer Art Gussglas, vor der Fassade aus Betonplatten gestaltet. Dieses Material lässt Licht hindurch, verringert jedoch die Einblicke auf die dahinter ausgestellten Kunstwerke. Zum Teil sind die Tafeln auch als Schutz der unterschiedlich großen und mit unregelmäßigen Abständen angeordneten Fensterpartien montiert. Eine leichte und filigrane Stahlkonstruktion nimmt die Glastafeln über Punkthalterungen auf. Entstanden ist somit ein Gebäude mit Einsichten und Transparenz ohne den erforderlichen Schutz der gezeigten Werke zu verhindern. Bautafel: Architekten: Robbrecht & Daem Architecten, Gent/B, Projektbeteiligte: Kristoffel Boghaert, Sofie Delaere, Brigitte D'hoore, Chaterine Fierens, Gilberte Claes, Francesca da Fonseca, Shin Hagiwara, Hugo Vanneste (Mitarbeiter), Bauherr: Museum Boijmans van Beuningen und die Gemeinde Rotterdam, Fertigstellung: Mai 2003

#### **Libraries:**

**Biblioteca São Paulo – Brasil 2010**

4.500 sqm

The antithesis is strong and the metaphor becomes obvious. Where before a prison, now freedom: of knowledge, of ideas, of books. It is in this place, that could carry a dark memory forever, where is located the Sao Paulo Library. The old Carandiru penitentiary complex, in Sao Paulo, has changed its face: now it is the Youth park. Within the park, the Library, which contributed to the urban impact of this revigoration in a way that could surpass the quarter limits, bringing people from every corner of the city granting to them leisure, entertainment and culture. The building has an ample area with zenithal illumination, assuring great flexibility in the layout. The structure is composed by 20 columns and 10 beams, spaced each 10 meters. The furniture has funny and colourfull tones and ludical serigraphies were proposed in the glasses to give more intimacy to those who will read or research. The library is organized as a bookstore, aiming to attract a non-reader public as well. The idea is that this project can be replied in other cities. A new library, implemented in Brazil but inspired in the public library of Santiago, Chile. The program we find in the building is composed by a ground floor with reception, quantity, auditorium for 90 people and reading modules for children and teenagers. The existing terrace on this floor was covered by a tensor structure, that reminds “nautical tents”, receives a cafeteria, sitting areas and performance spaces. In the upper floor we find another quantity space, several reading spaces being one module restricted to adults in addition to multimedia areas. There are special furniture such as tables for people with visual deficiency and ergonomic desks to physical deficient. In order to attend the accessibility regulation the floor finishing was made in a way that could be tactil, railing with two heights, inscriptions in Braille as well adequated ramps. The upper level terraces in the east and west facades, with higher insolation, were covered with pergolas made with reforestation eucalyptus and polycarbonate, assuring a pleasant space for performance as well living room. The remaining facades are composed by pre-molded panels with texturized finishing. More than a beautiful and different library, this new institution has the mission to be the central of 961 libraries in the state of Sao Paulo – spreaded in 602 municipalities. (Aflalo)

## **Studio 8 ½, Plovdiv, Bulgaria**

studio 8 ½ is a new and young space, established and based in Plovdiv, directed mainly to designing of conceptual projects and architecture ideas, as well as participating in international competitions.

<http://studio812.eu>

### **Libraries:**

#### **ConTemporary Library, Plovdiv – Bulgaria 2012**

Although the wooden library by Studio 8 ½ was placed inside the abandoned 16th century Turkish bath for less than one week, it set an example for how new and old architecture can complement one another and introduce new uses.

This was the objective of the Art Today Association, when it assigned the project to Studio 8 ½ for the Urban Dreams Contemporary Art Festival, which took place in the vibrant Bulgarian city of Plovdiv from 20 October to 30 November.

Placed right in the centre of the hammam – as the Turkish baths are called – the installation consisted of a sitting area, a bookshelf and a multimedia point, fulfilling the main functions of a library.

Circular, like the bath's main hall, the library was made entirely of wood, left in its natural colour to contrast with the old stone and brick surface of the surrounding space. The form was spiral-like, directing the gaze to the grandiose 13-m-high cupola of the building. A simple but well-designed lighting system stressed the building's refined details and provided light to the installation, creating a discrete and sophisticated unity between the two.

<http://www.frameweb.com/news/contemporary-library-by-studio-8-1/2>

#### **New Public Library “Otets Paisiy”, Plovdiv - Bulgaria 2011**

The project reveals a conceptual vision for a new public library, which would be housed in a waste tram at the “Otets Paisiy” Street in the town of Plovdiv. This is the exact street where the first trolleybus was passing through 55 years ago. The street is “cut” because of urbanization reasons, but has preserved itself as a parallel and alternative city culture, collateral to the main pedestrian and touring zone in the city. The project offers a new life for a small city square, which has lost its main function through the years. During the past years a number of foundations turn serious attention to this bohemian part of the town's past and present. They initiated projects, exhibitions and festivals. This library will fill in to some extent a palpable gap, formed by the lack of cultural centers and sharpened by the closing of the historic square nearby and the emblematic for the city book-store, bearing also the name of one of the holiest Bulgarians- Otets Paisiy. (Studio 8 ½)

## Burkina Faso

Article 25: the built environment's charity'

Report by Article 25 written for [www.e-architect.co.uk](http://www.e-architect.co.uk)

School extension takes shape in natural stone in Burkina Faso

Author: Martin Spring

A keenly awaited £200,000 school extension is now visibly taking shape in Burkina Faso in West Africa, unaffected by the civil war currently waging in neighbouring Mali. The design was developed in London by Article 25 who now monitor the construction works on site. The emerging walls proudly display their local origins in rugged laterite stone blockwork that was quarried out of the ground less than five miles away.

Local masons are skilled at laying blocks of local laterite sandstone:

When completed in June, the three new classroom blocks and latrines will substantially increase the size of the existing Bethel Secondary School in the provincial town of Gourcy. Bethel school is overwhelmed by local families' demand for education, in a country that the UN Development Programme calculates suffers one of the world's lowest literacy rates. Once enlarged, the school will be able to accept many more of the children it currently has to turn away.

New classroom and latrine blocks will have raised roofs for cooling ventilation:

The first section of wall sets the standard for masonry and metal louvred windows:

The construction site has an orderliness that demonstrates capable management. This is shared between contractor Mantral and Article 25's site representative, Kodzo Adali-Mortty; both are based in Burkina Faso's capital, Ouagadougou, two hours drive away. Bilingual architect Adali-Mortty is an ideal intermediary between Article 25 architects in London and Mantral's 20-strong, French-speaking construction team. He files weekly reports brimming with progress photographs and details of challenges encountered to which the London team and Mr Adali-Mortty find proposals for their solution.

One of the main challenges encountered so far has concerned the supply of laterite stone. As the stone is simply dug out of the ground nearby, it avoids the expense of concrete blocks made with imported cement and has the benefit of being denser than concrete blockwork. Laterite walls absorb much of the tropical heat that builds up in the afternoon that would otherwise make the classrooms unbearable. Some 20,000 laterite blocks are required and to meet the supply schedule Mantral subcontracted the quarrying of the stone to two teams, each comprising of 5 experienced masons. As well as masonry and laying concrete strip foundations, work on site includes a welding workshop where metal louvred shutters are assembled for windows and doors.

Rough laterite blocks from the quarry are precisely dressed to shape on site:

Soon after the three classroom blocks and latrine are completed in June, construction will start on a second phase that will include a library and sports changing facilities. The project is funded by the UK charity, Giving Africa, and the completed school will be run by the local operator, AEAD. The long-term plan is that Bethel's new school extension should serve as a cost-effective, environmentally friendly prototype that will be rolled out across Burkina Faso.

Metal shutters for windows and doors have adjustable louvres to control daylight and rain penetration:

### **acdf Architecture, Montréal, QC - Canada**

<http://www.acdf.ca>

#### **Libraries:**

#### **Bibliothèque Municipale de St-Constant, St-Constant, QC – in design**

La richesse des différentes strates paysagères d'un rang agricole constitue le point de départ de notre démarche conceptuelle d'implantation urbaine. Ce nouveau projet cherche à revitaliser la rue Saint-Pierre et à lui redonner son importance, comme le font les rivières ou les routes pour un ensemble de rangs agricoles.

L'analyse des lignes de force (lignes des propriétés) permet de constater la richesse du dialogue possible entre les deux côtés d'un axe véhiculaire par la simple alternance des cultures et des textures végétales. Ce principe d'organisation architecturale et paysagère peut être transposé à plusieurs échelles du projet : au niveau urbain sur la rue Saint-Pierre, dans la planification intérieure de la bibliothèque (rythmique, traitement au sol, signalisation, etc.) et dans l'aménagement des espaces commerciaux.

Le volume épuré de la bibliothèque contient la connaissance comme la matière première contenue dans les wagons de train. Les parois de verre au niveau du rez-de-chaussée accentuent la diffusion et le rayonnement de l'institution. Le langage architectural des bâtiments s'inspire des wagons et de leur simplicité volumétrique et tectonique (bois et métal). Ainsi, le nouveau projet consolidera la thématique ferroviaire de la rue Saint-Pierre et de la ville de Saint-Constant. (acdf)

#### **Ville Saint Eustache, Bibliothèque Guy-Bélisle, Saint-Eustache, QC – Canada 2012**

**projet lauréat concours d'architecture de la bibliothèque de Saint-Eustache, 2010**

010-11-09

La nouvelle bibliothèque: un pavillon phare à l'entrée de la ville!

(Saint-Eustache, le 9 novembre 2010) Le maire de Saint-Eustache, M. Pierre Charron et le conseiller municipal responsable des dossiers culturels, M. Raymond Tessier, ont dévoilé le concept architectural qui été retenu pour la nouvelle bibliothèque municipale de Saint-Eustache. Le projet, résolument contemporain, a été présenté par l'équipe formée par les firmes Opron Construction Inc., ACDF Architecture, SDK et Associés, ainsi que Pageau Morel et Associés.

Le bâtiment offre une vue unique sur la rivière des Mille Îles, une luminosité exceptionnelle et une remarquable fonctionnalité des lieux et des espaces. Son architecture intègre plusieurs principes écoresponsables, en misant tout d'abord sur la compacité des volumes, l'économie d'énergie et l'utilisation de matériaux nobles assurant une pérennité du projet.

« Le nouveau bâtiment fera le pont entre la ville et la nature, entre la tranquillité évoquée par le cours d'eau et la vie mouvementée de la ville. Il agira comme un pavillon phare à l'entrée de notre municipalité. L'aménagement valorisera la présence de l'eau et les paysages riverains du site. La perspective permet d'ailleurs d'imaginer un bâtiment ayant les pieds dans l'eau », a déclaré M. Charron.

Faisant preuve d'innovation dans le cadre de ce processus, la Ville a obtenu l'aval du ministère de la Culture, des Communications et de la Condition féminine du Québec, afin d'effectuer un appel de candidatures selon le principe dit de design-construction. Selon ce concept, des équipes formées de constructeurs, d'architectes et d'ingénieurs ont dû préalablement se qualifier et répondre aux critères établis par la Ville. Une fois qualifiées, ces équipes ont préparé leur projet, selon le programme de besoins et le devis de performance répondant aux exigences de la municipalité. Un comité de sélection, composé de représentants du ministère, d'architectes et de représentants municipaux, a analysé les projets soumis pour déterminer qui serait l'équipe lauréate.

« Cette façon de faire constitue un véritable projet-pilote pour le ministère, qui observe attentivement le processus que nous avons mis en place. D'autres organisations pourraient être intéressées à avoir recours à ce procédé, puisqu'il a l'avantage de limiter au maximum les dépassements de coûts et de faire respecter un échéancier serré de construction, tout en respectant scrupuleusement les critères de transparence en matière d'attribution de contrats », a ajouté le maire Charron.

Bénéficiant d'une subvention de 3,1 M\$ du ministère de la Culture, des Communications et de la Condition féminine, le bâtiment de 2600 m<sup>2</sup> sera érigé au montant de 9 M\$. Les travaux devraient débuter au printemps 2011 et la bibliothèque devrait ouvrir ses portes au début de l'été 2012.

La bibliothèque sera construite sur le site situé en bordure de la rivière des Mille Îles, à l'entrée du pont Arthur-Sauvé. « Situé au croisement des deux grands axes routiers que sont le boulevard Arthur-Sauvé et le chemin de la Grande-Côte, ce site offre une position géographique avantageuse. Il est aussi très bien desservi par le transport en commun et offre une vue exceptionnelle sur la rivière des Mille Îles. Le prolongement de la promenade Paul-Sauvé, depuis la mairie jusqu'à la nouvelle bibliothèque, en passant sous le pont Arthur-Sauvé, compte aussi parmi les atouts majeurs du projet », a rappelé M. Tessier.

Par ailleurs, afin d'assurer la fluidité de la circulation dans le secteur, l'entrée du stationnement sera aménagée dans la partie est du terrain, ce qui assurera un dégagement suffisant du pont Arthur-Sauvé. Un feu de circulation sera implanté au coin de la rue Landry, afin de faciliter l'accès au stationnement et de sécuriser le secteur. Celui-ci offrira d'ailleurs 95 cases, soit plus d'espace que ce qu'exige le règlement d'urbanisme pour un bâtiment de cette envergure. Un débarcadère sera construit en face de la porte principale, permettant aux autobus et aux automobilistes de faire descendre leurs passagers en zone sécuritaire.

Avec ce projet, la Ville doublera la superficie de la bibliothèque par rapport à celle existante. Les lecteurs jouiront de salons de lecture confortables et accueillants, de fauteuils « familiaux », facilitant la lecture parent-enfant, d'un coin allaitement pour les mamans et d'une zone pour les poupons. Les enfants bénéficieront de l'ajout d'aires de lecture et de jeu. Les adolescents y trouveront leur compte avec l'aménagement d'une section dédiée avec des documents, des postes Internet et du mobilier choisi en fonction de cette clientèle. Une agora sera aménagée pour les animations.

La nécessité de construire ce bâtiment est liée à l'accroissement de la population de Saint-Eustache, qui a plus que doublé depuis la construction de la bibliothèque actuelle, dans les années 70. Celle-ci ne répond plus aux normes de qualité reconnues pour les bibliothèques publiques québécoises. (<http://www.ville-saint-eustache.qc.ca>)

#### **Bibliothèque Laure Conan et hôtel de ville de La Malbaie, La Malbaie, QC – Canada 2011**

Consortium with Bisson Associés, Québec, QC <http://www.bissonassociés.com> and Architecte Norman Desgagnés, Saint-Joseph-de-la-Rive, QC

Client: Ville de La Malbaie, Costing: 6.5M \$, Area: 2,040 sqm

Le parti architectural et urbain a été de révéler le potentiel et la valeur patrimoniale paysager commune aux habitants de La Malbaie en venant créer un belvédère culturel.

La stratification programmatique en continuité avec la topographie existante permet à l'hôtel de ville et la bibliothèque de rester en interconnection et de faire le lien entre la ville et le fleuve.

En transposant la typologie des galeries des maisons typiques de La Malbaie à l'expérience de la bibliothèque. La Galerie de lecture donne l'occasion aux citoyens de se retrouver dans un instant commun entre la ville et le fleuve.

Le projet de la Bibliothèque/Hôtel de ville de La Malbaie réconcilie ainsi la ville actuelle avec son patrimoine paysager et historique étroitement lié au fleuve Saint-Laurent. (acdf)

Located on the edge of the St. Lawrence River, La Malbaie was one of Canada's first holiday resort towns. The new Laure Conan Library and City Hall in La Malbaie, emphasizes the importance of offering a contemporary architecture with a "story to tell." The project's main narrative focuses on the value of the site's historic landscape as it symbolizes the reconciliation between the present city, and the historical landscape closely linked to the St. Lawrence River.

The city's name La Malbaie, or "bad bay", is said to have been born from the expression used by Samuel de Champlain, and describes the many maritime mishaps related to the bay and its heavy rising and falling tides. The architectural concept of the project is based on the dialogue and contrast between: city/river, wood/stone, and opacity/transparency. The architectural approach integrates several eco-responsible principles: the basic idea of compactness, energy savings, and the use of local resources.

The project also encouraged local workers to become highly involved in the construction of the project. The abundant use of locally produced wood siding was justified given the crisis currently affecting the forestry industry in the province of Quebec. The dialogue created by the contrasting outdoor materials (dark and light wood, stone, glass), and the visual openings and structural features, are several of the strategies used to create a unique multipurpose building that fully integrates itself into La Malbaie's urban condition, the natural landscape, and historical narrative.

The site's highly sloping topography that reaches towards the St. Lawrence River is one of the bases of the architectural concept. Responding to this dramatic site condition, two different entrance levels were created to access the building while integrating the library and city hall in a very simple volumetric concept. The stone base positioned on the lower portion of the site hosts the city hall, while a wooden clad box rests on top, housing the Library.

This concept offers a contemporary architectural image against its neighbouring built environment. The use of wood, stone, and conceptual references to the history of the site, fosters a harmonious integration of the building into its context in a contemporary manner. Reading, study, and consultation areas are all located along the façade with an expansive view on the river. Through the fragmentation of the two main masses, certain programmatic functions also receive full views towards the city.

Further, the spaces located between the two dominating elements of the city and river; offer a unique atmosphere to experience. The city council room and all city hall offices have full fenestration with a view on the water. The positioning of the building on the site preserves the original views from Nairne Street towards the river. The library's wooden volume extends over the principal outdoor staircase forming a viewing device that amplifies and frames the view on to the St. Lawrence.

The fragmentation of the library volume reduces the depth of certain sections of the building, allowing complete transparency through the library from Nairne and Saint-Étienne Streets towards the St. Lawrence. The plan of the library is organized to form an open space without structural columns. It is therefore possible to organize the library in many ways, increasing efficiency and flexibility for the future.

The centrally located service counter offers views on every section of the library requiring supervision. This approach is essential in the context of a small library operating with a minimum number of staff. The multipurpose room is accessible from the entrance hall of the building, or by an independent entrance from the exterior public space. The positioning of the room also provides direct visibility on Saint-Étienne Street.

The cantilevered form of the library also protects an outdoor space that functions as an extension of the multi-purpose room. This gathering space is also equipped with small bleachers, that can be used for story telling, exhibitions, community receptions, and as a rest area for cyclists and pedestrians using the trails along the St. Lawrence River. ### **Libraries:**

**Newnham Campus, Renovation & Expansion, Seneca College of Applied Arts and Technology, Toronto-ON - Canada 2003**

\$ 45.700.000, 5.416 m<sup>2</sup> Construction, 29.165 m<sup>2</sup> Renovation.

Poorly related, inefficient buildings and dark, congested hallways: this was Seneca's Newnham Campus before the College undertook a major renovation and expansion project. Today, it stands transformed as a bright, graceful and modern campus.

aA's rejuvenation of Seneca's first campus turned a collection of buildings with failing exterior envelopes into a welcoming, unified, energy-efficient environment. Three skylit atriums were punched through the deep floor plates, funneling natural light into the core of each building. The existing buildings were re-clad in clear and coloured glass and corridors moved to the building edges, where exterior views help students to orient themselves within the complex. A new, equally transparent Faculty of Business building gives the College a new presence and visibility in the neighbourhood. The architects renovated classrooms, labs, and the College library, created a new 220-node. (architectsAlliance)

### **Libraries :**

#### **Bibliothèque Raymond-Lévesque Saint Hubert, Ville de Longueuil (Montréal), QC – Canada 2010**

SAINT-HUBERT. La nouvelle bibliothèque municipale qui sera bientôt construite dans l'arrondissement de Saint-Hubert sera unique en bien des points. Située au cœur du Parc de la Cité, elle s'harmonisera à merveille à son environnement puisque sa conception est tout ce qu'il y a de plus «vert». La Ville de Longueuil a dévoilé aujourd'hui le concept architectural de cette bibliothèque, qui intègre tous les principes fondamentaux du développement durable. Réalisé au coût de 14 M\$, le bâtiment moderne privilégiera des matériaux nobles, notamment le bois torréfié, qui se veut être actuellement le meilleur choix écologique, de l'avis de l'architecte Manon Asselin. Grâce à son toit végétal, à une abondante fenestration et au système géothermique qui permettra un transfert de chaleur, l'hiver, et de fraîcheur, l'été, la consommation d'énergie sera réduite de 50% et le bâtiment utilisera plus de 40% des énergies renouvelables. Les eaux de pluie provenant du toit seront captées pour servir à l'irrigation des marais environnants et pour rafraîchir la cour intérieure du bâtiment plutôt que d'être dirigées vers le système d'égout pluvial.

«La Ville de Longueuil a été visionnaire en demandant une conception qui a recours aux principes fondamentaux du développement durable. C'est d'ailleurs la première fois qu'une telle exigence est faite lors d'un concours d'architecture provincial», a spécifié Manon Asselin, du consortium d'architectes retenu, Manon Asselin + Jodoin Lamarre Pratte. La nouvelle bibliothèque regroupera sur une superficie de plancher de 4000 m<sup>2</sup> une collection de quelque 230 000 volumes, soit 140 000 de plus que dans l'actuelle bibliothèque. Elle ouvrira ses portes au printemps 2010. (<http://lecourrierdusud.canoe.ca>)

This project, a new main library for the borough of Saint-Hubert in Longueuil, represents the winning entry in a Quebec-wide architectural competition held in the fall of 2008. The building will be situated at the northwest entrance to the Parc de la Cité, the city's principal civic park covering 50 hectares of land. Straddling city and park, the library acts simultaneously as a gateway pavilion, an institutional building, a civic structure and a cultural centre. It is conceived to provide designated areas for young families, children, daycare and school groups as well as for adolescents, adults and retirees. It will provide a platform not only for learning but also for vital intergenerational exchanges within the community. Its program will offer traditional library services, access and dissemination of new technologies as well as a wide range of public activities including a café and multipurpose exhibition room. Since the beginning of the 20th century, Saint-Hubert's built environment and cultural heritage has been intimately linked to Quebec's aeronautics industry. Due to its geographic location, Saint-Hubert benefits from unique meteorological conditions resulting in a remarkable potential for wind energy. The architecture of the new library is sculpted in response to this force of nature, poetically materializing and celebrating the presence of the wind while technically seeking to take advantage of this resource for its bioclimatic strategy. Delicately sited between protected wetlands and a red maple forest, the new library explores an essential link with Saint-Hubert's most important natural environment. Beyond the formal allegory of the flying carpet, the architectural concept is foremost an elementary bioclimatic response to the site's conditions. Its geometry speaks of the renewable natural resources of the earth--the wind, the sun and the rain. From west to east, its roofscape bends under the prevailing winds. The giant cut at its centre collects the rainwater in a retention basin while the wood blades of its filigree envelope filter the sunlight. The façade composition of wood louvres, inclined according to the path of the sun, highlights the constructional nature of the filigree assembly and its spatial and aerial qualities. The programmatic elements are organized in a single continuous move that unfolds from the public place to the forest, delineating a central open court. This exterior court forms the geographic, social and perceptual heart of the library. Acting as contemplative space and oasis, the court visually connects while keeping adjacent program elements physically separated. While allowing for the deep penetration of natural light, it facilitates orientation, organizes the different collections, and ensures the tranquility of the main reading room. In winter, its carpet of snow will accentuate the luminosity and peacefulness of the library spaces. Working with a team of engineers from the very outset of the competition, reduction in environmental footprint was taken into account throughout the development of the project by considering the synergy between the building's key phases of design, construction, commissioning and maintenance. As such, the project's bioclimatic concept relies on using as much as possible the surrounding climatic resources: sun, water, wind and earth--in the form of geothermal energy. Moreover, the building's HVAC is supplemented by a controlled natural ventilation system and the protected microclimate of the central exterior court.

GH: The simple elegance of this proposal is a joy to behold. The library will be a glass pavilion in the woods. I could imagine spending hours reading there. I generally hate folded buildings, but this one has subtle folds sculpted by the sun's path. These architects have serious talent.

JPL: This very poetic project constitutes a great example of sensitive and mature planning. The architects worked with the metaphor of a flying carpet, creating a central organizing element through the introduction of an open court flooded with natural light. This area solves several programmatic issues while allowing the users to easily relate to the various sections of the library. The compact building envelope remains remarkably open to its park-like setting which will no doubt provide users with a variety of rich experiences. The detailing seems to be carefully thought through and the use of wooden slats on the façade nicely echo the surrounding woods.

PR: This is a fabulous library that is true to its concept, and thoughtfully and elegantly composed. With respect to the interior in establishing a connection to the forest, the building's massing is purposeful, with generous spatial conditions. However, the design certainly contains a lot of glass in its building envelope for such a cold climate, something which should necessitate the use of high-performance glazing.

#### **Bibliothèque Municipale de Chateauguay, Chateauguay, QC – Canada 2006**

Architect Atelier Tag and Jodoin Lamarre Pratte et Associes Architectes

Client: City of Chateauguay

The winner of an open architectural competition that was held in Quebec in 2001, the new Municipal Library of Chateauguay is located in the city's Honoré-Mercier park, a welcome addition to the existing cluster of municipal services buildings on site. Chateauguay, a south-shore suburb of Montreal, fell prey to the urban sprawl that started in the 1970s. Quite apart from its importance as a home to more than 150,000 documents--including periodicals, reference and audio-visual material--the new library functions as an important symbol of renewal in this bleak landscape of tract housing and strip malls.

The architects clearly understand the important role that a small municipal library plays in such suburban context, and have created a true public space that is meaningful to its community and a source of civic pride. To convey a sense of monumentality critical to the project's success, architects Manon Asselin and Katsuhiro Yamazaki conceived of the street-facing front elevation as an expansive plane of roughly hewn stone suspended high above the ground on pilotis, articulated through simple load-bearing masonry, preserving scale, mass and texture. In contrast to this solidity, the largely glazed back elevation opens the library's contents and inner functions to the natural amphitheatre of the park. The library maximizes the site's public setting to create a focus of social spectacle and community gathering.

The ground floor works with the natural grade of the site in communicating a fluidity of public functions: café, periodicals reading area, internet atelier and multi-purpose meeting room. A grand stair dominates the lobby and leads to the second floor, emerging into the double-height oblique hall, a vast space which contrasts to the ordered density of the stacks on the second and third floors. Conceived as "clearings in a dense forest" of printed material, the various reading areas and work rooms interspersed with the stacks on these floors can be perceived as inner courts that provide framed views of the exterior landscape. Julien De Smedt: The Bibliothèque Municipale de Châteauguay appears as a villa in the landscape. By that I mean that it manages to address and invite its surroundings with the ability of a smaller structure: the park climbs over a multipurpose room and turns its roof into a piece of nature. A similar work of continuity occurs on a programmatic level, where the classical idea of a promenade architecturale is revisited by the injection of diagonal visual relationships, thickening the overall richness of the building. I particularly appreciated the sobriety yet clarity of the material choices as well as the economy of ornament. The raw aesthetic contributes to focusing the means towards practical/active effects rather than stylistic waste. Canadian Architect 2006-05-01 (<http://www.canadianarchitect.com>)

## **B + H, Toronto, ON – Canada**

B+H Architects (formerly known as Bregman + Hamann Architects), founded in 1953, is an international architecture, interior design and urban planning firm. Based in Toronto

B+H BuntingCoady is now B+H Architects  
October 15, 2012

October 15, 2012, marks an important milestone in our firm's progress in British Columbia. On this date we are completing the transition that began in 2010 when we acquired Bunting Coady Architects and merged the firm with our existing Vancouver practice. Now, in accordance with regulatory directives, our team previously known as B+H BuntingCoady Architects is being rebranded B+H Architects. Our hospitality interior design team will retain their current name, B+H CHIL Design. Our Vancouver practice is thriving as one of Western Canada's leading architecture and interior design firms, renowned for designing buildings that are healthy, integrated and energy efficient. The practice has earned a strong position in the Vancouver market, and has received numerous awards for design quality and building performance. Recent examples include many awards, amongst them three top rankings from the National Association of Industrial and Office Properties, being awarded to Broadway Tech, a Canadian Architect Award of Excellence win for Heritage Mountain Middle School, the Shangri-La Vancouver being rated the #1 luxury hotel in Canada by TripAdvisor as well as having been awarded an exclusive and highly-coveted Five Diamond AAA rating, and a total of four B+H CHIL Design projects being ranked among the top 25 hotels in Canada by TripAdvisor. To steer the Vancouver practice towards future success, Bruce Knapp will be leading the team in his role as Managing Principal. B+H is committed to maintaining the focus on sustainability that our Vancouver practice is so well known for and ensuring that it continues to integrate with our global operations. At the same time we will continue to thrill clients and guests alike with the most exciting and memorable hospitality environments. We thank our clients, employees, and industry partners for their contribution to our success thus far, and look forward to many more years of world-class projects lead by our team in Vancouver and our teams around the world

<http://www.bharchitects.com>

### **Libraries:**

#### **[Heritage Mountain Middle School, Anmore, BC – Canada in progress](#)**

Client: School District No. 43 (Coquitlam), Size: 58,437 ft<sup>2</sup> | 5,429 m<sup>2</sup>

### **Awards:**

**Heritage Mountain Middle School received a 2011 Canadian Architect Award of Excellence.**

The underlying goal of the new middle school design is to create an environment for learning that captivates the imagination of the students and actively encourages exploration and growth. The space intends to simultaneously stimulate teachers, staff and visitors through their experience within the school. The result is a design that creates a series of carefully considered, light-filled spaces which seamlessly integrate into the natural landscape.

Rather than advancing with a response based on the idea of "teaching", the design team consciously redirected point of view and formalized a creative response from the standpoint of "learning". Understanding the manner in which children learn, interpret and discover our world provided the underlying methodology for the design of the new middle school which focused on education through interaction. This approach was a fundamental means of informing and ultimately formalizing an architectural response which was a direct result of the act of interpretation and discovery. It allowed the design team to approach the design process without preconception or reticence. The derivative is a design which innovatively responds to the specific program, the client's needs, budget constraints and simultaneously addresses the unique challenges of this particular site. As a synthesis, the product is a design concept which places emphasis on student exploration and provides a learning-based environment which has been conceived "through the eyes of the students".

The tiered building design is characterized by an earth-bermed lower level which supports the elevated main classroom level where the building effectively acts as a new connective link between the upper Anmore Village and the lower Port Moody side adjacent to an existing Secondary School. The main level of the school is a "U-shaped" configuration where the two primary classroom wings and the centrally located library open onto a common elevated courtyard space which optimally binds the program spaces in which students learn. (B+H)

#### **[Canadian Music Centre, Toronto – Canada 2012](#)**

Client: Canadian Music Centre, Size: 623ft<sup>2</sup>/190m<sup>2</sup>

Located in Central Toronto, The Canadian Music Centre holds Canada's largest collection of Canadian concert music, and acts as a resource centre for students and composers. The building was originally constructed in 1892 in the Queen Anne style. This project saw the renovation of the second floor, which had previously comprised a series of walled-off offices, into a modernized, open-plan area including a performance space, library, and lounge, as well as private offices and a washroom.

Throughout much of the floor, walls and drop-ceilings were removed to create a more fluid and bright space. The entry to the central staircase was relocated and opened up to provide views into the performance space when entering the floor. The performance space was designed to feature a grand piano, and also includes a small sound room for recording performances. In the library area, fixed shelving was replaced with a series of movable storage units, designed to be able to adapt to the needs of the organization and to accommodate both archival materials and more modern storage media. The lounge area includes a kitchenette and seating, providing a meeting place for music students and composers.

Original features were retained where desirable, including fireplaces, stained glass, leaded windows and wainscoting. (B+H)  
**University of British Columbia Okanagan - Engineering, Management and Education Building, Kelowna Canada 2011**

Joint Venture in association with MQN Architects MQN Architects, Vernon, BC <http://www.mqnarchitects.com>  
Client: UBC Properties Trust, Size: 174,957 ft<sup>2</sup> | 16,254 m<sup>2</sup>

The Engineering, Management and Education Complex (UBCO) contains both the Faculty of Applied Sciences (Engineering) and the Faculty of Management. The two buildings are connected by a central atrium and organized around shared amenities, including common areas, classrooms, lecture theatres and a collegium. Within each faculty area there are customized faculty and administration offices, a variety of teaching and research labs as well as library facilities. The modularized building form is designed to easily adapt to future expansion.

The west side of the Engineering and Management building contains three stories of laboratories. Engineering lab spaces contain skylights for natural day lighting and reduce the overall load on artificial lighting. The use of natural ventilation and day lighting has been employed throughout, with as many labs, offices and classrooms as possible having both operable and vision windows. (B+H)

**University of New Brunswick — Hans W. Klohn Commons, Saint John's, NL - 2010 Canada**

B+H worked in association with Sasaki Associates.

Client: University of New Brunswick, Size: 40,000 ft<sup>2</sup> | 3,700 m<sup>2</sup>

The Commons is expected to become the heart of the UNB Saint John campus. This library will bring together the people, services and activities that support the learning environment, creating a more integrated and nurturing student-focused academic experience. In addition, it will provide gathering spaces that help to foster a sense of community for students, faculty and staff and that can be used to draw people from the greater Saint John community to the campus.

This project is registered and targeting LEED Silver certification. (B+H)

**Kwantlen Polytechnic University - Coast Capital Library, Surrey, BC – Canada 2010**

Client: Kwantlen Polytechnic University, Size 57,726 ft<sup>2</sup> | 5,363 m<sup>2</sup>

**Awards:**

**Green GOOD DESIGN**

The renovation and expansion for Kwantlen Polytechnic University - Coast Capital Library accommodates the expanding demand and growth of the educational program and envisions a re-establishment of the Library as the primary building on campus and is envisioned as the “campus heart”. The overall Library’s vision statement was to create “a dynamic centre dedicated to successful learning”. The renovation incorporates a complete envelope remediation and the replacement of the existing entry with a revitalized two storey glazed lobby space incorporating a gallery and sitting area on the ground floor and a study “balcony” on the second floor. The central three storey atrium features north glazing providing natural daylight and visual transparency between the library and the campus courtyard beyond. The atrium ground floor accommodates a 60 seat learning commons and provides a transition space between the renovated north wing library and the new three storey west wing. The flexible east wing accommodates learning labs in addition to group and individual study spaces. This project was completed by Bunting Coady Architects, who merged with B+H in December 2010. (B+H)

**Okanagan College Centre for Learning, Kelowna – Canada 2009**

In association with MQN Architects

Client: Okanagan College, Size: 73,754 ft<sup>2</sup> | 6,852 m<sup>2</sup>

**Awards:**

Okanagan Mainline Real Estate Board’s Commercial Zone’s Commercial Building Awards

Institutional Community Award, Green Award and Judge’s Choice (Awarded to Bunting Coady Architects who merged with B+H in December 2010)

Okanagan Mainline Real Estate Board’s Commercial Zone’s Commercial Building Awards

Institutional Community Award Size

LEED Gold Certified

The Okanagan College Centre for Learning is a 6,852m<sup>2</sup> addition to the existing college library located in Kelowna, British Columbia. The new five-storey interdisciplinary facility is connected to the existing building with a three story light filled atrium. The primary gathering space is characterized by pedestrian street which stretches along the entire east/west axis. This space has been conceived of as an agora which effectively binds the old to new, links the indoor and outdoor spaces, and creates a centralized meeting space which encourages academic and social interaction.

The “Centre for Dialogue” is the focal sculptural element elevated within the main atrium. The circular room is constructed of local wood and is designed to reflect the “basket art” of the indigenous people of the region which encourages the traditional learning circle concept of education. This is consistent with the overall mandate of the learning centre’s initiatives to encourage the open exchange of ideas and the development and application of critical thinking skills. The entire facility offers a variety of components to educate visitors about the building’s mechanical systems and the overarching principles of sustainability and the buildings relationship to environment.

**Archives of Ontario / York Research Tower, Toronto, ON – Canada 2009**

Client: PCL Contractors and Plenary Group, Size: 248,970 ft<sup>2</sup> | 23,130 m<sup>2</sup>

**Awards:**

**CDBI: 2012 Award of Excellence - Runner-up**

Located on York University's Keele Campus and envisioned as a hub of people and information, this project has three components: a 3-storey, 127,220 square foot podium containing the new Archives of Ontario; the 6-storey, 121,750 square foot York Research Tower; and a station entrance for the future Spadina subway line extension. The project has received LEED® Canada-NC Silver certification. B+H and PCL Constructors Canada Inc. were members of the team led by the Plenary Group who was selected by York University to design, construct, finance and operate this facility.

**McGill University, Redpath Library Cyberthèque, Montréal, QC – Canada 2008**

with ékm architecture (<http://www.ekmarchitecture.com>), Montréal, Québec – Canada

930 m<sup>2</sup>

This project's first phase involved a master plan to transform McGill's most historic library into a new type of academic library geared towards a new Internet generation. The second phase was to execute a 10,000 sq. ft. portion of that plan on the campus level of the library. Features include glassed-in group study pods, banquettes, quiet tables with or without computers for individual study, an e-classroom for information skills classes and programs, assignment production area, central information point called the genius bar, and casual study areas with bright, comfortable lounges. B+H worked in association with ékm architecture on the design. (B+H)

**Nordic International Management Institute, Chengdu (Sichuan) – China under construction**

Client: Chengdu Beixin Knowledge City Real Estate Co. Ltd., Size: 25,115sm

Designed and planned with the cooperation of the EU, this low density facility in Chengdu is an international business-education school to train business professionals who want to work in the international market. Strong sustainability principles are implemented across a wide range of landscape and architectural programs.

The grand central courtyard is a public open space that anchors the entire site and is used for a variety of activities. The Institute includes administration buildings, teaching buildings, multi-media centre, collaboration college, serviced student apartments, sports centre and supporting retail facilities.

**Surrey Public Library, City Centre Library, City of Surrey, BC – Canada 2011**

80,000 sq. ft., CAD 33,000,000

If we want a stronger Canada as well as stronger provinces, then our cities have to be stronger, too. That's the way Surrey Mayor Dianne Watts sees it, even though our cities receive only about eight cents out of every tax dollar Canadians pay. And from those few pennies, cities must fund a multitude of service costs, including big-ticket items such as police and fire protection. The fiscal imbalance continues to tilt away from equilibrium as both senior governments continue offloading their responsibilities on to the most junior and least-powerful governance partner. So it's all the more remarkable that Surrey is proceeding with its ambitious Civic Centre Development Project, which will provide B.C.'s fastest-growing metropolis with a new city centre to serve as the South of Fraser region's central business district. It will include a new city hall and large civic plaza next to an expanded Simon Fraser University. There'll be new office towers, a performing arts centre and a new main library. There'll be upgrades to King George Highway and the nearby Skytrain system, plus a new bus exchange. All this is about to happen adjacent to the existing one-million-square-foot, 25-storey Central City office tower and nearby Surrey Recreation Centre between 102nd and 104th avenues.

The first phase will be construction of the the Surrey Central Library. Council on Monday saw new design sketches of this \$30-million library by local award-winning architect Bing Thom. In an interview Wednesday, Watts described the designs as "stunning." But the 65,000-square-foot library is under the gun time-wise, Watts explains, because it's a jointly funded project under Ottawa's fiscal-stimulation program and must be completed by March 31, 2011. "The three levels of government are contributing \$10 million each and now the next phase is to put the library out to tender," the mayor says. Next on the agenda is relocating the existing 134,000-square-foot city hall at 14245 56th Ave. into a new city hall/office tower complex at the new city centre. "We've simply outgrown the existing city hall's space," the mayor says. "We need at least 150,000 square feet in a new city hall, plus room to grow." But Watts acknowledges that the new city hall, which is now in the design phase, will be far more than bricks and mortar to house city staff and council. "The city has to take the lead here," she says. "If we expect the private sector to invest in our downtown core, then the city has to invest in the core as well." The existing city hall will be either leased or sold to help fund the new premises, which will be developed as a city hall and office tower in conjunction with the private sector, Watts says. The Civic Centre Development Project's final component will be a performing arts centre that will contain a 1,600-seat theatre and a 250-seat studio theatre. Watts also says she's confident that the total project can be completed within several years--without serious impact on Surrey's tax levels, which are the currently the lowest within Metro Vancouver.

**Surrey Public Library Board: Vision Statement for the City Centre Library:**

Surrey's new City Centre Library will be a unique state-of-the art environmentally friendly landmark that provides access to the broadest range of information, learning opportunities, and diverse cultural experiences. The new City Centre Library will be:

•The centrepiece for Surrey's City Centre; adorned in architectural excellence for the 21st century, the library will contribute to the vitality of the City and put Surrey in a class with other great cities.

•A foundation for the City's future success by boosting economic and cultural activity and attracting visitors from all parts of the country.

•A source of pride and a great public space, where the community gathers to celebrate, reflect, connect and share information, knowledge, and culture.

•A trusted centre that inspires learning and knowledge exchange, empowers people and encourages open dialogue.

(Adopted by Surrey Public Library Board September 27, 2007)

Scheduled to open Summer 2011, this new library designed by Bing Thom Architects, as the first piece of a new development, will be a critical anchor that will set the stage for the future development and transformation of downtown Surrey.

It marks the beginning of a major civic investment in the area that will continue the transformation of downtown Surrey that began with BTA's Central City project, completed in 2004. This new civic development will ultimately include a new city hall, large urban plaza, underground civic parkade, performing arts centre, and additional commercial space. All of these uses will be arranged adjacent to one of the most intensively used transit hubs in Metro Vancouver. "We are thrilled to again be contributing to the future of downtown Surrey," stated Bing Thom. "This is a great opportunity to create something exciting for the future that will attract a wide variety of people to the downtown." Creating dynamic environments that look to the future of Surrey is nothing new to BTA. Nearly a decade ago, the firm designed the incredibly vibrant Central City, which sits down the street from the new Surrey Library. The architectural and social innovation evident at Central City—a fusion of office space, a shopping center and a university—is further exemplified in BTA's library design. Like Central City, the library encourages the gathering of diverse groups of people from the surrounding community. Its design features large windows, a welcoming entrance and central atrium with clear sight lines that allow visitors to quickly orient themselves in the space. The form of the building is inspired by the curvature of the adjacent University Boulevard with an added dynamism provided by their outward slope. Designed to LEED standards, the outward sloped walls also provide solar shading. BTA understands that the role of the library is changing and that the book collection is no longer the central focus. With advances in easily available electronic information and inter library loans, providing the appropriate spaces

for evolving library activities is now the priority. These activities range from the traditional research and education roles to the need for libraries to become a point of connection and even a gathering place in the community. As a result, the design includes a diverse mixture of large interconnected “high” spaces with generous natural light and “low” more intimate spaces to accommodate the book stacks and individual activities like studying and writing. In all cases, the spaces have been deliberately kept informal to make the library feel like an extension of the patron’s living room. As Thom says, “The design evolves out of the need to provide a space for reading, studying, and above all, gathering as a community. This building is very flexible and will accommodate all of these purposes.” Surrey is the second largest and fastest growing city in British Columbia. In fact, the population is expected to outgrow the originally proposed 65,000-square-foot library in a span of about five years. As a result, BTA encouraged the city to future-proof the building by constructing 78,000 square feet now. The excess space will be rented out for educational and other complimentary uses until the library can grow into it. Similarly, there is a full level being built underground, which can later be integrated into an underground civic parkade, another strategy for future expansion and integration with the community. As BTA Principal Michael Heeney states, “Surrey City Centre Library is the beginning of a whole new civic initiative that’s going to further establish the downtown for this growing and important city.” (<http://www.archdaily.com>)

### [Woodbridge Library, Washington, DC – USA in progress \(2015/16\)](#)

Client: DC Public Library, Size: 22.500 sqft. , Budget: \$ 13.000.000

Jaclyn Hersh, Woodbridge Librarys Redesign, Architech Newspaper 14.04.10

The ongoing redesign of Washington, D.C.’s Woodridge Library takes into account the rapidly evolving world of technology that is changing how and what we read. Created by the design team of Bing Thom Architects and Wienczek + Associates, the modern 22,500-square-foot library will stand apart from its 1958 single-story predecessor with its white walls and interior curves surrounded by exterior angles. Similar to his previous collaborative design process for the Surrey City Centre Library in British Columbia, Thom met with the Woodridge community while drafting this design, listening to them share their visions, which could be reflected in a rear entrance that will open directly out onto the grassy Langdon Park. Other elements further reinforce this indoor-outdoor relationship: an open multi-story floor plan, large windows providing an abundance of natural light, and a rooftop deck. Thom’s design fosters a place for community interactions and gatherings of different sorts and sizes, even after library hours, while still supporting traditional intimate spaces for reading and studying. (<http://www.archpaper.com>)

This new neighbourhood library is conceived as an elegant treasure chest that orients library patrons towards the verdant Langdon Park behind the site. A welcoming entrance opens into a central circulation area that is bathed in natural light. All levels of the building are quite open with clear sightlines providing interesting internal views to complement the views out to the park. The library is designed with a great deal of flexibility to support a wide range of activities. These activities range from intimate reading spaces through to grander spaces that could be used to accommodate larger community assemblies. (Bing)

#### **Libraries:**

#### [Bibliothèque Montarville, Boucherville, QC - Canada 2009](#)

**Brrière, Gilbert + associés, architectes en collaboration avec Denis St-Louis, architecte**

Existing Area: 1,700 sqm, Extension Area: 1,470 sqm, Budget: \$3.4 M

**PROGRAMME SOMMAIRE** Construite il y a plus de 25 ans, la bibliothèque de Boucherville doit s’agrandir et revoir ses aménagements existants de manière à développer sa mission et ses services en lien avec les nouvelles tendances sociales, culturelles et technologiques.

**GRANDES ORIENTATIONS** Dès nos premières appréciations du contexte existant de la bibliothèque municipale de Boucherville, c’est notre compréhension du potentiel d’interrelation inexploité avec le boisé du Parc de la Rivière-aux-Pins qui a motivé notre approche conceptuelle et son développement. C’est donc par une architecture décrochée et ouverte que nous croyons pouvoir communiquer l’essence même d’un lieu dont la fonction essentielle est la découverte et l’ouverture sur la connaissance et le monde. **ÉNONCÉ DU PROJET** Inspiré de la logique formelle du bâtiment existant, soit quatre carrés similaires qui tournent autour d’un même centre, l’agrandissement suggère le glissement et le décrochage d’un de ces carrés vers le boisé existant. Ce glissement engage ainsi de nouveaux liens ouverts entre le bâtiment et son environnement, redéfinit le cœur de la bibliothèque et assure l’unité de l’ensemble, voire l’intégration de l’existant et du nouveau avec le boisé.

Dans ce sens, un grand volume de bois complètement ouvert sur la nature ainsi qu’une nouvelle promenade d’accueil, axe formel de circulation extérieure traversant tout le site, sont les deux principaux éléments qui structurent le paysage et clarifient l’appropriation des lieux.

Positionné entre l’existant et le nouveau, le nouveau hall, son comptoir de prêt et son atrium organise les espaces intérieurs et permet de distinguer clairement et rapidement les principaux secteurs de la bibliothèque, dont les trois collections générales (jeunesse, adolescents et adultes) situées sur chacun des trois étages de l’agrandissement. (Brière)

The Montarville – Boucher la Bruère Public Library is located in the downtown core of Boucherville, a town of 40,000 situated on the banks of the St. Lawrence River just east of the Island of Montreal. Built more than 25 years ago, the municipal library needs to expand and reconfigure its existing facilities so that it can better pursue its mission and provide services in accordance with new and emerging social, cultural and technological trends.

This project, which was the award winner in a 2007 architectural competition, consists of a three-storey expansion (1,470 square metres) plus an indoor renovation and refit of the existing structure (1,700 square metres). It includes an atrium, a new entrance hall, a new library promenade, a new loans counter and a complete reorganization of all the library collections. floor plans

After an initial assessment of the library’s current context, it was the untapped potential for a visceral connection to the wooded area in the adjoining Rivière aux Pins Park that was the stimulus for our conceptual approach and further development of that idea. In contrast to the existing building, whose introverted geometry suggests only the slightest relationship with its immediate social and natural environment, our approach adopts an open, barrier-free design that we believe will convey the very essence of a centre whose essential function is discovery, as well as openness to knowledge and to the world.

An expansion that is simple, open and effective, to the benefit of all library patrons. Given the opportunity to emphasize and highlight the adjacent woods, the library expansion project offers, in terms of its implementation, its architecture and its three storey

volume, a formative gesture that defines the landscape and encourages visitors and users to come to the library. Like a unifying link, the expansion pulls together the component parts, giving concrete expression to the new physical and visual elements that connect the library to its urban context and the Rivière aux Pins Park.

Inspired by the formal logic of the existing building (four similar squares that revolve around a central core), the expansion suggests for one of these squares a shift in emphasis and an opening up to the nearby woods. This establishes new, open-ended connections between the building and its surrounding environment, redefining the heart of the library and ensuring a comprehensive unity, integrating the existing building with both the new addition and the adjacent woods.

In that sense, the two main elements that give structure to the landscape and clarify its harmonious integration are a large wooded area completely open to nature and a new library promenade, a formal exterior pathway that runs through the entire site.

The woods are an identifying element visible from the street and the surrounding area, heralding the presence of a cultural institution in an urban landscape. The three floors of the new extension, in addition to reducing the actual building footprint at ground level, mean lower costs and preserve as much as possible the trees adjacent to the building. The three storeys are home to the library's three general collections – books for children, adolescents and adults.

elevation & section

Taking advantage of the natural topography of the site and of the proximity of the trees, a large three-storey glass wall allows for diverse visual links between the indoor spaces and the woods. Consequently, each clientele (children, adolescents, adults and senior citizens) benefits from a distinct relationship with the vegetation, the trees and the foliage, which inspire calm, silence and rejuvenation.

Directly linked to existing footpaths, the new promenade runs alongside the building. It follows the contours of the topography and directs visitors toward the new reception area and main entrance, thereby anchoring the library to its immediate context, its neighbourhood and its town.

Taking maximum advantage of the sunshine from the building's southern exposure, the promenade organizes pedestrian access and traffic throughout the site. It serves as an efficient physical and visual link connecting the various component elements – the main entrance, the multipurpose room and adjacent terrace, the service entrance, the two parking lots, the woods and the river and two nearby roads (Chemin du Lac and Rivière aux Pins Street), as well as the residential sector, two parks (Parc de la Mairie and Pierre Laporte Park) and Boucherville's old historic centre.

In response to the introverted organization and the constrictions of the existing indoor space, we opted for an open spatial organization that is centred round the new lobby. With its loans counter and its atrium, it is the veritable heart of the project.

Positioned between the old and the new and extended vertically via the atrium, the lobby is a central locus that allows for quick, clear identification of the main sectors of the library.

The new reception area sets the tone, facilitating orientation and serving as a point of reference. As soon as visitors enter the building, they are literally plunged into the imaginary world of children. Located just below the entrance, the children's sector offers a direct view of the woods from the lobby and the reception counter, and from the library sections located in the existing structure.

Visible throughout the atrium, an access ramp serves as a continuation of the lobby and leads to the children's section, the main staircase and the elevator. It is a veritable architectural promenade that serves both as a transition between the various sectors and as a place to discover the entire library. These comings and goings offer other visual perspectives of Rivière aux Pins Park, thereby enriching the journey from one floor to the next.

The various sectors (periodicals, audiovisual materials, children's/adolescent/adult sections) benefit from new reading areas that have a visual connection to the adjacent woods. The history, genealogy, documentary and reference sectors are located in the existing building near the loans counter and information desk. The administrative sector is located nearby, ensuring optimum supervision and control.

The main lobby, the multipurpose room, the technical services and the administrative offices have all been relocated so that they have a direct connection to the library promenade. Relocated to the front of the building, the reception and library service areas will become intermediary spaces that make the vital connection between reading and urban life.

Reflecting its educational vocation, the new library's use of wood, its big open spaces with views of the outdoor landscape and its geothermal heating system convey respect for the environment and pride in our culture.

In addition to reducing costs, the use of wood (untreated natural cedar) and conventional planks-and-strips siding ensures a smooth transition from the existing wood-and-brick building. 14.04.10 ArchDaily (<http://www.archdaily.com>)

#### **Saint-Laurent Borough Library, Montréal, QC – Canada on design (2012)**

The Minister of Culture, Communications and the Status of Women, Christine St-Pierre, the Mayor of Montréal, Gérald Tremblay, and the Mayor of Saint-Laurent and Vice-Chair of the City of Montréal Executive Committee, Alan DeSousa, yesterday announced the winner of the Quebec-wide architectural competition for the new library in Montreal's Saint-Laurent Borough. Also present at the announcement were Helen Fotopoulos, who is responsible for culture, heritage and the status of women on Montréal's Executive Committee, and Lise Bissonnette, Chair of the competition jury. The chosen project was submitted by the team composed of Cardinal Hardy/Labonté Marcil/Éric Pelletier Architectes en consortium/SDK et associés inc./Leroux Beaudoin Hurens et associés inc. "I would like to congratulate the winning team," said Minister St-Pierre. "It will have the marvelous task of designing a space dedicated to knowledge—an ideal place where users can develop a taste for reading and become attuned to culture. By incorporating premises reserved for the exhibition and conservation of works of art, the library will truly serve as an environment adapted to the needs of Borough of Saint-Laurent residents." "Not only are our libraries key sites that enhance neighborhood life for Montrealers, they play an essential role in strengthening Montréal as a city of knowledge and culture," stated Mr. Tremblay. "And while we have focused over the last few years on making our libraries more accessible and enriching their holdings, we also know that the quality of our libraries' architecture plays a crucial role in ensuring that Montrealers take pride in using them." "I congratulate the competition winners, whose proposal responds to the vision of the project that we had set for ourselves and that is based on a thorough study of our community's needs and of the wishes voiced by citizens during the consultation process," expressed Mr. DeSousa. "On behalf of Saint-Laurent Borough Council, I would like to thank the jury and the technical committee, who undertook their task brilliantly." "With Montréal being a UNESCO-designated City of Design, I am delighted that we have architectural competitions such as this one for the new Saint-Laurent library," added Ms. Fotopoulos. "These competitions allow us to enhance the quality of our built heritage while also calling on the creative genius of our home-grown talents." "All of the four finalists submitted proposals that were highly noteworthy from an architectural standpoint," said Ms. Bissonnette. "However, the winning project presented the best combination of assets in terms of the building's functionality and its ability to integrate easily into its urban and natural environments."

#### Description of the winning project

In compliance with Montréal's policy on sustainable development for municipal buildings, the project is aiming to obtain LEED "Gold" certification (Leadership in Energy and Environmental Design). A true cultural gathering place, the new building will include, in addition to the library, an exhibition space as well as the Musée des maîtres et artisans du Québec's collection conservation center. The building will consolidate the role of the Boulevard Thimens civic axis and also help enhance the value of the Parc Marcel-Laurin woodland by providing it with a new point of entry. The winning team, for its part, stated: "The new Saint-Laurent library is a place where users will feel a sense of ownership—of knowledge, of culture, of the site itself—as well as discovery. This isn't a project about architecture alone: it's also about landscape. Located between Boulevard Thimens and Parc Marcel-Laurin, the new library integrates into the site by drawing on the major elements of the park. As such, the building connects the city with the surrounding landscape, and serves as a point of connection that allows users to explore its site—inside and outside, from Boulevard Thimens as well as from the park. Visitors will discover the building by approaching it from a variety of spaces both intimate and dramatic, spaces that, by offering a variety of access pathways, set the stage for the site as well as for its users." According to the established schedule, the winning firm will develop the plans and specifications for the new building throughout 2010. Construction will begin in 2011 and continue into 2012. The building is slated to open at the end of 2012. (<http://raddblog.wordpress.com>)

#### **Libraries :**

[Bibliothèque Félix Leclerc, Val-Belair, Ville de Québec, QC – Canada 2009](#)

#### **Awards :**

Prix d'excellence 2009 de la construction en acier de l'ICCA-Québec [quebec.cisc-icca.ca/excellence](http://quebec.cisc-icca.ca/excellence) 09.19 Agrandissement de la Bibliothèque Félix Leclerc, Québec

Pour une expression équilibrée de l'espace comportant à la fois de la rigueur et une intégration harmonieuse entre l'acier, le bois et le verre. Dans la nouvelle partie de la bibliothèque de Val-Bélair, à Québec, l'acier est apparent partout, à l'intérieur comme à l'extérieur. La structure d'acier du bâtiment existant, construit en 1987, devait être remise aux normes, notamment sismiques. On a choisi d'insérer un mur de refend ductile en acier, une technique utilisée pour la première fois à Québec. Dès l'amorce du projet, on a voulu faire participer la structure à l'expression architecturale. Le voile de bois structural est soutenu par des poutres d'acier qui trament l'espace, puis s'effacent devant la grande baie de fenestration s'ouvrant sur le parc. Toutes les parois de verre ont également une structure d'acier supportant les meneaux. La finesse de l'acier et la minceur du pontage de bois donnent une grande légèreté à la toiture. À l'arrière, un oculus a été percé au-dessus d'une oeuvre d'art. (Carrier)

[Bibliothèque René-Richard et Centre d'archives régional de Charlevoix, Ville de Baie-Saint Paul, QC Canada 1998](#)

Située entre l'église et l'aréna sur un site originellement désorganisé mais hautement stratégique, la nouvelle bibliothèque permet de lier deux pôles importants, l'église et l'aréna, en requalifiant un parcours générateur d'activités culturelles, en plein coeur du secteur patrimonial de Baie-Saint-Paul. Le corps principal du nouveau bâtiment s'implante naturellement le long de la rue Forget, sur les traces d'une ancienne grange, tandis que la section nord reprend discrètement l'alignement des terres ancestrales. La transparence de la façade et la pente du toit affirment l'appartenance de la bibliothèque à l'espace collectif. Un volume opaque abritant la salle d'animation vient s'y loger, révélant son contenu à l'espace public par une large vitrine. L'intervention atténue la présence de l'aréna et accompagne les piétons entre la rue Fafard et la section nord de la ville. Pour appuyer ce geste, le bâtiment s'ouvre radicalement sur la rue et se ferme à l'arrière, où il ne laisse filtrer que la lumière naturelle requise. (Carrier)

Client: Okanagan Regional Library, \$ 12.600.000, 30.000 sqft.

#### **Awards:**

Excellence Award, Community category 2012

Thompson Okanagan Commercial Building Awards

Judges' Choice, 2012

Libraries are welcoming and inspiring places for all who seek information and knowledge, and are evolving from being perceived as book repositories to community service centres. Flexibility for the future is more important now than ever.

Working cooperatively with the ORL Team and TASK Construction Management, we endeavored to ensure that the New Vernon Library is configured to meet the changing needs of users and tap the potential of emerging technologies. Using our 'Listen-First' approach to design, this project promises to be a model for community sustainability, enhancing access, promoting literacy, and ensuring a healthy environment for users and staff.

The design phase of the project was initiated with our signature Design Charrette. This intensive three-day event involved members of the ORL Board, ORL executive staff, Vernon Library staff, Library users, Community Groups, Representatives from the City of Vernon, and the entire Design Team. The results of the charrette are manifest in the final plans for the project and show the strength of an Integrated Design Process. The building design met the many different objectives of the project and resulted in a unique expression that is current, while still responding to the past.

The area of the new library has expanded, now with 30,000 square feet over two floors of modern, open space boasting city-wide views and lots of natural light. The main floor features a kids area, teen area and a 125-person community meeting room opening directly to the street. Upstairs via an open staircase flooding both floors with natural light are public internet stations, a computer lab and study space, smaller meeting room, adult reading area and offices for library staff. (CEI)

[Tommy Douglas Library, Burnaby, BC – Canada 2009](#)

Client: City of Burnaby, Costs: \$ 9.100.000, Size: 15.500 sqft.

#### **Awards:**

Tommy Douglas Library achieves LEED Gold, May 17, 2012

Library Building Award of Merit, 2010, BC Library Association

This bright, 17,500 square foot library serves the diverse Edmonds Town Centre neighbourhood with a catalogue of over 80,000 books and reference materials. The project, a joint venture between CEI and Diamond and Schmitt Architects, incorporates a variety of sustainable features, including a green roof, natural daylighting, geo-exchange heating and an underground cistern that collects rainwater from the roof that is in turn used for landscape irrigation.

The design of the facility emphasizes openness and accessibility. The main library space is a large room with a high ceiling. Exterior glazing adds to the sense of transparency and connectivity between library patrons and pedestrians outside. Given the importance of the site, which faces Kingsway, a prominent thoroughfare, the scale of the building as viewed from the street influenced the design. The high ceiling contributes to daylighting by allowing high-level light from the clerestory windows to diffuse across the room. The added height helps with the ventilation of the space — automated, high-level windows open to allow hot air to escape, exploiting natural convective forces.

The library has been described by visitors as “light and airy,” and “bright and welcoming.” It is achieving its goal of providing the community with a social gathering place that encourages reading, research and interaction. According to library statistics, Burnaby residents borrowed 33 percent more items from the new Tommy Douglas Library in its first full month of operation than they did from the former branch in a comparable month, suggesting that the library has opened a successful new chapter for residents of Burnaby. #### **Cambrian College Learning Commons, Sudbury, ON – Canada 2008**

April 2008: Cambrian College today opened its Library and Learning Commons. This \$2.5 million expansion reflects some of the newest and most progressive directions in the evolution of the traditional library. The Library and Learning Commons, which is now over 20,000 square feet in size, is the College’s hub for information, study, research, and out-of-classroom learning. It provides an environment where users can access traditional library resources, technologically-advanced learning tools, and both group and individual study spaces. “When this project was initiated, we listened closely to the needs that were identified by our students and addressed these as part of the renovations,” said Cambrian College President Sylvia Barnard. “This facility supports the educational experience of Cambrian students, ensuring that they have access to a wide variety of materials that will help to enhance the knowledge they gain through their programs.” The Library and Learning Commons is a bright, strategically-designed space that facilitates access to information and provides support to the research and studying aspects of the learning environment. The additional space, combined with the renovations that comprised the project, has allowed Cambrian to integrate some strategic leaning support services with both traditional and new directions. (CS&P)

#### **Sheridan Library Learning Commons, Sheridan College, Trafalgar Campus, Oakville, ON – Canada 2008**

Located at Sheridan’s Trafalgar Campus, the recently completed Library Learning Commons (LLC) is the first phase of a two-phase Library Master Plan completed by CS&P Architects. The LLC transforms an existing 15,000 sf warehouse-like space into a spacious, light-filled and technology-enhanced support environment designed with student’s comfort and convenience in mind. The programme for the facility houses a number of distinct spaces including technical support, seminar and group study rooms, computer labs, presentation and conferences spaces and a large information commons with hub resources spaces that function as totemic elements within the large, double-height volume. (CS&P)

#### **Kimel Family Education Centre, Community Hebrew Academy of Toronto (CHAT), Toronto, ON – Canada 2007**

(in joint venture with Petroff Architects)

CHAT is the coeducational Community High School of the Greater Toronto Jewish Community. We welcome students of all Jewish affiliations and beliefs. Founded with a small number of students in 1960, we have grown to over 1,400 students on two campuses. CHAT has a teaching faculty of over one hundred and seventy, including over sixty Jewish Studies faculty. We are known for the caring dimension of our teaching; the close student-teacher relationships; and the family atmosphere within the school - both within each grade and across the grades. A full team of Guidance Counsellors and a system of Staff Grade Teams have ensured that our most important qualities remained intact as our school has grown. A successful programme of Peer Counselling and Peer Tutoring maintains our tradition of mutual student-to-student help. We offer a comprehensive range of educational services, ensuring that we are meeting the individual educational and social needs and interests of a very wide range of students. Our General Studies programme prepares students for University entrance in Canada, the United States and Israel; we have an enviable record of success. We provide Remediation and E.S.L. at both Campuses through Learning Centres. Special Education is provided at CHAT TC. Our campus can accommodate students with physical disabilities. (<http://www.chat-edu.ca>)

The plan of this independent secondary school is program driven, simply organized as a ring of classrooms around two courtyards and major public rooms, layering outdoor spaces with art, books, dialogue, technology and spirituality. The building knits together transparent programmatic elements with compelling views through these spaces to the campus beyond. This resulted in an open and light-filled school environment, which dissolves boundaries and fosters exploration. (CS&P)

#### **Welland Civic Centre, Welland, ON – Canada 2005**

Welland Civic Square, City Hall and Public Library

The challenge of this revitalization project was to provide a generous home for the two principal users ( Welland City Hall and Welland Public Library ) on the same limited site, without diminishing the identity or public front for either occupant. The building’s cross-section provided the solution, with an entrance on Main Street for the City Hall and an entrance on the Canal side for the Library. The Council Chamber reads as a freestanding object and establishes a “dialogue” across the new civic square with the historic 19<sup>th</sup> century limestone courthouse. (CS&P)

#### **Technology Enhanced Learning, Georgian College, Barrie, ON – Canada 2002**

This major addition and renovation is the first project for the new campus master plan developed by CS&P Architects and Urban Strategies. The addition of the Learning Resource Centre creates a new public face to the highway and main playing field. The building achieved exceptional energy conservation performance, and state of the art integrated technology, adding lecture, seminar and meeting rooms, smart classrooms, staff offices and social spaces for over 2,500 students. (CS&P)

## **DAM Architects, Montréal, QC – Canada**

<http://www.desnoyersmercure.com>

### **Libraries:**

#### **Bibliothèque Kirkland, Kirkland, QC – Canada 2011**

Client : Ville de Kirkland, Coût : 2 545 000 \$, Fin des travaux : 2011

À l'aube de ses vingt ans d'existence, la bibliothèque municipale de Kirkland demande à être rénovée et son environnement, rajeuni. Le programme des travaux comprend l'intégration d'un nouvel ascenseur à l'entrée existante pour permettre l'accès universel aux espaces situés en sous-sol ainsi qu'une rénovation complète des systèmes mécaniques et de l'éclairage des salles de lecture. DMA propose une approche en continuité avec le bâtiment existant, où l'entrée est toutefois complètement remodelée pour marquer le renouveau et ouvrir la bibliothèque sur la communauté. Ceci est conçu de manière à laisser entrer la lumière naturelle par le Nord, tout en ne gênant pas les activités de lecture à l'intérieur de la bibliothèque. (DAM)

#### **Bibliothèque Fraser Hickson, Montréal, QC – Canada Concept 2009**

Client : Église Trinity Memorial

En 2009, L'institut Fraser Hickson vend ses installations de Notre-Dame de Grâce et projette de se relocaliser sur un site plus petit afin de réduire ses coûts d'opération à long terme. Le projet élaboré par DMA propose de relocaliser la bibliothèque au sous-sol de l'Église Trinity Church, permettant ainsi également à l'Église de rationaliser et moderniser ses installations (ajout d'un ascenseur et transformation du système de chauffage) et réduire ses propres coûts d'exploitation.

Le projet est conçu en deux phases : la première visant l'installation, à court terme, de la salle de lecture principale au sous-sol de l'église; la deuxième phase profite du potentiel de développement permis par le zonage du site et vise un agrandissement de la bibliothèque sur le terrain adjacent à l'Église, avec une nouvelle adresse autonome et des infrastructures d'accueil indépendantes de celle-ci. Ce projet, qui demeure aujourd'hui un bel exemple d'optimisation dans le développement immobilier d'un patrimoine religieux, est encore à l'étude et à l'étape de recherche de financement. (DAM)

#### **Bibliothèque du Parlement d'Ottawa, Ottawa, ON – Canada 2008**

joint venture with: Ogilvie and Hogg et Spencer R. Higgins and Lundholm Associates

Client : Travaux Publics Canada, Coût : 78 000 000 \$, Fin des travaux : 2008

Designed by Thomas Fuller (1823 Bath Enland – 1898 Ottawa Canada) and Chilion Jones (1838 – 1912), and inspired by the British Museum Reading Room, the building is formed as a chapter house, separated from the main body of the Centre Block by a corridor; this arrangement, as well as many other details of the design, was reached with the input of the then parliamentary librarian, Alpheus Todd. The walls, supported by a ring of 16 flying buttresses, are load bearing, double-wythe masonry, consisting of a hydraulic lime rubble fill core between an interior layer of finished stone and rustic Nepean sandstone on the exterior. Around the windows and along other edges is dressed stone trim, along with a multitude of stone carvings, including floral patterns and friezes, keeping with the Victorian High Gothic style of the rest of the parliamentary complex. The roof, set in three tiers topped by a cupola, was originally a timber frame structure covered with slate tiles, but is presently built of steel framing and deck covered with copper. The initial overall combination of colours—grey Gloucester limestone and grey Nepean, red Potsdam, and buff Ohio sandstones, as well as purple and green slate banding—conformed to the picturesque style known as structural polychromy.

The main reading room of the Library of Parliament

The main reading room rises to a vaulted ceiling and the walls and stacks are lined with white pine panelling carved into a variety of textures, flowers, masks, and mythical creatures. In the galleries are displayed the coats of arms of the seven provinces that existed in 1876, as well as that of the Dominion of Canada, and standing directly in the centre of the room is a white marble statue of Queen Victoria, sculpted by Marchall Wood in 1871. The northern galleries are also flanked with the white marble busts of Sir John Sandfield Macdonald; Prince Edward, Prince of Wales (later King Edward VII); Alexandra, Princess of Wales (later Queen Alexandra); and Sir Étienne-Paschal Taché.

La Bibliothèque du Parlement, classée monument historique national, a ouvert ses portes à l'origine en 1876; elle a été modifiée en 1953 à la suite d'un incendie majeur. Ses qualités architecturales exceptionnelles et son profil sur la colline parlementaire en font la meilleure référence au Canada du style « néogothique de la grande époque victorienne ».

Le mandat octroyé à DMA (en consortium) consistait en la conservation et la réhabilitation de cet édifice remarquable. L'étendue des travaux comprenait le remplacement des toitures, la restauration des fenêtres, la consolidation des murs porteurs en maçonnerie, la rénovation des espaces intérieurs, le remplacement des systèmes mécaniques/électriques désuets et la conservation des finis intérieurs. Pour l'intégration de nouveaux espaces pour les livres et les systèmes mécaniques, 13 mètres de profondeur fut excavé dans le roc sous le bâtiment et ces services furent distribués verticalement de manière à les intégrer et à les dissimuler.

La préservation de l'esprit patrimonial existant à la Bibliothèque du parlement a inspiré la stratégie de conservation dans la conception des nouvelles interventions mais sans imitation servile. (DAM)

#### **Cour Suprême du Canada, Library, Ottawa, ON – Canada 1995**

Client : Travaux Publics Canada, Coût : 18 000 000 \$, Fin des travaux : 1995

Bâtiment construit en 1951, il fut décidé vers la fin des années 80 de procéder à une mise aux normes du point de vue sécurité-incendie, de remplacer la toiture, de rendre le bâtiment accessible aux personnes à mobilité réduite et surtout de réorganiser la bibliothèque pour recevoir plus de 500,000 volumes et pour assurer la préservation de la plus importante collection de droit civil et de droit commun au Canada.

La bibliothèque à l'époque de la construction du bâtiment avait été aménagée dans la partie sud du troisième étage. Les problèmes d'accessibilité et d'espace ont depuis rendu ces espaces inadéquats pour une bibliothèque de cette importance. L'objectif principal consistait à trouver l'espace nécessaire pour loger le programme proposé par les responsables de sa réorganisation, de lui conférer un caractère en harmonie avec la noblesse des lieux et de l'intégrer au fonctionnement de l'ensemble du complexe judiciaire avec une relation directe avec le grand Hall d'Honneur au rez-de-chaussée. (DMA)

## **Diamond Schmitt Architects, Toronto, ON – Canada**

<http://www.dsai.ca>

### **Libraries:**

#### **Brentwood Library, Toronto, ON – Canada 2012**

The Brentwood Library reopened recently following a two-year renovation and expansion designed by Diamond Schmitt Architects. The updated library adds 30 percent more public service, collection and staff space configured on a tight site in the suburb of Etobicoke, Ontario.

The form of the original (1955) two-storey east wing is maintained and connects with a three-storey addition by a double-height Reading Room that houses the library's main book collection and seating areas. This central spine features an exposed steel-tension truss-and-wood roof as a sculptural element and fully glazed north and south elevations have clear and coloured translucent glass panels. Natural lighting is abundant throughout the library and all occupied spaces have windows and outdoor views.

The cladding consists of curtain wall, zinc panels, split-faced limestone masonry and charcoal-hued brick – materials that reference the adjacent precinct and the library's siting between commercial interests to the south and residential to the north. Landscaping furthers this transition with the addition of benches and a shade park with shrubs, ornamental grasses and perennials.

"This library reflects the multi-purpose role libraries serve in the community and provides a wide range of highly visible program space for group and individual activities," said Donald Schmitt, Principal with Diamond Schmitt Architects.

Next to the entrance hall on the main floor, the Urban Living Room comprises a lounge with soft seating around a fireplace with an original Group of Seven painting by A.J. Casson. This high-circulation area features computer stations, new fiction, periodicals and multi-media. A 90-seat community room serves as a quiet study area and supports public functions with audio-visual equipment and a kitchen. The balance of the ground floor contains the KidsStop Interactive Early Literacy Centre – intimately scaled zones according to age groups and story-time activity.

The second floor features another fireplace seating area, the adult book collections, a computer learning centre, a group study area and an enclosed Teen Zone with large screen TV. Office and support areas are located on the third floor.

Traditional and contemporary finishes create an elegant and playful interior. White glazed concrete block defines the spine, which features vertical banded lighting. A rich chocolate carpet field connects program areas that have distinct floor colouring and patterns. Black walnut wood is used for all shelving, millwork, wall panels and benches. An array of contemporary colourful chairs, tables and loose furnishing further provide contrast and a sense of fun.

"We strive to make our branches welcoming, accessible and inspiring neighbourhood hubs, and I think the Brentwood Branch renovation has achieved these goals," said Toronto Library Board Chair Paul Ainslie.

Sustainable design initiatives include reusing the structure of the west portion of the former building's foundation walls, steel columns and second floor assembly. The existing arched glulam beams and wood roof deck previously concealed by acoustic tiles have been restored and exposed. A high performance building envelope, energy-efficient mechanical features and a radiant floor heating system reduce energy consumption. A mechanized shading system controlled by light sensors enhances indoor lighting and control. An elevator was added and the ground floor of the existing wing was lowered to grade, for full accessibility. Canadian Architect 11.11.12 (<http://www.canadianarchitect.com>)

#### **Harris Learning Library, Nipissing University / Canadore College, North Bay, ON – Canada 2011**

Client; Nipissing College, Canadore College

The three-storey, 56,000-square-foot library serves as a new gateway to the shared Nipissing and Canadore campus and doubles the size of existing collection space and student user space. Key architectural elements include two large, fully glazed volumes that bookend the building with a double-storey study hall at one end and service space at the other. A three-storey skylight atrium serves as the axis for student orientation and provides natural day lighting throughout. A unique feature is a terraced reading area with built-in seating on a gentle grade between the first and second floor. The periodical reading room provides views over the evergreen forest landscape.

This library serves equally as a resource centre and a town square for information exchange where students can access group study space, computer rooms, distant learning facilities, informal study space and traditional reading rooms. The configuration transitions from social learning on the lower floors to study space that is quieter and more focused on the third floor. A special feature of the library is the Treaty Learning Centre, designed for studying the experiences of First Nations in Canada. (Diamond)

#### **University of Ontario, Institute of Technology, University Library, Oshawa, ON - Canada 2011**

### **Awards:**

2012

Copper Development Association / Canadian Copper and Brass Development Association, North American Copper in Architecture Award - New Construction

2008

RAIC / CIP / CSLA, National Urban Design Awards - Medal of Excellence for Community Urban Design

2007

Building Magazine, Outside the Box Award - Green Building Design

2006

Society for College and University Planning / AIA Committee on Architecture for Education, SCUP Awards - Honor Award for Excellence in Planning for a New Campus

The Brick Industry Association, Brick in Architecture Awards - Bronze

2005

RAIC - Award of Excellence for Innovation in Architecture

With its 650 fully computer-connected workspaces and electronic classrooms, as well as its dramatic, three-storey glass rotunda, the library at the University of Ontario Institute of Technology in Oshawa, Ontario, is a showplace for the twenty-first century. Much attention has been paid to the quality and variety of student space in this facility. Large study halls overlook the landscaped commons and provide a variety of table, carrel and lounge seating. Enclosed rooms are provided for group study, seminar discussion and quiet work activities. A small sixty-seat café in the library overlooks a reflecting pool/ice rink and a stormwater management pond. The library houses a print collection of about 125,000 books, with a significant emphasis on reference material, but it is the provision of wired and wireless connection to electronic collections that distinguishes it from libraries in most other post-secondary institutions. The library has been designed to achieve an energy efficiency target of 30-per-cent below ASHRAE 90.1 standard and to obtain LEED Gold certification. (Diamond)

### **Library and Learning Commons, Centennial College, Toronto, ON – Canada 2011**

Centennial College is moving ahead with a visionary plan to construct a new library and classrooms that will add much-needed academic space at its flagship Progress Campus, thanks to a \$35-million infrastructure investment by the federal and Ontario governments. Construction is set to begin in August, with occupancy slated for as early as the summer of 2011. The 104,600-square-foot building, situated just north of the main campus entrance, will include a full-service library as well as 22 additional classrooms, lab space and a large lecture theatre. The project is supported by the Knowledge Infrastructure Program (KIP), a federal-provincial initiative to renew Canada's college and university campuses. "We're delighted by the news that our bold library project has earned financial support from two levels of government," says Ann Buller, Centennial College President and CEO. "It's wonderful to see our colleges recognized by both Ottawa and Queen's Park for helping to develop the advanced skills so essential to Canada's growth." The new library will offer state-of-the-art technology with both in-house and remote access to digital resources, as well as print and visual media collections. The learning-centred environment will be open, dynamic and physically adaptable to accommodate various needs. A 'Learning Commons' will function as a gathering place offering a gallery, small performance area and classrooms with instructional technology and presentation technology suites. Under KIP, Ontario will invest \$27.7 million towards the new building and the federal government will provide \$7.3 million in support. Centennial itself will contribute \$5.8 million towards the \$46-million project, which is expected to create about 460 construction jobs. The new library is part of a \$143.5-million rejuvenation plan for Ontario's oldest college. Centennial is planning for additional enrolment growth when its campuses are linked by Toronto's proposed light-rail transit lines. (Diamond)

### **Tommy Douglas Library, Burnaby, BC – Canada 2009**

The Brock Learning Commons, designed by Diamond & Schmitt Architects Inc., will be an inviting learning space where physical surroundings and student services will converge to create an environment that supports the informal and social dimensions of learning. Centrally located at the heart of the campus on the main floor of the James A. Gibson Library, the Learning Commons will also encompass the area previously occupied by the University Book Store. The renovations will result in an open expanse of more than 20,000 sq. ft. dedicated to student learning space and service. The Learning Commons is a partnership among Career Services, the Centre for Teaching, Learning and Educational Technologies, the Library, and the Student Development Centre. The partners are very grateful to our students for their strong endorsement of the \$4.5 million Learning Commons project by committing \$1 million over 5 years from the Brock University Students' Union Strategic Expansion Fund.

### **Gerstein Science Information Centre, Reading Room, Toronto, ON – Canada 2008**

#### **Awards:**

Awards of Excellence from the Ontario Association of Architects in 2010.

In 1996/97 the Frank Gerstein Charitable Foundation made a donation to the previously named Science and Medicine Library and the library became known as the Gerstein Science Information Centre.

Prior donations in 1990-93 from full time undergraduate students improved the disabled entrance to the building.

Beginning in the early 2000's, a series of gifts from the Morrison family inspired the construction of the library's Morrison Pavilion which is dedicated to study space for students. The Bertrand Gerstein Family Foundation made donations which aided in the restoration of the beautiful ceiling and skylight of the original reading room, now called the Gerstein Reading Room. The Marvin Gerstein Reading Room was also modified and now shows its previous beauty.

Donations from George Kiddell and the estate of Dorothy Ashbridge Bullen have enhanced facilities within the library.

The building renovations designed by Diamond & Schmitt Architects between 2001-2008 have received several architectural awards. (<http://www.donate.libraryx.utoronto.ca>)

### **North Vancouver City Library, Vancouver, BC – Canada 2008**

The North Vancouver City Library is a landmark building servicing a growing community. The library and surrounding plaza generates urban vitality and provides a community meeting place that compliments the surrounding business district.

The distribution of program space within the library is used to create superb study spaces overlooking either the Civic Plaza or the Courtyard with unheralded mountain views.

Energy to the library is provided by the Central Lonsdale District Energy Plant, located beneath the plaza. A large array of solar panels following the south slope of the roof monitor, provide heat for domestic hot water to the District. (Diamond)

The Heart of the City

Located in what is considered 'the heart of the City', the new North Vancouver City Library encompasses three levels of public space totalling 36,000 square feet. More than twice the size of the old library, the new state-of-the-art facility features an expanded collection of 150,000 library items, including DVDs, CDs and games. The adjoining Civic Plaza offers free wireless internet connectivity for the public and a unique and welcoming gathering place for the community. Featuring a wireless café terrace, market promenade and amphitheatre, the plaza provides easy access to the new library, City Hall, Lonsdale Avenue and the Central Lonsdale neighbourhood.

Green and Gold Standards

The new library is one of the City's newest green buildings. Designed by world renowned architect, Jack Diamond and Diamond + Schmitt Architects Inc. in a joint venture with CEI Architecture, the North Vancouver City Library was constructed to a minimum LEED Silver standard. The City aims to achieve a LEED Gold standard in the near future. The library also represents a first for the award winning Lonsdale Energy Corporation: it is the first facility in Central Lonsdale to enjoy high efficiency district energy service using rooftop solar panels to generate alternative energy. (<http://www.cnv.org>)

### **Pierre Berton Resource Library, Vaughan, ON - Canada – 2004**

Client: Vaughan Public Libraries

#### **Awards:**

2007

Ontario Library Association - Award of Excellence

2006

American Library Association / International Interior Design Association, Library Interior Design Competition - Honor Award, Public Library

2005

City of Vaughan, Vaughan Urban Design Awards - Honourable Mention

The Pierre Berton Resource Library is designed to serve the information, cultural, learning and leisure needs of a growing multicultural population. Vaughan Public Libraries has been at the forefront of mobilizing new technology to benefit library users.

**The new library incorporates an array of Internet-access computers, word-processing stations, and CD-ROM terminals to meet the ever-growing demand.**

The facility is also designed to optimize the library's visibility in the community. The north facade along Rutherford Road is glazed, exposing all the activity inside. The double-height Internet café protrudes from this facade, and its media installation acts both as a beacon and as a source of information to library users. The second-floor study lounge breaks out of the main building mass, commanding a presence along Rutherford Road and providing views to the adjacent Boyd Conservation Area. (Diamond)

### **María A. Shchuka District Branch Library, Toronto, ON – Canada 2003**

December 1, 1999

To: Budget Advisory Committee

From: City Librarian

Subject: Proposed Reconstruction of Maria A. Shchuka District Library  
York Eglinton - Ward 28

Purpose:

To respond to the request from the Budget Advisory Committee that the City Librarian report back on the feasibility of reducing the size and scope of the Maria A. Shchuka District Library so that it is not deemed to be a district library and rationalize the reconstruction.

Financial Implications and Impact Statement:

There are no financial implications to the Library's original capital submission except for the effect on cash flow resulting from deferment.

Recommendations:

It is recommended that this report be received for information.

Background:

At the November 16, 1999 Capital Budget Review meeting with the Budget Advisory Committee, the City Librarian was directed to report on the feasibility of reducing the size and scope of the Maria A. Shchuka District Library so that it not be deemed to be a district library and rationalize the reconstruction. The Maria A. Shchuka Library, formerly the "main" library of the City of York Public Library, provides service to the entire community (1996 population = 146,534). Prior to amalgamation, reconstruction of this 24,000 square foot library was a priority of the City of York Public Library Board. Studies were undertaken to investigate reconstruction and expansion to 48,000 square feet. More recently, it was designated by the Toronto Public Library as one of the 17 district library locations. The current reconstruction proposal replicates the existing square footage and addresses the structural and service deficiencies.

Comments:

The most recent study "Interim Report on Maria A. Shchuka Library Branch Feasibility Study Update" (July 1998) conducted by the Randolph Group in association with A. J. Diamond, Donald Schmitt & Company, summarized the following major deficiencies:

- (1) Internal building layout a labyrinth;
- (2) A multitude of rooms and walls which make the collections virtually inaccessible without staff assistance (eg. children's collections divided into three separate rooms);
- (3) Customers are totally unaware of the second floor since stairs and elevator are not very visible;
- (4) Poor access and movement for those with disabilities (eg. one program/meeting room totally inaccessible);
- (5) Insufficient seating and study areas;
- (6) Inadequate, outdated and inefficient HVAC, electrical and mechanical systems;
- (7) Collections overcrowded and poorly displayed;
- (8) Sightlines are non-existent and therefore security problems abound.

In short, the present building does not function effectively as a district library.

As a district library, Maria A. Shchuka provides a higher level of reference service and collections than is available in neighbourhood branches. The community is used to, and expects this level of service, and anticipates its continuance. At a public meeting on October 21, 1999, the community was informed of the proposed reconstruction, and also of the plans for future service. The response to the proposals was very positive.

The branch is situated in an area of the city with high demands for services for children, youth and seniors. Enhancements to service such as improved computer and electronic resources, more study areas, literacy services, as well as improvements to Youth and Children's services have been identified as being essential to the needs of the community. A reduction of this library in size and function (ie. to a neighbourhood branch) would effectively diminish service levels for the community.

It is worth noting that although the Oakwood Village Library and Arts Centre is in relatively close proximity to Maria A. Shchuka Library, as a neighbourhood branch it is not large enough to fulfill a district library function. It has a mandate as an arts centre which gives it a very different and special focus.

All other libraries in the district are categorized as neighbourhood libraries, and have neither the physical size nor collection depth to fulfill a district function.

Of particular importance in the proposed reconstruction project is the issue of partnerships. These partnerships have been thoughtfully conceived and executed to enhance both community and district library services:

- (1) The Toronto Public Library has agreed to provide the land for an affordable housing component in partnership with the "Let's Build" initiative of the City of Toronto, Community and Neighbourhood Services. This has already been through an "expression of interest" process, and four proposals have been received.
- (2) A Youth Resource Centre will be accommodated within the proposed square footage in partnership with COSTI, a highly respected and longstanding community organization. Such a partnership is dependent on the service mandate of a district library.

Conclusions:

In summary, the reconstruction of the Maria A. Shchuka District Library will provide a better, not a bigger library. Also, the combination of a district library in partnership with a youth centre and affordable housing would contribute to the development of the community and the planned revitalization of Eglinton Avenue.

It is not feasible to reduce the Maria A. Shchuka Library to neighbourhood status as this would result in a severe reduction in service and limit the Library's ability to respond effectively to identified community needs (eg. literacy, computer skills, special needs of families, youth, seniors, ELS and immigrant communities). (<http://www.toronto.ca>)

### **Gerstein Science Information Centre, The Morrison Pavilion, Toronto, ON – Canada 2003**

The Gerstein Science Library comprised three wings constructed in 1893 and 1912. With the Sigmund Samuel addition in 1952, it was essentially a warehouse for books and had become a disorienting, dysfunctional and inadequate facility. The master plan for the library set out a phased strategy of interior renovation, restoration of heritage reading rooms and construction of a new wing. The Morrison Pavilion, only 9 metres wide, extends the full length and height of all five floors and forms a new facade on the forgotten ravine east of the building. Limestone cladding and new bay windows emulate the material and proportion of the 1912 wing. New

reading rooms at each floor bring 650 new student seats into daylight and provide views to the landscape and the city. Book stacks are consolidated in the relatively windowless interior. A new continuous stair between the existing facade and the new wing provides a clear, visible connection between all five floors. This design adds only 11 per cent to the area of the library but creates a 70 per cent increase in student places, a 50 per cent increase in collection space and a 20 per cent expansion in staff accommodation. (Diamond)

### Dub Architects, Edmonton, AB – Canada

<http://www.dubarchitects.ca>

#### **Libraries :**

#### Edmonton Public Libraries, Mill Woods Library, Seniors and Multicultural Centre, Edmonton, AB – Canada 2014

joint venture with Hughes Condon Marler, Vancouver BC (<http://www.hcma.ca>)

##### Location

The new Mill Woods Library, Seniors and Multicultural Centre will be situated in the immediate vicinity of the Mill Woods Town Centre and Mill Woods Transit Centre. The new library is planned to be in the order of 25,000 square feet, almost double the size of its current location (approx. 12,800 square feet). Expected completion date is Summer 2014.

Currently the Mill Woods Branch is the only library branch serving residents in the City's southeast, defined as the area south of 63 Avenue/Argyll Road and east of Gateway Boulevard.

##### Statistics

In 2010, the Mill Woods Branch was the second most visited EPL branch with nearly 633,000 visitors (a 5.6% increase over 2009). Items borrowed from the Mill Woods Branch increased by 19% during this time with over 1.2 million items borrowed in 2010 ranking it third among all EPL branches. The Mill Woods Branch serves an area of about 84,800 people.

##### Diversity

Mill Woods is a culturally diverse community, with many residents speaking languages other than Canada's two official languages of English and French. The 2006 federal census shows that non-official languages are the mother tongue of 29% of the target area's residents, as compared to 26% of Edmonton residents. As well, 17% of the Mill Woods Branch service area's population speaks a non-official language most often at home, which is higher than the City figure of 13%. The 2006 Canada census data also indicates that compared to Edmonton as a whole, the residential neighborhoods of the Mill Woods Branch service area have a higher percentage of immigrants, with 28% of the population having been born outside Canada, as compared to 23% for the City of Edmonton.

The Mill Woods Branch works collaboratively with Mill Woods agencies and organizations to provide programs and services that meet identified needs, particularly those of newcomers and immigrants of all ages. (<http://www.epl.ca/about-epl/building-projects>)

This project involves the design and construction of a new Library, Seniors Centre and Multicultural facility. Set within the context of suburban malls and big box retail, the new building announces its civic presence by dramatically revealing the functions through a sculptural interior space. The building is designed such that public areas of the library act as « carved » spaces within the larger structure, with support spaces hidden within the « solid » portions of the building's form. The material expression of the concept further emphasizes the contrasting spatial characteristics. Translucent portions of the building contrast with the public spaces that are light in colour, creating bright, airy multi-storey public spaces and reading rooms. (Dub)

#### Jasper Place Branch Library, Edmonton, AB – Canada 2012

The new Jasper Place Branch Library design reflects the Edmonton Public Library's aspirations to create an open and memorable presence in the community. The design attempts to satisfy the following:

- A sustainable building that fulfills present and future library needs and uses.
- A welcoming space that acts as an inclusive designation for all demographics of the community.
- A flexible space that will be able to accommodate future reorganizations of the collection and reading areas.
- A distinctive building that announces its unique role in the neighborhood as a place for public use.

##### SITE DESCRIPTION

The Jasper Place Library's role in the neighborhood landscape has changed over time. Originally the library prominently faced a large shopping mall parking lot. Over the years, a fire-hall was added to the north side of the site, and the mall has since undergone expansion, partial demolition, and partial replacement with medium-density condominiums. The current library itself has been renovated and expanded several times to the current size of 10,700 sq ft, and caters to a diverse demographic of approximately 38,500 people. In recent years, the number of users has grown, increasing demands on the facility. Reassessment determined that the library required expansion to 15,000 sq ft, as well as a redesign to suit the library's latest objectives. A building audit was conducted to compare expanding the existing facility, which has continuing structural problems, with constructing a new facility to replace the existing one. Evaluation concluded that a new facility would best serve the needs of the library and community.

##### PROJECT DESCRIPTION

The project consists of a new 15,000 sq ft library at the intersection of 90th Avenue and Meadowlark Road. Fronting onto 90th Ave, the library primarily consists of a large public space over two levels. The ground is occupied by most of the staff functions, as well as a double-height reading room consisting of book stacks and reading areas. This public area extends above the staff area to a mezzanine level overlooking the central space. Stairs (some of which are designed to double as reading spaces or an amphitheatre) are located at the ends of the mezzanine to form a continuous loop for patrons to circulate. An elevator is also provided as an option. A publicly-accessible outdoor terrace is featured on mezzanine level at the south side of the building. An undulating concrete roof structure with metal cladding covers the building footprint, and descends on the east and west. Glazing is predominantly used on the north and south facades, overlooking landscaping to the north and the entrance plaza to the south. Washrooms and the Community Room (used for library programs as well as by the community at large) are located adjacent to the entrance, so they may be used independently after library hours. Mechanical and electrical rooms are located on a basement level below the staff areas. On-site parking for library and fire-hall staff, as well as some public parking, has been provided along 156 Street on the east side of the site. The majority of public parking is located on the street along 90th Avenue.

##### DESIGN EXCELLENCE

The design was in part inspired by the original 1961 Modernist design of the Jasper Place Library, and that period when the community was growing. The project will express civic pride, and celebrate structural honesty with distinctive roofscapes and strong profiles set against the prairie sky and surrounding trees. The proposed design attempts to utilize the library and community facilities to give the larger Meadowlark Community a distinctive landmark distinguishing it from other communities in the city. While the form of the building distinguishes it from the surroundings, it does so by working with the particular qualities and

opportunities of the site. From the road, the design recognizes the site's exposure to vehicles traffic and the potential West LRT along Meadowlark Road. For the pedestrian and patron, it offers the community a friendly welcome by using transparency to open its south and west faces to the passerby. The design addresses the challenges and opportunities of building in Edmonton's climate. The large southern exposure of glazing will invite considerable sunlight and thermal comfort during the winter, while being shaded from the summer sun by a combination of an overhang, sunshades, glass coatings, and trees. Additional natural light will be provided by the glazing on the north facade, while the more opaque east/west facades will limit the heat gain that comes from the horizontal morning/evening sun. The roofscape is designed to shed water and melting snow through a series of peaks and troughs. The concrete structure will be insulated and clad with a metal roofing system. Although the materials were chosen in part for their durability and ability to express a sense of civic permanence, they will be used in a sinuous form that also evokes an inviting and playful softness. The concrete structure will be exposed to the interior space, which continues over the entry plaza. Sustainability on all fronts is a central focus. The design seeks to create a memorable space of lasting social value. The functional longevity will be strengthened by an open, flexible floor plan that can accommodate future reorganization and adaptation. Environmentally, the facility will use the LEED® standard (aiming for a minimum of LEED® Silver certification) to ensure sustainable strategies. The project will incorporate a public art component through the Edmonton Public Art program. While a specific artist/work has yet to be determined, the expectation is that the artwork will be thoughtfully and meaningfully integrated into the architecture and site. ## **ekm (Emond, Kozina Mulvey) architecture, Montréal, QC – Canada**

<http://www.ekmarchitecture.com>

### **Libraries :**

#### **McGill University Redpath Library, Cyberthèque, Montréal, QC – Canada 2008**

The redesign by EKM and **B + H Architects** addresses both the library user experience and the radically changing nature of library collections and functions. Nowadays, says Douglas Birkenshaw, a partner at B + H, "the library needs to be a door onto the digital world, and the librarian the doorkeeper." That's certainly the case at the Cyberthèque. No longer a container for physical books, the space instead provides easy access to McGill's growing collection of over two million electronic books and over 50,000 journal databases. "Whereas a hard-copy book may be borrowed 60 or 70 times in a semester, the electronic version will be downloaded 10,000 times," says Janice Schmidt, McGill's director of libraries. "The library has to reflect that reality."

### **Libraries:**

#### **Walter Koerner Library, University of British Columbia, Vancouver, BC – Canada 1997**

with: Architectura and Aitken Wregglesworth Association

see also: Simon Fraser University, Burnaby, BC-Canada 1965/ Donald Kaufman Library, Los Angeles, CA – USA 1987

see also: <http://www.images.goggle.de> (Walter Koerner Library)

€24.000.000

In 1991, the area immediately to the west of the underground Sedgewick Undergraduate Library was confirmed as the site for Walter C. Koerner Library. Construction began in January 1995. Sedgewick/Koerner continued to operate, maintaining most library services. The two underground floors of Sedgewick were renovated and upgraded to current library and safety standards. These two levels were extended on the west to become the base of the new construction between Old Administration, Mathematics, and the Math Annex. The Walter C. Koerner Library opened officially on March 10, 1997. The new construction extends five stories above the level of the mall. The new design, while classical in order and structure, is modern in material and technology, with a central entry on axis with the Main Library and a tripartite vertical organization into base, body, and attic. The base is composed of a battered granite wall, complementing the materials of the Main Library. The granite is from the same quarry as the granite used on the Main Library. There is a course of clerestory windows and a continuous planter above. On the front façade, the three mid levels are sheathed in a flush plane of glass shielded by a system of external glass screens. The transparency of these levels allows the building to 'read' as a library and permits the maximum amount of appropriately screened daylight into the building. Level seven, the classical attic, is set back from the levels below. This level is finished in a sloping natural zinc roof. Zinc is a soft grey material that weathers and ages well. This is also the major material of the side elevations. The back façade is clad in stucco with a grid of diamond-shaped windows. The central nave is top-lit by a shallow vault of translucent glass. Walter C. Koerner Library totals 17,200 square metres: 7,000 square metres of new construction and 10,200 square metres of renovated space from Sedgewick Library. Functions within the building are composed of 54% for collections (6,420 shelving units for an approximate total of 800,000 volumes), 25% for service and offices, and 21% for 920 study spaces. Funding was through donations to UBC's World of Opportunity Campaign, with matching funds from the provincial government and the President's discretionary funds. It is named in honour of Walter C. Koerner, recognizing his lifetime commitment to and support of the University and the Library and his substantial gift toward the construction of Koerner Library. ( <http://www.library.ubc.ca> )

#### **New Halifax Central Library, Halifax, NS – Canada 2014 (in construction)**

see also: Schmidt Hammer Lassen Copenhagen, Denmark

Client: Halifax Regional Municipality

People in Halifax had a look at what the city's new \$55 million Halifax Central Library will probably look like at a meeting Thursday night — and their final say in its design.

The architects unveiled scale models and colour slides of the publicly inspired structure that will replace the aging library across the street.

Construction will begin next spring at the corner of Queen Street and Spring Garden Road, and it will bring a modern look to an historic city.

"It sort of reminds me of a pile of books, and lobster crates thrown on top of each other," resident Joe Jollymore, said of the design, Thursday. "So, it almost brings that feeling of that's what our community is, part of our history."

It will be a glass building with an open concept, dotted with meeting spaces, gaming stations, and a lot of books — 50 per cent more than are in the old library that it's replacing.

It's a design the public helped create along the way. The architects held a series of public meetings to get input into what the library should look like.

"I like seeing the transition of how all of our ideas were changed into what it looks like tonight," Hillary Webb said.

Others are taking more of a wait-and-see attitude toward the new library.

"You know, the old library had a personality to it. I just think it will take time to get used to the new design," Teresa Wooshue said. Project director George Cotaras said the major components of the design have now been decided.

"At the last public meeting, we showed an extreme opposite of that, where things were very much aligned," he said. "We got a reaction to that saying, 'No, no, we like the twist; we want it back.' So now we've twisted it back a little bit, but not to the extreme that it was before."

With big decisions such as overall design out of the way, Cotaras said there will just be some tweaking over such things as colour and furniture.

The library is expected to open in 2014.

The building is being designed by a collaboration of architects from Fowler Bauld & Mitchell Ltd. of Halifax, and Denmark's schmidt hammer lassen architects. 05.11.10 (<http://www.cbc.ca>)

### **Citadel High School, School Library, Halifax, NS – Canada 2007**

Value: \$25 Million

#### **Description:**

The winner of an architectural design competition, Citadel High School was designed to replace two existing high schools in downtown Halifax. At the foot of historic Citadel Hill, it occupies one of the most significant sites on the peninsula and has many unique features. These include a modern, curving west facade, transparency through to and into the three main components of the school (academic, arts and athletic), exposed steel in the classrooms permitted by a performance-based code solution evaluated by computer modeled fire simulations, steam from the adjacent QEII Hospital complex as the source of heating, and other energy and water saving features. Opening September 2007 and LEED Silver certified, the three story building also includes an additional community gymnasium and the shell for a 900 seat theatre. (Fowler)

The design for the new Central Library in Halifax, Canada was recently revealed at the fifth public consultation meeting. At this last public consultation meeting in the design phase of the Halifax Central Library, the architects identified the trends from all four of the prior public meetings and showed how the building design has responded to the users' ideas.

The 45 million Canadian dollars (€33 million) Central Library in the Canadian port city of Halifax, Nova Scotia will have a clear Canadian reference as well as a detectable Scandinavian design heritage as the winning team behind the design is the Canadian architectural practice Fowler Bauld & Mitchell and Danish schmidt hammer lassen architects. In March 2010, Fowler Bauld & Mitchell and schmidt hammer lassen architects won the international competition to design Halifax Central Library. "In the design process we have been particular keen on reflecting the spirit of the local community as well as the 'genus loci' of the site making Halifax Central Library unique in many ways. We believe that Halifax Central Library will become a landmark cultural hub for the community," said Morten Schmidt, Founding Partner at schmidt hammer lassen architects.

At this point, Fowler Bauld & Mitchell and schmidt hammer lassen architects enter four months of Design Development, with a final public presentation and unveiling of the final detail design in March/April 2011. Breaking ground is scheduled for mid 2011 and the library is due for completion in early 2014.

schmidt hammer lassen architects works with libraries across all scales from branch libraries and central libraries to university libraries. The practice is renowned for the extension of The Royal Library in Copenhagen, Denmark, and has also designed Halmstad Library and the extension of Växjö Library in Sweden. Ongoing library projects include The University of Aberdeen New Library in Scotland, UK, The Urban Mediaspace, Scandinavia's biggest public library, in Aarhus, Denmark and the new Highlands Library for Edmonton Public Libraries in Alberta, Canada. 13.01.11 (<http://www.bustler.net>)

### **Dalhousie University, Dalhousie Computer Science Building, Halifax, NS – Canada 1999**

Size: 73,000 sq.ft.

#### **Awards:**

**2000 Faculty of Computer Science Building, Dalhousie University, Halifax, NS | Citation**

#### **Description:**

Winner of a Lieutenant Governor's Award for Architecture in 2000, this 73,000 sq. ft. building for the Faculty of Computer Science, was completed in August 1999 utilizing fast-track construction management procedures. The contemporary design is unique for its five story atrium and exterior walls clad with zinc panels on a highly energy-efficient curtain wall system. As an innovative, flexible and efficient, high performance learning environment, the building is demonstrative of a supportive work environment. With high levels of natural light, abundant internet connection ports and an open, welcoming atmosphere, it has become a learning place of choice for students within and outside the faculty. Green and energy efficient features include operable windows, in-floor radiant heat in the atrium to reduce the ambient temperature, a sport cooling strategy for the atrium to provide maximum effect where best suited, a water source heat pump system, low energy lighting systems and controls, low water consumption w.c. fixtures and hands-free controls at sinks. The robust, exposed concrete structure is used for thermal mass to reduce peak cooling and heating loads.

This commission was shared by Brian MacKay-Lyons Architecture Urban Design and Fowler Bauld & Mitchell Ltd. Mackay-Lyons was responsible for design while Fowler Bauld & Mitchell prepared all construction documents and provided full site services. FBM coordinated the work in close partnership with the construction manager to meet fast-track construction schedules and budgets. Five tender packages were prepared in order to accelerate the schedule and meet the university's target date for completion. (Fowler)

### **Walter Francl Architecture, Inc., Vancouver, BC – Canada**

<http://www.franclarchitecture.com>

#### **Libraries:**

### **John Richard Allison Library, Regent College, University of British Columbia, Vancouver – Canada 2007**

Mention solar energy and people often think of individual roof-mounted panels. Mention stained glass and people think of traditional windows in churches. Not too many people would think to combine them, but artist Sarah Hall has done this and more, with the first stained glass installation in North America to utilize solar cells. The stained glass is the central element of a wind tower that will complete a new \$10 million, 28,000 square foot theology library at Regent College on the University of British

Columbia campus in Vancouver. The library officially opened on Saturday, September 29th. The aerodynamic forty-foot wind tower was designed by Vancouver architect Clive Grout, in collaboration with Walter Francl Architects, as a natural ventilation system for the underground library building and a functional symbol of Regent's commitment to a sustainable environment. The engineering for this tower was both innovative and elegant; Hall's task was to bring further beauty and interest to the tower, while continuing the theme of alternative energy. At the heart of the glass design, titled "Lux Nova", is a luminous column of light, flowing like a waterfall in silvery blue, violet and white. Included in this column is an array of solar cells that will collect energy during the day and use it for nighttime illumination – acting as a beacon for the surrounding park. Arranged within the design are twelve dichroic glass crosses, creating an ever-changing rainbow of colour. Woven through the flowing waterfall of light is the Lord's Prayer in Aramaic which acknowledges the theology library below. Solar cells are a nearly perfect energy source, as they generate electricity without emitting harmful greenhouse gases. Being durable, they can transform a glass façade into a clean, long-lasting energy source. Inspired by the vast and attractive energy-collecting facades she saw in Europe, Hall began to incorporate them into her art glass. Physicist and activist Ursula M. Franklin, C.C.FRSC, writes, "Colour, light and art have brought joy and inspiration to people throughout the ages. There is something both real and unreal about light and colour. They are tangible and distant, familiar and mysterious. Light and colour are constant companions of body and soul. They constitute a many-faceted door to the mind, and the artist's use of these elements has often reflected their own society best understands of the natural world. While in recent decades electrically generated light sources have stimulated artistic imagination, it is only now that the new scientific insight - that light can generate electricity - has been translated into a new and unique artistic offering. Sarah Hall's new windows illuminate, but they also create light. Incorporating photovoltaic cells, her installation bestows a double gift: beauty and helpfulness. What more can we wish for? " Sarah Hall, RCA is an architectural glass artist who is renowned for pioneering imaginative projects. The windows incorporate techniques such as fusing, airbrushing, tempering, lamination and sandblasting. These techniques give the windows a light, lyrical quality - along with breath-taking color. The windows were created in collaboration with Glasmalerei Peters of Paderborn, Germany. "Stained glass has a thousand-year history," she says. "Using solar energy is one way of bringing new technology to an art form that most people consider traditional and unchanging. However, tradition is not for keeping the ashes – but the fire alive. By forging art with a source of energy we create a powerful image of how we can live in this world." (For further information visit: [www.SarahHallStudio.com](http://www.SarahHallStudio.com))

## **Group2 Architecture, Edmonton, AB – Canada**

<http://www.group2.ca>

### **Libraries :**

#### **Edmonton Public Libraries, Meadows Community Recreation Centre and Library, Edmonton , AB – Canada 2013**

joint venture with Perkins Will (Shore Tilbe Perkins Will) <http://www.perkinswill.com>

Project budget: \$119,000,000

The Meadows is a new community hub in South East Edmonton. It combines a recreation centre with a public library under one roof, and is surrounded by a district park. The rec centre portion includes an aquatics centre, fitness centre, gymnasium, arena (2 rinks) and multipurpose rooms. (Group2)

17th Street in southeast Edmonton, is a collaboration between EPL and the City of Edmonton. In addition to the library, this multi-purpose facility includes indoor skating arenas, swimming pools, fitness centre and gymnasium, as well as outdoor sports and recreation fields. Construction on the entire facility is set to begin September 2011 and is expected to open Spring 2014.

(<http://www.epl.ca/about-epl/building-projects>)

The library will be approximately 15,000 square feet and features an outdoor culture bowl and reading garden.

#### **Innisfail Public Library, Innisfail, AB – Canada 2011**

Project budget: \$8,900,000

The Innisfail Public Library addresses both how the library operates as a business and how it is organized as a facility. The design focuses on creating an open, flexible interior environment with an abundance of natural light. The exterior highlights the connection to the natural environment and combines materials and volumes in a holistic manner. Upon entering the building, each programmatic function is revealed through a series of open and inviting spaces. The building includes exposed interior/exterior wood columns in the central spaces and full glazing on the east wall shaded by mature trees.

The library is both open and flexible in order to respond to current and future needs. The perimeter and free standing bookshelves effectively envelope the user with library materials while also framing views to the exterior. Sustainable design principles are incorporated throughout the project that promises to set a positive example for similar development across the province. (Group2)

#### **South Fisch Creek Education Recreation & Library Complex, Calgary, AB – Canada 2002**

Project budget: \$43,000,000

### **Awards:**

The project was the winner of CEFPI Architectural Building Design award 2001 (Alberta Chapter), Calgary Award for Accessibility 2002 and Illuminating Engineering Society Award of Merit for the Entire Complex and for the Shawnessy Library and Alberta Construction Magazine listed the project as #1 of "The best in 2002 Institutional Construction".

The Complex is a partnership with the City of Calgary, Calgary Public Library and Calgary Roman Catholic Separate School. It is the first of its kind in Canada with the number of diverse partners, involving a highly collaborative process to ensure the needs of each partner. The school is a 1,800 student high school with 300 seat theatre, labs for food & fashion, mechanical shop, video production / multi-media centre, arts, drama and music studios, and two full size gymnasiums. The YMCA includes 25m lap pool, leisure and whirlpools, gymnasium, climbing wall, elevated banked running track, dance studios, café and daycare. The complex also includes a 1770 m<sup>2</sup> public library and community facilities including an additional gym, twin ice arenas with bleacher seats, locker and official rooms. (Group2)

**Dan S. Hanganu, Montréal, QC – Canada**

<http://www.hanganu.com>

**Libraries :**

**Marc-Favreau Library, Montréal, QC – Canada on design**

Montréal, February 15, 2010 – This past December, the four finalist firms in the competition to design the new Marc-Favreau Library submitted projects of high quality that complied with the core development requirements: family aspect, integration of new information technologies, importance of design, and concern for sustainable development. After deliberating, members of the jury unanimously chose the project submitted by the firm Dan Hanganu Architects, citing, among other reasons, the firm's modern approach to the image of a new generation of libraries. The winning submission also stood out for the following reasons: The design quality is a perfect fit with Montréal's status as a UNESCO City of Design. With regard to the building's façade, the jury appreciated the way the transparent central volume framed by two masses of masonry (including the existing building at 700 Boulevard Rosemont) blends with the new section dubbed "Le Coffre," which will house the main stacks. The central area, called "La Lanterne," becomes an avant-garde window open to the outside. The whole seems to be borne by the image of Sol (the character famously portrayed by the late Marc Favreau), ubiquitous on the imposing column in the forecourt. The project is well suited to the street grid and the site. The fluidity of the spaces provides "breathing room" for Parc Luc-Durand, in the rear, which will be surrounded by several other new buildings. Inside, the jury liked the amply lit spaces, the generous opening of the library onto the forecourt, the way the reading rooms face the green spaces outside, and the pride of place given to the multipurpose room and multimedia room, strategically sited behind glass in La Lanterne so that passersby cannot fail to notice the activity within. Also notable are the multigenerational aspect of the design, and a number of elements borrowed from nature, such as wood elements and a living wall, evoking Mr. Favreau's interest in the family, ecology and sustainable development. (<http://mtlunescodesign.com>)

MONTRÉAL, le 25 mai 2012 - C'est avec fierté que le député de Laurier-Dorion, monsieur Gerry Sklavounos, au nom de la ministre de la Culture, des Communications et de la Condition féminine, madame Christine St-Pierre, le maire de Montréal, monsieur Gérard Tremblay ainsi que le maire de l'arrondissement de Rosemont-La Petite-Patrie, monsieur François William Croteau ont marqué officiellement aujourd'hui le début de la construction de la bibliothèque Marc-Favreau. Rappelons que cette bibliothèque, qui sera située à deux pas du métro Rosemont dans l'arrondissement de Rosemont-La Petite-Patrie, vient combler le déficit en bibliothèques de ce quartier. Cet important projet de 19 M\$ bénéficie d'un soutien financier du ministère de la Culture, des Communications et de la Condition féminine, de la Ville de Montréal et de l'arrondissement dans le cadre de l'Entente sur le développement culturel de Montréal.

« La consolidation du réseau des bibliothèques publiques constitue l'un des axes principaux de l'entente culturelle entre la Ville de Montréal et le ministère de la Culture, des Communications et de la Condition féminine et un engagement dans le cadre du Plan d'action Montréal métropole culturelle 2007-2017. La nouvelle bibliothèque viendra combler une lacune dans ce quartier à forte densité familiale et permettra ainsi d'améliorer la qualité de vie des citoyennes et des citoyens de l'arrondissement. Afin d'accroître l'accès à la culture de la population, le gouvernement du Québec investit chaque année des sommes importantes dans la rénovation, l'agrandissement et l'implantation d'équipements culturels dans les centres de diffusion, les salles de spectacle, les musées et les bibliothèques », a déclaré le député de Laurier-Dorion, monsieur Gerry Sklavounos.

« Le début de la construction de ce qui sera l'une des plus belles bibliothèques de Montréal est une excellente nouvelle pour les citoyens de l'arrondissement de Rosemont-La Petite-Patrie et pour l'ensemble des Montréalais. Cette bibliothèque avant-gardiste conjuguera design, développement durable et convivialité, en plus de remplir admirablement son rôle visant à encourager la lecture et à augmenter l'accès à la culture pour l'ensemble des citoyens. La bibliothèque Marc-Favreau sera très certainement appelée à jouer un rôle important comme pôle culturel, social et communautaire », d'ajouter le maire de Montréal, monsieur Gérard Tremblay.

Monsieur François William Croteau est particulièrement enthousiaste de voir enfin se concrétiser ce magnifique projet tant attendu. « Je souhaite ardemment que la bibliothèque Marc-Favreau, pensée et imaginée par les équipes de l'arrondissement et de la Ville, conçue par la firme d'architectes Dan S. Hanganu, et réalisée par la firme Sept Frères Construction, soit un lieu culturel prisé et fréquenté par les résidents de tous les âges de l'arrondissement. Elle viendra augmenter leur qualité de vie, tout en rehaussant magnifiquement le paysage urbain de ce secteur en pleine revitalisation. »

Rappelons que quatre grands axes d'aménagement ont guidé la conception de la bibliothèque afin qu'elle devienne ce lieu privilégié d'information, d'éducation et de culture : vocation familiale, nouvelles technologies de l'information, design et développement durable.

Rappelons également que la nouvelle bibliothèque Marc-Favreau fait partie du vaste projet de mise en valeur du site des anciens ateliers municipaux qui comprend de nouvelles tours d'habitations à vocation mixte ainsi que le site Bellechasse, en voie de développement, qui transformera le paysage urbain de ce grand quadrilatère. (<http://www.montreal2025.com>)

**Faculty of Law Nahum Gelber Library, McGill University, Montréal, QC – Canada 1996 - 1998**

**Unique library for a unique school**

New students entering McGill's Gelber Law Library for the first time may be curious about the large statue of a hare that greets them in the lobby, standing upright and seemingly full of purpose. The Nijinski Hare, as he is known, is one of many pieces of art that add a distinct flair to the facility. That particular item, a former resident of the Montreal Museum of Fine Arts, is a loan from Nahum Gelber, a law alumnus who you may have guessed was instrumental in making the library a reality. In the Nahum Gelber Law Library, the Nijinski Hare looks busy as always. Owen Egan

The library opened its doors in 1998, rescuing scores of students and faculty from the previous library, often described as overcrowded and stuffy. Designed by one of Canada's most influential architects, Dan Hanganu, the Gelber Library is a bright, beautiful, contemporary building. It is an integral part of the law faculty and of its program as well. Every law student must follow two years of legal methodology courses, the research section of which is taught by a librarian. This way, every student is provided with an opportunity to hone their skills in what John Hobbins, law librarian, terms "information literacy" — the ability to find information in the electronic world. (Hobbins notes that required courses make for a captive audience.) Without taking anything away from the artwork or research potential, the greatest benefit to users of the Gelber Library is undoubtedly its impressive collection, which makes it, for Hobbins, "unlike any other Canadian academic law library." It is a collection based on a policy developed by the librarians that reflects the unique nature of the law school it serves. In 1998, McGill's Faculty of Law adopted what is known as a trans-systemic approach, whereby both common law and the civil law are studied together, with an emphasis placed on legal traditions, comparative law and the internationalization of law. The library had to suit this reality. "Other libraries offer professional training for a particular jurisdiction — we don't really do that," explained Hobbins, adding, "We tend to look at law as an academic discipline rather than as professional training for the bar." That attitude echoes the underlying philosophy of the law school. The Gelber Library spends a larger portion of its budget than most law libraries on books and monographs, as opposed to "continuations" — journals, serials, periodicals. In so doing, it supports research (rather than training) and intensive study that is international in scope. When choosing additions to the comparative foreign collection, for example, Hobbins refers to the FIGS rule

— French, Italian, German, Spanish — representing some of the more important civil jurisdictions in the world. The library also boasts a remarkable rare-book trove, kept in a climate-controlled room that houses the Wainwright Collection, primarily the work of early French jurists on pre-Napoleonic Civil Law, and the Canadiana collection of early Canadian, British and American titles. These collections are considered national treasures and can be viewed upon request. The Nijinski Hare looks as if he has somewhere important and interesting he needs to be. If he is looking for something important and interesting to read, he is already in the right place. Pascal Zamprelli (<http://www.cgill.ca/reporter>)

## **Hariri Pontarini, Toronto, ON - Canada**

<http://www.hariripontarini.com>

### **Libraries:**

#### **Richard Ivey School of Business, UWO, The University of Western Ontario, London, ON - Canada** **in progress**

\$75,000,000 | 240,000 sqf

Hariri Pontarini Architects approached this design from the inside out, capturing what is meaningful and singular about Ivey to build community and design a building that reflects its unique team-based learning approach. With its more opaque masonry, the exterior conveys a timeless expression that relates to the form and materiality of a traditional campus. The inner core around the court is a space to experience vibrancy, energy and warmth, reserved for the inner experience of the school. At its most elemental, the design is a simple, three-storey quadrangle building surrounding a landscaped courtyard. The shaping of the design is anchored in the team-based learning that happens both formally and informally throughout the school. Special program elements—dining hall, library and amphitheatre—are afforded distinctive treatment as pavilions, attached to the main circulation. These pavilions extend into the surrounding landscape as distinct objects with unique social and spatial experiences, part of the external identity the school conveys as a confident global leader. (Hariri)

#### **Faculty of Law (Library), University of Toronto, Toronto, ON – Canada in progress**

\$60,000,000 | 160,000 sqf

The North American competition-winning design for the renovation and expansion of the historic University of Toronto Faculty of Law responds directly to the client's ambition to create a law school among the finest in the world. Although internationally renowned for its diverse faculty, sought-after students and distinguished alumni, the school's existing facilities had not kept up with the Faculty's growth. The design involves the careful weaving of history with a contemporary vision of community that is at the heart of the design. The Faculty's Dean Mayo Moran has championed this design as a landmark building at the Faculty's privileged position between Queen's Park and Philosophers' Walk, and the design responds with three simple gestures: a crescent-shaped classroom and office wing overlooking Queen's Park, the renovation of an outmoded library as a luminous pavilion connecting to Philosophers' Walk, and the creation of a unifying gathering space, the Law Forum, to bring a new heart to the Faculty. Working from the insight that the quality of the social network and unified sense of community are the most important advantages a law school can confer upon its students, the Law Forum answers the need for a galvanizing social space to bring students and faculty together in a singular gesture, permitting the previously fragmented Faculty to function as a unified, coherent community. As all roads proverbially led to Rome, so too all routes pass through the Forum: it is the focal point of all social activity, circulation and passage, the animated heart for events and celebrations, the open centre that links old and new. Like its ancient Roman precedent, the Forum is a place of animated conversation, debate and laying the foundations of the social networks that are the informal basis of a broad humanist education and understanding of systems of justice. (Hariri)

#### **Pape Danforth Library, Toronto, ON – Canada 2006**

\$1,900,000 | 9,000 sqf.

### **Awards:**

**2009 Toronto Architecture & Urban Design Awards Award of Excellence—Building in Context/Public**

Our renovations to this neighbourhood library involve extensive reworking to the interiors of the original Pape building, while maintaining the integrity of the historic building envelope, and increasing the branch's street presence with a fresh face, large windows and improved signage. Maximizing on the availability of natural light, the alterations include the addition of skylights and bay windows, which also provide passersby with a lively glimpse of the warmth and activities inside the building. The new library is more accessible to children, seniors and to those requiring barrier-free access, through the relocation of the main entrance to the highest grade of the street. The inclusion of a prominent central stair to the second floor, a new, full-sized elevator that connects all three floors, and improved circulation routes and reference systems throughout. (Hariri)

#### **Schulich School of Business (Library), York University, Toronto, ON – Canada 2003**

\$ 110,000,000 | 300,000 sqf

**Siamak Hariri, Partner-in-Charge, Joint-Venture with Young + Wright Architects**

### **Awards:**

**2007 Ontario Association of Architects Awards Design Excellence Award**

**2006 Governor General's Medal in Architecture**

**2004 Toronto Construction Association 'Best of the Best'**

The 300,000 sqf building for the Schulich School of Business both participates as a model citizen in the urban design master plan for the whole campus and at the same time establishes its own individual identity as a refined composition of buildings. Occupying a whole block of the campus, this complex is a composition of individual buildings skillfully brought together thematically, materially, and volumetrically into a unified whole. The Executive Learning Centre program accommodates mid-career students who attend special classes and are housed in a hotel attached to the school. These students are at the south end of the building, marked by the landmark tower and double height dining room for the Executive Learning Centre. Schulich's Executive Learning Centre (ELC) reinforces the School's mandate of innovative learning with a first-class corporate setting. The ELC is a 60-suite integrated residence and education centre offering short-term and long-term residence programs to business executives and corporations. In the manner of the world's best boutique hotels and first-class lounges, the ELC simulates a familiar and elegant business environment that caters to executives in every detail with stylish guest suites; a strong sense of privacy; spectacular views; enhanced classrooms with comfortable furniture; a fitness facility; lounges equipped with personal internet access; and an elegant dining room serving fine food and an outdoor courtyard. Each guest suite is equipped with a fully integrated desk and work area. The ELC's combination of

residential dwellings and sophisticated, educational environment with spaces for team teaching and team learning brings corporate learning to a new level that is unmatched in Canada today. (Hariri)

**Quest University Canada, Library, Squamish, BC – Canada 2007**

Area Library 44,170 sqf., University Services 31,550 sqf., Academic 50,660 sqf., Recreation Centre 28,202 sqf.

Budget \$ 100,000,000, Completion September 2007 (Phase 1)

Tanya Southcott (Tanya Southcott is an intern architect living and working in Vancouver):

The challenge of place-making in the heart of Sea to Sky Country is to create an architecture that is responsive to the dramatic landscape of coastal British Columbia rather than subservient to it. Located in Squamish, a community geographically midway between Vancouver and Whistler, Quest University is Canada's first private not-for-profit, secular liberal arts university. It was created through the vision of David Strangway, a former president of the University of British Columbia who had a vision to build a private university soon after he retired as president in 1997. The process of creating Quest University was not without its challenges from those who felt that the university would undermine the public educational system. Despite these challenges, Strangway managed to open the university in 2007, with 160 students enrolled in an institution that charges a \$25,000 annual tuition. Today, the \$100-million campus considers itself an integrated community that draws its inspiration from its spectacular context while nurturing an intimate sense of community akin to the European hillside village, albeit one with state-of-the-art sustainable design.

In 2003, Hotson Bakker Boniface Haden Architects + Urbanistes were retained by the Sea to Sky Foundation (now known as Quest University Canada) to develop a master plan for the university. Located at the mouth of Howe Sound, the new campus sits atop 240 acres of coastal mountain range in the Garibaldi Highlands about 10 kilometres outside Squamish's town centre. The first phase of the project featured the design of key campus buildings including the library, academic building, services building and the recreation centre. Yet to be completed, the second phase will feature more community-driven development including residential market housing, a chapel, a theatre and a neighbourhood commercial hub, not to mention more academic buildings to accommodate a student population that will eventually surpass the university's current capacity of 800 students. The university marks a new direction for postsecondary education in Canada. Designed primarily for undergraduate studies, the liberal arts and science program approaches its curriculum thematically, integrating multiple disciplines into intensive three-and-a-half-week "blocks." Classes are kept small through seminar-based learning with a student-to-teacher ratio of not more than ten to one. Even the university's motto--Intimate, Integrated and International--attempts to describe this unique educational experiment while setting the stage for an architectural manifestation of its ideology. The opportunity to develop a campus design that responds to the university's philosophy while addressing the students' yearning for a different educational environment is unprecedented. Winding its way up and around the campus, the approach along University Parkway reveals a series of robust buildings carefully integrated into their natural surroundings. Of note is the central academic complex that sits at the top of the steeply sloping knoll like a modern acropolis. But rather than design pristine sculptural objects set against the landscape, the architects designed campus buildings to firmly embrace the site and its surrounding beauty. At the core of the university, buildings are designed to take advantage of dramatic views that frame a series of interlocking plazas. The campus's library sits on the uppermost peak while the academic and services buildings are set into the more steeply sloping western portion of the site. Collectively, they frame the main outdoor social area for the campus whose fourth side opens up to the landscape beyond. Outdoor walkways, landscaped open spaces and large terraces link one building to the next and tie the complex together through numerous opportunities for visual connections with the outdoors. The library serves as both the heart of the campus and a gateway to the university community. Yet it is an introverted, centrally focused building constructed around a large three-storey interior atrium functioning as the main social hub for the building. High clerestory windows allow daylight to penetrate deep into the interior, creating a room that is warm and welcoming, even during the shorter days of winter. An opportunity for impromptu social engagement, the central staircase connects the administration, student services and café at the ground level with the upper two levels of the library. With 360-degree awe-inspiring views as a panoramic backdrop, only the view from the library stacks uses the landscape as a visual focus. The academic building is the largest building in the complex. Organized around a central exterior courtyard that follows the natural contours of the site, each floor plate is designed to create a series of social spaces that contribute to the academic life of the school. Modestly sized seminar rooms are located along the perimeter of the building, while smaller breakout rooms are focused inwards. Wide corridors with framed views of the courtyard below and the mountains beyond link these two areas together. To give another level of expression to the building, each study and meeting space is coded by door type and differentiated by glass panels that feature a different piece of a larger poem. Both the services building and recreation centre are designed as meeting places for students and faculty as well as the local community. The double-curved roof of the services building opens up toward the south while overhead doors open up to the patios and plazas to maximize sunlight and provide opportunities to connect outdoor spaces with the large informal cafeteria and multipurpose room. To date, the recreation centre accommodates a collegiate-level gymnasium, fitness area, squash courts and change rooms. Commercial units are still under development and have yet to become operational. As the first development along Village Drive--the university's main street--the recreation centre offers the opportunity to become a more authentic village centre once development in the area increases. While the experience of each building is governed by its individual program-driven design, the buildings complement each other throughout the complex via common materials, colour, and their relationship with the outdoors. The materiality of the buildings--heavy timber and laminated beams, or horizontally laid corrugated metal siding--is clearly informed by the industrial context of the region. Canopies and shading devices are assembled from a kit of parts, adapted throughout the campus to further enhance the user experience. Along with concrete, metal, glass and wood, colour is used to unite the architectural expression of each building and becomes a tool for wayfinding within the complex. Individual floors within each building are distinguished by fields of colour, as are prominent circulation cores that become beacons of colour and light. Both compact and walkable, the campus is also completely accessible. Visitors are dropped off at the library where access to all buildings and amenities is convenient and close. Parking and service areas are located underground, along a "utilidor" that runs beneath the complex and beyond pedestrians' experience. These are accessible from one entrance bay only, thereby eliminating requirements for excessive service access roads. Part of the mandate for Quest University was to use environmentally, socially and economically responsible principles going back to Strangway's original motto, and to this end the strategies read like a checklist. Geothermal heating and cooling, used as the main energy source for the campus, are distributed through radiant-slab systems. Siting was sensitive to the existing conditions of the landscape to minimize rock blasting while retaining the maximum number of trees. Moreover, the design of interior and exterior spaces was also governed by solar orientation. All buildings have operable windows for

natural ventilation and user comfort while exterior sunshades and high-performance glazing were used wherever appropriate. Locally sourced materials, the use of bioswales, infiltration fields and retention ponds further reduce environmental impact of the campus. Though modest in program and spatial requirements, Quest University could have easily been accommodated by one building with a more compact footprint. As it sits, the campus uses 60 acres to accommodate fewer than 1,000 full-time students, faculty and staff. The decision to spread the program across the site reflects a socially motivated attempt to instill a more urbane, user-friendly environment for the new student population. The use of circulation to enhance social interaction in the creation of more sustainable spaces has been a focus of Hotson Bakker Boniface Haden's work since their redevelopment of Vancouver's Granville Island in the 1970s. While the transformation of a dilapidated industrial site into a vibrant, livable community was visionary at the time, its successes draw significantly from its location in the heart of a metropolis of over two million people. Quest University, by contrast, feels empty and isolated, and its ability to act as a catalyst for local development might better be served by a more integrated approach. Currently under capacity, the state-of-the-art facility is limited in terms of the social and support networks it can offer its young student body and in the level of security and control the secluded campus can provide. For Squamish, a town historically fuelled by the local pulp-and-paper mill, the development of a postsecondary institution helps position the community within a larger global context while creating new economic opportunities for residents otherwise affected by the decline in the British Columbia forest industry. By using the campus as an opportunity to showcase British Columbia and its landscape, Quest joins a long tradition of pioneering and speculation that has made the West what it is today. While the long-term viability for private postsecondary education in Canada remains to be seen, the ambition of Quest University's architecture speaks to the potential of such an institution and its long-term possibilities for the region. ### **Mount Royal College, Roderick Mah Centre for Continuous Learning, Calgary, AB – Canada 2007**

#### **Awards:**

**LEED: Certified Gold**

Centre for Continuous Learning, Calgary, AB Client: Mount Royal College, Hotson Bakker Boniface Haden architects + urbanistes, in collaboration with Cornerstone Architecture, prepared the master plan for a new integrated complex as a part of Mount Royal's Lincoln Park Campus expansion. In collaboration with Stantec, HBBH designed the first phase of this complex - The Centre for Continuous Learning. This adult-professional training facility is a 4470 square metre building and includes a 450 seat Great Hall, two computer labs, ten classrooms and a 60 seat training room wired to accommodate comprehensive IT and display media servicing. The Centre can also accommodate and host special events. This project is the College's first Leed® certified building and consumes up to 40% less energy than a similar, traditionally designed space. Features include: concrete construction to help regulate the temperature inside the building during all seasons; angled windows to maximize natural light; windows that automatically open in the evening to cool the building and provide fresh air supply; a rainwater collection and retention system to reduce treated water consumption in the washrooms, solar chimneys to allow hot air to escape; and sun shades on windows to keep the building cool in the summer. (Hotson)

### **Hughes Condon Marler, Vancouver, BC – Canada**

<http://www.hcma.ca>

#### **Libraries:**

### **Mill Woods Library, Seniors Centre & Multicultural Centre, Edmonton - Mill Wood, AB - Canada 2014**

This project involves the design and construction of a new Library, Seniors Centre and Multicultural facility. Set within the context of suburban malls and big box retail, the new building announces its civic presence by dramatically revealing the functions through a sculptural interior space. The building is designed such that public areas of the library act as 'carved' spaces within the larger structure, with support spaces hidden within the 'solid' portions of the building's form. The material expression of the concept further emphasizes the contrasting spacial characteristics. Translucent portions of the building contrast with the public spaces that are light in colour, creating bright, airy multi-storey public spaces and reading rooms.

This project is a joint venture with Edmonton-based DUB Architects and is a LEED Silver candidate. (Hughes)

### **Jasper Place Branch Library, Edmonton, AB – Canada 2013**

Joint Venure with DUB Architects, Edmonton <http://www.dubarchitects.ca>

The Jasper Place Branch Library design reflects the Edmonton Public Library's aspirations to create an open and memorable presence in the community. A welcoming and inclusive space, this sustainable design is flexible and will fulfill present and future library needs and uses. This distinctive building will announce its unique role in the neighbourhood as a place for public use.

For this project, HCMA is working in joint-venture with Dub Architects, an Edmonton-based firm. (Hughes)

The new Jasper Place Library design encompasses the Edmonton Public Library's aspirations to create a flexible, open and memorable presence in the community. The design satisfies the following aims: A welcoming space that acts as an inclusive designation for all demographics of the community; a distinctive building that announces its unique role in the neighborhood as a place for public use; and a sustainable building that will fulfill present and future library needs. With an eye to a potentially bookless future, this iconic, 15,000 sq ft library is focused more on social spaces than on books. The ground floor is occupied by staff functions as well as a double-height reading room consisting of book stacks and reading areas. This public area extends above the staff area to a mezzanine level overlooking the central space. Stairs—some of which are designed to double as reading spaces or an amphitheatre—are located at each end of the mezzanine to form a continuous circulation loop for patrons. This landmark project will generate civic pride, with its distinctive roofscapes and strong profiles set against the prairie sky and surrounding trees. The facility will set the larger Meadowlark Community apart from other communities within Edmonton. From the road, the concrete roof acts as a unifying enclosure and reinforces the continuity of public space. The design takes advantage of the site's exposure to vehicle and pedestrian traffic and the potential of light rail transit along the adjacent road to the west. For the community, it offers a friendly welcome by using transparency to open its south and west faces to passersby. Sustainability on all fronts is a central focus. The design seeks to create a memorable space of lasting social value. The functional longevity is strengthened by an open, flexible floor plan that can accommodate future reorganization and adaptation. The facility is targeting LEED®-Silver certification.

Sebatian Jordana, Jasper Place Branch Library, 07.07.10 ArchDaily (<http://www.archdaily.com>)

### **Whistler Public Library, Whistler, BC – Canada 2008**

Gross square footage: 1,400 m<sup>2</sup>, Total construction cost: \$6.7 Million

#### **Awards:**

**AIA/ALA Library Building Award 2003**

The building form minimises summer, solar heat-gain while maximising desirable northern light suitable for reading.

The resultant gently sloping building section provides dramatic views to the mountains to the north and a strong visual connection between interior and exterior spaces. This indoor outdoor connection has been accentuated by the use of natural building materials that include locally-quarried basalt on the building's totemic elements, locally harvested cedar for cladding and an innovative, laminated-wood roof structure made from second-growth hemlock (worldarchitecturenews)

Hughes Condon Marler Architects showcase locally sourced hemlock in Whistler's new public library, by Jane F. Kolleeny. As the key location for skiing events at the 2010 Winter Olympics, Whistler, British Columbia, will no doubt be irrevocably imprinted on people's minds this winter. Two hours north of Vancouver, the village occupies a narrow valley along the Sea to Sky Corridor of the Coast Mountains. With over 200 ski runs, the area has become a top resort for winter sports and a natural for the Olympic races. While the 10,000 residents of Whistler prepare for the onslaught of spectators, athletes, and the media arriving in February, they can seek respite in their new 14,500-square-foot public library, designed according to green principles by Vancouver-based Hughes Condon Marler Architects. The library, which opened in January 2008, has been lauded for its design, functionality, and sustainability by locals and the international design community alike.

#### Program:

Strictly enforced methods for harvesting wood ensure that British Columbia, whose land mass is two-thirds woodland, serves as a leading global provider of wood from sustainably managed forests. In addition, government requirements encourage design teams to use indigenous wood as a primary building material in local construction. When the architects expressed an interest in hemlock, the Coast Forest Lumber Association (CFLA) offered them incentives to incorporate it in the library's design. The CFLA provided 20-by-26-foot lengths of the wood, and the architects and structural engineers investigated how best to utilize these structural members in a manner that resolved the wood's susceptibility to warping and bending. The design team also needed to satisfy a challenging program, which included significant green features, a durability to withstand heavy winter snow load, and the need for a daylight interior open to mountain views.

#### Solution:

The architects sought a design that reflects both the drama of the garland of peaks circling Whistler as well as the village scale of the town, modeled after a Swiss village. "With its pitched roofs and fake trim, romantic to a fault, the typical design of buildings in the village is popular with tourists and has its place, but is not becoming for a civic building," commented Daryl Condon, the firm's principal in charge. "So we took a more intellectual approach," he continued. The front of the building, with a raised wall of high-performance glazing and an exposed ceiling, contains the main areas of the library. The rear lies in a lower elevation with standard ceiling heights and more intimate gathering areas. The height juxtaposition responds to the differences in scale between the surrounding mountains and the village. Existing parking is tucked under the front of the building, creating a plaza in front of the library where strolling pedestrians can congregate. The building features hearty structural roof panels fabricated from interlaced hemlock. "Managing the snowfall is a major consideration. You either hold the snow on top of the building, or provide a dump zone for it to drop into that does not interfere with pedestrians," added Condon. "So we did both, but maximized the amount held on the roof." The structure gains strength from its staggered arrangement, steel I-beams, and king-post trusses. In between each 4-foot-wide panel, a narrow column accommodates conduit to allow a clear expanse of panels overhead. Off-site prefabrication of the components using modeling software allowed the team to keep to a tight schedule, and to fulfill sustainable goals, including "quality control, economies of scale, low-embodied energy, and a reduction in the amount of glues used in production," explained Condon. The architects' daylighting scheme minimizes the need for electric light while maximizing northern light suitable for reading. The gently sloping building provides dramatic views to the mountains, establishing a strong visual connection between outside and inside. In addition to the hemlock, building materials include locally quarried basalt, and cedar for cladding. Ground-source heat exchange, underfloor heating and cooling, and high-efficiency boilers provide energy savings. Windows can be operated manually or controlled by a digital system. A green roof covers 80 percent of the library, reducing storm-water runoff and increasing insulation. The high-performance library is the first municipal facility in Whistler to apply for LEED Gold certification and is projected to use 45 to 50 percent less energy than a comparable facility with conventional systems.

#### Commentary:

The Disney-like character of the adjacent village posed challenges for the architects. Using vernacular mountain design elements, including heavy-timber construction, abundant local stone, and broad overhangs, they succeeded in responding to the context while raising the bar for good design. Martin Pardoe, project manager of the Whistler Public Library, commented, "The local community's prescriptive design approach challenged the library team to reinterpret existing design guidelines. The [team's] innovative and contemporary interpretation has produced an original look that is the new precedent against which other projects are evaluated." Since opening, visitation has increased by 185 percent and the library has become one of the community's favorite gathering places, a true measure of success. (<http://archrecord.construction.com>)

### **Renfrew Branch Library, Vancouver, BC – Canada 1995**

#### **Awards:**

**RAIC Governor General's Awards for Architecture**

**AIA Western International Design Awards**

The library provides bold civic design and sensitive siting within a park context while emphasizing community-use and public accessibility. An iconic roof extension greets patrons, while keeping out direct, potentially damaging sunlight. The library offers facilities for all demographics—quiet, light-filled carrels, seating areas, a media centre, a children's section (with lower ceilings), and a common areas for families. Careful siting improves pedestrian movement around the library as well as the existing adjacent park and community centre.

This project was completed by HCMA's predecessor firm Hughes Baldwin Architects. (Hughes)

### **Bibliothèque Raymond-Lévesque St. Hubert, Ville de Longueuil (Montréal), QC – Canada 2010**

Projet réalisé en consortium : Manon Asselin | Jodoin Lamarre Pratte architectes en consortium

see: Atelier TAG (Manon Asselin), Montréal-Canada

<http://www.arc.umontreal.co/prof/Manon.Asselin/>

Dates de réalisation : 2007 à 2010, Superficie : 4000m<sup>2</sup>, Budget : \$ 12.000.000

Le jury apprécie le parcours suggéré par l'organisation du projet et il est sensible à la qualité et à la variété des espaces proposés. Il estime que la qualité des liens visuels entre les espaces de la bibliothèque enrichira l'expérience des visiteurs ; les espaces proposés

pour la lecture lui semblent étudiés avec un souci du bien être des lecteurs. Il est sensible aux efforts de mise en œuvre d'un contrôle de l'environnement audacieux, basé sur une analyse convaincante des conditions climatiques locales mais aussi sur une technique de mise en œuvre délicate. -commentaires du jury, concours d'architecture

Le projet, dont l'inauguration a eu lieu à l'automne 2010, est récipiendaire du «AWARD OF EXCELLENCE 2009» du Canadian Architect, de 2 Trophées Contech 2011, soit comme projet lauréat de la Distinction en développement durable et d'une mention honorifique pour Pratiques novatrices, du prix GOLD - COMMERCIAL ARCHITECTURE remis au Design Exchange de Toronto en décembre 2011 et récemment d'un GRAND PRIX DE DESIGN 2011 en développement durable.

La nouvelle bibliothèque de Saint Hubert, 5ième plus grande bibliothèque du Québec, a une vocation civique et culturelle d'importance pour sa communauté. C'est un lieu où le savoir et la culture sont rendus visibles et où l'amour de la lecture peut se propager et se renouveler pour en faire profiter plusieurs générations de citoyens.

Outre l'allégorie du geste architectural, le concept du tapis volant est d'abord une réponse bioclimatique élémentaire aux conditions du site. Il en résulte une construction durable incorporant la géothermie active et passive, la ventilation naturelle des espaces intérieurs, la gestion des eaux de pluie en respect de l'environnement humide voisin et une insertion compacte sur le site de façon à minimiser les coupes d'arbres existants.

L'enveloppe de la nouvelle bibliothèque de Saint Hubert témoigne des ressources inépuisables des éléments de la nature: le vent, le soleil et la pluie. D'ouest en est son toit se plie et se replie sous les vents dominants. Les pentes végétalisées, qui en résultent, animent les espaces intérieurs par la couleur de leurs fleuraisons. La grande entaille du tapis végétal délimite un préau, accroît la pénétration de la lumière naturelle et facilite la ventilation passive. Les eaux de pluie qui la traverse sont captées dans un bassin minéral filtrant qui s'écoule vers la place publique et marque l'embrasure du parc. Depuis la douce lumière septentrionale jusqu'à la lumière zénithale du midi, l'enveloppe s'entrouvre et se déploie selon l'angle et l'orientation du soleil. Les lames de bois ajourées, qui l'habille, modulent l'intensité de la lumière et réduisent l'éblouissement. Le bois de l'enveloppe, une ressource naturelle locale renouvelable, est le choix écologique par excellence au Québec.

Les éléments programmatiques, développés sur 4000m2, sont organisés en un mouvement continu qui se déploie depuis le parvis, de la ville au boisé, du plus bruyant au plus calme, de la douce lumière septentrionale jusqu'à la lumière zénithale changeante du midi. Le préau forme le cœur géographique, social et perceptuel du bâtiment. La fluidité spatiale qu'il engendre facilite les rencontres fortuites et catalyse les relations humaines. Ainsi l'organisation des fonctions autour d'un espace extérieur commun enrichit la communauté en favorisant les activités intergénérationnelles.

La localisation centrale du comptoir de services et ses catalogues informatisés organisent l'espace de l'entrée et structurent l'axe de circulation principal. Au nord-est, les aires dynamiques multifonctionnelles sont regroupées et forment un ensemble autonome facilement accessible depuis la place publique. Le café et l'espace presse, qui l'animent, jouissent d'une grande transparence en continuité avec la place publique ainsi que d'une terrasse protégée au cœur même du préau. Au sud-ouest, le secteur jeunesse, adjacent au comptoir de services, offre une grande visibilité à la fois depuis le comptoir principal et celui de l'aide aux lecteurs. Enfin la zone des services techniques est adossée au comptoir de services. Cette localisation permet une excellente relation fonctionnelle et procure au personnel des espaces de travail paisibles et illuminés par la lumière matinale du sud-est.

Depuis le grand escalier, on accède aux aires calmes de l'étage. L'ascension s'ouvre sur un morceau de ciel bleu cadré par le toit végétal. L'aide aux lecteurs, située à l'embrasure de l'escalier, permet un contact visuel direct avec l'espace multimédia et l'espace ado. D'ici les autres collections se déploient autour du préau: référence, romans et documentaires adulte. L'espace histoire et généalogie, en continuité avec la référence, forme une percée visuelle depuis le comptoir jusqu'aux bureaux de l'administration. Le rayonnage avec éclairage intégré, diminue la quantité d'éclairage requis et la consommation énergétique. Le parcours architectural culmine sur la salle de lecture dont la grande baie en projection délimite le portail du préau, s'ouvre sur la place publique et le paysage montérégien. (Jodoin)

### **Bibliothèque de Châteauguay, Ville de Châteauguay, QC – Canada 2003**

Projet réalisé en consortium : Manon Asselin architecte | Jodoin Lamarre Pratte et associés architectes en consortium

see: Atelier TAG (Manon Asselin), Montréal - Canada

<http://www.arc.umontreal.co/prof/Manon.Asselin/>

Dates de réalisation : 2001 à 2003, Superficie : 2 530m2, Budget : \$ 5.900.000

Lauréat d'un concours d'architecture parmi plus de 60 projets présentés et 4 projets finalistes, ce projet pour la Bibliothèque municipale de Châteauguay est situé dans le centre névralgique de services municipaux de la ville de Châteauguay. La nouvelle bibliothèque se lit comme un mot clé que l'on aurait écrit en caractère gras pour en accentuer la présence dans l'ensemble d'un tissu urbain hétérogène.

Telle une pierre levée, la bibliothèque municipale se démarque en élevant symboliquement son «cabinet de livres» en pierre des champs au-dessus du paysage Châteauguais d'arbres et d'eau. De par la force poétique de son abstraction, la pierre levée de la bibliothèque de Châteauguay marque l'embrasure entre la ville et la sérénité du parc qu'elle délimite. Le concept architectural proposé s'inscrit dans la simplicité de la forme et la matière.

Le «cabinet de livres» en pierre est l'élément architectonique unificateur qui permet une continuité avec l'héritage historique de Châteauguay. Cette pierre levée qu'est la nouvelle bibliothèque de Châteauguay est avant tout la manifestation concrète de sa mémoire collective dont la portée irradie à travers l'ensemble du site.

Le projet proposé exploite la topographie naturelle du Parc Mercier et établit un tête-à-tête intime avec le paysage. En partie entrelacée et en partie superposée, l'architecture devient paysage et le paysage architecture. La nouvelle bibliothèque donne accès à plus de 150,000 documents, incluant les périodiques, documents de référence et documents audio-visuels, et s'organise en deux grands secteurs : les activités publiques sont en continuité et animent le paysage alors que la bibliothèque proprement dite s'ouvre dans le plan oblique de l'étage noble.

Accédé à partir du grand escalier de la «place publique», le «hall oblique» de la bibliothèque s'ouvre sur le feuillage du petit boisé. Lieux d'orientation, d'information et de services, la transparence du «hall oblique» permet une interaction visuelle continue entre les différentes constituantes du programme et la sérénité du parc. En circulant à travers les nombreuses strates de livres on découvre des clairières de lecture et de travail qui s'ouvrent sur le ciel. Localisés au même endroit sur tous les niveaux du bâtiment, les services de la bibliothèque forment un axe vertical charnière qui permet un lien visuel direct avec toutes les constituantes du programme. (Jodoin)

### **Awards:**

**Canadian Architect 2004 Awards of Excellence. (Hespeler Library.) Canadian Architect. December 2004.**

The Hespeler Library addition and renovation in the Town of Hespeler, Ontario (now part of Cambridge) wraps a 1922 Carnegie Library in this historically significant textile mill town within an elegant and generous glass case. The new building envelope is contemporary in its materiality with modulated ceramic frit patterns on glass that weave around the building to create varying degrees of transparency that respond to interior activities and views. The design pays homage to both the community's historic textile past and its current technology-driven service industries while showcasing the Carnegie Library as an important piece of the town's history. "This is a clear, elegant solution to the problem of expanding an existing historic building. Old and new co-exist in an unexpected way through conceiving of the new as a kind of "wrapper," rather than a separate building. The fine scale of the texture of this "wrapper" defers to the character of the existing building. At the same time, the wrapper is not neutral, but is composed of several layers that change to achieve varying levels of transparency." (Kongats)

The Hespeler Library is an existing community public library located in the Village of Hespeler in Cambridge, Ontario. Its history is rooted in the manufacturing and textile milling industries, which was particularly active during the first half of the last century. The library is located in the village's historic core and its redevelopment is a large component of the City of Cambridge's plan to reinvigorate the area's potential for recreational, tourist and cultural uses. The intention to redevelop the existing library rather than build a new facility reinforces the notion of preserving local history while providing the capital cost savings of building on a greenfields site. The project addresses three key issues: shortage in space, site context, and the unification of several past renovations and additions made to the original Carnegie building. The library will remain on the northeast corner of Tannery and Adam Streets in Hespeler's historic core, while the proposed redevelopment is located to the east of the existing building. The architectural image of the redeveloped library conveys a unified, accessible and contemporary quality achieved by delicately enveloping the existing building with a new transparent structure extending along Adam Street and the newly relocated entrance along Tannery Street. The materiality of the envelope pays homage to Hespeler's history as a textile town by layering a woven wire cloth and a ceramic fretted pattern within panes of glass. The modulated density of the layering of materials within the panes of glass around the building permits varying degrees of opacity and transparency, and also allows natural light to penetrate deep into the space while reducing glare. The density of layering almost disappears completely at the front façade of the Carnegie building, thus revealing the showcase object. The area of the facility will increase from an existing 7,000 square feet to 14,000 square feet, organized on two levels connected by stairs and a double-height space located around the perimeter of the Carnegie building. The design for the redevelopment originates with the existing building and has evolved into a series of visually and physically linked spaces defined by differing architectural qualities of size, materials, light and views. The design opposes the modern standard of a library as a neutral warehouse space with unlimited flexibility and an undefined physical presence. In order to ensure the relevancy of the library redevelopment design for the future, anticipated growth areas within the building have been accommodated without sacrifice to the architecturally defined spaces in the current design so that each of the individual rooms will maintain its intended use while being capable of absorbing volume increases. Monteyne: Of all the entries, it is this project that best exemplifies the potential of architecture to create exceptional experiences within the realm of day to day life. The parti of this project is simplicity itself, and yet complexity and exceptional beauty result from the subtle variations in the plan and manipulation of tectonic elements such as cladding. Shnier: The proverbial "ship-in-a-bottle," this proposal is straightforward and unapologetic in the way in which it subsumes the historic structure. This practical and bold proposition is unencumbered by extraneous architectural mumbo-jumbo. For this project to be possible, it would have to have a client that is as fluent in the potential of the gesture as the architect is. Yarinsky: This is a clear, elegant solution to the problem of expanding an existing historic building. Old and new co-exist in an unexpected way through conceiving of the new as a kind of "wrapper," rather than a separate building. The fine scale of the texture of this "wrapper" defers to the character of the existing building. At the same time, the wrapper is not neutral, but is composed of several layers that change to achieve varying levels of transparency.

Client: Cambridge Libraries and Galleries, Architect team: Alar Kongats, Sofia Di Sabatino, Philip Toms, Danielle Lam-Kulczak, Samer Hoot, Tim Lee, Structural: Egberts Engineering Ltd., Mechanical: Lam Associates Ltd., Electrical: Lam Associates Ltd.

## **Kuwabara Payne McKenna Blumberg Architects (KPMB), Toronto, ON – Canada**

<http://www.kpmbarchitects.com>

### **Libraries:**

#### **University of Toronto, Rotman School of Management – Toronto, ON - Canada 2012**

The Rotman Expansion, the winning scheme in an invited design competition designed by Kuwabara Payne McKenna Blumberg Architects (KPMB), was officially opened in September. The Rotman School is part of the University of Toronto and according to a recent Financial Times survey of MBA programs, is ranked one of the top 10 business schools in the world for faculty research. The expansion project was conceived to create a vibrant global hub in which to evolve Rotman's core mission to promote the power of creativity, innovation and integrative thinking in 21st-century business education.

As Roger Martin, Dean of Rotman, said, "We now have the hardware necessary to engage in next building of Rotman's software – the programs and the people – to be best in the world for Canada. The interplay of this hardware and software opens huge possibilities."

The nine-storey-high project is seamlessly integrated with and doubles the size of the Rotman School's home on the University of Toronto's downtown campus. It is also connected to an existing Victorian residence. KPMB conceived a vertical campus to fit the varied program of tiered classrooms, study rooms, research centres, study lounges, and dedicated student spaces on a tight urban site. The project features many spaces for gathering, including the event hall, a state-of-the-art teaching and meeting space. The 500-seat event hall is the centrepiece of the project, its large elevated glass box facing out on to St. George Street to broadcast the vibrancy of Rotman's programs to students of U of T and the city. The multi-level south atrium features a large-scale serpentine staircase with a hot pink accent which simultaneously reduces reliance on elevators and increases interaction between students and faculty.

Marianne McKenna, partner in charge for KPMB of the Rotman expansion, says that the design process was inspired by the Rotman's Integrative Thinking™ program: "the design is a direct reflection of broad thinking, flexibility and teamwork involving the input of the Rotman and the University of Toronto."

Targeting LEED® Silver certification, the project exemplifies sustainable design principles and prioritizes the well-being of students, faculty, staff, and visitors. The interior is filled with natural light, fresh air, and spectacular views of the university's campus.

Terraces with green roofs and a courtyard provide access to the outdoors. In scale and massing, the KPMB design responds to the surrounding context, between the residential scale of the historic 19th-century residence and the massive Brutalist architecture of the Robarts Library across the street. It is sited to respect views and minimize shadow impact on Massey College to the east.

Design partner Bruce Kuwabara said, "The expansion project is both contemporary and in dialogue with the history and the architecture that surrounds it. An expression of the hallmarks of the Canadian experience – tolerance and openness – the Rotman is now open and poised to help move Rotman forward in Canada and on the world stage." Canadian Architect 05.10.12

#### **Joseph S. Stauffer Library and Computing Center, Queens University, Kingston, ON – Canada 1994**

230,000 sqft., €29,000,000

### **Awards:**

2001 City of Kingston Livable City Design Award

1997 Governor General's Award of Merit

1990 Winning Scheme, National Design Competition

The winning entry in a national design competition, the Joseph S. Stauffer Library and Computing Centre implements the vision of Queen's University to establish a library system for the 21st century. The project houses a collection of approximately one and a half million volumes within a fully networked environment containing digital information resources including Internet access.

The project offers a contemporary interpretation of collegiate architecture to respond to the historic campus context. The architecture is inspired by the vertical proportion and rich silhouette of academic architecture at Queen's as well as European and North American precedents. Traditional forms and materials are translated in a modern idiom conditioned by contemporary building methods, materials and systems. The building occupies the northwest corner of the principal campus intersection at Union Street and University Avenue. An octagonal stone and glass element announces the main entrance to the library. A central stack building organizes the plan and soars above a series of smaller perimeter building elements that accommodate reading rooms. A skylit circulation spine clarifies the sectional organization of the plan. The exterior material palette of limestone masonry, wood and metal refers to the history of limestone architecture in Kingston. Inside, cherry wood, painted metal and stone bandings are used to evoke the warmth and richness of collegiate architecture. The colour palette comprises buff yellow, lavender blue and terra cotta red, variations on the Queen's tricolor theme. Custom-designed furnishings incorporate wire management to provide desktop power and data delivery to all user positions. (Kuwabara)

#### **Raether Library and Information Technology Center, Trinity College, Hartford,**

#### **Connecticut – USA 2003**

\$ (USD) 30,000,000, 118,000 s.f. renovation of two buildings: the original 1952 building and a 1977 addition, 60,000 sq.ft. of new construction.

### **Awards:**

2004 Connecticut Building Congress, Project Team Runner-up Award

2004 Connecticut Real Estate Exchange Award

The Raether Library and Information Technology Center is envisioned as a new locus for the Trinity College campus, fitting into the institution's larger vision to elevate its academic standing in New England and enhance its architectural position in the urban fabric of Hartford. The Library and IT Center is arranged as part of an arrival courtyard with a two-storey cloistered arcade connecting it with the neighbouring performance theatre. In architectural and programmatic terms, the Center is intended as a place of cultural, academic and social intersection. The Raether Library and IT Center houses a double-height reading room for study and research. The new addition is linked to the existing buildings by a three-storey atrium, which contains the principal circulation stair with multi-level links connecting the existing with the new. Physical and intellectual access to the library and collection is enhanced through increased stacks and reader spaces, new circulation and reference desks, electronic training labs and a new 24-hour zone for computer use, study and socializing. The project employs such enduring and New England-appropriate materials as local red brick and brownstone. Inside, wood-paneled reader alcoves with views of the campus enhance the learning experience. Vitrines and shelves lining the Reading Room showcase Trinity College's significant collection of rare books and manuscripts. (Hughes)

## **Moffat Kinoshita, Hamilton, ON - Canada**

Cannon Design acquires assets of Moffat Kinoshita Architects.

<http://www.cannondesign.com>

Cannon Design, an internationally recognized architectural, interior design, engineering and planning firm with offices throughout North America has acquired the business of Moffat Kinoshita Architects. Moffat Kinoshita Architects' principals and employees will become an integral part of Cannon Design's regional network. Cannon Design is consistently ranked among the leaders in planning and design for the health sciences, higher education, sports and recreation, as well as corporate and commercial development. At present, with a staff of over 700 delivering services through 14 regional centres, the firm is working in 32 US states, 7 Canadian provinces and 15 countries in Latin America, the Middle East, the Far East, Asia and Europe. Cannon Design has been operating in Canada since 1985 through offices in Vancouver, Victoria and Toronto. Over the last 40 years, Moffat Kinoshita has earned a reputation as a well-respected, award-winning design firm with a portfolio of work in healthcare, higher education and civic architecture throughout Ontario, Canada and abroad. Along with Cannon Design's staff of ten Toronto-based interior designers, Moffat Kinoshita's staff of 30 will continue to serve clients through existing offices in Toronto and Hamilton.

### **Libraries:**

#### **York University, Keele Campus, Learning Commons, Toronto, ON – Canada on design**

York University has selected Levitt Goodman Architects to develop detailed designs for its competition-winning design for a 26,390-square-foot renovation of York University's main library on its Keele campus. The "Learning Commons" will provide users with a mix of group study areas that will shift York University's 40-year-old Scott Library into a progressive learning environment. The \$2-million renovation will be the first initiative on the campus specifically designed to reflect York's pedagogical shift from a teacher-centered approach to active and collaborative learning. The three-stage selection process began with an invited list of 12 firms. Four shortlisted firms were invited for an interview from which three firms were hired to participate in a two-week design competition. Levitt Goodman was selected for its balance of fresh ideas and proven accountability. The firm's winning scheme offers a mix of open and semi-private multipurpose areas designed to promote interaction, collaboration and group study. The first part of the multi-phased initiative will proceed under the direction of Brock James, Levitt Goodman's partner-in-charge of the project. The library will remain open during the construction period, which is expected to commence in the spring of 2010, with a projected completion date for the start of the fall semester. "The concept of a library is changing into a very active public place," said Brock James. "With this project, York University is making a powerful commitment to its students. We look forward to helping the university to make the library one of the campus's key learning environments. It will be designed to encourage connections with both colleagues and the wider world. We regard this as a significant opportunity and an exciting design challenge." The Scott Library renovation furthers Levitt Goodman Architect's specialization in library design. The firm's recent library projects include the Musagetes library at the University of Waterloo School of Architecture, Bridgenorth Library, the five-year multimillion-dollar renovation of the Queens Square Central Branch of the Cambridge Libraries system and the \$24.9-million renovation of the Kitchener Public Library (in association with Walter Fedy Partnership and Phillip H. Carter Architect) which will be completed in 2013.

This is the first in a series of stories about York University's new learning commons that will examine different aspects of this innovative, learning-centred place for students. The learning commons, which will be housed in the Scott Library on York's Keele campus, will feature an innovative design, a green retrofit to lighten its footprint and supportive programming for students. Phase 1 of the commons will open in September 2010. York has always striven to do things differently from other Canadian universities and nowhere is this more apparent than in how the University is approaching the creation of its new learning commons. A learning commons is a new kind of flexible learning space where students can work individually or collaboratively in groups and have access to a variety of academic supports such as research, writing and learning skills assistance. Learning commons are typically situated in academic libraries and are sometimes referred to as information or library commons. Above: A conceptual drawing of the Collaboratory area in York's new learning commons. The learning commons will be located on the second floor of the Scott Library. Starting this summer, the second floor of the Scott Library will undergo a major facelift as walls are torn down, new areas are opened up and the space is reconfigured into a learning commons. The space will feature comfortable seating, collaborative work areas and a hub that will bring research, writing and learning skills development supports together in one place. The renovation will add hundreds of new study seats, open up thousands of square feet and will include a green retrofit that will decrease its footprint and energy consumption. The library's IT capacity and capability will also be enhanced with LCD screens for collaborative work and desktop workstations. The learning commons will feature distinct regions or zones: The Collaboratory will feature modular furniture, including sofas, easy chairs and tables that can be moved and regrouped. A central stepped area will create a layered seating area where students can plug in and stretch out. There will be booths where groups can meet and work together and review findings and presentations on large flat-panel screens. The Hub will offer a place to go for academic support. The Hub will be the home of the research, writing and learning skills consultation "pods". In addition, the area will be equipped with instructional spaces and computer workstations. The Salon will house the Scott Library's collection of reference books and will contain quiet pockets of lounge furniture, as well as important modern Canadian art by David Partridge, Claude Tousignant and others. Two state-of-the-art group study rooms will be available for booking by small groups of up to eight people. An art walk will display work by York students, faculty and staff. "York University's new learning commons will be very cutting edge," says Mark Robertson, associate University librarian. Robertson and Norma Sue Fisher-Stitt, York's associate vice-president academic learning initiatives, together with a team of faculty, librarians, staff and students, have been working for more than a year on developing and refining the concepts and programming for the University's learning commons. As part of their work, the group conducted focus groups and surveys, and engaged in dialogue with students about what kind of library and learning commons they wanted and needed. "Last year we did a series of focus groups with students to find out what they needed from their libraries," says Robertson. "The findings were very interesting. Students told us that when they leave the formal setting of the classroom, they need a place to absorb what happens in the classroom. They need spaces where they can engage with their learning, either on their own or with their peers. York is a commuter university and as a result, the need is higher for this kind of place for students. "Students talked about the need for a variety of different types of differentiated spaces for their learning. Typically libraries have been very formal environments designed for individual study," says Robertson. "The libraries have those spaces, but students said they also need more informal areas for collaborative work. "We asked students who we saw working in Vari Hall, in hallways or cafeterias why they were there and they told us that they had spontaneously decided to work together. Many said that such meetings couldn't take place in the library because they had to book the group study rooms in advance," says Robertson. "It quickly became clear that this was an important part of learning that would be enriched because of all of the services, resources and collections that exist in the library," says

Robertson. "It was an aspect of learning that was not being accommodated." The development of areas like the Collaboratory is a response to this kind of need, says Robertson. He pointed out that in some respects, the Scott Library atrium is already serving as an informal collaboratory. "Floor sitting is a very common sign in the atrium. This speaks partly to the need for additional seating, but in many cases it's because students are looking for places to work together without disturbing others." "The other aspect was the social learning that was taking place. Students said they need to work in groups because they are receiving an increasing number of assignments that involve group work," says Robertson. "Students are also studying more together and discussing what they are learning among people in their group." This is an aspect Robertson feels mirrors the social lives of today's students, who collaborate online through Facebook and chat. But the collaborative areas are not the only thing that will make the learning commons unique. At the core of the learning commons will be a new integrated model of academic support. The Hub area just off the atrium will be the home of a variety of services previously scattered across campus: research, writing and learning skills support. A team of librarians, tutors and other professionals will be offering drop-in consultations and workshops to help students achieve their academic best. "Libraries have always had research assistance. But the integration of writing and learning skills in the learning commons recognizes the non-linear nature of academic work. Research, writing and learning do not happen separately. They are woven into each other and so the approach we are taking with the Hub is more holistic and more convenient for students," says Robertson. The Hub area will contain service pods that will be jointly staffed by the Scott Library Reference Department, the Writing Department and the Learning Skills Program in Counselling & Disability Services. The Scott Library project, says Robertson, is intended to create a variety of new informal environments and provide more integrated academic support services. "We want students to feel a sense of ownership over this space," says Robertson. Flexibility will be key to the new learning commons with everything from increased electrical drops, ubiquitous access to accessibility software, modular furniture, whiteboards and partitions, shared LCD panels, multimedia production technology, couches, comfortable chairs and lots of natural light. In the future, there may even be a café in the learning commons, says Robertson. Quiet study areas, group work rooms and flexible classrooms are planned for future phases of the commons. There are also plans to revitalize the atrium as a forum or piazza for cultural functions such as author readings, book launches and displays. (<http://www.yorku.ca>)

### **Kitchner Public Library, Kitchner, ON – Canada 2013**

The renovation and expansion of the Kitchener Public Library and the accompanying Civic District Parking Garage has been granted approval based on designs by Toronto architecture firm Levitt Goodman Architects in association with the Kitchener-based Walter Fedy Partnership and Phillip H Carter Architect.

The \$24.9 million library will include the complete renovation of the existing facility along with the design and construction of a 25,000 sq ft addition. The project also includes an \$18.5 million, three-level underground parking garage that will service the entire Civic District. The new library aims to enhance the lives of residents as a centre for information, imagination and community that will contribute to the economic and cultural life of the city. The parking garage will discretely alleviate the parking deficiency in the area and provide a platform for a future public square, helping the project in its aim to reach Gold LEED status.

The project will proceed under the direction of Janna Levitt, principal-in-charge, and David Warne, project architect, both of Levitt Goodman. The library will remain open during the construction period, which is expected to commence in 2010, with a projected completion date in 2013.

Levitt Goodman led team was selected for the project because of its design ability, its long-standing commitment to Kitchener Public Library and its recognition that this project will play a central role in the future of the region as a cultural destination. Levitt Goodman has authored the past three feasibility studies for KPL and participated in the Civic District design charettes. Other Levitt Goodman projects include the Waterloo Regional Children's Museum and the University of Waterloo School of Architecture. Phillip Carter has successfully overseen over 50 libraries including renovations to over 25 Toronto Public Library Branches. The Walter Fedy Partnership will provide expertise in parking garage design, LEED, mechanical, electrical and structural engineering and has a history of local civic projects. (<http://www.worldarchitecturenews.com>)

### **Queens Square Library, Cambridge Library System, Cambridge, ON – Canada 2012**

#### **Queens Square Library renovation**

We were hired by the Cambridge Library to execute a five phase renovation of their main branch. To date we have completed the first two phases, both of which were aimed at bringing the central branch in line with the CEOs desire to bring all aspect of the library, starting with patron services in to the 21st century. In general, our client wanted to reinvigorate the main branch by transforming the physical environment from a more sombre and traditional branch into a bright, welcoming and open experience. One of the key elements of this was the redeployment of staff through the introduction of RFID both in the self check out and check in and the elimination of the traditional circulation desk. The design of the self check out was guided by our client requirement for a experience that would be open and playful. We designed the checkout as a combination of permanent and moveable elements, with ample room at all 3 station to allow maximum flexibility for all patrons. A parent with a stroller, baby bucket and/or a toddler can now easily check out his or her books while keeping an eye on the kids at one station while a group of teens can be congregating around another. The self check in area was designed as a feature prominently located at the entry area. We playfully displayed the conveyor system beyond by leaving strategic gaps within the slatted wood wall. A bench for seating is conveniently placed for kids to sit/stand and watch the action within. A small shelf beside the book slot allows for a patron to stack a multitude of library material allowing an easy returns process. The choice of materials was carefully selected. The existing building, purpose built in the 1970 is a beautiful example of regional modernism, with its exposed brick and steel structure. Distinct architectural features such as the steel stair and landings are, even after 40 years, still attractive and robust. We wanted build on this language with the current renovations. The exposed and powder coated steel both provide the continuity with the existing building and insure a finish that is both extremely durable and attractive. The marble is a new material we introduced that is an extremely durable and elegant finish which also offers the patrons and staff an elevated and timeless environment in which to work and learn. The existing cedar ceiling was refurbished and playfully updated by cascading it down the wall of the new self check in. The Douglas Fir, also used in the original building, is reintroduced in key points such as the new reception and patron services desks and at the ends of all the book shelves, adding an element of warmth in to the current palette. Finally all the lighting was replaced with energy efficient fixtures that increased the output while consuming less energy. The tube light "chandelier" suspended in the double height space defines the new reading area insures proper illumination while adding an element of visual delight, both in the day and in the evening. Janna Levitt, May 3, 2012 (<http://www.accessola2.com>)

### **Bridgenorth Library and Community Hall, Bridgenorth, ON – Canada 2009**

\$ 1.600.000, 790 sqm

#### **New Bridgenorth library wins Green Building Award by Anita Locke**

The Bridgenorth Library and Community Hall was this year's winner of the Green Building Wood Design Award of the Ontario Wood WORKS! organization. Ontario Wood WORKS! exists to promote the use of wood and wood products in commercial, institutional and industrial projects. Wood WORKS! is an industry-led initiative of the Canadian Wood Council. Its goal is to

promote the use of wood and wood products in innovative construction projects and to acknowledge the contribution of wood use advocates. The Bridgenorth library was designed by Levitt Goodman Architects, Phillip H. Carter Architect and Blackwell Bowick Partnership Ltd. The award was presented at an Awards Gala on November 5 at the Old Mill Inn, Toronto. In submitting their entry, the Levitt Goodman principals noted that “By constructing this main branch public library for Bridgenorth entirely of wood products we were able to set the tone of a great lodge or grand community cottage that supports the vision of the town and takes cues from the nearby landscape. “Employing wood frame construction, beyond simply using a renewable resource, allowed us to substantially reduce the quantity of finish materials and to implement other sustainable design elements. “Veering away from conventional construction detailing, we decided to expose as much of the wood structure as possible. This strategy included exposing the wood framing in the walls, much of which is not hidden behind the typical layer of gypsum board thus eliminating a large quantity of material that would normally be required. The porous nature of the exposed wood and its high level of surface articulation absorbs and disperses sound negating any need for acoustic treatments in the library spaces. “The economical cost of wood frame construction allowed us to include other sustainable design techniques without going over budget.” The wood products that were used in the construction of the library and community hall included LVL wood studs, engineered joists, double plywood trusses, oriented strand board, plywood, Glulam timber, Maibec wood siding, Hardi panel siding, red oak (vener plywood, solid core doors and wood shutters), and clad wood windows. The architects also incorporated other sustainable design elements such as a high level of insulation to reduce energy usage, large roof overhangs to block summer sun, large windows to allow maximum interior daylighting to reduce electricity consumption and many other features. Brock James of Levitt Goodman Architects says, “The great thing about this Wood Works Award is that it recognizes that smaller communities can create top quality public facilities. The Bridgenorth Library and Community Hall has a local feel and addresses the community’s needs with an affective green approach that respects the Township’s budget. Township staff wanted a building that would satisfy practical concerns while creating an inspiring space worthy of community aspirations – what a great way to invest our public resources.” (<http://www.lakefieldherald.com>)

### **Musagetes Design Library, University of Waterloo, School of Architecture, Cambridge, ON – Canada 2004**

Renovation of 12,000 sq.ft in a converted silk mill

The Musagetes Design Library is part of the University of Waterloo Library system dedicated to architecture books, periodicals and a rare book archive; which integrates closely with the larger School of Architecture. The front door of the library is a custom engineered 8'x10' cantilevered glass door suspended in a steel frame which is counter-balanced across bearing pivots by a 900-pound steel ballast. (Levitt)

### **MacKay-Lyons Sweetapple Architects, Halifax, NS – Canada**

Brian MacKay-Lyons, Talbot Sweetapple, Melanie Hayne

<http://www.mlsarchitects.ca>

#### **Libraries:**

### **University of Toronto, Academic Resource Centre, Toronto-Scarborough, ON - Canada, 2003**

see also: <http://www.rdharch.com>

The Academic Resource Centre is located at the heart of John Andrew’s Brutalist Scarborough Campus of the 1960’s. The new building is conceived as functioning as a “town square”- the backdrop to the intellectual heart of the University, contrasting markedly with Andrews’ serpentine hill-town aesthetic that straddles the valley edge. This project involves the creation of a new central library which will serve the entire Scarborough campus, combined with a new 500-seat lecture theatre and a small art gallery. The building program embraces 18,000 square feet of renovated space and 80,000 square feet of new construction on two floors; the program incorporates 17,000 square feet of book stacks, 665 study spaces with 90 networked study units, laboratories and workrooms comprising an 8,300 square feet Teaching and Learning Center, an extensive Collections Management and Circulation Area, Advising and Career Center, and supporting offices. The Academic Resource Centre is the first stage of the University’s program of planned new growth. This development must respect the architectural vision of John Andrews, while considering the future potentials of the site and its surrounding area. To this end, a strategy that combined consolidation and infill was used. In addition to the new program of construction, extensive renovations of existing buildings were undertaken. The new building has a potential for vertical expansion, with the possible addition of a third floor in a later phase. Horizontal expansion can be facilitated through the repetition of the modular ‘boat’ forms on plan. Additionally, the archetypal courtyard, street and boat forms may be repeated as the needs of the university develop and change. (MacKay)

### **Marshall Tittlemore Architects, Edmonton, AB – Canada**

<http://www.mtalink.com>

#### **Libraries:**

### **Edmonton Public Libraries, Highland Branch, Edmonton, AB – Canada 2013**

Joint Venture with Schmidt Hammer Lassen, Aarhus, Denmark (<http://www.shl.dk>)

The Highlands Branch has been serving customers in northeast Edmonton, Highlands, Montrose and Bellevue communities since 1962 when it began operations in a storefront. In 1963, the branch moved into a cottage at 8606-118 Avenue and was affectionately known as the “Little House Library”. The current building, located at 6710-118 Avenue, was constructed in 1964. Since that time, the area’s population has grown and its needs related to library service have changed.

Construction will begin soon and we hope that a new library stimulates further development and upgrading along 118th Avenue as well as improving the quality of life for area residents. The proposed design is intended to be an open pavilion conveying the idea of democracy and openness, that the building is open to all; a free public space, a place to read, a place to learn, a place to meet, a place to be. The new Highlands Branch - being re-built in its current location - will be a distinctive landmark for the district and corridor with its bold form and openness. Expected opening date for the new branch is Fall 2013.

(<http://www.epl.ca/about-epl/building-projects>)

## **MCA Makrimichalos Cugini Architects, Toronto, ON –Canada**

<http://www.mearch.com>

### **Libraries:**

#### **Ajax Catholic Elementary School, Ajax, ON – Canada 2012**

Owner: Durham Catholic District School Board

Ajax Williamson is a new two storey JK-8 school highlighting an efficient plan both in its program and circulation. The school's design creates a multifunctional student centre by integrating a stage that opens both to the Library and the school's Gymnasium. The layout of the Library is open and flexible encouraging creative use of space by allowing for a variety of functions to take place.

The placement of the school on its site creates an urban gathering space at the intersection of Williamson Drive and Thackery Drive. It establishes itself as a community building within a thriving new residential area at the intersection of Williamson Drive and Thackery Drive. It establishes itself as a community building within a thriving new residential neighbourhood. The playground and field align themselves with the adjacent park to take advantage of the open green space which abuts the school's property. Solar panels are integrated into the design to exemplify to the community the Board's commitment to the environment and will be used as an educational tool for the students. (MCA)

#### **Richview Library, Toronto, ON – Canada 2011**

Partner in Charge: Leo Makrimichalos

Owner: Toronto Public Library

Richview District Library is the largest library in the City of Toronto's west end. The interiors of the existing three level library had become dated over 20 years of being well-used by the community it services. The new interior design of the library's main level provided for a complete revitalization of the library spaces. The existing large customer service desk was replaced with a small, sleek circular desk. New express check-out stations backed with purple coloured glass walls were provided adjacent to the library's main entrance. The redesigned ground floor level resulted in the removal of irrelevant rooms such as the "microfiche room, that was replaced with a new, distinct Teen room separated from the main library space with a glass screen. The Teen area provides for diner style seating and comfortable sofas to cater to the different study habits of today's teens. Sophisticated newspaper lounges and computer counters, designed with bright lime green glass screens were provided. New study tables and low side tables in all lounge areas are equipped with power at the centre of each table top. This caters to the new library as a place for long term study with lap tops, web browsing on personal tablets and for reading of e-books. (MCA)

#### **Mount Pleasant Village School, Library and Community, Brampton, ON – Canada 2011**

Partner in Charge: Cid Cugini

Owner: Peel District School Board, City of Brampton, Brampton Library

This building is a unique partnership between the Peel District School Board, the City of Brampton Community Services and the Brampton Library. The elementary school includes 18 classrooms and 8 kindergarten classrooms. The library and school share the 35,000 sqft public library space, an extensive computer room and several seminar rooms. The school's gymnasium space is also shared with Community Services for after hours recreational programming. The public library is a 2 storey building with a double height glazed corner façade. Connected to the library, with a glass link, is a restored City of Brampton train station that houses additional programming for Community Services. The train station fronts the Mount Pleasant Civic Square which includes a fountain and skating rink. The building includes mechanical and parks service rooms that will support the Civic Square. (MCA)

#### **Cedarbrae Library, Toronto, ON – Canada 2010**

Owner: Toronto Public Library

Of Toronto Public Library's 99 branches, Cedarbrae District Library is the third busiest library building in the library system. The original building was designed in 1966 and had become a run-down repository for books. The existing library was no longer capable of catering to the evolving needs of its community. The redesign involved the complete interior renovation of the building and a 4,400sqft addition.

Our vision for the building redesign was to provide the library with a new visual identity, by creating a new street presence that would transform the library into a landmark building on the site. This was established by introducing two storey glazed walls along the full extent of the north and west building facades. This provides the community with unobstructed views into the library and to the street from the interior. Natural light penetrates deep into the building and creates a public friendly interior space. Colourful glass panels animate the building exterior and a large "LIBRARY" sign displayed on the west wall informs the community that this is a public building for their use. (MCA)

#### **Dufferin/St. Clair Library, Toronto, ON – Canada 2008**

Partner in Charge: Leo Makrimichalos

Owner: Toronto Public Library

### **Awards:**

2009 Heritage Toronto Award of Merit

The Ontario Library Association 2010 Award of Excellence

American School and University Award for Outstanding Design in the Educational Interiors Showcase 2010

Located on Dufferin Street, south of St. Clair Avenue, Dufferin/St.Clair Library is one of Toronto's heritage listed buildings. The original library facility was built in the 1920's and is situated adjacent to a park actively enjoyed by the Community.

Our vision for the project involved restoring the building to its original charm, uncovering and repairing existing walls murals to create a dynamic interior space, demolishing the existing stucco additions and constructing new glazed additions to the west and south sides. The building interiors were completely renovated to include a new sophisticated adult area, a separate Teen Zone, a vibrant Children's area and a KidsStop, an interactive children's play and learning area for babies and toddlers. Also included is a new Community Room that projects into the adjacent park and a new public interior entry ramp that connects the existing main entry to the new south entry from the adjacent park. The new glass facades create for more inviting building elevations that encourage the Community to peek into the reinvented public friendly spaces. It also promotes a visual connection between the interior public spaces and the new exterior public reading garden in the adjacent park and between the library interior and the street. (MCA)

## **Central Erin Mills Multi-Use Complex, Mississauga, ON – Canada 2001**

**Partner in Charge:** Cid Cugini, Terry Fitsialos (from STIP)

**Owner:** Dufferin Peel Catholic District School Board, City of Mississauga, Mississauga Library Board

### **Awards:**

**2001 Mississauga Urban Design Award**

This Project combines, in a highly efficient and aesthetic manner, a Secondary School, a Community Centre with wellness and aquatic programs and a Public Library as a single integrated public facility. The Pedestrian movement both externally and internally is designed to be efficient with ease in finding ones way. The internal "people movement" is facilitated by the use of an "internal street" as the principal organizing element. This street becomes the social space, creating opportunities for social interaction, relaxation, and visual relief via vistas into the aquatic areas, community rooms and public library. The introduction of natural light internally in the street and the school's interior court becomes a vital component creating a friendly environment for all the students and public users. The School uses as an organizer, an internal court/multi-use space for gathering, entertaining, eating, reading and participation in the school's every day activities. (MCA)

## **McCellum Sather Architects Inc., Hamilton, ON – Canada**

<http://msarch.ca>

### **Libraries:**

#### **McMaster University, Faculty of Health Sciences Library, Hamilton, ON – Canada 2007**

51,000 sqft. Renovation, 2,800 sqft. New Construction

### **Awards:**

**2010 Ontario Library Association, Library Building Award**

**Award of Design Excellence**

**2007 City of Hamilton Urban Design and Architecture Awards**

**Award of Excellence**

**2007 City of Hamilton Urban Design and Architecture Awards**

**People's Choice Award**

This renovation and expansion to the Health Sciences Library on the McMaster Campus represents an exciting departure for the University. Located within the internationally renowned McMaster University Medical Centre (MUMC), the challenge was to renovate the interior space to respond to changing aesthetic and social library requirements in a manner that aesthetically captured the progressive and innovative reputation of the Faculty of Health Sciences.

The design concept for the McMaster University FHS Library dramatically reflects this shift with the addition of a new reading pavilion. This two storey glazed box is a direct counterpoint to the existing opaque precast concrete enclosure. A strong visual link is created between the library, the immediate landscape, and the larger campus beyond, breaking down the isolation and interior focus of the existing library.

Internally, the integration of a new cafe with a large glazed entry and social gathering space, in conjunction with a totally redesigned information centre, creates a very welcoming and animated student hub. The addition of group learning spaces, group study rooms and internet connectivity throughout complete the renovation concept. (McCallum)

#### **Liberia Library and Community, Paynesville (Monrovia) – Liberia in design**

17,300 sqft.

Liberia is in the process of renewal as the country benefits from several years of a stable government that was preceded by years of a very destructive and debilitating civil war. MSA was approached several years ago by Leo Johnson, a Liberian now living in Hamilton and very actively involved in activism and empowerment through his not-for-profit organization, Empowerment Squared, which is specifically targeted to immigrants and refugees. His passion for his birthplace led him to want to give back to the country by creating a legacy project that would help empower and educate the youth of Liberia. This led to the conception of a library/resource/community centre as the vehicle for promoting education. Working with Mr. Johnson, MSA developed a schematic design and program that outlined appropriate spaces to be built in three phases over time.

The preliminary design concept was developed to establish a design approach to the project that reflected a sustainable methodology to the design and construction of the project. The notion of building in phases allows the project to proceed as funding becomes available but each phase must be capable of functioning completely as a standalone project and not be dependent on future phases to function appropriately. The purpose for the Samuel Morris Memorial Library and Community Centre Project is:

- To gradually establish smaller centres in strategic locations across Liberia where rural school and underprivileged youth can find safe space and resources to express themselves.
- To promote the importance of literacy in every form in the development of the analytical and personal skills.
- To stimulate the habit of reading and restoration of a future for thousands of frustrated Liberian youth.
- To build a relationship between the youth population and literacy which has been denied from them for too long.

The Library and Community Centre is designed as a series of built spaces, arranged around a variety of common gathering areas that will help promote positive social interaction and will inspire youth to be involved in such literary pursuits as poetry recitals, story readings, and upholding their strong oral tradition.

#### **Phase 1: Library**

The Library space will house the book collection and will have layering of spaces with a bridge at the mezzanine level for quiet reading. The bridge will also provide connection to the upper level outdoor green space. The meeting area, offices, and service spaces are placed next to the library. Introverted and arranged around an intimate courtyard space. The total gross area of Phase 1 is approximately 4,100 sq. ft.

#### **Phase 2: Reading Room and Conference Centre**

The Reading Room and the Conference Centre will close the courtyard on the south edge with a covered walkway flanking the east edge, an addition of approximately 3,700 sq. ft. The indoor/outdoor spaces, such as a covered walkway with open wood slats between columns, are designed to promote the much needed air circulation in a tropical climate without disturbing the intimacy of the space.

### Phase 3: Recreation Centre

The Recreation Centre will complete the Community Centre development with an addition of 9,500 sq. ft. of space. This space is designed to facilitate more public outdoor gatherings through openings on the south façade accessing the front outdoor space. (McCallum)

## **Menkès Shooner Dagenais Letourneux Architects, Montréal, QC – Canada**

<http://www.msdl.ca>

### **Libraries :**

#### **Bibliothèque de Théologie du Collège Jean-de-Brébeuf, Montréal, QC – Canada 2004**

Le dévoilement de l'espace original constitue le geste essentiel de la restauration de l'ancienne Chapelle. Par ailleurs, le projet loge une bibliothèque de 175.000 volumes et génère un vaste volume aux fins pédagogiques et culturelles. La coexistence des fonctions nécessite la démultiplication des surfaces et la séparation symbolique et phonique des activités. Entre la nef et le chœur, un écran de verre structural distance les étudiants de l'espace d'exposition des livres anciens. Les détails contemporains par leur finesse, distinguent l'intervention actuelle et introduisent une mise en valeur mutuelle des composantes nouvelles et anciennes. L'aménagement de cette bibliothèque considérable relève de la création d'éléments contemporains performants et d'une restauration exemplaire. (Menkès)

## **MJMA (MacLennan Jaukalns Miller) Architects, Toronto, ON – Canada**

### **Libraries:**

#### **Niagara Falls Community Centre and Library, Niagara Falls, ON – Canada 2005**

Client/Owner City of Niagara Falls & YMCA of Niagara, 106,000 sqft., Construction Costs \$ 21,000,000,

The MacBain Community Centre is a multi-stakeholder civic project that combines several community programs under one roof. A central lobby, with reception and snack bar, provides common access and views to several key building areas: the public library, gymnasium and swimming pools. The YMCA of Niagara operates the gymnasium, courts, fitness and aquatic centre for the City of Niagara Falls Department of Parks, Recreation and Culture. Multi-purpose facilities for community meeting and wellness functions are shared with Heart Niagara, Big Brothers and Big Sisters of Niagara and the Coronation 50+ Seniors Centre. Also accessible from the lobby is a state-of-the-art branch of the Niagara Falls Public Library. Built on a highly visible landfill area at the corner of Montrose and McLeod Road in Niagara Falls, the rejuvenated site now features re-naturalized areas, parkland, walking trails, children's playground and skateboard park. This project was completed in joint venture with Chapman Murray Architects of Niagara Falls. (MJMA)

#### **Wellesley Community Centre / St. James Public Library, Toronto, ON – Canada 2005**

Client/Owner City of Toronto, Toronto Public Library, Project Area 55,000 sq.ft., Construction Costs \$10,000,000

### **Awards:**

2007 Ontario Library Association Award of Excellence

2006 Design Exchange National Awards – Bronze Award

2005 Toronto Architecture and Urban Design Honourable Mention: Building In Context

The Wellesley Community Centre and St James Town Public Library is a joint project between the City of Toronto and the Toronto Public Library to provide a community focus for the dense St. James Town inner city residential neighbourhood. The 50,000 square foot facility integrates a public library branch, a second-level childcare centre with private exterior play courtyard, and an athletic component with a weight and fitness room, an aerobics studio, and a gymnasium. Located at the north-east corner of Wellesley and Sherbourne, the hybrid civic building provides an active street edge along the Sherbourne Street elevation and establishes a green park zone along its east edge to Bleeker Street. The public circulation system of the facility is totally transparent and evident from the exterior. The public components all open on to a central public lobby that is equally accessible from both the street and park sides of the facility. (MJMA)

#### **Whitchurch – Stouffville Library and Aquatic Centre, ON – Canada 2001**

Client/Owner Town of Whitchurch-Stouffville, Project Area 32,000 sq.ft., Construction Costs \$6,700,000

The Whitchurch-Stouffville Library and Aquatic Centre is located within Stouffville's park system at the centre of a new quadrant of residential expansion. The hybrid community centre is composed of three major public components that share an open, common lobby: a 1,200 square metre fully digital community library and resource centre, an aquatic hall with a 25 metre fitness pool, shallow water teaching, children's basins, and a fitness and training facility including exercise and dance / aerobic rooms. The facility is designed for future phased expansion of both the library and community program areas. MJMA was responsible for the master planning of the central park area to ensure that the major public halls each connected to landscaped exterior gardens and were oriented to park views. (MJMA)

#### **St.Laurent Don Gamble Community Centre and Library, Ottawa, ON – Canada 1995**

Client/Owner City of Ottawa, Construction Costs \$11,000,000

### **Awards:**

1997 Ontario Association of Architects Architectural Excellence Award

1996 Ontario Library Association Building Design Award

The project, now called the Don Gamble Centre, entailed renovating adjacent centennial-era buildings, a pool, an arena with a link through the addition of a new 15,000 square foot library, a music theatre studio, a daycare centre, senior's and youth centres, and an arts studio. A new dance studio, weight room, and multi-purpose gymnasium were also added to the complex. The pool and arena underwent substantial renovations including a new ice slab, change facilities, and building services. The Centre also included extensive landscape work to incorporate an outdoor splash pad, a garden, and playground. This facility functions as the heart of an established residential community. This project was a joint venture with David S. McRobie Architect of Ottawa. (MJMA)

### **Libraries:**

#### **Toronto Reference Library (TRL), Toronto, ON – Canada on design**

(see also: North York Central Library 1987)

“Public Libraries are vital to Toronto’s cultural and economic health” said Linda Mackenzie, director of research and reference libraries. “The Toronto Reference Library in particular is a cornerstone of city life” (dnonl.com)  
The Library is designed as a cheerful stimulating environment that would attract patrons to the world of books. An Area for teens, featuring juke boxes with headphones, is a place for meeting friends and socializing as well as for learning about books. The toddler’s area is designed as a castle with appropriately-scaled furnishings and brightly coloured signs. A straightforward and easy organization ensures that the Library is non-intimidating. Information centres for each Department are located in the middle of floors to be readily accessible. Furniture at the information centres is eye-catching and energetic (Moriyama)

Members of the public are invited to drop by to hear about the upcoming renovation and expansion of Toronto Reference Library, Toronto's most popular library on Tuesday, June 5th at 6:30 pm. The open house will take place in the Asquith Room on the second floor of the library, located at 789 Yonge Street. Toronto Public Library staff and Ajon Moriyama of Moriyama & Teshima Architects will be on hand to talk about renovation plans. Scheduled to begin in late 2007, the renovation will: \*redesign the Yonge Street building façade to make the library transparent and open to the community, \*add a vibrant new glass main entrance cubeM \*add a new Special Collections Centre, \*provide expanded space for library programs, \*expand the exhibits gallery, \*add a new coffee shop and gift store, \*completely renovate the upper floors to create new subject centre configurations, introduce alternative use areas, idea gardens, casual group gathering areas, improved quiet study areas and enhanced audio and visual learning areas. The Toronto Public Library is North America's busiest public library system. Every week more than 329,000 people visit its 99 branches and borrow more than half a million items. (<http://www.canadianarchitect.com>)

#### **Lakehead University Orillia Campus, Library – Canada 2010/11**

Opened in September 2010, Canada's first Leadership in Energy and Environmental Design LEED campus, Architects: Moriyama and Teshima, Accommodates 1,000 to 1,200 students, 80,000 sqft., Facilities include:

- technology-abled classrooms
  - 2 science labs
  - 2 lecture theatres (120/200-seat)
  - library/learning commons
  - food kiosk
  - administrative and faculty offices
- Opened in September 2011: Food Services & Bookstore building, 271 Bed residence

Lakehead - Orillia's new Academic Building on University Avenue is the first step in the development of a Leadership in Energy and Environmental Design (LEED) campus, the first of its kind in Canada. Lakehead Orillia's outstanding accomplishments over the past four years have allowed us to expand into a campus that combines our historic Heritage Place downtown setting with a new kind of facility - one that showcases our leadership in innovation and environmental sustainability. (<http://www.orillia.lakeheadu.ca>)

#### **Nova Scotia Community College, New Metro Campus, Dartmouth, NS – Canada 2006**

+ Barrie and Langille Architects in association with Moriyama & Teshima Architects

This is a complex project which is of landmark significance to the Nova Scotia Community College (NSCC). The location of this campus on a prominent waterfront site in the heart of Halifax is intended to radically revise the image of the College in the minds of the government, business and post-secondary stakeholder communities of Nova Scotia. The building is the first phase of the planned campus development. It contains program spaces for the Schools of Business, Health and Human Services, Applied Arts and New Media, computer lab, specialist lab, and studio environments. Common services include a Library and Learning Commons, Food Court, Presentation Centre, Exhibition space, Student Services Centre, and meeting and administrative support facilities.

It is a technically complex design and construction program that incorporates environmental and energy-efficient measures targeted at achieving a LEED Silver certification. Energy modeling studies indicate that the efficiency of the building design will result in a 46% reduction in energy usage.

#### **Burnamthorpe District Library, Mississauga, ON – Canada 1992**

Designing the Burnhamthorpe Library was a process of intense collaboration with City officials, librarians, staff, and users. A common vision developed of a humanizing environment that would engage the entire community. A low, undulating brick structure in a peaceful campus-like setting, the Library encourages a relaxed pace, good manners, and respect for fellow patrons. At the entrance, a 476-ton sculpture of Queenston limestone symbolizes the passage of time and the permanence of nature. (Moriyama)

## **Nicholson Sheffield Architects, Inc., London, ON – Canada**

<http://www.mnsa.ca>

### **Libraries:**

#### **The London Central Library, London, ON – Canada 2002**

joint venture with Shore Tilbe Irwin & Partners.

The new London Central Library re-occupies an existing three-storey department store structure adjacent to a large urban shopping centre in downtown London. The project scope included a complete renovation of the existing structure and building system/finishes. Malhotra Nicholson worked closely with Joint Venture Architects Shore Tilbe Irwin & Partners and the management and staff to complete a functional plan.

The renovated building includes a 380-seat performance hall, meeting rooms, a spacious children’s area, a Garden Reading Room, administrative offices, the many standard library services, and a Cafe, Offices of Pilar and the London Arts Council and London’s Business Hall of Fame.

The innovative design features of the new Central Library reflect the ideas and suggestions of London residents who participated in an extensive process of consultation to identify the community’s needs and expectations of its public library system. Our team has been recognized for our creative response to and leadership of that process and particularly for accessibility issues

## Westmount Public Library Branch, London, ON - Canada 2002

joint venture with Shore Tilbe Irwin & Partners.

This new facility of 15,000 sq. ft. consists of stacks, adult and children's reading areas and meeting rooms. Unusually for a library, it is located in a "pad" in front of a mall style development, so the project looks outward towards the street and inward towards a small reading garden. The building can be opened after the library's operating hours to be partially used by the community.

## Patkau Architects, Inc., Vancouver, BC – Canada

<http://www.patkau.ca>

### **Libraries:**

## La Grande Bibliothèque de Québec, Montreal, QC – Canada 2000 – 2004

Architect: Patkau / Croft Pelletier / Menkès Shooner Dagenais architectes associés

### **Awards :**

Winning Submission, International Design Competition 2000

Lieutenant Governor's Medal for Architecture 2006

American Institute of Architects / American Library Association Honor Award 2007

The Bibliothèque Nationale du Québec is a 350 000 sq ft central library for the province of Québec. Located in the Latin Quarter of Montréal, the building consists of general collections, an historic Québec collection, and a variety of public spaces including a lecture theatre, café, gallery, garden, and booksellers. The collections are housed within two large wooden rooms, each with different characters. The Québec collection is conceived as a grand room, inwardly focused, with the stacks at the perimeter and reading areas within. The general collection is conceived as a storage container for the various materials of the collection with reading areas outside its boundaries. Connecting the collections is an architectural promenade that begins at the entrance of the library, and weaves upward through the collections to a public reading room. Complementing the architectural promenade is a conventional circulation system with elevators and stairs that allows for efficient access to the library. The wooden rooms are housed within a glass and copper-clad building. Between the wooden rooms and exterior skin are rich and complex spaces that reflect the diversity of the program, through a variety of light conditions, scales of spaces, and unexpected adjacencies. The public spaces of the library are arranged in a topographic manner below the collections, so that the public spaces of the library support and activate the public spaces of the city. (Patkau)

## Winnipeg Centennial Library Addition, Winnipeg, MB – Canada 2002 – 2003

Architect: Patkau Architects / LM Architectural Group.

### **Awards:**

Winning Submission, Design Competition 2002

Prairie Design Award 2006

Lieutenant-Governor's Medal in Architecture 2007

Governor General's Medal in Architecture 2008

A major renovation and addition to the Winnipeg Centennial Library is proposed to revitalize the existing 1970's building. Changes include reorganization and expansion of the collection, reorganization of the circulation systems, and new social spaces. The existing library consists largely of independent floor plates isolated from one another. In order to foster a greater sense of community within the library, a large terraced reading room that interconnects the existing floor plates and a new fourth floor was developed along the edge of the building. The terraces complement adjacent functional spaces, and an integrated staircase provides convenient circulation between the floors. At the top of the terraced reading room, (presently the roof), a new grand space houses the Library's reference collections. Because the existing library is largely introverted and lacks any strong connection to the exterior, the entire edge of the terraced reading room is glazed, opening up the library to views of the adjacent park and city streets. At the same time, the glazed wall allows the life of the library to contribute to the life of the park and street beyond.

## Newton Library, Surrey, BC – Canada 1990 – 1992

### **Awards:**

Governor General's Medal 1994

Canadian Wood Council Merit 1994

To give the library the presence necessary to allow it to compete on a typical North American "commercial strip", the height of the single-story perimeter walls to the north and south are exaggerated. Not only does this give the building greater presence on the street, but it also allows large amounts of natural light to enter the building: on the south side through carefully controlled openings, and on the north through a glass curtain wall that allows a soft ambient light to fill the interior. While the walls to the north and south are exaggerated, the entrance to the west is compressed to a human scale. This compression runs the entire length of the building, creating a valley in the roof that helps to reflect natural light deep into the interior. This valley also works in conjunction with an attic space to provide a plenum which houses the air distribution ducts leading from a mechanical penthouse. The cross section of this attic space diminishes as it moves away from the penthouse, resulting in a cross slope which drains the entire roof to each end of the building, where rainwater is collected in rock cisterns and allowed to percolate into the water table. The construction of the building begins with a laminated timber frame on a concrete base. The tectonic qualities of this construction establish the primary character of the building shell. To reflect natural light deep into the interior of the library, a complementary clad construction of white painted gypsum board on the interior, and stucco on the exterior, is overlaid on portions of the building. In this way a dialectic of construction types energizes the architectural expression of the building. (Patkau)

Projet ou les limites entre le paysage et l'architecture se confondent et modifient les perceptions de l'utilisateur, bibliothèque ouverte, accessible et perméable, liant l'utilisateur au paysage. (Pelletier)

### **Bibliothèque Charlesbourg, Québec QC – Canada 2006**

Though Quebec City can't boast of a building like Montreal's Grande Bibliothèque, the Bibliothèque de Charlesbourg, inaugurated last year, makes a worthy little cousin. Winner of a 2004 Canadian Architect Award of Excellence, it's a fantastic example of a functional and sustainable new building that takes into account the history of the site. I rank it as my favourite new building in the city. The library's design may be contemporary, but it nevertheless references Charlesbourg's past. Most towns in Quebec were initially laid out along a linear strip. Charlesbourg, now a suburb with an old historic core situated a few kilometers north of Quebec proper, was different from other towns. Its Jesuit founders experimented with a more community-oriented radial plan, drawn up in 1627. Settlers were given pie-shaped slices of land and built their homes around a central square that included a church and common pasture lands. This urban layout was still visible until the 1950s. Since then, buildings and parking lots sprouted up in this central area and the original urban plan was muddled in the throes of suburban expansion. The construction of the Bibliothèque, with its publically-accessible sloping green roof, is an ingenious attempt to evoke the pasture lands that were once at the core of the community. It is one of the largest public green roofs in North America and will make a lovely public park when completed. (<http://www.urbanphoto.net>)

### **Perkins+Will, Vancouver, BC – Canada**

As part of a strategic expansion into the Pacific Northwest and Canada, we merged with Vancouver-based Busby + Associates in 2004 to provide full-service architectural, urban design, interiors and sustainable design consulting. The Vancouver office is a local and international leader in sustainability and is consistently ranked as one of the Globe and Mail's Top 100 Greenest Companies in Canada. In April 2011, the Vancouver office joined forces with Toronto-based Shore Tilbe Perkins+Will and Dundas- and Ottawa-based Vermeulen Hind Architects to establish Perkins+Will Canada. This three-office merge creates a pan-Canadian practice with four strategic locations and brings an exciting synergy of architectural expertise and talent to the Canadian marketplace as well as the global stage.

With one of the largest portfolios of completed green buildings in Canada and one of North America's leading sustainable practices, the Vancouver office is known for innovative sustainability integrated within a clean, modern vernacular. The office provides expertise spanning various market sectors including Civic + Cultural, Corporate + Commercial along with institutional experience in Higher Education, K-12 education and Healthcare. In addition, the majority of our ground transportation expertise resides in the Vancouver office. With a staff of more than 90 professionals, the office bases design solutions on functionality, durability and value with a view to the life of each building and the well-being of its occupants and users.

#### **Libraries:**

### **Orillia Library and Market Square, Orillia, ON – Canada 2011**

Square Footage: 42,000

**LEED Gold certification targeted**

The design for the new market square and library seeks to create a suite of urban public spaces that engage Orillia's 19th century opera house and support the city's vibrant farmer's market. The building takes the form of a 2-story, L-shape that creates coherence within the surrounding urban fabric while framing and setting off the monumental form of the opera house.

The 42,000 square foot structure combines two floors of collection and support space with community meeting rooms, an information outlet and a market hall that houses a smaller farmer's market in the winter months. (Perkins)

### **Stoney Creek Community Recreation and Library, London, ON – Canada 2010**

Square Footage: 74,500

**LEED Gold Targeted**

The Stoney Creek Community Recreation Centre and Library is the new civic and recreational hub for north London. The City of London and the YMCA of Western Ontario expressed the desire for this building to demonstrate leadership in sustainable design by directing the project team to aim for LEED Gold Certification.

The brown-field site for this project sits between a major urban thoroughfare and a protected woodlot. The design responds to its location between the urban and the natural and focuses on the ideas of an aesthetically pleasing front aspect and a visually stimulating prospect from the back of the building. The project is designed to be seen as landmark from the street, while the focus on the interior is a visual engagement with the meadow and woodlot to the north. In addition to this, the "Lantern", "Saw-tooth" and sloping green roof elements lend the layout a visual hierarchy to the civic face, while the use of natural materials throughout the building brings the elements of the outside to the experience inside.

The Stoney Creek Community Recreation Centre and Library includes a 12,000 sq. ft. fitness centre, a gymnasium, a six-lane pool along with a 1,300 sq. ft. teaching/leisure pool, multi-purpose program rooms, and a library.

### **Cornell Community Centre and Branch Library, Town of Markham, Cornell, ON – Canada 2010**

Square Footage: 125,000

Part of a groundbreaking master plan to create a community campus in partnership with the Markham-Stouffville Hospital, the integrated campus includes the hospital, community center and library, a future wellness center and public park elements on the grounds. The community center and library are intrinsically healthier in the way it allocates resources and provides essential services to create a stronger sense of community and a greater awareness of our environment.

The center will include a 25-meter, eight-lane competition pool, leisure and therapeutic pools, a fitness center with indoor track and a gymnasium.

There are also multi-purpose programming spaces for youth, adults and seniors, therapeutic resources and facilities for the hospital and the Cornell Branch Library with an integrated medical library. The campus strategy includes significant green. (Perkins)

### **Brooklin Library and Community Centre, Brooklin, ON – Canada 2008**

Square Footage: 13,000

A remnant forest in the historic village of Brooklin, Ontario provides the setting and inspiration for this district library and community centre. Each of the key program areas including the library, community centre and gymnasium are housed in one of three linked structures whose rooflines and simple forms recall the region's agrarian roots. A sophisticated approach to structural articulation, detailing and materiality transforms a regional inspiration into a sharply articulated response to the design issues of the 21st century. Porches, breezeways and glazed links provide the common space and allow the three shed volumes to frame courtyards and views into the surrounding hardwood forest. The preservation of specimen hardwoods was critical to the placement of the building footprint and the resulting micro climates, along with sophisticated glazing and energy management systems, are integral parts of the building's sustainable strategy.

The library component adds 13,000 square feet of new collections, lounge and study space to the growing community. A strong sense of community emerges out of the placement of diverse program elements under a single timber roof. The library is suffused with natural light tempered by the forest and the material qualities of wood and stone. (Perkins)

### **Clarence-Rockland Library, Clarence-Rockland, ON – Canada 2008**

Square Footage: 6,000

The Clarence Rockland Library replaces an outdated branch library and is a 6,000 square foot addition to an existing Catholic high school. Located in the heart of a rapidly growing community east of Ottawa, this new library is part of a larger community and cultural center initiated through a partnership between the City of Clarence Rockland, the Library Board and the local YMCA.

This facility greatly expands services and programs available to the high school, while serving the larger public. It includes generous study, reading spaces and stack areas as well as a large information playground for children. The design is based on a delivery model that de-emphasizes traditional desk-based systems allowing staff to 'roam' the floor space and offer greater point-of-use assistance. Provision for automated systems including self check-out units enhances this model. Extensive mobile and fixed-display units help actively market the various collections. At the heart of the space is a large double height reading room with a distinctive wood slat ceiling and limestone clad fireplace offering a warm and inviting environment for its users. The library's open concept enhances the interactive nature of its spaces, establishing a vibrant new focal point for the whole community to enjoy. (Perkins Will)

### **Hazel McCallion Academic Learning Centre, University of Toronto, Mississauga, ON – Canada 2007**

Square Footage: 98,000

LEED Silver certified

#### **Awards:**

Award of Excellence, 2007

Mississauga Urban Design Awards

This learning centre and library provides a vibrant focus for student activity on the University's north campus. It is sited and designed to reinforce the campus plan with indoor and outdoor spaces that animate the campus and link to existing pathways and green space.

The need for high density mobile compact shelving to house the library's permanent collection and the university's desire to create a structure that would adapt well to the demands of future digital content, led to a building design inspired by the metaphor of the Japanese puzzle box. An arrangement of interlocking pieces is organized around the building core becoming the "treasure" (library collection) within the box. This allows generous perimeter space for study and lounge areas in an open and flexible arrangement with views out to the surrounding campus and natural landscape.

The library provides a wide range of collaborative study and work environments that reflect evolving pedagogical and technological trends as well as student work habits. A series of interconnected 2-story spaces provide clear circulation and orientation within the building as well as space for social interaction and collaboration. An information commons, café, conference space, instructional lab and career counseling center are located along this linear "street".

The stepped atrium, 2-story cantilevered study wing on the building's west façade, study bays to the east and north, the south-facing roof garden and three sunken gardens all pull the outdoor environment into the building and push the building into the fabric of the campus. Exterior wood panels reflect the naturalized landscape and respond to the campus' ecological context. (Perkins)

### **Whitby Public Library and Civic Square, Whitby, ON – Canada 2005**

Square Footage: 56,000

The primary design objective for this 50,000 square foot central library is the creation of a dynamic relationship between a grand interior public space and an outdoor urban public space in the form of a new civic square. The design team has adopted a simple "L"-shaped configuration in order to maintain the existing library structure during construction and to create a strong spatial definition for the proposed urban plaza that faces onto a heavy traffic artery.

A three storey, north-facing Library hall opens directly on to the urban square. The new urban square is animated by the concentration of vertical circulation, information commons and displays, all visible through an uninterrupted expanse of glass at the edge of the square.

From the urban square, landscape elements including a green promenade and a linear reflecting pool penetrate the building bringing natural light and colour deep into the building mass. The lower east wing of the building brings the presence of municipal archives, meeting rooms and a café to the existing streetscape. While the building's south facade presents an abstract composition of masonry planes with a reduced scale to the existing residential neighborhood. (Perkins)

## **David Premi (dp.AI), Hamilton, ON – Canada**

founded 2005

<http://www.dpai.ca>

### **Libraries:**

**Hamilton Public Library Office Renovation, Hamilton, ON – Canada 2012**

\$ 600.000

Following the successful completion of the Main Floor renovations and additions, dp.AI were asked to assist with a phased program of upgrades and renovations to the 2nd, 3rd, and fourth floors of HPL Central.

The First phase involves the consolidation of multiple staff work areas into a single location on the 2nd floor. The suite contains work space, meeting rooms, admin offices, a kitchenette, and storage. The suite includes offices for for DISH (Disability Information Services Hotline) and LINC (Language Instruction for Newcomers to Canada) (Premi)

Hamilton Public Library & Farmers' Market Renovation and Addition

2009 Canadian Architect Awards of Excellence

Honorable Mention

Hamilton Farmers' Market and Public Library Renovation and Addition

The redevelopment of the Hamilton Public Library and Farmers Market is a pivotal project in Hamilton's overall urban renewal strategy. This \$14 million project involves the reorganization and rebranding of both the market and the library, two of Hamilton's most important civic destinations. The Hamilton Public Library is to be reborn as "Information Central: Your Marketplace of Ideas", featuring new public spaces, reorganized and enhanced collections, and increased computer and internet access through the introduction of a 50 workstation information commons. The renovation of the Farmers Market is focused on improvement of HVAC, lighting, and plumbing servicing. This project involved carefully planned facilitation of many diverse interest groups ranging from market staff, stallholders, library administrators and various departmental managers, City staff, city councilors, and the public. Transparency, integration of public art, and operable section of the façade are some of the design features supporting the new image, integral to the rebranding of both market and library. It is hoped that this project will act as a catalyst for further downtown renewal initiatives. This \$14 million project, being completed in partnership with RDH Architects, involves the reorganization and rebranding of both the market and the library, two of Hamilton's most important civic destinations. (Premi)

**Cookstown Public Library, Cookstown, ON – Canada 2007**

The Town of Innisfil has undertaken to create a multiuse facility on the historic site of the Cookstown Fairgrounds. This new facility would include an expanded Cookstown Branch of the Innisfil Public Library, a Community Facility and outdoor recreational facilities, all contained in one 9000 square foot building. A series of participatory programming and design workshops were held with the Cookstown Library and Community Facility Design Committee during June and July, 2007. The purpose of these sessions was to help the Committee members clarify and advance their understanding of their needs, and to translate them into a set of program requirements that would be handed to the Prime Consultant. (Premi)

**Academic Resource Centre, University of Toronto, ON – Canada 2006**

Project Architect: David Premi, Architect of Record: RDH Architects with McKay-Lyons Sweetapple

\$ 15,000,000

This prestigious project involves the creation of a new central library to serve the entirety of the Scarborough Campus together with a new 500-seat fully wired lecture theatre. The project included 18,000 square feet of renovated space and 80,000 square feet of new construction on two floors. Collaborative design sessions allowed us to facilitate a solution that met the needs of a diverse number of users groups and a complex program.

Security was a particularly challenging aspect of the design. The project was completed on time and significantly under budget. The building was the recipient of an OAA Award of Excellence in 2008 and a Lieutenant Governor's Awards for Architecture in 2004.

ARCHITECT Magazine. Cover Story - Hamilton Central Public Library and Farmers' Market. June, 2011.

RDH in association with David Premi Architects Inc. were retained by the city of Hamilton to design for the redevelopment of the Hamilton Public Library (HPL) and the Hamilton Farmer's Market (HFM). Both facilities are housed within a single building fronting onto York Boulevard in downtown Hamilton. The new addition is located on the northwest corner of the site and houses a new barrier free entry to the library, a large interactive information commons and a secondary entry into the market . The addition

is integrated into the overall building composition by way of a new double glazed envelope which wraps around the first storey of both the library and market facilities. (rdh)

#### **MPL1 : Lakeview Branch Library, Mississauga, ON – Canada 2011**

##### **Awards:**

2012 Governor General's Medal in Architecture

##### **Literature:**

2012 Canadian Architect magazine. Governor General's Medals - Feature project. May 2012 Edition.

RDH Architects are responsible for the major renovation of three branch libraries in Mississauga, Ontario, Canada. The design is based on an adaptive re-use strategy for renovations and additions to the Lakeview, Port Credit, and Lorne Park branch libraries, all dating from between 1956 and 1967. The three renovations have been structured as one project. This strategy was put forth by the client as a means to use public infrastructure money in an efficient manner. The original three libraries were designed as mid-century modern buildings, displaying similar physical and aesthetic characteristics. As such, the design for the projects is based on the development of a single vocabulary of consistent parts which can be applied to each of the three libraries in a varied manner. The solution offers a balance between an appropriate response to three very similar buildings and an efficient solution for a fast paced schedule. One part of this common vocabulary is the creation of a new steel frame canopy system for each building. The canopy system integrates the existing building volumes and transforms the exterior aesthetic of each library. Each system provides for solid canopies, solar shading, volumetric integration, led lighting and planting. Renovations also include new high-efficiency glazing and a complete gutting and redesign of all interior spaces. The Lakeview Library is the first of the three branch libraries which comprise the greater Mississauga Library project. This branch is located adjacent to a park, within a mid century suburban residential community. The canopy system collonade engages with the main access street to the north, parking to the west and a park setting to the south and east. Large fields of energy efficient, double glazed glass are used as virtual voids within the envelope. These voids help to exentuate an elevational rythm of vertical solids and voids within the original buidlign design. Structural glass partition walls and low shelving help to reinforce a material vocabulary of transparency throughout the facility. This transparency is complimented by Douglas Fir book stacks and vibrant accent walls of yellow and green. (rdh)

#### **MPL2: Port Credit Branch Library, Mississaug, ON – Canada 2011**

##### **Awards:**

2012 Governor General's Medal in Architecture.

##### **Literature:**

Canadian Architect magazine. Governor General's Medals - Feature project. May 2012 Edition.

The Port Credit Branch Library is located along Lakeshore Road, the main commerical street of the old town of Port Credit, now a part of the greater Mississauga area. The canopy system creates a collonade which engages the main street to the south, a park setting to the north and west and a parking area to the east. This project incorporates a small addition of new building area on the west side of the facility. This new area creates more space for a back of house staff work room. Further to this, the addition allows for a complete opening up of the existing collection area. A large reading atrium has been placed at the west end of this area. The west wall of this space has been demolished and replaced with floor to ceiling glass from which to view the park and the Credit River beyond. Once again, a material vocabulary of transparency is utilized for increased sight lines and views within the facility and to the surrounding area. These views are complimented by a neutral, white backdrop, interspersed by accents of vibrant reds and oranges. The use of an open plan, great abundance of natural light, vibrant colours and views inside and out help to re-invigorate a delapidated facility and inspire and encourage a new generation of library users. (rdh)

#### **MPL3: Lorne Park Branch Library, Mississauga, ON – Canada 2011**

##### **Awards:**

2012 Governor General's Medal in Architecture.

##### **Literature:**

2012 Canadian Architect magazine. Governor General's Medals - Feature project. May 2012 Edition.

The Lorne Park Branch Library is the third of the three facilities which comprise the greater Mississauga Library Project. This branch is located adjacent to a park and a high school within an established, densley planted, residential area. The canopy system collonade engages with the main access street to the east, a park setting to the north and west and a parking area to the south. The largest of the three branch libraries, the plan utilizes an "internal street" to help organize library program. This interior street draws users into the library by way of views. At first one might focus on the a view straight through the library to park space beyond. Once within the street, the public is able to clearly observe program areas to the right and left as well as browse the most current titles, displayed on retail style podia. Once again, a material vocabulary of transparency is utilized for increased sight lines and views within and to the surrounding park setting. Lorne Park utilizes a rich colour palette of dark walnut book stacks and dark grey corian service point counters, coupled with vibrant blue accent walls throughout. The designs for these three buildings apshire to revitalize and transform the existing, delapidated facilities by breaking down the dividing lines between indoor and outdoor environments; flooding interior reading areas with natural light; and in general, cultivating a new sense of the library as beautiful, sustainable and contemporary pieces of architecture. (rdh)

#### **The Bloor/Gladstone Branch Library Renovations and Addition, Toronto, ON – Canada 2009**

2011 Architectural Record - "Building Types Study", USA.

2011 Architektur Magazine - "Ziegelarchitektur versus Glaskubus",

RDH, in association with Shoalts & Zaback Architects and ERA Architects, were commissioned to renovate, restore and expand the existing Heritage Library, doubling its size to meet the current Toronto public Library Standards of a District Library. The new design retains the main public entrance at its existing location, but in order to meet current barrier-free standards the exterior and

interior stairs will be removed and the public will now enter at the lowest level, approximately 450mm below the elevation of the existing public sidewalk. The addition is designed as a complementary foil to the Heritage building, with large areas of glass facing Bloor Street, a main commercial street in downtown Toronto, expressing a more current idea of a library as an open and engaging community meeting place. Library program components include a children's section, teen area, computer access centre, open study carrels, quiet study areas, group study rooms, lounge areas with soft seating, large and small meeting rooms, and a significantly expanded book, magazine and media collection. (rdh)

### [University of Toronto at Scarborough, Academic Research Centre, Toronto, ON – Canada 2003](#)

see also : MacKay-Lyons Sweetapple <http://www.mlsarchitects.ca>

Rounthwaite, Dick & Hadley, in association with Brian MacKay Lyons Architect, was awarded the commission to design the new Academic Resource Centre at Scarborough in June 2001. This prestigious project involves the creation of a new central library to serve the entirety of the Scarborough Campus together with a new 500-seat fully wired lecture theatre. The project included 18,000 square feet of renovated space and 80,000 square feet of new construction on two floors. The program incorporates 17,000 square feet of stacks, study spaces for 665 including 90 networked study spaces, labs and workrooms for an 8,300 square foot Teaching and Learning Centre, extensive Collections Management and Circulation Areas, an Advising and Career Centre, and support offices. The Academic Resource Centre is a kinetic environment wherein academic and technical staff are empowered to roam among students and interface within a "virtual" space known as the Teaching and Learning Commons. The project was over \$1 Million under budget at the time of tender and opened to students and faculty in September 2003. (rdh)

### [UQAM'S Science Heart \(Library\) – Université du Québec à Montréal, QC – Canada 2005](#)

\$ 22,800,000

#### **Awards :**

**2006 Hue Award**

The library re-occupies a historic building formerly used as a studio by the technical university that occupied the western section of the campus. Its transformation involved paring back the structure to its 1911 bones, and the addition of a glass extension containing the entrance and a lofty, light-filled reading room above. A red carpet painted on the floor guides users through the principle circulation route, leading up to the reading room on the second floor, and down to the expansive underground space dedicated to the book storage located beneath Kimberley the street and lit from skylights above. (Saia)

### [President Kennedy Building, Université du Québec, Montréal, QC – Canada 1997](#)

Client: Université du Québec, \$ 42,000,000

#### **Awards:**

**2001 Prix d'excellence de l'IRAC (Institut Royal d'Architecture du Canada) / RAIC (Royal Architectural Institute of Canada) Award of excellence**

**2001 ASHRAE Technology Award**

As the principal element and flagship of the new UQÀM Science Campus, the streamlined 10-storey President Kennedy Building houses both teaching and research activities as well as associated private corporations including the departments of mathematics, computer science, physics, earth sciences, and electronics. It also contains the Environmental Science Institute and the micro-computing laboratory for the Faculty of Science, the 3,500 square meters Science Library, a food service facility, and is linked directly into Place des Arts metro station.

A state-of-the-art facility, many of the building's major components are made from recyclable materials. In the wall insulation, for instance, no foamed plastic was used anywhere in the building. The thermal resistance of the elements of the building envelope exceeds those required by the laws regarding energy conservation. Particular care was taken in the choice of glass which ultimately resulted in a reduction of the mechanical system capacities and thus in energy savings. The integration of mechanical and architectural concerns together with innovative mechanical design garnered this project a first prize in the institutional category of the prestigious ASHRAE Technical Awards. The innovation and execution of this project has also received distinction by the Royal Architectural Institute of Canada (2001 Award of Excellence for construction drawings). (Saia)

### [Calgary Campus Digital Library, Calgary, AB – Canada on design](#)

University of Calgary President Dr. Harvey Weingarten recently announced that the university will break ground on the construction of the \$113-million Campus Calgary Digital Library on April 1, 2006, the date of the U of C's 40th anniversary. The groundbreaking will mark the first stage of a \$710-million five-year capital growth strategy that would allow the university to enrol 7,000 more students by 2010. The announcement also marks one of a series of events and celebrations being planned by the U of C to celebrate its 40th anniversary. When opened in 2008, the Digital Library will be dedicated to Calgary. "April 1, 2006 is the 40th birthday of our university. Our university was created, and has grown remarkably quickly, because of the incredible support we have received from the Calgary community," said Weingarten at his annual Report to the Community on October 6. "This is the university's gift to the city of Calgary. It is acknowledgement and thanks to Calgarians for the incredible support and encouragement they have given us throughout the years." The Campus Calgary Digital Library (CCDL) is a partnership with all the public post-secondary institutions in Calgary—Bow Valley College, Mount Royal College, ACAD, and SAIT Polytechnic—as well as those in neighbouring regions, such as Red Crow College on the Blood Reserve. The partnership is a first in Canada and will create an information network that will see the university's vast electronic library holdings made available to the public electronically for use in business, education and non-profit applications. It will make it possible to create a single library card for all post-secondary students to gain access to the university's digital holdings. CCDL is also the cornerstone of the [Lois Hole Digital Library](#). In the Throne Speech last March the Province announced the Access to the Future Fund to support innovation and excellence in post-secondary education. It was announced in the speech that "The new fund will also support the development of an Alberta-wide digital library that will allow all students and faculty, wherever they are located in the province, to access the resources and knowledge currently held in the individual libraries of our post-secondary institutions. To be named the Lois Hole Digital Library,

this leading edge initiative is centred on the work already underway at the University of Calgary.” The Digital Library will be built next to the existing [MacKimmie Library complex](#). It will include space for the public to use the Digital Library and 500 new computer stations. An extension of the Digital Library will be built on the U of C’s Urban Campus in downtown Calgary to serve students and the downtown community. Satellite access points will be located at all partner institutions. The Calgary Campus Digital Library and Experiential Learning Centre will result in 3,500 more student spaces; the Institute for Sustainable Energy, Environment and Economy will add 1,000 more spaces; the Urban Campus initiative will add 2,500 spaces downtown. Work on the Experiential Learning Centre—particularly upgrading existing lab space on campus—will begin in tandem with the CCDL. At a meeting on October 14 the university’s Board of Governors will consider a recommendation from the university’s Planning and Finance Committee to borrow the necessary funding. “It is important for our students—and for our community—to increase the university’s capacity. We are growing at a tremendous rate in order to keep up with Calgary’s economic and population growth,” said Weingarten. “These projects not only give us the space we need for these students, as well as the faculty and staff who will teach them, but they also provide the facilities we need to provide a progressive and contemporary education for our students and to continue the growth of our research and scholarly programs.” Campus Calgary Digital library offers public access to vast collection

The Campus Calgary Digital Library is the University of Calgary’s top-priority capital infrastructure project. The Campus Calgary Digital Library is one of four major infrastructure projects that make up the university’s \$710-million capital plan. The projects – the Experiential Learning Centre, the Urban Campus, the Digital Library and the Institute for Sustainable Energy, Environment and Economy – are the cornerstones of the university’s goal to enrol 7,000 additional students by 2010. The Calgary Campus Digital Library and Experiential Learning Centre will result in 3,500 more student spaces; the Institute for Sustainable Energy, Environment and Economy will add 1,000 more spaces; the Urban Campus initiative will add 2,500 spaces downtown. The Campus Calgary Digital Library (CCDL) is a partnership with all the public post-secondary institutions in Calgary – Bow Valley College, Mount Royal College, ACAD, and SAIT Polytechnic – as well as those in neighbouring regions, such as Red Crow College on the Blood Reserve. In addition, the Digital Library will build on the U of C’s relationship with the Calgary Health Region and ensure access to more, and the most current, information for health care providers. The partnership is a first in Canada and will create an information network that will see the university’s vast electronic library holdings made available to the public electronically for use in business, education and non-profit applications. It will make it possible to create a single library card for all post-secondary students to gain access to the University’s digital holdings. The Digital Library will provide students, faculty and the public with information, expert help and facilities that support the quest for knowledge, understanding, creativity and innovation. The Digital Library will be built next to the existing MacKimmie Library complex. It will include space for the public to use the Digital Library and 500 new computer stations. An extension of the Digital Library will be built on the U of C’s Urban Campus in downtown Calgary to serve students and the downtown community. Satellite access points will be located at all partner institutions. The project also frees space in existing academic buildings on the U of C campus through the relocation of some existing services, and this will create areas for new classrooms, laboratories and learning space. In addition to U of C students and faculty, all post-secondary students, researchers and faculty in the Calgary region will have the same access to print, archival and museum collections. The Calgary Campus Digital Library will also provide the foundation for the province-wide Lois Hole Digital Library. Combined, the projects will make Alberta one of the most information-rich jurisdictions in North America. When opened, the Digital Library will be dedicated to Calgary as a gift to recognize the community’s support of the university in its 40-year history. Total cost of the project is an estimated \$113 million. The Digital Library is expected to open to the public in the fall of 2008. (University of Calgary)

#### [Perimeter Institute, Library, Waterloo, ON – Canada 2006](#)

Client: Perimeter Institute, Space: 6,000 m<sup>2</sup>

The Perimeter Institute, an international center for basic research in foundational issues of theoretical physics, is located on the shore of Silver Lake in Waterloo Park.

The building defines the secure zones of the institute’s facilities within a series of parallel walls, embedded in an erupting ground plane that reveals a large reflecting pool.

The design is inspired by the nebulous spaces occupied by the subjects of theoretical physics, at once micro- and macro-cosmic, rich in information and of indeterminate form and substance. The facade design, with its geometrically patterned panels, is meant to underline the nature of its occupants’ investigations of mysterious natural forces. The design achieved everything in the program within a context of stunning beauty and daring innovation. Two wings of offices are separated by a glass-roofed atrium and an exterior courtyard. Three bridges span the exterior courtyard, to encourage easy continuance of scientific discussion for researchers, connecting the building on the second and third levels. Each bridge culminates in an informal meeting area, overlooking either the exterior garden or the atrium, that are visually accessible from alternate floors, enabling resident researchers to quickly assess who is in the building throughout the day or night. There are 44 single research offices, together with larger shared offices, to accommodate additional researchers, and 15 administrative offices. The building is flooded with natural light from the generous amount of glass throughout the building and from the central atrium. The facility also contains a [two-story library](#), two seminar rooms, a large lecture theater, seating 210, and a bistro with a rooftop deck, located above the lecture theater at the eastern edge of the building. To ensure a warm and personal atmosphere throughout, six wood-burning fireplaces are placed in lounges, informal meeting areas and the bistro. (<http://www.arcspace.com>)

#### [New Pavilion for the McGill University Schulich School of Music, Library, Montréal, QC – Canada 2005](#)

Executive Architect: Menkès Shooner Dagenais

Constructed Area: 11,775 sqm

The design for the new Faculty of Music Building gives prominence to the southeast corner of the McGill University campus at Sherbrooke and Aylmer Streets in downtown Montreal. The new building is adjacent to the historic Strathcona Building, the existing home of the Faculty of Music, which houses one of the university’s main concert facilities. The new program adds to the faculty space, and includes a library, recital hall, state-of-the-art multimedia and practice studios, and faculty offices.

The site is a narrow strip of land between Aylmer Street and the east wing of the existing faculty building. The multimedia studio anchors the design. It is a polished limestone volume almost five stories high that is “embedded” three stories into the ground at the north end of the lot. Practice rooms and technical studios also inhabit the underground realm south of the multimedia studio. Above these submerged spaces, at street level, are located the recital hall and main entrance. A folded concrete plane defines these spaces and appears to support the main body of the building above. This plane evokes an eroded ground plane leading to Montreal’s prominent Mount Royal beyond. A three-storey high library sits immediately above the recital hall, over which are three additional storeys of office and practice space.

The new building is linked to the older faculty buildings by a glazed bridge that runs through the main entrance hall.

The building’s east and west façades are discrete planes that frame the views of the city along Aylmer Street and toward the mountain. The east façade is clad in black and gray zinc, with long strip windows that illuminate the office corridors, and a large glazed opening into the library entry space. The west façade is designed to evoke musical figures—the surface pattern of matt and

polished aluminum reflects the Strathcona Building while a series of punched windows, evoking the music rolls of antique mechanical pianos, bring light into the smaller spaces inside. The glazed front façade, facing Sherbrooke Street, allows exquisite daylight to permeate the library and conference spaces, creating interior environments conducive to learning and research for the visitors and occupants of the Faculty of Music. (Saucier)

## **Shore Tilbe Irwin & Partners, Toronto, ON – Canada**

Now: In January 2010, Shore Tilbe Irwin merged with the renowned architectural practice Perkins+Will

## **Shore Tilbe Perkins Perkins+Will has announced a merger with Toronto-based Shore**

**Tilbe Irwin & Partners.** Established in 1945, the 80-person Canadian firm works across many sectors where Perkins+Will already has a strong presence—including healthcare, education, and institutional—and also has a strong presence in sports and recreation facilities, an area into which Perkins+Will has shown interest in expanding. Shore Tilbe Irwin & Partners has completed a number of YMCA buildings and community recreation centers across Canada. In a press release on the acquisition, Perkins+Will CEO Phil Harrison said, “the Shore Tilbe Irwin merger supports our strategy to grow by targeted acquisition, as it represents a pooling of expertise that will bring significant benefits to our business.” The corporate takeover will bring Perkins+Will’s North American office count to 19, and it will be the U.S.-based megafirm’s second office in Canada. – Canada. Architect 13.01.10 (<http://www.architectmazine.com>)

### **Libraries:**

## **Edmonton Public Libraries, Meadows Community Recreation Centre and Library, Edmonton, AB – Canada 2014**

joint venture with Group2 Architecture, Edmonton, AB (<http://www.group2.ca>)

The Meadows Community Recreation Centre and Edmonton Public Library will provide year-round recreational and cultural community opportunities for the surrounding local and regional neighborhoods. With a focus on creating relationships between indoor and outdoor programs, the facility emphasizes transparency to create an active space that is open and welcoming during every season of the year. Indoor amenities include a twin-pad ice arena, an aquatic complex that includes a recreation pool and slide as well as a competition and therapy pool, two-level fitness area with an indoor track, multi-purpose gymnasium, community multi-purpose rooms and a 15,000 square foot branch library for the Edmonton Public Library. Complementary outdoor amenities include a leisure skate area, multi-use courts, an exterior library reading garden and amphitheatre, spraypark, and beach volleyball courts.

Inspiration for the project was taken from the Alberta landscape with the concept of the Dominion Grid as a theme for organizing and ordering the site and its components. Architectural ideas explore the building as topography, reflecting the Alberta landscape through an undulating roofscape whose diverging slopes present opportunities for clerestory glazing and the provision of natural light to the interior. Natural materials are emphasized, creating an environment that is visually appealing and also healthy for building occupants. This project is targeting LEED Silver certification as mandated by the City of Edmonton and includes sustainable features such as a vegetated roof, efficient mechanical systems, re-use of waste heat for the arena spectator seating area, efficient pool filtration systems and reduced water consumption. (Teepie)

## **Brooklin Library and Community Centre, Whitby, ON – Canada 2010**

Project Size: 43,000 sq. ft., Project Value: \$12.4 million, Completion Date: 2010, Client: The Town of Whitby/Whitby Library  
A remnant forest in the historic village of Brooklin, Ontario provides the setting and inspiration for this district Library and Community Centre. A series of low-slung shed roofs hover over the forest floor, framing courtyard spaces and views into a dense forest of century maples, oaks and ash trees. The Library and post office frame an entry court that accommodates towering sugar maples and which looks back to the village's main street. The "forest hall", a long heavy timber structure which encloses the gymnasium and the entry lobby, reaches back into the wooded site offering views and a cool dappled light. A senior's centre and youth program rooms look onto a west facing timber porch and a landscaped side yard. Throughout, heavy timber structures, roughfaced limestone and brick recall the village's early agrarian and industrial architecture. (Shore)

## **Clarence-Rockland Library, Clarence-Rockland, Ontario – Canada 2008**

Square Footage: 6,000

The Clarence Rockland Library replaces an outdated branch library and is a 6,000 square foot addition to an existing Catholic high school. Located in the heart of a rapidly growing community east of Ottawa, this new library is part of a larger community and cultural center initiated through a partnership between the City of Clarence Rockland, the Library Board and the local YMCA.

This facility greatly expands services and programs available to the high school, while serving the larger public. It includes generous study, reading spaces and stack areas as well as a large information playground for children. The design is based on a delivery model that de-emphasizes traditional desk-based systems allowing staff to ‘roam’ the floor space and offer greater point-of-use assistance. Provision for automated systems including self check-out units enhances this model. Extensive mobile and fixed-display units help actively market the various collections. At the heart of the space is a large double height reading room with a distinctive wood slat ceiling and limestone clad fireplace offering a warm and inviting environment for its users. The library’s open concept enhances the interactive nature of its spaces, establishing a vibrant new focal point for the whole community to enjoy. (Perkins Will)

## **Hazel Mc Callion Academic Learning Centre and Library, University of Toronto, Mississauga Campus, Toronto, ON – Canada 2007**

Client: University of Toronto at Mississauga, Area: 100,000 sqf., Budget \$ 22,000,000

The Academic Learning Centre and Library is a 98,000 sq. ft. facility on four floors at the north end of the UTM campus. The building is a state-of-the-art facility that contains UTM’s permanent collection of bound volumes, serials, maps and archival material as well as an extensive digital information retrieval commons. The building also offers over 22,000 sq. ft. of safe, inviting study space nearly half of which on the first and second levels. The organization of the permanent collection into compact storage shelving in the heart of the building allows for generous perimeter spaces to be given for study and work. The main vertical and horizontal

circulation routes are organized into two routes, one north-south and one east-west. The north-south route is the primary orientation space in the building and is comprised of a series of interconnected two-storey spaces. The Library's main entrance, stair, elevators and café are all located within this linear 'slot' which serves as a concentration of the buildings most active spaces, isolating noise and commotion from the quiet study spaces located on the far side of the compact storage range. The east-west circulation route is expressed on every floor and divides the plan into service spaces. (Shore)

Building a new library for the evolving University of Toronto at Mississauga (UTM) campus presented significant challenges for Shore Tilbe Irwin & Partners (STI): it was critical to balance architectural innovation with some degree of restraint in order to complement its award-winning neighbours--Saucier + Perrotte Architectes' (S+P) Centre for Information Technology (CIT) and Baird Sampson Neuert Architects' student residence, all of which grace this very walkable, yet highly suburban university campus. Having recently strengthened the south end of the site with their design for the Wellness Centre in 2006, STI have created yet another gateway building. This time, located at the northern entrance into the university, the recently completed and popular Hazel McCallion Academic Learning Centre marks the latest in a series of new buildings linked together through a network of paths and courtyards. The requirement that the new library hold almost its entire collection of books in high-density mobile compact shelving allowed STI's design lead Andrew Frontini to create more flexible and adaptable study spaces, with openness and security achieved through clear sightlines. The evolution of the contemporary university library is increasingly based on spatial conventions where students access and retrieve information digitally. Who needs to sequester themselves in a quiet corner with a book, when research material is increasingly available online? Other programmatic requirements for the facility include digital data retrieval areas, special meeting rooms, a centre for adaptive technology designed to assist students with various forms of learning disabilities, a career counselling centre, and increased office space for the library staff. Even the indefatigable octogenarian Mayor of Mississauga, Hazel McCallion, for whom the building is named, has a corner office here. Rising to the challenge of designing compact shelving as a progenitor for the parti, Frontini and his team took inspiration from three-dimensional Japanese puzzle boxes that open and close in various configurations. Through the use of wooden models comprising various moving parts, their architectural explorations of shifting volumes led them to a strategy of "kinetic elements" that was able to define clear access points into the building, while expressing the book stacks and study areas without compromising the puzzle box metaphor. Frontini was very clear about avoiding a building that yielded a normative expression of spandrel panels and punched windows. Beginning with the inner and outer "cabinets" of the compact storage spaces for the books, the building layers itself outwardly and is accentuated with a variety of basic interior surface treatments for the walls and ceiling, such as wooden panels and inlaid ceiling tiles. The design and spacing of the interior columns varies throughout the building, establishing a structural hierarchy and clear logic to the program. Stacked shelving constitutes a heavy load requirement, demanding more robust concrete columns. However, lower load requirements along the perimeter enabled a lighter architectural expression for the staff, study and lounge areas. The landscape for the project was designed by the MBTW Group and further enhanced the manipulation of the various volumes expressed throughout the building. The sunken garden along the south façade, for example, serves as an extension to the adjacent green roof of the CIT parking garage while creating a microclimate extending the seasonal use of the campus's outdoor space system. Resulting from a reduction in some of the building's programmatic footprint, a south-facing rooftop garden tucked away behind crenellations on the fourth floor offers a delightfully surprising element for the students, although it remains largely inaccessible due to safety and maintenance concerns. One defining feature of the library is the successful two-storey cantilevered study wing hanging off the building and comprising the west façade. With its unique pattern of dots applied to the inside surface of the glazing--providing some protection from the afternoon sun (heat gain is reduced by 60 percent through this application), students are able to sit on stools along the façade and work away on their laptops, or engage in quiet conversation as they gaze out into the adjacent forest. Intended as another dynamic element to the building, the steel hangers supporting the cantilever successfully express the strength and innovation of the structure, while descending into custom-designed cherrywood study tables. The structure's hangers are attractively engineered, but the unsightly consequence of the required spray-on fireproofing where the hangers connect to the columns warrants some design refinement. Fortunately, part of the post-occupancy acoustic retrofits to the building will allow the architects to address this and a few other unresolved design issues such as visible sprinkler lines and wall and ceiling detailing. Another notable feature of the project is the glazed link connecting the new library to S+P's CIT building. The process of joining the two buildings was not without its challenges, but the issues of deficiencies will eventually be fine-tuned. Although technically considered a "public corridor" for code considerations, the link between the two buildings--intended as an "interior street"--is used much more intensively than initially anticipated. Because of this, as well as ensuring a degree of design continuity, various issues had to be resolved so that fire separations, mechanical conditions relating to heat and air handling, and the selection of windows and hardware could be determined through the combined efforts of STI, S+P and the mechanical engineers. What makes this building particularly handsome is its delightful use of a Spanish panellized cladding system known as Prodema. It is the first time that such a cladding system has been used for a large assembly building in Ontario. Each panel is comprised of a resin-impregnated wood veneer laminated over a high-density phenolic core. Because this product is relatively new to the Canadian market, it had to undergo ULC tests for fire and weather ratings before being applied. Due to the project's scheduling, if the ULC rating hadn't been confirmed for another two weeks, an alternative cladding system would necessarily have been selected. With features that include sensors and programmed dimmers to control the lights, a heating and cooling system powered by the campus's co-generation system, various shading and overhang design elements, and the use of recycled materials comprising much of the interior finishes such as the carpet, ceilings and millwork, the library has achieved the distinction of being the campus's first LEED Silver-rated building. As for the building's success, the proof is in the programming. When the library initially opened, it quickly grew popular with the student body and is well used. But the campus--often referred to as "Erindale High"--is characterized by a very young student body often lacking in awareness or respect for its own built environment. Cigarette butts, chewing gum, noisy cell phones and petty vandalism do not mix well with an elegant architecture that consciously avoids the palette of materials usually found in 1970s institutional buildings--painted cinder blocks, epoxy floors, brutal concrete, fixed plastic seating and few windows. It is hoped that with the new Hazel McCallion Library, students will learn to appreciate this architecture as part of their new university experience, differentiating it from the durable and nearly bulletproof Brutalist architecture forming the architectural foundations of most universities in Canada.

#### **Whitby Library and Civic Square, Whitby, ON – Canada 2005**

Project Size: 50,000 sq. ft., Project Value: \$20 million, Completion Date: 2005, Client: Town of Whitby

The primary design objective for this 56,000 sq. ft. central library is the creation of a dynamic relationship between a grand interior public space and an outdoor urban public space in the form of a new civic square. The design team adopted a simple 'L-shaped' configuration in order to maintain the existing library structure during construction and to create a strong spatial definition for the proposed urban plaza that faces onto a heavy traffic artery. A three-storey, north-facing library hall opens directly on to the urban square which is animated by the concentration of vertical circulation, information commons and displays, all visible through an uninterrupted expanse of glass at the edge of the square. (Shore)

Whitby (pop. 115,000) is a bedroom community located about 45 minutes east of Toronto along the Trans-Canada Highway. As the needs of the town grew, the original 16,000-square-foot library built in the early '60s by Moriyama and Teshima needed

replacement.

Located on top of a hill, overlooking drive-through banks and fast food restaurants, the completely new 50,000-square-foot facility and civic plaza is just down the road from Whitby's original Main Street, a respectable and active 19th-century streetscape. The effective siting of the library is what contributes to its overall success. The site is bounded by Dundas Street, a busy four-lane arterial to the north, with Henry Street, another busy arterial to its west. To allow for a sufficiently scaled public plaza, Frontini "dragged the program" back to the south end of the site along Colborne Street, an inconsistently scaled residential condition with heritage Victorian homes adjacent to an unfortunate '70s precast concrete apartment building. The eastern edge along King Street is anchored by two recently restored City-owned heritage properties. By closing off King Street from Colborne Street, Frontini allowed a quiet south-facing landscape to be designed by the MBTW Group. This forecourt serves as a quiet counterpart to the civic plaza while giving something back to the neighbours who were concerned that the new library would be overbearing. In a car-oriented community like Whitby, vehicular access is essential, but the landscaped forecourt that greets staff and visitors as they enter the building from the 18-stall parking lot is a well-tempered feature to the project. The framing of the north-facing civic plaza is particularly effective. A narrow L-shaped two-storey building along the eastern boundary intersecting with a deeper volume stretching across the southern portion of the site provides a convincing backdrop for a generously scaled plaza. The transparency of the library's expansive north façade allows for an animated expression while engaging in a dialogue between interior and exterior spaces. The eastern edge of the plaza is anchored by a variety of busy activities: community meeting rooms, offices and a café. Along the western edge of the plaza, a one-metre drop in elevation was used as a design opportunity to create a water fountain and reflecting pool extending back into a notch in the library. And finally, with a long thin canopy, Frontini defined the edge of the Dundas Street site with a gateway meant to be inhabited by market stalls or a range of civic activities. The canopy roof is clad in copper and the illuminated structural piers are clad in limestone. Although the plaza's opportunities for a civic gathering place are only beginning to be understood by the town, it is hoped that the farmers' market, outdoor celebrations and other activities will migrate to this civic square for a range of year-round activities. Inside the library, Frontini has created a multi-layered space. The main entrance, an intimately scaled central lobby, is located at the intersection of the building's three main functions: library, meeting rooms and archives. The central spine, or North Atrium, looks out toward the plaza. This is the area of the library containing "spinners," densely stocked display racks of pulp fiction and popular reading material. Long, slender light fixtures suspended from the ceiling illuminate both the North and Central Atria. Made of translucent plastic with fluorescent lighting inside the tube, the fixtures include uplighting and downlighting elements and accentuate the double-height spaces in the library, serving as beacons to those approaching or driving by the building. Minimally obstructing the view out toward the plaza, the façade is braced by a steel frame comprised of an unusually dimensioned narrow HSS profile imported from the US. Paying roughly a 20 percent premium, Phillip Meades assisted Frontini in specifying a steel section that is much more narrow than wide. Also situated along the North Atrium spine is a computer lab, kiosks with internet connections, and automated check-out stations. Migrating south through the building are study rooms, quiet chairs and places where various reading and research facilities are located. Towards the back of the library, north-facing clerestories, light wells and indentations into the south elevation provide ample and diffuse natural daylight. Also along the south elevation, one discovers a deep copper-clad bay window with large leather cushions for introspection and reading. Throughout the building, there are various notches cut into the perimeter that attempt to engage a dialogue between the landscape and interior spaces. For the most part, these are largely gestures, but the reflecting pond that continues into a notched recess at the juncture of the children's reading lounge along the main east-west axis is particularly successful. And while the heavily articulated angled fins along the western façade relate the building to the mature row of trees lining the edge of the site, this design feature seems largely disconnected from the overall architectural expression of the building. Under the direction of Frontini, Whitby's new library and civic plaza marks a new era of intelligently designed projects to emerge from Shore Tilbe Irwin and Partners. The project is also representative of a new generation of work resulting from the regeneration of one of Canada's oldest firms. Indeed, the library's success can be measured by the number of visitors using the building--an increase from 18,000 to nearly 50,000 users per month. Just as the library was completed, Frontini was awarded a second project for the Town of Whitby: the Brooklin Library and Community Centre. And with that project and with many other ongoing projects from STI, we await the results of the firm's ongoing efforts to reposition itself on the architectural map. (<http://urbantoronto.ca>)

#### **Angus Glen Community Centre and Library, Markham, ON – Canada 2004**

Project Size: 175,000 sq. ft. (Library: 30,000 sq. ft.), Project Value: \$32 million, Completion Date: December 2004, Client: Town of Markham.

The major elements of the program include a twin-pad arena component, gymnasium, pool, related change rooms and service spaces, multi-purpose rooms, senior and youth areas, a district library, as well as ancillary retail, food and beverage outlets. The building layout connects at several locations on three levels to outdoor passive and competitive activities. The building is designed to harmonize with the strong natural landscape incorporating natural materials such as zinc cladding, Warton limestone, clay brick and a Douglas Fir heavy timber and glulam structure. The massing of the Centre similarly utilizes the topography of the site to partially bury the large bulky volumes of the arena, while showcasing the more animated volumes such as the pool and library. Large sweeping roofs above the pool and arena create a strong design theme, replicating the undulations of the site. In association with Stafford Haensli Architects. (Shore)

#### **Barrie Public Library, Barrie, ON – Canada 1996**

Designed by the Toronto firm of Shore Tilbe Irwin & Partners in association with Ted Handy and Associates, the new \$7.5 million Barrie Public Library was built with funds made available by the Canada Infrastructure Programme. Federal, provincial, and municipal governments made matching grants. As well, the Library Board was required to raise \$1 million from the community. Thanks to tremendous community support, the fundraising target was met within one year. Opened in December 1996, the new Barrie Public Library features a two storey building housing both adult and children's services with the capacity for increased use of technology including Internet service and an expanding CD-ROM collection. The new library provides additional study space for groups and individuals as well as meeting room space for the community. A unique feature of the new library is its accessible outdoor reading garden. (<http://www.library.barrie.on.ca/about/history.htm>)

#### **Mississauga Central Library, Mississauga, ON – Canada 1990**

Project Size: 152,000 sq. ft., Project Value: \$35 million, Completion Date: 1990, Client: City of Mississauga

#### **Award:**

**Mississauga Millennium Design Icon Award 2000**

Completed in 1991, the Mississauga Central Library occupies a prominent site adjacent to the Mississauga City Hall. While the library is strongly related to the City Hall, in both its use of materials and scale, it still manages to establish its own unique identity. On the east and west, major entrances are strongly defined by pavilions adjoining an octagonal, sky-lit public rotunda. From this orientation space, the public can either enter the library or the various public spaces such as the Café Gallery and meeting rooms. A central courtyard with glass elevators and a large open staircase links the various departments. (Shore)

## **G. Bruce Stratton Architects, Toronto, ON – Canada**

<http://www.strattonarchitects.com>

### **Libraries:**

#### **Woodside Square Library, Toronto Public Library System, Toronto, ON – Canada 2007**

\$ 900,000

Woodside Square Library is located in a suburban shopping mall in Scarborough. Immediate mall neighbours include Shopper's Drug Mart, LCBO and the Royal Bank. The inclusion of public spaces such as libraries into the private realm is not a new concept but it remains somewhat of an enigma given that public institutions such as libraries do not often share premises with private retail interests. We would argue that Woodside Square Library has made a noticeable, positive impact on the 'streetscape' of the shopping mall. Interior architecture is always about material selection and the marriage of the materials as well as the composition, texture, colours and lighting both natural and artificial. Maple veneers, stainless steel, coloured glass, recycled carpet tile and porcelain tiles are the materials which have been selected for the library. Energy efficient T5 suspended light fixtures have been utilized for the study areas. Public libraries within Toronto are cornerstones of communities and focal points even if they are located in mid-sized suburban shopping malls. (Stratton)

#### **Runnymede Library, Toronto Public Library System, Toronto, ON – Canada 2005**

\$ 3,300,000

### **Awards:**

**Design Excellence 2007 Toronto Association of Architects**

Runnymede Branch Library created a sensation when it opened its doors in 1929. Designed by Canadian architect John Lyle (1872 – 1945, Runnymede Library 1930. A branch of the Toronto Public Library. Incorporates elements of English and French colonial architecture in Canada and uses Canadian imagery for ornamentation), the library was marked by a clear division of spaces and a residential character that allows it to immerse itself in its Bloor Street West neighbourhood. Notoriously, an avant-garde edge surfaced in the bas-relief details: they were predominantly of Canadian flora, fauna, and North American Native motifs--a radical departure from the Elizabethan or Jacobean style typical for this kind of public building. The challenge in renovating this building and designing an addition to it was to maintain the integrity of the original without trying to imitate it, such that the addition develops as a unique character that strengthens and enhances without overwhelming. Views from the street played an important role in the design process, as did views from the library into the adjacent park. (Stratton)

#### **Long Branch Library, Toronto Public Library System, Toronto, ON – Canada 2005**

\$ 950,000

Long Branch Library originally opened in 1955, a modernist building designed by Toronto architects Murray, Brown, and Elton. After 50 years of successful operation with an ever-increasing client load, the interior was in a desperate state of repair, requiring a rethinking and a reorganization of all the interior spaces. The newly renovated space takes cues from exterior Art-Deco elements and establishes them in the library's interior. Featuring a combination of rectilinear and curvilinear geometries, stainless steel decorative features, bird's eye maple and sapele millwork, and intricate porcelain tile inlay, the new layout revolves around a centralized circulation desk which provides staff with good sight-lines to all key parts of the library. Finishes have been selected to withstand a high degree of abuse, and lighting has been carefully gauged to provide comfortable light levels for reading and studying. The new program includes distinct children's and teens' areas, a multi-purpose space, and new computers with internet access. The library houses some 35,000 books, magazines, and CD/DVDs. (Stratton)

#### **Black Greek Library, Toronto Public Library System, Toronto, ON – Canada 2003**

\$ 550,000

Located in the lower level of Sheridan Mall in North York. The concept was to provide a space which was bright and warm with flowing lines in the design to encourage sliding perspectives. The lounge at the front of the library takes advantage of the mall traffic and allows light to the rear of the space. Finishes include birch veneers, solid acrylic surfaces, onyx, slate, and glass tile. (Stratton)

#### **Bayview Library, Toronto Public Library System, Toronto, ON – Canada 2002**

\$ 750,000

Public libraries in urban settings can find themselves in a variety of locations and building types ranging from standalone facilities to part of multi-use complexes. Bayview Branch Library is an example of yet another genre - the shopping mall tenancy. This branch occupies a space on the south side of an upscale mall, where store front picture windows provide an abundance of natural light into the lounge/reading area. Coloured glass strips in these windows both advertise the entrance to the library from the street, and cut down on glare in the reading areas.

The library occupies a split-level floor plate, emphasized by a colourful children's folly straddling the space between stairs and ramp. Finishes are rich and distinctive, featuring zebra wood veneers, slate floors, glass tile accents, a travertine circulation desk, and strong highlight colours. (Stratton)

## **SZA Shoalts and Zaback Architects, Ltd., Kingston, ON – Canada**

<http://szarch.com>

### **Libraries:**

#### **Scugog Memorial Public Library, Port Perry, ON – Canada 2011**

Client: Township of Scugog, Size: 1,513 sq meters

### **Awards:**

**2012 Ontario Library Association Library Architectural and Design Transformation Award**

The circa 1980 Scugog Memorial Community Centre and Library has been expanded and revitalized by this project. The existing building was wrapped in a series of additions to completely transform its character, to move the main entrance to the street facade, and to take advantage of its setting in the waterfront park. The library remained open throughout construction.

The Library contains dedicated Teen and Children's areas, a series of quiet Study Rooms, a Fireplace Lounge, and a Computer Training Centre. Seating, Lounge Spaces, and Outdoor Reading Terraces are located in an addition to the east to take advantage of views to Lake Scugog.

The Centre includes the Kent Farndale Art Gallery and a new large community room complete with outdoor terrace.

The project is designed to LEED Silver, certification is in process. The project incorporates high efficiency HVAC with heat recovery, a photo voltaic system, and cistern for rainwater collection. (SZA)

#### **Sydenham Public Library, Sydenham, ON – Canada 2011**

Client: Kingston Frontenac Public Library, Size: 6,000 sq ft

One storey branch library located in a waterfront park in the centre of the Village of Sydenham.

The library includes a dedicated Children's and Teen's Areas, a Community Meeting Room, and a Reading Porch facing the water. The interior is focused on a Fireplace Lounge.

Designed to LEED Silver standard with radiant heat and high efficiency HVAC with heat recovery. (SZA)

#### **Ottawa Library Tech. Services + Material Handling Centre, Ottawa, ON – Canada 2011**

Joint Venture with Barry Hobin Architects

Client: Ottawa Public Library and City of Ottawa, Size: 95,000 sq ft

#### **Awards:**

Archives Association of Ontario Corporate Award 2012

This project incorporates a Materials Distribution Centre and a Library Collections and Technical Services Centre for the Ottawa Public Library system. The Ottawa Public Library system has 33 branches. The Materials Distribution Centre is a technologically advanced and flexible centre. When complete it will set a new standard for Canadian Libraries.

The Collections and Technical Services components are being designed with flexibility and a high quality work environment as the prime design objectives. The Library functions are co-located with the City of Ottawa Archives Centre. The program also includes public meeting and exhibition spaces. JV with Barry Hobin Architects.

The project is a LEED Gold Building featuring a heat pump system with heat recovery, low flow plumbing fixtures, and a well insulated building envelope. A total of 50% annual energy savings is achieved. (SZA)

#### **North Grenville Public Library, Kemptville, ON – Canada 2011**

Size: 10,500 sqft.

Following amalgamation of the City of Kemptville and the surrounding municipality the decision was made to close the existing small library and create a Central Library to serve the new municipality.

The Library is designed at a central site in downtown Kemptville where the main street crosses the Kemptville River. The Library is designed to take advantage of both the main street site and its proximity to the river. The plan was developed to allow the creation of a small park beside the river.

The Library design is based on a Customer First Library Service Model. The Library includes dedicated Children's and Teen's Areas, a Quiet Collaboration Room, extensive merchandising areas, a Fireplace Lounge, and an Outdoor Reading Terrace facing the river. The multipurpose room opens to the Library (through the use of a folding partition) allowing the space to be used as reading and study spaces when the area is not in use for programming. (SZA)

#### **Bloor Gladstone District Library, Toronto, ON – Canada 2009**

Client: Toronto Public Library

#### **Awards:**

Ontario Library Association Design Award, OAA Award for Design Excellence, Design Exchange Awards Gold Medal, Heritage Toronto Award, Canadian Interiors Best of Canada Award, Chicago Athenaeum International Architecture Award, Canadian Architects Awards Honorable Mention 2007

The 1919 Bloor Gladstone District Library was the first library built by the Toronto Public Library. The project consists of a complete exterior and interior restoration of the original landmark library as well as a new glass addition. The design maintains the original entrance while providing barrier free access by lowering the entry 450mm to grade. A central courtyard inserted into the original building links both floors of the original library and the addition. The glass addition opens the library to Bloor Street thus embodying the idea of a library as a community commons. In association with RDH and ERA. (SZA)

#### **Newcastle Branch Library, Newcastle, ON Canada 2009**

Client: Clarington Public Library, Size: 9,500 sqft.

The project is designed to support the library's pro-active public service model with the use of small, mobile customer service desks. The library features mobile shelving and displays to allow easy rearrangement and to facilitate diverse programs and events.

Includes designated Children's and Teen Areas, multi-purpose rooms, dedicated study and seating areas, "Living Room" with fireplace, outdoor reading terrace and staff work, lunch and rest areas. Designed to LEED Silver. Green design features include radiant slab heating, heat recovery and lighting control systems to interface daylighting and artificial light. (SZA)

#### **Calvin Park District Library, Kingston, ON – Canada 2009**

Client: Kingston Frontenac Public Library, Size: 11,000 sq ft

#### **Awards:**

Ontario Library Association Design Award

LEED Gold

A one storey branch library which is organized around a central secure outdoor courtyard. This courtyard accommodates many of the activities of large summer programs for children. The library is based on a proactive customer service model. The design supports this with small, mobile and adjustable customer service points. Mobile display units and mobile furniture also facilitate a wide variety of uses and programs within the library. Green design features include radiant slab heating, heat recovery and lighting control systems to interface daylighting and artificial light. (SZA)

### Cookstown Library, Cookstown, ON – Canada 2009

In association with Saltar Pilon.

Client: Innisfil Public Library, Size: 10,000 sqft.

The site is on the former County Fairgrounds in the centre of Cookstown. The Library is designed as a series of functions sheltered under a single roof form. A continuous roof monitor floods the interior with controlled daylight. The Library is designed around the proactive customer service model. It features open feasible space and clear sightlines. The library contains dedicated Teen and Children's Areas and a Fireplace Lounge.

Included in the program is a 2,000 sq ft Community Meeting and Recreation space. Both the Library and the Community Rooms open to a Common Lobby using folding partitions. This allows multiple uses of the same space. (SZA)

### Greenboro District Library & Community Centre, Ottawa, ON – Canada 2006

Client: City of Ottawa, Size: 25,000 sqft

The South District Library is a 25,000 square foot addition to Greenboro Community Centre. The centre is organized around an interior street with Cafe and Community Rooms. The project also includes Gymnasiums, Community Rooms and a Daycare. The building is designed both as a community focal point and a "library of the future." It confidently embraces new computer technologies, new strategies of proactive customer service. The approach is based in part on ideas from new large bookstores as well as new methods of public service such as self check in, check out and drive by book drop. The design is flexible, open, inviting and accessible to all.

The project is one of the City of Ottawa's first sustainable design projects. It was designed to a LEED Silver Level. (SZA)

### Petawawa Public Library, Petawawa, ON – Canada 2004

Client: Town of Petawawa, Size: 7,000 sq ft new construction, 5,000 sq ft renovated space

This project involved the addition to and renovation of an existing community center. The work included an expanded, renovated library, a 60 seat multipurpose room with separate after hours access and a new entrance and internal street linking all of the facilities of the existing community center into a multi-purpose integrated facility.

The design accommodates technological resources to current standards with flexibility for future growth and change. The design includes: a central reading area with fireplace, bay windows with reading seats, group and personal study spaces, multi-media listening and viewing areas, a dedicated teen area, children's reading and study areas and a children's program room. (SZA)

### Albert College Junior School & Library, Belleville, ON – Canada 2003

Client: Albert College, Size: 27,900 sqft

This project evolved from a master plan for the 80 year old private school redevelopment including a 21,000 sq ft Arts Wing, 300 seat theatre, 64 beds girls residence and 23,370 sq ft junior school and library for primary and junior students. Relocation of playing fields and courts and redevelopment of parking and circulation routes including a new major entrance to the site.

The first phase was the school for primary and junior students. It is arranged around a central library. The library includes both individual and group study areas as well as an informal reading room for author readings, student performances and other similar events. (SZA)

### Pittsburgh Branch Community Library, Location: Kingston, ON – Canada 2000

Client: Kingston Frontenac Public Library, Size: 5,000 sq ft (2,500 sq ft restored)

#### **Awards:**

Ontario Library Association Design Award

Heritage Kingston Award

Renovation of historic Hawthorn House (1866) and an addition compatible with the historic architecture. The existing ground floor rooms were restored, including working fire places for use in reading and study rooms. Library includes a technology area, children's program room, reading and study rooms and 18,000 volume collection. The design was developed in consultation with various stakeholders during the amalgamation of three municipalities and two library systems. It and was embraced by all, while being completed within the agreed budget and schedule. (SZA)

### Cornwall Public Library, Cornwall, ON – Canada 1996

Associate Architects: Diamond + Schmitt Architects

Client: Cornwall Public Library, Size: 70,000 sqft

#### **Awards:**

Ontario Library Association, Library Design Awards, 1999

Site selection study identified an under utilized historic Post Office in the downtown core. This option was selected providing 70,000 sqft. of space, higher quality finishes and materials within the budget for 40,000 sqft. of new space.

The renovation included a multipurpose room with full audiovisual facilities, with the latest technologies for systems management.

The program also includes the provision of the Cornwall room, a local history archive.

The project included \$1.1M in exterior restoration. This consisted of extensive stone restoration and replacement, as well as window and roof restoration.(SZA)

#### **Reason for Designation:**

The primary reasons for designation are of an architectural and historical nature including that the former Post Office building is an unique example in the Municipality of Institutional International style Architecture with a prominent stone façade and sidewalk promenade facing Second Street. As well, the aluminium-clad windows on the first storey and interior black marble add to the buildings uniqueness. Constructed in 1953, the structure was originally home to the City's Main Post Office. Under a comprehensive Library Relocation project that was completed in 1996, extension attention was given to carrying-out and adaptive restoration and reuse of the structure/site for the Cornwall Public Library. The site continues to act as a focal point for the Community and it an integral component to the viability of the City's Downtown Core. (<http://www.waymarking.com>)

## **Teeple Architects, Toronto, ON – Canada**

<http://www.teeplearch.com>

### **Libraries:**

#### **City of Edmonton, Clareview Recreating Centre and Branch Library, Edmonton, AB – Canada 2013**

joint venture with Arndt Tkalcic Bengert Architekts (<http://www.archatb.com>)

Silver LEE rating

This facility is designed to promote safe interaction and connectivity within the community while providing expanded recreational, educational and community support services. The transparency of the main façade allows the interior activities of the building to be visually accessible and inviting to passers-by. The building creates a new and emerging civic realm, and reflects the goals of the Edmonton Master Plan for the neighbourhood, providing state-of-the-art recreation and education facilities to the community. (Teeple)

#### **John M. Harper Library and Stork Family YMCA, City of Waterloo, ON – Canada 2011**

joint venture with Garwood-Jones & Hanham Architects

Brought together as one integrated facility, this library and recreation centre creates an enhanced community realm for the City of Waterloo. The two, seemingly disparate, program elements are designed to interact and elevate one another through a number of strategic architectural gestures. A light-filled galleria is the interstitial space between the two programs and creates a visual porosity between library and recreational users. The galleria mitigates the friction that inherently exists between a contemplative space and an active space. The Library program includes study lounges as well as a flexible group learning environments, while the YMCA component includes gymnasium and pool facilities with associated change rooms. (Teeple)

More than the smell of primer paint and sawdust, it's the light that makes the biggest impression on walking into the new YMCA and library in Waterloo.

Smooth, grey walls stretch to vaulted ceilings and an open-concept design help the sun stream through skylights and bounce through the building, set to open in phases in September.

A railing along the rim of the second floor surrounds what will be the fitness centre, where workers test and assemble elliptical trainers and stationary bicycles equipped with individual televisions as well as iPod jacks and USB plugs.

The Fischer-Hallman Road North location — funded by the city, the YMCA and Waterloo Public Library — will house the Stork Family YMCA and the John M. Harper District Branch Library.

The \$22.3 million project is expected to come in on budget and will be celebrated at a ribbon-cutting ceremony in October.

“It’s really a connecting space ... for a fairly large district of Waterloo,” said John Haddock, chief executive officer of the YMCAs of Cambridge and Kitchener-Waterloo. The multi-use facility offers “easier access to multiple leisure, recreation and health services, which really creates a healthier community.” After the closing of the Lincoln Road location in 2005, this facility marks the return of a YMCA fitness facility to Waterloo — but Haddock said they never really left and maintained 15 program sites during the past six years.

“There’s no kind of marquee spot” right now, said Haddock, but the new Stork Family YMCA will give the organization a new façade.

Designed by Toronto’s Teeple Architects, the building’s 68,000 square feet are laid out in an inviting, asymmetrical shape. A large basketball court made of reclaimed wood beckons from left of the entrance. A large track encircles it from above. Down the hall and beneath an overhead walkway, raw wood stretches along what will be the YMCA’s front counter.

From the accessible pool — complete with a chairlift and ramp — to the building’s LEED Silver certification, everything about the facility’s design is contemporary. Bits of grass from the green roof peek over the sides from the parking lot, and all the lighting is energy-efficient. The change-room lights are controlled by motion sensors, and the fluorescent lights are square because they are T8s, a power-saving version.

Instead of heading down a long corridor to the pool area, turn right, and 22,000 square feet of library space lies ahead. Bright magenta accents break up the mostly grey interior, which the project’s manager, Alan McGregor, said was the most controversial point of the design process.

“Colours were probably the biggest problem we had,” he said Tuesday while showing off the completed but empty pool.

The original designs for the exterior of the building included more magenta to break up the grey. McGregor said some of the stakeholders were thrown off by the vibrant hue, so they opted for neutral silver instead.

Otherwise, he said plans have gone ahead smoothly, but in his five years overseeing the project, the hardest task was finding the space to build it.

That hurdle was tackled early, when the University of Waterloo agreed to lease the approximately three-hectare location to the city for a \$1 a year in exchange for \$9 million in services such as roads, watermains and sewers for its northwest campus.

In addition to that trade, the city kicked in \$13.6 million, while the YMCA added \$8.2 million and Waterloo Public Library contributed \$530,000.

Once the joint facility opens, Haddock said he’s “looking forward to all of the parts working independently, but working in the expected manner, serving families and people in the community.” The Record 04.08.11 (<http://www.therecord.com>)

#### **Early Learning Centre, University of Toronto – Canada 2009**

12,500 sqf.

### **Awards:**

**Ontario Association of Architects, Award for Excellence**

The architecture is intended to embody an enriched range of spatial experiences that spark the imagination, and encourage multiple interpretations and extended opportunities for play. Two “pods”, spatial units comprised of either infant/toddler playrooms or preschool playrooms and a shared service core, are separated by multipurpose spaces on each of the facility’s two playrooms floors. The pods are defined by metal “petals” which serve to create a play environment that is both protected and open to the world beyond. Petals mark play pits in the infant playrooms, while defining lofts in the preschool rooms. These create low protected areas that are tucked away from the activities of the rooms, as well as overlooks from which to survey the terrain. These lofts are made by clerestories that visually connect the playroom to rooftop play spaces. (Teeple)

#### **Langara College Library, Vancouver, BC – Canada 2007**

80,000 sqf.

### **Awards:**

**Holcim Acknowledgement for Sustainable Design SAB Award 2008**

**Canadian Architect Award 2005**  
**Holcim Acknowledgement for Sustainable Design 2005**

The project is envisioned as an urban form, inflected by the environmental conditions to which it is subjected. Its roof form is inflected to gather wind and direct it into atria / chimneys that have been displaced from the original volume of the building. These spaces inform the sequence of pedestrian movement within the building. The building is ventilated entirely through this natural stack effect without the use of fans. Air is brought into the building underground, tempering its natural state. Temperature control is achieved through ground source heating and cooling, which adjusts the temperature of the building's concrete thermal mass. The impact of these measures on energy use is significant. Energy modeling has demonstrated an improvement of 72.8 % over the Model Energy Code. (Teeples)

**Jane and Dundas Branch Library, Toronto Public Library System, Toronto, ON – Canada 2007**  
12,150 sqf.

The newly renovated library design transforms the previously dark and inward-facing building into a community focal point. It brings attention not only to the activities within the building, but creates a safer, brighter and more inviting streetscape. A glass façade on the north face of the building and additional windows on the east, bring soft, natural light into the spaces without excessive solar heat gain, creating a bright and well tempered interior. Indirect southern light maintains the muted and evenly distributed interior luminosity, creating the perfect reading environment. The main reading room features open stacks, which allow light to penetrate deeper in the building. A new youth wing and play zone accommodate the growing needs of young users, and new computer and research stations enhance the existing collection, converting the library into a research facility. Improved circulation, wheelchair accessibility and security increase the efficiency and clarity of the spaces, making them more accessible to the public, without discrimination. (Teeples)

**Burlington Central Library, Burlington, ON – Canada 2005**  
64,000 sqf.

This addition to the 1960s era Burlington Public Library required questioning of the original functional organization. A principal feature of the addition is a narrow, three-storey lobby with entrances from the south from New Street and the Park, and from the north parking area. This lobby is a main orientation point including a café and display areas facing an old row of trees from the original farm property and allowing views to the park area to the west. The addition wraps around the south of the existing building creating a new image to the Park and the New Street. At the lower level are administrative areas and the upper level is the two-storey reading room. (Teeples)

**Brant Hills Branch Library, Burlington, ON – Canada 2004**  
21,000 sqf.

This project involved the expansion of the existing Brant Hills Community Centre along with the addition of a new Branch Library. The 3,500 sqf. addition to the Community Centre involved a new gymnasium and offices as well the re-organization of associated public spaces. The 7,000 sqf. Library addition is connected to the Community Centre by a new large gallery space that acts as an entry hall serving the east and west sides of the site. The 11,000 sqf. of interior renovations to the Centre was required to integrate the addition and upgrade existing materials. (Teeples)

**Ajax Main Central Library, Ajax, ON – Canada 2003**  
30,000 sqf.

**Awards:**  
**2004 Ontario Library Association Award (New Library)**

The new main library simultaneously creates a gateway into Ajax while defining a new civic square. A striking image is created along Harwood Avenue as the building reaches out toward the corner with a high glazed reading space. This space is the culmination of a skylit promenade through the library that leads from the entrance lobby. The two-storey arcade defines one side of a new civic square that has been created between the library and the existing municipal building. This space will form a new focal point of public activity in Ajax. Prominent spaces within the library overlook this square, including the community room and the children's programming room. (Teeples)

**Pickering West Library, Pickering, ON – Canada 2003**  
17,600sqf.

This combined library and community centre overlooks Petticoat Creek on the western edge of the City of Pickering. A large protecting roof lifts upward toward the ravine, shading the facility and accentuating the exquisite view along the creek. Translucent glazing is utilized to create a bright interior environment appropriate for library use. The facility contains a branch library, a senior's room, as well as a community room for youth programs and a commercial kitchen. All of these facilities are brought together by a shared gallery space which will be used for art display. The building creates outdoor patio space along the ravine edge, where users can enjoy exceptional views to this beautiful landscape. (Teeples)

**Quinte Technology Enhanced Learning Complex, Loyalist College of Applied Arts and Technology, Belleville, ON – Canada 2004**  
52,000 sqf.

The learning resource centre consists of traditional print material with clustered computer stations, study spaces, student lounge, circulation desk/workroom and offices on the main floor. A mezzanine level, with barrier free access, includes two student seminar rooms, fully wired study carrels and general study spaces that overlook the library. The complex creates strong links between the college and its rural landscape while presenting a new image for the college toward the entry of the campus. The Computer Commons consists of a multi-use 24-hour student access lab, and high-speed fibre optic cabling to over 180 computer stations on two levels. New classrooms have also been created to facilitate multi-task interactive teaching environments, as well as a fully wired 100-seat lecture theatre. (Teeples)

**Eatonville Public Library (Toronto Public Library System), Etobicoke, ON – Canada 2001**

The Eatonville Library is situated at the edge of the city, where the intersection of a major road and a highway occurs. The nature of that position is captured in the space of the library. A zinc band, reflecting the speed and dynamism of the highway, is stretched between stone walls that ground the building to the urbanity of the street. This band forms a deep overhang that shades the clerestory window above the perimeter bookshelves. This minimizes heat gain in winter, while enabling sunlight to penetrate the

library in the winter months. The facility includes fully networked public areas, a large childcare area, study and lounge areas, as well as a community room. The building can be experienced at both the city and the regional levels, as one enters the library through its two entrances. On the urban street front, entry to the building is along the pedestrian-scaled stone wall, while the main entrance passes below and through the highway-scaled curved zinc wall. One's experience of the building shifts from the city to the highway, from stasis to a dynamic space from which the flow of traffic is constantly in view. Daylighting is the principle means of achieving energy savings in the project. Translucent glazing systems are utilized throughout the building. These are punctuated by clear bay windows that cut through the facades creating localized views at reading areas and carrels. The principal building materials include black natural stone, brick, and zinc cladding. Natural, low VOC materials including linoleum floors have been utilized throughout the interior. Gross square footage: 25,000 sq ft, Total construction cost: \$2.29 million ( <http://www.archrecord.construction.com> )

#### **Preston Branch Library, Preston, ON – Canada 2000**

##### **Awards:**

**Ontario Library Association Award, City of Cambridge Urban Design Award**

This project involved extensive renovations and additions to an existing branch library in downtown Cambridge, Ontario. Care was taken to provide the library with a strong urban presence and a more inviting entrance, including a sculpture forecourt and a large entrance canopy extending to the sidewalk. Additional public service space, staff areas, as well as dedicated gallery space and children's program rooms were created. The building was revitalized through the combination of Canadian stone, glass tile and western red cedar. The firm also designed integrated custom furniture for the branch, including computer work stations, information kiosks and shelf display units. (Teepie)

#### **Barton Branch Library, Hamilton, ON – Canada 1999**

An existing 10,000 sq. ft. library constructed in 1961, has been completely renovated and updated. The building has been transformed into a welcoming branch library, complete with updated information technology and full accessibility. A new sloped ceiling was installed to accommodate new lighting and ductwork, which also emphasized the existing wood roof structure. Our firm planned and coordinated all new furnishings for this branch. (Teepie)

### **ZAS Architects, Toronto, ON, Vancouver, BC - Canada**

<http://www.zasa.com>

##### **Libraries:**

#### **University of Waterloo, Stratford Campus, Digital Media Lab, Waterloo, ON – Canada 2012**

Capital Costs: \$ 13,000,000

##### **Project Description**

The University of Waterloo at Stratford (Waterloo Stratford Campus) will be a leading innovator in undergraduate and graduate instruction, new media research and industry-academic-creative collaboration. The campus, to be built on a key site in downtown Stratford, is intended to be accessible to the public and to combine learning, research and commercialization initiatives. The first building for Waterloo Stratford Campus will house instructional, research, and team collaborative spaces. It will be the heart of a new campus, growing quickly to include conference facilities and a commercial incubator. It will emphasize digital media, content creation, project-based learning and technologically-enabled collaboration. Waterloo Stratford Campus is intended to be a global institution, engaging both virtually and through on site conferences with advanced partners around the world. The Waterloo Stratford Campus must model through its teaching and research approaches, its public profile, its collaborative/team culture and its facilities the latest thinking about the engagement of the academy with its community---government, business, the arts; locally, nationally and internationally. In brief, it is intended to bring together the very best characteristics of the University of Waterloo and embed them in a campus designed from the outset to serve the needs of students and researchers in the 21st Century.

The facility is to provide spaces for teaching, and research for the UW Digital Media Program. The programs will operate with partnerships from business, government and the university.

Participants from all three areas of partnership will be represented through technical expertise sharing, influence on program direction, supporting project specific research, and funding. Participation from the outside community is expected, in the form of events, conferences, and displays.

##### **Users:**

The facilities primary users will be students, faculty and staff from the University of Waterloo. Contributing to the program will be technology partners, outside consultants, collaborators and lectures. It is expected that this facility will grow to provide space for approximately 300 students and 35 faculty and staff members.

The students and researchers will work within classrooms, project rooms, meeting rooms and collaboration spaces. The media lab functions will be supported by administrative and technical functions. Educational activities in the facility will include traditional classroom functions, group project work, independent project work, research, interaction with outside experts, and non traditional classroom functions. The facilities will also host conferences, exhibits and community outreach programs. To accommodate the wide variety of users and activities the atrium / exhibit space, classrooms, project rooms, and offices will be considered multipurpose.

The project will accommodate the programmatic elements on three floors in one building. These elements are as follows:

Office Space (on all three stories)

Classroom, Project Rooms, Collaboration Space (on all three stories)

Event Space (on first storey)

Mechanical Penthouse

The construction and facility shall be registered with the Canada Green Building Council's LEED Canada NC 2009 Green Building Rating System in the New Construction category and achieve a certification level of Silver. (ZAS)

#### **Milton Performing Arts Centre/Central Library, Milton, ON – Canada 2012**

Client: Town of Milton, Size: 82,000 sqf.

ZAS provided concept design/bridging services leading towards the design-build development of a new performing arts/visual arts centre and central library in this high-growth suburban community. Located at a prominent intersection, our concept design capitalizes on its' gateway location to create a substantial and powerful Civic Campus for its citizens. To realize the potential of the site, our building design is conceived as a series of public rooms linked by an open and transparent Civic Lobby that engages this corner site. The openness of this lobby is symbolic and highly functional, providing a major assembly space that all building entrances converge upon. The centerpiece is a 500-seat theatre designed in the classical "shoebox" proportion, resulting in a functional, yet memorable room, and supported by outstanding acoustics within the chamber. Visual arts programs straddle both

levels of the complex, with the major assembly and display programs being located at grade. This includes a large multi-purpose room that is located prominently at one corner of the Lobby and also creates a direct and convenient link to other cultural programming offerings by Milton Public Library. The Central Library exerts a powerful architectural presence along the street frontage, and can easily be identified as a distinct area within the overall complex. In particular, a large cantilevered bay window and street level glazing showcase the amenities within and encourage public accessibility. (ZAS)

#### **Bram East Community Centre & Library, Brampton, ON – Canada 2012**

Client: City of Brampton, Size: 300,000 sqf. integrated building, 34,000 sqf. Library

Located on a 143-acre rural site, the new Bram East Community & Sports Centre is a unique multi-programmed facility containing over 300,000 s.f. for the residents of a rapidly growing multi-cultural district in Brampton. Inspired by the agricultural and natural landscape, both the site and building design reflects a modern attitude to design, yet is mindful of its past heritage. Reminiscent of the adjacent farmers' fields, the site design is an abstract expression of linearly planted bands of selected vegetation that include perennial flower beds, framed by grids of bushes and treed orchards. This landscape is also the foreground for the building's main exterior feature, a multi-directional curved glass wall simulating the undulations of windblown-planted harvest fields. In its movement, this glass wall reflects a spectrum of light and images ranging from the distant sky to the immediate landscape that grounds the building. Conceived of as the new "Centre of the Community", the facility combines sport, fitness, and library services on one site and under one roof. The central organizing element of the building will be timber framed public galleries that stretch along the main façade and links the community centre, aquatics centre and public library. The facility design also includes a future indoor soccer centre, with a gently arching wood diaphragm structure above the FIFA soccer pitch. Sustainable design strategies and systems have been utilized to ensure the facility will achieve LEED Silver certification. (ZAS)

#### **Painswick Branch Library, Barrie, ON – Canada 2011**

Client: City of Barrie, Size: 15,000 sqf.

This project represents Barrie's initiation of a multi-branch library system. The 15,000 s.f. branch is situated on an unremarkable suburban greenfield site that buffers the transition between a commercial zone and a residential neighbourhood. The nature of the site encouraged a very strong language for the building's design. Positioning of the building close to the road, with parking located behind, introduced a deliberately urban strategy and a strong streetscape presence to the area. Strong linearity in the fenestration and large dramatic gestures such as the main roof with sunshade and the curtainwall "lantern" will establish this building as a destination within the south end of Barrie. A generous transparent public lobby provides an effective double-sided entrance (from street and parking lot). The Program Room and primary washrooms are located to one side of this lobby while the library-proper is on the opposite side, allowing the lobby to act as a natural control point for after-hours community use of the Program Room. Programmatically, the library is organized in a straightforward linear manner. The stacks are arranged along the south reading wall, under a double-height space, allowing for easy reconfiguration of the collection as it evolves. Generous seating and browsing areas line the perimeter of the building, anchored by a Living Room that houses the periodicals, A/V and high-volume materials. (ZAS)

#### **Burnhamthorpe Branch Library & Cultural Centre, Mississauga, ON – Canada 2011**

Client: City of Mississauga, Mississauga Public Library, Size: 56,000 sqf.

Program: 25,000 sqf. Library, 300-Seat Theatre, Multi-purpose Rooms, Seniors/Youth Areas, Art Gallery, Cultural Programming Space, Dixie-Bloor Neighbourhood Centre, Space Reconfiguration Study

#### **Awards:**

**Award of Merit - Community Scale, Context, Execution and Living Green - Mississauga Urban Design Awards, 2011**

**Library Building Award – Ontario Li**

Designed in 1974 by Raymond Moriyama, the existing building, with its distinguishable sculptural form and multitude of floor and ceiling level changes, is a significant example of Canadian modernism providing a unique combination of library and theatre services to the Burnhamthorpe community of Mississauga. Apart from accommodating program additions and functional improvements, ZAS enhanced the building's street presence and provided spatial identity to both major existing tenants - the theatre and the library, as well as the new occupant of the facility – the local community outreach agency offices. Sensitive and respectful of the heritage nature of the existing architecture, new building elements radically depart from its current form and materiality. The existing curved geometry is contrasted with rigidly applied rectilinear grid and mostly transparent, light, glass walls stand out against existing solid heavy masonry. The 200-seat, 8,000sf community theatre benefits from increased visibility and much improved delivery access to its back-of-house facilities. A new two-storey wing with 14,000sf leasable space under the green roof was added to house the offices of the local community outreach agency and boost the building's street presence. (ZAS)

#### **Beaty Branch Library, Milton, ON – Canada 2008**

Client: Milton Library Board, Town of Milton, Size: 11,300 sqf.

The creation of this new branch library represents the first step in the creation of a multi-branch system within the municipality. Located within an emerging New Urbanist inspired residential neighbourhood, the 11,300 s.f. branch is situated on a compact site that borders a storm water and naturalized greenbelt. To capitalize on this natural feature, the single-storey library stretches across the breadth of the site with an arching, glazed façade supplying abundant natural light to the library collections area. A central program room punctuates this elevation, its wood clad frame marking the suggestion of an aperture with views in and out of the library. A corner entrance is clearly articulated by means of a canopy, signage and materials quality. Within the library, the periodicals and browsing area overlooks the main, facing street, much like a Living Room to the community. This collage of building elements and calculated transparency creates a beacon-like effect, particularly notable during the library's evening hours. Sustainable design strategies and systems have been utilized to ensure the library will achieve LEED certification by the Canadian Green Building Council. (ZAS)

#### **Ryerson University Central Library Renovation, Toronto, ON – Canada 2004**

Centrally located within the University Campus, the existing library occupies eight levels within the multi-storey Jorgenson Hall building. The design team's challenge was a complete re-planning of the library's 17,000 s.f. entrance level, which includes circulation areas, reference materials, special collections, as well as an expansion of the library's information technology commons. Custom millwork was designed for the major service areas of the library, with particular emphasis on the circulation desk and reference/information commons desk. The remarkable transformation is highly functional, attractive and achieves a revitalized importance for Library services at the University. Developed within a fast track process, design and construction was completed while maintaining continuous operation of the library. (ZAS)

## **Zeidler Partnership Architecten, Toronto, ON – Canada**

<http://www.zeidlerpartnership.com>

### **Libraries:**

#### **Ryerson University, Student Learning Centre, Toronto – Canada 2014**

Co-Architect: Snøhetta

Size: 155.463 sqf. (14.443 m<sup>2</sup>), Client: Ryerson University

Designed by the architectural team of Zeidler and Snøhetta the stunning new building will provide Ryerson student, with an outstanding environment to study, collaborate and discover. The eight-storey Student Learning Centre marks Ryerson's new face on Yonge Street. It will feature a glass façade, an elevated plaza, a bridge to the existing library and a range of academic, study and collaborative spaces for Ryerson's students, faculty and staff. Yonge Street frontage will feature destination retail at and below grade, creating a prominent commercial façade. With links to the existing library building, the Student Learning Centre will offer a variety of creative and inspiring learning environments and spaces. Every floor will have its own personality, some will be open and interpretive with flexible furniture and terraces while others will be densely filled with enclosed study rooms for groups of four to eight people. The top floor will encourage independent, quiet study and contemplation. With full digital support and accessible academic services, the Student Learning Centre will foster learning success and help promote a culture of collaboration and creativity among Ryerson students. The lightweight transparent glass skin of the 155.463 sqf. Student Learning Centre will feature a surface design that will create varying light qualities within the interior space. As a further demonstration of Ryerson's long time leadership in sustainability, the building will be LEED® Silver compliant. At least 50 per cent of the roof will be a dedicated green roof.

#### **Mohawk Public College of Applied Arts and Technology, Hamilton, ON – Canada 2011**

Client: Hamilton

Hamilton's Mohawk College has broken ground on a centre that is intended to serve both as a regional hotbed for innovation and entrepreneurship and a community showcase for environmental sustainability. Scheduled to open in January 2011, the \$14.5 million Mohawk Centre for Entrepreneurship, Learning & Innovation will include the new Cummings Library and Learning Commons and 10 classrooms, all with the latest in wireless, multi-media technology. Designed by the Zeidler Partnership Architects, the centre will be constructed to achieve LEED Gold status. The building will feature a two-storey green wall to filter indoor air and a rainwater recycling system. College and community events will be held on new outdoor green space surrounding the three-level centre, establishing the campus as a social and cultural hub on Hamilton's West Mountain. The project is being undertaken by a team that includes structural engineers Halcrow Yolles, mechanical and electrical engineers MCW Consultants Ltd., LEED consultant Enermodal Engineering and KOM Management Services Inc. The project, located at the college's Fennell campus, is being fast-tracked. Key subtrade contracts have already been tendered. An excavation contract has been awarded to Terrasan Environmental. The centre will face Fennell Avenue, giving the campus "a new front door, a new public face and an even higher profile in the city and region. "One of the greenest buildings in our community will serve as a regional hotbed for innovation and entrepreneurship," says Mohawk College President Rob MacIsaac. "We're creating new spaces where students, staff and college partners will collaborate and create, foster a culture of innovation and ignite a spirit of entrepreneurship." The centre is part of an overall 18-month, \$30 million renewal project on the Fennell campus. Major renovations throughout Mohawk's largest and oldest campus will result in new, expanded and improved services, including a one-stop centre for student services in the current library and a main street running north-south through the heart of the campus. The Fennell campus renewal project is supported in part by \$20 million in infrastructure funding from the Ontario government. Last September, Mohawk completed a \$27 million transformation of the Stoney Creek campus into the Mohawk Skilled Trades and Apprenticeship Research, Resources and Training Institute. Mohawk is also exploring potential opportunities for a new campus in downtown Brantford. (<http://www.dcnonl.com>)

Mohawk College contracted Zeidler Partnership to lead

#### **Belleville Public Library and John M. Parrott Art Galleries , Belleville, ON – Canada 2006**

Project Cost: \$ 8,000,000, Main Building Area: 38,000 sqft., Library: 30,000 sqft., Galleries/Meeting Spaces: 8,000 sqft.

### **Awards:**

**2009 design excellence award Ontario Association of Architects**

The new 38,000 sqft. Belleville Public Library provides resources for research and recreation as well as a cultural and community destination. The view to the City Hall tower, adjacency to the Pinnacle Theater and the previous Corby library, connects the new library to past history and the future. The new cultural precinct will act as a catalyst for growth and renewal.

The design articulates the library in two distinct masses; the rectangular mass is anchored to the west; the circular element faces both Campbell and Pinnacle Streets. The rectangular element houses the library stacks, lounges and study spaces, the circular is more public in nature including entrance, giftshop and street café. The third floor gallery is easily seen from the main three-storey entrance rotunda. This hall greets patrons as a civic space, connecting building activities vertically.

The rectangular building's exterior is enveloped with a quilt made up of beige and reddish brown squares of precast concrete inspired by pattern paintings and quilts. Within the site context, the notion of the quilt allows inclusion of a variety of colours and textures, now easily achieved with pre-cast technologies.

A large plaza frames the circular building, welcoming people from Campbell and Pinnacle Streets. A courtyard nestled between the library and the Pinnacle Playhouse may be used for special events. Visible from within, these public spaces have added greatly to the animation of the urban site. (Zeidler)

## Chile

### **A & F Arquitectos, Santiago de Chile – Chile**

<http://www.diav.cl>

#### **Chilean National Library, Founders Hall (Salón Fundadores, Biblioteca Nacional) Santiago de Chile – Chile 2009**

400 m<sup>2</sup>

On August 19, 1813 was founded the National Library of Santiago de Chile, which was later reopened in 1925 in a new building at Alameda Avenue in the city center. Here once stood the monastery of nuns clear, until 1913 it was demolished and in its place rose the Library which was completed in 1925.

It was designed after the design team led by A & F Architects won a competition organised by National Museums & Archives Organization for the renovation of the hall which involved acoustic renovation as well.

The interior architectural project proposes a glaze volume elevated over the level of the room, which represent the contemporary intervention with a straight cube shape, which will contrast and highlight the classical architecture around.

This volume separates the display and reading sites and it is structured of a silk-screened glass with texts containing the names of the main Chilean writers, which are illuminated with cold white light, emitted by LED hiding on top perimeter.

The classical architecture of the room has a warm white lighting, which highlights the most important elements of its architecture, such as arches and pillars and dome.

Hence, it is proposed to contrast the heritage character of the Lounge (warm light) with the contemporary nature intervention (cold light).

### **Marsino Arquitectos Asociados, Santiago de Chile – Chile**

<http://www.marsinoarquitectos.cl>

**Libraries:**

#### **Biblioteca Publica de Independencia, Santago de Chile – Chile 2009**

Con un entorno de fuertes contrastes caracterizado por la presencia de edificios públicos de gran valor arquitectónico y viviendas precarias, el proyecto apuesta por una imagen unitaria, contundente y monolítica que otorgue identidad a la biblioteca como centro cultural de independencia. El contenedor arquitectónico debe entregar las condiciones físicas que puedan motivar y acoger el acto de la comunicación que caracteriza a las actuales bibliotecas más allá del tradicional rol contenedor del acervo bibliográfico tradicional. Las bibliotecas devienen en iconos arquitectónicos que articulan e impregnan de nuevos significados jerárquicos a la forma compositiva de la ciudad tradicional. Dada su condición de esquina y su larga fachada, el proyecto propone una “promenade architectural” abierta hacia la ciudad, con un recorrido ascendente que se inicia en Av. Independencia haciendo fácilmente comprensible al visitante todo el programa que contiene. Un contenedor espacial estratificado por desniveles interconectados que permite la integración visual y la segregación funcional. La estructura perimetral permitió considerar plantas libres en todos sus niveles lo que facilitará la adaptación y redistribución futura de las áreas de atención al público. Incluso la mayor altura de las plantas del segundo piso permitiría la ampliación de la biblioteca al interior de la misma. (Marsino)

#### **Biblioteca Central, Universidad de Tarapacá, Arica – Chile 2007**

Proyecto Arquitectura: Arquitectos: Jorge Marsino, Claudio Santander, Colaboradores: Paula Herrera, Cliente: Universidad de Tarapacá, Ubicación: Campus Saucache, Arica, I Región, Chile, Superficie Construida: 3.200 m<sup>2</sup>., Año Proyecto: 2002  
Año Construcción: 2003-2004

El nuevo edificio para la biblioteca central de la universidad de tarapacá, situada en la ciudad de arica, debía constituirse además como un hito entorno al cual se re-organizara el campus saucache de la universidad, cuyo crecimiento explosivo de los últimos 10 años había generado un espacio sin un centro definido y dividido por un accidente geográfico que cruzaba transversalmente el campus generando dos zonas aisladas entorno al antiguo lecho de un río seco, hoy sub-utilizado como campo deportivo. El edificio resuelve el encargo en un edificio de 6 pisos de altura y situándose al borde de la quebrada, que a partir de este edificio se quiere consolidar como un parque interior. La forma, completamente hermética hacia el sur y abierta hacia el norte, obedece a la incorporación de la cosmovisión del pueblo aymara, en relación a la presencia del sol / sombra y responde además a las orientaciones y asoleamiento requeridos por la biblioteca. Aparecen dos elementos referentes que tienen que ver con la cultura del lugar: el muro como un elemento de carácter masivo y compacto que forma parte de la tradición constructiva de la zona, el que es intervenido en pequeñas fenestraciones a través de cortes y pliegues del mismo muro, y el tejido en la pantalla de cobre que rescata la tradición artesanal y permite el control de la radiación solar al interior de la biblioteca. (Marsino)

#### **Biblioteca Central Universidad Católica de Norte, Antofagasta – Chile 2006**

4.262 m<sup>2</sup>

El encargo del proyecto Biblioteca Central era resolver de manera contemporánea la compleja condición programática de una biblioteca centralizada de colección abierta (220.000 volúmenes) con capacidad para albergar a 850 usuarios de manera simultánea y fuerte presencia tecnológica computacional, que reflejara el cambio paradigmático que está experimentando la educación en Chile en el traspaso de la enseñanza al aprendizaje. El contenedor arquitectónico debía ser capaz de jugar un rol relevante en la

conceptualización y configuración de los espacios de encuentro, entregando las condiciones físicas que puedan motivar y acoger el acto de la comunicación que caracteriza a las actuales bibliotecas más allá del tradicional rol contenedor del acervo bibliográfico patrimonial. En este nuevo contexto, las bibliotecas devienen en íconos arquitectónicos que articulan e impregnan de nuevos significados jerárquicos a la forma compositiva del campus universitario tradicional. En el caso del campus de la UCN, la construcción de la biblioteca como objeto central de referencia y de una plaza al frente, presentaba la oportunidad de recuperar un espacio de representación pública enajenado por la construcción de infraestructura docente de carácter provisorio en el área central del campus. (Marsino)

### **Libraries:**

**Biblioteca Universidad del Región Bio Bio, Concepción – Chile 2007 - 2010**

1.818 m<sup>2</sup>

El año pasado les mostramos la obra en proceso constructivo, en esta ocasión se las presentamos ya terminada. La biblioteca, fruto de un concurso post- inundación (2006), consiste en la primera etapa del nuevo centro de información UBB, a completarse con la próxima construcción del edificio de Servicios Informáticos, constituyendo un nuevo acceso al campus. Cada proyecto, con sus demandas y restricciones propias, es el resultado de un proceso difuso, donde se sintetizan múltiples experiencias y obras vividas. Potenciando el carácter público y abierto de la Universidad, tal como hiciera Emilio Duhart en la UDEC, se liberó parte del primer nivel constituyendo un corredor peatonal cubierto, sobre una plataforma de madera elevada sobre la cota de inundación, protegida de los vientos del norte que acompañan a las copiosas lluvias locales. La operación principal, consistió en vaciar un volumen suspendido de madera. Se abrieron sus dos extremos hacia el follaje de los árboles y se realizaron incisiones verticales en sus caras laterales, ritmando con su luz el caminar. Modelando la luz natural, se sustraen tres vacíos verticales, reinterpretando los patios de la anterior biblioteca, inundando de luz cenital el interior y el corredor exterior. Todo lo anterior, para constituir un paisaje interior, donde se insinúan posibles usos del espacio, permitiendo diversas instancias para la lectura, entre los muros de libros y los vacíos de luz, entre los pilares de acero y el follaje de los árboles. Respondiendo a la mala calidad del suelo arcilloso, junto con algunos muros de hormigón visto pulido, se proyectó una estructura predominante de acero, explicitando su resistencia al sismo mediante sus diagonales, buscando una expresividad cercana a una obra gruesa, donde la arquitectura será poco más que su estructura, tal como desarrollara Max Bill en sus esculturas constituidas por sumatorias de pilares y vigas. Como sistema de calefacción, se optó por pisos radiantes, se contemplaron ventilaciones pasivas, direccionando la presión natural de las suaves brisas estivales, y se consideró una piel exterior en tinglado ventilado de pino radiata local. by Alejandro Concha (<http://www.plataformaarquitectura.cl>)

## **Murúa-Valenzuela, Santiago – Chile**

<http://www.murua-valenzuela.com>

### **Libraries:**

**Taltal Public Library – Chile 2009 - 2010**

Facing the central square of Taltal and near the recently remodeled Alhambra Theater, this project's location proved strategic from a preliminary stage, orienting some fundamental elements of the design. One of these characteristics is that the building will integrate both indoor and outdoor spaces, creating a place with an exceptional view of the central square and the entire city. The main idea behind this project was to generate a cultural network between the theater and the new library. Another key factor that defined this project was the relevance between the site's dimensions and the eventual library use. This affected the design, encouraging us to integrate a sequence of complementary spaces (each with different heights) to accommodate diverse library activities. These spaces all connect to a central reading room, which is joined with an interior patio. (Murua)

Structure Type: Reinforced Concrete Framework

#### **Awards:**

Architecture Art Award China 2003

In designing the library, my purpose was to make people aware that they live between mountains and water, which is the garden style of Suzhou. Backed by a mountain full of bamboo in the north and facing a lake that used to be a disposed brickfield in the south, the slope site descends southward with a difference of four meter in the level. According to the principles of gardening, buildings between mountain and water should not be prominent. So nearly half of the library is underground. The three-storey building actually shows only two-storey to the entrance-side. The rectangle main body is floating over the water, facing south, the dominant direction of the winds in summer. From north to south, and also from mountain to water, four separate pavilions are inserted into the complex. It is the soul of the traditional Chinese garden to change scale from one to another. For a literati, the small houses are much more important. The pavilion-like building in the water, – the poetry and philosophy reading room of the library -, is from the Chinese literati point of view, in a position where man and nature are balanced. #### **Library Xianlin Campus – NJU Nanjing University, Nanjing – China 2010**

The library in Xianlin campus of NUPT was started constructing in 2007, and was completed in May, 2010, with a building area of about 33,018 square meters, a collection of 684,437 books, 4,645 seats for its readers, and modern service facilities such as newspaper reading machines, guidance stations, automatic borrowing-returning machines, separate reading rooms for VIPs, etc.. The new library employs the modern management mode of "the Great Circulation" integrating storing, borrowing and reading with a single entry exit. Readers, in and out with their bags, enjoys great freedom here. The library is truly a spiritual paradise of all the readers. (<http://www.njupt.edu.cn/s/2/t/2/33/7d/info13181.htm>)

Cooperative Designer: California Civil Design Group

<http://www.pfeifer.de>

The TEDA library is situated at the heartland of the administrative sector of Tianjin Economic and Technical Development Zone, and the library is to be constructed with a 45° bearing as is planned in the architectural program to make this building the most stirring musical note in the whole city. The modeling of this library is of individuality and identifiability, with the giant and rhythmic facade of chancery as the background. The concise and elegant oval modeling of the library and its transparent reading rooms reflect the time spirit of this building. The indoor space of the library is characterized by openness, and the up-to-date design theory of flexible and nonflexible space is adopted. Blocks and tubes of different shapes are provided in vitreous bodies according to their functions, and the effects of space circulation and transformation can be achieved through the combination, inter-penetration and variation of all the elements. (ECADI)

## **GL Studio – Gong Lu Architectural Design Studio, Shenzhen – China**

<http://www.chinese-architects.com>

### **Libraries:**

#### **Library of Dongguan Institute of Technology, Dongguan – China 2004**

Project Name: Library of Dongguan Institute of Technology, Location: Dongguan, Guangdong Province, Client: Dongguan Songshan Lake Administration Committee. Dongguan Institute of Technology, Architect: Gong Wei Min, Lu Yang, Yu Yong, Gao Wenfeng, Den Desheng, Yang Jun, Hu Qingbo, Structure and Material: concrete, steel, aluminium, Building Area: 24700 sq. Meters, Design Period: 2002\_2003

The new campus of the Dongguan Institute of Technology at Songshan Lake comprises 12 building projects, the design of which is undertaken by various young Chinese architects. The campus is located on hilly terrain rich with vegetation and water bodies. Located in middle of the campus, the library is the center of a public building complex which consists of an administration block to the southwest, a theater and a conference building to the west. It also defines a central campus plaza with neighboring buildings to the east. The succinct rhomboid shape is dictated by these site and contextual conditions. The two-level-high colonnade is to provide generous space for dynamic interactions and social life in campus. Transparency is achieved through the use of architectural glass, thus linking the natural forest to the west and the plaza to the east. Taking advantage of the site condition, the grand steps add monumentality for the east and south fronts. The internal streets allow sunlight to reach the center of the building. It also forms visual corridors, bringing natural views into the depth of the building. The south and north facades feature plain concrete wall punctuated by small windows. The east and west facades are made of an inner layer of sliding windows and an outer layer of aluminum shutters which provide shading, prevent glare, and give the building a fresh and transparent feel. <http://www.kalarch.com>

### **Libraries:**

#### **Tianjin Binhai Library, Tianjin – China in design 2012**

Client: Tianjin Airport Authority, 2.100 m<sup>2</sup>

....The façade design was developed in a rather unusual, relaxed, manner; namely, the playful examination of a piece of paper. The architects folded the paper in a way that loosely corresponded to the base, and layout, of the existing building, whilst examining the new contours being created; this led to the eventual visualisation of the new structure's skin. When constructed, extensions will be administered in a perforated metal, which will allow for different angles and views of the library. Holes have been rendered into the façade, with an expressed visual metaphor for the importance of reading between the lines; these breaks in the overall external aesthetics, will supposedly force everybody to 'read between the lines' of the 2,100 sq m library itself.

The idea, behind renovations, was not only to redefine, to the benefit of the surrounding city, its extrinsic appearance, but also to have a positive influence on the environment inside the building. In order to achieve this approach, all angles of their frontispiece define two different types of spaces incorporated within: classrooms and study areas, positioned to provide users a sight-line to the sky; and lobbies and exhibition rooms, facing out onto the reflective surfaces of the river.

## **Kokaistudios, Shanghai – China**

<http://www.kokaistudios.com>

### **Libraries:**

#### **Tsinghua Law Library, Beijing – China Competition December 2011**

Architects: Kokaistudios, Location: Beijing, China, Design Team: Filippo Gabbiani, Andrea Destefanis, Pietro Peyron, Li Wei, Qin Zhantao, Daniel Ding, Client: Tsinghua University, Area: 20,000 sqm

....Circulation and public spaces, both indoor and outdoor, are interlocked in an innovative sequence of 'places', a coherent continuum of solids and voids directly inspired to the traditional urban carpet of the Courtyard Houses, characteristic of Beijing. Within the proposed site, three new multifunctional buildings are located around a public square, center of a system of new sunken gardens and outdoor pedestrian connections providing access to the buildings' public functions located in the basement and ground floor.

Inside the Library of Law Faculty, the program is structured in three major functional areas, vertically organized according to their increasing requirement from privacy: classrooms and students' facilities are located in the lower floors, the Library at the center, while teachers' laboratories and Research Institute occupy the three top floors, opened around the roof garden.

This inner system of voids and public spaces is expressed as a seamless and continuous sequence of openings carved in the stone modular façade of the Law Library Building. Archdaily 10.05.2012

<http://www.archdaily.com/232493/tsinghua-law-library-building-proposal-kokaistudios/>

### **PKU University of Law, Beijing - China 2010**

Architects: Kokaistudios, Location: Beijing, China, Team: Andrea Destefanis, Filippo Gabbiani, Li Wei, Fang Wei Yi, Liu Wen Wen, Yu Feng, Local Architect: BIAD, Structure: BIAD, Mechanics & Electricity: BIAD, Project Area: 10,000 sqm

A challenging project for the most prestigious University in China in the heart of its historical campus.

In 2009 a prestigious American Foundation and Beijing University invited Kokaistudios to design the building for the new faculty of law located in a prestigious location within the historical campus of China leading University. This particular site, where the pagoda symbol of the university is standing, required considerable effort in terms of design in order to find architectural answers that could satisfy and meld in a harmonious way the heritage elements; the beautiful natural environment and the new contemporary building. This prestigious project, completed in October 2010, is considered the milestone of a new era for Beijing University, and a symbol for better and more environmentally sustainable standard of living for the future University Community and for architectural buildings within that community.

This project has been conceived on a rigid volumetric shape imposed by the strict regulation protecting the historical site and at the same time by the necessity to fulfill all the functional requirements of the new faculty. The rigorous style requested to be accepted by the large number of heritage commissions have been interpreted in creative way by Kokaistudios by proposing an elegant use of few materials, concrete plasters and local stones with capabilities to transmit day light and a clever use of skylights, sinking gardens in order to increase the use of natural light and thermal efficiency of the building. Kokaistudios transformed the facades to become light filters and diffusing soft daylight light all over the interiors. The entire system of internal spaces has been designed by our team so to upgrade the standards of working, living, and studying of the future professors and students, using sustainable materials and creating aggregation facilities and spaces that could satisfy the flexible demands of the faculty in the future. ### **Lyics Architecture, Hangzhou – China**

<http://lyics-arc.com>

**Libraries:**

#### **Jiaying University Library and Media Center, Jiaying – China 2012 - 2014**

Location: Jiaying, China, Total Area: 42,000 Sqm

Project Dates: 2012-2014, Architect Of Record: Architectural Planning Design & Research Institute Of Zhejiang University Of Technology

With the new winning competition entry for the Jiaying University Library & Media Center, LYCS seeks to break antiquated design conventions by intelligently negotiating contemporary architectural design into the traditional Chinese campus. Surrounded by rich woods and luscious water, the 42000m2 library plays with hierarchy – the hierarchy of multiple, increasingly private spaces; the hierarchy of the pace of spatial experience; and the hierarchy of introversion and extroversion. A division between the campus and the courtyard, the library encourages public activities in the courtyard and on the roof garden while limiting excessive visual interruption to the three lobes. Instead of using the traditional circulation of straight staircases, a gently sloping ramp wraps the core creates a softer circulation experience that responds to the information-oriented architecture. Slicing the corners off of the triangular plan softens the form and allows for better utilization of daylighting. The double layered facade lifts from the ground plane by a nurbed surface, creating a theatre-like experience of form : as one progresses toward the center court, the facade curves extrudes to a height of 35 meters, expanding into three roof gardens that converge toward the geometric center of the plan. A floating crystalline form is achieved by the juxtaposition of the glossy reflection of the aluminum/glass facade and the gentle curves of the lakeside. The first two levels of the building contain museum, archive, and network center, with a library above. The views at the perimeter open to the landscape outside, while the ramping forms create varying vantage points within the building, weaving a multiplicity of experiences between the green spaces, reading spaces, and common areas. (Lyics)

### **MADA s.p.a.m, Jingan District, Shanghai - China**

<http://www.madaspam.com>

**Libraries:**

#### **Jidang District Public Library, Shanghai – China Design 2008**

Client: Jidang New City Development CO Ltd.

13,600 m<sup>2</sup>

#### **Library for Zhejiang University, Hangzhou – China 2002**

7,010 m<sup>2</sup>, Total construction cost: 73.7 millions RMB

Unusual geometry characterizes this unique academic library. This library is located on the Ningpo campus of Zhejiang University, which was also master planned by the same architect. Because the campus was constructed in its entirety within a year, developing a traditional, time-cultivated, identity was very difficult, if not impossible. The library's ambition is to achieve a strong identity. To fulfill this, the architects' strategy was to create a clear character distinguishing it from the campus as a whole. This deviation is expressed through both its logistic centrality and its architectural banality. It simultaneously occupies the hinge point between living and teaching quarters of the campus, the nodal point of the monumental common green running east-west, and the major internal circulation line running south-north. Its central location makes the library and open space around it the heart of the campus. The

library takes form and connotation from the ancient Chinese Scripture Pavilion (cang-jing-ge), a sacred room within a temple made to accommodate religious books. With a seven-story mass rising above a concrete pavilion, the building is monumental, rising high within the plane of the level green around it, with colorful irregular cut-outs in the façade and a playful use of color within the cut-out areas. Inside, all book stacks are densely packed and arranged along the building perimeter, resulting in a large void at the center. Within this void, floating spaces accommodate public functions including an index room, Internet café, and reading lounge. A series of skylights on the roof bring in natural light. Within the dense perimeter made by books and walls, various reading areas are carved out. (Mada)

Not all the projects have extraordinary geometries but inventiveness abounds as in the great grand staircase entrance to the Ningbo Campus Library at Zhejiang University in Ningbo. Designed by MADA spam, which is headed by Chinese architect Ma Qinyun, and completed in 2002, the staircase has many angled railings rather randomly spaced. "The library, elevated on a large podium, is a nine-storey red cubic building, and as expected, the building as a central void in order to 'seduce' the reader. An outer layer of the perimeter forms the privatized reading areas. For Kahn, the void, symbolically, is about sharing, which complements the private experience of reading and learning. The books, in this scenario, mediate the two experiences. Quite to the contrary, the architect of the Ningbo campus library has followed the notion of a Buddhist scripture pavilion - cangjing ge - in a Chinese temple, wherein the library is a sacred room with permanent stacks of Buddhist scriptures. The spiritual power of the scriptures should overwhelm the reader, and hence books are worshipped. It is unclear as to whether or not the architect wanted to make this library a sacred place in a modern university but its scale, bright colour, podium elevation and the vast foreground lawn contrive to make it the most monumental building on the campus." (<http://www.thecityreview.com>)

## **P & T (Palmer Turner), Hong Kong – China**

<http://www.p-t-group.com>

### **Libraries:**

#### **Shunde Cultural Center Complex (Library), Shunde (Foshan) – China 2006**

Client: Shunde Shi New City Development Centre, 26,200 m<sup>2</sup>, RMB 137,000,000

### **Awards:**

**Design for Asia Award 2006 - Best Design from Greater China**

An award-winning new cultural center complex is underway in the Shunde district in Foshan City southeast China. Commissioned by the Shunde Shi New City Development Centre, a local government body, the complex includes a performing arts center, library, and two museums. Shunde Cultural Centre consists of a performing art centre and a library in Phase 1 and two museums in Phase 2. To give identity to these four buildings while appearing as a unified whole, they are layout on both sides of the new city axis and are made into two complimentary pairs like the couplet outside traditional Chinese doors. Being in a new district developed from farmland and almost without any site context, the four buildings adopt a bold geometry to express the entrepreneur and daring spirit of Shunde people, and at the same time, pay great attention to practicality and attempt to design "without fat", not only to express the pragmatic character of the people, but also to meet the tight budget of the project. The first pair of couplet formed by the performing art centre and the library share a complementary "yin yang" massing with the oval form of the arts center fitting into the void of the library. The performing arts center will include a 1,500-seat theater, a 500-seat oval shaped concert hall and an ancillary music school. Through the use of an inverted "Y" shape, the back-of-house facilities and technical equipment for the theater and concert hall can be shared. The Shunde Performing Arts Center was awarded in "the 2006 DFA Best Design from Greater China". The jurors commented that "Shunde Performing Arts Centre puts Shunde and Foshan on the Asia cultural scene and proves that outstanding design and a tight budget are not necessarily mutually exclusive." The adjacent Shunde Library serves the community as a public library and also houses two major exhibition halls on its lower floors. The lobby, which is made up of colonnades of reading booths resembling a gigantic bookcase. The theme of bamboo, the "scholar of nature" according to Chinese ideology, is used in the design of the elevation and throughout the interiors. Reading areas are punctuated with gardens and courtyards, and there is considerable natural sunlight throughout. The project was awarded by the American Institute of Architects (AIA) and American Library Association (ALA) "the 2007 AIA/ALA Library Building Award". The jurors commented that "This Chinese library achieves a subtle, poetic response to its Asian culture, reflecting a global architecture that, nonetheless, maintains a compelling sense of place. The jury was impressed not only by its community centred offerings but also by the quality of its design and execution that equals the best of international architecture." Across the street, two new museums share a similar concept and composition that follows traditional feng shui principles and the vernacular architecture of the region. The Shunde Science and Technology Museum is visually formed by seven solid slabs rotating around a glass drum which is linked to the roof to form a greenhouse. At the center is a capsule-like atrium with a cascade of escalators. The arts center completed in 2005 and library was completed in 2006; the museums are under construction and scheduled for completion in 2009.

(<http://www.worldarchitecturenews.com>)

The library, together with a performing arts center and two museums, forms the new cultural center of Shunde, a fast-growing district with a population of about 1 million located in Foshan in the Pearl Delta Region. Standing on the previously context-free district center, the library and its neighbors adopted bold geometries. Functionality and meeting the tight budget were the major concerns in design, resulting in a simple rectilinear form that was easy and cheap to build. Free of odd shapes, the plan allowed for flexibility of layout. The "no-frills" approach turned functional elements—like the reading booths and the staircase—into design features. Additionally, climatically responsive facades minimized energy consumption while careful planning and a clear segregation of day and night zones cut management costs. The library, apart from serving the community as a district main library, also houses two exhibition halls on its lower floors, which take up more than a quarter of the total gross floor area. Formed by colonnades of reading booths, the lobby was designed to resemble a gigantic bookcase that orients visitors to the correct sections of the library, while reading areas are punctuated with gardens and courtyards. The theme of bamboo (in Chinese ideology the scholar of nature) was reflected in the design of the elevation and choice of materials. The interior of the library follows the Chinese idiom (bright windows and tidy furniture), which defines the ideal study environment for Chinese readers. Except for the west side for energy reasons, the all-glass facades with considerable shading from the projecting features allow a flexible layout of the reading spaces while a minimalist interior provides visitors with a neat and harmonious environment for reading and study. (P & T)

An award-winning new cultural centre complex is underway in the Shunde district in Foshan City, southeast China. Commissioned by the Shunde Shi New City Development Centre, a local government body, the complex includes a performing arts centre, library,

and two museums. Located in the centre of the Pearl River Delta, Shunde has a booming economy and a reputation as “the kingdom of household appliances.” The government has committed to major infrastructure improvements from highways to advanced telecommunications systems to cultural and educational facilities. The entire 40.5 acre (16.4 hectare) complex is being master planned and designed by Hong Kong-based P&T Architects and Engineers with the Shunde Architectural Design Institute and Guangdong Architectural Design Institute. To promote a unified image while providing identity to each building, the four buildings are laid out in pairs on two sides of a new city axis. The Shunde Performing Arts Center and the Shunde Library share a complementary “yin yang” massing with the oval form of the arts centre fitting into the void of the library. The performing arts centre will include a 1,500-seat theatre, a 500-seat oval shaped concert hall and an ancillary music school. Through the use of an inverted “Y” shape, the back-of-house facilities and technical equipment for the theatre and concert hall can be shared. The Shunde Performing Arts Center was awarded “the 2006 DFA Best Design from Greater China.” The jurors commented that “Shunde Performing Arts Center puts Shunde and Foshan on the Asia cultural scene and proves that outstanding design and a tight budget are not necessarily mutually exclusive.” (<http://www.asiacre.com/download/ACRE3-07WEB.pdf>)

## **Urbanus Architecture & Design, Shenzhen – China**

<http://www.urbanus.com.cn>

### **Libraries:**

#### **Futian Library Complex, Shenzhen – China 2001**

Client: Shenzhen Futian Building Affairs Bureau, 60,000 sqf.

This project intends to explore the extra-high densities of contemporary Chinese cities and its effect on the urban culture. As an urban strategy, a good design should let buildings demonstrate relationships within the existing urban structures, as well as shape and stimulate new living conditions. Although the site is initially prepared for a library and the information center laid in parallel, our solution is to stack them vertically to form a 60-meter-high cube, freeing up half the site. Therefore, building density is highest on the eastern side, while the western side has no building density whatsoever. The advantages of such a layout is two-fold. First, the library becomes an impressive civic icon with a generous front plaza. The centralized volume formed by a stacked program draws a sharp contrast with the surrounding buildings, creating a significant landmark in terms of massing and spatial organization. Second, a conventional façade design could not enough to combat the problems of urban congestion in this area. This new elevational approach moves away from a mere articulation of elements, and towards a true exhibition of interior activities, which almost spill out into the urban spaces outside. (Urbanus)

### Felipe Uribe de Bedout Architectos, Medellin – Columbia

<http://www.felipeuribedebedout.com>

#### Libraries:

#### Biblioteca Empresas Públicas (EEPPM) de Medellin) José Luis, Medellin – Columbia 2006

Aquitectónico Style Theme Library EPM is modern in a pyramid. The work includes approximately 10,000 m<sup>2</sup> containing the services expected and needed to be considered a contemporary library: reading areas, storage of books, internet lounge, exhibition gallery, café, copy center, playgrounds, technical areas, local commercial areas of training, film library, auditoriums, study carrels, among others. This project achieves the best balance between user and information, bearing in mind the idea of feasibility in terms of construction, functional and aesthetic. Architect Name: Felipe Uribe de Bedout Architect, Architects signing Bedout Uribe.

What is made building materials? Drayble lined metal base on the ceiling, the walls are marble, wood and glass, the floor is in marble. Functionality of the structure: The building is in the order of the pyramid of knowledge, that is usually part of their first floors, to the specific at senior levels, distributed internally in four levels and a basement.

#### LEVEL 01.

1. City Room: In this space presents a cultural exhibition focusing on projects concerning the development of the city and areas of expertise of the Library.
2. Children's Room: The most appropriate place in the Library for children and young people, has a library collection consists of books, encyclopedias, dictionaries and literature on specialist areas of the Library in simple language. It offers Internet service and develops a schedule that includes seed science, workshops reunion, video, lectures, games and other programs that encourage creativity, to train future researchers and scientists in the areas of Science, Industry, Environment and Technology . It also has a space to develop their play activities and experimental workshops.
3. Cinematheque: Seating for 110 people. It is used for activities related to the specialty of the Library as cycles and film forums, conferences, among others.
4. Technical Processes: This space is made by the technical processing of new library materials in various media (books, magazines, CD ROM, DVD, etc.) before being placed in service to users.
5. Administration: This area includes the offices of the address, secretariat, logistics, communications and culture.

#### LEVEL 1

1. General Past news: You can consult the general interest magazines and major newspapers. Additionally, this place is the reference collection as dictionaries, encyclopedias and atlases; material for learning English and the folding of EPM.
2. Digital Art Gallery: This gallery will display traveling exhibits of digital art.
3. Internet, audio and video: Composed of four rooms which offers these services free of charge in shifts of 30 minutes per person. You can consult on specialty areas of the library, video collection and see the national and international news. To save the files you download from the Internet, you must bring a CD or USB memory.
4. Gallery: You can enjoy various art shows, in a comfortable, pleasant, with the possibility of using the coffee service.

#### LEVEL 2

1. General Reading Room: Here are the library collections of electronic engineering, electrical, hydraulic, mechanical, systems, circuits, digital electronics, data transmission systems, telecommunications, telephony, energy processing systems, soil mechanics, rules on construction techniques and architecture, structural analysis, environment, hydrology, water falls, water treatment, control theory and machines, gas, among others. It is a comfortable and friendly place where users can read, consult and make breaks.
2. Specialized Training Rooms: The Library has four rooms for specialized training and online information resources that respond to each of the areas of Library Science, Industry, Environment and Technology. These, with resources of information in electronic form and online access.
3. Balcony of study. Study has 40 seats with a panoramic view towards the Plaza de Cisneros. In addition, 10 cubicles for individual study. They are collections of national and international technical standards, print and online. Books on informatics and sciences, as well as reports, balance sheets and geographic information systems.
4. Scientific TV rooms. The Library has two TV rooms science, each with a capacity for 18 people. Have continuous programming ranging from Discovery Channel, Animal Planet, National Geographic. You can also reserve space for groups interested in consulting videos in the collection of the Library.
5. Auditorium: At this level there are two halls located in each of the sides, north and south. One with 90 seats and the other for 81 where different events pertaining to specialty areas of the Library.

#### LEVEL 3

1. Specialized Newspaper Archive. There are 40 posts of study and houses the collection of journals, 90% of them in English, published by national and international organizations recognized by the four specialty areas: Science, Industry, Environment and Technology.

#### LEVEL 4

1. Terrace - The terrace of the Library to appreciate the Plaza de Cisneros, Railway Station, the Alpujarra and a nice landscape of the surrounding mountains in the east of Medellin.
2. Researchers rooms - There are four rooms for up to fifteen people each, equipped for the development of activities of research groups in the four areas of expertise of the Library. (<http://www.reddebibliotecas.org.co>) (<http://www.fotografiavarquitectura.com>)

## Giancarlo Mazzanti Arquitectos, Bogotá - Columbia

<http://www.giancarloalmazanti.com>

### Libraries:

#### Biblioteca España, Santo Domingo Savio, Medellín – Columbia 2007

Architect: Giancarlo Mazzanti, Collaborators: Andrés Sarmiento, Juan Manuel Gil, Freddy Pantoja, Camilo Mora, Pedro Saa, Alejandro Piña, Iván Ucros, Gustavo Vásquez, Constructed Area: 5500 sqm, Concrete Structure: Sergio Tobón, Steel Structure: Alberto Ashner

#### Background and needs

The Project is located on one of the hillsides that have been affected by the violence since the 80's because of the drug traffic network that operates in the city of Medellín. It is part of the government's social master plan program to give equal economic and social opportunities to the population. The program asked for a building with library, training room, administration room and auditorium on a unique volume. The proposal was to fragment the program in three groups: The library, the rooms, and the auditorium; then join them with a bottom platform that allows flexibility and autonomy, improving the people's participation considering each volume operates independently.

#### Justification of the adopted composed solution

Medellín is geographically mountainous. The city is located in the north of Los Andes mountain ridge, one of the most topographically broken places of Colombia. This geography defines the identity and the image of the city. This image is precisely what the project aims at, it intends to integrate itself into the landscape and become an interpretation of it.

#### Architecture as landscape

More than a building, it proposes the construction of an operative geography that belongs to the valley like a mechanism of organization of the program and the zone, showing the unknown directions of the irregular mountain contours, not like a metaphor, but like an organization of the form in the place, a folded building cut like the mountains. A landscape building that redefines the folded mountain structure in form and space, nullifying the idea of the landscape like a background and encouraging the ambiguity building-landscape. Justification of the urban insertion of the proposal

#### The Place:

The Project is organized in two structures: the first one is the building – landscape (rocks) and the second one is a platform that integrates and transforms the cover into a square that looks into the valley; this way, the building is empowered as a meeting place, multiplying the connections and letting it develop as a reference point.

#### The building like an icon

The place is made by small brick houses, product of auto construction; and residue of green areas as a result of the impossibility of construction on it. This organization produces a uniform texture of the city like a building – landscape, like an icon, keeping the tension that already exists. Geography as an element of hierarchy; and architecture as the epitome of texture. The Project is noticeable from a big part of the city, allowing it to redefine itself as the symbol of a new Medellín, as a way of making people feel identified and receiving the building as their own. In the present state, the building is one of the touristic points in the city and one of the most visited.

#### Ambient and atmosphere

Additionally to make an icon building, the first premise was to develop a construction that, through its interior design, could descontextualize the individual from the poverty that is experienced in the outside creating a warm atmosphere based on natural light, allowing a great ambient of study and lecture. This is the reason why the building takes a timid look into the city through the small windows that show the relation with the valley, letting the illumination go into the top of the building.

<http://www.archdaily.com>

Giancarlo Mazzanti builds an icon to foster optimism in Medellín, Colombia, with his Parque Biblioteca España.

By Beth Broome

Although Medellín, Colombia, a valley metropolis of more than two million in the northern reaches of the Andes, is sometimes called the City of Eternal Spring, it is better known for its erstwhile reputation as Murder Capital of the World. It earned its nickname when drug lord Pablo Escobar and his minions made it the center of their business operations in the second half of the 20th century, and guerilla and paramilitary groups and street gangs proliferated in their wake. Though Escobar was "taken out" 15 years ago and the crime rate has dropped dramatically, Medellín has been fighting a long uphill battle to reinvent itself and gain back its reputation as a vibrant commercial and academic center.

Following in the footsteps of the country's capital, Bogotá, the city started developing a social master plan in the late 1990s. By creating infrastructure, architecture, and community programs, the government hoped to bring opportunity to the lower classes (to repay a historical social debt of inequity), improve the quality of life for all, and draw business and tourism to Medellín. Since the turn of the millennium, the city has been experiencing a building boom (guided most notably by Mayor Sergio Fajardo) of parks, housing, schools, libraries, and new public transportation—concentrated primarily in poorer neighborhoods—for which it has employed many accomplished designers from within the country.

In 2005, Colombian architect Giancarlo Mazzanti, whose firm is based in Bogotá, was awarded two public commissions by way of open competition, and has designed a pair of libraries, one in the neighborhood of La Ladera, the other the Parque Biblioteca España, whose striking, unorthodox form sits in stark contrast to the makeshift architecture around it in Santo Domingo Savio barrio.

Completed in 2007 at a total cost of about \$4 million, Parque Biblioteca España, which looks out over the valley from its hillside perch among simple brick and stucco structures, has a profound presence and has caused quite a stir, which has spread far beyond the neighborhood. At the end of the last century, the Santo Domingo Savio barrio was considered one of the most violent in all Latin America—so dangerous that the police purportedly would rarely enter. Though much improved today (no longer dominated by a panoply of outlaws, it is now fairly safe to walk around), it is still an impoverished district. Few cars use the winding, narrow streets, so a strange silence pervades, penetrated by the rattling of homemade go-carts that children race down the hills. Most people enter the neighborhood by way of the new Metrocable, a gondola that serves some of the city's more depressed and inaccessible areas. Mazzanti responded to this most unusual site by building not just a public facility in a densely populated community, but also a point of pride for the neighborhood and a symbol for the larger city. The program requirements were straightforward, calling for a library, auditorium, classrooms, and administration areas.

Though the 11,500-square-foot library's three discrete, boulderlike shapes were informed by the rugged, mountainous terrain, they also help the building stand out from the surrounding neighborhood, emphasizing its monumental scale and muscular stance. The program is simply divided among the three masses: auditorium, library, and community center, which are linked by a rectilinear concrete podium at the main level. The various areas are entered through this "covered public square," which is topped with a wood deck, connecting the volumes at the next level and offering dramatic views down into the valley through the voids between the faceted mounds.

The facades' glazing is limited to small square and rectangular windows grouped in irregular patterns on axis or on a diagonal. Daylight enters the library and community center mostly by skylights that run around the periphery of the roof and bring light into the broad floor-to-ceiling chasm between the poured-in-place concrete core and the steel-framed envelope, which is clad with dark stone tile. The library's core houses three stacked, double-height reading rooms, each ringed with computer stations in upper balconylike mezzanines that look down on the rooms below. At its uppermost level, an event space tops off the core. The community center holds a day care in one of the lower levels and, within the core, classrooms/workshops and an exhibition/event area. The auditorium is a simple white space lined in drywall with dark strips of acoustic fabric on the back wall and ceiling. Its stadium seating follows the steep contour of the hillside to which the whole building clings. The solitary source of daylight, a cluster of small windows, admits light into the backstage area. Limiting apertures to create an inward-looking building was an intentional move by Mazzanti. This "disconnects the people temporarily from their context," says the architect. "We wanted to take people from this poor community into another place and change their reality." And it works: In the pleasant interiors, animated with children's activity, one quickly forgets the difficult realities of the world just beyond the library's confines.

Mazzanti employed simple materials, such as the dark stone tile for the exterior walls, which comes from the Bogotá area; a local stone tile for the floors, commonly referred to as "café pinto"; and drywall. Oak paneling sheathes many of the interiors in the library core, and is accented with squares of lime-green laminated glass, while a dark stained patula pine wall system encloses the core space in the community center.

Though the library has only been open about a year and a half, it is already showing signs of aging. There is water damage around many of the windows, and some of the exterior tile, which is fastened to a fiber-cement-board substrate with rivets, has fallen off, while a white efflorescence runs down portions of the facades. These problems are largely attributable to the difficulties of public construction in Medellín. Among other things, Mazzanti says he had just three months for the design phase (which is typical for public work), and that construction deadlines were pushed—and corners cut—to complete the building in time for a visit from King Juan Carlos I of Spain who contributed a small sum toward the project (hence its name). Mazzanti, who says that he is working to make the necessary repairs, also acknowledges that pushing the envelope with the design may have been a stretch for the government-assigned local work crews, which use low-tech construction methods and low-skilled labor.

Construction quality is one factor that has left the Colombian architecture community divided on the library, which won the 2008 Iberoamerican Architecture Biennial award and has grabbed the widespread attention of the international press. "The fact that it received an award has caused the first real uproar we have had in the architecture community for years," says one Colombian architect, explaining that some believe the library, among other things, is not representative of "Colombian architecture." But others question the existence of a single, authentic vernacular. "It's not so much a Colombian tradition as a Salmona tradition," says another architect, referring to the detailed masonry work that became the hallmark of the revered late Colombian architect Rogelio Salmona, a widely adopted approach with which Mazzanti does not actively identify. Instead, Mazzanti, who says he is "interested in understanding conditions that reflect what the world is today," maintains that inserting riskier, global architecture in this context was necessary to create the symbolic gesture he was after.

With the Parque Biblioteca España, Mazzanti set out to create an icon, and in this he has been successful. With its site, bold forms, and materials, the library is the most visible of the projects associated with Medellín's recent program to use architecture to effect social change. It has also helped catalyze a challenged community, especially its children, who flood the computer stations and play and socialize on the deck. Additionally, the building has created a pride of place, with boys even greeting visitors getting off the gondola by offering "architectural" tours. This is quite a change from the feared neighborhood of the recent past. Given all this, of course, it is incumbent on the city to maintain the building: Watching a symbol of hope fall into disrepair could have troubling consequences. It is critical that the powers that be in the municipal government have a continued interest in the Parque Biblioteca España and other programs they have helped bring into the small world of Medellín.

#### **Biblioteca Ladera, León de Greiff, Medellín – Columbia 2007**

Constructed Area: 6.800sqm, Services: Constructor AIA CONSTRUCTORES, Structural Engineer: Sergio Tobón, Materials: Concrete, Wood, Glass

The aim is to establish a project that enables the biggest amount of urban connections and the development of public spaces. To achieve this, there are several proposals such as enabling the roofing of the building as public space, empowering meeting places and developing viewing-points which overlook the city.

#### **Zonal Equipment – Management Strategy**

The model allows the usage of communal facilities as small open spaced theatres, viewing-points, small plazas and sport fields when placing them on the rooftop, leaving plain borders as vacuums inside the lot and thus enabling their external use. We propose a management program between the EDU and the Culture Secretariat called "Film, Music and Theatre in my quarter". This will allow the usage of the above mentioned roofing as auditoriums so that every two weeks a cultural show can be taken to each quarter. The place presents itself as a green viewing-point and a territory of connections between the lower and upper zones of the quarter, which are actually used as areas for sport activities. The project we propose will redefine the existing paths and empower the creation of shaded plazas on the library's rooftop. As a result, it will not only multiply the connections because the building will be an obliged path, but it will create more and more events as people intertwine in the public spaces provided around the library. More than a transformation, we want to re-interpret the space so that it can be recreated into a symbolic place for the city. The project will consist of a system conformed by three contained, rotated, squared modules that turn, adapting themselves to the landscape and the view and one curved module that unites and relates the other modules and that, in addition, allows other uses. The project is a landscape that gives the urban geography continuity through the paths and the building of public space on the rooftop, a landscape constituted by paths, theatres or inclined plazas, a spatial network with connection multiplicity and meeting places.

**PROGRAM:**

1. CONTAINER 1 – COMMUNITY CENTER - User: individual and in groups. Time: 24 hours. Multiple Salons (quarter meetings), my quarter, gymnasium, sieve, technical substation (optimizing the land cut left by housing).
2. CONTAINER 2 – LIBRARY- User: individual. Time: Attending from 8am to 8pm. Foyer, reception, catalogue, collection, reading rooms, navigation centers.
3. CONTAINER 3 – CULTURAL CENTER - User: Organized groups. Time: Scheduled events. Auditorium, workshops.
4. CURVED CONTAINER - 24 hours. Can be used as support. Exposition rooms (as obliged path for all users), cafeteria, management, bathrooms, ludotechs (will be used as kinder gardens 24 hours).

Structural system in reinforced concrete, in porches and screens. Each container module is structurally independent from the curved connector. Modules are conformed by screens in the ends to compensate the projection afore mentioned and in the center 2 axes of rectangular columns in concrete. The connector is proposed in a reticule of metallic columns filled with concrete and a contention wall in stone gabion and concrete in the rear part. Vinyl floors in different colors and shapes limiting pedagogic areas. Visible roofing in white concrete with inferior cake and wooden panels of 5 cm planks. White antique concrete walls. Crystal plates in sandwich with colored resin on the inside to mark and provide some color to the pedagogic areas. The mobile panels of the façade in folded cool rolled planks and curved borders with elements in teka wood. Following this, the Container Module 1 is thought to have 3 floors, using the tilt of 12 meters left by housing. Circulation systems crossed airs through the mentioned patios, which allow cold air to displace hot air. We propose the usage of natural air cooling systems, nurturing the inside of the library with fresh air. In addition to this, we want mobile blinds to cover the windows that face the sunset so that the effect of sunlight can be minimized. On top of the roofing-view points, we propose the plantation to trees to provide shadow. (<http://www.archdaily.com>)

## **Rogelio Salmona**

\*28.04.1929 Paris – + 03.10.2007 Bogotá

### **Libraries:**

#### **Biblioteca Pública Virgilio Barco, Bogotá – Columbia 2002**

El Parque Virgilio Barco y su Biblioteca Pública, del mismo nombre, forman con el contiguo Parque Simón Bolívar un solo conjunto recreacional, cultural y paisajístico a pesar de estar separados por la avenida 50.

Su unión se establece por medio de un puente peatonal que da inicio por el occidente al paseo peatonal que termina en la estación del “Tren de Cercanías”, lugar que a su vez es una de las entradas a los dos parques, e inicio, por el oriente del paseo.

El terreno del Parque Virgilio Barco, de forma triangular, está rodeado por un ancho andén y una ciclo-ruta que forman parte del nuevo sistema peatonal iniciado por la Alcaldía.

Contiene además de la Biblioteca Pública “Virgilio Barco”, así denominada en honor al expresidente Virgilio Barco, varias construcciones como cafeterías, espacio cubierto, una plaza con una escultura, senderos peatonales, lagos y taludes que conforman un jardín semi-enterrado.

El paseo peatonal que une el lado oriental ( estación del tren) con el occidental ( puente peatonal) conduce directamente a la Biblioteca ubicada en el sector nororiente conformando una gran “batea” en cuyo centro se encuentra la edificación.

Este partido arquitectónico, resultado de las características del terreno: ( un relleno de 5.00 mts de altura sobre el nivel de la calle ) implicaba, para evitar costos: efectuar movimientos de tierra en el interior del predio de 13 hectáreas, creando taludes de distintos tamaños y formas entre las cuales se conformaron los senderos y caminos peatonales, los lagos, y las distintas plazoletas, las cafeterías y el espacio cubierto.

Se accede a la Biblioteca por el paseo peatonal atravesando una pequeña plaza que comunica con un patio central con una fuente escalonada. Por este patio central, tomando una rampa o una escalera se llega a un primer vestíbulo que distribuye a la sala de lectura infantil del lado occidental y al gran vestíbulo, “sala de pasos perdidos”, por el oriente.

La primera visión que tiene el usuario al entrar en esta parte de la edificación es la panorámica de los cerros de Bogotá recortados por la horizontal del talud verde que rodea la Biblioteca.

La sala de “ pasos perdidos” permite el acceso a todas las dependencias de la Biblioteca que se encuentran en ese piso: sala de lectura, hemeroteca, auditorio, sala de música y conforma un gran espacio de exposiciones y de información general.

En el nivel inferior al vestíbulo están localizados una librería, locales, talleres y una sala múltiple con un escenario abierto al exterior y comunicado con un pequeño teatro al aire libre formado por taludes. La capacidad de la sala múltiple es de 250 personas.

La cafetería ubicada también en este piso tiene la característica de abrirse al paisaje inmediato formado por un gran espejo de agua, taludes verdes y la panorámica de los cerros orientales. Un jardín interior complementa esta zona.

Por otra parte, este nivel contiene todos los servicios técnicos de la Biblioteca ( depósitos, recepción de libros, clasificación, servicios de empleados, etc, y estacionamientos cubiertos de vehículos ). El número de vehículos, 256, responde a las necesidades de la Biblioteca y del Parque Simón Bolívar. El acceso al estacionamiento se hace por la avenida 50.

En el nivel superior del vestíbulo se encuentra la sala Bogotá a la que se accede por medio de una rampa que la rodea y que continúa hasta la terraza jardín. Su cubierta es un auditorio al aire libre.

La administración de la Biblioteca y la Bibliored está localizada en la terraza jardín, que sirve también como zona de lectura al aire libre.

La galería de acceso a la zona administrativa está integrada a la sala de lectura.

La sala de lectura es un gran volumen semicircular constituido por tres zonas diferenciadas cada una en un nivel diferente.

En una primera zona y nivel se encuentra la entrada a la sala, el control, la información y la sala de referencia. Por medio de rampas y escaleras se accede tanto a la sala de lectura general en un nivel inferior, como a la sala de lectura “informal”, situada en un altillo.

Las salas de lectura están orientadas al norte y nororiente para obtener una iluminación pareja y constante, reforzada por la iluminación cenital. Se prolongan al exterior por terrazas donde se han organizado áreas de lectura al aire libre y se disfruta la panorámica de los cerros.

Esta somera descripción no explica otros aspectos de la Biblioteca, como es su espacialidad, sus transparencias, sus posibles sorpresas. Esto es lo más importante en una obra arquitectónica, además de ser abierta al encuentro, a la alegría y que sea enriquecedora para los sentidos

Una obra así pensada, permite entonces ciertas libertades, mejor aún, las exige. Exige por ejemplo componer con transparencias entre sus partes, luminosidades repentinas recorridas por los muros, o el agua que la recorre indiferente.

La arquitectura está hecha para ser vista, vivida y usada tanto por quien le pertenece como por todas aquellas personas que son testigos de su presencia en la ciudad. Es un bien común.

En resumen: el Parque Virgilio Barco y su Biblioteca, unidos al Parque Simón Bolívar constituyen un nuevo servicio social cultural y recreativo para la ciudad de Bogotá, y lo que es más importante, un enriquecimiento del espacio público concebido para el disfrute ciudadano.

Un proyecto de esta envergadura, que se aúna a los otros proyectos de recuperación y creación de espacios públicos, de parques y avenidas, de bibliotecas públicas, demuestra que la ciudad ha dejado de ser la gran abandonada y que por el contrario se está

creando una nueva espacialidad enriquecida por paseos peatonales, ciclo-rutas parques y edificios culturales , jardines infantiles , colegios , escuelas y un nuevo sistema de transporte colectivo.

El espacio público, esencia de la ciudad, recorrido con facilidad y goce, es el medio más eficaz y digno para lograr una ciudad hecha para el ciudadano donde los valores estéticos, armónicos y democráticos vuelvan a ser, a pesar de los conflictos sociales, el lugar de encuentro y la casa del hombre.

La ciudad es el sueño del hombre.

Hay hombres que la han soñado , pero al mismo tiempo han sabido ejecutar ese sueño.

Es lo que estamos viendo en Bogotá: un hombre y una administración que han decidido soñar y recuperar la ciudad abandonada y ofrecer con osadía una posibilidad de conocerla, recorrerla, gozarla y ,claro está, habitarla.

#### **Osijek University Library, Osijek – Croatia Competition**

Architects: SANGRAD Architects + AVP Arhitekti, Location: Osijek, Croatia, Team: Vedran Pedišić, Mladen Hofmann, Iva Marjančević, Gordana Gregurić-Miočić (SANGRAD Architects), Erick Velasco Farrera (AVP Arhitekti), Collaborators: Prof. Boris Baljkas, Željko Bertić, Owner/Client: University J.J. Strossmayer in Osijek, Status: Competition entry – 1st Prize  
Building Area: 13,400 m<sup>2</sup>

Designed by SANGRAD Architects + AVP Arhitekti, the first prize winning proposal for the Osijek University Library becomes a place for cultural enrichment and at the same time, relaxation through the use of green loggias, clean energy, and a pleasant micro-climate on outdoor spaces. The importance of the proposal's orientation is crucial; for the idea is to design an energy efficient library, which was one of the starting components in the design. More images and architects' description after the break.

The site where the project is located was practically defined by the program thus the proposal filled almost entirely its surface.

Following several analysis of different positions for the library, the concept to set the main entrance was set from the most opened area (a green surface of a former sports arena on the east of the plot) thus it became the main square in front of the library. On the west side, a secondary access was generated by the program guidelines for the functionality of the congress area so it could work independently from the main library.

According to the future main promenade located on the southern part of the plot, and which will run through the whole campus, the library opens itself on the ground floor with a glass facade and a large loggia through the upper floors to establish a physical and visual contact. The technical spaces and services access was defined on the northern part.

The library's space, just like any other architectural form that is in some way subordinate to utilitarian considerations, was thought with different approaches. The solution emerged from the given program (size of the basement) and spatial sequences that were generated with the character of a historical Osijek block structure (the fortress on the Upper and Lower Town). Thus, the library becomes a building-block. The library building is programmatically and functionally determined by the central patio and inside was situated the multifunctional hall which formally and metaphorically became the heart of the project. The building tilts its roof towards the south for the accommodation of solar panel.

A library is a very specific spatial structure which is further defined by its functional scheme that belongs to this type of building, so in order to respond to its functionality, the idea was to create spacious rooms with flexible layout of furniture, with a touch of introversion, concentration, targeted and carefully located and directed lightning, diffuse and cool, with a quiet and partially conservative atmosphere.

The external skin is solved in two layers. The first layer is a neutral, metallic, porous membrane that covers the outer contour of the continuous structure (except the main entrance and the recessed loggias). This outer skin also works as a protective film against the solar insulation, but at the same time makes it possible to have visual contact with the outside. The second layer makes multi-layered, composite insulating glass. The interior space is completely open and thanks to the glass façade that filters the vistas from the outside toward the inner patio. The facade of the multifunctional hall within the patio is the same as the outer shell; with the second layer being a semi gloss metalized surface.

#### **Zadar University Library and Campus, Zadar – Croatia Competition 2009**

Vedran Pedišić, (SANGRAD architects), Emil Špirić, Erick Velasco Farrera and Juan Jose Nunez Andrade (AVP\_arhitekti) have submitted their competition proposal for the University of Zadar Library in Zagreb, Croatia. The project received was awarded with an honorable mention. The appearance of the composition is the primary visual phenomena. But yet to determine materiality, tactility, invoice, smoothness and roughness, the detailed distribution of surface, surface variations, plans, open, fullness and emptiness, the colors ... some initial assumption is already there: it relies on visual approaches to the environment, the natural and artificial forms of tradition and cultural standards, the trends and beliefs. The library building is introverted, dignified and a typological highly ranked form. By itself, and because is located within a city where stone predominates, the project becomes a number of solid volumes, like a sculpture from Chillida. The building is thus solid and closed on the exterior and opened within the inner space, through which the inside of the library comes diffuse and shadowy light. Essential visual settings are defined as rough materiality monochrome, external closed surfaces and the smoothness of glass, inner surfaces, all secondary visual art makes its way from the interior and is expressed as the inner light, the movements of people, colors, and order books on the shelves. Material is mostly reinforced concrete, a material of the outer lining is a cornerstone in the form of vertical slabs that encapsulates the basic structures (external walls), and glass surfaces oriented mainly towards the north or shaded inner region. Libraries project proposes, therefore, the protocol established basic scheme. The ground floor are set complementary facilities, the main entrance to the library and the secondary entrances plus various components of the Library (administration, system support, treatment services), and the entrances and exits from the garage. On the first floor are arranged four main functional units: - Library administrators - Collection of open access - Closed circuit repository - Spaces for teaching. On the second, third and fourth floor are arranged, to house the consulting areas, each of which have the option of flexible rearranging spaces. In the basement are allocated 135 garage parking spaces. Orientation certain rooms is determined by the known rules: storage of books, shelves, cabinets, compacts. The reading area is illuminated the by diffuse light from the vertical glass openings that are oriented toward the north or shady, sun-protected areas. Rooms administration oriented towards the south with appropriate protection. Courtesy of AVP\_arhitekti Architects: Vedran Pedišić, (SANGRAD architects), Emil Špirić, Erick Velasco Farrera and Juan Jose Nunez Andrade (AVP\_arhitekti). Location: Zadar, Croatia. Owner/Client: Private .Status: Competition entry, honourable mention. Building Area: 13,500.00 m<sup>2</sup>

#### **Frankopan Krsto – Elementary School, Krk – Croatia 2005**

Project Name: Osnovna Škola Fran Krsto Frankopan, Elementary School Fran Krsto Frankopan  
Year designed: 2003, Year built: 2005, Commission type: invited competition, Area: 3900 m<sup>2</sup>

The city of Krk is a historical town with 3300 inhabitants, so the decision where to locate the school was a very important one: to move the school in a more accessible site on the periphery, or to keep it in the original position in the center of the medieval town. The Mayor has involved the city council in the debate, engaging practically the whole town in the process. The debate has resulted with the decision to keep the school in a more complex location, but one that has the recognizable character. Involvement of the wider community was present throughout the whole process, from the invited competition procedure to the final realization of the project, engaging architects in a direct communication with both the client and the local community. The elementary school is situated on a north-east corner of the medieval town. The scale of the intervention in proportion to the size of the medieval town made it an urban project: the school with its 20 classrooms and 3900 m<sup>2</sup> was clearly the largest volume in the city. The first issue concerning the positioning of the school was its relation within the urban matrix. The initial idea was to erase the borders between the public space and school areas, making the school part of the city. Street and square are transformed in the school territory: with the gym on the other side, the school opens to the street with the main entrance, the library and the restaurant, making the street part of the school courtyard. The second important element was the relation to the city wall. The construction of the school occurred simultaneously with the reconstruction of the medieval wall and archaeological excavations. The building floor plan recedes from the medieval wall and follows the topography of the terrain adapting to the city skyline. Monument preservation department played the critical role in the realization of the project. It has supported both the choice of location and the design method, and the whole project was realized in a close cooperation with them. (<http://www.e-architect.co.uk>)

## **Studio 3LHD, Zagreb – Croatia**

<http://www.studio3lhd.hr>

### **Libraries:**

#### **Zamet Centre, Zamet – Croatia 2009**

Client: Rijeka Sport d.o.o., Project: 2004 – 2008, Construction: 2008 – 2009, Site area: 12289 m<sup>2</sup>, Gross floor area: 16830 m<sup>2</sup>, Volume: 88075 m<sup>3</sup>, Footprint: 724 m<sup>2</sup>, Budget: 22.000.000 EUR

The basic characteristic of the design is the integration of a big project task into the urban structure of Zamet, with the objective of minimizing disruption and to evaluate its given urban conditions - unlevelling the terrain, the pedestrian link in a north-south direction, the quality plateau in front of the primary school, the park zone, placing the programme in the centre of Zamet at the intersection of communications. The joint conceptual and design element of the handball hall and the Zamet centre are "ribbons" stretching in a north-south direction, functioning at the same time as an architectural design element of the objects and as a zoning element which forms a public square and a link between the north - park-school and the south - the street. One third of the hall's volume is built into the terrain, and the building with its public and service facilities has been completely integrated into the terrain, i.e. it creates it with its "ribbons". The public space on the roof is not only a feature of the building in the business part of the centre, but the roof of the hall is also used as a kind of extension of the park situated to the north of the hall. The hall has been designed for major international sports competitions, in compliance with state-of-the-art world sports standards. The design of the hall has been conceived as a very flexible space. The auditorium has been designed as a system with telescopic stands, which open and adapt to the kind of competition and the number of spectators; at major competitions it is possible to seat 2380 spectators by opening all the stands. The architecture of public facilities, the shopping centre, the library and the local authority stands out in the topography of the terrain, connecting the square in front of the hall and in front of the school and tries to integrate into the overall existing context of western Zamet. ### Kuba & Pilar Architekti, Brno – Czech Republic

<http://www.arch.cz/kuba.pilar>

Masaryk University, Art Faculty Library, Brno – Czech Republic 2001

Concealed within a labyrinth of buildings in the centre of Brno is the Art Faculty Library at Masaryk University. Together with the faculty building, it forms a complex that comprises almost half an urban block. Yet in their outlines, form, utilisation and origin the two buildings could not possibly be more different. In the immediate neighbourhood are picturesque gardens and some residential buildings which close off the block on the other side. It is in this context that the library makes its appearance, displaying strictly rectangular volumes, an abstract surface and none of the traditional articulation of windows and roof.

#### Libraries:

National Technical Library, Prague – Czech Republic 2006 - 2009

#### Awards:

2009 Award of Mayor the City of Prague

2009 Award of the State Environmental and for Infrastructure

2009 Build of the Year

#### Literature:

A 10 2007/3 New European Architecture. Two Libraries Prague/Hrdec Králové  
site area: 11.740 m<sup>2</sup>, construction area: 51.434, € 40.000.000

The idea of the new technical library is quite old and started in the 90's. The architectural competition took place in 2000. The investor is the ministry of education on behalf of the State technical library. Our design got 1st prize among approximately 50 proposals. There wasn't any second prize and, instead there were three third prizes. Afterwards, there was a time gap till the year 2004 in which the ministry of education chose to sponsor another competition to decide who would continue in the building design. After the plans were finished in 2006 the developer Sekyra Group was chosen to construct in a PPP like program. The real building contractor was then the partnership Metrostav – OHLŽS. Building construction started in the year 2006 and was finished in January 2009. Currently books are being moved in. There are more sources of the architectural concept of the building. Firstly there is a spatial context influence which involves the historical urbanistic plans for the whole area as well as its present significance. Secondly the concept is our answer to the idea of the institution and especially to the role of the library in today's society. That is why on the ground floor there is a minimum of the library itself unlike all the complementary services such as the cafeteria, exhibition hall and congress hall. Next the chosen shape and material should resolve one of crucial question of how to be modern and monumental at the same time. And, what is important, the building from the very beginning was formed to be energy saving one and the shape show it clearly. Part of the concept is as well the use of the area around the building – social space on the west and a green park on the east. Finally, the building was designed to include the interior and the graphic design following the concept "the technological schoolbook", so a lot of things (for example installations) are knowingly shown for better understanding how the building was designed and functions. The building has three underground and six aboveground floors. Underground there is book

storage, technology, supply and a parking lot. On the ground floor and the second floor there is the main entry to the library and all complementary facilities – conference hall, exhibition hall, cafeteria, bookshop and cloak room. All of them are around the entry hall which is the main place for meeting people not just from the library but from the whole university campus. That is the reason why the building has not one but four entrances to all sides. The idea was to give to the campus, not just a library, but a needed public place as well; where all the students could meet together. The entry hall doubles as a square for bad weather days (in summer the campus is empty). Additionally, there is a night study room on the ground floor so the building can provide the 24 hour service without needing to open all the building during the night. In the middle of the ground floor is the entrance to the library and first info desk. The visitors then follow up to the second floor and the atrium hall with the main desk. The atrium is naturally lit through the skylight and it is the main space of the whole building. Then the library floors follow from third to sixth. The setup is similar. On the north side of the floor there is the administration section. In the public part there are the study places and study rooms of different sizes next to the façade, followed by book shelves in the darker part of the floor and finally an info desk and other study places around the atrium with natural light. This plot mirrors not just the natural light level in different parts but also helps to distribute the warm gain from the sun and to differentiate acoustic demands. For administration the open space-system is used. Each floor is a little different but the main orientation points remain. More differences are found in the last floor where two open atriums give the chance to read under the sky, and is also where individual study rooms for rent are located. In construction of the building many interesting technological solutions were used. Some of them help the flexibility, the others help save on energy demands. The construction itself used columns in a 15 meter grid with, in both directions, pre-stress concrete slabs. The static deflection diagram for floorslabs pre-stressing was used for designing the floor, so you can imagine how the strength in the construction goes. The concrete core activation system is used for the heating and cooling. There are plastic pipes directly in construction slabs with a medium whose temperature is changing according to demands during the year. This system perfectly suits the open space of the library. In addition, there is an easy system for pre-cooling the building during summer nights just by natural ventilation via opening windows. The main façade is divided into glass and blind parts on the surface in a ratio near to 50/50% in order to optimize the amount of heat energy. Recuperation of air and sun blinds are standard solutions, here thanks to an external double façade, wherein the sun blinds are sheltered from the wind. For the surface of the ground floor an asphalt-based floor covering material (bitu-terrazzo) was used. It significantly reduces noise levels in the building. The fire prevention system is an automatic water mist-spraying fire extinguishing system which is more property/asset-protective, plus it does not require a large-capacity storage vessel. The roof is covered with extensive green to create the fifth façade of the building for views from surrounding higher buildings. It also slows down draining in case of heavy rain. The interior is very open and friendly to express the openness and friendliness of the contemporary institution. The main elements are the power-colored floor and the orientation of all lighting which point to the very middle point of the building. In every room you are sure about your position. Some furniture was developed especially for the library to give visitors a free-minded feeling. They are movable so the students can build their own constellations from them. The main principle of interior design is about collaboration and reciprocal influence. The important parts of the interior are the graphic design, which follows the technical schoolbook concept, and the art. We invited an art curator with the group PAS (production of contemporary activities) to prepare an art scheme for whole building. From the big scheme only the central artwork remains because of the lack of money. There was an international competition for this job and the famous artist Dan Perjovschi won. So now you can see an elaboration of his ideas from MoMa in New York. The National Technical Library will be ceremonially opened on September 9(th), 2009. Library users will have access to over 1,200 seats in study areas and 300 seats in relaxation areas. It is estimated that the library stores about 1.2 million volumes. There will also be an exhibition hall, a conference hall with 200 seats, a cafe with 150 seats, WiFi internet access throughout the building, parking for 300 cars and stands for 200 bicycles. It is expected that the new library will draw up to 900,000 visitors every year. (31.07.2009)

### **Educational and Scientific Library, Hradec Králové – Czech Republic 2004 – 2008**

€ 12.000.000

Educational and Scientific Library in Hradec Králové is a public universal library. Through its services and holdings the library guarantees the right of equal and unrestricted access to all types of recorded information to all citizens. Educational and Scientific Library is a part of a system of libraries and performs coordination, professional, information, educational, analytical, research, methodical and consultancy activities in conformity with valid legal regulations on providing public library and information services. Educational and Scientific Library was designed by the Prague-based architectural studio "Projekttil architekti". Opened in September 2008, the new library is the result of the winning proposal in an open architectural competition in 2002. It is situated on a river bank in Hradec Králové, near the secondary school building designed by famous Czech architect Josef Gocár (1880-1960). The five-storey building represents a concrete construction with the final visual in the form of a monolithic concrete façade. The original shape of the building is the precast concrete letter "X". The building is cut through in the parterre. One can walk through the building without entering the institution – library. The building creates an open public urban space, which complies with the ideas of architects about openness of public buildings, as far as architecture is concerned.

#### **Libraries:**

#### **The Culture Yard, Helsingør – Denmark 2010**

Client: Helsingør Municipality, 13.000 m<sup>2</sup>

Inspired by the unique site and its captivating history the Culture Yard is designed as a hinge between the past and present, symbolizing Elsinore's transformation from an old industrial city to a modern cultural hub.

In many years the attention has been aimed at the site adjacent, where the UNESCO World Heritage site, Kronborg Castle, which is famous for its role in Shakespeare's Hamlet, exerts its magnetic pull on both tourists and local citizens of Elsinore – but now Elsinore's old shipbuilding yard has been transformed into a 13,000 m<sup>2</sup> cultural and knowledge centre, including concert halls, showrooms, conference facilities, a dockyard museum and a public library.

The contrast between the past and present permeates the Culture Yard. For instance, the original concrete skeleton with armoured steel has been reinforced, but left exposed as a reference to the site's industrial past. The historic context has thus been the main structural idea in the design process, ensuring the keen observer will discover a chapter of history in every corner of the yard and every peeling of the wall.

Particularly striking, when viewed from the seafront and Kronborg Castle, is the multifaceted façade. Like a fragmented, yet strongly coherent structure, the enormous glass and steel façade challenges the historic site and stares unflinchingly across the strait that separates Denmark and Sweden.

The façade encloses the yard in a distinctive atmosphere, as the dazzling and dramatic play of lines generates a sense of spaciousness. Although the façade is made of hundreds of lines and triangles it appears as one big volume, generating a sense of place and time. The volume also takes the environment into account, as the façade not only functions as an aesthetic architectural feature, but also as a climate shield, reducing the energy demand for cooling and heating of the building.(AART)

### **ADEPT, Copenhagen – Denmark**

#### **Libraries:**

#### **University Library + Plaza, Högskolan Dalarna, Falun, Denmark on design**

invited competition, 1<sup>st</sup> prize 2010, collaboration with Sou Fujimoto, Topotek1, Rambøll A/S and Bosch & Fjord  
3000 m<sup>2</sup>

The new library, placed centrally at the Dalarna university campus, is organized as a "spiral of knowledge". The sloping terrain continues in a ramp through the building. Wrapping itself the ramp creates a spiral-shaped space - the heart of the building for information seeking and easy orientation. This organization of program creates a various learning environment where students can take part in the vibrant life of the library as well as retreat into various study niches. The different sound levels and activities create a diverse and eventful library. The library has its own spatial character in which library and multimedia functions unite and create synergy with the existing university. Wooden facades integrate the building in the surroundings, reflecting the local tradition of using wood as construction material. Dalarna Media Plaza is created in addition to the library – together they form a new landmark for Högskolan Dalarna. Through a simple reorganization the car park becomes a new surface with 'islands' of activities. The programming of the Plaza is flexible and will be developed in the user process. The Plaza, which is a mix of recreational functions and furniture, serves as arrival area and hang-out space for users of Högskolan, the library and visitors in the area. This project will help to attract people in the neighborhood, thereby anchoring the library in the local community. In addition the ambition is to project strengthen the collaboration between regional and international educational and research institutions. With its public functions and activities Dalarna Media Library will become a dynamo in the area and an attraction for both local inhabitants and businesses. Activities in the café, exhibitions, lectures, continuing education, etc. will provide fertile ground for international exchange and interdisciplinary collaboration. (ADEPT)

ADEPT WINS SWEDISH MEDIA LIBRARY COMPETITION WITH A MULTIFUNCTIONAL "SPIRAL OF KNOWLEDGE"

(10. 08. 2010) Danish ADEPT, Japanese SOU FUJIMOTO Architects and an advisory team consisting of Topotek1, Rambøll A/S and Bosch & Fjord win the competition for a new library in Falun, Sweden, with the project "Dalarna Media Arena".

The project, which consists of a 3000m<sup>2</sup> library and an adjoining plaza, is a part of Dalarna University campus. Dalarna Media Arena is a reinterpretation of the library – a multifunctional event- and knowledge center – targeting students and teachers as well as the local community. Dalarna Media Arena matches a new library culture, staging a wealth of opportunities for events and inspiration. The library and plaza at Högskolan Dalarna will be the city's third space – a dynamic meeting point with activities for students, employees and visitors. The library is organized as a "spiral of knowledge". The sloping terrain continues in a ramp through the building. Wrapping itself the ramp creates a spiral-shaped space - the heart of the building for information seeking and easy orientation. This organization of program creates various learning environments where students can take part in the vibrant life of the library as well as retreat into various study niches. The different sound levels and activities create a diverse and eventful library.

The library has its own spatial character in which library and multimedia functions unite and create synergy with the existing university. Wooden facades integrate the building in the surroundings, reflecting the local tradition of using wood as construction material. Dalarna Media Plaza is created in addition to the library – together they form a new landmark for Högskolan Dalarna. Through a simple reorganization the car park becomes a new surface with 'islands' of activities. The programming of the Plaza is flexible and will be developed in the user process. The Plaza, which is a mix of recreational functions and furniture, serves as arrival area and hang-out space for users of Högskolan, the library and visitors in the area. This project will help to attract people in the neighborhood, thereby anchoring the library in the local community. In addition the ambition is to project strengthen the collaboration between regional and international educational and research

institutions. With its public functions and activities Dalarna Media Library will become a dynamo in the area and an attraction for both local inhabitants and businesses. Activities in the café, exhibitions, lectures, continuing education, etc. will provide fertile ground for international exchange and interdisciplinary collaboration.

Dalarna Media Arena is designed by an international team consisting of ADEPT (DK) and Sou Fujimoto Architects (JP) in collaboration with Rambøll (DK), Topotek1 (DE) and Bosch & Fjord (DK). ADEPT and Sou Fujimoto Architects also joined forces for the Deichmanske Library competition in Oslo, Norway. The jury minutes stated: "In conclusion it's an exciting building rich on variety and with many possible meeting points integrated in a coherent environment [...] The proposal has solved the total program in an interesting, exciting and playful manner – inside as well as outside."

ADEPT is based in Copenhagen, Denmark and works within the fields of architecture, Urban planning and landscape design. ADEPT is founded and lead by architects: Martin Laursen, Martin Krogh and Anders Lonka.

ADEPT is currently working with projects: "Flintholm Spark" 4000 m2 House of Culture and Movement at Frederiksberg (DK), 'Village in the Sky' 22.000 m2 high rise (DK), "Iceland Academy of Arts" 20.000 m2 educational and cultural institution in Reykjavik (IS), and urban planning projects: "The Tolerant City" 1.000.000 m2 urban development in Helsingborg (SE), "Køge Coast" 350.000 m2 urban development project for Køge Municipality, and "The Måløv Axis" 100.000 m2 urban space in Ballerup (DK). ADEPT's three partners have all been engaged and involved in teaching, workshops and lectures since they founded the company. Anders Lonka teaches in sustainable urban planning at The School of Architecture at the Royal Danish Academy of Fine Arts, while Martin Laursen and Martin Krogh are external professors at The Faculty of Architecture at Aalborg University.

House of Culture and Movement, Copenhagen by MVRDV and ADEPT.

Sou Fujimoto Architects is an architecture studio based in Tokyo, Japan. The studio consists of approx. 19 architects, designers, artists and concept developers who all dedicate their skills to the studios work with in architecture, urbanism, research and innovation. Sou Fujimoto has won several prizes and competitions counting among others: AR Award Grand Prize in 2006, Japan Institute Of Architects Grand Prize in 2008, 1. prize at World Architectural Festival 2008 in Barcelona and Wallpaper Award in 2009. The studio is moreover involved in several international competitions and commissions, e.g. a 16.000 m2 art museum in China and a 64.000 m2 mixed program library in Norway.

Topotek1 is based in Berlin and consists of 25 landscape architects and architects besides the firms two founders; Martin Rein-Cano and Lorenz Dexler. The office has since 1996 primarily worked with urban space and landscape architecture. Through the years the Topotek1 has won 28 national and international competitions and prizes like German Urban Planning Award, German Architecture Award (2003) and Living City Fund (2005). Imperial War Museum North, Manchester - Topotek 1 design.

Rambøll Danmark A/S is one of the largest consulting engineering organizations in Denmark. From 22 offices throughout the country, Rambøll in Denmark provides services and expertise in all areas of building engineering, infrastructure, geotechnics, transport and urban planning, environmental services, renewable energy installation design and oil & gas infrastructure.

Tuborg Waves, Copenhagen - Rambøll Danmark project.

Bosch & Fjord is established in 2001 by Rosan Bosch and Rune Fjord Jensen. With a team of artists, architects, designers and academics the office has competences with in architecture and interior design, communication, management and generation of processes and user involvement.

## **Arkitema Architects, Århus – Denmark**

<http://www.arkitema.com>

### **Libraries:**

#### **Mediaspace, Århus – Denmark 2014 / 2015**

together with Schmidt Hammer Lassen

#### **Globe Billund, Grindsted – Denmark 2007 – 2010**

Client Globe Foundation, Billund Municipality, 21.000 m<sup>2</sup>, DKK 230 Mill.

Sports and cultural centre in Grindsted - leisure mecca with rich selection of sports facilities, swimming pools, gymnasiums, a library, cinema, hotel, etc.

#### **Kolding Library, Kolding, Eastern Jutland – Denmark 2006**

Design and installation of special fittings for Kolding Library. The commission was carried out in close collaboration with the staff of the library. The central tasks were to facilitate and design high-end technology on a personal scale, and to create a smart sense of continuity between the new working areas, new working methods and service. (Arkitema)

The new public library building in Kolding was opened in 2006. It is situated close to the city center with a unique view to the lake by the former castle Koldinghus. The building also contains a hotel and private apartments. A café connects the library and the hotel.

It is designed by the architectural firm Arkitema from Aarhus, Denmark. With its transparency, open spaces and light wooden interiors it represents a minimalistic continuation of the Scandinavian library style. The zoning of the library functions respects both the need of public media spaces and the need of quietness and contemplation. The two atriums of the library are decorated with metallic spirals and prisms by the artist Olafur Eliasson. (<http://www.librarybuildings.info>)

#### **Library and Activits Centre, Kjellerup – Denmark 2005**

Client: Kjellerup Municipality, 2.800 m<sup>2</sup>, DKK 42 Mill.

The library and community centre is a vibrant meeting-place, relating to both the school and the town.

The building is a meeting point. It encompasses many functions and lies in close proximity to the local school and community hall, and provides a natural meeting-place between the cultural and leisure activities of the school and the town.

The vision is that the entire development – the building and the surrounding spaces – will be woven into the existing, somewhat complex urban scene to create a new wholeness and identity in the area, while at the same time establishing itself as a public meeting-place. The building houses: library, cinema, meeting facilities, teaching facilities, school administration, local art exhibition and more.

The aim is to create a building that is open and inviting, and which will allow itself to be coloured and transformed by the various activities taking place there during the day and evening. The building is called Mosaikken – the mosaic – because of its mix of functions which takes place in it.

The building is open towards the square that links it to the sports hall. From here, users are led into the building's common area, which has the character of a market square.

It is a bright room with a high ceiling and two large space-creating elements: "The Rotunda" and "The Bookshelf", both of which are visible from the outside, and consequently help to communicate the building's activities. The Bookshelf provides access to the library and separates it from the 'market square'. Its location along one side of the market square means that the library makes natural use of parts of the square for its exhibitions, notice boards, etc. The school and the library are also linked by a smaller connecting building.

The Rotunda houses the auditorium/multi-purpose hall. It can be opened up with large folding doors, allowing the market square to become a regular floor area, which may be utilised for large events, exhibitions, etc.

The building also houses a number of functions associated with the adjacent school. These functions are located in close proximity to the existing school buildings, and form a backbone towards the west and south.

Along the south side of the market square is a meeting centre with transparent walls on the hall side, allowing contact with the building's activities.

The activity centre is located on the ground floor on the western side of the building.

In 2006 Mosaikken was granted with support from the Statens Kunstfond, Denmark and was decorated with items of art made by the artist Leonard Forsslund. (Arkitema)

### **Town Hall and Library, Skive – Denmark 2004 -2005**

10.950 m<sup>2</sup>, DKK 25 Mill.

Skives new town hall and library is built with the goal to save the most energy and avoid the most releases of CO<sub>2</sub>. Overall, there is 10,700 m<sup>2</sup>, where the use of alternative energy sources and use of energy saving measures have made it possible to reduce energy from traditional fossil fuels to what that corresponds to a house of ca.130 m<sup>2</sup>. This could produce a global CO<sub>2</sub> emission from energy facilities (electricity and heat) of approx. 25% compared with a traditionally built town hall / library.

(<http://eng.energibvenskive.dk>)

### **Mons Library, Møns – Denmark 2005**

Rebuilding 670 m<sup>2</sup>, Extension 420 m<sup>2</sup>

### **Ebeltoft Town Hall – Denmark 1995**

Client Ebeltoft Municipality, 9.300 m<sup>2</sup>

Project Conversion of private hospital into town hall and library for Ebeltoft Municipality

## **BIG Architects – Bjarke Ingels Group, Copenhagen - Denmark**

<http://www.big.dk>

### **National library, Astana, Kazakhstan – Kazakhstan 2012**

BIG architects were awarded first prize in an open international competition to design kazakhstan's new national library in astana, named after the first president of the republic of kazakhstan, Nursultan Nazarbayev, encompasses an estimated 33.000m<sup>2</sup>. The winning proposal was chosen by the prime minister of kazakhstan K. Masimov together with Astana's akim I. Tasmagambetov and a council of architects. The circular organisation of the archive at its inner core combines the clarity of a linear organisation with the convenience of an infinite loop. 'The design of the national library combines four universal archetypes across space and time into a new national symbol: the circle, the rotunda, the arch and the yurt are merged into the form of a Möbius strip. The clarity of the circle, the courtyard of the rotunda, the gateway of the arch and the soft silhouette of the yurt are combined to create a new national monument appearing local and universal, contemporary and timeless, unique and archetypal at the same time' - Bjarke Ingels. The library is conceived as a symbiosis of urbanity and nature. Like Astana, which is located in the heart of the Kazakh mainland, it will be integrated into the heart of a re-created Kazakh landscape. The park around the library is designed like a living library of trees, plants, minerals and rocks allowing visitors to experience a cross section of Kazakhstan's natural landscape. (<http://www.designboom.com>) (see also: <http://www.dezeen.com>)

## **Bosch & Fjord, Copenhagen – Denmark**

After more than ten years of renewal, change and challenge of office landscapes, learning environments, libraries and city space, it has become time for Rosan Bosch and Rune Fjord Jensen to renew themselves. The creative art and design company Bosch & Fjord therefore splits up as of January 1st, 2011 and becomes two new companies led respectively by the former partners of Bosch & Fjord, Rosan Bosch and Rune Fjord Jensen. Bosch & Fjord has existed since 2001 where Rosan Bosch and Rune Fjord Jensen decided to work collaboratively with art, design and architecture in interdisciplinary projects, with the purpose of creating spatial surroundings and environments that open up for new possibilities and invite to new ways of acting. Since then, a wide range of challenging and engaging art and design projects have come into being, with everything from engaging city signs that develop our way of seeing and using the city to overall interior design of Lego's Development Department. In Bosch & Fjord's projects, art slides into the everyday life as a natural part of organisations and in the identity and function of places. The purpose has been to create projects where art has a function and design has a meaning. Through the years, Bosch & Fjord has stood out with a wide range of interesting projects. In their first project in 2002, they created 'Mindlab' for the Danish Ministry of Economic and Business Affairs, which reorganised and renewed the way the employees work at the Ministry. In the same way, the overall interior design of Ordrup School (2006) paved the way for the development of a new learning environment where challenging rooms now create space for varied teaching and creative thinking. Bosch & Fjord's design gives the individual pride of place as for example in the project 'It's Not My Fault' (2007) where the artist duo in collaboration with the prison inmates created new, child-friendly visiting facilities at Vridsløselille State Prison, where children of inmates now can visit their parents in safe and child-friendly surroundings. Internationally, there has also been a keen interest for Bosch & Fjord's design, where especially the Free Zone Istanbul sign project and the interior design of LEGO (2007) and Hjørring Library (2008) has attracted much attention. For example does many Japanese believe that Hjørring is a part of Copenhagen, as Bosch & Fjord's library design really has put the city on the global map. Through their work as artists and designers, Bosch & Fjord has shown that there is an actual need for dynamic, engaging and challenging space and environments – and it doesn't stop here! The duo is now moving in opposite directions to examine their possibilities on their own, but will still cooperate as artists on selected projects. And one thing is for certain – it is not going to be dull! (Bosch Fjord)

<http://www.bosch-fjord.com>

**Libraries:**

**Hjørring Central Library, Hjørring – Denmark 2008**

Bosch & Fjord's vision for a future library has become a reality in the new shopping mall in Hjørring, the Metropole, designed by Schmidt Hammer Lassen. Focusing on the library's role in society, Bosch & Fjord have created a forward-looking setting for the modern library's communication and organisation of material and knowledge. In close cooperation with the library's employees and management, Bosch & Fjord have developed a new platform for communication and experiences that turns the library into a multi-functional experience and knowledge centre. In line with the changes in society, the role of the library has changed. Today and in the future, people will visit the library in order to get experiences and stimulate their need for learning. In light of this, it was important to focus on the new social role of the library and make the library into a sort of meeting place that encourages engagement as well as active participation and development. The heart and pivotal point of the new library is a physical communication structure that twists and winds its way through the library, breaking through walls, floors and bookcases. Sometimes a counter, sometimes a table, sometimes a section of shelves, the structure points, guides and tempts the visitors to explore the library area. The band works as a decoration and an active communication tool for the library staff. The same is the case with the bubble wall, which has large holes for exhibiting and presenting reviews, and the poet's staircase, at the top of which the listener is confronted with a giant mouth reciting poems. In developing Hjørring Central Library, it was essential to create an emotional connection between the children's area and the general section of the library. This focus has resulted in a deliberate youthfulness in the library and a sliding and balanced transition between offers for children, youth and adults. The library has stops for every taste and all generations – shared as well as separate. Hjørring Central Library is a new kind of library. It is a place that meets all visitors' needs for inspiration, experiences and personal development. (Bosch-Fjord)

**Gladsaxe Main Library – Denmark 2008**

Previously, a library was a retrospectively oriented institution based on the storage of printed media. It was a place for collecting and lending out books. The future library has to be a forward-looking institution that challenges and provides library users with both experiences and knowledge. In collaboration with Gladsaxe Main Library, Bosch & Fjord have developed a master plan and design manual to ensure consistency in experiences and communication for users of all ages. The first step in the realisation of the plan is a refurbishment of the library's entrance and information areas. The entrance section was pointed out as a particularly important area, since this is where visitors and users get their first and most important impression of the library. Here, the interior should make visitors feel welcomed and seduce them into exploring the rest of the library. The visitor is encouraged to step closer by the open and well-lit space with its green floor and red, organically shaped information desk. The green floor spreads across the entrance area in stark contrast to the red walls of the room. The colour green signals activity and progress – and these are exactly the values that characterise the new entrance area, where the library's drop-off and check-out functions are located. The organically shaped red information desk wraps around one of the corners like a giant tongue. The colour and shape draw the visitors closer. The bookcases are painted white, with the respective category written in big black letters on the side. Light boxes have been installed above entrances and interior doors. With the realisation of this new entrance area, Gladsaxe Main Library has taken a big step forward toward its goal of being at the forefront. The main library is inherently a pioneering example for the local libraries. Thus, the refurbishment is designed to let the main library continue to evolve and draw inspiration from the local library's specialised knowledge. (Bosch-Fjord)

**COBE ApS, Copenhagen – Denmark**

<http://www.cobe.dk>

**Libraries:**

**Copenhagen Culture House and Library, Copenhagen – Denmark 2011**

**The Library**

Location: Copenhagen NW, Denmark Client: City of Copenhagen Program: Extension of existing culture house and new library and concert hall Size: existing 1.150 m<sup>2</sup>, new building 2.000 m<sup>2</sup> Status: 1st prize in competition in 2009, completed in 2011 Collaborators: TRANSFORM, Wessberg, Schönherr, Bdr. A&B Andersen

Nordvest (Northwest) is an area in Copenhagen located between the lively and diverse urban neighborhood of Nørrebro and the villa neighborhoods at the edge of the city. Many people live and work in this multiethnic area. Yet, since the area is located in the vicinity to numerous entry roads, most Copenhageners only use Nordvest as passage when going in and out of the city by car. The new Culture House and Library will help improve the identity of the area. It is designed to create a landmark and to provide a meeting point for the local community.

The new culture house consists of four clearly defined programs: a children's library, a youth library, a library for adults and a concert hall. These four functions are stacked on top of each other like a series of golden "books". Each "book" is a world of its own with individual interiors and furnishment. The spaces between the books are open zones for flexible use. This gives a varied coherence between open and closed spaces. The open spaces are marked by the immediate context and the closed areas as completely choreographed places.

The building has two entrances. One from the north and one from the south, making the foyer and zone between the existing building and the extension act as an urban passage for the neighborhood.

As a main gesture, the concert hall is placed at the top of the building. A powerful object that seems to defy the laws of gravity, the position of the hall encourages people to move across the building towards the magnificent view over Copenhagen. (COBE)

**Cornelius + Vöge, Atelier for Arkitektur, Roskilde – Denmark**

<http://www.corneliusvoege.dk>

**Libraries:**

**North Atlantic House, Odense – Denmark 2013**

A design consisting of three houses on pillars in a landscape of stairs, shelves and terraces is the winning proposal for a future culture house on the harbour of Odense in Denmark. The building is set to open in 2013.

Young Danish architects CORNELIUS + VÖGE and ISAGER architects together with contractor Hans Jørgensen og Søn, Grøntmij and Masu Planning, have been selected winners of the cultural building House of The North Atlantic. The Building will represent

and exhibit the 3 North Atlantic countries: Faroe Islands, Iceland and Greenland in Denmark. The building has an area of 3800 m<sup>2</sup> and will include exhibition areas, conference rooms, restaurant, library and student housing.

The focal point of the competition has been to make House of the North Atlantic a strong architectural statement that expresses the culture and identity of the 3 Nordic countries.

The building is made as a small assembly of separate houses of different shapes and heights. The houses are on pillars standing on an organic landscape plateau of sitting areas, stairs, shelves and terraces. The ground floor is open and transparent making all the public facilities visible from the harbour side. The houses have a clear reference to the black wooden buildings of the Nordic countries and the landscape plateau is related to the dramatic landscapes of the North Atlantic islands. The materials are telling the same story as the architecture; black metal, concrete with stones from Greenland and driftwood from Iceland.

### **Libraries:**

**University Humanities Library (Part of the Royal Library), Copenhagen – Denmark part one 1998, part two 2008**

### **Awards:**

**Prize: G-Mark Award for Good Design**

University library and library archive rooms, Closed competition 1994: First prize, Floor area: 13,300 m<sup>2</sup>

Client: The Danish Ministry of Culture / The Danish Royal Library, Owner's consultant: Byggedirektoratet / Danish Building Directorate (phase one) and Moe & Brødsgaard (phase two), Architect and design/build consultant: DISSING+WEITLING  
Landscape Architect: Sven Kierkegaard, Engineer: Rambøll, Book storage capacity: 73,000 metres of shelf space, Number of readers' desks: 500

The University Library - part of the Danish Royal Library, Copenhagen. With its 500 readers' desks and some of the Danish Royal Library's most sophisticated archive rooms, Copenhagen University's new Humanities Library is a vital hub of the university's new Amager campus. User based design. Throughout the planning and design process, architectural focus has been on creating the optimum faculty library based on users' needs. Dissing+Weitling - in co operation with a user group of Royal Library employees - analysed functionality requirements and work flow. Optimum design solutions catering for the needs of both employees and students were then designed on this basis. The result of this intensive planning and design process is a building characterised by flexibility, airy openness and simple, clear definition. The three open floors have been laid out with incremental noise levels in mind - from easy socialising in the lounge and café areas to group study areas and finally to the library reading rooms designated for "quiet" use where students can concentrate completely on individual study. 73 km of cultural heritage safeguarded in climate controlled archive rooms. In addition to its study and reading facilities the new faculty library building houses three large archive rooms for Royal Library books and records. The first of these, erected as part of phase one of the project built in 1998, houses 45 km of book shelves. Phase two includes a further two archive rooms with - between them - 28 additional km of shelving affording storage conditions with optimum temperature and relative humidity C for particularly sensitive audiovisual control, including one archive at 2 material. Award winning architecture. The opening of the new humanities library marks the completion of a long term project started by the Danish Ministry of Culture in 1989. The project attracted international attention even at this early stage, and Dissing+Weitling received the prestigious Japanese G mark Award for phase one of the project. With the inauguration of phase two the Ministry of Culture completes its plans and fulfils its ambition to create a combined library and archive facility designed and built to the highest architectural standard. (Dissing)

**New Carlsberg Glyptotek, Research Library Expansion, Copenhagen – Denmark 1994**

### **Awards:**

**Beautiful Building Award for Alterations and Renovation 1996 by the City of Copenhagen**

Research Library and Canteen New construction and renovation. Area: 2,090 m<sup>2</sup>, Client: Ny Carlsberg Glyptotek

Client Advisor: Byggedirektoratet, Engineer: Crone & Koch, Landscape Architect: Birgitte Fink

The collection at the Research Library of the New Glyptotek is an extension of Brewer Carl Jacobsen's original personal library. The collection includes primarily sculpture of Greek, Egyptian, Etruscan and Roman origin, as well as Danish and French art from the 19th century. The library is an important addition to the collection, and is open to Glyptotek employees and external scholars.

The new library is an addition within one of the original courtyards, in close proximity of the main library. Its basis are the architectural principles and modules found in the original library, but with a modern approach. The new two storey room has balconies and wooden bookcases, all completed with the same care and attention to details that is found in the original library. The balconies are a cantilevered steel construction with a steel grate floor. The entire room is surfaced with wood: maple floors with belinga patterned borders, arched maple ceilings with vaulted a milk white acrylic skylight, that gives a calm, diffused light to the room. Bookcases with glass sliding doors are also made of maple. The room is furnished with a counter and three square standing height tables with steel pedestal bases and belinga tops with inlaid leather. (Dissing)

#### **Albertslund Bibliotek – Denmark 2002 – 2004**

Collaborators: Cowi and Esbensen

Client: Municipality of Albertslund, Gross floor area: 3,000 m<sup>2</sup>, Type of assignment: First prize in invited competition

The children's library has also had more space and light. New pillow lounges have made the experience of borrowing a book more complete; it has become possible to stay in the world of books for a while and thereby becoming familiar with and hopefully experiencing joy by being in a world of wisdom. The process of renovating Albertslund Public Library has been characterised by a common vision shared by the municipality and consultants, which means that the aesthetic and functional ambitions have been in focus together with the wish for energy efficient design. The project can be said to be one of the first IED cooperation projects in Denmark. The engineering company Esbensen and Henning Larsen Architects together incorporated design elements for natural, hybrid ventilation and control of daylight. The architects from Henning Larsen Architects were Lars Steffensen, Rasmus Pedersen, Frants Drewniak, Claus Simonsen and Margrete Grøn. (Henning)

#### **IT University, Copenhagen – Denmark 2004**

Client: Danish National Research and Education Buildings, Gross floor area: 19,000 m<sup>2</sup>, Year of construction: 2001 - 2004

Type of assignment: First prize in invited competition, 2000

The IT University is arranged around a large central atrium. In the atrium, a number of group and meeting rooms, designed as corbelled boxes, are placed in a dynamic composition – like extracted drawers of various sizes.

A digital art installation by the American artist John Maeda creates a dynamic and interactive visual composition in the atrium, projecting words and images onto the white meeting boxes.

The ground floor comprises the common facilities; lecture halls, students' café, canteen and library. All research and teaching areas are located on the upper floors. Teaching facilities in open study areas surrounding the atrium and research departments in the calmer zones at both ends of the building.

The building stands elevated above terrain. A metal clad frame folds around the entire volume in one singular dynamic movement. The glass facades inside the frame are divided into horizontal ribbons of glass of varying colour and character – powerful green-coloured glass, translucent glass and clear glass. (Henning)

#### **Universitetsbiblioteket Roskilde – Denmark 1999 – 2001**

Client: Danish Ministry of Education, Gross floor area: 7,600 m<sup>2</sup>, First prize in invited competition

The library is characterized by transparency and openness, and it forms one side of a new garden. The glass facades allow an excellent view of the garden, where a lake surrounds the library building.

The light and reflections of the trees in the lake add special character to the building, changing in accordance with the seasons. The library consists of a long, three-storey brick building and a distinctive glass building, in which a large part of the lending department is placed in an 8 meters high room of 2,300 m<sup>2</sup>. The room is connected with two floors of the long building, and the top floor is designed as a balcony in the open volume.

The intention was to design the largest volume possible for the lending departments to ensure a clear view and to give the daily visitor and the staff an experience of spatiality. The library contains open library areas, offices for the administrative staff, three classrooms, study hall and an exhibition area. The module of the large lending area is 9 meters, which ensures a high degree of flexibility for the arrangement of the bookshelves. (Henning)

#### **Institute of Diplomatic Studies, Riyadh - Saudi Arabia 2013**

Partners: Buro Happold and Geoffrey Barnett Associates

Client: Ministry of Foreign Affairs, Saudi Arabia, Gross floor area: 46,000 m<sup>2</sup>, Year of construction: 2010 - 2013

The Ministry of Foreign Affairs of the Kingdom of Saudi Arabia will expand with a new building that is to house facilities for the Institute of Diplomatic Studies and Consular Affairs Department. The new building comprises among others a large auditorium, lecture halls, library, classrooms, a large hall for visa applicants and office space. The building accommodates a number of shared facilities e.g. a cafeteria and prayer rooms.

The site is unique, oriented towards the big lush park space with the two monuments: Nasseriyah Gate and the Ministry of Foreign Affairs. The new building will correspond and contribute positively with its well-defined architecture to the area. Elaborated façades will make the large building vary vividly when passing by, and like looking through a veil one will sense the life and activities within the building. When entering, the architecture of the building is expressive and easily conceivable. All the larger facilities for the Consular Affairs Department and the Institute of Diplomatic Studies are located in a large room stepping upward (the stepped oasis).

An intelligent façade

The façade is a 3 dimensional pattern that appears as a characteristic veil laid over the building. Through the façade one will sense the lively atmosphere and activity on the stepped oasis inside the building. From the street the entry and hall for the visa department appear open and welcoming. From the inside there is a clear view to the outside from the stepped oasis.

As well as the façade is the significant appearance of the building it also serves as a shell providing shelter for sun, wind and climate. This façade is designed to adapt perfectly to the conditions in Riyadh. The system of triangles leaning in and out from the vertical plane creates shade for one another and the angled position of the shading opens the façade towards the north where it will have the optimum daylight without heat gain from direct sun impact. The façade system will be clad with natural stone to match the existing MOFA building. Different grindings of the surface could be used to underline the faceted triangular system and make the façade sparkle from reflections.

The stepped oasis going upwards in the building and the overhanging decks create a huge cohesive spatiality. As each of the steps and deck are twisted with an angle of 45 degrees to the façade it provides long areas with visual contact with the stepped oasis, view through the façade and connections between the Consular Affairs Department and the Institute of Diplomatic Studies. This stepped oasis will with its green plants create a unique environment and atmosphere, which will excite and please visitors and users as they make their way around in the building. All offices and classrooms are placed along the four façades providing necessary daylight. Common facilities for the Consular Affairs Department and the Institute of Diplomatic Studies as lobby, cafeteria and library are placed on the stepped oasis, and due to the angle on the stepped storeys these facilities have daylight and an exciting view to the Ministry of Foreign Affairs building. (Henning)

#### **Prince Naif Centre for Health Science Research, Riyadh - Saudi Arabia 2012**

**Collaboration:** NNE Pharmaplan (labs, MEP), Buro Happold (structure, civil engineering, geotechnical engineering, acoustics, fire, security, sustainability, waste management), Geoffrey Barnett Associates (quantity surveyors).

**Client:** King Saud University, Gross floor area: 23,800 m<sup>2</sup>, Type of assignment: Commission

The Prince Naif Centre for Health Science Research is a new building designed for the largest university in Saudi Arabia, King Saud University, situated in the capital of Riyadh. The new Centre of 23,800 m<sup>2</sup> comprises world-class research facilities, including facilities for research in cancer, molecular biology, genetics, infectious diseases and several other medical disciplines. Inspired by a monolith, the building is placed on a podium, which roots the building in the urban, local context. The central Science Square is the heart of the building and features common functions such as lobby, café, library and lecture hall. Visual and physical contact connects the laboratories to the workstations on the open balconies. Thus, the design supports informal meetings and innovation across research areas. The significant architectural cut of the northern facade marks the main entrance to the building and provides a view of the life in the Science Square. The remaining facades have a modern, sophisticated structure, which filters the strong daylight and reduces the need for cooling. The interplay between light and shadow provided by the facade contributes to creating a cool, light and vibrant atmosphere in the building. (Henning)

#### **Arts Campus (Library) Umeå University, Umeå – Sweden 2012**

**Client:** Baltic Group, Gross floor area: 15,000 m<sup>2</sup>, Year of construction: 2008 – 2012, Type of assignment: Commission

The creative environment of the Institute of Design and the Academy of Fine Arts is the essence of a new arts campus at Umeå University. The dynamic campus area is developed at the Umeå riverside. The unique locality at the water with the riverside promenade and the proximity to the centre of Umeå are the ideal surroundings for a university campus with public recreational areas. The first stage of the arts campus includes three new buildings: the School of Architecture, the Academy of Fine Arts and a new museum of art, which is the central building of the campus area comprising exhibitions and café open to the public. The campus skyline is formed by the above mentioned three separate buildings each contributing with a distinctive identity to the area. The interaction between independence and synergy is the fundamental idea for the structures and it is created by physically linking the buildings in a big common base placed parallel to the riverside promenade. The base holds all common facilities. The scale of the buildings at the campus area refers to the other buildings of the city. The lamella façade is inspired by the birch trees and the water reflections from the river. (Henning)

#### **Reykjavik University (Library) – Iceland 2010**

**Client:** Reykjavik Háskólinn, Gross floor area: 90,000 m<sup>2</sup>, Year of construction: 2007 – 2010, Type of assignment: First prize in international competition

Reykjavik University, Reykjavik Háskólinn, consolidates the currently spread university functions at one campus in the southern part of the city.

The objective is to strengthen the city identity as a lively and attractive centre of education that – as a flagship for educational trends – attracts students and researchers from all over the world.

The large-scale building, is designed as a circular, independent city with streets, squares and shopping centre. The project realises the idea of the university as a city allowing the individual departments to be organised as independent quarters around a uniting, inner square.

The square provides access to all the university departments whilst housing the common university facilities such as café, restaurants, art gallery, gym, bookshop, nursery, library etc. Thus, a lively urban scene is created in the building – a vibrating centre that generates life and energy to the surrounding streets.

The building covers 90,000 m<sup>2</sup> in total of which 32,000 m<sup>2</sup> has been built. (Henning)

#### **Jättå Vocational School, Stavanger – Norway 2007**

**Client:** Rogaland County Council, Gross floor area: 16,000 m<sup>2</sup>, Year of construction: 2005 - 2007

**Type of assignment:** First prize in international competition, 2000

#### **Literature:**

**World Architecture News, 2009,27. Febr. “A Modern Learning Environment”**

Jättå Vocational School is designed as a small ‘town in town’ featuring a vibrant double-high central street surrounded by individual ‘urban quarters’, each with their own teaching environments and lecture rooms.

The heart of the school – the central street comprising the main hall, canteen and resource centre – forms an active and vibrant gathering point offering a view of the green patios and roof landscape of the building as well as the workshops and study areas. A sequence of ramps and stairs lead from the entrance further up through the building and through the lecture hall, all the way up to the roof landscape offering a view of the scenery and fjord.

With its minimalist, almost floating architecture, Jättå Vocational School forms the entrance to Stavanger’s new urban quarter by the fjord. The concentrated design enhances the way the building interacts with its surroundings and thus underlines its proximity and transparency. The double high windows allow daylight into the building, stimulating the learning process.

With a capacity of 1600 students the school offers among others several subjects within service and technique. The 2,700 m<sup>2</sup> sports centre is located in connection with the school and is designed by Henning Larsen Architects in 2006. The school opened in 2007. (Henning)

### Universitätsbibliothek Rostock – Germany 2002 – 2004

Client: Ministry of Finance Mecklenburg-Vorpommern, Areal: 13,000 m<sup>2</sup>, First prize in invited competition, 2000

Located on a significant, elevated site on the corner of Albert Einsteinstrasse and Ringstrasse, the library will mark the entrance and stand out as a landmark of the new university. The L-shaped building creates a new, active space in the city interacting with the students' café opposite. The individual study spaces are located in a narrow L-shaped reading gallery towards the entrance square, separated from the shelf areas by a crevice of light that extends up four storeys. A large organically shaped carving in the lower floor – leading from porch to counter – defines the flow in the entrance area of the building. A light steel staircase in the interior crevice of light runs up through the storeys. The library is a developing project focussing on energy saving measures. Refrigeration of the building is embedded in the concrete floors and connected to a geothermal facility. (Henning)

### Stadsbiblioteket Malmö – Sweden 1994 – 1999

Client: Malmö Municipality, Gross floor area: 14,056 m<sup>2</sup>, Year of construction: 1994 – 1999, Type of assignment: First prize in international competition

#### **Awards:**

Diplom fra "tyckomhus.nu" 2001

Kasper Salin Priset, Sverige 1997

Årets Stadsbyggnadspris 1997

The extension of the historic Malmö City Library has provided the city with an open, welcoming and modern library interacting with nature and the surrounding city.

The new library building is based on – and is diagonally detached from – the square shape of the existing library. The two buildings together constituting Malmö City Library are uniquely situated towards the park where the large illuminated spaces open up to the sculptural trees and the reflecting lake in the park.

Malmö City Library comprises three detached volumes: The old library building; the new, central entrance building and the new library building – all united by glass corridors. In the old library, the original glass-covered atrium has been restored. Daylight plays an essential role in all building spaces and is experienced as a stimulating and varying element during all hours of the day. The entrance space is lit up from above along the walls while the central space fills the entire room with light flowing down and filtered through the storeys. Here, the sky constitutes the view. The large library space functions as a kind of 'calendar of light' where the light is coloured by the leaves of the large trees in the park. (Henning)

### Bibliothèque Centrale – Médiathèque Municipale de Tarentaise Saint Étienne – France 1993

Cooperation with Cabinet Stéphanois Arch

6,000 m<sup>2</sup>

La municipalité décide au début des années 1990 de construire un nouveau bâtiment pour abriter la bibliothèque principale de la ville, jusqu'alors installée dans un hôtel particulier inadapté, l'Hôtel Colcombet.

Cette réalisation s'inscrit à l'époque dans une politique culturelle municipale active tendant à compenser les difficultés économiques que traverse le bassin stéphanois, et arrive ainsi peu après celle du Musée d'Art Moderne (1989). Le site choisi pour sa construction, Tarentaise à l'ouest de la ville, n'est pas non plus anodin et procède de la volonté des édiles de revitaliser ce quartier paupérisé et marginalisé.

L'architecte danois associé avec le cabinet stéphanois Arch, dessine un bâtiment carré et sobre, organisé sur 3 niveaux :

- Le sous-sol accueille le magasin, climatisé pour la conservation des films, et les garages.

- Le rez-de-chaussée se compose d'un grand espace central où sont entreposés les ouvrages et les autres supports, et autour duquel sont disposés des salles de lecture et d'étude, de consultation audiovisuelle, de projection ainsi que de conférence.

- Le premier étage abrite les bureaux de l'administration ainsi que des locaux techniques disposés autour d'une galerie qui surplombe l'espace central du RDC.

La bibliothèque a intégré la prestigieuse cinémathèque de Saint-Etienne, créée en 1922, et propose par conséquent une offre vidéo très développée.

Au plan technologique, le bâtiment est alors particulièrement innovant et bénéficie d'un système complexe de régulation (sécurité, énergie, communication) et de diagnostic de pannes. Enfin, il est au centre d'un réseau informatique mettant en commun les ressources de la plupart des établissements documentaires de la ville et qui, dans un second temps, est même connecté au réseau de la Bibliothèque municipale de Lyon. (<http://www.pss-archi.eu>)

## **KHR Arkitekter (Gunnar Krohn, E. Hartvig Rasmussen), Copenhagen - Denmark**

<http://www.khr.dk>

### **Libraries :**

#### **Ørestad School & Library – Denmark 2012**

Client: Copenhagen Council, Budget: 290 mio. Dkr.

The City and exploration. Intimacy and inspiration.

It is KHR's vision for the new school, after school care and public library in Ørestad City.

The building has hanging gardens, bay windows and small piazzas like any inspiring medieval town. Visitors are invited to explore a myriad of small alleys and terraces on the outside of the building, which is made public by a stairway running from the bottom to the top floor

Multitude of meeting places

A multitude of meeting places outside and inside ensures the building's status as Ørestad's new social and cultural focal point, where people in all ages and from all backgrounds can meet. Inside a large stairway connects the school with the library in the ground floor and creates a dynamic exchange between the two institutions. The stairs run through the eight floors of the school and connects a sequence of overlapping rooms of different size, décor, inflow of light and orientation.

The building has many different types of rooms, which opens up for different types of learning situations from work in groups; individual tutoring to learning by doing in work shops. The floors and the connection between them are designed as streets in a

mountain village with a variation of narrow alleys, piazzas, views over the surroundings and small quiet rooms. The main routes through the school are clearly delineated while short cuts and extra connections create diversity and connect the different functions in the school.

**Luxuriant and varied**

The school is a public school with 3 parallel classes and a special emphasis on aesthetic and virtual subjects and learning processes. The design is luxuriant and varied in both plan and facade with a precise structure on the inside. Outside the school takes good use of the surrounding urban landscape with places for learning, play and breaks at the building's terraces, along the canals, over the fortified roof towards Ørestad high school to the Pocket park to the north. A large area where the children can play, learn and grow. Spearhead project

KHR arkitekter was one of the first studios to introduce sustainable architecture in Denmark. The consideration for the environment is reflected in the new building, which will be a spearhead project in Copenhagen Council's efforts to save energy. (KHR)

### **University of Copenhagen, Library – Denmark 2002**

Client: University of Copenhagen, Acreage: 50.000 m<sup>2</sup>, Cost: 500 mio Dkk.

The new University of Copenhagen – Amager (KUA) is a compact, urban construction with attractive outdoor areas that bind the wings of the buildings together.

**Democratic educational buildings**

KHR has many years of experience in creating educational facilities. The aim is to design reliable spaces that work as a healthy basis for the creative development and learning of students. KUA is conceived as a democratic educational building where students can develop through enjoyable and concentrated learning. All rooms have been designed with the aim of strengthening and enhancing the internal communication between students with each other and with their teachers. All rooms are flexible and non-confined. The first building section comprises the first stage of the total development plan for the university. With its location on the canal in the north-eastern corner of Njalsgade and Amagerfælledvej, it made up the first part of the new city district. The total area of the first building section is 41,500 m<sup>2</sup>.

**Teaching below, research above**

The aim was to design a compact, varied urban building where the outdoor areas adjacent to the buildings are functional spaces. In later stages, squares and common areas supplement these outdoor areas. The building continues the architectural competition's idea of north/south-oriented wings of six storeys. Classrooms are located on the ground and first floors, while the second to fifth floors are reserved for research and the various departments. The sequence of the wings is varied with large common rooms such as canteens, libraries and auditoriums. The facade of the two lowest floors consist of two large glass sections that ensure contact across the structure to the canal and rooms facing the yard. The facades from the second to the fifth floor are designed as natural stone fronts in travertine with window strips. (KHR)

### **Ordrup School, Charlottenlund – Denmark 2006**

Floor Area: 5800 m<sup>2</sup>

School extensions can create 'schoolscapes' by allowing for new connections and by opening up new interior spaces. At Ordrup School, the new extension forms the fourth side of a square, making a loop out of what were previously three separate buildings. Its plan maximizes connections between all parts of the old school; a system of short cuts allows for new and flexible ways of organizing the school day. The programme consists of a café, a media library, a music room, teaching spaces and two auditoriums. The larger of the two auditoriums is at once a place of passage and a place of gathering, as are all communal places. The choice of colour for the façade is not just an aesthetic one; it also tells the story of the building, one about short cuts and connections between the different levels of the old school buildings. The window panels on the second level are black - in contrast to the otherwise strong yellow - so they appear as cut-outs between the connective lines of the building. (<http://www.mimoo.eu>)

### **Malmö College's education and research building, Malmö General Hospital Campus, Malmö – Sweden 2003**

Client: Malmö Högskola v. RegionFastigheter Skåne, Area: 12.500 m<sup>2</sup>, Competition: 1998

**Awards:**

**Malmö Stadt 2004**

Malmö College's new education and research building is located on the Malmö General Hospital campus, ensuring the integration of teaching and practice. The campus is composed of freestanding buildings set among areas of green that open up to the nearby Pildamm Park.

The building complex consists of two elongated, stone-clad volumes with a connecting building of glass. The wings are each oriented toward the neighbouring buildings, resulting in an angled geometry that opens up toward the park. The three separate volumes reflect the functions of the program: education, research, and community.

In order to achieve a high level of flexibility as well as a unique ceiling expression, the floors consist of exposed double-T concrete elements, spanning from façade to façade. The constructive system is integrated with the façade, where clerestory windows allow daylight deep into the rooms through the ribs of the concrete elements.

The interior climate of the building is based on radiant floor decks of polished concrete and the natural ventilation of all spaces. (Lundberg)

### **Libraries:**

#### **Aarhus University, Building 1351, Library Extension, Aarhus – Denmark 2011**

Client: Undervisningsministeriet Byggedirektoratet

An extension of the Library of the Faculty of Social Sciences, Aarhus University, created the need for a design solution that could cause the original and the new to appear as a single continuous space.

In addition to the choice of surfaces, colours, furniture and lighting, the task also involved the design of custom fixtures, including service counters, a lending desk with integrated self-service lending scanner, IT-workplaces integrated into standing tables, and shelves with integrated multimedia screens.

The brief was to integrate modern multimedia and IT solutions into the decor, so the library offers opportunities for both co-operation and interchange between the students and for individual peace and quiet for concentration. The decor thus offers many opportunities for standing, sitting or hanging out on the more informal, upholstered lounge furniture, while the loose fixtures with small tables, light chairs and movable partitions enable the decor to be adapted to many different types of study.

The green shades of the materials in the chairs and screen walls and the linoleum surfaces of the custom decor form an interplay with the raw, yellow brick of the walls. In combination with shelving and tabletop edges in golden ash, the premises present a bright and modern appearance without abandoning the workmanlike and matter-of-fact expression that characterises Aarhus University. (Møller)

#### **National Maritime Museum (NMM), Library, London – UK 2011**

On Thursday 14th July, the polished Sammy Ofer Wing of the National Maritime Museum (NMM) in London opened to the public. Ruelly described as ‘one of the most challenging sites conceivable’ by Julian Weyer, Partner at C. F. Møller and lead architect on the scheme, the NMM is a Grade I listed building cupped in a leafy UNESCO World Heritage Site. This lengthy project was ignited five years ago with a ‘worthy but perhaps rather unexciting’ brief to extend the existing Museum’s archive and retrieval system, and was spurred on by the appointment of Dr Kevin Fewster as Director of the NMM and a very generous donation of £20m by international shipping magnate and philanthropist Sammy Ofer. Without this charitable gift the extension could not have been realised. Weyer truthfully admitted: “What we are facing here is a completely impossible dilemma for an architect’s point of view because it emerged from the process this was an opportunity to give the museum a new face towards the park, a new entrance, and at the same time it became clear that to make this a successful addition to such a strong building complex it needed to be subordinated.” The constraints imposed by the site’s heritage status forced the extension underground, with a cavernous space 10m deep, 35m wide and 55m long excavated from beneath the main foyer for temporary exhibitions. Mark Hammond of executive architects Purcell Miller Tritton relates the oddities uncovered during this invasive dig: “We have come across something like twenty bodies of seamen – some of which were reinterred at the end of the site, others needed to be examined and removed to be reburied elsewhere – the remains of a Tudor road, which we always thought was going to be here, and also on this site in the Victorian era was a (heated) swimming pool which also needed to be carefully investigated and recorded before it was removed.” Originally the sole reason for this 1,625 sq m expansion, the Caird Library, Archive and Reading Room are a series of softly-lit study spaces and efficient storage units which more than double the NMM’s existing library capacity and enable the majority of its collection (the largest collection of maritime artefacts in the world) to be housed onsite. Between 2 and 3 million books, manuscripts, charts, journals and other archival materials are now located at the NMM in an extensive storage unit that totals almost 9 linear kilometres of shelving. Swift and simple to use, the efficient system enables academics and visitors to the NMM to peruse the collection at their leisure in a quiet environment delicately illuminated by wide panels of glass. Internally the exhibition spaces are artificially lit, with the permanent exhibition space – entitled the Voyagers Gallery – located directly opposite the main entranceway and encapsulating a myriad of treasures enlightening visitors on the lives of those who lived and died on the seas. A cascading platform which runs the length of this room is illuminated with scores of naval-inspired expressions which enliven the static plane and give it the illusion of waves in motion. An adjacent Compass Lounge encourages visitors to explore the NMM’s archives through interactive display boards, using touch-sensitive navigation tools to scan an impressive array of maps, charts, diagrams, artefacts, and oceanic paintings. On crossing the NMM’s newly inaugurated threshold (which is now to act as the main entranceway to the entire museum) and entering the light-rich foyer, what grabs one’s attention is a gaping void in the floor. A great glass elevator and similarly modern staircase lead the way to a basement exhibition space marked for temporary displays, currently housing an intriguing installation by United Visual Artists and Cape Farewell entitled High Arctic which is well worth a visit. Visitors are invited to take a UV torch into the darkened room to examine thousands of creamy columns hidden in the blackness, each representing a real glacier in Svalbard. Despite the lack of natural light within the prime exhibition spaces, the design team have gone to great lengths to encourage the sun’s rays to penetrate the extension’s walls. A handful of protruding light bays have been inserted above the central foyer to draw light in directly above the initial depression into the lower temporary gallery, and great walls of glass at the front of the extension allow the weak London sunshine to infiltrate the space. The effect is surprisingly efficient yet lacks the intensity of Rick Mather Architects/BDP’s neighbouring Neptune Court scheme from 1999 which illuminates an internal covered plaza and places the remainder of the NMM’s exhibition spaces in the shade. Light was not the end goal for the Sammy Ofer Wing however. During exhaustive early development work it was discovered that a high percentage of visitors to the neighbouring Royal Observatory were either unable to access the adjoining NMM or were unaware that they could do so. Landscape designers Churchman Landscape Architects have opened up the external space, introducing a broad walkway linking the NMM to the Observatory both visually and geographically, and inserting a 160m-long stepped rill as a subtle reference to maritime culture. As Julian Weyer divulged in an interview with WAN: “It is hard to choose a favourite part of the new wing but what I feel is most important here is that museum and park have become one which makes a grand difference. The archives and the creation of new exhibition space are fantastically important here but the really big change that people will feel – even if they don’t enter all the interior changes to the museum – is that park and museum now blend together.” And so the design team’s work is done. Sian Disson, News Editor (<http://www.worldarchitecturenews.com>)

#### **Älvstranden Education Centre, Hagfors – Sweden 2010**

C.F. Møller Architects in collaboration with LLP Arkitekter AB

Client: Municipality of Hagfors, Size: 7000 m2 new building, 8500 m2 rebuilding, Year: 2008-2010, Competition year, 2006

### **Awards:**

**2006 1. prize in architectural competition**

Älvstrand upper-secondary college has undergone an extensive renovation of the existing buildings, and a new extension has

been added, with the intention of creating a new educational centre for Hagfors Kommune. The centre integrates lower school, middle school, upper-secondary, adult education, a public library, a music school and a day care centre in one coherent campus. The centre provides communal facilities for all users including auditoriums and lecture theatres, canteen facilities and a café. The centre has a capacity for 1000 students and 150 staff. The overall concept behind the renovation and extension is to create an overview and to give each unit its own identity. The characteristics of the new education centre is bright rooms and strong colours creating a recognisable identity for the entire centre. (Moller)

### **Libraries:**

**Kulturhus (Library) NordVest, Copenhagen – Denmark on design**

**Ordrup Multihal & Bibliotek, Copenhagen – Denmark 2005**

Cooperation with: SRL Architects (Søren Robert Lund)

3.300 m<sup>2</sup>

Ordrup is a compact hybrid building with emphasis not only on design but also on the content. It is developed in a user driven design process where a library, sports facilities, auditorium and teaching are weaved into one consistent building. The green iconographic envelope are embracing these programs in one gesture allowing the difference of each component to become one. The idea about an outer and inner compression / deformity is underlined in the choice of materials, where the outer shape is defined by a green glass fiber coated façade which opens up, like a portal to the inner deformity. In the interior, the border between the different functions, are a mix between concrete surfaces and open glass areas. These compressions and deformation motif are used on the vertical surfaces and in the horizontal organization of the building and is recognizable as two different elements weaved together.

-In ground level all floors are green as a carpet of artificial grass. -On the first floor the grass and by that the nature, is pulled up by the green slopes and creating a bridge throughout the building from east to west. As a central crossing point in the building the main stair and the amfi stair are placed as an element that both express the vertical deformity of the figure, but also uses the horizontal surfaces in the building. The stair is designed like a sculpture steel element and this gives the motif to the rest of the building surfaces covered with steel. The iconographic character of the design allows for a renegotiation of the typology of the cultural building. It neither expresses the dryness and dullness of the library nor the rigidity of the sports building. The envelopes iconographic nature instead becomes a openness of interpretation, a building that will grow with its use. It becomes a building that reinterprets the historian Greek gymnasium where body and soul where given equal weight. A building that will interact with its community and perform as a new platform for developing cultural services for people of the twenty first century.

### **Libraries:**

**Urban Mediaspace – Europlads, Aarhus – Denmark 2011 – 2014**

Client: The Municipality of Aarhus. Client partner: Realdania, Area: 35,600 m<sup>2</sup>, Construction sum

€ 215 million excl. VAT, Competition 2009, first prize in restricted international competition

Other consultants during the competition: Bosch & Fjord Interior Design & Art, The Danish School of Librarians by Dr. art Henrik Jochumsen and Dr. art Casper Hvenegaard Rasmussen

Urban Mediaspace will be Scandinavia's largest public library and represents a new generation of modern hybrid libraries and thus the building contains multiple potentials. The building is situated at the mouth of the Aarhus River in one of the most prominent sites of the city centre of Aarhus.

Urban Mediaspace is part of the ambitious district plan to revitalise the former industrial cargo docks on the harbour front by connecting the area both visually and physically to the historic centre of the city.

The leading idea is a covered urban space. A large heptagonal slice hovers above a glazed prism, which is resting on a square of ice flake-shaped stairs fanning out to the edge of the sea. The ice flakes create wide plateaus and accommodate recreational activities and outdoor events.

The heptagon will contain the media house administration and offices for rent. The glass building below is transparent and allows passers-by visual access to the activities in the building while the users have a 360 degree panoramic view from the inside. The library contains several divisions in staggered levels that cover literature and media areas, exhibitions, children's theatre, interactive activities, public events, cafés and restaurants and hence, they form an eventful promenade through the building.

Below ground the large parking area will be available to the whole city. Part of the traffic along the waterfront will run beneath the building. To boost public transportation the new tram will have a stop here. (Schmidt)

**Culture Island in Middelfart, Middelfart – Denmark 2005**

Cooperating Architects: Karl C. Rosenberg Rasmussen

Client: The Municipality of Middelfart, Area: 4,500 m<sup>2</sup>, Construction sum € 8.7 million excl. VAT

Competition: 2002, 1st prize in restricted competition, Status: Construction period 2003 - 2005

Contractor: MT Højgaard

The highly sculptural quality of the new Culture Island energises the newly created peninsula extending from Middelfart's waterfront. The Culture Island is a multi-building accommodating a whole range of the town's culture facilities under one roof, including a large new library, a cinema, a panorama restaurant, a café, a tourist information office and the town's new assembly hall.

The Culture Island is situated on an artificial peninsula in the narrow channel between Jutland and the island of Funen. The peninsula is floating above the water on piles deep in the sea bed, and it is surrounded by an exclusive marina. Standing on the harbour seafront of Middelfart it is easy to understand why the town is known as the Town of Bridges. From the Culture Island there is an impressive view of the two bridges that link Jutland with the island of Funen. The view to the west is of a fine bridge built in 1935 that brings railway traffic over the Little Belt, and to the north can be seen an elegant suspension bridge from 1970 over which motorway traffic crosses between the island and the mainland.

Four large glass panels afford views from the cultural centre over the water, and also admit generous levels of daylight into the interior. These glass panels act as large eyes that look out to all four corners of the world. In the evening, these windows glow and fields of light are reflected in the water. The rest of the façade consists of large surfaces covered with zinc, interrupted by small, vertical slits that project beams of light into the building. The zinc casing gives the building a lightweight look and creates an elegant interplay between the sky and the water.

The Culture Island of Middelfart is created from its surroundings. It is a spectacular architectural sculpture inspired by the sea and by the two distinctive bridges that span the Little Belt on each side of the Culture Island. The trapeze-shaped glass panels and curved surfaces suggest associations with ships and sails. With its dynamic sweeping façades, the Culture Island of Middelfart is a finely honed exercise in dramatic architectural form, further enhanced by the continuously changing light characteristic of the area.

(Schmidt)

### **The Royal Library, Copenhagen – Denmark 1995 – 1999**

Client: Danish Ministry of Culture, Area: 21,000 m<sup>2</sup> new build, 7,000 m<sup>2</sup> conversion, Construction sum € 49 million excl. VAT, Competition 1993, 1st prize in european competition, Engineer: Moe & Brødsgaard A/S, Interior design: shldesign

#### **Awards**

1998, The Danish Arts Foundation Award 1998

1999, The Eckersberg Medal 1999

1999, The Timber Industry Information Council Award, Ground-breaking use of wood

2000, The Architecture Prize of the Municipality of Copenhagen

2000, Nominated for the Mies van der Rohe Award

2001, The Nykredit Architecture Prize

2003, Du Pont Benedictus Award

The Royal Library is with its clean-cut lines and glittering polished surfaces one of the most significant architectural landmarks on the Copenhagen waterfront. Clad in black granite, the extension to the Royal Library is known as The Black Diamond. Situated in the historic heart of Copenhagen, the extension marks a radical shift from traditional library structure and accommodates a range of cultural facilities. Open and essentially democratic, the building includes scientific and literary institutions, exhibition rooms, a bookshop, a café and a restaurant, as well as a roof terrace and a hall with 600 seats for concerts, theatrical performances and conferences. The extension has doubled the library's overall size. The open shelves can accommodate more than 200,000 books compared to the previous capacity of 45,000 books. There are six reading rooms with a total of 486 seats.

The new library has seven storeys plus a basement. The solid black cube is divided in two by a vast glazed atrium housing the majority of public functions. This central space, affording panoramic views over the waterfront, also serves as a significant source of daylight which is dispersed throughout the building.

The Royal Library has become an icon for Copenhagen – a prominent, accessible and public focal point for the life in the city. The aim of the design was to create an informal meeting place for citizens in Copenhagen, students, tourists and restaurant guests. The dynamic rooms are crowded with people and filled with movement and life, and in a sophisticated way, the building connects the public and private areas. The purpose of the public space around the building is to create a natural meeting point for everyone in Copenhagen. (Schmidt)

### **Katuaq – Cultur Centre, Skibhavnsvej, Nuuts – Greenland 1994 – 1997**

Client: Nordic Council of Ministers, Greenland's Home Rule and Nuuk Municipality, Area: 4,800 m<sup>2</sup>

Construction sum € 12 million excl. VAT, Competition 1992, 1st prize in restricted scandinavian competition, Engineer: Rambøll A/S NIRAS A/S

#### **Awards:**

1997, Selected Buildings Award

1998, The Nykredit Architecture Prize

1998, The Danish Arts Foundation Award

1999, The Eckersberg Medal

Inspired by Greenland's dramatic scenery of icebergs, snowfields and mountains, the main element of the building is sheathed by a floating, undulating screen of golden larch wood. This second skin lends the scheme an elegant airiness, creating a contrast with the solid form of the core building. The screen acts as an architectural metaphor for the Northern Lights, whereas the dark and massive form of the main building is reminiscent of the icy mountains of Greenland.

Daylight streams into the large foyer through roof lights and narrow oblong glass slits in the external screen. The foyer serves as an indoor public piazza for the city and is divided into separate areas by three free-standing geometric structures housing the main facilities of the Cultural Centre: a square box for the television studio, a triangular structure for the café and a circular form for the multi-purpose auditorium which has seating for 550 people and can also be used as a cinema or a concert or conference hall. The Cultural Centre of Greenland in Nuuk is a dynamic meeting place for Inuits from all over the northern hemisphere.

### **Cultural Centre and Library, Karlshamn – Sweden Competition 2013 1st Prize**

The New Cultural Centre and Library in Karlshamn, Sweden, is designed to gather the city's cultural functions under one roof. schmidt hammer lassen architects has just won an international competition to design this 5,000 square metre cultural centre. Karlshamn will get a sculptural and flexible building containing a library, an exhibition area, a cinema, a tourist office and a café. It will be the city's new meeting place and will embrace diversity.

The building is situated on Östra Piren between the industrial harbour, the local folk high school, the city and the beautiful Swedish skerries. The facade and roof are designed to meet the scale and sight lines of the surroundings hereby creating a distinctive shape.

"Through a poetic interpretation of the surroundings we have created a meeting place, which will be a striking visual focal point that connects the city to the landscape and the water," stated Ms Trine Berthold, associate partner at schmidt hammer lassen architects. She continued: "The meeting place is defined by a sculptural, folded roof made of wood that gathers activities and visitors in the building under one roof – which is both the motto and the main concept of our design."

The main access to the Cultural Centre and Library will be from the square at Östra Piren. A large glass facade ensures visual contact between the inside of the building and the surroundings. Visitors will be able to get an overview of the whole cultural centre from the information square and the atrium in the centre of the building. The different functions are carefully situated to create synergy while ensuring open, flexible and accessible spaces that invite visitors to interact, be curious and create.

The facade of the building is clad with robust wooden lamellas to minimize solar gain while allowing visual contact with the inside of the building. During winter, the warm light from the building will appear inviting to visitors. In the summer, a long bench, stretching the length of the facade, will invite passers-by to sit down or engage in activities around the cultural centre.

“The New Culture Centre and Library in Karlshamn is a library of the future, which is accessible, diverse and flexible. It is an example of a reinterpretation of the Nordic architectural tradition with a focus on the human scale, the Nordic light and

the use of robust materials,” explained Mr Kim Holst Jensen, partner at schmidt hammer lassen architects. The New Cultural Centre and Library in Karlshamn is the latest project in a long row of libraries designed by schmidt hammer lassen architects. This is the third library designed by the practice in Sweden. In 2006, the 8,000 square metre library in Halmstad was inaugurated, and the extension of the Växjö City Library was completed in 2003. Furthermore, schmidt hammer lassen architects is working on two libraries in Canada – one in Halifax and one in Edmonton – and another library, Dokk 1, in Aarhus, Denmark. Dokk 1 will be the largest public library in Scandinavia when it is finished in 2014. (Schmidt)

#### **Halifax Central Library, Halifax, NS – Canada in construction (2014)**

**Local architect: Fowler Bauld & Mitchell**

**Client: Halifax Regional Municipality & Halifax Public Libraries, Area: 14,500 m<sup>2</sup>, Construction**

**Budget: € 32.8 million. Competition: 2010, 1st prize in a restricted international competition**

**Status: Construction period 2011 – 2014, Interior design: shldesign**

The new Halifax Central Library is to be sited on a prominent position in downtown Halifax. The site itself is bound by the heritage neighbourhood of Schmidville, the historic Citadel Hill, Dalhousie University School of Architecture and the busiest shopping street east of Montreal, Spring Garden Road. The new library will become a multifunctional cultural hub with direct accessibility to the vibrant surrounding urban context of historic and new buildings, and the buzz of downtown. When finished the library building will stand as an iconic reflection of the diversity of the community and modern life within the municipality as a whole, and stand as a flagship for all 14 branch libraries servicing the whole municipality.

The construction of the library is essentially cubic in form with four significant 'volumes' vertically placed on top of one another with a horizontally twisted and shifted facade alignment. A number of distinctive cantilevers and one signature larger cantilevered element create a voluminous expression whereas the remaining façades align elegantly with the neighbouring façade of the classic architecture of Dalhousie University's Architecture School. From the top of the building access to an open green roof terrace provides a unique view towards Halifax Harbour, Citadel Hill, the historic George's Island, Dartmouth and onto McNabs Islands that reaches out towards the North Atlantic Ocean.

Every stage of the architectural design process has been carried out through extensive monthly public consultations; and several workshops with various focus groups have been held. Live streaming on the library's website has ensured all future users of the library have had a substantial influence on the design process. The citizens of Halifax have welcomed this initiative by participating in these events and have provided important contributions, for instance the way green space is represented within the building and how light is brought into the building, the establishment of private spaces and also the priority of seating and workspaces.

The project is aiming ambitiously towards a LEED Gold certification. The façade of the building is intended to reflect the local history of the site which was once a central local 'garden' and significant green space within the heart of the city. An abstracted 'leaf' motif of varying densities creates a façade that appears more solid in some areas, yet fully open in others reflecting the strong seasonal nature of the much loved trees that surround the site. The approach is to combine this local reference with that of a Scandinavian design signature and to create a modern hybrid library building that will stand out from other public buildings.

The new Halifax Central Library is the most significant public building to be built in Halifax in a generation, and will represent the diverse communities, talents, and creativity of the residents of Halifax throughout the municipality and present this to the world. (Schmidt)

#### **Edmonton Public Library, Highland Branch – Canada 2013**

The Highlands Branch has been serving customers in northeast Edmonton, Highlands, Montrose and Bellevue communities since 1962 when it began operations in a storefront. In 1963, the branch moved into a cottage at 8606-118 Avenue and was affectionately known as the “Little House Library”. The current building, located at 6710-118 Avenue, was constructed in 1964. Since that time, the area's population has grown and its needs related to library service have changed.

Construction will begin soon and we hope that a new library stimulates further development and upgrading along 118th Avenue as well as improving the quality of life for area residents. The proposed design is intended to be an open pavilion conveying the idea of democracy and openness, that the building is open to all; a free public space, a place to read, a place to learn, a place to meet, a place to be. The new Highlands Branch - being re-built in its current location - will be a distinctive landmark for the district and corridor with its bold form and openness. Expected opening date for the new branch is Fall 2013. (<http://www.epl.ca/about-epl/building-projects>)

#### **Aberdeen University Library, Kings College, Scotland – UK 2009 – 2011**

**Client: University of Aberdeen, 15,500 m<sup>2</sup>, Construction sum: € 40 million excl. VAT, Competition: 2005, 1st prize in restricted, international competition, Engineer: Arup & Partners Ltd, Quantity Surveyors: Davis Langdon LLP, Landscape Architects: schmidt hammer lassen architects.**

The building process of the University of Aberdeen New Library in Scotland is well underway as the topping-out ceremony just took place. The 15,500 m<sup>2</sup> landmark is expected to open to the public in 2011. The University of Aberdeen, established in 1495, is the fifth oldest English-language university in the world. In 2005, schmidt hammer lassen architects won the international competition to design the new university library which is to replace the existing Queen Mother Library. The new library will reinforce the reputation of the University as an important academic institution, as a place of research, learning and teaching. The 15,500 square metres of floor-space will host over a quarter of a million books, maps and manuscripts, as well as 1,200 reader spaces in a variety of environments, where cutting edge technologies are available. Additionally, Special Libraries and Archives offer historical collections in connection to a secure rare books reading room. The new library will be run by approximately 60 staff and serve a community of over 16,000 students. “University of Aberdeen New Library will be an exciting embodiment of the library of the future: open, multi-functional and accessible. It will be both a meeting place and a cultural centre for the University and the wider Aberdeen community; offering public

spaces, exhibitions and events,” explains Morten Schmidt, Founding Partner at schmidt hammer lassen architects. The sweeping contours and organic form of the vast spiralling volume of the atrium, connecting the eight storeys, contrast with the clean cut exterior profile of the library. The glazed façade enables the library to appear shimmering during the day and to glow in the night. Presently, half of the glass façades have been mounted; the remaining part will be mounted in the coming weeks.

“University of Aberdeen New Library will be certified BREEAM Excellent which proves that the building is designed to minimise long term running costs and energy use. For instance rainwater harvesting for use in the WC flushing and photo voltaic cells on the roof of the library will be incorporated, as will the integrated hybrid ventilation and a series of intelligent management systems to optimise the energy strategy. Moreover, the extensive glazing of the library provides high insulation standards and plenty of daylight combined with that from the central atrium,” Stephen D. Willacy, Partner at schmidt hammer lassen architects clarifies. He stresses that sustainability is integral to the holistic design process of schmidt hammer lassen architects. schmidt hammer lassen architects works with libraries across all scales from branch libraries and central libraries to university libraries. The practice is renowned for the extension of The Royal Library in Copenhagen, Denmark, and has also designed Halmstad Library and the extension of Växjö Library in Sweden. Ongoing library projects include Urban Mediaspace, Scandinavia’s biggest public library, in Aarhus, Denmark and two medium-size libraries in Halifax and Edmonton, Canada. With 24 years of experience, schmidt hammer lassen architects is one of Scandinavia’s most recognised, award-winning architectural practices and has a long track-record of designing educational and learning facilities. In London, the practice has designed City of Westminster College which will have practical completion in November 2010 and

#### **Chaucer Buchanan District Centre Library, Sheffield – UK 2008 – 2011**

Client: English Partnerships, Area: 9,000 m<sup>2</sup>, Construction sum: € 2.9 million excl. VAT,  
Competition: 2007, 1st prize in restricted international competition, Status: Construction period 2010 – 2011, Project Manager and Quantity Surveyor: Sheffield City Council, Design & Project Management, Engineer: Scott Wilson and Sheffield City Council, Design & Project Management  
Landscape Architect: Sheffield City Council, Design & Project Management

The Chaucer Buchanan District Library Learning Centre is located in the northern part of Sheffield. The purpose built library and learning centre will provide exceptional facilities for teaching and learning and will be an important catalyst for the regeneration of the neighbourhood.

The new building will house a public library and the offices of the Southey Owlerton area regeneration partnership. A new public square is located in front of the building and will form the centre and gathering point for the neighbourhood. Adhering to a Scandinavian architectural tradition, careful consideration has been given to the use of natural daylight, choice of materials and interaction between the internal spaces. The building opens up towards the new public square with a large glazed facade creating a connection between the inside and outside and inviting people into the library learning centre. With its energy efficient design, the new library will set a high standard of environmental sustainability with attention paid to reduce life cycle and maintenance costs.

The Library Learning Centre is part of the overall development of the new Chaucer Buchanan District Centre in North Sheffield. The project was assigned to schmidt hammer lassen architects through a framework agreement with English Partnerships. (Schmidt)

#### **City of Westminster College, Library, London – UK 2008 - 2010**

Client: City of Westminster College, Area: 24,000m<sup>2</sup>, Construction Sum: € 81 million excl. VAT, Competition 2006, 1st prize in restricted international competition, Status: Construction period 2008 – 2010, Engineer: Buro Happold, United Kingdom, Landscape Architect: schmidt hammer lassen architects, Main Contractor: McLaren Construction Ltd, Other Consultants Knight Frank LLP, Stace LLP

#### **Awards:**

2011, World Architecture Festival, shortlisted in the Learning category

2011, shortlisted for The Concrete Society Awards

2011, RIBA Award

2011, New London Award, Learning category

The new flagship Campus for City of Westminster College by schmidt hammer lassen architects is designed to support new ways of teaching and learning. The 24,000m<sup>2</sup> College, won in a competition in 2006, provides much greater amounts of open learning spaces than typical colleges in the UK and holds state-of-the-art facilities for both students and staff. The building is designed to embrace interaction and diversity and allow students to learn from each other, both formally and informally.

The learning spaces of City of Westminster College are adaptable and flexible so that, in addition to the integrated technology, the students’ development is supported by the diverse architectural spaces of the very building they are in. It is a design which encourages new ways of teaching and learning.

The College is located in the heart of Central London at Paddington Green on the site of its previous building, an inefficient and failing 1960s block. The building has been designed from the inside-out, responding to the needs of the diverse groups who use the College, as well as taking into account the sensitive local context. It appears as a clean-cut, modern building with a distinct Scandinavian heritage. The building’s simple geometric forms rotate around a terraced atrium, creating a unifying yet flexible organisation.

The respective floor plans surrounding the atrium have visual connections from one floor to the other, making the atrium a dynamic centre and the heart of the College. The large atrium, which on some floors extends all the way to the façade, enhances the relationship between the inside and the outside. It offers light-filled, open and inclusive spaces which encourage the interaction between students.

To support connectivity with the local community, most public functions – including an exhibition area, a theatre and a café – are located adjacent to the main entrance before the security turnstiles. The choice of colours for the building is inspired by its context and by the change of the seasons, whilst the light timber panels lining the interior form a contrast to the exposed concrete surfaces and underline the Scandinavian design heritage.

The building is designed to be sustainable and energy efficient and the overall scheme will have a low maintenance liability, significantly reducing the building’s lifespan costs and carbon footprint.

#### **Halmstad, Växö – Sweden 2004 – 2006**

Client: The Municipality of Halmstad, Area: 8,000 m<sup>2</sup>, Construction sum: € 12 million excl. VAT  
Competition: 2002, 1st prize in restricted Nordic competition, Status: Construction period 2004 – 2006, Engineer: Rambøll A/S, Interior design: shldesign

### **Awards:**

**2006, Nominated for the Kasper Salin Award**

**2006, The Architecture Prize of the Municipality of Halmstad**

**2007, Awarded the Helgjutet-prize from Swedish Concrete Industry**

Halmstad Library is set within a park next to the Nissan River, overlooking the historic centre of Halmstad. With its atrium encircling a large existing chestnut tree becoming its fulcrum and the long concave facade with double-height glazing distended between the seemingly floating floor-plates, nature, the seasons and the city all become part of the library. Inside, the library is essentially a single open space, flexible and highly legible: an open structure which allows an active interplay between the columns and the trees outside. The double-height glazing of the concave facade creates a welcoming, transparent ambience. The atrium is the focal point that creates an instant overview and connects the library's three floors vertically. Surrounding the atrium is the information plaza: a dynamic zone containing the reception area, computer terminals, exhibitions, a café, and stairs to the balcony and the stacks in the basement. Around this zone looking out in the direction of the facade and the views, the various sections unfurl, breathing their own tranquil atmosphere, affording users space to ponder or be drawn in.

The library is extended across the wide expanse of the Nissan River like a bridge linking the historic part of town and the new urban development area, formerly divided by the river for hundreds of years. A square in front of the library creates a new urban space which can host a range of civic activities.

The library is constructed of few and simple materials: concrete, glass and Nordic larch flooring that interact effectually with the exterior surroundings. The Library is raised above street level on a forest of columns echoing the trees surrounding the building. The grass roof of the building is a sustainable solution, reducing UV penetration and the need for drainage, as well as providing additional insulation. (Schmidt)

### **Växö City Library, Västra Esplanaden, Växö – Sweden 2003**

Client: Växjö Municipality, Area: 3,850 m<sup>2</sup> new build, 3,100 m<sup>2</sup> conversion, Construction sum: € 9.8 million excl. VAT  
Competition: 2000, 1st prize in restricted international competition, Status: Construction period 2001 – 2003, Engineer: Moe & Brødsgaard A/S, Landscape Architect: schmidt hammer lassen architects, Interior design: shldesign

### **Awards:**

**SAJK Architecture Prize 2005**

**Kroneborg County Architecture Award 2005**

**Växö Municipality's Prize 2004**

**Nominated for the Kasper Salin Award 2004**

Växjö City Library sits in the cultural centre of the city and comprises a new build extension and a sensitive refurbishment of architect Erik Uluot's building from 1965. The extension is an independent circular volume that matches up with the existing square library.

With a base of light-toned natural stone terminated at the top by an unbroken band of glass, the new building appears as a simple, balanced juxtaposition of stone and glass. Visual weight below and an apparent lightness above – exactly like its sister building but with the order reversed. The interconnecting building sensitively mediates contact between the circular building and its quadratic counterpart.

The circular atrium is the new building's unifying element. Extending up through the library's three storeys, long flights of straight-run stairs present a linear contrast to the geometry of the circle. Between the atrium and the building's facade are the library's many functions located, positioned as freestanding furniture pieces on the light-toned wooden floors at each level. (Schmidt)

### **Libraries:**

### **Cultural Center and Library NordVest, Copenhagen – Denmark 2011**

A bright and beautiful building on top of Bispebjerg in the northwest part of Copenhagen, shaped like a staggered stack of books, has become the first integrated arts centre and library of its kind in Denmark.

The building includes a traditional library, spacious meeting rooms, café and lounge areas, and a computer workshop.

"This new library and cultural centre will be a gathering spot in Bispebjerg," said the City of Copenhagen in the competition announcement. "The ambition is to create a unique framework for cultural reflection and development that can generate energy and strengthen community life."

The building is designed by a consortium of Brødrene Andersen, COBE, Transform, Wessberg and Schønherr.

Books give the building its shape

Architects took into consideration the flexible and alternative functions of a library. The new complex can be seen as a stack of books-form imitating function. The staggered "books" are large open spaces with glass walls.

The architects integrated the two cultural institutions with a network of catwalks and other connections. The surprising location of the conference room at the very top of the building is expected to produce a large flow of people up and down the foyer-staircase system, a tide that will emphasize life in the building.

A hub potential

The project is an extension of the district's existing cultural foundation, and will house a combination of the area's two libraries-Ørnevej and Vænget-in a new, modern library. Additionally, the project will accommodate additional cultural facilities. The City of Copenhagen believes the project has huge potential for the entire Northwest quarter. The cultural centre on the hill will act as a neighbourhood gathering place, and a beacon of knowledge for the city at large. (**<http://www.dac.dk>**)

## Estonia

### **3+1 architects, Tallinn – Estonia**

<http://www.threepusone.ee>

#### **Libraries:**

#### **Pärnu Central Library, Pärnu – Estonia 2008**

3.500 m<sup>2</sup>, €5.806.000

#### **Awards:**

The architects of „3+1“ are the laureates of annual architectural prize of the Cultural Endowment of Estonia 2008 for designing Pärnu Central Library building.

The title “Deed of the Year” has in 2008 been awarded to Pärnu central library.

#### **Architectural idea or principle:**

Pärnu Central Library was designed by „3+1“ architects Markus Kaasik, Andres Ojari and Ilmar Valdur.

Construction of the library has unfortunately been a long, drawn-out process as the municipality of Pärnu decided to build the structure in two stages. Due to constantly rising construction costs during the property boom of the early 2000s, due to the lack of resources, the municipality was only prepared to finance the building of storage space for the books and totally neglected the public function of the library. In 2007 the architects and city government signed a contract for the completion of their project. And the building of Pärnu Central Library was completed in November 2008. The library has three floors: there's the periodicals reading room, Open Internet Access Point with 10 workstations (1 for the vision impaired), galleries for exhibitions, coffee corner, conference hall, administration and acquisitions department on the ground floor. Pending conference hall, home lending department and children's department are on the first floor and reference reading room, German reading room and music department are situated on the second floor. The library is situated in the central square in the city of Pärnu, next to a 1960s theatre building and close to the city's 17th-century fortifications. Pärnu's central square was planned following World War II for the location of the Old Town, reduced to ruins. The new library located along the trajectory of Pikk Street completes the Stalinist plans that were unfinished in their day, and connects the square in front of the theatre with the moat. The library is framed by a different view from each direction. In order to link it to its context, the all-glass building has a smaller plaza in front that leads to the entrance; the outside space is continued inside the building and transparent walls allow for visual continuity between them. The purpose of the building is to add more cultural life and compactness to the existing unfocused space, while breaking up the rigid linear symmetry characteristic of Stalinist planning. The library is surrounded by a different environment on all sides and small local open plazas were created on each side, which also correspond to the division of the functions inside the library. Much attention has been paid to purpose-driven function and planning of the interior creating a non-hierarchical spatial system. The backbone of the building is comprised by a system of stairs and ramps that extend through the whole building and as it descends, opens into different library halls. The ramps and stairs extend outward from the building as open common spaces, each with a different appearance. The views from the different levels and the sloping surfaces that jut into the building create a coherent space that „flows“ through the building – from the central square to the baroque-era moat. Most importantly, the public urban space continues through the library building, or more precisely the library itself becomes a part of the city space. The other important aspect is the way in which it provides insight into the context of the city space: the building is located with an overhanging corner right above the former commander's castle. The library is completely covered with shiny glass, allowing one to perceive through the facades its „belongingness“ to the city. As the city of Pärnu is a popular summer resort, the building has to meet not only year-round local requirements, but also cater for the interests of a large visiting public. In addition to designated reading areas, the library is equipped with conference rooms, exhibition spaces, children's corner and a cosy coffee corner. The main structural innovation related to the library function is the fact that all books are on open shelves – the public can freely stroll the stacks and browse the volumes. It is perhaps akin to an ordinary supermarket – shelves upon shelves where it is as easy as possible to find the product (book) you are looking for. The only major difference is that here no one is compelling you to buy anything. The modern library is becoming more and more user-friendly, a fluid event space. (<http://www.librarybuildings.info/estonia/paernu-central-library>)

The central square was designed during the post-war Stalinist period to replace the ruins of the bombed medieval city centre. New library adds activity and cultural intensities to the existing bleak space, breaking with its positioning square's rigid axial symmetry. The library is bounded by different environments from each direction. The facade of the building is completely clad with clear glass. So the local squares are created in all sides of the building, which are characterised by the placement of the library's functions. Special attention is focused to the functional aspects and interior planning, creating a non-hierarchical arrangement of space. The views unfolding in the levels as well as ramps intersecting into the building create coherent space, which extends through the library from the central square to the Baroque moat. (3+1)

The library is situated in a central square in the city of Pärnu, next to a 1960s theatre building and close to the city's 17th-century fortifications. Library is framed by a different view from each direction. In order to link it to its context, the all-glass building has a smaller plaza in front that leads to the entrance; the outside space is continued inside the building and transparent walls allow for visual continuity between them. The interior is arranged largely as an undivided continuum that serves to reinforce the idea of a single coherent space extending through the library from the theatre square to the edge of the old town. As the city of Pärnu is a popular summer resort, the building has to meet not only year-round local requirements, but also cater for the interests of large visiting public. In addition to designated reading areas, the library is equipped with conference rooms, exhibition spaces and cosy coffee corner. (“4dsocial : Interactive Design Environments, 2007).

The architects of 3+1 are the laureates of annual architectural prize of the Cultural Endowment of Estonia 2008 for designing Pärnu Central Library's building. ([http://www.pkr.ee/en/about\\_library.html](http://www.pkr.ee/en/about_library.html))

## Architektid Muru & Pere OÜ, Tallinn - Estonia

<http://www.vamp.ee>

### Libraries:

[Nurmenuku Library, Tallinn – Estonia 2007](#)

609 m<sup>2</sup>

The architect Peeter Pere described the building as an experiment with the room and the light.

In the elaboration of the building he used veneer, metal, concrete and glass as a collage. The outer shell of the building is like a porous sponge that imbibes the light in the day to irradiate it in the dark.

Nurmenuku Library's service ground is 608,7 square metres. New modern interior decoration, cool chairs, sitting pillows on the stairs enable everyone to feel comfortable while spending time at the library. Children can use the white curtain in the children's reading area to make themselves a small library of their own, where it is fun to be with their friends and discover the world of books. On the blackboard wall everyone can demonstrate their drawing skills in chalk. In summer it is possible to read a book on the library's balcony, if the weather permits.....

<http://www.librarybuildings.info/estonia/nurmenuku-library>

[Pääsküla Library, Tallinn – Estonia 2002 - 2005](#)

510 m<sup>2</sup>

### Detailed description:

After the Soviet Period Pääsküla Library is the first library in Tallinn which is specially designed and built for library. It was designed by architecture bureau Architects Muru & Pere OÜ. The architect Peeter Pere has described the building: „Pääsküla Library has a simple, even archetypical form. The financial situation was taken into account when designing the library. Also the building traditions of the district, the function of the building and the needed size. All the components were piled on a small building site. Facade is one board wall without windows, other side without the wall – only single window. Windows are scattered as raisins on two sides of the building for flavouring, mixed some spirit of the place, cool staircase added between two floors – and done.“

Pääsküla library is very accessible. It is located by the highway, 1-5 minutes walking distances from the bus stops and 2 minutes walking distance from the railway station. The grocery store is nearby. You can't miss the library, even in the dark. The library has quite good accessibility conditions for physically disabled people.

Pääsküla library has two floors. On the ground floor there are mostly shelves with books and on the first floor there is a reading room and 8 internet workstations. The books for children and youth are located on the first floor. On the first floor there are also being displayed Peeter Pere's three works of art from series „Positsioonid. MZ 108-04. Makarov. Parabellum“, they belong to Tallinn's art collection. Mentioned series was in Venetian Biennale in 1999, in Estonia Peeter Pere received a Kristjan Raud's Award.

Architecture critic Urmas Oja has written in the newspaper „Areen“ about the Pääsküla library: „The new Pääsküla library is not stagnantly monofunctional, it is suitable for reaserches as well as playground children who are still learning to spell. /.../ Architects Muru & Pere's new building is very modern construction, which lacks at times overexploited suddenness. Relatively small size of the building gave an opportunity for more playful and human approach, so that the outcome was warm and friendly.“

## Architectural Studio JVR, Tallinn - Estonia

<http://www.jvr.ee>

### Libraries:

[Viljandi City Library, Viljandi – Estonia 2002](#)

ILMAR JALAS

11.07.2003

Architect: Architectural studio JVR

Author: Ilmar Jalas, co-author Laila Põdra

Structural design: Ago-Allan Kuddu

Bank interiors: Rasmus Tamme, Tambet Pedak (OÜ ARS Projekt)

Library interiors: Üllar Varik (Varik Projekt)

Completed: 2002

The construction of the new Viljandi City Library building has quite a unique story. The structure is divided into two parts. Each part has it's own property, owner, contractor and architect, only the administrator is the same. The major part of the library was constructed as a new building that is owned by Viljandi Centrum Ltd who rents it out to the City. Four architects' offices responded to the announced open bidding (for the reconstruction without the new part). Because of some bureaucratic formalities our office was not eligible to compete for the reconstruction project. The job was given to RTG Projektbüroo Ltd., the author of the design is Jelena Beljajeva. It meant that the whole library building could not be designed by the same architect. The designer of the new extension had to start with the pre-existing design of the lobby and the main stairwell.

We still have to take major steps towards a democratic society. All city residents, including the City officers have a chance, even a professional duty to foresee the design problems of the future buildings in the master planning process. When a city government, a property owner or other interested party have very certain wishes in terms of building height, roof shape, windows and so on, it makes sense to write these restrictions into the master plan. But why do the interested parties wake only when the bulldozers are already working on the site? It is because authority wants to interfere but doesn't want to take responsibility.

When the client has given the architect the room program, the floor heights are given by the neighbouring building's stairways and the contour of the building is determined by the property lines the architect only has to design the suitable door and window openings. ....

<http://www.solness.ee/maja/?mid=130&id=290>

## Finland

### **Anttinen Oiva Architects, Helsinki – Finland**

<http://www.aoa.fi>

#### **Libraries:**

#### **University of Helsinki, City Campus Library, Helsinki – Finland 2012**

Project Manager: Vesa Oiva, Collaborators: Jussi Kalliopuska, Selina Anttinen, Antti Lehto, Building services consultant: Aila Puusaari, DI, Pyyry Building Services Oy, Construction-engineering consultant: Sami Lampinen, DI, WSP Finland Oy  
Library consultants: Irma Pasanen, office chief, Library of Helsinki University of Technology / Risto Maijala, library amanuense, Library of Helsinki University of Technology, Client: University of Helsinki, Project Area: 32,000 sqm, Design year: 2008-2010  
Construction year: 2010-2012.

The University of Helsinki is developing its library structure by joining together the five faculty libraries of its central campus, which are presently dispersed around different parts of the city centre, to form a single administrative unit. The largest academic library in Finland will be created in the historically important Hirvi [Elk] city block in the very heart of the city centre. The new library building complements the urban block by adding a curved brick facade, integrated within the street line formed by the adjacent buildings. (<http://www.archdaily.com>)

### **ARK-house arkkitehdi Oy, Helsinki – Finland**

<http://www.ark-house.com>

#### **Libraries:**

#### **Info Centre, Korona, University of Helsinki-Viikki – Finland 1999**

The Korona information centre is the new main building of the University of Helsinki Viikki Campus. The large Science Library forms a major part of the building and it houses the departmental libraries of the Faculty of Agriculture and Forestry, which were formerly independent, as well as the Pihlajamäki branch of the Helsinki City Library. The building also houses the administrative offices of the faculty and the campus, and the main teaching facilities and assembly rooms. The co-existence of the Science Library and the public library will provide an opportunity for cooperation between the two and expand the user base of the building, thus creating a link between the university campus and the surrounding residential area: a meeting place for students and the local community.

The Infocentre project began in 1996 with an invited competition. The name of the building, Korona, stems from the pseudonym of the winning entry. The name is a reference to the principal design idea behind the curved facade, a central feature in both the competition entry and the final design. "The outer circle is a radiating corona - in constant interaction with its environs. The 'conservatory wall' and its changing lighting give the building a strong identity during both day and night", state the architects in their account. Varying transparency of the glazed circumference and the rich-colour and rough texture of the back wall create an interplay that brings the facade to life. Seasonal changes, the time of day and light source all affect the appearance of the elevation. The hue of the reflected light colours the surroundings of the building, establishing it as the key building in the Viikki area.

The interior spaces are organised around high, toplit 'streets' that lead from the entrance hall - piazza - at the heart of the building, towards the gardens, or 'parks' as they may be called. The corridors delineate the book stack space by opening up vertical and horizontal vistas across the building. The curved blue wall, as well as the auditorium, team work facility and office masses, lined with shuttering plywood, have been separated as independent elements. Together with the steel balustrades and staircases they establish the ambient colours and materials of the interior.

The curved facade is accentuated by three gardens separated from the interior spaces by a glass curtainwalls. The Nile Arboretum, the Roman Garden and the Kyoto Bamboo Garden represent the landscapes and garden art of ancient civilisations and symbolise the significance of global interaction in the expansion of human knowledge. The vegetation in the gardens is representative of the respective cultures and the disciplines studied in Viikki. Once the plants have grown, they will offer the library visitors a chance to stop for a while in the midst of greenery during the dark and chilly days of autumn and spring. In mid-winter, the temperature is kept below room temperature, at a level required by the plants.

A rectilinear area has been cut off the south-west quarter of the cylindrical building to form a square, flanked by the Biocentre 1 building at the opposite edge. The square links the contrasting geometry of the building to its context and creates a central public space of the campus area. The square is paved with concrete pavers and a grid of cobblestones that delineates the surface. The hardness of concrete is softened with grass sown in the paver joints, thus bringing some of the greenness of the surrounding lawns in the square. The contrast between the subtracted rectilinear form facing the square and the cylindrical portion is enhanced by different methods of cladding. The planar facades are characterised by the warm colour of the translucent coating of the wood batten sun screens and machine seamed sheet metal cladding. The sunscreens, canopies, and the café terrace form a linear pattern oriented towards the main entrance.

The glazed envelope of the curved facade is not only architecturally motivated but also has an ecological and technological function. The envelope acts as a low-maintenance 'overcoat', which enables the use of very simple structures inside, and eliminates the need for further weather protection. The envelope reduces heat losses during winter and the need for cooling during summer. The space between the glazing and the masonry wall acts as a climatic buffer used for preheating incoming fresh air. Thanks to the circular shape of the building, fresh air can be taken in from the desired sector, depending on the season and temperature.

(<http://www.e-architect.co.uk>)

#### **Helsinki City library, Viikki - Finland 1999**

The floor area 1000m<sup>2</sup>

Viikki Library is the cultural centre and public living room for the surrounding community, while also offering the citizens a path to the world of science.

In addition to the extensive basic library functions, the library in Viikki focuses on the disciplines taught and researched at the campus, and offers information services. The library is committed to sustainable development and ecological values in its operation.

The Viikki Info Centre Korona is the main building of Helsinki University at Viikki Campus. The Helsinki University Science Library and the Viikki Library of Helsinki form its central part. The building also houses faculty and campus administration as well as teaching and lecture facilities. (<http://buildings.libraries.fi>)

<http://www.arkboehm.fi>

### **Libraries:**

#### **Pakkala Learning and Information Centre “Point” (Pakkalan oppimis – ja informaatiotalo “Point”), Vantaa – Finland 2004**

900 m<sup>2</sup>, €13.000.000

Point, or the Pakkala Learning and Information Centre, consists of the International School of Vantaa, Y.E.S. Day Care Centre, Pakkala Citizen’s Office and Point Library. Point provides its users with pupil, information and cultural facilities. At Point, lifelong learning is a daily reality for children, pupils and adults alike. Point is a place where knowledge and emotions meet and where information and knowledge are present in a human environment. Point Library is open to pupils even outside the opening hours, while the Learning Centre is open to the public after school hours. In addition, courses and lectures taking place at Point and Vantaa’s only astronomical observatory provide opportunities for learning new things and gaining experiences. Many works of art from the City of Vantaa’s collection are on display at Point, and some of them have been specially designed for the premises. Get a portfolio available on the ArtKart and learn more about the works of art on display. I hope Point with its excellent services and facilities will emerge as a living room for the people of Pakkala and the neighbouring areas where they will want to return to and spend time together, enjoy themselves and perhaps experience a few surprises, too. Ms. Kirsti Tuominen, Director of Point (<http://www.vantaa.fi>)

The Pakkala Learning and Information Centre consists of the International School of Vantaa, Day Care Centre, Pakkala Citizen’s Office and Point Library. The heart of the school is the Learning Centre, which is also open to the library users after school hours. The building is like a four leafed clover in which the library is one leaf. The Centre is located along Hagelstamintie and the library is like a crown in the street crossing. There is many lodges for different learning purposes and exhibitions in the library. The chapes of the lodges make the architectural idea of the library. (<http://www.librarybuildings.info>)

## **Davidsson & Tarkela Architects, Helsinki – Finland**

<http://www.arkdt.fi>

### **Libraries:**

#### **University of Helsinki, Learning Centre Aleksandria, Helsinki – Finland 2003**

The topping out ceremony of the learning centre on the University of Helsinki City Centre Campus took place on Thursday, 9 January 2003.

Construction work was begun in September 2001 by tearing down the part of the Fabianinkatu 28 building that stood in the courtyard. The part facing the street, a residential building designed by Gunnar Stenius and completed in 1907, was renovated. A new building with four storeys above ground level and one below ground level was constructed into the courtyard. The street wing was renovated to accommodate mainly offices for the staff. The courtyard was covered by a glass roof and a new entrance into the Kaisa Shopping Centre was constructed in the Fabianinkatu 26 courtyard (facing the Language Centre building). The learning centre can also be accessed through the Kaisa Shopping Centre. In time, the roofed corridor in the courtyard, connecting the buildings in the quarter, will run from the learning centre all the way to the Porthania building.

The architectural look of the new building is dominated by colourful blinds covering the facade.

The total floor space of the new building is 3,005 br-m<sup>2</sup> and the old, renovated building has a total floor space of 2,492 br-m<sup>2</sup>. The building project cost about 8.8 million euro. Simultaneously with the building project a cooling system serving the whole network of university buildings in the quarter was installed.

The developer was the University of Helsinki Technical Department and the construction consultant was Indepro Oy. The architectural design was by Davidsson Architects and interior design by Interior Arcitects Gullstén-Inkinen Oy. The main contractor was SRV Viitokset Oy. (<http://www.helsinki.fi/aleksandria/english/presentation/historyofthebuilding/htm>)

## **Tero Harjunniemi, Tampere – Finland**

### **Arkkitehtitoimisto AR-Vastamäki Oy – Tampere – Finland**

<http://www.vastamaki.fi>

### **Libraries:**

#### **Library Ylöjärvi – Finland 2002**

The floor area 2696m<sup>2</sup>, Designed by Architect Tero Harjunniemi (Arkkitehtuuritoimisto Teuvo Vastamäki Oy)  
The total expenditure of the construction 5 milj. €

The library design is based on “Kite”, the winning proposal from the invited competition. The basic idea of the design was to give the residents of Ylöjärvi an architecturally spectacular and individual, user-friendly library. The building is centrally located along the busy Kuruntie. Environmental factors played a significant role in the layout, which consists of two triangles. The library is accessible from both halves. The same division also occurs in the functional side. The larger triangle contains the actual lending room and the smaller, the staff’s workspace and facilities as well as storage space. The avenue divides the spaces into those for patrons and those for staff. The Reference

Desk and Circulation are concentrated in a triangular service point, which is the central. (<http://www.librarybuildings.info>)

The Ylöjärvi main library “Kite” was opened to the public in November 2002. The library consists of two large triangles, and the avenue between them divides the space into public and staff areas.

The interior was designed to be spacious and sunny: a long glass wall is facing Kuruntie. The main colour inside the building is a warm light brown accentuated with a bright blue. Kite-like features, like the triangular service point and the shape of the roofs, have been used in the architecture.

The library averages around 900 daily visitors who read newspapers and magazines, use the public computers, borrow books, films and music, visit exhibitions or just meet one another.

The building is centrally located along the busy main street Kuruntie and fits harmoniously with the surrounding fields.

### **Vuotalo Cultural Center, Helsinki – Finland 1997 – 2000**

6.095 m<sup>2</sup>

Vuotalo Cultural Centre is a part of a network of suburban cultural centres around Helsinki. The building houses a library and facilities for music and other arts as well as a stage for theatre and dance performances. Vuosaari has become one of the new growth extensions of Helsinki, with already almost 40,000 inhabitants; the population is represented by all social groups, and a large part of the inhabitants have come from elsewhere in Finland and there is also a significant number of foreign immigrants. The basic design solution of the Centre resembles a hinge, where multi-level functional and traffic connections are integrated. The building opens out along its entire length towards a pedestrian route while turning its back against a busy bus traffic artery. All the activities of the building are visible at a glance behind the 2-storey glazed main facade. The rear side, on the other hand, is covered with stainless steel chain-link conveyor belt normally used in the processing industry, which, depending on lighting and the angle of view, appears to cover the facade behind it in a silvery armour or scales of a salmon – or turns it completely transparent. In the building mass, which is deep due to its half-circle plan shape, two glass-covered 'canyons' have been sliced. It is via these that natural light enters into the centre of the building, and together with the entrance gallery, they create spatial variation in the otherwise even height landscape, as well as bringing together the library and the art studios above it into one ensemble. The overlapping spatial structure of the building creates surprising internal views, and at its best it can cross-connect the users and functions in unexpected ways. As a contrast to the metallic exterior, the interior of the library is mainly wood. The floor is finished in heat-treated and oiled birch and the walls of the 'canyons' are comprised of a pine trellis that frame the views into the classrooms, but at the same time create the image of a classical library with its endlessly continuing walls. Art works were commissioned from artists Jaakko Tornberg and Pekka Syrjä, to be placed at the end of the 'canyons'. Planting is also an essential part of the architecture. When arriving from the north, one walks through a labyrinth of bushes arranged in even rows and the recessed yard contains Swedish whitebeams planted in a grid, the foliage of which will as time passes form a green cloud completing the territory of the building to form a circle. The pedestrian route is divided by steel rings from which lamps are suspended lighting the route; banners advertising the activities of the building can also be stretched from them. During the first spring of the building's life a colourful series of sails hung from the structure, the colour of which had been taken from a bouquet of tulips. (Heikkinen)

### **Lumen Mediacyenter, University of Art and Design, Helsinki – Finland 1995 – 2000**

12.000 m<sup>2</sup>

The University of Art and Design is located in the old industrial premises of Arabia Ceramics in the historic section of Helsinki, where the city was founded in 1550. The area has a long tradition in industrial design manufacture. With ceramic production moving into modern technologies, vacant parts of the old factory buildings are available for new uses. The audiovisual center will partly be incorporated into renovated manufacturing structures adjoining the existing University of Art and Design. Film and television studios, a black-box theater, and an auditorium will be located in a new addition. The center is an integral part of a larger master plan for this industrial block. The extensive building complex projected can be seen as a small town, which will be organized hierarchically into squares and boulevards, back alleys and service areas. The renovation of the old manufacturing structure will retain its original roughness and authenticity, an approach that fits the practical needs of its new function. The project includes rearranging the main entrance of the university as well. A glazed gallery connects the new entry across the block to the future main square of a proposed residential suburb. The gallery will have spaces for exhibiting student projects and will also serve as the lobby for the four-hundred-seat auditorium and the experimental theater. The Audiovisual Center implies numerous design layers of function and mechanical and electrical systems, as well as advanced cable networks. The architecture relies on a balanced coordination of these matrices. Its references are to microchips, in the sense of mastering complex flows of energy rather than of the fetishism of hardware icons. (Heikkinen)

## **Helin & Co. Architects, Helsinki – Finland**

<http://www.helinfo.fi>

**Libraries:**

### **Sello Regional Library, Espoo – Finland 2003**

Client: Real estate limited Kiinteistö Oy Kauppakeskus Sello, City of Espoo, 10.240 m<sup>2</sup>, volume 63.500 m<sup>3</sup>.

The new Regional Library includes a city service point, a consumer advice centre as well as commercial services – cafeteria, bank, and real estate agents. The lobbies of the Library and the outside market place are visually connected through gigantic glass wall zones. The tall glass walls are stiffened with net-type steel tension rod lattices, supported on the walkways running above the lobbies. The walkways have composite constructions. The bridges in the central lobby are supported to three-storey slender steel-frame columns. The outside surfaces of the bridges are suspended from the steel girders of the top floor slab by means of vertical tension rods. The interior of the library is airy and light. The railings and partition walls are made of glass and steel. The large frame stiffening steel lattices have been utilised as architectural elements.

Functionally the building is divided into two longitudinal parts. The open public spaces, the Children's and Young Peoples Sections as well as commercial facilities are located towards the market place. The Music Section with the associated studios and the Adult's Fiction Section are located on the street side, followed by the service point of the City of Espoo and the consumer advice centre. The reading rooms, studies, meetingrooms and the Non-fiction Sections are located on the second floor of the library. The high central lobby, the exhibition space and the glazed aperture of the Young Peoples Section connect the floors. On both floors the spaces may be separated by glass partition walls or by large turning and sliding oak veneer doors. (Helin)

### **Joensuu Regional Library - North Karelia Provincial Library – Finland 1992**

The floor area: 4217m<sup>2</sup>, Designed by: Architectural office Helin & Siitonen, Tuomo Siitonen and Tuomas Wichman, Interior design Simo Heikkilä, The total expenditure of the construction €8.500.000

The space solution reminds of the grid plan of the city with main streets crossing the building. The streets are spacious areas with glass ceilings and can be crossed using bridges on the first and second floors. The streets divide the space into four blocks. The public café and the multipurpose hall are situated in the entrance lobby, at the crossroads. The spacious building also houses reading rooms, the North-Karelian collections, storage and offices on the ground floor.

The first floor is the main public space. The music department is found on the second floor.

"Here, the books play the main role", comments Tuomo Siitonen, the architect. "Natural light, the painted, light-coloured concrete surfaces and the slab grillage ceiling form the background that is awakened to life by the books."

Joensuu main library was awarded the Concrete Building of the Year Prize in 1992. The jury praised the exceptionally harmonious and finished style which takes into account the scale of the surroundings. (<http://buildings.libraries.fi>)

## **Arkkitehtitoimisto Hannu Jaakkola Oy, Helsinki – Finland**

<http://www.ark-jaakkola.fi>

### **Libraries:**

#### **Vidhin pääkirjasto (Vihti Main Library) 1990 – 1998**

The library has been designed to be the parlour of the residents of Vihti. Two of the three floors are open for the public.

The main floor is divided into different levels: the circulation desk and reference service, adults' fiction and non-fiction and the children's department. The music department and the youth department are on the 2nd floor.

The library offers reading and team-work rooms for quiet work, a newspapers and magazine reading room, two conference rooms and a children's story corner.

The library also offers exhibition space with display racks and glass cases. The staff offices are mainly situated on the 3rd floor. The interior solutions make the customer floors open to the nature outside and fill the space with natural light.

The name of the library

The Municipal Library of Vihti (main library) named "Agricola"

The name of the municipality/organization

Vihti

The population of the community covered by the library  
over 27 000

The location of the library

In a central location in Nummela, (Pisteenkaari 9, 03100 Nummela), the library is located near the market place. The building has been beautifully landscaped.

The library is a new construction. The floor area 2300m<sup>2</sup>. The library was opened in 1998

Designed by

Architectural office Hannu Jaakkola. The building project was carried out as a modification of the original Agricola proposal of Hannu Jaakkola and Tapani Kernttula. The proposal won the first prize in an architectural competition held in 1990.

The total expenditure of the construction Building cost + furnishing app. 3,2 million (<http://www.buildings.libraries.fi>)

## **JKMM Architects, Helsinki – Finland**

<http://www.jkmm.fi>

### **Libraries:**

#### **Moby Dick, Vantaa Cultural City, Vantaa – Finland 2004 – 2014**

##### **CITY OF CULTURE**

The plan is progressing for the educational, cultural and recreational centre rising up next to the Science Centre Heureka. The City of Vantaa held a competition concerning the construction of the Vantaa City of Culture project as a whole in January 2007. The winner of the competition was SRV Group Plc. The area will be developed into a unique rendezvous of intelligence, discovery, knowledge and experience.

The altered city plan entered into force in January 2007. The planned area is primarily intended for buildings that house cultural activities, but space has also been reserved for a hotel, office buildings and small shops, as well as for public service companies or, for example, sports facilities. The entire area of the planned plot is approximately 7.5 hectares with a permitted building area of 64,000 m<sup>2</sup>. A parking lot will be built for a total of 1,000 cars.

Heureka learning centre

The City of Culture consists of many parts that are joined together by a covered indoor street. Five hundred metres long and at the most one hundred metres wide, the building embraces the visitor with pleasant summer climate throughout the year. The cultural centre designed by JKMM Architects successfully met Heureka's architectural challenge. The building runs smoothly with the shape of the ground beneath it and adapts easily to changes, and is able to accommodate a large number of different interior solutions.

Premises will be reserved in Heureka's expansion for the learning centre.

Heureka is a cultural and educational institution that offers an open learning environment for those interested in science and technology. The purpose of the learning centre is to utilise the versatile, intellectually stimulating content of Heureka in the teaching provided by schools and other educational institutions as broadly as possible. These activities will be significantly increased by founding a new learning centre in Heureka.

When planning the content, the specific needs of different fields of science will be taken into account regarding the furnishing and equipment for the premises. All working areas will have the most modern equipment, which will be replaced on a regular basis. The learning centre will also make it possible to implement the Heureka camp school on wider terms than the present science camp activities. The camp school offers the opportunity to research different themes or even to concentrate on one theme during a period of one or two weeks.

Some 75,000 schoolchildren visit Heureka annually. The learning centre will organise programmes in their own premises for approximately 50,000 people and distribute their products throughout the school system in the whole country, as well as running international programmes, particularly related to the EU. (<http://www.skyscrapercity.com>)

#### **Seinäjäki Library, Seinäjoki – Finland 2012**

Competition 2008 1<sup>st</sup> prize, 4.500 m<sup>2</sup>, €10.000.000, Client City of Seinäjoki

Fri, 26/10/2012

The Finnish town of Seinäjoki hosts the most extensive cluster of buildings designed by Alvar Aalto in the world. Asmo Jaaksi of architects JKMM explains his practice's approach to designing a new addition to this hallowed Aalto Centre

The Centre displays Aalto's masterful touch, ranging from the area's town planning to the smallest door detail and is an invaluable cultural asset which gives the whole town its identity. Five Aalto buildings make up the Centre: the City Hall, State Office Building, Theatre, the Cross of the Plains Church and the Old Library.

DIALOGUE BETWEEN OLD AND NEW

Built in 1965, the Library needed a modern extension to meet today's demands and JKMM's design, called 'Clover', won the competition for the project. The aim was to create dialogue between old and new. The new library respects the protected cultural environment but, at the same time, takes pride in contemporary architecture. One of the objectives of the design was to find an interface with the typical characteristics of Alvar Aalto's architecture without imitating it.

#### **VARIED INTERESTING SHAPES**

The new library stands separate from Aalto's original, although connected by an underground link. Division of the building into three sculptural units was an important decision to be able to blend the large building volume with the surrounding townscape. This generates varied, interesting shapes when viewed from different directions. The exposed boarded-formwork concrete interiors are punctuated by carefully placed windows and larger glazing offering controlled views of the Centre. The view from the glazed wall in the main library hall is dominated by the highlights of the area: the bell tower or the Cross of the Plains Church and the fan-shaped facade of the original Aalto Library. The heart of the building is the wide staircase, intended for different events and as an informal meeting place, which leads to the collection departments on the ground floor and through the connecting underground corridor to the Aalto Library.

#### **LIVELY AND VIVID SURFACE**

The external skin of the new library is dominated by copper. The darkening pre-oxidised copper sets the new library apart from the whiteness of the surrounding buildings. Copper is not a new material to the area but in the Aalto Centre it is mainly the roofs that feature the material's beautifully patinated green surfaces. In the new library, copper has been used comprehensively across facades, plinth and roofs – creating a single-material skin.

A special shape of copper shingle was specifically designed for the facades to give the building a highly individual, lively and vivid surface. In some situations, the shingle surface is formed into ventilation slots to accommodate air handling. Copper is also used to form vertical grilles and as a door facing to maintain the material continuity.

Written by: Chris Hodson

Seinäjoki Public Library – Provincial Library consists of the main library, 4 branch libraries, 2 mobile libraries and 5 lending stations.

The main library operates in two buildings. The old building was built in the 1960's (1961 -1965) and is designed by architect Alvar Aalto (\*1898 Kuortane, Finland - + 1976 Helsinki). The building is part of the administrative and cultural centre of Seinäjoki, Aalto Centre. The Aalto Library is about 1600 m2 in area.

The new building will be inaugurated in 2012. It is located near Aalto Centre and it will be about 3 500 square meters in area. The new library is designed by JKMM Architects and the main architect is Asmo Jaaksi.

In the new building will be located: children's department, youth department, music department and part of the adult lending department as well as the news area for magazines, newspapers and computers. There will also be WLAN in the whole building, a café, a lot of room for events and exhibitions, computer classroom and self-service issue and return. Beautiful staff rooms will also be located in the new building.

The architecture of the new building is fabulous. It is modern, user-friendly, and experimental. The materials are of good quality and space utilization is quite ingenious.

In the Aalto Library will be located the Seinäjoki collection, microfilm room, stacks, room for group works etc.

In August of 2012, the new library building has just been inaugurated and the Aalto library will be closed for renovation.

#### **Turku City Library, Turku - Finland 1998 – 2007**

9.300 m<sup>2</sup>, €14 Mill.

#### **Awards:**

**SIO Good Environmental Award 2008**

The new city library in Turku is located at the historical centre of the city. The building is the latest addition to a block with the old library and several other historically valuable buildings. The historical and cultural value of the site presented a great challenge for the planning of the new building. The objective of the project was to create a new construct, which would harmonize with the historically invaluable setting while also manifesting an architecture of its own age. In terms of urban planning the goal was to fill out the open and unstructured street corner by following the edges of the existing urban grid. By constructing the building on the outer perimeter, we were able to provide an open space in the middle of the lot, which was designed to serve as a courtyard for recreation and a stage for cultural events. The interior of the new building is annexed with the existing 100-year old library building and the chancellery of the governor built at the beginning of the nineteenth century, now restored and transformed to facilitate a café and meeting rooms.

The new library has a functionally clear design. The public spaces are situated mainly on two floors surrounding the opening to the courtyard. The staff premises are located systematically on one side of the building facing the street. The new main entrance opens onto the corner of two main streets. The first floor has a reception and lounge area, a children's and youth section, and a modernized version of a periodicals reading room called the news market, which functions simultaneously as the link between the new library and the old buildings. The main room of the new building is reached through a main stairway, which opens to a monumental space containing the non-fiction stacks and reading areas. The guiding principle in the space planning was flexibility; the functions of the library may change radically in the future with the introduction of new media. The rooms are open, and the functions are limited only by the transformability of the easy-to-move furniture.

The materials of the building were chosen to accommodate the environment. The facades are mainly plastered, which is the predominant material of the old buildings in the block. Initially we considered using red brick, but gave up the idea to allow the old library building to remain the only brick building on the block thus emphasizing its primary position in the neighbourhood. We also used natural stone extensively on the facades, the stairway and the grounds surrounding the building. In the interior we used mostly European Oak in the wall furnishing and furniture. The structure of the building was made from concrete cast on site, which was left exposed as an important part of the interior design. The fair-faced concrete was formed with vertical boards to achieve the rough feeling characteristic of the material. Glass was given a seminal role both in the outer architecture and the interior world. From the first steps of the planning process it was clear that the exuberant use of glass would be the best choice. Transparency befits this type of building; a public library building should evoke the idea of openness.

The basis of the planning was to create a new library to meet up with the challenges of the future. At the same time, the library has a long and rich history, which the architecture should also take into account. The architectonic whole is formed from the union of these two oppositions, the past and the future. 14.01.09 <http://www.archdaily.com>

#### **Lahdelma & Mahlamäki Oy, Helsinki – Finland**

<http://www.ark-l-m.fi>

**Libraries:**

### **Lohja Main Library – Lohja City Library, Lohja – Finland 2005**

3500 m<sup>2</sup>

The library building is a part of the 'cultural campus' in the centre of Lohja. Its architecture directs the flow of pedestrian traffic towards the cultural complex and into the library. Its principal material, red brick, integrates the building into the existing civic architecture; in the interior, the red brick walls delineate the open spatial composition as one entity and guide the eyes towards its primary aspects, the town centre and the church. The library is literally built for its location. The building has an in-situ, post-tensioned concrete frame and red brick walls. (Lahdelma)

The city of Lohja organised an open architectural competition for a new main library in 2002. In Finland many even smaller municipalities have their own public library. They act as the public living room and as the cultural centre also for a wider region. After the competition the design was further refined on the basis of our winning entry.

The Main Library is part of the group of civic buildings of the town centre together with the Church of St. Lawrence, school centre, Laurentius Hall and the Lohja Music Institute. It is quite fitting that the new library is also a meeting place that guides people arriving in the area.

A central location in the town's fabric is an ideal point of departure for library activities, however, the plot being partially within the town block set demanding challenges for the overall scheme. The angled lines of the walls define the position of the oblong two-storey building. Inside the red brick walls act as an organising element that integrates the openly linked spaces into a unified whole and also direct the sight towards the most important views: the town centre and the old church.

We broke the horizontality resulting from the two-storey interior height by opening it up with conical roof lights, which also play a part in the resulting townscape.

Lohja Main Library is literally built for its site on the site as it has a post-tensioned concrete frame cast in-situ and red brick walls.

(<http://de.urbarama.com>)

### **Rauma Main Library, Rauma – Finland 2003**

Extent Floor area 4 550 m<sup>2</sup>, Gross area 4 600 m<sup>2</sup>, Volume 24 600 m<sup>3</sup> The library building is part of the arts and cultural centre of the town. Designed by Architectural firm Lahdelma & Mahlamäki Oy. Ilmari Lahdelma, architect (SAFA), professor. The total expenditure of the construction building 6 362 000 € movables 636 000 €

The Main Library of Rauma has a significant role to play in the townscape. It acts as a unifying element in the field of space formed by buildings of different age and a park. The low-built library, with its timber facades, makes a reference to the delineation of urban spaces in Old Rauma, the town's historic centre, and the element of surprise contained therein.

The transparency of the library building communicates the openness of its operation. Towards the canal the library forms sheltered courtyard spaces, which can be used for theatrical performances and other events. The character of the library is based on the timeless values of architecture, attention to site requirements, spatial variety, well-thought-out views and vivacious use of natural light as an element of the interior.

The principal part of the building has a reinforced concrete frame, with the exception of the reading room, which has a frame of glue-laminated timber. The facade materials are painted timber and glass. Silk screen printing was used to create patterns emulating the lightness of lace, in the making of which Rauma has a long tradition, to the glass parts of the facade.

The City of Rauma held an invited architectural competition on the library in spring 2000 and the competition entry which the design is based on, was awarded the first prize. (Lahdelma)

The Rauma Main Library has a significant role to play in the townscape. It is a unifying element in a space formed by buildings of different ages and a park. The transparency of the library building communicates the openness of its operations.

The local traits and traditions are taken into account in the design of the building. The façade is made of painted timber and glass. Silk screen printing was used to create patterns emulating the lightness of lace, the making of which has a long tradition in Rauma, on the glass parts of the façade. Bunches of metallic letters hanging from the ceiling form words in the Rauma dialect.

The Library operates on two floors.

A newspaper reading room, the children's department, part of the adult department, a conference and computer room as well as most of the staff offices are situated on the ground floor. The mobile library garage is also on the ground floor.

The adults' arts, fiction and music collections can be found on the first floor. The study rooms, the artothèque, and office space are also located there.

The technical equipment includes borrowing and returning self-service machines, free wireless internet, a video surveillance system, electronic lockdown of the doors and time card system. (<http://www.buildinglibraries.fi>)

### **Vaasa City Library, Vaasa – Finland 2001**

Extent Gross area 8,050 m<sup>2</sup>, the area of renovation covers almost half of the size, Interior design: Design and Architecture Gullstén & Inkinen, Overall Cost: €9,500,000

The purpose of library and information services is to promote equal access to education, literature and art, and to constant development of knowledge, skills, and civic prowess, as well as to internationalism and life-long learning. The library will produce virtual and interactive web services as well as educational content in data networks.

Finland's first lending library Vaasan Lukukirjasto was founded 1794 in Vaasa, for "the amusement and pastime" of the members in Vaasan Luku-Seura.

In 1936 the library moved into its present location Kirjastonkatu 13, the first premises in its history that were purpose-built for the library.

Architectural idea or principle:

The new library building reflects the internal landscape of knowledge. The different bridges combine - symbolically and concretely - old and new, humanities and sciences, as well as the various subject areas. In Vaasa, we have had the chance to combine a unique history of Finnish library services with futuristic visions of libraries. The new library building will be a dynamic bridge between old and new. New media and materials, future electronic operations, will find their place in the library complementing its traditional mode of activities. Nevertheless, the essence and idea of library services will remain ageless. (<http://www.librarybuildings.info>)

### **Arkkitehdit NRT, Helsinki – Finland**

<http://www.n-r-t.fi>

**Libraries :**

## Library Hollola, Hollola – Finland 2004

1.920m<sup>2</sup>

Architects: arkkitehtitoimisto Nurmela, Raimoranta, Tasa Oy / Jyrki Tasa, Teemu Tuomi

The library building is situated in the centre of Hollola and encloses the northern edge of Market Square. The building is organised on a single floor, but on the side of the square the eave height reaches nine metres. This helps provide enclosure for the square and to give the library a status of a public building. The main entrance is at the centre of the square-facing side, below a great clock. The newspaper reading room and children's story-telling room have large windows, which direct their orientation towards the Market Square. The red curtain of the story-telling room, hung from an undulating rail, adds colour and an element of change to the silver and black facades. The rectangular plan of the library is subdivided into an open lending library-reading room space and a work and staff zone, with services at the interface of the two. Public facilities that can be closed off include the children's fairytale room, the reference reading room, the exhibition and conference space and the music room. On Sundays only the newspaper reading room is open to the public, while the other spaces are shut off with sliding partitions. The design of the lending library is airy and light. Sufficient height, rooflights, large window surfaces directing the orientation of the space towards the park and the light colour of the floor are the means used to achieve this effect. By a combination of direct and indirect lighting this atmosphere can also be achieved in the evening with artificial lighting. Fixtures, designed by the office, placed on the bookshelves provide the indirect lighting in the space. In order to define distinctive fields of space for different functions in the main hall and to provide spatial variety, we have given its ceiling an undulating profile. The height of the interior space varies, being the greatest in the area of the central functions and then descending to more intimate level above the smaller departments. The form of the ceiling is a ruled surface, which in addition to the undulating profile also has a variable lateral angle. (<http://www.e-architect.co.uk>)

## **Käpy and Simo Paavilainen Architects, Helsinki – Finland**

<http://www.ark-paavilainen.fi>

### **Libraries:**

#### **Tritonia Science Library, Vaasa – Finland 2001**

8.000 m<sup>2</sup>

The Tritonia Academic Library in Vaasa is a joint venture between three universities: the University of Vaasa, Åbo Akademi/Unit of Ostrobothnia and the Vaasa Unit of the Swedish School of Economics and Business Administration. The one building also houses a Learning Centre that jointly supports teaching and study at the three universities. Moreover, Tritonia connects two languages and cultures – the different Finnish and Swedish traditions.

The library and the Learning Centre on the campus area on the shore of the Gulf of Bothnia were opened to the public on 20. August 2001. The library's prime customers are the universities' teachers, researchers and students, but anyone seeking scientific information is welcome. As the biggest academic library within three neighbouring provinces, Tritonia serves various other educational establishments, adult learners, the business sector and individuals. It co-operates with the libraries of two polytechnics in Vaasa and with Vaasa city/regional library, and it maintains the regional web library ([www.uvasa.fi/~sukkula](http://www.uvasa.fi/~sukkula)).

The first part of the name Tritonia refers to the number three, and the whole name to the fact that the building stands by the sea. In Greek mythology Triton was a son of the sea-god Poseidon and, according to some myths, tritons are the male equivalents of mermaids.

Tritonia encloses 35,890 m<sup>3</sup>, and its total floor area is 7,997 m<sup>2</sup>, of which the library and Learning Centre have a net area of 5,500 m<sup>2</sup>. The library was designed by the architectural bureau of Käpy and Simo Paavilainen, and the main contractor was NCC Finland Oy. The building proprietor, Senaattikiinteistöt Oy, has selected the library as Building of the Year 2001 out of its 130-odd projects.

### **Planning**

The three universities at Vaasa are all rather young. The University of Vaasa, with some 4,200 students and four faculties, started as a school of economics in 1968; it became a multidisciplinary college at the start of the 1980s, and a university ten years later. Åbo Akademi has its main activities in Turku, but branched out to Vaasa in 1974; today around 1,800 students attend its two faculties here. In 1980, the Swedish School of Economics and Business Administration expanded from Helsinki to Vaasa, where it now has about 500 students.

As long ago as 1981-2 a working group appointed by the Ministry of Education was considering how co-operation could be developed between the various units operating in Vaasa. Their key suggestion was that a common academic library should be founded, to be operational in 1984. The proposal was way ahead of its time; nowhere else was there anything similar, so the matter was postponed... but not forgotten. In the mid-1980s the library became part of the architectural competition for the new campus, and early in the 1990s a common database was planned, though it could not be achieved until the next generation of computer systems arrived.

The academic library was part of the second building phase on the campus. To design it functionally a planning group consisting of representatives of the three universities was appointed: two of its members were professors, one was head of the Office of Student Affairs and three came from the libraries; additional experts were a students' representative, the property manager, a computer specialist and an external mentor with excellent knowledge of managing university libraries. This planning group further appointed several subgroups to plan the internal operations. The groups worked closely together with the architects and also visited, for instance, research libraries in Stockholm and some libraries under construction on the campuses of Helsinki University. Library staff went on study tours to new libraries and learning centres in the Netherlands, Germany and Great Britain.

### **Regulations and financing**

The rectors of the three universities signed the library agreement in December 1998. This is complemented by a set of guiding principles, which were separately approved by the boards of all three universities in the spring of 2001. Immediately after approving the guiding principles the universities appointed their representatives for the library board. At its first meeting the board approved the library's operating regulations that define its internal organisation.

The regulations stipulate that the library costs are shared according to the number of students, researchers and The Tritonia Academic Library New ways of organizing libraries teachers in each university. These figures are taken from the Ministry of

Education's KOTA database. On this basis the University of Vaasa contributes two thirds of the library's budget, which is set annually in joint negotiations between the universities' and the library's managements.

For the time being, the Learning Centre operates as an independent separate project run by a management group under the local rectors of the three universities. It is financed largely by the Ministry of Education with funds assigned to the Finnish universities for developing the virtual university.

The library regulations specifically mention bilingualism. Official documents are drawn up in both Finnish and Swedish, other documents in the mother tongue of whoever prepares them. In daily work, the staff is naturally bilingual, as has always been the case in bilingual regions. In customer service Finnish and Swedish are used in almost equal proportions. Obviously, users of the minority language are more active in making use of staff services. As all three universities emphasize internationalism as a value in itself and a strategic choice, customers are in fact being served in at least three languages.

New library services, and operating the Learning Centre, demand generous computer and AV equipment, as well as versatile facilities for study and research. There are 420 work desks in the building; in reading rooms, computer classes, rooms for group work, multimedia rooms and on the four floors of the library, where collections and work desks alternate. The building also houses a separate researchers' tower. For library customers there are 39 carrels in the tower, in rooms for one or two persons. These are allocated on application to postgraduates working on doctoral theses or to students working on master's theses.

Finally

Tritonia's modern and beautiful facilities have had great effect both on customer service implementation and on staff well-being. Merging three independent libraries, moving collections from five different addresses to one common building and introducing new forms of service, while at the same time changing the computer system, have all been carried out successfully. We can go on developing the library in good heart.

### **Jyväskylä City Library (Palokka Library) – Regional Library of Central Finland – Finland 2012**

The floor area: 1511m<sup>2</sup>, Designed by Tomi Perko, Arkkitehtitoimisto Perko Oy, Helsinki, Interior designer: Olli Pursiainen, Arkkitehtitoimisto Meskanen ja Pursiainen, Helsinki, The total expenditure of the construction €4.600.000.

The library shares a location with a comprehensive school and an adult education center. The immediate proximity of the school and Palokka Youth Center sounds in the functions of the library.

The library is functionally modern establishment that makes it possible to offer traditional library services as well as provide opportunities to create and participate. Among other things, there is a stage for performances, a games area, a computer studio to be used in cooperation with the school and the adult education center, and a newspaper and periodicals room that can be used also outside the opening hours. Part of shelves are movable to make the library space adaptable to various functions.

**Libraries:**

### **Aralis Library Centre, Helsinki – Finland 2002**

Client: Varma Mutual Pension Insurance Company, 2200 m<sup>2</sup>

Aralis Library and Information Centre is built inside the old Arabia factory complex. The library centre brings together Helsinki City Library's Arabianranta Library and three art libraries: University of Art and Design Library, Helsinki Metropolia University of Applied Sciences Resource Library for Arts and Culture, and Helsinki Pop & Jazz Conservatory Library.

A big glass roofed internal courtyard houses the library and a restaurant, which is open for public. The combination forms a meeting place for everybody visiting or working in Arabia Gallery. The architectural design did not include interior design. (Tommila)

### **ISO Omena Shopping Centre, Library + Cinema, Helsinki – Finland 2001**

Client: Ilmarissen Tiikkiin Teistöt Oy, Library: 2400 m<sup>2</sup>

Owner: City of Helsinki, Helsinki University

Iso Omena Shopping Centre also houses public and private services. The service level is located above the market level and contains among other a Library and a Cinema next to each other.

Espoo City Library's branch library is accessible from the shopping centre. It has a view to the glass roofed gallery and a sunny roof terrace. A small Japanese garden inside the library provides a peaceful environment for concentration.

The Cinema has three auditoriums, and altogether more than 400 seats. Outside the business hours it is also directly accessible from outside the shopping centre. (Tommila)

### **Ylöjärvi Main Library "Kite", Ylöjärvi – Finland 2002**

The floor area 2696m<sup>2</sup>, Architect Tero Harjunniemi (Arkkitehtuuritoimisto Teuvo Vastamäki Oy), The total expenditure of the construction €5.000.000

The Ylöjärvi main library "Kite" was opened to the public in November 2002. The library consists of two large triangles, and the avenue between them divides the space into public and staff areas.

The interior was designed to be spacious and sunny: a long glass wall is facing Kuruntie. The main colour inside the building is a warm light brown accentuated with a bright blue. Kite-like features, like the triangular service point and the shape of the roofs, have been used in the architecture.

The library averages around 900 daily visitors who read newspapers and magazines, use the public computers, borrow books, films and music, visit exhibitions or just meet one another. (<http://buildings.libraries>)

**Relais Culturel, Ville de Wissembourg – France 2010**

3.800 m<sup>2</sup> SHON, € 4.800.000

Le projet de restructuration du Relais culturel de Wissembourg représente un sujet complexe sur le plan urbain, architectural et technique. Intégrant la nef de l'ancienne église des Dominicains, il associe également la requalification de l'extension datant du début des années 80 et une nouvelle appropriation de l'espace urbain jusqu'à la rue des écoles. Des différentes contraintes du site émerge une nouvelle richesse d'expression. Dans le respect des orientations du programme et des prescriptions de l'Architecte des Bâtiments de France, nous proposons un projet soucieux de la préservation du patrimoine tout en ouvrant la voie à l'expression d'un équipement multi-média résolument actuel. Les interventions extérieures ont été limitées dans le respect du cadre strict imposé. Une extension est créée en bas-côté de la nef par la constitution d'un volume régulier organisé symétriquement autour de deux alignements d'ogives. Elle est constituée d'une double paroi en verre transparent laissant pénétrer le regard et la lumière tout en offrant un isolement acoustique remarquable. Une extension limitée en façade Ouest de la grande salle de spectacle est destinée à marquer fortement la nouvelle identité et l'entrée de l'édifice tout en offrant des surfaces nouvelles. Traitée comme « une boîte à lumières » expressive et vivante, ce volume apporte par son traitement « joyeux » une note festive et conviviale projetant le spectacle sur la ville. L'entrée principale et le hall ont été conservés et bénéficient d'une lisibilité accrue. A l'intérieur la salle de spectacle a fait l'objet d'une refonte totale tant au niveau de son organisation, des circulations et de la desserte qu'au niveau de l'approche scénique, et du renouvellement du matériel. L'espace réunion, cafétéria, médiathèque, foyer et médiathèque, ont bénéficié également d'adaptations et réorganisations afin de créer une cohérence interne entre les différents espaces une fluidité de circulation au travers de l'ensemble du bâtiment. "Le plus grand mérite de cette modeste bibliothèque des environs de Paris est sans doute de permettre de lire à livre ouvert la réponse vivante et claire que des architectes ont su donner à un obscur problème d'extension de bâtiment municipal en site historique protégé. Vécue de l'intérieur ou vue de l'extérieur, [la médiathèque du Raincy] offre au public ce fameux supplément d'âme qui distingue l'architecture de son contraire.

Qui aime l'architecture bien pensée - ou veut l'aimer - doit prêter attention à ce bâtiment limpide. C'est une œuvre typique du raffinement français dans ce qu'il a de moins arrogant : une touche foncièrement actuelle et cependant foncièrement indémodable. Son élégance sans faille, sa fluide ingéniosité feraient presque oublier la dextérité avec laquelle cette construction assure l'alliance de styles contrastés.

L'intelligence est ici intelligible sans tapage. N'est-ce pas exactement ce qu'on demande à une bibliothèque ?"

David DeBolt, The Oakland Tribune (USA)

"La bibliothèque-médiathèque prend sa place dans l'ancienne maison du notaire local. La vieille bâtisse est débarrassée de ses scories accumulées au fil du temps ; son jardin d'hiver est reconstruit à l'identique ; on y retrouve même, pérennisées par sérigraphie sur la véranda d'entrée (image n°10 ci-dessus), les feuilles mortes accumulées à l'automne !

L'extension s'immerge avec délicatesse dans un coin du jardin, et s'ouvre en éventail vers le nouveau parc urbain. Sa façade courbe, réduite au minimum, propose un dialogue symétrique entre l'intérieur et l'extérieur, mettant en scène pour le promeneur les livres et leurs lecteurs, et valorisant les hautes frondaisons du jardin pour les usagers de la médiathèque et le personnel à l'ouvrage. Comme un cristal de roche piqué de corail, l'ensemble des luminaires et du mobilier, spécialement dessiné, accompagne les aménagements et participe à la vision d'ensemble."

Jacques Dubois (Ameller)

**Îlot Armanac, Logements, Médiathèque et Gymnase, Bordeaux – France 2012**

Olivier Calvarese, Fanny Rozé (concours et études), Etienne Challet-Hayard (Directeur de Réalisation), Matthieu Miquel (Architecte Chantier), Maître d'ouvrage/Client ING Real Estate, Site Bordeaux, Date 2012, Surface 18 000 m<sup>2</sup> SHON, Montants travaux 25 464 000 € T.T.C

L'îlot Armagnac forme une transition entre les typologies d'échoppes bordelaises et la nouvelle densité créée dans ce quartier. Cet îlot en proue amorce le développement urbain du quartier Belcier. Il apporte une forme d'urbanité à la place Armagnac, à l'échelle de l'existant et amène progressivement aux échelles plus hautes de la ville à venir. Il est composé à partir d'alignements stricts sur les rues et dispose d'une ouverture visuelle vers la place publique au sud. L'îlot est mixte avec logements et équipements publics - gymnase et médiathèque. Le cœur d'îlot est traité en jardin. Sa mise en scène gradinée vers le sud le rend bien visible depuis la place. Le cœur de l'îlot est vert, c'est un espace planté partagé par tous les logements. Ceux-ci sont tous différents et ouverts pour la plupart, sur le jardin central accessible à tous. Le parking n'est pas enterré, mais ses 4 niveaux sont intégrés à l'îlot de manière non visible, il est éclairé naturellement au nord. L'îlot est traversé par un cheminement piéton qui distribue chaque entrée d'immeuble, et renforce la convivialité.

Le jardin central est composé en terrasses successives qui s'élèvent depuis la place publique jusqu'au niveau 6, tout en haut de l'îlot. Cet effet de « jardins suspendus », orientés plein sud, est accentué par la diversité des plantations et les terrasses privatives qui donnent aussi sur le jardin.

La conception des immeubles répond aux principes de l'architecture bioclimatique. L'ensemble des façades est isolé par l'extérieur. Les toits orientés principalement au sud, sont équipés de panneaux photovoltaïques et de capteurs thermiques. Certains logements sont dotés de vérandas/serres, espaces inter climatiques qui prolongent le séjour et assurent une récupération de chaleur l'hiver et une ventilation l'été.

Les logements possèdent des qualités de lumière et d'habitabilité : ils sont traversants pour la plupart, ou bénéficient d'une double ou triple orientation. De grands duplex croisés, avec des doubles hauteurs généreuses sont implantées sur l'espace vert public. Les logements orientés sur le cœur d'îlot possèdent tous des prolongements extérieurs : balcon, loggia, jardin ou terrasse en toiture. Les parties communes sont éclairées naturellement. (a/nm/a)

**Médiathèque Mont de Marsan – France 2012**

Programme: Médiathèque, espaces adultes, jeunesse, arts/musique/cinéma, salle de conférences. Conception du mobilier et de la signalétique. SURFACE : 4 750 m<sup>2</sup> SHONCOUT DE L'OUVRAGE : 12 309 000 € HT, 120 000 € HT pour le mobilier et la signalétique. CALENDRIER : Lauréats concours juin 2007 - Livraison nov. 2012. MAITRE D'OUVRAGE : Communauté d'Agglomération du Marsan. MAITRE D'OEUVRE : archi5 associés à B. Huidobro.

Sur une surface de 4 046 m<sup>2</sup>, la médiathèque est à proximité immédiate du centre ville de Mont de Marsan. Implantée sur le site de l'ancienne caserne Bosquet, la médiathèque se veut lieu d'enrichissement de connaissance et de découvertes autour du livre, de l'image et du son, mais aussi espace d'animation, de rencontres et d'échanges. (arch5)

La Médiathèque du Marsan, avec sa mission à caractère culturel, mais aussi sa fonction de loisir, d'information, d'intégration sociale, de soutien pédagogique et de conservation documentaire, met à la disposition de tous les publics des supports d'information variés, que ce soit en consultation sur site ou par système de prêts directs de documents.

Des expositions, des conférences, des ateliers et projections s'y dérouleront tout au long de l'année pour en faire un lieu incontournable de la vie de l'agglomération. Elle constitue également un pôle ressources pour l'ensemble des structures de lecture publique de l'agglomération.

A la pointe de la modernité, la Médiathèque ne contient pas que des livres, mais propose aussi des périodiques, des disques, des images, des accès Internet, sur tous les thèmes : vie quotidienne, sciences, littératures, sociétés, musiques, cinémas. De même, sa vocation est d'être en constant mouvement grâce à l'activité culturelle qu'elle provoque et grâce à toutes sortes d'animations aussi bien pour les petits que pour les grands. (<http://www.lemarsan.fr>)

**Lycée Marcel Sembat, Sotteville lès Rouen (Rouen) – France 2011**

PROGRAMME : Réhabilitation et extension du lycée. Nouvel internat. Nouveau restaurant et bâtiment de la vie scolaire. Nouveaux ateliers. SURFACE : 12 764 m<sup>2</sup>. SHONCOUT DE L'OUVRAGE : 35 320 318 € HT CALENDRIER : Lauréats concours oct. 2005 –

Le lycée Marcel Sembat se compose de six bâtiments de datant de 1930 à 1990, le site est traversé par une rue.

Le lycée Marcel Sembat Marcel est dédié, pour sa partie technique, à l'enseignement de la mécanique automobile et de la carrosserie. Les nouveaux ateliers exigeaient donc des hauteurs élevées et des volumes importants. Nous souhaitons aussi que le projet donne une réponse à un complexe social: complexe de la banlieue, de l'enseignement technique, de l'automobile. C'est pourquoi nous voulions le bâtiment le plus vaste, le plus clair et le plus agréable pour les ateliers.

Nous avons opté pour un projet simple et facilement compréhensible. Notre proposition visait à redonner une unité et une identité visuelle forte et moderne au lycée. Nous avons voulu reconnecter le lycée et son environnement, notamment avec le bâtiment des ateliers qui, par ses lignes douces et leur déclivité vient naturellement épouser la topographie du parc. L'unité entre les deux sites autour de la rue traversée est assurée par la création d'un nouvel espace public qui lie le lycée à la [nouvelle bibliothèque](#). Nous avons choisi d'utiliser l'acier car il est l'outil de la création formelle, ancien allié de l'ombre qui sut s'imposer au grand jour à l'aube de l'ère industrielle. Il permet des chantiers rapides et propres, grâce à la préfabrication en atelier, en écartant les surprises d'aspect. Il reflète précisément le dessin comme une mise en œuvre industrielle de la pensée. Il est rapidement apparu comme la solution pour assurer l'élancement, l'ondulation, les volumes libres et l'identité forte que nous recherchions. (archi5)

### [Une nouvelle vie pour l'Hôtel des Postes, Médiathèque Chartres L'Apostrophe - France 2007](#)

MAITRE D'OEUVRE : Paul Chemetov architecte mandataire de la maîtrise d'oeuvre, archi5 architectes associés  
see : <http://www.paulchemetov.com>

PROGRAMME : Réhabilitation de l'ancien Hôtel des Postes en médiathèque, SURFACE : 5 268 m<sup>2</sup> SHONCOUT DE L'OUVRAGE : 10 886 754 € HT, CALENDRIER : Lauréats concours avril 2004 - Livraison avril 2007, MAITRE D'OUVRAGE : Ville de Chartres  
MAITRE D'OEUVRE : Paul Chemetov architecte mandataire de la maîtrise d'oeuvre, archi5 architectes associés

La bibliothèque catalyse une nouvelle intensité culturelle et urbaine qui s'inscrit dans le projet «Coeur de Ville». La transformation de l'Hôtel des Postes en équipement culturel suit un principe de stratification. Les nouveaux éléments clairement identifiables forment un ensemble cohérent avec le bâtiment existant et instaurent un dialogue subtil entre ancien et nouveau. La paroi interactive, support de l'audiovisuel et du virtuel, est un des éléments majeurs de la nouvelle identité du bâtiment. Installée derrière la façade Ouest et réalisée en toile tissée métallique, cette paroi sert de protection solaire intérieure. La mise en lumière des toitures et des façades inscrit le bâtiment comme signal urbain, engendrant, à échelle proche, une vibration lumineuse qui se diffuse au-travers de la transparence retrouvée des baies vitrées. (arch5)

Chartres

Chartres media library or Mediatheque de Chartres formerly was a post office named Notre-Dame des Postes.

Raoul Brandon (\*24.03.1878 Lucé (Eure-et-Loir) - + 04.12.1941 Assay(Indre-et-Loire), graduated from National School of Fine Arts Paris, was the architect who built the building in 1923. The construction itself finished in 1928.

He took some inspirations of middle ages buildings and combined with new-Gothic bell tower and Art Deco elements.

Mediatheque de Chartres. In 2005, the Chartres authority decided to alter the function of post office building as a media library and re-open its door for public in 2007 after a complete interior reconstruction with a new name L'Apostrophe.

#### [Médiathèque Michel-Crépeau, La Rochelle – France 1999](#)

Cet équipement est tête de pont des bibliothèques et médiathèques de la communauté d'agglomération. Ouverte en 1998, propose au public une consultation libre et gratuite. Ses collections sont larges et variées (outils encyclopédiques, ouvrages généraux et spécialisés, bandes dessinées, romans, disques, vidéos, artothèque...). De plus, la médiathèque a pour mission d'assurer la conservation et la valorisation du fonds ancien et du fonds local, qu'il s'agisse de collections appartenant à l'État, ou à la ville de La Rochelle ou de collections patrimoniales.

Face aux 2 tours de La Rochelle et juxtaposée à la Bibliothèque universitaire, la Médiathèque Michel-Crépeau est un des équipements culturels gérés par la Communauté d'agglomération.

#### [Media Library and Art House, Médiathèque, Saint-Malo – France 2014](#)

Contracting authority: City of Saint Malo, 6.000 m<sup>2</sup>, € 15.000.000

S'intégrant dans la transformation générale du nouveau quartier de la gare, le Pôle Culturel en sera la clef de voûte. Les portes de cet outil culturel majeur, situé au cœur de la ville, devraient ouvrir à l'horizon 2014.

Sur une surface de 4200 m<sup>2</sup>, ce nouvel espace réunira entre autres une compactothèque (celle du Centre Allende), une salle de conte, une salle de consultation du fonds patrimonial, des îlots enfants... 125 000 ouvrages seront disponibles dans une médiathèque largement tournée vers les nouvelles technologies.

Trois salles de cinéma sont également prévues : une de 220 places, pouvant servir d'auditorium, et deux salles plus petites de 150 et 100 places.

Le projet comprend encore une petite salle d'exposition de 250 m<sup>2</sup>, sur la façade est côté gare, un café et un foyer reliant les deux structures.

En ce qui concerne l'aspect final de la construction, la Mairie a souhaité un bâtiment représentatif du XXI<sup>e</sup> siècle : lumineux, transparent, fonctionnel, accessible... sortant de l'ordinaire tout en s'intégrant à son environnement.

L'agence "Architecture Studio", qui a déjà réalisé le bâtiment du Parlement Européen à Strasbourg, est chargée de la conception du projet. (<http://www.ville-saint-malo.fr>)

#### [École Nationale a Ingénieurs \(Médiathèque\), Metz \(Dep. Moselle, Reg. Lothringen\) – France 2009](#)

Contracting authority: Moselle Department, General Council of Moselle Region, Lead architect: AS.Architecture-Studio, Co-architect: Patrick Giopp, Area: 18,500 sqm, Cost: € 19 M, Competition: 2005, winner, Completion: 2009

Metz National Engineering School (ENIM) for 1,240 students: classrooms, administrative premises, three amphitheatres of 90 seats, an amphitheatre of 250, seats, a media library, a video conference room, workshops, a scientific, technical and industrial research cluster. This project offers a strong, young and contemporary image to the ENIM in relation with the excellence of the training that is provided as well as the dynamic character of the school and its spirit. This image is mostly given by the " velum ", i.e. the general envelope of the building. It is as much facade as roofing and it unites under its bending curve the academic and technological

teaching clusters. This velum, this sail pulled up in the landscape, is designed like the logotype of the ENIM: a sign within the technological cluster and a sign within the city. (AS)

**Superior Art School (Library), Clermont-Ferrand (Dep. Puy-de-Dôme, Reg. Auvergne) – France 2005**

Contracting authority: City of Clermont-Ferrand, Architect: AS.Architecture-Studio, Co-architects: Bourbonnais-Jacob, Intersite, Atelier réalité, BUA: 6,000 sqm, Cost: € 6,9 M, Competition: 2001, Completion: 2005

Education & Research / Culture / Public facilities, School for 500 students, library and accommodation for guest artists

The new School of Fine Arts is an interface between the unachieved building and the achieved one. The facade along the square plays a major part as to how art is offered to the city. It is exhibited behind a theatrical copper skin. The use of copper is meaningful thanks to its ecological and artistic features. It's a raw material that needs to alter in order to protect itself against the passage of time. It offers the permanent spectacle of a natural " performance ". (AS)

School of 100 students comprising administrative premises, an amphitheatre, a library, workshops and a cafeteria. (As)

### **Atelier Choiseul, Paris – France**

<http://www.atelierchoiseul.com>

**Libraries :**

#### **Maison de la Recherche Serpente, Paris (6ème) – France 2000 – 2005**

Commanditaire Université Paris IV - la Sorbonne (Ministère de l'enseignement supérieur) / SSBAIF (conducteur d'opération).  
Partenaires Sincoba BET économiste, Coût 7,5 M euros H.T. (compris réalisations mobiliers MOE), Surface 7 300 m<sup>2</sup> SHON

Située au coeur du quartier latin, la Maison de la Recherche de l'Université Paris IV - la Sorbonne occupe un ensemble de bâtiments hétéroclites. Construits entre le XVIII<sup>e</sup> et le XIX<sup>e</sup> siècle, ils s'implantent sur quatre parcelles identifiables. L'opération de réaménagement, chargée d'une réelle valeur patrimoniale, s'ancre dans la nécessaire constitution d'un outil fonctionnel et performant à l'image de la réputation d'excellence de l'Université. Elle témoigne aussi d'une volonté d'écoute et de respect des bâtiments existants.

Les structures constructives (planchers, ossatures, façades, etc...) ont été conservées. L'ensemble des bâtiments a néanmoins supporté une profonde transformation spatiale.

Réhabilitation globale et mise en sécurité : centres de recherche, bibliothèque, salles de conférences, laboratoires de langues, administration et services généraux, lieux de vie et de rencontre, logements de fonction. (Atelier Choiseul)

#### **Bibliothèque Universitaire, Vannes – France 1998 - 2002**

Commanditaire Rectorat de Rennes, DDE du Morbihan, Coût 3,6 M€ (actualisé), Surface 2 200 m<sup>2</sup> SHON

Le bâtiment, conçu autour d'un atrium central de distribution aménagé pour des expositions publiques, a été réalisé en structure poteaux/poutres et panneaux de béton préfabriqués avec incrustation de granit. Il offre des espaces lumineux, fluides et ouverts sur le campus.

L'ensemble du mobilier des espaces accueillant le public à été dessiné et réalisé sur mesure. Le chantier à été réalisé en corps d'états séparés. (Atelier Choiseul)

#### **Maison de l'Asie, Paris – France 1995**

Commanditaire Ministère l'Education Nationale/ SCARIF (MO déléguée), Partenaires L.Guedj architecte, Coût 4,5 M€ HT (act.)  
Surface 3 500 m<sup>2</sup>

Cette restructuration d'un bâtiment composite constitué d'un hôtel particulier construit au XIX<sup>e</sup> et étendu en 1923 par un grand volume sur l'arrière donnant sur la rue de Longchamp, regroupe différents centres de recherche sur l'Asie (dépendant de l'EHESS, de l'EPHE) et accueillant le siège de l'École Française d'Extreme-Orient (EPHOE) et une bibliothèque qui incarne le coeur de l'institution. Le projet a entièrement réorganisé les circulations autour de la bibliothèque de recherche et du centre de conférence situé dans les étages noble. (Atelier Choiseul)

#### **Médiathèque HQE à Chelles – France 2012**

Maître d'ouvrage : communauté d'agglomération de Marne Chantreine, Programme : médiathèque centre de réseau, auditorium (230 places), bâtiment HQE, Surface : 3 500 m<sup>2</sup> SHON. Coût : 8,2 millions d'euros HT

Situé à la rencontre de différents tissus urbains, le terrain d'accueil de la médiathèque présente des complexités fortes, amplifiées par les objectifs programmatiques et la présence du centre culturel avec lequel il fallait composer.

La médiathèque est implantée afin que les halls respectifs des deux équipements soient en continuité, créant ainsi un pôle culturel majeur à l'échelle de la ville. Un mail accompagne dans son unicité la frontalité des deux bâtiments en créant un ordonnancement calme et posé.

Prenant accroche sur le carrefour, le projet se développe parallèlement à la rue puis s'enroule face au parvis pour ensuite longer la façade latérale du centre culturel. Ce mouvement en spirale est affirmé par l'amplification des volumes en doux crescendo avec l'auditorium en ponctuation finale.

Cette partition rend immédiatement perceptible l'emprise des pôles de lecture de la médiathèque dissociée de l'emprise trapézoïdale de l'auditorium. Le volume de transition, produit par l'éloignement de ces deux composantes, signifie quant à lui la présence du hall qui les dessert. Ce dispositif oriente et ouvre les espaces de lecture soit sur la ville soit sur l'intériorité de la cour intérieure ainsi créée.

Les variations du projet et sa sinuosité expriment la richesse et l'univers infini du savoir, dans un lyrisme ténu mais qui suffit à démarquer la médiathèque des constructions du quartier.

La blondeur ondulante des façades est ponctuée par des fenêtres qui, fonctionnant comme des cadres, sont des invitations à pénétrer les espaces de lecture. Aux articulations du bâtiment, certaines font saillies pour agir comme des vitrines ou lanternes dans la ville. (Atelier Novembre)

#### **Médiathèque – Convent des Urulines, Quimper, Dep. Finistère (Dep. Bretagne) – France 2008**

Maître d'ouvrage : communauté d'agglomération de Quimper, Programme : médiathèque, salle de conférence, exposition, Surface : 6 500 m<sup>2</sup> SHO, Coût : 11,1 millions d'euros HT, Concours 2004. Avancement : livraison février 2008

La médiathèque constitue un élément essentiel dans la recomposition du centre ville, l'ancien couvent des Ursulines se situant à la charnière entre le quartier historique de Quimper et l'lot culturel comprenant le théâtre, l'école des Beaux-arts, le centre d'art contemporain et un cinéma.

En travaillant sur la perméabilité et les transparences du rez-de-chaussée, la conception du bâtiment permet d'offrir une transition entre les espaces de la rue et la place culturelle. Les deux niveaux supérieurs sont entièrement consacrés à la consultation et à la lecture. Ils sont répartis suivant quatre thèmes : imaginer, savoir, créer et enfance.

Les extensions, côté parvis d'entrée, empruntent un vocabulaire résolument contemporain tandis que côté jardin, il est proposé une restitution de l'état d'origine du clotre.

Traînée en encorbellement sur la façade d'accès, l'extension abritant le fonds patrimonial est une zinguée doublée par un plan vitré sérigraphié qui rappelle, par sa matière, la texture du papier et par sa calligraphie, le monde du livre. La nuit, la lumière en révèle la translucidité et laisse apparaître la structure métallique en filigrane. (L'Atelier)

### **Libraries:**

#### **Médiathèque Marguerite Yourcenar, Paris – France 2007**

Afin de rééquilibrer le domaine documentaire du XV<sup>ème</sup> arrondissement et de proposer un équipement de son temps, pouvant répondre à l'évolution de l'informatique, la ville de Paris a lancé en janvier 2003 un concours pour la création d'une médiathèque, rue d'Alleray. C'est le cabinet Babel qui remporta le concours avec son projet social illuminé par son caractère environnemental. Situé entre des immeubles de 5 et 8 niveaux, au voisinage d'une école primaire, le projet devait respecter ces différents volumes et occupants. Le choix fut de faire un retrait des deux derniers niveaux face à l'école, et ainsi rester dans des échelles pour les plus petits. De l'autre côté, les deux niveaux supérieurs s'inscrivent dans la façade pour accueillir la partie administrative de la bibliothèque.

Un parvis signale l'entrée de la médiathèque, elle permet aussi d'assurer la continuité des édifices de la rue. La façade visible depuis la rue ne laissera pas les passants indifférent, matérialisant le coté service public, la façade double-peau est aussi un exploit technique qui m'a encouragé à publier cet article. Le rideau de verre permet de s'ouvrir sur la population, alors que son système de pare-soleil couplé avec le verre permet de capter les apports du soleil l'hiver et de s'en protéger l'été. La diversité de couleur des panneaux de la façade résulte de la richesse intérieure de l'ouvrage. Elle marque un point d'honneur sur le caractère environnemental du projet.

Le long de la voirie, exposé au sud, le bâtiment n'était pas seulement confronté au problème thermique mais aussi au bruit et à la gêne occasionnelle du soleil pour les différentes activités pratiquées à la médiathèque. La double paroi en verre agit comme un véritable mur antibruit assurant la tranquillité recherchée par les usagers et crée un effet de serre en hiver produisant une économie d'énergie.

La façade nord possède aussi son caractère, ouvrant sur un jardin de tranquillité, il sera dans le futur lié au jardin public. Le long de la façade, l'escalier s'estompe derrière la dentelle métallique de garde-corps chahutés, il témoigne de l'animation des occupants puisque cette médiathèque est organisée de façon à accueillir les visiteurs toute la semaine, y compris le samedi et le dimanche. Initialement prévue en acier, la structure a été finalement réalisée en béton, une alternative proposée par l'entreprise de construction utilisant la technique de Freyssinet. Cependant le choix de l'acier a été conservé pour les locaux administratifs des deux derniers niveaux. Outre le verre, largement présent, le choix de la brique s'est imposé pour l'enveloppe nord en adéquation avec l'école en vis-à-vis. Le cabinet d'architecture a choisi le mobilier dessiné par USM & Ligne et couleur pour l'aménagement contemporain du bâtiment.

### **Libraries :**

#### **Bibliothèque des Sciences et Techniques, Université de Versailles, Versailles-St. Quentin – France 2012**

4.011 m<sup>2</sup> SHON, € 7.057.000

The site, situated on the campus of the University of Versailles, falls within the historical district of the Château de Versailles which imposes, amongst many constraints, minimal building heights. The campus itself is a historical domain having been the property of the car manufacturing family Panhard. In the nineteen sixties, buildings on campus were built around the « historical centre », constituted by the Panhard pavilion and its gardens. Devoid of any particular character, these structures do not impart a strong identity to the campus. The creation of the sporting grounds left recesses and embankments in the park's natural terrain. Before the project's intervention, the site was cut in half between the sloped park to the east and the vast sporting grounds to the west.

The University Library is set on this boundary, articulating the two spaces. The building communicates between the two sides of the campus rather than forming a mass permanently cutting the site in two. It has no main façade. It unifies the multiple aspects of the site. From this central position, its multidirectional nature has been achieved by juxtaposing three volumes with four different directions (north, south, east, west), intersected by a series of voids, allowing abundant light to enter as well as creating transparencies between the park and the sporting grounds.

The three separate volumes express the three parts of the program: the entry hall, the reading rooms and internal spaces. The shape is an expression of our perception of the program and our response to the requirements of a low energy building, fully acknowledging lighting and thermal comfort as well as highlighting the site's contrasts.

PROGRAM | fluidity and flexibility of the university library

Typologies such as university libraries are today subject to many questions related to the place of paper versus the internet. More and more students go to libraries, despite having computers, to seek optimum working conditions: space, quiet, silence, and help if needed. Today the library is no longer a place to store and preserve books, but a place to live. In these new hybrid libraries, open and modular floors are paramount to accommodate the on-going developments of our society

The indoor layout of the University Library has been designed to be as clear as possible: the entry hall at an intermediate level dispersing, by means of a monumental staircase, to the two large reading rooms. Special attention has been put into making the reception area easily accessible and giving them a convivial atmosphere. The play on height changes throughout the structure can be

perceived from the entry hall, allowing one to enjoy simultaneous views of different floor levels and displaying the flexible organisation of the library.

**ARCHITECTURAL STATEMENT** | an organic shell that reveals the inside

Clinging to the existing paths and slope, the building, like a ribbed-shell covering rough concrete, organises and structures the spaces and views. The inner skin amplifies the idea of an organic architecture, using the sheds to suspend the upper floor beam. The large trusses within the sheds suspend the upper reading room thus liberating the floor plan from any columns. The inside and outside thus communicate freely and the facades are a result of this relationship: they create an "indoor show" for visitors.

The east facade is completely open to the woodland and is naturally protected from the sun by a curtain of trees. Smooth and straight, it allows those who walk outside to discover alongside them the two reading floors as well as allowing people on the inside to benefit from the view of trees and plants that is offered to them.

In contrast, the west facade is structured by a series of closely-knit cells that become the form of the sheds on the roof, drawing in the light with a northern exposure, thus avoiding direct sunlight. The transparency of the façades and the openness of the floor plans allow slanted and distant views.

The north facade is pierced following the disposition of the study rooms.

Lastly, the entrance on the south facade or Trombe Wall (named after the physicist who invented the principle) is formed by a darkly stained concrete wall in front of which is placed a glass screen. The air circulating in the gap between the two layers is heated by the sun to help heat the building. Overheating risks are reduced by the shadow brought by the brise-soleil during the summer.

Overall indoor ambiances are determined by natural light and visual framings on the surrounding landscape. The colour variations of the furniture (going from green to blue) are like reflections of the trees and sky outside, which vary depending on the light, also evoking the metal exterior cladding.

La maîtrise de la langue orale et de la culture écrite reste le moyen privilégié d'appropriation du savoir, indispensable pour choisir et construire sa vie. Offrir un outil de qualité à chaque citoyen, pour que dès son plus jeune âge, il puisse accéder à la connaissance constitue une mission fondamentale de notre service public local. Avec l'ouverture de la médiathèque Boris Vian, la Ville s'est dotée de cette structure culturelle de très grande qualité et accessible à tous. Mettons en fête la gratuité d'accès et d'emprunt qui permet à tous les chevillais de bénéficier de livres, de consulter la presse, de découvrir des expositions et des rencontres culturelles. Depuis l'ouverture de la médiathèque, beaucoup d'actions culturelles et éducatives ont été mises en place. Tout d'abord, le Contrat-Territoire-Lecture, signé avec l'État, permet de développer l'accès à la lecture publique. Aller vers les publics les plus éloignés de l'écrit est au cœur de ce dispositif. Labellisée Cyber-base, la médiathèque dispose d'un espace internet pour tous et participe à la réflexion sur les technologies de l'information et de la communication menée par les professionnels du livre. Notre médiathèque a compris la nécessité d'être attentive au progrès mais aussi à la fracture numérique, inégalité nouvelle contre laquelle nous devons lutter. Le "Bibliothèque94 Conte" a quant à lui, permis de valoriser le fonds de la médiathèque et de la Maison du Conte. Unique dans le département, il s'est développé grâce au soutien financier du Conseil général. N'oublions pas le portage à domicile de biens culturels pour les personnes empêchées physiquement de se déplacer. Au-delà, tous les partenariats que la médiathèque construit avec les établissements scolaires, les associations, le Théâtre et les conservatoires enrichissent encore la vie culturelle locale. Merci à toute l'équipe de la médiathèque pour son engagement, indispensable à la réussite de nos projets.

....A priori, il n'y a pas là de quoi s'esbaudir. Pas d'expressionnisme du plan et des articulations ni de vitalité spatiale particulière. La trame régulière des poteaux du rez-de-chaussée se retrouve en partie à l'étage. Pas de cartésianisme ou d'abstraction des masses dont on espère une vibration. Pas de complexité métaphorique de celle de la connaissance.

En fait, cette disposition presque banale au-delà de sa simplicité ne manque pas de résolutions adroites. Sitôt passée la rotonde, par exemple, s'aperçoivent la salle de lecture des enfants et la discothèque. Entre elles, un axe de distribution conduit à l'extrémité Ouest de la bibliothèque. Sensible ou non à l'orientation, le lecteur saura gré à l'architecte de ces efforts de repérage. D'autant que demain, l'épine dorsale du couloir devrait se prolonger au-delà par une rue structurant un nouveau quartier d'habitation.

Ces marques prises dans la bibliothèque se confortent par des vues adjacentes donnant au rez-de-chaussée et à l'étage vers le Sud et le Nord où l'architecte capte la lumière naturelle nécessaire pour éclairer un bâtiment large et profond (environ 30 x 30 m).

La rotonde, aussi, point secondaire de ralliement dans la ville, après le campanile, sert de point focal et de distribution des flux. La banque d'accueil et de prêt en occupe le centre. De son siège, le bibliothécaire voit quiconque entre et peut aussi surveiller à la fois la salle de lecture des enfants et la discothèque comme l'accès au campanile. Ou bien encore porter son regard vers les hauteurs. Car au-dessus de lui, la rotonde s'évide en son centre vers une coupole presque plate. L'appel vers le ciel se renforce à l'étage, dévolu à la consultation des périodiques. Là, le lecteur se trouve dans une sorte de tambour rythmé d'ouvertures étroites et verticales à travers lesquelles ne s'aperçoivent que les nuages et le ciel. Plus haut encore, les facettes de verre décrites tout à l'heure laissent couler des flots de lumière que ponctue l'ombre nette des châssis. En partie séparé du monde, chacun est convié au voyage de l'esprit, qu'ordonnent toutefois la structure métallique et la coupole nervurée en étoile à dix branches.

Cette possible envolée, l'escalier du campanile l'a lui aussi annoncée. Enlacé autour de la cage d'ascenseur, puis de la structure centrale qui lui succède, il conduit vers son sommet ajouré. Sans convier Jorge-Luis Borges et ses vues perdues dans l'infini et l'obscurité, il y a là une contribution contenue et réussie au thème de l'élévation par la lecture et la connaissance.

Simple et à la fois précieuse, la salle du conte placée au Nord de la bibliothèque ressemble au corps d'un instrument de musique avec ses panneaux, son plafond de hêtre et son plancher de chêne. D'une capacité d'environ 40 places assises taillées en gradins d'amphithéâtre, on y accède à la fois par la bibliothèque et de l'extérieur, pour éloigner à l'occasion le tumulte des petits. Selon les besoins, la teneur des récits, les activités choisies, des rideaux occultent les fenêtres.

Les salles de lecture des enfants et des adultes en comparaison paraissent plus banales. Plutôt refermées sur elles-mêmes, malgré des ouvertures importantes sur la cour de l'école au Sud, leur identité tiendra aux livres accumulés, au cloisonnement du mobilier....

## **B+C Architectes, Paris – France**

<http://www.bcarchitectes.com>

### **Libraries:**

**Médiathèque Boris Vian, Tremplay-en-France – France 2009**

MAITRE D'OUVRAGE : Ville de Tremplay-en-France, MAITRE D'OEUVRE: B+C Architectes, PROGRAMME : Restructuration de la médiathèque Boris Vian et du hall du centre culturel Louis Aragon – 2009, SURFACE : Médiathèque 2 200m<sup>2</sup> et hall 4 000m<sup>2</sup>, COUT : Médiathèque 4.2 M€ et hall 3M€

Le centre culturel Louis Aragon et la bibliothèque Boris Vian étaient à l'origine regroupés dans un bâtiment unique construit dans les années '80 situé au cœur de la cité. Le bâtiment, complètement introverti, était traversé d'est en ouest par une galerie urbaine piétonne desservant les différentes entités.

L'absence de véritables entrées déqualifiait intégralement les espaces extérieurs, totalement délaissés par les habitants.

L'intervention a consisté en :

- la démolition de la galerie urbaine, la réhabilitation de la médiathèque, la réorganisation des circulations, des entrées et des fonctions
- la création au cœur de la médiathèque, dans le vide créé par la démolition de la galerie urbaine, d'un volume vitré destiné à accueillir une salle de conférences pour 50 personnes
- la requalification des espaces extérieurs avec le réaménagement à l'est d'une place minérale (l'esplanade des droits de l'homme) et la création au sud de la nouvelle entrée de la médiathèque

Dans un environnement rendu monotone et sombre par l'épaisseur des volumétries d'origine, l'utilisation de la couleur (pour les revêtements, la signalétique et l'ameublement, jusqu'au totem marquant la nouvelle entrée de la médiathèque) permet de redonner lisibilité et luminosité aux différentes fonctions.

## **Béal & Blanckaert, Lille – France**

### **Libraries :**

**Médiathèque Corbie, Enclos de l'abbaye Corbie – France 2007 - 2009**

Client : CC Corbie – Villers Bretonneux, € 1.770.000, 890 m<sup>2</sup> SHON

La construction de la nouvelle Médiathèque de la communauté du Val de Somme à Corbie est un acte culturel fort. À plusieurs titres : Tout d'abord il permet de doter la communauté d'un outil performant lié à la lecture et aux nouveaux médias de la culture

au service du public. Il favorise ensuite l'aménagement d'un site en devenir. Comment habiter ce lieu, comment affirmer la présence de la Médiathèque dans ce site tout en résolvant des questions de territoire. Ici, il faut raisonner en termes de paysage architectural ou d'architecture paysagère pour comprendre les futures qualités du lieu. Notre projet est donc à la fois un bâtiment, une sculpture, un objet qui saisit le paysage alentour et le cristallise. Mais c'est aussi un conteneur culturel qui regarde avec attention les qualités du site. La Médiathèque est à la fois ouverte sur ce paysage divers, au sud sur la ville de Corbie à qui il adresse sa grande fenêtre et sa terrasse ouvertes, au Nord et à l'ouest sur les jardins de l'enclos et prêtant attention aux arbres et aux surfaces végétales. Elle est également fermée sur elle-même, préservant des poches d'intimités propices à la lecture ou à l'étude. Elle est tout à la fois une métaphore et une métamorphose du site de Corbie. (Béal)

#### **Faculté de Pharmacie, Lille – France 2006**

1999-2001 extension / 2004-2006 : restructuration, Maître d'ouvrage Université de Lille 2, Maître d'oeuvre Antoine Béal - Ludovic Blanckaert, architectes. Surface extension Shon 1800 m<sup>2</sup>, Budget extension 2 005 619,00 Euros TTC, Appel d'offre projet lauréat - architecte mandataire

façade principale

L'extension de la faculté de pharmacie de Lille complète sans l'altérer, un bâtiment à forte valeur patrimoniale.

À la place du programme prévoyant l'extension au-dessus de la bibliothèque, condamnant en cela l'éclairage zénithal de cette salle de travail et supposant des travaux de reprises en sous-oeuvre et une fermeture provisoire d'une partie de l'établissement, nous avons proposé, par une mise à profit du terrain disponible de tendre le nouvel équipement à 8,00m des façades du bâtiment actuel (distance minimum de sécurité incendie) contre la rue passant au Nord.

Le projet se présente ainsi au Sud par une façade abstraite blanche réfléchissant la lumière solaire vers la bibliothèque et simplement percée de fines meurtrières éclairant les laboratoires, et au Nord par un mur de béton suspendu couvert de briques suivant strictement la courbe de la rue. Cette façade derrière laquelle se cachent les circulations est percée de longues embrasures apparemment aléatoires, et d'un grand bow-window révélant les niveaux. Cette façade suspendue au-dessus d'une feuille de verre transforme l'ancien arrière de la Faculté, ses terrains résiduels et ses locaux technique en nouveau signal institutionnel. L'ensemble, vu essentiellement de profil, révèle le feuilleté réel de la composition

L'entre deux ainsi créé fabrique de façon naturelle un jardin patio et permet une mise en scène des bâtiments (ancien et nouveau) ainsi qu'une zone de calme propice à la concentration des étudiants et chercheurs ainsi qu'un complément pédagogique aux enseignants botanistes par la mise en scène de plantes médicinales, champignons, etc...

le jardin. (Béal)

#### **Médiathèque Armentières - Ville d'Armentières - France 2008**

4.891 m<sup>2</sup>, € 6.000.000

La nouvelle Médiathèque dotera la ville d'un outil performant lié à la lecture et aux nouveaux médias de la culture au service du public. Elle favorisera ensuite au niveau d'un réaménagement urbain la structuration du quartier de la gare. Enfin, ce sera un élément public phare que doit transcender un acte architectural du début du XXI<sup>e</sup> siècle. Nous ne dissociions pas ces trois termes : La culture, l'urbanité et l'architecture sont des acteurs. Par l'utilisation de matériaux unificateurs et une "présence formelle", l'écriture architecturale se pose dans des termes de narration et d'expressionnisme propice à l'interprétation formelle en opposition à toute rigueur trop théorique. Le programme est contenu dans une enveloppe et des gabarits qui qualifient le site. Cette règle assure à l'édifice une juste dimension, dans une enveloppe horizontale ondoyante qui se plie et se déplie pour épouser les contraintes de prospect et absorber les différences de hauteur des programmes. (Béal)

#### **Faculté de Pharmacie Bibliothèque, Lille – France 1999-2001 extension / 2004-2006 : restructuration**

Maître d'ouvrage Université de Lille 2, Maître d'oeuvre Antoine Béal - Ludovic Blanckaert, architectes. Surface extension Shon 1800 m<sup>2</sup>, Budget extension 2 005 619,00 Euros TTC

L'extension de la faculté de pharmacie de Lille complète sans l'altérer, un bâtiment à forte valeur patrimoniale.

À la place du programme prévoyant l'extension au-dessus de la bibliothèque, condamnant en cela l'éclairage zénithal de cette salle de travail et supposant des travaux de reprises en sous-oeuvre et une fermeture provisoire d'une partie de l'établissement, nous avons proposé, par une mise à profit du terrain disponible de tendre le nouvel équipement à 8,00m des façades du bâtiment actuel (distance minimum de sécurité incendie) contre la rue passant au Nord.

Le projet se présente ainsi au Sud par une façade abstraite blanche réfléchissant la lumière solaire vers la bibliothèque et simplement percée de fines meurtrières éclairant les laboratoires, et au Nord par un mur de béton suspendu couvert de briques suivant strictement la courbe de la rue. Cette façade derrière laquelle se cachent les circulations est percée de longues embrasures apparemment aléatoires, et d'un grand bow-window révélant les niveaux. #### **Médiathèque François Mitterrand Annoeullin, Communauté de Communes de la Haute-Deûle - France 1999 - 2001**

Maître d'oeuvre Architectes : Antoine Béal - Ludovic Blanckaert, Bureau d'études Projex, Surface Shon 1800 m<sup>2</sup>, Appel d'offre Concours Public -Projet Lauréat, Budget 1 920 850 Euros HT valeur 1999

Un projet social, pédagogique, culturel et urbain. Lieu ouvert à tous, le projet est le reflet des ambitions du programme : Ouvert sur l'extérieur et conçu pour une communauté de 10 000 habitants, il offre un nouveau cadre social et culturel aux villes et transforme en l'achevant, un quartier à la nouvelle identité.

Un fonctionnement simple et lisible : Le hall d'accueil est le pivot du projet: autour de lui rayonnent la salle d'exposition et de spectacle qui s'ouvre ou se ferme sur le hall ou le patio, les deux bibliothèques aux géométries différenciées, les archives à l'accès contrôlé et à l'étage l'administration.

Un projet architectural moderne et pérenne : Lumière, transparence : le nouveau centre culturel souhaite montrer le dynamisme de la nouvelle communauté des communes. Sous un auvent unificateur se lisent les entités du programme Des patios intérieurs, diffusant lumière et verdure, se transforment en lieux de spectacle, d'exposition ou de lecture. (Béal)

#### **Bibliothèque Municipale, Chauray (Dep. Deux Sevres, Reg. Poitou-Charentes) – France 1998 – 1999**

La bibliothèque est installée dans un ensemble de bâtiments anciens, situés en centre bourg. Cette opération s'inscrit dans un projet global de réaménagement et d'identification du centre bourg. Les bâtiments ont été déstructurés, l'espace ouvert, de manière à obtenir un espace fluide. L'enveloppe extérieure n'a pas été modifiée : L'intérieur est marqué par une forte présence du bois de frêne, bois très présent dans la région. Ce bois clair, a été utilisé pour les portes, le parquet et le mobilier (rayonnages, banque d'accueil, tables fixes et tables mobiles). Cette présence forte du bois confère à l'espace un caractère chaleureux et lumineux. Le mobilier : tables, plateaux intégrés et banque d'accueil ont fait l'objet d'un design spécifique. Les chaises sont de Arne Jacobsen. Les luminaires, de Louis Poulsen. De grands puits de jour, procurent une lumière zénithale douce, bien dosée. Ils agissent comme une boîte à lumière, grâce à la réflexion sur des parois blanches. Leur conception, évite l'éclairage direct. Du côté ouest, une petite extension, correspondant au secteur des enfants, a été construite, par Manuel Paiva, en pierre banchée. (Beaudouin)

#### **Musée et Médiathèque Lussac-les-Châteaux (Dep. Vienne, Reg. Poitou-Charentes) – France 1994-1996**

Le bâtiment situé au coeur du bourg de LUSSAC LES CHATEAUX s'inscrit dans un ensemble historique comprenant plusieurs bâtiments du XVI et du XIX ème. Le programme comprend une médiathèque et un musée de la préhistoire qui abrite les importantes collections de pierres gravées trouvées dans les grottes locales. Ces 2 entités sont connexes à la MJC existante l'ensemble fonctionnant avec une entrée unique. Les bâtiments anciens sont restaurés et reconvertis et une extension a été implantée dans la cour existante. La galerie accueille, au rez-de-chaussée, les expositions temporaires et à l'étage une partie du musée. La galerie a été construite avec un béton de site particulier, coulé par strates successives de hauteur et de granulométries différentes. Le béton a été fabriqué sur place avec des moyens rudimentaire : dosage au seau, petite bétonnière et coffrage sauteur. La paroi texturée, à l'aspect très naturel, rappelle les couches archéologiques dans lesquelles les pierres gravées ont été trouvées. Ce béton est composé à partir de granulats trouvés à 15 km de LUSSAC, le sable, lui aussi provient d'une exploitation située à 5 km. Les variations de couleur proviennent exclusivement des variations de taille de granulats suivant les couches La porte monumentale de l'entrée est habillée de planches de robinier conservées dans leur état naturel sans aucun traitement. Les ouvertures de la galerie sont des fentes horizontales très fines placées au ras des planchers. Cette disposition, reprise du précédent musée des Arts du Cognac permet de laisser libre, la totalité des cimaises. Du côté de la MJC, la paroi s'infléchit en courbe et de grandes ouvertures verticales s'inscrivent dans la courbe. Les fenêtres en bois sont disposées en applique, du côté extérieur. Le vitrage est tenu par des plats en acier inoxydable sablé ce qui lui donne un très bel aspect terne. A l'intérieur, une paroi coulissante qui se ferme entièrement en porte à faux - sans rail haut ni bas - permet de séparer la galerie du hall d'accueil. (Beaudouin)

#### **Médiathèque François Mitterrand, Poitiers (Dep. Vienne, Reg. Poitou-Charentes) – France 1994 – 1996**

in collaboration with : Sylvain Giacomazzi, Nancy / Emmanuelle et Laurent Beaudouin, Nancy

Architecte associé (chantier) : Hervé BEAUDOUIN

La Médiathèque François Mitterrand de Poitiers a été construite à proximité de l'université à deux pas de l'église Notre-Dame la Grande. D'une superficie de 8000 m<sup>2</sup> c'est le plus grand édifice public construit à Poitiers au XXème siècle. Le bâtiment comporte 6 niveaux, 4000 m<sup>2</sup> sont ouverts au public. La Médiathèque contient : 300 000 documents dont 400 manuscrits précieux du Moyen-âge. Le volume est approximativement carré. Les façades sont traitées de façon autonomes. Une des composantes majeure du projet a été le travail sur la lumière. Chaque façade correspond à une qualité de lumière : transparence (ouest), diffuse (est), réfléchie (nord). Le traitement de cette lumière est accentué par la polychromie des espaces intérieurs. Les différents niveaux se découvrent à partir d'une rampe très douce qui relie les différents espaces entre eux. Les matériaux naturels ont été très employés. Le bois de chêne forme les murs rideaux. Cette paroi vitrée est entièrement suspendue à partir de l'acrotère. Les assemblages ont fait l'objet d'études très particulières. Le serrage se fait par écrous à cames fabriqués spécifiquement. Le chêne est repris dans les menuiseries intérieures et les parquets. Le béton brut est traité de différentes manières : lisse et texturé, à la planchette plate ou à la planchette à chanfrein. Les bétons sont, soit gris naturels, soit réalisés à partir de ciment blanc et de granulats clairs, la pierre est, soit lisse, soit appareillée à joints seers, soit à joints pleins. (Beaudouin)

#### **Bibliothèque Universitaire, Université Paris Est, Marne La Vallée, Campus de la Cité Descartes – France 2012**

8.670 m<sup>2</sup> SHON, € 17.600.000

Futur coeur et espace de sociabilité du campus de l'université de Marne-la-Vallée, la nouvelle bibliothèque centrale possède le fort avantage d'être placée sur un site remarquable : la Ferme de la Haute Maison. Datant du 17ème siècle, ce site 'historique' confère un rôle stratégique à cet équipement. Ce n'est pas tant la qualité des constructions qui lui donne son identité : la douve qui la ceinture, étendue en jardin d'eau et la cour centrale devenant le parvis principal, sont deux éléments fédérateurs de ce lieu qui instaurent ainsi une émotion particulière.

Calées sur la ligne horizontale des chéneaux existants, les deux parties de l'établissement sont marquées et différenciées. La partie basse (accueil) recrée une frontalité avec l'autre partie de la Ferme conservée. Simple et rectiligne, elle plonge vers la douve et devient l'appui de la partie haute (salles de lecture). Volume tellurique suspendu, comme arraché de son élément naturel, il s'étend côté jardin, transpercé par des inclusions dorées saillantes en verre et des patios qui apportent de la lumière naturelle en sous-face. A l'intérieur, calme et blancheur dominant. Quelques ponctuations végétales créent des séquences spatiales et apportent un confort visuel complémentaire au paysage installé. Une attention particulière est aussi apportée sur la qualité environnementale (démarche HQE) et principalement sur la gestion des énergies.

Espaces privés et publics sont clairement séparés et délimités, permettant ainsi d'installer une gestion des flux très claire. Les grandes entités fonctionnelles sont donc rapidement identifiables de par leur morphologie et leur emplacement. (<http://www.lacourrierdelarchitecte.com>)

#### **La „Canopee“ Chatelet-Les-Halles, Paris – France 2014 / 2016**

Les choses sérieuses commencent pour la Canopée des Halles, futur emblème d'un Forum (1er) complètement métamorphosé à l'horizon 2016. Les travaux de construction de cette immense structure de verre et d'acier, de 14 mètres de hauteur, entrent ce mois-ci dans leur phase décisive. «Deux grandes grues vont arriver dans les jours à venir et, dans le patio, on s'attelle déjà à mettre en fonction des escaliers de secours pour pouvoir démolir l'escalier monumental en maïs», pose Dominique Hucher, directeur du réaménagement des Halles à la société d'économie mixte PariSeine. Une partie de la charpente de la Canopée sera ainsi visible dès l'été pour une livraison prévue en juillet 2014.

Cette feuille translucide, présentée comme ondoyant à hauteur de la cime des arbres du jardin remodelé, abritera deux nouveaux bâtiments disposés autour du patio pour accueillir un conservatoire, un centre de hip-hop, une bibliothèque, un atelier des pratiques amateurs et un centre culturel pour les sourds et malentendants. D'un coût supérieur de 216 millions d'euros, soit plus d'un quart de la facture d'un chantier estimé à 802 millions, la Canopée suscite depuis le début l'opprobre de l'association de riverains Accomplir. «C'est quelque chose de trop cher, de hideux et d'écrasant, qui bouchera la perspective sur l'église Saint-Eustache, s'insurgent ses membres. De plus, elle viendra fermer le cratère à ciel ouvert du Forum et son toit laissera passer la pluie et le vent, mais pas le soleil!» (<http://www.lefigaro.fr>)

Das unterirdische Pariser Einkaufszentrum „Forum Les Halles“ (Georges Penreac'h, Claude Vasconi 1972-1972), seit seiner Zeit als Nahrungsmittel-Großmarkt als „der Bauch von Paris“ bekannt, soll überarbeitet werden. Der internationale Architekturwettbewerb wurde bereits im August 2007 entschieden (BauNetz-Meldung vom 30. August 2007). Die Stadt Paris hat nun die Planungen der französischen Architekten Patrick Berger und Jacques Anziutti genehmigt, die unter einer muschelähnlichen Glashülle Cafés, eine Bibliothek, ein Gesundheitszentrum, ein Auditorium mit 350 Sitzplätzen vorsehen. Desweiteren sollen Werkstätten für bildende Künstler, Tänzer und Musiker eingerichtet werden, die vom französischen Kulturministerium betrieben werden. Berger und Anziuttis Planungen ersetzen damit die überirdischen Teile des Forums. Das neue Glasdach, eine doppelt gekrümmte, selbsttragende Stahl-Glaskonstruktion, soll den Zugang zum bestehenden unterirdischen Komplex und zum Garten erleichtern, der vom Architekten David Mangin (Seura Architects Urbanistes, Paris <http://www.seura.fr>) neu entworfen wurde. Mangin hatte 2004 einen früheren Planungswettbewerb für Les Halles gewonnen (BauNetz-Meldung vom 16. Dezember 2004). Sein Entwurf für ein Glasdach wurde damals verworfen, der Gartenentwurf jedoch beibehalten. Mangin wird das gesamte Projekt koordinieren. Der Baubeginn ist für 2010 vorgesehen, die Fertigstellung für 2013. (<http://www.baunetz.de>)

#### **Renovation Du Forum des Halles, La „Canopee“**

Le projet a pour caractéristique d'être déduit du site : sa forme, ses espaces et sa matérialisation sont issues d'une confrontation entre l'état des choses et l'émergence des nouvelles énergies aux Halles. Ses principes architecturaux peuvent être résumés ainsi : Une réorganisation du site. L'aménagement actuel, reparté sur une diagonale entre la Fontaine des Innocents et l'Eglise Saint Eustache fait place à une nouvelles configuration. L'ensemble urbain constitué par la Bourse, le jardin et la Canopée est unifié par une orientation de l'espace selon un axe Est/Ouest. Une dimension métropolitaine. La Canopée n'est que la partie visible d'une pièce urbaine de 500m de long en majeure partie souterraine. La gare s'étend en sous-sol jusqu'à la Seine. Agrandie et simplifiée, la station Chatelet-les-Halles et la plateforme d'échange forment une unité. Une porte de Paris. Une continuité est créée entre les deux sols de référence du site : celui de la ville au-dessus, celui du forum en dessous. On « monte » désormais vers Paris. Un microclimat pour un espace unitaire. La canopée est un abri à l'échelle urbaine contre les intempéries. Elle protège un espace global où l'on peut circuler en tout temps et en toute saison. Un système constructif adapté. Les choix constructifs résultent des deux contraintes majeures du site : Construire en prenant appui exclusivement sur les poteaux de la structure du sous-sol et sans arrêter le fonctionnement du forum et des transports. Il en résulte un ouvrage de grande portée en acier et en auto-traction. Une forme à l'équilibre. La morphologie de l'architecture résulte d'un équilibre entre toutes les dynamiques du programme et du site. Cette complexité a été optimisée en prenant comme modèle les morphogénèses de la nature. C'est une forme unique dans un site unique. Une homothétie des éléments et une enveloppe translucide. Les éléments constituant la Canopée présentent une parenté avec sa silhouette. L'enveloppe est conçue comme une substance. Sa matière est celle d'un verre céramique. Diffusant la lumière le jour, c'est un lustre la nuit. Le dessin de l'architecture a été fait librement mais guidé par ces principes. (Berger)

#### **Médiathèque François-Mitterrand, Tours- France 2007**

La médiathèque François-Mitterrand à Tours par Berthelie, Fiche et Tribouillet

Médiathèque - Tours nord, Maîtrise d'ouvrage : Communauté d'agglomération Tour(s)plus, Programme: Salles de lecture, salles de projection, espace multimédia, amphithéâtre, Surface : SHON 1.484m<sup>2</sup>, Coût des travaux : 2.223M€ HT

Au nord de la cité tourangelle, la nouvelle médiathèque défend l'idée d'une architecture à la fois minimaliste et ludique. Elle est devenue le fer de lance d'une ambitieuse politique de régénération urbaine. Derrière cet abord géométrique, la médiathèque révèle tout un univers de courbes où aucun mur n'est totalement parallèle à l'autre. Un projet de qualité pour un quartier sans qualités. Ce n'est pas faire offense à cette partie nord de Tours, baptisée " Europe ", que de constater le peu d'intérêt de ses petits immeubles d'habitation construits dans les années 1960. Inscrite dans une opération de " requalification " urbaine, comprenant notamment un raccordement vers le centre-ville grâce au tramway, la nouvelle médiathèque a vu le jour à l'issue d'une consultation architecturale dont le trio Berthelie-Fiche-Tribouillet est sorti vainqueur. La séduction du projet a pesé dans la balance lors du choix final. Car, au-delà du fonctionnel, il fallait aussi donner une dimension esthétique à cet outil culturel et le rendre attractif. Après neuf ans passés auprès de Jean Nouvel, Sophie Berthelie a rejoint en 1992 l'agence de ses amis Philippe Fiche et Benoît Tribouillet. Repéré avec l'extension réussie - dans l'esprit de Le Corbusier - du lycée Rémi-Belleau à Nogent-le-Rotrou (1993), le trio qui travaille essentiellement pour la commande publique défend l'idée d'une architecture inventive et minimale, sensible et ludique. " Créer, c'est vivre ", lance Sophie Berthelie en guise de mot d'ordre. Dès qu'on arrive sur l'esplanade François-Mitterrand, l'oeil se perd dans le miroitement subtil et légèrement hypnotique des façades sous le soleil. " Le lieu a été pris en compte, mais nous n'avons pas cherché à faire une architecture qui s'intègre ", précise Benoît Tribouillet. Originalité du bâtiment : malgré les apparences d'une structure géométrique, les murs courbes, dont aucun n'est parallèle à l'autre, évoquent la souplesse de la page de livre. Ce choix entre joliment en opposition avec la monotonie orthogonale des bâtiments environnants. Autre caractéristique, et non des moindres, une

énigmatique peau sensuelle qui enveloppe les deux faces du bâtiment. De loin, on imagine une constellation d'or. De près, on découvre une myriade de copeaux de bronze noyés dans la résine plastique. Tout simplement très beau. Il s'agissait pour les architectes d'apporter une matière, une couleur, une lumière s'opposant au blanc et au gris des alentours. " L'effet cinétique dynamise la façade. Nous n'avons pas attendu que cela devienne une mode pour inaugurer ce travail sur la "peau" externe du bâtiment. Nous aimons jouer avec les reflets qui perturbent le regard. En 1993, nous expérimentions déjà le principe en associant le verre et la tôle perforée sur le site du lycée Belleau. " Les copeaux de bronze scintillent d'autant plus qu'ils se reflètent sur le bardage d'inox habillant une partie du bâti. Côté rue, un poème de Jorge Luis Borges choisi par les bibliothécaires couvre la surface vitrée superposée à la façade principale. Banque d'accueil en Dacryl rouge conçue par les architectes " double peau " crée une barrière thermique et répond à des exigences d'écoconception. À l'intérieur, la lumière entre à flots, tamisée par cet écran " pare-soleil " qui préserve aussi l'intimité des lecteurs vis-à-vis de l'extérieur. Le texte de Borges file comme une invitation à pénétrer dans cette médiathèque de 1 500 mètres carrés sur deux niveaux. Le poème est imprimé sur une toile micro-perforée tendue au plafond dont la doublure en laine de verre assure l'isolation phonique. Le noir des murs et du sol (une résine coulée et chargée d'agrégats de marbre et bronze) met en valeur le mobilier de designers choisi avec attention par les architectes, jusque dans l'espace réservé aux enfants. Système d'étagères USM, fauteuils Ron Arad (Vitra), sièges Enzo Mari, chaises Jasper Morrison et tables Marcel Wanders (le tout chez Magis), poufs de Sit On It... La banque d'accueil en Dacryl rouge (un verre acrylique haut de gamme) avec tranche phosphorescente a, elle, été dessinée par le trio. Le tout est de grande qualité. " Nous sommes sensibles aux détails ", commente Benoît Tribouillet. Quatre mois après son ouverture, la médiathèque comptabilisait déjà 4 823 nouveaux inscrits. Un vrai succès public qui ravit les architectes : " C'est important que les gens adhèrent à des projets un peu différents. Il faut que cela fasse école. " LAURENCE SALMON (<http://www.lesechos.fr>)

"L'idée de frontières et de nations me paraît absurde", déclarait en 2001 Jorge Luis Borges lors d'un entretien au Monde Diplomatique. Ainsi est-il logique, sans doute, que les utilisateurs de l'ancienne bibliothèque du quartier de l'Europe à Tours aient choisi l'un de ses textes - Alexandrie, treize poèmes datant de 1978 - pour orner la façade est de leur nouvelle médiathèque. Ce quartier excentré de Tours est composé d'une place - la place du Nord, au pied d'un beffroi qui n'est qu'une ancienne chaufferie - entourée d'une haie de petits immeubles de trois étages, aux matériaux uniformes et d'aspect monotone. Encore cette notion de place n'existe guère - son statut est mal défini et relève davantage du parc de stationnement - si ce n'est peut-être le jour du marché où elle s'anime et vit.

Il fallait donc repenser l'ensemble, le transformer en un véritable lieu de vie attractif et ludique pour ce quartier qui trouvera ainsi une nouvelle identité", assurent les architectes Sophie Berthelier, Philippe Fichet et Benoît Tribouillet (BFT pour les besoins de cet article, qu'ils nous en excusent). "Le site d'implantation de la médiathèque restructure l'angle des rues de Jemmapes et de Tourcoing et vient cadrer le futur parvis où arriveront les transports en commun", disent-ils. Sans doute.

Jean Germain, maire de Tours et président de la Communauté d'agglomération Tour(s)plus, maître d'ouvrage, avait une exigence plus modeste : "la médiathèque devait devenir l'icône contemporaine d'un quartier manquant de repères et d'image projetée", explique-t-il. Mais c'est ailleurs que se trouve la clé de la réussite de ce petit équipement culturel chargé à lui seul de dynamiser un quartier.

"L'idée était d'écrire une histoire autour de ce quartier, de faire lire ce bâtiment, utiliser les mots en tant que matière ; c'est une idée banale mais pas dans ce quartier où les gens n'ont pas l'habitude d'aller à la bibliothèque", explique encore BFT. Alors, que devant la façade est, un paravent de ventelles de verre orientable soit sérigraphié d'une multitude de mots issus du texte du poète argentin, n'est pas tout à fait une surprise. Dans ce quartier, peut-être, mais depuis quelques années déjà la calligraphie envahit les façades parisiennes - qu'il s'agisse notamment de l'immeuble du Monde ou du Mémorial de la paix - et il n'est que justice que la tendance arrive en province. Que ce texte se prolonge au plafond ondulé de l'étage de la médiathèque, invitant les visiteurs à lever la tête, est une bonne idée. Mais ce n'est pas là encore que se trouve la véritable inspiration de ce bâtiment.

A noter cependant que ces ventelles en façade - sérigraphiées ou non - sont une trouvaille dans le sens qu'elles participent, ainsi que d'autres détails, à la ventilation du bâtiment et à son impact en terme de durabilité. Et les grandes lettres du texte de Borges, qui couvrent 50% de la surface, participent à la protection solaire. "Un souci constant d'économie d'énergie et de maîtrise des coûts est manifeste dans tout le bâtiment", assurent les architectes à juste titre.

"L'adoption de la double 'enveloppe' ouverte supprime les effets du vent et le phénomène de pont thermique. L'utilisation passive de l'énergie solaire, un maximum d'éclairage naturel, une maintenance aisée, confort acoustique, l'optimisation des performances des matériaux, renforcent le principe de qualité environnementale recherché dans le bâtiment. Les protections solaires sont composées de plaques en PMMA permettant le contrôle efficace de la luminosité et de la chaleur. Un auvent protège les parvis nord et sud. Les inclusions et la sérigraphie jouent un rôle esthétique, mais constituent aussi des filtres évitant les effets de serre ainsi qu'une protection contre les dégradations et les graffitis", disent-ils.

Les panneaux en résine incrustés de copeaux de bronze jouent le même rôle. La climatisation n'est pas prévue mais les gaines ont été installées "au cas ou". Les employés de la médiathèque, qui avaient déjà pris position des lieux lors de la visite de presse, en apprécient le confort. Mais sa qualité durable, qui est loin d'être négligeable - ne nous méprenons pas - n'est pas ce qu'il y a de plus remarquable dans ce bâtiment.

"Refusant l'ostentatoire, l'idée qui a présidé à la conception est celle d'une feuille de papier... La forme de la médiathèque devait en avoir la légèreté, la souplesse, la fluidité, la modularité. Exprimée par une volumétrie en courbe, elle se parachève dans le choix de matériaux qui répondent parfaitement à la recherche d'alternance entre opacité et transparence, cultivant l'aspect flou d'un papier japonais qui filtre, puis diffuse une lumière dorée et imprécise", expliquent BFT. Soit.

Le programme prévoyait quatre entités spécifiques sur seulement deux niveaux de surfaces différentes : au rez-de-chaussée la salle de consultation destinée aux enfants, une salle de projection et de débats, les services administratifs et, à l'étage, la bibliothèque adultes et adolescents, un espace multimédia images et son.

Cette dernière salle de lecture fait le tour du site, offre des "tableaux sur le quartier" et le plafond imprimé en toile tendue réaffirme que l'on peut détourner et mettre en scène les matériaux les plus simples. Les panneaux sandwichs en métal perforé de catalogue, repeints en noir et en bronze allient ainsi une fonctionnalité tant acoustique qu'esthétique. Et on s'approche enfin là de ce qui rend ce bâtiment si accueillant et si intéressant, voire sympathique.

En effet, cette économie de moyen, loin d'être seulement une contrainte, est ici une jouissance ; non pas celle de l'architecte béat devant sa créativité mais celle qui naît, avec tout le détachement liée à la nature professionnelle de l'acte, d'être parvenu à exprimer auprès des gens du quartier un véritable respect et une générosité non feinte. Et ce sont les panneaux des façades qui en témoignent absolument.

Si l'enveloppe principale est composée d'un mur rideau de panneaux de verre réfléchissants ou opaques et d'inox poli miroir, sur les flancs de la médiathèque une paroi transparente en méthacrylate "épouse, en s'en distanciant, les formes galbées, magnifiée par la lumière qui vibre sur des copeaux de bronze doré récupérés chez un ferrailleur et inclus dans la matière. Un écran uniforme passe, comme une feuille diaphane, devant d'autres panneaux vitrés et des murs opaques, suggérant l'intérieur tout en isolant les salles de consultation de l'extérieur, sans que les limites ne soient jamais parfaitement définies. Un jeu de double peau qui masque et révèle, intrigue et appelle à la réflexion". Ainsi parlent donc des architectes.

Mais au final, ces copeaux de récup' aux formes improbables, sertis dans des panneaux en résine "moins froids que le verre" indiquent aux habitants de la place nord du quartier de l'Europe qu'ils ont droit autant que quiconque à la richesse, non formelle mais implicite en ce lieu de culture, que l'on a considéré qu'ils savaient être subtils et qu'à partir d'une vieille vis en bronze, ils pouvaient prendre un raccourci jusqu'à la création et l'abstraction, qu'elle fut architecturale n'étant ici qu'un détail. Bref, que ce lieu morne était plus qu'une place insipide parce qu'elle devenait encore mieux leur place car eux seuls, au-delà de l'usage, sauront au fil des jours en découvrir de nouveaux détails sans cesse renouvelés. C'est là tout le travail d'un architecte sans doute.

D'ailleurs la façade ouest, tout en métal, permet au quartier de se réfléchir dans sa médiathèque. D'ailleurs, BFT a imaginé un "entre-deux", espace n'appartenant ni à la médiathèque, ni à l'espace public et permettant, par son épaisseur "de donner une sorte de monumentalité dans la profondeur qui rappelle la vocation d'équipement public de cette architecture ; on se trouve dans un monde à part, multiforme, ni intérieur, ni extérieur, qui filtre et isole du bruit et des températures extérieures". C'est le maître d'ouvrage qui a choisi de bloquer les accès de ces espaces un peu mystérieux, protégés et ouverts, propices aux secrets et confidences dans une agora où rien ne peut échapper aux regards inquisiteurs des voisins-voisines.

"L'usage de matériaux authentiques, issus ou dérivés des circuits de fabrication industrielle, durants et faciles d'entretien" (dixit BFT) peut bien avoir présidé aux choix constructifs, Jean Germain, le maire, ne s'y est pas trompé. "Le quartier de l'Europe, quartier à l'architecture monumentale, fermé sur lui-même, disposait du potentiel démographique et économique pour devenir l'un des centres de l'agglomération. Il lui manquait sans doute le rayonnement et peut-être la fierté nécessaires pour occuper ce rôle. Beaucoup a déjà été fait mais la médiathèque marque un point de bascule dans ce processus d'affirmation et de polarisation. Avec elle, la ville reprend ses droits", dit-il.

Le hall d'entrée, entièrement vitré, lumineux et accueillant, est aussi le lieu d'expositions temporaires ; il irrigue l'ensemble des services. Et la rénovation de l'ancienne chaufferie - le beffroi - en logements sociaux a été confiée à BFT.

Alors oui, quand on y pense, l'idée de frontière, d'ailleurs récente à l'échelle de l'homme, est absurde. Et ce n'est pas Jean Vilar qui, ici, nous dira le contraire. (<http://www.lecourrierdelarchitecture.com>) (30.10.2010)

Un mur de lumière

Ce projet se situe dans un bourg fortifié d'Alsace. La commande portait sur deux équipements situés de chaque côté d'une rue et sur un terrain en plein centre historique, en bordure du rempart. Le programme prévoyait d'un côté de la rue, une école primaire de dix sept classes et un bâtiment périscolaire et, de l'autre côté de la rue, une médiathèque. A la différence du projet très contextuel de l'école, la médiathèque est plus autonome: elle ne cherche pas à rendre compte du site sans doute parce qu'il s'agit d'un programme nécessairement moins ouvert sur l'extérieur. Plus compacte, elle est isolée par l'extérieur et entièrement revêtue d'un contre-mur en brique. A l'intérieur, le grand espace d'un seul tenant est couvert d'un plafond tout en courbe qui va chercher la lumière du nord alors que le mur opposé à la façade sur jardin est dédoublé, laissant couler une lumière zénithale qui équilibre largement celle apportée par la façade « classique ». Ces deux dispositifs sont largement inspirés de l'église de Bagsvaerd de Jorn Utzon dont la visite nous aura durablement impressionnée. (BQ)

**Médiathèque Choisy le Roi – France 2013**

Maître d'ouvrage : SADEV 94, Date de concours : 2010, Date de livraison : juin 2013, SHON : 2 400 m<sup>2</sup>

Une médiathèque représente toujours le lieu du savoir, aussi, la figure que nous proposons pour le projet est une spirale, image qui symbolise le progrès, la progression par la connaissance, l'ascension sociale par la culture mais aussi le brassage inter générationnel. Les espaces majoritairement ouverts s'enroulent autour d'un vide central formant un ruban volumétrique. Recouverts d'un parement d'aluminium anodisé, perforé aux diamètres variables en fonction de l'orientation, les volumes sont abstraits et s'inspirent des silhouettes élémentaires d'édifices portuaires, en mémoire du lieu. Les fenêtres sont parfois occultées, parfois valorisées en

fonctions de la pièce ou de l'orientation. Deux très grands cadres viennent ouvrir l'intérieur de l'édifice à la manière d'une coupe. Ces deux grands écrans tournés vers la ville et le fleuve symbolisent également son ouverture, la valeur intrinsèque de l'équipement, dédié à la lecture publique, lieu d'apprentissage et de savoir, ouvert à tous, lisible depuis l'espace public. Utilisant la situation privilégiée du terrain en proue, le bâtiment ressemble à une nef qui flotte sur un sol végétal en mouvement et retenu à la rive par la passerelle de bois. Placée en partie supérieure de l'édifice, une enseigne en néon indiquera son nom, afin de renforcer sa visibilité depuis le pont mais également depuis l'autre rive. De loin, lorsque la Seine exhale sa brume d'hiver, ce « bateau » aura des allures de vaisseau fantôme. chef de projet : Florent Descolas. (Brenac)

Au bord de la Seine, à la rencontre de la rue Mendès-France à Choisy-le-Roi dans le Val de Marne, l'agence parisienne Brenac + Gonzalez livrera en juin 2013 sa nouvelle médiathèque. Ce ruban enroulé de 2 400 m<sup>2</sup> se situe en proue dans le quartier du port. Son implantation dans le quartier du port est un clin d'œil à l'histoire de la ville, de plus elle permet d'étendre le centre-ville à cet ancien port et de le lier à son fleuve. Le site anciennement industrialisé laissait la possibilité aux architectes de proposer une architecture moderne. L'atelier Brenac + Gonzalez en a profité pour concevoir une médiathèque à l'ère du numérique. Enveloppé par des feuilles métalliques déployées, les façades sont marquées par deux grands cadres en verre, les étages en retrait reposent sur un RDC transparent.

Les ouvertures qui jalonnent ce parcours culturel sont tantôt valorisées, tantôt occultées. Les deux cadres qui constituent une véritable section dans le volume dégagent une image forte, issu de son ouverture sur la ville et son fleuve, cet équipement à la valeur indéterminé est ouvert à tous, il est dédié à la lecture, à l'apprentissage. Les architectes ont également profités de la position en proue pour dégager les volumes avec des porte-à-faux et des retraits. Signalisé par des néons, la médiathèque apparaîtra comme un bateau mystérieux derrière la brume d'hiver de la Seine.

Le PPRI (Plan de Prévention aux Risques d'Inondations) inclus dans le programme préconisait un déplacement de la médiathèque à l'étage. Ainsi, le RDC permettra d'abriter des expositions temporaires visibles depuis l'espace public. Cet espace est dépourvu de façade opaque au bénéfice du verre, la transparence permet également d'entrevoir la Seine depuis la rue Mendès-France et de support de communication. L'accès sera possible depuis le quai et la rue Mendès-France. Le niveau accueille la salle de quartier qui sera plus accessible, elle est dotée d'une mezzanine en cas de remontée d'eau.

L'organisation des étages de la médiathèque suit l'ascension d'un ruban, elle représente l'ascension sociale que la médiathèque offre à travers la culture. Le vide engendré par l'organisation de l'espace crée un puits de lumière. Le premier étage dispose d'un hall pour les lecteurs (abonnement, prêt, recherche) un espace pour les enfants décomposés en trois : livres, albums, l'heure du conte. Une salle de travail fermée répond au besoin de tranquillité de leurs occupants.

Le troisième niveau abrite les collections adultes, l'administration ainsi qu'une terrasse. La terrasse ouverte sur le fleuve proposera un jardin calme pour les employés. Du point de vue structurel, les dalles reposent les voiles de périphérie, ce qui permet de s'abstenir de poteaux et donc d'avoir une plus grande aisance dans l'organisation des rayons.

### [Médiathèque Robert Calmèjane, Villemoble \(Région parisienne\) – France 2004](#)

Ville de Villemoble, S.H.O.N 2.110 m<sup>2</sup>, € 5.500.000

The site for the new library in Villemoble is that of a defunct minor château of which, today, only the estate gardens remain in the form of a public park. The two main elements of the programme, four multi-purpose rooms for private hire and one multifunctional library, are separated from one another in order to reduce noise nuisance. This programmatic schism creates an architecture that appears volumetrically fragmented from the garden but is more unified from the street side. Schizophrenic, its urban face is an opaque linear screen composed of alternating panels of polished concrete and glass, evocative of stacked industrial containers. In contrast, its park face is completely transparent thanks to the open volumes of the reading rooms. The overall silhouette of the building is reminiscent of French mansions with their vast slate roofs. The presence of the new building in the park fills a historical emptiness and awakens the submerged memory of the bygone château. (<http://www.mimoo.eu>)

### [Médiathèque Ville de Bagnolet, Bagnolet – France 2002](#)

2.500 m<sup>2</sup>, € 2.000.000

Activité et type de locaux : accueil, salles de lecture enfants et adultes, salle de conte, bibliothèque, taritement intellectuel, traitement physique, salles polyvalentes

Le projet s'inscrit dans une opération de logements.

Le volume disponible bénéficie d'une hauteur de 7 mètres et s'ouvre largement sur les rues avoisinantes et un jardin intérieur. Nous avons exploité la forte linéarité de la parcelle en développant un axe majeur et la mise en place d'une passerelle centrale. Son volume en laqué rouge devient un objet flottant dans l'espace qui réfléchit la lumière et fait éclater sa couleur.

### [Médiathèque de Tarnos - France 2010](#)

Coût 3.725.000 €, Surface 1.600 m<sup>2</sup> Shon

Le projet pour la médiathèque de Tarnos s'inscrit dans le projet urbain du centre-ville. La topographie du site de la médiathèque est caractérisée par une cassure altimétrique Nord-Sud entre une "partie haute" le long de la rue principale de la ville, l'avenue J. Duclos, et une "partie basse" sur la rue du Fils. Un jardin public en partie haute du site, face au centre-ville, prolonge le parvis de la mairie récemment construite. Le projet propose d'étendre le jardin existant pour former toiture à la médiathèque et d'installer l'ensemble du programme sur un seul niveau en rez-de-chaussée le long de la rue du Fils. Une traversée publique est créée depuis le jardin et le centre-ville vers le parvis et l'entrée de la médiathèque, et permet d'accéder au parking public créé sous l'édifice. La médiathèque s'insère en douceur dans le site, sans entrer en concurrence avec l'édifice voisin de la mairie. Dans le jardin public agrandi et modelé, patios et verrières apportent la lumière naturelle au cœur de la médiathèque. (Brochet)

### Bibliothèque multimédia de Guéret – France 2010

Coût 6.800.000 € Surface 2.780 m<sup>2</sup> Shon

Implantée au coeur de la ville, au milieu d'équipements publics, la bibliothèque s'affirme comme une nouvelle image pour la ville de Guéret. Installée sur le site en fonction de la topographie existante (trois courbes de niveau et un bâtiment dans les arbres), la bibliothèque de Guéret définit un paysage architectural où les fonctions de lecture et d'animation s'implantent. Ces deux étages publics, installés sur pilotes au-dessus du parking jardin, sont deux plateaux aux formes souples reliées entre eux par un atrium, qui s'enveloppent dans une façade composite faite de panneaux verriers transparents, opaques ou opaques, en alternance selon l'orientation et l'ensoleillement qu'ils régulent. La porosité variable des panneaux qui composent l'enveloppe, permet de régler la perception de l'environnement intérieur de la bibliothèque. (Brochet)

### Médiathèque de Lormont 2007

Coût 7.450.000 €, Surface 8.000 m<sup>2</sup> Shon

La médiathèque s'installe dans le domaine du Bois fleuri, un parc arboré qui sépare le vieux bourg d'une cité HLM des années cinquante en cours de restructuration. Dans ce parc, une salle de sports datant de la même époque sert de lieu de culture provisoire et accueille concerts et animations. Le projet tente de faire le lien entre les deux quartiers : la médiathèque s'installe simplement sur le chemin qui la relie à travers le bois. En s'adossant à l'ancienne salle polyvalente, la médiathèque prend racine sur ce chemin ; à l'hypothèse de la démolition de cet équipement vétuste, nous avons préféré l'intégrer dans un ensemble qui renforce l'identité culturelle du lieu et respecte l'environnement naturel de qualité. Le chemin qui séparait autrefois les deux entités sera désormais un sentier urbain fréquenté, pour les activités quotidiennes de la salle de sport et de la bibliothèque. Les activités les plus vivantes, heure du conte, atelier informatique, espace pour les enfants, s'ouvrent en interne sur l'ancien chemin et renforcent son caractère vivant et accueillant. Le Bois fleuri n'est plus un obstacle, il devient un lien. La forme architecturale choisie indique l'abri simple et évident, ouvert à tous, sans ostentation, signe du lien social recherché. (Brochet)

### Médiathèque Narbonne - France 2003 – 2004

Coût 6.097.960 € Surface 5.000 m<sup>2</sup>

Au centre de la ville, dans un jardin public surplombant sur le canal, la médiathèque est une plaque béton qui d'un côté est posé en continuité du jardin et de l'autre est en porte-à-faux au-dessus du parvis et forme un belvédère sur le canal. Aménagées dans ce plateau unique, les salles de lecture s'organisent autour d'un atrium central dans lequel s'étend en pente douce une rampe escalier suspendue, qui accompagne le visiteur dans une déambulation à travers les espaces de la médiathèque et offre des vues plongeantes. Elles reçoivent la lumière par la façade sur le canal, à travers un double filtre vitré, en toiture par des sheds, et par des patios creusés dans l'épaisseur du volume. Au niveau du parvis d'entrée sont logées les salles d'activités publiques, avec au fond les réserves. Au dernier niveau, émerge la section musique. (Brochet)

### Médiathèque de Pessac – France 2000

Coût 4.116.000 €, Surface 4.500 m<sup>2</sup> Shon

#### **Littérature :**

**AMC Le Moniteur architecture : Une année d'architecture en France 2001, 121,2002**

C'est sur le site de l'ancien château viticole de Camponac que s'intègre la nouvelle médiathèque dans une logique de composition d'ensemble. En recherchant une certaine complémentarité, faite d'une multiplication de points de confrontations des formes et des matériaux (façades de verre teinté et d'acier, toiture plissée en zinc, sheds, verrières, volets en bois à persiennes), et en reprenant l'implantation, la volumétrie et le caractère industriel des bâtiments de vinification, l'extension contemporaine crée, dans un esprit de respect et de valorisation, une intelligence nouvelle du lieu en même temps qu'un nouvel usage au caractère public affirmé. (Brochet)

### Médiathèque de Kourou – France 2001

Coût 4.116.123 € Surface 5.000 m<sup>2</sup>

A l'entrée de Kourou, au bord du lac, la construction de la médiathèque et de la maison des associations établit une centralité en créant un point identifiable dans l'urbanisation incertaine de la ville. Les deux programmes sont regroupés autour d'un vaste parvis, sous un grand toit. Les techniques et les archétypes architecturaux sont mélangés, valorisant à la fois les savoir-faire locaux, traditionnels dans une logique de transposition contemporaine. Prenant en compte le climat tropical, le toit ondulé assure une ventilation naturelle en captant le vent par des ouïes, et les façades sont équipées d'un bardage en clins de bois ajouré et de persiennes à ventelles orientables en aluminium. Le bois local est utilisé en troncs naturels, bardages et claustras. (Brochet)

#### **Littérature:**

**Mialet, Frederic, Francis Rambert, Les vitrines de la 'modernité', in : D'architecture, 1995,53,1995,pp 22-25**

The Media Library of Toulouse is the symbolic building of the Marengo District urban renewal, a link between past and future, bordering the historic center's urban structure, protector of a modern space that builds up on the existing city's layers. The building

asserts the Jaurès-Jolimont main metropolitan axis, it punctuates it without interrupting its flow, it strengthens the perspective and enhances the architecture as an urban fact. It integrates through a unifying outer layer the complex and diverse program's several components. Two volumes, connected underground and in the sky, are framing the main axis. There are crowned by a belvedere-roof, which plays an exceptional role: from there, the city offers itself to one's stare. Alive day and night, the Marengo Gate becomes Wilson's square counterweight, in order to better revive the Jean Jaurès path. It's at said paths' end that the edifice rises from a lower level garden, opening itself toward it. The main axis crosses above the garden thanks to a footbridge that becomes a square, where meetings and distributions occur, the strong link and focal point between Place Carrée and the Jean Jaurès path. (Buffi)

Deux volumes reliés sous terre et dans le ciel se posent de part et d'autre de l'axe, transgressant la symétrie de la porte classique avec deux piles de largeur différentes. Les deux piles sont posées sur un socle vitré, accueillant l'espace jeunesse et les commerces. Pour une identification optimale, les niveaux publics de la médiathèque occupent l'aile Sud ; les commerces et les locaux de TLT, irrigués par la lumière du jardin, sont situés aux deux premiers niveaux de la pile Nord, en liaison avec la sortie du métro. Au-dessus, les locaux de l'INA se déploient sur deux niveaux. / Au bout des allées Jean-Jaurès, le bâtiment émerge d'un jardin en contrebas sur lequel il s'ouvre : l'axe traverse le jardin en passerelle pour se transformer en parvis, point de convergence, espace de distribution, lien entre la place carrée et les allées Jean-Jaurès. Ils sont couronnés par un toit belvédère qui offre une vue privilégiée sur la ville, dont les espaces de réception éclairés la nuit lancent un signal visible de loin. La terre cuite domine le traitement des façades, en écho à la forte identité de la cité. La façade principale est protégée par des pare-soleil, modules verticaux de hauteur variable, en éléments de terre cuite assemblés sur une ossature métallique. Réparties sur l'ensemble des trois façades principales, les immenses persiennes tamisent la lumière du jour, cadrent les vues sur la ville, elles magnifient l'assemblage inédit de la brique et du verre, tout en offrant aux visiteurs le spectacle de la vie urbaine. La "porte Marengo" est un monument, son architecture s'attache à exprimer l'institution. De loin, la médiathèque est un bâtiment énigmatique ; de près son fonctionnement intérieur se lit clairement : elle est en osmose avec le quartier Marengo, elle le fédère et en est le point de mire. (Séquences)

### **CHU – Centre Hospitalier Universitaire - Faculté de Médecine-Pharmacie, Rouen – France 1998**

Within a « chaotic » environment, the university appears as a unified equipment, a compact urban campus, an identifiable group within its components, simply and softly connected. The university is organized as a simple system of independent buildings, which confer an autonomy of realization and management to each of them. A single address is visible from the city: the square onto which are anchored the three most symbolic university buildings. The group of buildings, research & lecture theaters, frames in the background the Library. Those three buildings surrounding the square create a "call" that "responds" to the Chapel axis thus defining a powerful virtual connection between the hospital and the University. The square closed by those spaces forms the University antechamber, allowing the entrance's space "mise en scène" thus becoming a true public place. The three edifices are federated by the central building, heart of the group, which contains at once the lobby and the Library-Administrative Building: it lays at all flows' crossings. The main lobby opens opens with all its width, and through the entrance square, toward the city. (Buffi)

Réhabilitation d'anciens silos agricoles en médiathèque, maison du livre et de l'affiche de Chaumont  
Maîtrise d'ouvrage Ville de Chaumont. 4 700 m<sup>2</sup> SHON, 4,9 M€ HT

Built in 1935 and rehabilitated in 1994, Les Silos book and poster centre contains a media library and a centre for temporary exhibitions. It also supports the International Poster and Graphic Design Festival. The name is a reminder that the building was originally an agricultural cooperative, built in a design characteristic of 1930's architecture. The rehabilitation project allowed some of the old grain chutes to be kept. They run through the floors. Les Silo has a prestigious collection in its care, 5,000 late 19th-century posters from the Dutailly bequest, plus more than 15,000 contemporary posters and 450 manuscripts and very early books.

**XXème – France (2006) 2009 – 2016**

Maîtrise d'ouvrage: Ville de Paris - Nexity Apollonia (public-privé), Construction d'un ensemble immobilier composé d'une médiathèque (4300m<sup>2</sup>), d'une résidence de tourisme (170 chambres 6400m<sup>2</sup>), de 74 logements (7300m<sup>2</sup>), d'une salle de quartier (150m<sup>2</sup>) et d'un parking de 285 places.

La nouvelle médiathèque du 20e arrondissement, d'une superficie de 4200 m<sup>2</sup> sur trois niveaux, propose entre autres spécificités des ressources documentaires liées à l'histoire du 20e, une importante offre multimédia ainsi qu'un espace enfants disposé autour d'un patio intérieur. « Le dénivelé du coteau participe à la magie du lieu, il a constitué un élément fondamental de la conception du programme immobilier de la rue de Bagnolet car nous avons voulu que celui-ci soit en rapport avec les éléments existants du quartier » explique MICHAËL GREGORI du cabinet d'architecture ROLAND CASTRO. La médiathèque, installée en retrait de la rue de Bagnolet, rappelle le parvis de l'église Saint-Blaise toute proche. Un escalier s'inspirant de l'escalier Stendhal conduit les piétons de la rue Lucien Leuwen à la rue de Bagnolet. Dans la continuité, la rue Florian poursuit la descente dans Saint-Blaise. Les espaces accessibles au public du site culturel sont éclairés par la lumière naturelle, à l'exception de l'auditorium et de l'espace audiovisuel. Les façades sont largement vitrées, effet d'ouverture amplifié par d'importantes hauteurs sous plafond. Des jardins composés d'érables, d'arbres de Judée, de platanes, de juncs et de graminées ont été prévus pour prolonger les sols et apporter fraîcheur et ombre. (<http://www.pps-archi.eu>)

**Complex Médiathèque, Auditorium, Commissariat et Maison de l'emploi, Commune de Carros, Alpes Maritime – France 2000 - 2003**

Maîtrise d'ouvrage : Commune de CARROS, Surfaces 2.894 m<sup>2</sup>

La façade urbaine à la fois ouverte, fait se retrouver les deux parties de la ville. Fermée, elle tient un alignement urbain qui permet de requalifier l'ensemble de la rue d'Argillac, elle associe fortement le bâtiment dans la ville, en alliant caractère et convivialité. Elle permet un développement, un épaississement du centre. Le déploiement du bâtiment dans le vallon, figure plus majestueuse, épaisse et composite, amorce un dialogue entre celui-ci et la ville qui le domine, dans un esprit de fortification, en établissant un lien tranché mais bienveillant avec la nature luxuriante du vallon. Nous retrouvons dans cette façade imposante comme une "mémoire" des lignes des fortification, et la révélation d'une identité. Une ligne urbaine sur la rue, une façade plus dense et éclatée vers le vallon, le tout dans un jeu savant d'ombres et de lumière joue et jouit du climat méditerranéen en domestiquant sa luminosité à sa chaleur. Le ton de l'ensemble est donné d'une part par la cohérence d'usage et d'organisation et d'autre part par des partis visibles de modénature, de traitement qui se trouve pour toutes les façades du bâtiment. C'est à la fois contextuel et esthétiquement de parti pris. (Castro)

**CDDR Architecture, Marseille – France**

**Inter-Universitaire Library, Marseille – France 2014**

Contract Owner: City of Marseille, Mission: Construction of the inter-university library and reunification of laboratories in public and health economics, NET Floor Area 6 483 m<sup>2</sup>, Cost: 12 M€ Phase: Competition december 2006

There is a massive wall between two worlds. On the one hand the researchers the other the students. In this wall, there are breakthroughs in which the two worlds meet. Eyes that give to see and that inform each other. The wall leads thought, look, the steps towards a whole. Unconsciously, every one of his side takes the other to meet, exchange. One follows the thread, the other is drawn into the wide mouth of knowledge. At the end of the road, the meeting takes place in space open and transparent of the library. Some feed on the other, communion takes place. Then everyone leaves to his world for share the new wealth with his tribe. The massive wall accompanies them. By the breakthroughs, both look at each other and think it could be the other. (CDDR)

### **Libraries:**

#### **Médiathèque St. Pierre en Faucigny (Dep. Haut Savoie, Reg. Rhône-Alpes) – France 2008**

500 m<sup>2</sup>, € 1.100.000

Un projet intégré dans son environnement : Le projet s'implante sur une parcelle triangulaire, en périphérie du centre bourg, à proximité des groupes scolaires existants. Il prend en compte l'ensemble des contraintes et tire parti des qualités du site. Au Nord, les espaces de consultation bénéficient d'un environnement calme, d'un contact visuel fort avec l'environnement et d'une lumière naturelle douce et homogène. Pour leur part, les secteurs plus animés (heure de conte, salle de travail en groupes) sont orientés au Sud et profitent des rayons du soleil d'hiver (protection solaire extérieure pour l'été). Bien que la Bibliothèque soit identifiée clairement par une volumétrie forte, le bâtiment (de plein pied) reste à l'échelle du site et de l'environnement bâti dans lequel il s'intègre. L'accès principal, depuis le parvis sur la façade Ouest, est signalé et abrité par un large auvent.

Fonctionnalités internes : - Le hall d'accueil et d'information, « centre névralgique » de l'équipement, est situé au centre du bâtiment. L'accueil, point de convergence et de communication, met en relation les différentes entités fonctionnelles de la Bibliothèque. - Les secteurs audiothèques, adultes et jeunes sont directement accessibles depuis l'entrée et éclairés par un bandeau vitré en façade Nord. La géométrie de la toiture offre un volume généreux et en rapport avec la surface de l'espace principal, et permet d'amener la lumière naturelle jusqu'au fond du bâtiment par un bandeau vitré sud protégé d'étagères à lumière. Des puits de lumières à structure tubulaire éclairent naturellement l'accueil et l'entrée. - Au Sud, la salle de travail et l'heure du conte se partagent des surfaces modulables et isolables. (Chabal)

#### **Médiathèque La Passerelle, Bourg lès Valence (Dep. Drôme, Reg. Rhône-Alpes) – France 2007**

1.853 m<sup>2</sup>, € 2.800.000

Un projet intégré dans son environnement: Les façades Est et Sud respectent l'alignement donné par le plan d'urbanisme de Bourg-lès-Valence. À l'Ouest et au Sud, le bâtiment se protège des nuisances sonores (voie SNCF, autoroute, voie nouvelle) par des façades relativement fermées. Quant à elle très ouverte, la façade Nord se déroule comme un ruban vitré sur le Jardin en cœur d'îlot. Trois grandes lucarnes en cuivre cadrent des vues plongeantes sur le jardin et canalisent la lumière naturelle au centre de la Médiathèque. La volumétrie assez basse du bâtiment préserve la vue depuis le parvis, sur les crêtes de l'Ardèche. Le confort des utilisateurs, objectif prioritaire du projet : Les locaux nécessitant une ambiance calme sont systématiquement orientés vers le jardin et le parvis. En particulier, les espaces de consultation, avec vue sur le jardin, sont tournés au Nord et bénéficient d'une lumière homogène.

L'enveloppe "lourde" du bâtiment assure une bonne inertie thermique et un bon confort d'été. Chacune des ouvertures est, suivant son orientation, protégée du rayonnement solaire par des dispositifs appropriés. Les ambiances sonores intérieures sont contrôlées et des isolements renforcés sont prévus dans les salles sensibles. Un plancher chauffant réversible (rafraîchissement en été par circulation de l'eau de la nappe phréatique) est prévue sur les deux niveaux. (Chabal)

#### **Médiathèque, Pôle Animation et Maison de Quartier, Besançon – France 2007**

2.950 m<sup>2</sup>, € 3.500.000

Le site est fortement marqué architecturalement par un développement urbain caractéristique des grands ensembles. L'actuelle Bibliothèque des Jeunes est à l'articulation de l'avenue Ile de France, très passante, et d'espaces libres au cœur des immeubles d'habitations de Planoise. Nous avons choisi de conserver la médiathèque en vitrine sur la ville et d'orienter les salles d'activités de la maison de quartier sur l'Esplanade en belvédère sur le Parc. Le futur Pôle Animation, bien que fortement identifiable, reste cependant à l'échelle humaine (R+1). Il se développe en longueur et accompagne les cheminements piétons depuis l'Avenue vers l'Esplanade et s'ouvre sur le parc. Le nouvel équipement s'inscrit dans la morphologie du parc en se posant sur le talus existant. Il compose l'arrière plan, dirige le regard le long de la façade courbe vers l'esplanade qui offre un prolongement extérieur aux activités du pôle animation. L'esplanade ainsi requalifiée constitue désormais un nouvel espace de rencontre. Le projet est résolument tourné vers l'extérieur. Les façades, largement vitrées, mettent en interaction les activités du Pôle Animation avec son environnement et lui confèrent un rôle de signal sur l'avenue Ile de France. L'organisation fonctionnelle de l'établissement est très lisible. En rez de bâtiment, une galerie couverte dessert les différentes entrées, accompagne et accueille le passant. Un hall traversant, garantissant transparence et lisibilité des accès publics, distribue les différentes fonctions de l'établissement. (Chabal)

#### **Médiathèque & Logements à Grenoble – France 2006**

692 m<sup>2</sup>, € 2.140.000

#### **Bibliothèque Campus de la Doua, Université Claude-Bernard Lyon 1, Villeurbanne, Lyon – France 2003**

3.840 m<sup>2</sup> façade, € 2.060.000

Le bâtiment, conçu dans les années 60 par le cabinet Perrin-Fayolle, est de types "poteaux-poutres" à ossature béton. Ses façades étaient constituées de mur-rideaux reliés par des butons en aluminium à une série d'épines béton, elles-mêmes solidaires de la structure. Cette fermeture vitrée, fortement dégradée était devenue dangereuse. La position stratégique du bâtiment, très en vue, imposait une valorisation de son architecture fortement inspirée du modernisme japonais de Kenzo Tange. Un retrait de 80cm des façades vitrées a été mis en œuvre, renforçant l'effet de "double-peau" et offrant un double avantage: mieux abriter du soleil les surfaces vitrées et minimiser les coûts liés à l'entretien (mise en place d'une galerie technique extérieure pour le nettoyage). En complément, des brises-soleil en béton de fibre (DUCTAL de LAFARGE) ont été installés, rythmant la façade tout en renforçant les horizontales, minimisant l'effet de serre tout en ventilant les vitrages, filtrant et homogénéisant l'éclairage, ils ont ici un deuxième rôle "d'étagères à lumière", renvoyant le rayonnement solaire vers un faux plafond diffusant, les besoins en éclairage artificiel sont ainsi minimisés. En parallèle, des vitrages alliant contrôle solaire, isolation thermique renforcée, ainsi que des caractéristiques de transmission lumineuse élevées ont été mis en œuvre (double vitrage SAINT-GOBIN, feuilleté 1 face 44/2+12+6, FS=63, K=1.9, TL=72). Les allèges ont également été abaissées afin de dégager les vues sur le campus et d'augmenter la surface vitrée et l'apport lumineux. (Chabal)

#### **Bibliothèque Teissere, Grenoble – France 1999**

400 m<sup>2</sup>, € 129.000

Reconversion du rez-de-chaussée de l'école élémentaire Paul Cocat en bibliothèque de quartier. (Chabal)

## **Chabanne & Partenaires (Jean Chabanne), Paris – France**

<http://www.chabanne-architecte.fr>

**Libraries :**

### **Médiathèque Cretail - France 2011**

Construction d'une médiathèque comprenant un auditorium, un espace fiction, un espace art/musique/littérature, un espace documentaire/formation/multimédia, des espaces logistique, technique et administratif et un parking de 120 places. Le volume de la médiathèque est simple, compact et de faible hauteur. Il est conçu pour être au plus près de ses usagers.

Le cheminement à travers les espaces de la médiathèque se fait par un large escalier, puits de lumière en partie centrale qui inonde le cœur de tous les étages. Sa montée courbe et douce incite à découvrir chaque espace de consultation dans lesquels des objets, de formes et de couleurs différentes, abritant des espaces d'intimité, sont mis en scène.

La proximité des différents espaces les uns avec les autres est rendue possible par la disposition des plateaux de lecture en quinconce. Les façades de la médiathèque sont constituées d'un rideau en fibrociment dont la structure arborescente tantôt transparente, tantôt pleine ou translucide permet de suggérer l'activité qui s'y déroule. Celle-ci est mise en scène, elle suscite la curiosité, l'étonnement, l'émotion.

La cinquième façade est conçue comme un authentique jardin suspendu offert au regard des habitants des bâtiments voisins, elle s'organise comme un véritable présentoir d'œuvre d'art. (<http://www.architop.lemoniteur.fr>)

### **Médiathèque Centrale Colette, Epinay sur Seine – France 2011**

Superficie du PROJET 2.716 m<sup>2</sup> SHON, € 6.700.000

#### **Développement**

Plaine Commune a confié à la SEM Plaine Commune Développement un mandat de délégation de maîtrise d'ouvrage pour la construction d'une médiathèque

#### **Programme**

Réalisation d'une médiathèque s'insérant partiellement dans le rez-de-chaussée d'un immeuble d'habitation R+5 appartenant à l'OPDHLM 93.

Le programme prévoit l'organisation des services en pôles de consultation thématique, une salle d'animation de 100 places, un espace d'exposition et les services internes nécessaires à son fonctionnement.

#### **Spécificité du projet**

Réalisation du cône du savoir, traversant les espaces intérieurs de la médiathèque dédié aux activités de projections, conte, animation...

Réalisation d'une charpente métallique permettant d'alléger l'impact du bâtiment sur les niveaux inférieurs de parking.

(<http://www.semplaine.fr>)

A EPINAY, le chantier de la médiathèque débutera dans le courant du mois de janvier mais la place René-Clerc, qui arbore une affiche du projet, s'est déjà préparée à son arrivée avec le récent déplacement du monument aux morts. Car le futur équipement culturel, qui ouvrira ses portes fin 2010 en plein centre-ville, ne passera pas inaperçu. Son architecture futuriste est signée par l'agence parisienne Chabannes et Partenaires.

D'une surface de 3 000m<sup>2</sup> sur deux étages, le bâtiment sera conçu sur le principe d'une armature métallique supportant des façades entièrement vitrées. Ce cube de verre sera transpercé de bas en haut par un cône rouge géant, « le cône du savoir », qui accueillera un auditorium d'une cinquantaine de places et une salle de contes.

«L'accent mis sur les nouveaux supports technologiques »

Une deuxième façade, sorte de « seconde peau » en fine résille métallique sera chargée, explique la ville, de « tamiser les échanges lumineux entre l'intérieur et l'extérieur. Elle favorisera une diffusion douce de la lumière garantissant aux usagers une ambiance plus intime ». Le budget s'élève à 12 millions d'euros, financés par la ville avec des subventions du conseil général, de la région, de l'Agence nationale de la rénovation urbaine (Anru) et de la Direction régionale des affaires culturelles.

(<http://www.leparisien.fr/epinay-sur-seine-93800/bientot-une-mediatheque-dans-le-centre-ville-10-12-2008-337348.php>)

### **Médiathèque et Salle de Spectacles Rumilly – France 2009**

Maîtrise d'ouvrage : Ville de Rumilly, Maîtrise d'œuvre : Chabanne & Partenaires architectes et M.Praz, architecte associé

Surface S.H.O.N. totale : 3.243 m<sup>2</sup>, Coût des travaux : 8.4 M€ h.t., Concours en mars 2006, Durée des études 12 mois, Durée du chantier 18 mois

Une nouvelle médiathèque et salle de spectacles vient de prendre place à Rumilly. Baptisé «Quai des Arts», l'équipement réalisé par l'agence Chabanne & Partenaires et Michel Praz, se veut moderne et contemporain à travers ses deux volumes.

Le bâtiment «médiathèque» dispose d'une double peau vitrée imprimée d'arbres sérigraphiés qui permet de distinguer la vie du bâtiment et d'apporter de la lumière naturelle. Cette double peau fait partie du «dispositif technique de rafraîchissement à réaction humaine».

Pour les architectes, «la façade double peau agit comme un aspirateur thermique à convection : l'air frais pris à l'opposé, le long de la façade Est, traverse le bâtiment via de petites portes équipées de grilles attenantes aux portes traditionnelles des différents bureaux, que chaque utilisateur peut activer à sa guise». (<http://www.baticatu.com>)

### **Bibliothèque multimédia Epinal-Golbey – France 2008**

La bmi, bibliothèque multimédia intercommunale d'Épinal-Golbey, ouvrira ses portes au public en 2008, dotant la Lorraine d'un nouvel établissement de lecture publique, affichant à l'entrée du chef-lieu des Vosges un espace contemporain, alliance de la littérature et de l'image, affirmant la nécessité de ce lieu de liberté qu'est la bibliothèque pour les habitants d'Épinal et de son territoire.

Cette bibliothèque est la conjugaison de la volonté politique, du geste architectural et du programme fonctionnel. Lauréate du concours d'architectes organisé en 2005, l'agence lyonnaise Jean Chabanne & partenaires a œuvré en étroite concertation avec la maîtrise d'ouvrage pour créer un espace public fédérateur et structurant, signal fort dans ce quartier situé à proximité immédiate du centre-ville. La bibliothèque s'installera sur une friche industrielle faisant l'objet d'une requalification urbaine, dans un environnement conciliant le loisir et la mémoire – le parc du château – et le propos culturel – la bibliothèque et le multiplexe cinématographique. Il s'agit bien d'un signal à la monumentalité maîtrisée, au sens architectural comme dans l'organisation des espaces intérieurs.

Le parti pris architectural est un volume unitaire et sculptural, entaillé et fracturé selon des traces obliques ; ce sont les failles, ces lignes qui vont encadrer la salle des boiseries et guider le visiteur – nous ne parlerons pas encore de lecteurs puisque la première visite est souvent motivée par la curiosité... À cette vision unitaire de l'architecture répond une vision unitaire du public, pris en considération dans toutes ses composantes. La bmi, lieu de rencontres possibles. (<http://www.bbf.enssib.fr>)

### **Bibliothèque Universitaire Reims – France 2006**

Le premier exemple aujourd'hui achevé de bibliothèque HQE (haute qualité environnementale) est la bibliothèque universitaire Robert-de-Sorbon, à Reims. Réalisée par les ateliers d'architecture Chabanne à Lyon et BLP à Reims, elle a ouvert au public en septembre 2006. Les cibles HQE retenues ont été un chantier propre, la gestion de l'eau et de l'énergie, le confort acoustique, hygrométrique, visuel et la qualité de l'eau. Les objectifs limitaient la consommation d'énergie pour le chauffage à 25 kW/h par m<sup>2</sup> et prescrivaient une température inférieure à 27 degrés, sans nécessiter de climatisation. Un premier retour d'expérience, en mars 2008, montre une consommation d'énergie pour le chauffage de 60 kW/h par m<sup>2</sup>, ce qui est à la fois supérieur aux objectifs, mais déjà quatre fois inférieur à la moyenne constatée dans les bâtiments existant en 2007.

Une autre bibliothèque HQE a été construite en 2006 à l'université du Havre, par l'architecte René Dottelonde. Une bibliothèque HQE est également en construction à Versailles, par les architectes Marie-Hélène Badia et Didier Berger. Elle doit ouvrir en 2010. Les bibliothécaires n'en n'ont donc pas fini avec la culture des chiffres. Mais aux m<sup>2</sup> par habitant pour une bibliothèque publique, il faudra ajouter les kW/h par m<sup>2</sup> pour tout type de bibliothèque.

Bien sûr, il n'est pas nécessaire d'avoir un bâtiment neuf ou rénové pour commencer à avoir une attitude éco-responsable, par exemple éteindre les ordinateurs pendant la nuit !

Un mot enfin sur le wifi. Cette technologie donnant accès à internet sans fil est très prisée dans les bibliothèques, universitaires d'abord, mais aussi publiques. Elle présente l'avantage d'un déploiement rapide pour un coût relativement faible. L'impact des ondes wifi sur la santé fait cependant l'objet d'une controverse, qui a notamment interrompu sa mise en œuvre dans quatre bibliothèques de la ville de Paris. Il n'est donc pas impossible que dans quelques années, la diffusion d'ondes wifi soit plus sévèrement encadrée et qu'on en revienne à proposer des prises réseau à côté des prises de courant sur les tables équipées pour les ordinateurs portables. (<http://www.bbf.enssib.fr>)

### **Philippe Challes Architectes, Paris - France**

<http://www.philippechalles.eu>

**Libraries :**

#### **Bibliothèque Universitaire Université Damigny-Alençon, Damigny – France 2003 – 2006**

Programme : Service administratif et d'indexation, salle de lecture, salles de groupes, Maître d'ouvrage : Département de l'Orne

Adresse : Campus de Montfouillon 61250 Damigny, Montant des travaux : 1,4 M€ HT, Surface HON : 1 130 m<sup>2</sup>, Calendrier :

Livraison septembre 2006

La bibliothèque est conçue comme un volume unitaire dans lequel s'organisent les espaces fonctionnels. L'enveloppe épaisse en béton gris anthracite sablée constitue les murs et les toitures, variant les hauteurs des locaux, créant deux grandes « fenêtres » au nord et au sud. Traitées comme des vitraux, elles permettent de moduler la lumière en fonction des opacités du vitrage. (Calles)

### **Libraries :**

**Médiathèque Illkirch-Graffenstaden (Strasbourg) (Dep. Bas-Rhin, Reg. Elsass) – France 2006**

SHON 4.152 m<sup>2</sup>, € 8.070.000

En climat strasbourgeois, froid l'hiver et chaud l'été, la stratégie climatique est donc double, triple si l'on compte également la préoccupation d'éclairage naturel. L'isolation, la récupération des apports par des sheds et la ventilation double flux avec récupération de chaleur répondent à la stratégie d'hiver. Pour ce qui est de l'été, des protections solaires efficaces sur tous les locaux, et une surventilation nocturne forcée permettent le confort avec simplement un plancher rafraîchissant dans les bureaux et en mezzanine haute de la salle de consultation. (<http://www.tribu-concevoirdurable.fr>)

**Sceaux (Dep. Hauts-de-Seine, Reg. Île-de-France) – Faculté de Droit Jean Monnet (Bibliothèque Universitaire) – France 1997**

SHON 8.000 m<sup>2</sup>, € 12.200.000

Simple et lisible, l'implantation de la nouvelle faculté de droit tire parti du fort dénivelé, et règle avec habileté la disparité des fonctions universitaires, amphithéâtres, restaurant, bibliothèque. Prolongeant l'esprit du campus de l'ancienne faculté, Pascale Guédot et Olivier Chaslin ont alloué un volume distinct à chaque fonction, en rapprochant suffisamment les bâtiments pour créer entre eux une relation de proximité et des intervalles qui promettent de bons moments de soleil. (Le Moniteur,4868,14.03.97) (<http://www.services.lemoniteur.fr>)

**Médiathèque Départementale, Labège – France 2007 – 2012**

Lieu : Labège, Programme : Equipements publics, Superficie : 8 160 m<sup>2</sup>, Coût des travaux : 12,7 M€ HT, Maîtrise d'ouvrage : Conseil Général de la Haute Garonne

La nouvelle médiathèque départementale de prêt est implantée au coeur de la ZAC Innopôle de Labège. Le bâtiment présente un volume et un périmètre simples dans une grande équerre végétale. Son plan permet de gérer au plus près le circuit des livres et de minimiser les distances fonctionnelles. L'entrée publique occupe l'angle Nord de l'édifi ce ouvert sur l'accès au site. La plateforme fonctionnelle des bibliobus est placée à l'opposé de l'entrée, sur le même niveau en rez-de-chaussée. Le programme s'organise sur les trois niveaux du bâtiment. Les deux niveaux inférieurs, offrant de grands plateaux libres reçoivent l'accueil, l'exposition, la mise à disposition et le stockage des documents à l'usage des bibliothécaires départementaux. Le niveau R+2, ouvert sur le paysage par une courbe continue, regroupe les fonctions de traitement des documents, d'animation, de formation et d'administration. En plus de la lumière qu'il reçoit par le large percement des façades, le bâtiment s'ouvre sur le ciel par deux verrières et un patio qui éclairent les espaces de la zone centrale. Ces dispositifs permettent de ménager à l'intérieur du bâtiment, des profondeurs de vue, des surplombs, des perspectives, qui favorisent l'échange et la communication entre les différents niveaux. L'enveloppe générale du bâtiment est réalisée dans son unité de volume et de matière en béton clair soigneusement mis en œuvre pour sa belle et simple qualité de parement, par des trumeaux verticaux, dont les positions en décalage et en brise-soleil font jouer les ombres et les profondeurs des façades. Les pignons sont plus ouverts et traités en fonction de leur exposition. La couverture est en zinc naturel. (Chemetov)

**Bibliothèque municipale L'Apostrophe, Chartres – France 2004 – 2007**

L'ancien Hôtel des Postes, situé au coeur de la ville de Chartres, a été construit par l'architecte chartrain Raoul Brandon

(\* 24.03.1878 Lucé – Eure-et-Loir + 04.12.1941 Assay – Indre-et-Loire) entre 1923 et 1928. Il fait face aux flèches de la cathédrale et allie les styles de l'Art Nouveau, de l'Art Déco et de l'Eclectisme.

La Ville de Chartres a décidé de le transformer en médiathèque. Elle en a confié la maîtrise d'oeuvre à INGÉROP en partenariat avec Paul Chemetov, architecte mandataire du groupement composé également de l'atelier d'architecture Archi 5, l'atelier d'études en construction et urbanisme C+H+ et de l'acousticien Sam Baruch.

De ce bâtiment, inscrit à l'inventaire des monuments historiques pour sa façade et sa couverture, le projet n'a conservé que l'enveloppe. Il y a intégré l'ensemble des espaces de lecture, de consultations, de conférence et de services, répondant à la fonctionnalité d'une médiathèque du 21<sup>ème</sup> siècle. L'ensemble représente une surface de 6 500 m<sup>2</sup> répartie sur 7 niveaux.

L'un des points forts du projet a été d'insérer dans sa toiture néo-classique un pan complet de verrière ouvrant face à la cathédrale l'espace de lecture dévolu à la littérature. (<http://www.ingerop.fr/actualites-dossier-mois-331.html>)

**Médiathèque du Val d'Europe, Serris – France 2000 – 2006**

Programme : Equipements publics, Superficie : 3 650 m<sup>2</sup> SHON, Coût des travaux : 6,25 M€ HT , Maîtrise d'ouvrage : SAN des Portes de la Brie

Les Echos n° 19189 du 29 Juin 2004 • page 19

La médiathèque du Val d'Europe située sur la commune de Serris, dans la ville nouvelle de Marne-la-Vallée, devrait ouvrir ses portes en 2006, après un chantier de dix-huit mois et une phase d'installation du mobilier et des collections de douze mois. Le coût de l'investissement, financé essentiellement par le syndicat d'agglomération nouvelle du Val d'Europe, s'élève à plus de 7 millions d'euros, dont 2 millions de subventions de la région Ile-de-France et 1,21 million de l'Etat. Le projet du cabinet Paul Chemetov & Borja Huidobro a été retenu. La médiathèque (3.650 m<sup>2</sup> de SHON) comportera deux bâtiments vitrés de trois étages et une verrière sur cour. Pour contrôler lumière et température, un paravent de pierre de faible épaisseur sera suspendu dans une résine d'acier, devant la paroi vitrée.

Deux volumes, l'un haut et rectiligne, l'autre bas et courbe, viennent chercher le dialogue. Une belle coque de bois émerge des douves comme un navire à quai et des baguettes laissant goutter l'eau pluviale viennent souligner le dessin de la façade. La coque n'est pas vraiment opaque, elle laisse pénétrer la lumière dans les salles de lecture. Une faille lumineuse éclaire ce bâtiment qui ne manque pas d'épaisseur, autant la structure est toute bête (poteaux en métal et planchers béton), autant son aménagement respire l'intelligence. Légèrement évasé, le bâtiment offre des plateaux de plus en plus grands au fur et à mesure que l'on monte les étages. A l'intérieur du bâtiment, le cadrage est subtil : on ne voit que les toits et la cathédrale. La médiocrité environnante est comme gommée par ce beau deck de bois. Sous la toiture cintrée, l'administration respire. Eclairées par des lucarnes modernes, les salles petites et grandes se succèdent dans une ambiance de bois raffinée. Médiathèque d'Evreux, aménagement des espaces extérieurs, création du mobilier spécifique. (<http://www.archicontemporain.org>)

#### **Libraries :**

### **Université des Troisième Millénaire, Université 7 Denis Diderot, UFR des Sciences de la Vie, Paris – France 2007**

L'UFR accueille les enseignements des 1er et 2ème cycles des Sciences de la Nature et de la Vie, une bibliothèque et des laboratoires de recherche ainsi que les services administratifs, la bibliothèque et les laboratoires de l'institut Jacques Monod. Y sont également programmés des locaux commerciaux SHON 20 000m<sup>2</sup>. Les architectes ont été retenus en raison de leur réponse exacte au vœu « d'îlot ouvert » principe d'aménagement urbain appliqué par Christian de Portzamparc pour l'aménagement du quartier Masséna. Le découpage des plateaux de laboratoires en « quartiers » a suscité l'adhésion unanime des chercheurs. La structure associe le béton poli et le cuivre prépatiné. L'institut Jacques Monod occupe un bâtiment autonome. Le socle différencie les accès aux unités et services.

### **Médiathèque Champollion, Grésilles, Dijon – France 2007**

Ouverte depuis le 15 septembre, la médiathèque Champollion à Dijon entend être un événement culturel et urbain. Signé François Chochon et Laurent Pierre, le bâtiment est un bel objet architectural bâti autour d'un petit jardin intérieur par de larges baies vitrées. Première bibliothèque construite depuis vingt ans dans la capitale bourguignonne, cet équipement de 2 500 m<sup>2</sup> entend aussi symboliser la mutation du quartier "sensible" des Grésilles, 8 500 habitants. Il fait l'objet d'une opération de renouvellement urbain dont le coût, en partie financé par l'Agence nationale de renouvellement urbain (Anru), est estimé à 105 millions d'euros.

## **Pierre Colboc, Paris – France**

<http://archiguide.free.fr>

### **Libraries :**

#### **Médiathèque Louise Labé, Ciné Lumière, pôle jeunesse, Saint Etienne – France 1994 – 1999**

Les maîtres d'oeuvre ont été Pierre Colboc et Giovanna Piraina, architectes à Paris, assistés de Dominique Berger et Denis Bergmann.

Le bâtiment, posé sur un socle, est composé de deux pavillons rectangulaires de 25 mètres de large (un pour la médiathèque et un pour le cinéma) couverts d'une terrasse accessible au public. Une verrière entre les deux pavillons, au niveau du hall et de l'accueil, donne un éclairage naturel complété par celui dispensé par une verrière perpendiculaire pour les zones de prêt. La façade est entièrement vitrée avec une ossature en béton apparent.

A l'entrée, marquée par un immense auvent métallique, est visible une colonnade sur un plan d'eau avec plantes aquatiques. A l'intérieur, le béton est omniprésent, ce qui donne une solennité au bâtiment. Les liaisons horizontales et verticales sont soulignées par des couleurs pastel. Sol et mobilier sont en bois, ce qui contribue à donner le sentiment de l'harmonie des lieux.

La discothèque, l'auditorium, la vidéothèque, l'arthothèque sont situés au rez-de-chaussée, alors qu'au premier étage, on trouve les services internes, les espaces jeunesse ainsi qu'un espace public fonds ancien qu'on trouve rarement dans une bibliothèque de ville moyenne.

#### **Bibliothèque Universitaire, centre universitaire Condorcet, Le Creusot – France 1998**

Réhabilitation halle des grues et locomotives (1848)

La bibliothèque universitaire du Creusot surprend par son architecture particulière. En effet, avant de devenir le lieu que l'on connaît aujourd'hui, le bâtiment était une halle aux grues et aux locomotives au milieu du XIX<sup>e</sup> siècle. C'était même le premier atelier de construction de locomotives en France. En 1976, le bâtiment est inscrit à l'inventaire supplémentaire des monuments historiques.

En 1991, un projet de réhabilitation voit le jour. L'architecte Pierre Colboc prend en charge les travaux qui débutent à la fin de l'année 1996. La bibliothèque universitaire ouvrira ses portes en octobre 1998.

Étendue sur 1 300 m<sup>2</sup>, la bibliothèque universitaire a gardé quelques éléments de l'architecture de l'usine d'antan : poutrelles métalliques, crochets et treuils de levage de grues et briquettes rouges sur les façades extérieures. À l'intérieur, deux mezzanines surplombent le hall. Grâce aux nombreuses baies vitrées, le bâtiment jouit d'une très bonne luminosité. Un lieu idéal pour s'aérer l'esprit. Opération HQE (Cibles 1; 4; 8 et 10)

RT 2005

Utilisation de matériaux certifiés

Traitement d'air par des centrales à double flux avec récupérateurs de chaleur

Chantier à faibles nuisances

Une médiathèque est un point culminant dans la ville. Individualité et partage, découverte et apprentissage, échange et contemplation. Une médiathèque est un lieu urbain, un nœud dans la ville, un centre de vie commune, la matérialisation d'une culture partagée. Une médiathèque est aussi un lieu d'aventure. On y découvre des histoires : la nôtre, celles des autres, des histoires fantastiques. Les histoires y sont écrites, racontées, montrées en images, chantées dans les musiques du monde. La médiathèque est un lieu précis où l'on trouve une information particulière, elle est un lieu magique où l'on tombe sur les contes de fées inespérés. Elle est un lieu léger où l'on s'évade sur les promenades à travers le monde dans lequel nous vivons. Comme les vases en terre cuite protégeaient les premiers parchemins, la médiathèque contient notre univers. La médiathèque de Montauban cherche à être ce lieu aux multiples facettes. Elle s'installe sur un site particulier, emblématique du développement d'une ville. Ce site se trouve au centre d'un croisement de cheminements divers. Rotule entre le quartier Est restructuré et les quartiers Sud, signal d'entrée de la ville, point fort à la porte du quartier, la médiathèque doit assumer un rôle moteur à l'échelle urbaine et à l'échelle de ce site exceptionnel. Le projet proposé retrace les principaux axes du quartier et de la ville, qu'ils matérialisent dans sa volumétrie. A l'extérieur, le bâtiment réagit aux directions signifiantes. A l'intérieur, l'utilisateur se repère à travers les vues caractéristiques sur l'environnement urbain. – Il se repère facilement dans le bâtiment et se positionne par rapport à la ville. Il s'intègre clairement dans son contexte environnemental et régional grâce à sa matérialité : la terre. La terre, matériau essentiel, matériau archaïque, ancré dans la tradition architecturale et celle de la conservation du savoir, elle se décline sur la médiathèque dans toutes ses variantes : murs épais protégeant du bruit et de la chaleur et garantissant un confort maximal, claustras en terre cuite, briques de terre, de terre cuite, panneau de terre sur support de paille. (cfa)

#### **Centre Social de Arbrisseau, Lille – France 2011**

Montant des travaux : 4 076 000 € HT, SHON : 1 774 m<sup>2</sup>, Maîtrise d'oeuvre : Architectes mandataire > CFA, Chef de projet > Arnaud Sachet, Equipe > Ulrich Faudry, Malik Hammadi, Kerstin Heller, Bruno Sarles, Emmanuel Villoutreix, Lena Weis  
Mission > base et études d'exécution partielles, Bureau d'études techniques > Fluides et HQE : INEX - Structure : C&E Ingénierie - Économie : Bureau Michel Forgue - Acoustique : Jean-Paul Lamoureux - OPC : Philippe Bauer Programmation, Début des études : projet lauréat, octobre 2007, Date de livraison : juin 2011

#### Programme :

RDC : Hall, Protection Maternelle et Infantile, Multi accueil, jardin  
R+1 : Centre de Loisirs Sans Hébergement Maternel, Espace 6-12 ans, terrasse  
R+2 : Espace 12-16 ans, salle polyvalente, Espace adultes, terrasse  
R+3 : Administration, Logement de fonction, terrasse belvédère  
R-1 : Locaux techniques + 8 places de stationnement  
Développement durable  
Préfabrication des éléments en atelier Raccordement au chauffage urbain

L'isolation par l'extérieur est renforcée : les parois opaques comme les menuiseries ont des coefficients de déperditions en moyennes 50% inférieure à la référence, l'inertie thermique est garantie par les dalles et le noyau en béton armé Menuiserie à rupture de pont thermique, vitrage haute performance. 1/3 des surfaces vitrées est ouvrant afin de garantir le confort d'été  
Gestion des eaux de pluie: optimisation des zones d'absorption, rétention et réutilisation de l'eau de pluie  
Utilisation de matériaux certifiés  
Traitement d'air par des centrales à double flux avec récupérateurs de chaleur  
L'air neuf est préchauffé par un puits canadien  
Panneaux photovoltaïques en toiture  
Dispositif de suivi des performances mis en place  
Le centre social de l'Arbrisseau à une consommation en énergie primaire de 48,68 kWep/m<sup>2</sup>/an.

Le projet superpose les différents programmes afin de libérer le plus grand jardin possible tout en donnant un véritable statut d'équipement public, culturel et social à la maison de quartier. Au rez-de-chaussée se trouvent l'accueil, la Protection Maternelle Infantile et le multi accueil. Au premier étage s'installent le centre de loisirs maternel, l'espace jeune AILE et les salles d'activités des 6-12 ans dans lesquels l'espace de lecture, en double hauteur, et poursuivi par des gradins, crée une relation visuelle et physique avec l'étage supérieur. Au deuxième étage se trouve la salle polyvalente ainsi que l'espace adulte. L'espace de lecture de la bibliothèque adulte se prolonge en gradins et met en relation les deuxième et troisième étages. Sur ce niveau prend place l'administration et un logement de fonction de quatre pièces prolongé d'une terrasse au sud. Ces éléments programmatiques se fédèrent autour d'un atrium mettant en relation tous les âges. Autour de celui-ci, un noyau en béton, métaphore de l'arbre attendu par les habitants du quartier de l'Arbrisseau, exprime dans son dessin les forces structurelles qui le traversent, accueille les services, les circulations verticales et soutient l'édifice. Afin que toutes les activités bénéficient d'un espace extérieur, chaque niveau est prolongé par des terrasses. Elles sont mises en relation par des escaliers : l'utilisateur peut accéder aux activités par l'extérieur puis profiter du toit de l'édifice. Celui-ci, véritable belvédère dégage une vue sur le quartier de l'Arbrisseau. (cfa)

[Médiathèque d'Anzin, Anzin – France 2010](#)

The building reveals its preciousness at first sight. Its pure, sophisticated geometry situates it as a public building. The deliberate areas of transparency reveal its content. The reading rooms present the building to the town in the manner of an invitation. The multimedia library is covered with large white veils that reflect the light. The building asserts its lightness, like an origami. The successive folds and flaps repeat this image. It is white, almost immaterial, like the mere projection of a concept, yet it is brimming with the life that constitutes it beyond its physical limits. On the inside, there is abundant, uniform light. The space is open and fluid, offering optimal flexibility. The lighting effect produced by the tall gaps that appear to float in space is truly beautiful. The volumes are independent and geometrically free, giving the whole a wonderfully poetic feel. #### Libraries:

[Médiathèque la Pleiade, Beaugency \(Dep. Loiret, Reg. Centre\) – France 2000](#)

700 m<sup>2</sup>, € 900.000

Pour la conception de ce bâtiment, les architectes ont voulu signifier la présence proche de la Loire et le caractère historique de la cité de Beaugency. C'est pourquoi ils ont proposé un équipement qui offre " une image de belle et sobre monumentalité entre modernité et histoire ", horizontal et transparent qui accompagne la légère pente du terrain.

En référence à la Loire, de fins poteaux obliques, implantés de manière aléatoire comme des tiges de roseaux soutiennent la première partie du bâtiment qui comprend les salles de lecture, tandis qu'un plan oblique minéral, sous le bâtiment, est recouvert d'un film d'eau courante. De l'autre côté, un parvis conduit vers l'entrée.

Les matériaux dominants sont la pierre, le bois, le verre.

Les salles de lecture, vitrées, sont éclairées naturellement par la lumière du jour, relayée en soirée par un éclairage d'ambiance. La lumière est filtrée sur les façades exposées par des brise soleil en verre sérigraphié.

Les plateaux ont été conçus dans un souci de polyvalence susceptible de tenir compte de l'évolution des techniques et des exigences des utilisateurs ; ainsi le câblage circule en périphérie par la façade afin d'assurer une accessibilité parfaite.

Si la transparence est de mise pour les salles de lecture et le hall, d'autres lieux (réserve, sanitaires, salle polyvalente) sont préservés des regards, enchâssés dans des masses opaques. Une réflexion particulière a été menée sur la qualité des espaces de travail, afin d'offrir à chaque lecteur une bulle protectrice qui favorise le travail. (Texte : CAUE du Loiret/C. Costantini & M. Regembal)

**Médiathèque Jean Ferrat, Aubenas – France 2007**

1.980 m<sup>2</sup> SHON, € 3.600.000 TTC

La médiathèque d'Aubenas parle d'urbanisme. Elle inscrit un lieu et un nouvel équipement sur de nouveaux parcours, en offrant au quartier des espaces publics structurés, cheminements, parvis, jardins, parking. La médiathèque d'Aubenas parle d'architecture. Profitant d'une topographie qui surélève son terrain, la médiathèque inscrit deux nouveaux visages dans le paysage. A l'Ouest, un masque de béton rouge, monumental et familier, protège du soleil et cadre les vues sur la ville. Au Nord, sur l'entrée de ville, une longue façade vitrée, telle une enseigne démesurée, accueille le visiteur et éclaire les volumes intérieurs. La médiathèque d'Aubenas parle d'économie d'énergie. Profitant de la topographie et des orientations du site, la médiathèque propose deux dispositifs techniques particuliers qui optimisent le bilan énergétique du bâtiment : un labyrinthe thermique et un mur trombe. **Bibliothèque Médiathèque Cinéma, Lons-le-Saunier – France 2012**

Maître d'Ouvrage : Communauté de Communes du Bassin de Lons-le-Saunier, Localisation : Lons-le-Saunier

Programme : bibliothèque - médiathèque et cinémas, Concours : lauréat en avril 2008, Livraison : courant 2012

Surface : 3 500 m<sup>2</sup>, Montant des travaux HT : 8 M€ ht

L'église des Cordeliers, l'Hôtel de Balay et le mur d'enceinte de maison d'arrêt forment un ensemble urbain composé de lignes simples, de grandes surfaces minérales ou ardoisées et de masses imposantes, sobres et dignes. Le rapport qu'entretiennent ces trois constructions ne se saisit pas depuis la rue. Il n'est perceptible qu'en cœur d'îlot. A cet ensemble manque d'évidence un quatrième élément qui servira de clôture sur le côté nord. Ce sera le nouvel équipement culturel. Dernier arrivant dans cet ensemble, il a la politesse de se creuser pour ménager une place publique ouverte sur la rue. Il s'agit là d'une respiration urbaine bien venue dans un contexte bâti très dense. A l'instar de ses voisins, les lignes du nouveau bâtiment sont simples, sa matière est minérale (du béton) et sa présence s'affirme sans jeux superflus de volumes et de matériaux. Il tire sa force et son étrangeté du fait qu'il d'entretient des rapports actifs avec ses grands voisins. Ainsi, la double courbure de sa façade sud adresse une réponse formelle directe au grand glacis de la couverture ardoisée ; la courbe de son plan constitue une liaison naturelle entre la rue des Cordeliers, la nouvelle place centrale et le chevet de l'église. Si elle est respectueuse de son environnement, la médiathèque/cinémas n'en affirme pas moins sa présence unique. Son esthétique est réglée par une combinaison de lignes courbes. Par ce procédé il paraît un objet autonome : qu'on se place devant l'une de ses façades, on saisit le système qui la règle, on comprend qu'il s'applique à l'ensemble et on perçoit le tout. L'expérience extérieure se retrouve à l'intérieure. Dès l'entrée on perçoit l'entièreté du volume intérieur. Celui-ci correspond exactement aux limites courbes données par les façades. L'organisation intérieure est d'une grande clarté : les différentes fonctions se répartissent sur trois niveaux plus un sous-sol pour les salles de cinéma. Les niveaux de la médiathèque sont reliés par un escalier droit éclairé naturellement et dont les parois sont vitrées. (DBL)

**Bibliothèque Clermond-Ferrand – France 2006 – 2009**

La mise en sécurité de la bibliothèque universitaire droit-lettres de Grenoble a conduit à une réflexion globale sur le fonctionnement de la bibliothèque. La restructuration répond aux objectifs suivants : Clarification de l'organisation du bâtiment, Lisibilité et valorisation des salles de lecture par l'utilisation de la monochromie et de la transparence. Création d'un nouvel escalier central.

Séparation des espaces publics et privés. (DBL)

**Université Pierre Mendés, Bibliothèque Universitaire Droit Lettres, Grenoble – France 2002 – 2004 / 2006 – 2008**

Maître d'Ouvrage : Université Pierre Mendés France, Localisation : campus de Saint-Martin-d'Hères, Concours : 1999

Programme : restructuration, extension et mise en sécurité, Travaux : réalisation en site occupé 1<sup>o</sup> tranche réalisée 2002 - 2004

Surface : 1<sup>o</sup> tranche : 10 840 m<sup>2</sup> SHON, Montant des travaux HT : 1<sup>o</sup> tranche : 5.80 M€ ht

La mise en sécurité de la bibliothèque universitaire droit-lettres de Grenoble a conduit à une réflexion globale sur le fonctionnement de la bibliothèque. La restructuration répond aux objectifs suivants : Clarification de l'organisation du bâtiment, Lisibilité et valorisation des salles de lecture par l'utilisation de la monochromie et de la transparence. Création d'un nouvel escalier central. Séparation des espaces publics et privés. (DBL)

2002/04 (réhabilitation) Maîtrise d'ouvrage UPMF, architecte Agence Du Besset / Lyon

Du bâtiment ancien sont conservées toutes les façades. Les extensions sont à usage très fonctionnel : magasins, locaux administratifs. Tous les autres espaces deviennent des salles de lecture. Le concept adopté est celui d'une immense transparence à laquelle s'ajoute un principe de monochromie intérieur et extérieur qui doit favoriser la concentration et le calme. On accèdera dans ces salles par un escalier monumental partiellement encloué en verre. (<http://www.upmf-grenoble.fr>)

## Médiatèque de Troyes - France 2002

### **Awards :**

#### **Prix de l'équerre d'Argent**

Maître d'Ouvrage : Communauté d'Agglomération Troyenne, Localisation : boulevard Gambetta à Troyes (10)  
Concours : 1997, Travaux : juin 1999 - livraison juin 2002 , Programme : Bibliothèque Municipale à Vocation Régionale  
Surface : 11 000 m<sup>2</sup> SHON, Montant des travaux HT : 11.81 M€

La bibliothèque de Troyes est située en retrait, derrière le parking d'un restaurant Mac Donald, au sein d'un environnement bâti qui n'est pas valorisant.

Telle que nous l'avons dessinée, la bibliothèque n'offre pas a proprement parlé de façades. Toute intention ou composition de façade renverrait à l'environnement bâti, créerait un vis-à-vis et entretiendrait la conversation avec les voisins.

Pas de façades donc, ni devant, ni sur les côtés, ni à l'arrière. Rien qui fasse autorité par le biais des limites. La géométrie du bâtiment reste incertaine et fuyante, d'autant que sont estompées les distinctions entre intérieur et extérieur, entre devant et derrière, entre matière et couleur, entre écrit et construit.

La bibliothèque tient plus du phénomène que de l'œuvre et elle gagne en ouverture, en générosité et en disponibilité.

La présence du bâtiment est constituée par la juxtaposition de très grands éléments disposés en bandes ou en nappes filantes. Ces éléments sont : le faux plafond en résille dorée, le faux plafond du rez-de-chaussée, la façade bleue, la salle ancienne, les magasins, l'escalier rose, le déambulatoire jaune, le texte, la mezzanine.

Pour l'observateur, de tels dispositifs ne s'appréhendent pas d'un seul point de vue. La déambulation est nécessaire, au cours de laquelle s'acquiescent les impressions d'accumulation et de profondeur qui servent de métaphore à la lecture.

Tous ces éléments échappent à l'échelle commune de l'architecture et la bibliothèque règle ainsi son rapport à la ville : elle est, par elle-même, un paysage urbain.

Ce qui est si grand risquant d'écraser, la matière des éléments se confond dans la couleur : transparente et colorée, elle devient lumière ; opaque mais saturée d'une couleur elle se transforme en simple valeur au sein d'un spectre plus large ; brillante et colorée, elle se diffuse.

Enfin, ce qui pèse néanmoins et reste de lieux communs architecturaux est pondéré par l'utilisation d'une phrase inscrite au rez-de-chaussée. C'est l'œuvre de Lawrence Weiner. Elle utilise tous les moyens précités - la taille, la profondeur, la couleur - et concurrence la première des prérogatives du bâtiment (sa taille) sans abuser de son propre avantage (le sens) : la phrase est à la fois énigmatique et pertinente. Elle est un contrepoint à l'architecture de la bibliothèque et une confirmation de son ambition culturelle : Le sens de l'œuvre se réfère au rapport entre l'écrit et les choses. (DBL)

## Médiathèque de Lisieux – France 2000 – 2001

Maître d'Ouvrage : Ville de Lisieux, Localisation : place de la République à Lisieux, Programme : RDC : accueil, exposition, consultation périodiques, R - 1 : salle de lecture, discothèque / vidéo, auditorium, R + 1 : Jeunesse, administration, Concours : 1999  
Travaux : octobre 2000 - livraison décembre 2001, Surface : 1 878 m<sup>2</sup> SHON, Montant des travaux HT : 2.90 M€

La médiathèque de Lisieux est située à l'articulation d'une rue et d'une place commerçantes. Les constructions qui l'environnent sont sévères. Les règles urbaines exigeaient une expression de toiture et la conservation d'un reste de chaussée romaine situé à 2,5m sous le niveau du trottoir.

La médiathèque est conçue comme un pavillon. Transparente et vide au rez-de-chaussée elle ne perturbe pas le tissu commercial et on y rentre comme dans une boutique. D'autant qu'on aperçoit d'un coup d'œil ce qu'elle offre car la salle de lecture est en contrebas, au niveau de la chaussée romaine.

La médiathèque est au cœur de la part la plus animée de la ville en même temps qu'en retrait. On y trouve le calme sans s'enfermer. La bibliothèque des enfants est située sous la toiture qui est un contrepoint à la sévérité du contexte urbain. (DBL)

## Bibliothèque de Rungis, Ville des Rungis – France 1998 – 1999

Maître d'Ouvrage : Ville de Rungis, Localisation : Place du Général de Gaulle, Programme : réhabilitation d'un marché couvert en bibliothèque, Travaux : septembre 1998 - livraison septembre 1999, Surface : 1 200 m<sup>2</sup>, Montant des travaux : 1.14 M€

La bibliothèque de Rungis est aménagée dans une halle existante. Le principal atout du lieu est le grand volume qui peut être dégagé sous la couverture de la halle. A ce grand espace, nous faisons correspondre un objet qui en prend la mesure exacte.

Un meuble à l'échelle de halle forme la mezzanine qui accueille l'espace documentaire sur 200 m<sup>2</sup>. La mezzanine ne fait pas référence au monde de la construction afin de ne pas brouiller la lecture de la halle. Son registre est celui du mobilier : elle est traitée comme un meuble de grande échelle, revêtu d'une coque polyester. Cet objet autonome est abrité au plus juste par la vaste toiture. (DBL)

## Médiathèque d'Orléans – France 1992 - 1994

Maître d'Ouvrage : Ville d'Orléans, Localisation : place Gambetta à Orléans, Programme : RDC : accueil, hall, exposition, auditorium, salle de prêt, périodiques, cafétéria, R + 1 : salles de consultation, R + 2 : section jeunesse, R + 3 : vidéo et discothèque, R - 1 et R - 2 : magasins, Concours : 1990, Travaux : janvier 1992 - livraison janvier 1994, Surface : 8 000 m<sup>2</sup> SHON, Montant des travaux HT : 8.92 M€ \* avec mobilier

La médiathèque est placée à une cassure du tracé des anciens mails d'Orléans. Sa forme générale lui permet à la fois de constituer un fond de perspective aux boulevards et d'assurer la continuité des constructions qui les bordent. La façade de la médiathèque se développe sans constituer de façades pignon. Elle gagne ainsi en impact et sa stature s'impose malgré les fortes présences d'une banale tour d'habitation, d'une triste église et de l'agitation de la RN 20.

Une médiathèque est un lieu où les individus trouvent par eux-mêmes les moyens d'élargir leur connaissances. Le bâtiment veut donner une idée de ce processus. Processus qui ne peut s'engager sans que l'utilisateur montre de la curiosité. Alors, il devra procéder par étapes, un domaine de connaissance en induisant un autre. Au principe de cheminement intellectuel correspond celui du cheminement architectural : chaque espace fonctionnel donné par le programme (salle de prêt, salle de lecture, périodiques, cafétéria...) est singularisé par des moyens très simples : symétrie du plan, orientation, monochromie. Chaque espace est considéré comme une pièce. Il y a autant de pièces que d'éléments de programme. Elles sont emboîtées les unes dans les autres selon des rapports dynamiques. On doit sentir que chaque pièce possède sa raison d'être en même temps qu'elle intègre la présence de ses voisines immédiates. De leur assemblage, dont rien ne peut être ajouté ni retranché, il résulte une forme simple, fédératrice : celle de la masse principale du bâtiment. Sa lecture n'est pas univoque de la manière qu'on ne peut appréhender la culture de manière globale : les pièces, rebelles, saillent et donnent à l'ensemble sa dimension monumentale. (DBL)

## **Odile Decq, Benoit Cornette Architectes, Paris – France**

<http://www.odbc-paris.com>

Since 1985, Decq & Cornette have called on an architectural style which hinges on a dynamic opening-up of space by making use of "hyper-tension" (Centre for Cultural Exchange, Osaka, 1991, or "Hyper-Tension", installation within the Grenoble Contemporary Art Centre, 1993) where integrating movement generates a tension and complexity in spatial perception. This architecture, calling on transferral and instability -- and in which tectonics become "tectogenesis" -- has adopted a concrete form as seen, among other projects, in the Banque Populaire de l'Ouest building in Rennes (1990), the recipient of numerous prizes or, additionally, in three buildings for Nantes University (1998), among their many realisations. In 1996, they received the Golden Lion Award at the Architectural Biennial in Venice for their work as a whole. In 1997, they won the design competition for stands for a rugby stadium in Orléans and, in 1998, the City of Rotterdam requested their design for a third bridge project. Decq & Cornette have also worked on the development of the Gennevilliers Port and, among other projects, they are designing cultural complexes and restaurants in Cambridge and in London. At the same time, Odile Decq is also a professor at the Special Architecture School of Paris, and also in other institutions. (<http://www.archilab.org>)

### **Libraries :**

#### **FRAC (Fondes Régional d'Art Contemporain) Bretagne, Châteaugiron – France 2012**

Le bâtiment se présente comme un bloc monolithique, fendu en deux parallélépipèdes par une percée verticale qui ouvre sur l'intérieur. Traitées en béton anthracite et acier noir/bleu, les surfaces extérieures, selon les mouvances de la lumière, révèlent différentes qualités de noir, du mat absorbant au noir mordoré. En rez-de-jardin, la façade de verre teinté gris, presque réfléchissante, ne laisse percevoir qu'une partie de la réalité de l'édifice. Cette simplicité lisse et énigmatique de l'enveloppe architecturale permet de stimuler la curiosité du visiteur pour les activités qui animent la structure. L'intérieur du bâtiment est d'une autre nature. Plus vaste, il est aspiré par la verticalité de la trouée qui découpe son volume, véritable puits de lumière qui traverse les différents étages et plonge jusqu'au sous-sol, dans les réserves. Le dispositif de rampes d'accès et de passerelles étagé autour de cet atrium central met en relation active tous les services, depuis la conservation des œuvres jusqu'au centre de documentation au dernier niveau. L'espace, décentré, décline points de vue et perspectives qui rythment la déambulation du visiteur. Perpétuant son concept « d'hyper tension », Odile Decq invite à un parcours dynamique, à une découverte sans cesse renouvelée du bâtiment. Les espaces du nouvel édifice L'édifice dispose de 3 800 m<sup>2</sup> de surface utile répartis sur quatre niveaux. Le sous-sol de 1 000 m<sup>2</sup> accueille les réserves des œuvres, ainsi que des ateliers techniques. Au rez-de-chaussée, constitué de l'entrée, de l'accueil et d'un auditorium de 120 places, le visiteur accède aux différents dispositifs de circulation. Les premiers niveaux sont consacrés aux trois espaces d'expositions de 1 000 m<sup>2</sup> modulables, conçus comme des volumes blancs et neutres, recevant chacun un éclairage semi-naturel, semi-artificiel. Au dernier étage, sont installés différents services : l'administration, le service éducatif qui, sur 200 m<sup>2</sup>, associe atelier et espace d'expérimentation et le centre de documentation, déployé sur 400 m<sup>2</sup>. L'édifice est amplement ouvert sur l'extérieur et offre des espaces de convivialité : café, point-librairie, lieux de consultation et d'information.

#### **Université Nantes, Bibliothèque de Droit – France 1999**

11.244 m<sup>2</sup>, € 8.460.000

Situé à proximité immédiate de la Bibliothèque de Droit, l'UFR compose avec celle-ci et la Maison des Sciences de l'Homme, le même ensemble unitaire et fragmenté. L'UFR, qui reprend notamment la même trame structurelle longitudinale que la bibliothèque (7,6 m), est constitué de deux bâtiments en vis-à-vis, réunis par trois niveaux de passerelles. On y accède par une cour minérale ouverte sur la faculté de Droit. Inséré dans la déclivité du terrain, l'amphithéâtre apparaît de plain-pied vers l'Erdre, et en contrebas entre les deux ailes de l'UFR. L'accès principal, celui des étudiants, est situé sur la façade nord, en vis-à-vis de l'entrée de la bibliothèque. Chacune des deux ailes de l'UFR est consacrée à une fonction précise : enseignement pour l'aile sud, la plus large ; recherche et administration pour la plus fine, l'aile Nord. Sur quatre niveaux, les halls offrent des vues cadrées sur la forêt et l'Erdre. (<http://www.archilab.org>)

[Médiathèque de Grasse – France 2013](#)

La médiathèque de Grasse dessinée par Emmanuelle Beaudouin, Laurent Beaudouin, Aurélie Husson, Ivry Serres, et Stéphane Fernandez, donne au site une atmosphère de charme mais aussi de surprise et d'émotion. Il s'inspire du caractère unique de la structure urbaine de Grasse et joue des tensions et des proximités entre les bâtiments existants et la médiathèque. Il s'inspire des subtils rapports de matière entre les édifices publics et le tissu urbain et utilise, avec une vision moderne, une partie du langage et des matériaux traditionnels. En contrepoint de cette densité, la médiathèque offre des ouvertures visuelles sur le quartier et sur le lointain. La médiathèque Charles Nègre est insérée dans le contexte de façon à donner au public l'occasion de profiter de vues cadrées ou de perspectives panoramiques. La médiathèque de Grasse devient ainsi un lieu d'où l'on peut contempler la ville. Un belvédère au dernier niveau permet une vue directe vers la maison Charles Nègre, tandis que la terrasse met en valeur une vue frontale sur la mer et qu'un autre cadrage porte vers la tour de la Cathédrale. Un jardin suspendu de fleurs parfumées permet d'enrichir cet endroit qui deviendra rapidement un point de rencontre incontournable de la Médiathèque. La médiathèque de Grasse est clairement identifiable comme un bâtiment public ouvert à tous. Le projet doit résoudre le paradoxe d'être à la fois visible par la force et la qualité de sa présence et discret dans ses volumes et ses matériaux. Nous avons cherché une juste balance entre la présence d'un édifice d'exception et le respect attentif du voisinage. Les activités de la médiathèque de Grasse doivent être dévoilées sans être totalement étalées aux yeux du public. C'est aussi un projet urbain et dans ce cadre, nous proposons d'améliorer les relations piétonnes à l'intérieur du quartier. La médiathèque, idéalement située au cœur du centre-ville de Grasse, n'est pas conçue comme un monument isolé mais elle se veut le catalyseur d'une vie culturelle à l'échelle de la ville toute entière.

Le projet profite de la présence d'éléments de programme ayant une certaine indépendance pour créer plusieurs niveaux d'accès. Le hall de la rue Nègre, très large, permet de servir de foyer commun à l'exposition et à l'auditorium. Une arcade améliore le passage vers la place Vercueil et un ascenseur public relie le haut et le bas du site. Cet ascenseur est totalement indépendant de la médiathèque mais permet néanmoins un accès direct au hall principal. Il se trouve relayé plus loin par un second ascenseur public qui relie le jardin d'eau à la Place Morel. La vocation de la Place Vercueil est que s'y implantent des activités de café et de restaurant, l'accès des véhicules doit se faire dans la discrétion. Le traitement du sol en pierre se prolonge dans le passage du réservoir et se poursuit à l'intérieur du Matrium pour renforcer une impression de continuité naturelle entre l'intérieur et l'extérieur. En remontant la rue de la Lauve, on atteint, au dessus du réservoir, le jardin d'eau qui marque l'entrée principale de la Médiathèque. Le dessus du réservoir est partiellement couvert par un fin miroir d'eau dans lequel le bâtiment se reflète. Le choix de placer l'entrée principale à cet endroit est essentiel pour donner une vie nouvelle au magnifique amphithéâtre urbain que constitue la place Morel. C'est aussi une incitation à utiliser la rue de la Lauve, comme axe urbain au cœur de la ville. Par ailleurs, une grande partie du public arrive sur le site par le haut de la ville, en raison de la présence des parkings. Le hall et l'espace couvert qui le précède sont un lieu de fraîcheur. Le miroir d'eau y reflète le ciel, créant un volume fluide et transparent. Une grande arcade à l'échelle urbaine marque la présence de la Médiathèque et accueille le regard en profondeur. L'arcade est traversante et la lumière de l'extrémité opposée en accentue la transparence. La rue de la Lauve est accompagnée une rampe suspendue, perçue comme une prolongation de la rue à l'intérieur de la Médiathèque. C'est l'élément dynamique du projet, celui qui sera le plus spectaculaire. La rampe est une promenade qui incite le visiteur à une démarche tranquille, elle permet un passage entre les deux niveaux comme une transition. C'est un lieu de flânerie intérieure qui dégage un parfum un peu mystérieux. Dans le hall, un puits de lumière naturelle traverse les deux niveaux supérieurs pour souligner avec douceur la présence de la banque de prêt. À la suite de l'accueil, on peut rejoindre directement les trois types de circulations ou accéder à l'espace d'actualité et à la bibliothèque des enfants. Au dessus du niveau d'accueil, les salles de lecture de la Médiathèque sont rassemblées sur deux niveaux pour en faciliter l'exploitation et la surveillance. Elles sont ouvertes l'une sur l'autre pour inciter le visiteur à explorer toutes les offres de la Médiathèque et permettre de percevoir la Médiathèque comme un tout. La future Médiathèque est pensée comme un espace perméable à la lumière, tout en préservant la fraîcheur intérieure. Cela nécessite une approche nouvelle du dessin des façades. Les espaces de lecture reçoivent une lumière du jour tamisée et adoucie par le claustra de pierre qui enveloppe le bâtiment. Le claustra protège du soleil la façade vitrée située en retrait pour permettre le nettoyage. Les ventilations peuvent être ouvertes en soirée pour récupérer la fraîcheur de la nuit. L'architecture est conçue pour filtrer le soleil pendant la journée et restituer une dentelle de lumière en soirée. La double apparence diurne et nocturne sera une des qualités majeure du site. Cette présence lumineuse se fera en douceur, dans la discrétion et sans excès. C'est une atmosphère globale que nous avons recherchée, une ambiance qui soit également valorisante pour le voisinage. Le thème du claustra est en rapport avec la tradition provençale, mais étendu à grande échelle, il devient un élément très moderne. La lumière artificielle intérieure utilise les voûtes en béton blanc pour se diffuser de façon douce dans les salles de lectures.

Le plan des salles de lecture, malgré sa simplicité, préserve des atmosphères diversifiées vis-à-vis de la façon de lire. La variété des lieux permet aussi de répartir les collections avec souplesse. Le programme est abordé dans un esprit d'équilibre entre les lieux d'animation et les salles de lecture à l'ambiance plus calme. Le but est d'atteindre une grande fluidité entre les différentes fonctions et une parfaite visibilité des relations entre les salles. Les espaces de la bibliothèque doivent transmettre le plaisir de lire, mais, plus largement le plaisir de vivre. La complexité du programme s'insère dans des formes simples et des volumes clairs, emprunts de dignité. Les niveaux sont reliés entre eux par deux ascenseurs, un escalier et la rampe, facilitant la communication entre les salles. Les communications verticales mettent efficacement en relation les fonctions de façon à relier fortement des espaces que les utilisateurs doivent percevoir comme une continuité. Nous avons voulu recentrer le programme et éviter le plus possible un étalement dans le site. C'est pourquoi nous n'avons pas utilisé toutes les opportunités foncières permises par le programme. L'économie d'espace est voulue pour assurer à la Médiathèque un meilleur fonctionnement sur le plan de la surveillance des salles de

lecture et vis à vis de l'information des utilisateurs. C'est aussi l'occasion de permettre à la ville de compléter la construction de la Médiathèque en redonnant un usage d'habitation aux maisons voisines et en renforçant le tissu commercial et touristique du quartier. La compacité du programme permet de se traduire par une économie des coûts de construction et par la capacité de préserver certains édifices pour d'autres usages. Le projet permet ainsi une économie globale performante : dans son coût de construction, dans son coût d'exploitation et dans la réserve foncière qu'il préserve. Par ailleurs, le recentrage du programme est lié à la fonction même de la Médiathèque en facilitant les relations et la simplicité de surveillance et de circulation du personnel. Le projet que nous proposons s'affirme aussi comme un lieu vivant, ouvert sur l'évolution des technologies et en capacité de s'adapter facilement pour évoluer dans le temps. Une attention particulière est apportée à la souplesse de l'alimentation en énergie des salles de lecture. Le creux réservé entre chaque voutain contient en partie basse le réseau de ventilation et en partie haute des caniveaux d'alimentation électrique régulièrement répartis au sol des salles. La souplesse d'implantation du mobilier et la capacité de faire évoluer l'offre technologique, sans frais excessifs, sont des facteurs essentiels dans la prise en compte du développement durable. L'autre facteur de prise en compte des nouvelles technologies est l'importance accordée au « Matrium » qui est disponible et équipé comme un lieu de contact avec le public. Il est largement ouvert sur l'extérieur et, par sa transparence, renforce le lien piéton que nous avons voulu préserver entre la rue de la Lauve et la place Verceuil. La vitrine du Matrium met ainsi en scène le mur du réservoir dans sa totalité. Le mur, la porte historique et le passage restent à l'air libre, éclairés dans une lumière naturelle. (E.L.B.)

### **Bibliothèque Universitaire de lettres et sciences humaines, Brest – France 2009**

La Bibliothèque Universitaire de Brest construite par l'atelier Beaudouin – Husson est située à proximité du centre-ville sur une hauteur dominant le paysage. La Bibliothèque est conçue pour pouvoir un jour s'agrandir sur le côté latéral lorsque le gymnase actuel sera reconstruit sur un autre site.

Dans le projet de l'atelier Beaudouin – Husson, l'entrée de la Bibliothèque Universitaire de Brest se fait par un hall vertical, ouvert sur toute la hauteur, qui traverse le bâtiment pour rejoindre une promenade piétonne vers le centre-ville. Dans cette travée centrale se trouvent l'accueil et les espaces communs. Les niveaux de la Bibliothèque sont reliés par une rampe suspendue dans un parallélépipède coloré qui semble flotter dans le vide. La lumière zénithale, prise dans la toiture, se diffuse à l'intérieur de ce volume suspendu et se reflète sur le mur latéral par une ouverture dans le côté de la rampe. Le plan incliné pénètre ce volume pour rejoindre l'espace de ce qui devrait être un café littéraire.

À l'intérieur de la Bibliothèque, la salle de lecture est un grand espace sur double hauteur éclairé par des puits de lumière traversant le plafond en lamelles de bois. Les deux niveaux de la salle de lecture sont reliés par un escalier articulé par deux prismes croisés en acier. La structure principale du bâtiment de la Bibliothèque est en béton brut coulé en place. Les parties vues, en particulier les colonnes de la salle de lecture, sont coffrées en panneaux de contreplaqué chanfreinés pour obtenir un calepinage de joints en saillie. La structure est clairement visible depuis l'intérieur. Les colonnes de la salle de lecture déterminent l'espacement des puits de lumière de la toiture. Le plafond entre les arrivées de lumière est constitué de lames de bois légèrement espacées pour assurer le confort acoustique de la salle. Les trois façades de la Bibliothèque de Brest comportent une épaisseur destinée à filtrer la lumière et à créer des espaces pour une lecture plus intime. La façade sur rue est composée de volumes de béton qui créent une profondeur dans les salles et forment une alternance de transparences et d'opacité. Dans ces volumes s'installent des espaces de lecture individuels. Cette épaisseur des façades Est et Sud est constituée d'une structure béton porteuse intérieure et d'éléments préfabriqués en béton. Ces éléments ont une surface de pierre concassée noyée dans le béton au moment de la préfabrication. En façade Ouest, les brise-soleil sont en lames de verre sérigraphiées, posées en feuillure sur des bandeaux horizontaux en béton.

À Brest, une qualité particulière est recherchée dans le confort d'usage et dans le soin porté à définir l'atmosphère de travail et de recherche que doit offrir une bibliothèque universitaire. La façade rue est rythmée régulièrement par les petites salles de travail qui évoquent la figure d'un grand meuble en jouant sur l'ambiguïté du mot « bibliothèque » et de son double emploi en terme de bâtiment et de mobilier. C'est une épaisseur habitée qui permet d'avoir des vues diagonales sur la rue sans que le passage des véhicules ne perturbe trop le calme intérieur. Le contraste entre l'extérieur qui apparaît sérieux et austère et l'intérieur coloré et lumineux de la salle de lecture rappelle cette différence d'atmosphère que l'on trouve souvent dans les bibliothèques anciennes comme la bibliothèque Sainte Geneviève d'Henri Labrouste.

La lumière est essentielle dans ce travail. Elle s'insinue entre les volumes de la façade et se réfléchit sur les structures intérieures en frôlant des murs qui sont colorés soit en jaune, soit en rose. Contrairement à la lumière des musées, qui doit être stable et neutre, la lumière d'une bibliothèque peut être vivante et colorée. La lumière teintée de la Bibliothèque met en valeur les rapides changements d'atmosphère de la ville de Brest. La couleur compense les instants nuageux et la réflexion de la lumière dans les espaces intérieurs met en valeur la vivacité du ciel de Bretagne.

The project is on a university campus, situated close to the centre of Brest. The site is on a hill overlooking the town with a view of the sea in the distance. The building must be built in several phases, including the two projects of the university library and the municipal multimedia centre. The two are conceived to complement each other, while preserving the functional autonomy of each one. The conception of the two parts of the building is also offset in time. The thickness of the main façade is formed of volumes of white concrete and granite which creates a depth in the rooms and forms an alternation of transparency and opacity where the reading spaces and small video rooms are installed. The entrance is through a vertical hall open the full height of the building, which crosses the building to join a pedestrian walkway below. In this central row the reception and spaces common to the two projects are located. The levels are linked by a ramp suspended in the void. The ramp fits into a rusted steel parallelepiped, which seems to float in the void. The overhead natural lighting, drawn from the roof, is diffused inside of this suspended space and is reflected onto the lateral wall by an opening in the side of the ramp. Inside the university library the reading room is surrounded by a mezzanine whose underside of white concrete is uniquely marked by sheets of glass suspended from each side of the lights. The upstairs ceiling is covered in strips of wood, crossed by shafts of light. From these openings hang large sheets of opal glass which spread a subdued natural light through the room. The sheets of glass suspended from the roof repeat at a larger scale the sheets of glass of the ground floor lights. The two levels of the reading room are linked by a stairway which enters into two crossed prisms of rusted steel. The rusted steel and glass can be found in all the metallic elements, the railings, the ramp, the facades and the lights. The rusted steel evokes the maritime environment of the building. The rust colour can also be found on the Logona stone, used for the facade, which is coloured by red-orange iron pigments. (E.L.B.)

### **College Montaigu, Jarville la Malgrange (Nancy), Dep. Meurthe-et-Moselle – France 2004 – 2007**

Ce collège doit se construire à l'extérieur de Nancy, sur un terrain en longueur dont la vue s'ouvre vers un paysage de collines. Le projet trouve son origine dans une typologie d'espaces voûtés inspirés de cette frange de la modernité qui s'est intéressée à l'architecture méditerranéenne à la suite de Le Corbusier et de José Luis Sert. Le projet du collège s'inspire en particulier de l'œuvre argentine d'Antonio Bonet et de sa maison La Ricarda. D'une certaine manière cette source d'inspiration apparaît incongrue et hors du contexte, pourtant le projet assume sans complexe cette dimension exotique. L'exotisme est accepté comme une des dimensions traditionnelles de l'architecture, il fait partie de son inépuisable source d'inspiration. Le collège rassemble des groupes de salles autour d'une circulation centrale. Le volume des salles de classe est cintré pour donner une sensation d'espace et adoucir la lumière naturelle. Aucune salle n'est éclairée au Sud. La grande hauteur de la voûte permet un éclairage équilibré entre la lumière du jardin et celle qui entre en partie haute au-dessus des circulations. Les groupes de salles de cours sont séparés par des jardins

accessibles. Les jardins sont fermés au Sud par des claustras en béton peints de rose vif. La bibliothèque comporte plusieurs travées, séparées par un jardin intérieur. Elle est le lieu d'enseignement où le rapport visuel avec le paysage est le plus intense. Le hall articule l'ensemble des fonctions du collège à la rue intérieure. Il est surmonté de deux coupoles inversées qui se trouvent reliées par une fente verticale. L'ouverture crée dans la coupole inversée apporte au hall la lumière extérieure. Une des coupoles donne du volume à l'espace du hall, l'autre est un espace extérieur relié à la terrasse de l'administration. La coupole inversée peut être accessible de l'extérieur et forme une sorte de cratère ouvert, ne laissant voir que le ciel, à l'image de certains espaces de James Turrel. Les logements de fonction sont situés dans la continuité des maisons existantes, à l'ouest du terrain. Cette position assure la dimension privative des logements par rapport au collège.

### **MIK Médiathèque intercommunale du Kochersberg (Bibliothèque et école de Musique), Truchtersheim (Strasbourg) – France 2004 – 2007**

Surface : 1 620 m<sup>2</sup>, Coût : 2 833 000 € H.T., Maître d'ouvrage : COMMUNAUTÉ DE COMMUNES DU KOCHERSBERG  
Architectes : EMMANUELLE BEAUDOUIN, LAURENT BEAUDOUIN, CATHERINE LINDER PAYSAGISTE, PIERRE GAUCHER SCULPTEUR, Architectes assistants : CHRISTOPHE THIERY (chef de projet), PAOLO SOUZA, ROMUALD THIÉBAUT, SAMUEL CAMENZIND

Le terrain triangulaire choisi pour regrouper une école de musique et une médiathèque, est situé à l'entrée du village de Truchtersheim à l'ouest de Strasbourg est bordé au nord par un parc privé. Le vallonnement souple du site se retrouve dans la forme du bâtiment, dessiné par Emmanuelle Beaudouin et Laurent Beaudouin comme un écho du paysage. Le volume dessiné par l'atelier Beaudouin, se présente comme les doigts d'une main épousant le mouvement du terrain. Les façades du bâtiment sont en béton de site coloré dans la masse, utilisant des granulats et des pierres concassées. Le béton est bouchardé après décoffrage pour lui apporter un aspect proche de la pierre, et faire sortir les agrégats de grande taille. Ce béton de site donne aux façades une présence et une matière proche de certains murs de pierre du village. L'école de musique et la médiathèque, organisés de façon autonome sont reliés en un seul édifice par une galerie couverte. Dans la bibliothèque, les ouvertures sont basses, près du sol, pour ne pas exposer les tables aux rayons du soleil. Le plafond des salles de lecture est formé de fines lames de pin d'Oregon, espacées par des vides de même largeur et suit la forme souple de la toiture. Il laisse filtrer la lumière naturelle par des puits de jour tronqués, créant un dégradé de lumière chaude. Un éclairage suspendu complète les gorges lumineuses latérales et crée une nappe horizontale qui assure une lumière régulière aux espaces de lecture. Les jardins et les patios sont comme la prolongation de l'espace intérieur, ils sont plantés de façon dense pour faire un tout avec le parc existant. La salle de lecture des enfants est séparée de celle des adultes par un patio et un jardin en gradin servant de théâtre de plein air.

L'école de musique a une organisation simple avec de larges circulations pour faciliter le transfert des instruments. Les murs et la toiture sont formés de courbes réglées, à l'image de l'école de Gaudí à Barcelone ou de l'église d'Atlantida d'Eladio Dieste. La forme de sa façade et de la toiture règle l'acoustique de la salle. Les courbes irrégulières évitent les effets indésirables de résonance et donnent une image métaphorique du programme. L'auditorium est en surplomb par rapport au jardin pour devenir une scène réversible pour les concerts en plein air et à l'inverse peut se fermer par de grands volets intérieurs en bois.

L'ondulation qu'imprime la morphologie du bâti sur le dévers du site, est affirmée par une composition libre du parc, réalisée par le jeu de lignes brisées, ancrée dans la pente du terrain. Le parc est clôturé par une succession de haies d'arbres, relayés tantôt par des murets ou des fossés, de façon à réserver un espace plus calme à l'intérieur du parc, fabriquant un effet de « seuil » entre la séquence des équipements et l'arrivée dans le centre du village.

### **SCHOOL OF MUSIC AND MEDIATHEQUE**

The project is situated in the plains of Alsace at the entrance of a village west of Strasbourg. In the north of the triangular plot there is a private park towards which the project can face. It unites a music school and a mediathèque. The undulating nature of the land is reflected in the form of the building, as if it were an echo of the landscape. The mass seems like the fingers of a hand embracing the movement of the land without giving the impression of crushing it. The drawing of the edifice by making use of an eloquent and poetic architectural style, become a metaphor of the themes of the program. The facades of the building are in coloured concrete mixed with big stone chips and crushed stones. The concrete is bush hammered after being removed from the formwork to make it closely look like stone and accentuate the bigger aggregates. The facades made with this concrete resemble in matter and style certain old village walls. The music school and mediathèque are connected but function independently. They are part of the same building and linked by a covered gallery. In the library, the openings are near the ground so that the tables are not exposed to direct sunlight. The ceiling of the reading rooms are made with thin Oregon pine wood laths, equally spaced and following the supple contours of the roof. Natural light filters in through truncated light shafts, casting shades of warm light.

Pendant lights are fixed in the luminous lateral grooves and constitute a horizontal layer diffusing a pleasant, constant light on the reading areas. The gardens and the patios are like an extension of the interior space. The vegetation here is lush so that they seem to blend seamlessly into the park around. The children's reading room is separated from that of the adult's by a patio and a garden which doubles as an open air theatre.

The music school is organised simply with wide passages so that the musical instruments can be moved easily. The walls and roofing are made of harmonious curves reflecting the style of Gaudí's school in Barcelona or the church in Atlantida built in Uruguay by Eladio Dieste. The auditorium because of its facade and its roofing has excellent acoustics. There are no unwanted echoes due to the irregular curves of the big hall which present a metaphoric image of the program. The auditorium projects over the garden and can become a place for open air concerts but can be also be closed from inside by big wooden shutters.

The undulating nature of the building on the incline of the site is complemented by the fluid structure of the park created by a play of broken lines, anchored in the slope of the land. A row of trees form a fence around the park interspersed at times by small walls or ditches. This is to build a quieter space inside the park by creating a threshold effect between the amenities and the arrival at the village centre. (ELB)

### **Bibliothèque de sciences Les Mans – France 1999 – 2004**

Etude : 2002, Réalisation : 2004, Surface : 8 000 m<sup>2</sup>, Coût : 13 000 000 € H.T., Maître d'ouvrage : MINISTÈRE DE L'ENSEIGNEMENT SUPÉRIEUR ET DE LA RECHERCHE, RECTORAT DE NANTES, Architectes : EMMANUELLE BEAUDOUIN, LAURENT BEAUDOUIN, Architectes assistants : CHRISTOPHE PRESLE (chef de projet), ANTOINE CRUPI, CAROLINE LATWEIN, ALEXANDRE SCALABRINO, JEAN-CHRISTOPHE MATT

Dessinée par l'atelier Beaudouin pour la Bibliothèque Universitaire du Mans est située sur l'axe principal d'un campus universitaire dont les édifices sont très hétérogènes du point de vue du langage. Le site manque d'unité et la topographie dans laquelle s'inscrit le bâtiment de la bibliothèque est partiellement artificielle. Le projet d'Emmanuelle Beaudouin et Laurent Beaudouin s'adapte à cette situation difficile en cherchant des points d'ancrage dans la pente factice produite par le bâtiment voisin, comme pour lui donner du sens. L'entrée de la Bibliothèque Universitaire est située au Nord le long du boulevard principal et la façade de la bibliothèque,

peinte de brun sombre, se présente en conte-jour pour laisser transparaître sa luminosité intérieure. La façade est détachée de la structure et se présente comme une lame suspendue, détachée du bâtiment pour recevoir la lumière du Sud et la réfléchir vers l'intérieur. La lumière solaire, pénétrant par deux verrières zénithales balaye l'intérieur du mur au cours de la journée, sans pénétrer directement dans la salle de lecture. Elle montre le passage du temps comme une forme en mouvement. Cet hommage au soleil apparaît à l'intérieur du hall à travers trois puits de lumière cylindriques dont l'inclinaison en éventail formule, de façon métaphorique, le mouvement du soleil. Ces canons de lumière projettent au sol le mouvement du cercle solaire, comme s'ils dessinaient son trajet autour de la terre. Sur le côté du hall s'élève une rampe qui accompagne le parcours du visiteur jusqu'à l'étage et se prolonge vers une terrasse ouverte sur le paysage. Au niveau d'entrée, dans la prolongation du hall, se trouve une salle consacrée aux périodiques dont la mezzanine en porte-à-faux est tenue par un dispositif structurel inédit de murs courbes décalés. Cette forme réalisée en béton blanc, par vagues successives et décalées, est proche dans sa plastique des courbes de l'école de Gaudi à Barcelone et des structures inventées en Uruguay par Eladio Dieste. Elle permet d'assurer un contrepois en pied à la dalle en porte-à-faux et d'en avancer par périodes le point d'appui inférieur. La salle prend sa lumière en toiture par une trame régulière de cylindres et une verrière transversale qui éclaire les structures de béton. Au premier étage, de part et d'autre du bâtiment, les deux grandes salles de lecture s'ouvrent sur deux niveaux. Chaque salle de la Bibliothèque Universitaire a une spatialité différente. La première est ouverte sur le hall et comporte une mezzanine traçant un carré en couronne autour du vide central. Elle est entourée de volumes suspendus formant des alvéoles qui permettent un rapport intime à la lecture. Le centre de la salle trouve sa clarté dans trois fentes qui diffusent la lumière en se réfléchissant sur les structures porteuses en béton. La travée centrale franchit la largeur de la salle d'un seul jet par deux poutres jumelles descendant au niveau de la mezzanine à la hauteur des yeux. La seconde salle de lecture est séparée du hall par un patio. Elle s'éclaire à l'étage par une couronne colorée et suspendue qui surmonte un vide circulaire en mezzanine. Le bâtiment est éclairé au Sud par deux immenses panneaux de pavés de verre. Le plus haut est protégé du soleil direct par un claustra de béton peint d'un rose vif qui entre en contraste avec la couleur sombre des façades. Entre les deux niveaux de briques de verre se glisse une fente vitrée sur toute la longueur, préservée du soleil par une série de fines lames de verre verticales qui donnent l'impression paradoxale de porter le bâtiment.

The university library is located on the main axis of a university campus outside the city center. The buildings lack unity, and the topography in which the building is placed is partially artificial. The project adapts to this difficult situation to this difficulty by searching for points of anchorage in the unnatural slope produced by the neighboring building, as if to give it meaning. The entrance to the library is on the north side, along the main boulevard. The façade is painted dark brown and stands out against the sunlight which makes its internal luminosity visible. The façade is disconnected from the structure and looks like a suspended slat, disconnected from the building, in order to receive southern light, and to reflect it towards the interior. Sun light penetrates through two zenithal atrium windows and sweeps the interior of the wall during the day, without directly penetrating the reading-room. It shows the passage of time as a type of movement. This homage to the sun appears in the interior of the hall via three cylindrical light wells with an inclination in the form of a hand held fan, a metaphor for the movement of the sun. These light cannons project the movement of the solar circle onto the floor, as if they were drawing its trajectory around the earth. On the side of the hall a handrail rises to accompany the visitor to the first floor and prolongs itself towards a terrace open to the scenery. At the entrance level there is a room for periodicals with overhanging mezzanine, supported by the unseen structural device of walls with shifting curves.

This form, made in white concrete, with its successive and shifting waves brings to mind the curves of the Gaudi school in Barcelona and the structures invented in Uruguay by Eladio Dieste. The design is structural, it is used to ensure there is a counterweight to the overhanging paving stone, and to advance by degrees the lower support point. The double curve makes it possible to bear, without a column, the paving stone of the mezzanine.

The room draws light from the roof through a regular framework of cylinders, and a transverse atrium window which lights up the concrete structures. On the first floor, on both sides of the building, the two big reading rooms open on two levels. Each room has a different spatiality. The first opens onto the hall. It has a mezzanine in the shape of a square crown around the empty central space. This is surrounded by suspended volumes that form an alveolus which enables one to have an intimate relationship with reading. The center of the room finds is lit through three slits which diffuse light by reflecting onto the concrete-bearing structures. The central bay passes over the width of the room in one sweep, with two twin beams that go down to the level of the mezzanine at head height. The second lecture room is separated from the hall by a patio. It illuminates the upper part with a colorful and suspended crown which overrides an empty circular space in the form of a mezzanine. The building is lit from the south with two huge panels of glass mosaic. The highest one is protected from direct sunlight by a concrete screen wall painted bright pink which contrasts with the dark columns of the façades. Between the two levels of glass bricks, a glass slit creeps across the entire length, protected from the sun by a series of fine vertical glass slats which give the paradoxical impression of supporting the building. (ELB)

#### **Bibliothèque Universitaire, Belfort – France 1996 – 1999**

#### **Bibliothèque Chauray – France 1998 - 1999**

La bibliothèque est installée dans un ensemble de bâtiments anciens, situés en centre bourg. Cette opération s'inscrit dans un projet global de réaménagement et d'identification du centre bourg. Les bâtiments ont été déstructurés, l'espace ouvert, de manière à obtenir un espace fluide. L'enveloppe extérieure n'a pas été modifiée : les ouvertures ont été conservées. L'intérieur est marqué par une forte présence du bois de frêne, bois très présent dans la région. Ce bois clair, a été utilisé pour les portes, le parquet et le mobilier (rayonnages, banque d'accueil, tables fixes et tables mobiles). Cette présence forte du bois confère à l'espace un caractère chaleureux et lumineux. (E.L.B.)

#### **Bibliothèque universitaire de Besançon - France 1997**

La bibliothèque de Besançon se situe sur les hauteurs de la ville en bordure du parc de l'observatoire. Le campus universitaire est formé d'un ensemble de bâtiments de grande qualité qui s'étagent dans la pente du site en laissant s'ouvrir la vue vers la vallée de Besançon. Le terrain, en pente douce, se transforme en socle végétal au-dessus duquel semble flotter le bâtiment. La bibliothèque se présente comme un volume de pierre massive, identique à celle des bâtiments voisins, soulevé sur un vide transparent. Un bosquet d'arbres prolonge le parc devant l'entrée dans une sorte de parvis simplement bordé de deux sculptures de Yoshi Okuda. La bibliothèque est géométriquement constituée de deux carrés. Le premier volume contient trois grands cylindres inclinés, de quatre mètres de diamètre, conçus comme d'immenses télescopes, évoquant ceux de l'observatoire universitaire voisin, et qui captent la lumière du nord pour la diffuser dans l'espace intérieur. Ils créent dans l'édifice une volumétrie ouverte sur l'ensemble des trois niveaux. Les poteaux supportant le plan incliné sont à une distance de 18 mètres. La couleur a été choisie pour renforcer l'effet de légèreté et accentuer le bleu de la lumière du Nord. Des formes libres sont suspendues à l'intérieur du hall pour rentrer en contraste avec la symétrie globale et créer un contrepoint dynamique. Une rampe relie le hall au niveau consacré à la recherche dont les ouvertures regardent le paysage. La grande salle de lecture est située dans le second carré qui succède à ce dispositif. C'est un espace plus statique et plus calme, ouvert en rez-de-chaussée vers le parc. Il est éclairé en toiture par trois fentes zénithales intégrées dans les structures. Dans cette salle, les éléments porteurs sont largement en retrait des façades, produisant cette impression de suspension du volume. La lumière pénètre par le haut des structures de béton qui perdent un peu de leur massivité pour donner l'impression que la lumière suspend le bâtiment. À l'arrière, une façade formée d'alvéoles de pierres et de béton, donne une vision métaphorique de la bibliothèque dans le rapprochement visuel entre les meubles intérieurs et la volumétrie du bâtiment.

The Besançon university library stands on the city heights, on the edge of the parc de l'Observatoire. The building sits on a slightly raised base of greenery that follows the natural slope so as to ensure transparency between the reading rooms and the garden. A landscaped open court enhances the entrance, creating a transversal opening towards the park. The library is placed horizontally. Its plan geometry consists of two squares that follow one after the other. They are fronted by an entrance sequence with awning and sunbreakers clearly detached from the facade, superposed at right angles. The library's volume seems to be suspended over a glazed, transparent space that runs all around the sides, establishing visual continuity with the park. Its entrance lies in the axis of the place. Near the entrance, under the horizontal awning, is the general culture room and the exhibition space, which opens at the corners. The form of the hall is scanned by three large cylindrical light wells, which bring to mind architectural themes derived from the nearby Observatory. They are designed as huge telescopes, which catch the light of the sky and diffuse it in internal space. Inside the building they create a volumetry that opens above to the reception, research and administration areas. The light they bring in, thanks to its slant, lights all these three levels. The three light wells are concrete cylinders four metres in diameter. They open onto a 45° slope which enables the grouping in volumetric continuity of the upper administration level. The posts that support this slanting plane are spaced at 18 metres. The colour chosen for them accentuates the light-weight effect and the blue tinge of northern light. Independent volumetric elements are suspended inside the hall : a sloping yellow plane, lit by direct southern light; a white cylinder, a curved volume burnt umber in colour. They contrast with the overall symmetry and create a more dynamic complementary dimension. A ramp links the reception area to the research plateau opening on the mezzanine, the hall, and above the terrace, to the landscape. The volume of the large reading room follows on from this arrangement. Once again it is a square plane, more static and calm, open at ground floor level to the landscape and toplit by three openings integrated to the structures. (E.L.B.)

### **Bibliothèque Proudhon de l'Université de la Bouloie, Besançon – France 1993 – 1997**

Etude : 1993, Réalisation : 1997, Surface : 3 407 m<sup>2</sup>, Coût : 18 175 000 € H.T., Maître d'ouvrage : Région de Franche-Comté  
Architectes : EMMANUELLE BEAUDOUIN, LAURENT BEAUDOUIN, MAXIME BUSATO, Architectes assistants : JEAN-MARC METZGER (chef de projet), ANTOINE CRUPI, CHRISTOPHE PRESLE

### **Médiathèque François Mitterand, Poitiers – France 1996**

Etude : 1992, Réalisation : 1996, Surface : 12 000 m<sup>2</sup>, Coût : 8 980 000 € H.T., Maître d'ouvrage : VILLE DE POITIERS  
Architectes : LAURENT BEAUDOUIN, SYLVAIN GIACOMAZZI, HERVÉ BEAUDOUIN, Architectes assistants : JEAN-MARC METZGER, LUCIEN COLIN, DOMINIQUE

La Médiathèque de Poitiers construite par Laurent Beaudouin et Sylvain Giacomazzi est en bordure de la partie la plus ancienne de la ville. Le terrain chevauche un des murs d'enceinte qui protégeait la vieille ville à la fin de l'époque romaine, dont un fragment sera conservé dans le niveau bas du bâtiment. Le site comporte également, à proximité, un patrimoine roman important avec lequel le bâtiment entretient un dialogue direct. La présence de l'église « Notre Dame la Grande » servira de ferment à une partie importante de l'expression de la médiathèque. Dans ce site déjà complexe, l'édifice de l'université, construit en bordure du terrain au XVII<sup>e</sup> siècle, va servir de modèle pour comprendre comment un édifice de dimension semblable peut s'inscrire sans heurt dans un tissu urbain médiéval. Le programme du concours portait sur l'agrandissement du bâtiment de l'ancienne bibliothèque, lié à l'université. Le projet n'a pas suivi cette hypothèse pour proposer un volume indépendant, en retrait par rapport à l'existant. Il s'est adossé sur les murs des maisons mitoyennes et utilise une géométrie claire, à l'image de l'Université. Sa géométrie est basée sur un simple carré qui prend sa lumière sur trois côtés : Est, Ouest et Nord. Ce recul a permis la création d'un jardin public entre l'Université et la

Médiathèque, utilisé comme parvis d'entrée du bâtiment. La pente du terrain a servi à créer deux niveaux d'entrée : la plus basse s'ouvre sur un parvis vers la vieille ville, l'autre s'ouvre sur une rampe, côté jardin. L'influence du contexte n'est pas la seule à avoir marqué la genèse du bâtiment : le projet a été étudié après un voyage en Inde et l'exemple des « Millowners » à Ahmedabad s'est imposé comme un modèle possible, pour imaginer un édifice à plan carré, accessible par une rampe. Le projet de la médiathèque voulait retrouver un peu de la fluidité, de la lumière et du mystère de ce bâtiment de Le Corbusier. Il développe la théorie du plan libre dans un métissage entre le langage moderne de l'architecture et une évocation romane, faite de lumières, de pierres et de couleurs. La proximité de « Notre Dame La Grande », où la volumétrie initiale est perturbée par des adjonctions de volumes successifs et dont certains espaces intérieurs conservent une polychromie éblouissante, a servi d'incitation pour une architecture dont la volumétrie complexe semble se condenser autour du carré géométrique d'origine. L'entrée du bâtiment se fait par la rampe de pierre qui le relie au jardin. Après un passage où l'espace se resserre, le hall s'ouvre sur toute la hauteur, laissant apparaître un volume de béton suspendu et énigmatique qui emplit de sa forme courbe le vide carré de l'espace. Le volume est surmonté d'une série de puits de lumière éclairant l'intérieur de la médiathèque d'une lumière dont les couleurs changent suivant la position du regard. Le reflet des couleurs s'inspire de l'art cinétique et en particulier, de l'œuvre du peintre Luis Tomasello. Les puits de lumière émergent sur la terrasse du dernier niveau comme des sculptures abstraites qui renversent à l'extérieur l'effet plastique intérieur. Le projet est le premier d'une longue série expérimentant la présence des rampes comme moyen de dilater le temps et de permettre le passage du temps rapide de la vie urbaine au temps ralenti de l'architecture. Ce ralentissement du temps, freiné par le lent parcours de la rampe est accompagné d'une sensation physique différente, où le corps change de position et se réveille dans son rapport à la gravité. Autour de l'édifice, la lumière se diffuse et se colore en suivant l'orientation des façades pour donner aux espaces des atmosphères différentes. Dans la salle consacrée aux vidéos, trois alvéoles de béton s'insèrent dans les structures extérieures pour former des espaces intimes permettant de visionner des films. Ces salles, peintes de trois couleurs différentes, sont éclairées par des cercles de verre laissant pénétrer une lumière solaire qui trace sur les murs courbes des formes à la géométrie abstraite. La lumière du soleil et la lumière artificielle se superposent, évoquant leur différence comme dans la métaphore de la caverne de Platon.

The history of Poitiers is marked by Roman occupation, which left the first urban structures of the centre, and by a flourishing mediaeval period. This media library is located in the heart of the oldest part of the city, and straddles a Roman fortress wall that was taken down and rebuilt inside the building by archaeologists. Poitiers has a population of 80 000 and a large university. Part of the university occupies a 17th century building that forms a large trapezoid structure one side of which butts against some mediaeval houses. The urban implantation of the Mediathèque takes cues from this situation. The library's geometry is a simple square plan with 45 m. sides, which draws its light from its centre and three sides: east, west and north. The rigour of this form is broken on its periphery by volumes that project some of the functions of the interior to the exterior. These outgrowths break the continuity of the building's square. The idea of adding on elements around the initial volume derives from the Notre-Dame-la-Grande church, a Romanesque masterpiece that stands near the media library. The challenge inherent to this project was to build a large public facility in a dense, historic urban fabric. A setback in front of the building allowed the creation of a garden between the university and the media library, to fill out the entrance sequence. The sloping site has been used to advantage to provide two ground floors for the library. One forms the main entrance and is underlined by a stone ramp; the other creates a secondary entrance facing the old city. The presence of the ramp, of an external staircase and of free plan relate this library to Le Corbusier's Millowners' building in Ahmedabad. The design also attempts to achieve some of the fluidity, light and mystery of this great work. It blends modern architecture and Romanesque evocation, in lights, stone and colours. The three elevations articulate in independent manner. On the garden side, an enamelled glass sunbreaker gives the façade a changing visual aspect. Transparent on the garden side, from the small street the elevation is opaque. The north elevation is formed by a stone wall suspended in empty space, detached from the roof all the better to bring in and reflect the southern sunlight. It is both a light reflector and a place where transparency towards the city is the strongest. In the centre of this wall a large opening throws light across the breadth of the library into the street. The west elevation is a concrete grid amidst which seem to float three free volumes, which house the video rooms. The three façades are independent, separated in their corners by empty space, which emphasizes the stone veil's immobility and apparent state of weightlessness. The interior of the library is a crown open around a central void in which unfolds a ramp that links all the levels up to the terrace. The spatiality is centrifugal: fluid in the centre where people circulate, stable on the periphery where the reading areas are. (ELB)

Cohabitation im Fischerhafen

von Roman Hollenstein

Vornehm unterkühlt gefällt sich Frankreichs neue Architektur. Doch neben den Prestigebauten Mitterrands, die ganz der Rhetorik der Grande Nation verpflichtet sind, begegnet man auch «bescheidenen» Werken. Es handelt sich dabei vor allem um sensibel auf den Kontext bezogene Umbauten und Erweiterungen kostbarer Denkmalschutzobjekte oder alter Strukturen, die ihrer einstigen Funktion beraubt wurden. So hat etwa im Grossraum Lille, der Stadt, die sich rund um den TGV-Bahnhof einem urbanistischen Grosseingriff unterzog, ein Meister des Dekonstruktivismus, der Lausanner Bernard Tschumi, mit seinem Medienzentrum in Tourcoing bewiesen, dass sich auch ausgediente Bausubstanz in aufsehenerregende Architektur verwandeln lässt. Etwas im Schatten dieses Grossereignisses hat in Fécamp, einem an der Kanalküste zwischen Le Havre und Dieppe gelegenen Fischerstädtchen, der 56jährige Architekt Jacques Etienne aus Rouen, der sich mit einem Internat in Fécamp und mehreren Schulbauten in der Normandie bereits einen Namen machte, das Lycée Maritime Anita Conti, eine Berufsschule für angehende Fischer, gebaut. Die Schule - zuvor in einem Altbau untergebracht, dessen bedenklicher Zustand gleichsam die Krise des lokalen Fischereigewerbes spiegelte - sollte ein optimistisches Zeichen des Neuanfangs setzen in Frankreichs bedeutendstem Zentrum des Kabeljau-Fischfangs. Als Bauplatz zur Verfügung stand am Fuss eines steilen, aus den Klippen hervorgewachsenen Hügels ein altes, «la boucan» genanntes Gebäude, das einst eine Fischräucherei beherbergte hatte, und darüber - auf einer Gartenterrasse thronend - ein Haus von

Guy de Maupassant. An diesem bedeutungsvollen Ort, an dem sich Fécamps Wirtschaftsgeschichte mit Frankreichs Hochkultur vereint, versuchte Etienne - ganz ähnlich wie Tschumi in Tourcoing - die Spuren der Vergangenheit mit Hilfe heutiger Architektur systematisch herauszuarbeiten und neu zu interpretieren. Urbanistisch geschickt verwandelte er den Platz vor der «boucane» durch die Anfügung zweier Neubaufügel in einen Hof. Den schlecht erhaltenen Bau liess er teilweise abtragen, als Schulgebäude für den technischen Unterricht rekonstruieren und darauf ein pavillonartiges Panoramarestaurant setzen - mit Aussicht auf die Stadt und die bergseitige Terrasse. Deren einstige Exponiertheit wurde dadurch zu einem intimen Gartenhof geschlossen, der nun vom restaurierten Maupassant-Haus beherrscht wird. Dieses transformierte Etienne in eine Bibliothek und erweiterte es nach Osten um einen in die dahinterliegende Terrasse integrierten Mehrzwecksaal. Eine Treppenkaskade, die die Topographie suggestiv betont, führt über zwei Terrassen hinunter zum Eingangshof - vorbei am kubischen Ostflügel. Dieser in Nordsüdrichtung transparente Solitär aus Beton, Stahl und Glas dient dem Studium der grossen Meereskarten. Treppen, Relings und ein als minimalistischer Schiffsmast gestalteter Kamin aus Beton machen das Gebäude zu einer maritimen Metapher, während die holzverkleideten Seitenwände die von der «boucane» evozierte Hafenatmosphäre diskret unterstützen. Der aus der ehemaligen Räuherei herauswachsende Westflügel präsentiert zum Quai Guy-de-Maupassant hin ebenfalls eine Maske aus Holz. Dadurch wird dieser weit vorspringende Annex, das Kernstück der Anlage, fest mit der bestehenden städtebaulichen Textur verwoben. In ihm befindet sich die grosse Eingangshalle, zu der eine Brücke vom Hof her über einen Abgang führt. Auf diesem können die vom Fischfang zurückkehrenden Studenten direkt in die Umkleideräume und Duschanlagen im Untergeschoss gelangen. Ein nach oben sich verengendes, durch Oberlicht erhelltes Treppenhaus stellt von hier aus die Verbindung mit der Eingangshalle her sowie mit den darüberliegenden Theorieräumen und dem Mensa-Restaurant auf der fünften Ebene. In dieser Anlage, die von der architektonischen Umsetzung, den Abläufen und Stimmungen her überzeugt, gehen Alt und Neu eine harmonische Cohabitation ein, ohne jedoch zur spannungslosen Einheit zu verschmelzen. So kommen hier seit letztem Herbst rund 100 Schüler im Alter von 14 bis 19 Jahren in den Genuss eines funktionalen Hauses, das mit seinen überraschenden Inszenierungen bald an das Leben auf einem Schiff, bald an die Eigenheiten des Orts erinnert. Diesem Baukomplex, der ganz Ausdruck unserer Zeit ist und trotzdem stolz die Tradition umklammert, eignet ein architektonischer Ausdruck, wie ihn zuvor nur Jean Nouvels Erweiterung des Hotels St. James in den Rebbergen von Bouliac bei Bordeaux erreicht hat. #### **Réhabilitation du cinéma-médiathèque.Grenette, Yssingaux – France 2006**

1.748 m<sup>2</sup>, € 1.178.000

La Grenette est un bâtiment emblématique au cœur de la ville et témoigne de son histoire. A l'instar des greniers communaux, elle jouit d'une situation urbaine exceptionnelle. Forte de son architecture sobre et rationnelle, elle a su s'adapter à différents usages et garde un potentiel d'une qualité indéniable. A l'origine de notre travail : un paradoxe. Le bâtiment conserve sa qualité originelle et appelle à une réhabilitation respectueuse. Un bâtiment culturel regroupant une médiathèque et deux salles de cinéma nécessite une présence et des espaces adaptés. Plutôt que de les confronter, nous préférons les associer pour inventer un enrichissement mutuel. Profitant de sa position "centrale", le projet redonne à La Grenette son caractère de halle, de marché. L'espace accueille naturellement la médiathèque ouverte directement sur la ville sur les trois premiers niveaux. Sur les étages supérieurs, les salles de cinéma apparaissent au sein d'une nouvelle toiture. Des volumes différenciés créent une composition mesurée. Le cuivre vient unifier cette nouvelle volumétrie telle une "réduction urbaine" précieuse, expressive et valorisante. Cette intervention volontaire conjugue la valeur patrimoniale du bâtiment et l'expressivité nécessaire à la réussite d'un projet culturel. Il ne s'agit donc plus d'un projet bipolaire mais plutôt d'une mise en complicité qui ferait de "La Grenette" un lieu d'échange transversal. Le paradoxe initial devient une force. La Grenette revit. Elle retrouve sa fonction originelle : elle conserve, alimente et anime à nouveau la vie yssingelaise.

(Fabre/Speller)

#### **Rénovation et reconstruction de la médiathèque municipale de Lannion – France 2006**

3.345 m<sup>2</sup>, € 3.150.000

La médiathèque de Lannion est aménagée dans d'anciens corps de bâtiment du couvent Sainte-Anne, situés rue de Kérampont. Les bâtiments concernés sont l'aile XIXème du couvent, dit «bâtiment de communauté» situé au sud-ouest du Cloître, la «maison d'accueil», édifice XVIIIème plusieurs fois remanié et la chapelle XIXème et ses annexes. La médiathèque est accessible depuis la rue mais aussi depuis les jardins du Parc. Une nouvelle galerie vitrée est construite en liaison entre le bâtiment de communauté, la maison d'accueil et la chapelle, pour servir d'entrée et d'espace d'exposition. L'originalité de la médiathèque de Lannion est de proposer une relative mixité des lieux de lecture et de consultation, en considérant les deux principes suivants : accueillir en rez-de-chaussée les espaces de plus grande animation (multimédia, actualités et espace jeunesse) et associer section adultes et section littérature aux grandes salles des 1er et 2e niveaux en profitant de l'attractivité de l'espace musique et médias. Ces principes sont exprimés par la création d'un grand escalier qui s'inscrit en continuité de l'espace de la galerie du cloître et dessert l'ensemble des niveaux. Hormis la grande galerie de liaison à l'entrée et la création d'un escalier monumental, le traitement architectural des bâtiments exploite sobrement les dispositions intérieures sans modifier l'expression extérieure de l'édifice. L'entrée est marquée par l'aménagement d'un parvis dégagé, les grandes divisions des espaces sont conservées, pour une meilleure communication entre les salles quelques percements sont créés. (Fabre/Speller)

#### **Construction de la médiathèque de Bourgoin-Jallieu – France 2003**

2.490 m<sup>2</sup>, € 2.080.000

La médiathèque de Bourgoin-Jallieu, située dans l'extension du centre-ville, témoigne du passé industriel du site tout en offrant une large ouverture sur l'aménagement projeté et sur le parc de la Villa Diederichs contigus. Elle s'organise selon trois entités spatiales : - un grand bâtiment "galerie" vient clore le parc. Il offre un rapport urbain direct et marqué face à l'environnement proche, - au sein d'une tour, l'auditorium s'apparente à un lieu privilégié. Il particularise un fonctionnement autonome, - adossées aux murs du bâtiment "galerie", neuf nefs successives viennent couvrir et identifier les différents secteurs. Cet ensemble offre alors une forte présence au site et au développement futur du quartier. La médiathèque peut alors offrir une large ouverture sur la ville tout en préservant des lieux calmes et lumineux propre au livre. La minéralité de la galerie (pierre et béton), le cuivre de la tour, le bois des nefs soulignent les particularités tout en composant un ensemble harmonieux et durable. Un fonctionnement de plain-pied pour l'essentiel des espaces de prêt garantit une grande efficacité d'utilisation tout en préservant des espaces de travail et d'activités spécifiques protégés en étage. La simplicité des différents espaces offre une lecture évidente du bâtiment tant dans son usage que dans son apparence globale (matériaux, ambiances lumineuses,...). Un rapport fort au site permet un dialogue permanent et évolutif entre la trame urbaine projetée, le site existant et l'image du bâtiment public au sein de la ville de Bourgoin-Jallieu. (Fabre/Speller)

## Transformation de l'Hôtel Dieu en médiathèque de Dôle – France 2000

3.700 m<sup>2</sup>, € 3.200.000

L'émotion première que procure l'édifice provient de la façade. Mais plus forte est celle qui atteint le visiteur dès son entrée dans la cour du "cloître". Ce contraste fait de l'hospice de Dôle un édifice approprié à une vie intérieure forte. Cette signification globale de l'édifice peut bien correspondre à l'image traditionnelle d'une bibliothèque comme lieu de conservation du savoir et d'étude, mais elle s'oppose à l'image ouverte d'une médiathèque contemporaine. C'est cette contradiction que le projet devait résoudre. L'espace de lecture et d'accueil redevient emblématique et offre l'émotion intérieure et la chaleur silencieuse de nos anciennes bibliothèques. Le bâtiment est aménagé à partir "d'espaces-meubles" signifiant chacun un usage et formant un signal intérieur. La réutilisation du bâtiment de l'Hôtel Dieu ne cherche pas d'effet d'éclat mais vise au respect de l'édifice dans son architecture intérieure comme dans son expression urbaine. Ce mode de réutilisation permet d'habiter les lieux en réinterprétant leur nature spatiale et historique. Notre intervention se veut alors réversible face au fonctionnement d'une médiathèque en constante évolution. Ce mode d'intervention est un gage d'économie, d'efficacité et perpétue la tradition des constructions des bibliothèques. En associant deux modes de réinterprétation du bâtiment : apport de fonction, meubles et revalorisation des rapports de l'édifice avec la ville ; nous retournons la contradiction entre lieu fermé et médiathèque "diffusante". Il ne s'agit plus d'attirer l'œil mais d'attirer l'esprit et de redonner force et actualité à l'ambiance chaleureuse des vieilles bibliothèques. (Fabre/Speller)

### Restructuration et Modernisation Bibliothèque Municipale de Tours – France 2013

COÛT : 3 000 m<sup>2</sup> (SHON), 2 800 000 € HT, MAÎTRE DE L'OUVRAGE : VILLE DE TOURS

LIVRAISON : 2013

La Ville de Tours envisage une complète restructuration et une modernisation de sa Bibliothèque. Construite après-guerre par l'architecte Pierre Patout (\*23.05.1879 Tonnerre - + 21.05.1965 Rueil-Malmaison) dans un style Art Déco (1954 – 1957), la Bibliothèque nécessite une mise aux normes et une réhabilitation complète, qui seront exécutées en plusieurs tranches de travaux. En contact avec les Bâtiments de France, nous envisageons une mise en valeur de ses magnifiques volumes intérieurs, et nous proposons des plateaux de lectures flexibles, modernes et contemporains, à la hauteur de l'envergure culturelle de l'opération. (Fainsilber)

### Bibliothèque Municipale Vocation Regionale de l'Alcazar, Marseille – France 2004

La façade en marbre-verre, translucide est la vitrine de la bibliothèque sur la ville qui protège du soleil de l'ouest tout en laissant transparaître la richesse de la matière (3 millimètres de marbre compris entre deux panneaux de verre extra blanc). Les panneaux de marbre-verre sont assemblés comme les pages d'un livre ouvert. L'organisation de la Bibliothèque répond au souci de permettre au lecteur de se situer et de s'orienter facilement dans cet édifice de grande taille, grâce, d'une part à la lisibilité des espaces et d'autre part à un principe de circulation clair qui permet aux visiteurs de repérer facilement les ascenseurs panoramiques de la rue centrale qui irrigue la bibliothèque sur toute sa longueur du Cours Belsunce à la Place de la Providence. La lumière naturelle inonde la rue intérieure ; une verrière la couvre sur toute sa longueur ; des brise-soleil la protège et diffuse la lumière de manière indirecte. L'un des objectifs essentiels que nous nous sommes fixés est celui d'assurer le maximum de flexibilité interne pour que la Bibliothèque puisse s'adapter à l'évolution permanente des nouvelles techniques de la communication liées aux progrès incessants de l'informatique. (Fainsilber)

### Médiathèque Albert Camus, Carnoux-en-Provence – France 2007

2007 - 2008 Lauréat du Grand Prix Départemental de l'Architecture, de l'Urbanisme et du Paysage, Conseil Général 13 - CAUE 13, (Médiathèque "Albert Camus" Carnoux)

opposite design : Studio ST Architects, New York : <http://www.studio-st.com> !!

The multimedia library in Carnoux is nestled in the natural geography of the town. The site lifts the spirit, whit its ancient pines, its delicate mix of trees, its silhouette and its view, but also by the fact final the town is so close by it rises up from the foot of the hills, en "inhabited restanque" punctuated with a vast window looking out at nature. Soft and delicate, the building made of white Madagascan marble, opens up to the south over a peaceful garden carved out of the rock. This garden extends the space and creates perspectives, lengthens distances and eliminates boundaries. Speeding knowledge is a major task. Here, everything is designed so that the user can work in peace, and communicate within the building. The idea of e hub of information responds to the needs of the different areas but also to the open general space. Inside, the multimedia library takes up the whole of the hall. Large and light, you can see the whole collection in one go. A large window the whole height of the room looks out to the road and the nearby trees. From the hall you can see the reference room, with the adult and youth collections. Shelves, tables and storage space define the work area and the passageways. As well as this main room, there are three "alcoves"; the records room, the music and reading room and an area dedicated to storytelling. These different areas are organised around a long, narrow patio. The flooring is made up of crushed Madagascan marble and reflects a soft and welcoming light. The architecture, resolutely part of the landscape, is governed by the ephemeral – clouds, wind, seasons. As well as place of construction and dissemination of different media, this multimedia library has become a space of interaction, pleasure and reflection. ### Médiathèque John Lennon et Pôle Administratif, Courneuve – France

Création d'une Médiathèque et d'un pôle administratif à La Courneuve, Restructuration des anciennes usines Mécano  
Architectes : flint (Véronique Tastet, Christophe Gautié), Maîtrise d'ouvrage : Communauté d'agglomération Plaine Commune  
Surface : 5.020m<sup>2</sup> SHON, Montant des travaux : 10.800.000€ HT, Concours (loi MOP) : août 2010, Chantier : février 2012  
Livraison : novembre 2013

....Parmi les derniers projets illustrant ce savoir-faire figure, à la Courneuve, en Seine-Saint-Denis, la réhabilitation de l'ancienne usine Mécano en médiathèque et pôle administratif. Concours remporté en septembre 2010, le projet est actuellement en phase APD, pour une livraison prévue en novembre 2013....

Par ailleurs, «il était important de distinguer les deux programmes, c'est-à-dire de concevoir des halls d'entrée distincts au niveau du rez-de-chaussée».

Résultat : la médiathèque et son hall d'accueil sont répartis dans deux volumes occupant trois travées, les espaces administratifs en occupant deux.

A volumes distincts, revêtements communs car «il s'agit in fine du même bâtiment». Bardage bois «qui offre un contraste intéressant avec la brique et meulière des surfaces existantes» et métal perforé alternent donc au rythme des travées plutôt que des programmes. «Le métal perforé fait écho aux anciennes grilles surplombées par l'inscription 'MECANO' que nous avons conservée. Nous avons remplacé les grilles par une maille ajourée qui se déploie également sur les faux-plafonds des halls de la médiathèque et du pôle administratif», dit-elle.....

**Bibliothèque Interuniversitaire à Marseille – France on design (2013)**

6 janvier 2011 - Concours lauréat : Maître d'ouvrage : Ville de Marseille, Espagno Milani architectes co-traitants

Montant travaux : 12.302.000 € HT, Surface : 8.090 m<sup>2</sup>

### **Objectif**

Regrouper plusieurs entités de laboratoires au sein d'une bibliothèque inter-universitaire, sur le site de l'îlot Bernard-Dubois, afin de créer un nouveau pôle consacré à l'enseignement. Désengorger les sites existants de recherche en économie publique et en économie de la santé, et fournir un véritable outil pédagogique pour les étudiants.

### **Projet**

Il s'agit de réaliser un bâtiment de 7 800 m<sup>2</sup> de surface hors oeuvre nette composé de deux pôles, l'un consacré à la bibliothèque inter-universitaire au niveau inférieur, l'autre à la recherche au niveau supérieur. Avec près de 820 places prévues – soit une capacité d'accueil de 5000 étudiants -, cet équipement devra répondre aux besoins des étudiants en droit et en économie de la Canebière et de la halle Puget – qui ne disposent pas actuellement de surfaces suffisantes -, mais aussi à ceux des équipes de recherche qui seront installées sur place. Ce bâtiment regroupera aussi, sur près de 3 300 m<sup>2</sup> de surface hors oeuvre nette de bureaux, plusieurs équipes de recherche – Inserm, Greqam Idep, Shadyc, Ehess – actuellement réparties sur plusieurs sites.

### **Etudes**

Le lauréat du concours de maîtrise d'œuvre a été désigné fin 2010. Il s'agit de l'équipe « Fradin & Weck », Spc Espagno et Milani, Technip Tps et Ingeco.

### **Travaux**

Le début des travaux est prévu pour le 1er semestre de l'année 2012. Ils devraient s'achever à la fin 2013.

### **Cadre**

Une convention de mandat de réalisation a été confiée à Marseille Aménagement par la ville de Marseille.

### **Coût global**

22,8 millions d'euros Ttc. (<http://www.marseilleamenagement.com>)

La construction d'un ensemble de 5 niveaux sur sous-sol partiel, comprenant une bibliothèque inter-universitaire sur deux niveaux (rez de jardin et rez de chaussée) et de laboratoires de recherche sur 3 niveaux (R+1 à R+3) au coeur de l'îlot Dubois, à l'interface entre le secteur historique de Belsunce et les nouveaux quartiers en cours d'aménagement autour de la Porte d'Aix.

Les deux entités du projet sont intégrées dans une volumétrie homogène mais sont bien identifiables dans leur écriture. La bibliothèque est le socle de l'édifice en béton brut, finement percé, sur lequel reposent bureaux et laboratoires, paré d'une façade légère et très rythmée d'acier et de verre. (Fradin)

#### **Médiathèque Aimé Césaire, Oullins – France 2010**

Médiathèque Secteur Sémard à Oullins (69), Maître d'ouvrage : Ville d'Oullins, Shon : 2 560 m<sup>2</sup>, Montant des travaux : 4 900 000 euros hat, Concours : 2006, Livraison : 2010

Rez-de-ville, ouvert et « perméable » à son environnement, la médiathèque est un repère et participe à l'appropriation de ce quartier en mutation. L'architecture s'exprime à partir de trois matériaux : la pierre pour le sol du parvis et des espaces intérieurs, le bois est utilisé pour toute la structure qui supporte la toiture et les façades vitrées. Le volume de verre s'appuie quant à lui sur le volume de pierre et donne une échelle monumentale à l'ensemble. Le principe constructif permet de dégager des grands plateaux ouverts aux regards et à la lumière naturelle. Pour autant l'implantation et la distribution de ces plateaux ménagent une échelle et une intimité propices au travail ou à la détente. Notre projet s'appuie sur la rue de la République, le long de l'alignement, dense et régulier, des immeubles d'habitation. C'est sur cette rue que l'on trouve l'accès au parking ainsi que l'accès de service. Un socle minéral intègre, en sous sol, les parkings et constitue à la fois le parvis et le rez-de-chaussée de la médiathèque sur lequel sont construits les éléments constitutifs de la médiathèque : > Une boîte de pierre, parallélépipédique, qui accueille le « hard » du programme, les « espaces servants ». > Des portiques en bois dans un volume transparent permettant de protéger les espaces de lecture et d'échanges.

> Une couverture mince et claire, qui sert de auvent et de récepteur. Elle fonctionne comme un signal. Le confort acoustique est traité selon différentes zones : Au nord, l'atrium possède des parois absorbantes : le revêtement mural en pierre, comme le plafond, sont perforés. L'escalier principal, « encastré » dans la boîte de pierre, canalise les déplacements et les sources sonores associées. Les plateaux adultes et enfants ont des planchers en bois sur chant et des plafonds absorbants. Le mobilier apportera les corrections complémentaires. (Gautier)

#### **Médiathèque du Lyon Bachut Bème – France 2007**

A block in the Bachut district, in Lyons, including a media library, 80 apartments, a supermarket, outdoor areas, 110 parking spaces and 139 garages below ground. Project owner : City of Lyons, surface area : 10,720 m<sup>2</sup>, Total cost of works : euros 11,800,000 excluding tax. Competition winner : 2003, Delivery in : 2006

The interaction of indoor and outdoor spaces, their respective status, their interrelationships, the way they are distributed (their address) constitute the rules of urban architecture. In our view, it seemed important that the respective position of each of the elements of the scheme allow the status of the outdoor spaces extending from them to be emphasised. The media library therefore becomes the logical extension of Place du 11 novembre, the clear glass used in its fully glazed façade (possible thanks to the double skin) providing transparency during the day and, conversely, allowing light from the media library to illuminate the square at night. "The interaction of indoor and outdoor spaces, their respective status, their interrelationships, the way they are distributed (their address) constitute the rules of urban architecture. The scheme's mix constitutes a town-planning element in its own right.

In our view, it seemed important that the respective position of each of the elements of the scheme allow the status of the outdoor spaces extending from them to be emphasised. The media library therefore becomes the logical extension of Place du 11 novembre, the clear glass used in its fully glazed façade (possible thanks to the double skin) providing transparency during the day and, conversely, allowing light from the media library to illuminate the square at night. The media library's function of disseminating information and cultural awareness is highlighted by a tower, symbolising an information beacon and allowing the emergence of the

gable end of the building on avenue Berthelot to be dealt with. Naturally, the shopping area is located on the ground floor and forms a showcase along rue Marius Berliet, whereas the apartments are located above and overlook the heart of the block. On the street side, the facades of the apartment buildings act as a shield against the noise of the street and the north wind. (Gautier)

## **Philippe Gazeau Architecte, Paris – France**

<http://www.philippegazeau.com>

### **Libraries :**

#### **Médiathèque Romain Rolland, Cité Chachin, Romainville – France 2004 – 2011**

Surface : 2 085 m<sup>2</sup> SHON, Coût : 3 730 000 € HT, Phase : Batiment livré, Programme : médiathèque, auditorium

La médiathèque de Romainville s'installe au coeur d'une cité rénovée. Le désenclavement recherché par les urbanistes propose de fragmenter les barres de logements existantes et de dégager une plaine centrale pour accueillir un grand jardin et deux équipements dont la médiathèque qui doit servir d'élément attractif à l'échelle du quartier. C'est la couverture végétalisée du projet qui donne l'impulsion première. Les collines du toit transmettent le mouvement ondulatoire jusqu'au sol de la plaine centrale à travers l'espace de la grande salle de lecture à l'étage au confluent en négatif des ondes de la toiture sur son plafond. Le volume de la médiathèque est dans un même mouvement soulevé au-dessus du niveau de la rue et du jardin public, et glissé sous les ondulations de sa toiture végétale. L'exosquelette ceinturant et frôlant l'empennage vert kaki et les faces entièrement vitrées de l'étage permet d'étayer et d'arrimer sur les flancs béton du socle le volume en porte à faux de l'étage. L'espace intérieur de la salle de lecture orienté et en surplomb sur rue et sur jardin n'est pas seulement traversant, il est traversé et suspendu par le paysage qui se retourne en plafond.

[http://www.philippegazeau.com/fr/img/cintact/contents/123/123\\_001.pdf](http://www.philippegazeau.com/fr/img/cintact/contents/123/123_001.pdf)

#### **Bibliothèque, École Normale Supérieure, Paris 5<sup>e</sup> (Rue d'Ulm) – France 1999 - 2006**

Surface : 7 617 m<sup>2</sup> SHON, Coût : 12 700 000 € HT, Programme : Bibliothèque littéraire, bibliothèque de mathématique auditorium, salles de cours, 58 chambres étudiants

Partie intégrante de l'îlot urbain constituant le site de l'École Normale Supérieure, le projet d'extension occupe une cour en arrière-plan de l'entrée et des bâtiments principaux. Cette arrière-cour est une plate-forme surplombant une des trois rues bordant l'emprise du site universitaire. Grâce à cette disposition urbaine particulière, le nouveau bâtiment apparaît soit comme un pavillon en terrasse côté cour, soit comme un immeuble de huit niveaux côté rue. L'extension est ainsi placée dans une situation intermédiaire, entre deux niveaux, entre deux façades, comme un passage construit entre le niveau haut de l'école et le niveau bas de la rue, entre les façades néoclassiques sur cour, et les immeubles de l'autre côté de la rue Rataud, entre l'espace privé de l'école et l'espace public de la rue. Le projet actionne un dispositif de mise en relation physique et visuelle par et à travers le vide qu'il remplit, ce qui génère un espace architectural et urbain singulier traitant non pas d'insertion et encore moins d'intégration, mais plutôt d'ingérence et d'intrusion urbaine.

[http://www.philippegazeau.com/fr/img/cintact/contents/123/123\\_001.pdf](http://www.philippegazeau.com/fr/img/cintact/contents/123/123_001.pdf)

#### **Médiathèque, cinéma, Mouans-Sartou – France 2001**

Maître d'ouvrage : Ville de Mouans-Sartoux, Surface : 2 060 m<sup>2</sup> SHON, Coût : 1 900 000 € HT, Programme : Médiathèque, archives municipales, 3 salles de cinéma

### **Awards :**

Prix Architecture 2002 CAUE des Alpes Maritime

Prix special Environnement du Grand Prix d'architecture et du paysage de la région PACA 2003

La nouvelle médiathèque de Mouans-Sartoux (Alpes-Maritimes) avec ses trois cinémas accolés est exemplaire à plus d'un titre : son architecture, sa démarche HQE (haute qualité environnementale) et son système de climatisation au gaz naturel. Conçue d'un trait pour le concours, la construction fut pourtant soumise à une procédure HQE. Le projet s'impose par son évidence et sa liberté de conception. Les servitudes techniques sont assumées et les matériaux sont utilisés sans détour, au maximum de leur potentiel. L'architecte se montre tenace pour livrer une construction extrêmement simple qui organise les lieux, intérieur/extérieur, sans les figer. Les critères d'économie qui lui étaient imposés sont respectés. Philippe Gazeau livre là une architecture d'auteur tirée au cordeau et la commune accomplit un travail d'éditeur. Le choix énergétique a été objectivement étudié avant d'être décidé, afin d'assurer une température ambiante confortable. En résulte une stratégie globale : médiathèque chauffée et rafraîchie, cinémas conditionnés et un choix de l'énergie, le gaz naturel. Le chaud et le froid sont produits par une machine à absorption réversible alimentée au gaz naturel (puissances de 169 kW en chaud et de 141 kW en froid). L'ensemble des installations, comprenant également quatre centrales de traitement d'air pour les cinémas et l'administration, est intégré dans un décaissé de toiture. Le même souci d'intégration a présidé au choix d'un plancher chauffant – rafraîchissant pour la médiathèque. Au terme d'une année de fonctionnement, les résultats satisfont à la fois les objectifs de confort et de coût.

<http://syndicat-architectes.fr/files/2011/09/Passion-02.pdf>

## **Jean-Baptiste de Giacinto, Bordeaux – France**

<http://www.jeandegiacinto.com>

### **Libraries :**

#### **Bibliothèque Universitaire, Bayonne – France 2008**

Maître d'oeuvre : Jean de Giacinto Architecture Composite, Architecte associé : Duncan Lewis Scape Architecture, Maître d'ouvrage : Ville de Bayonne, Architecte chef de projet : Sébastien Causse, Date de concours : septembre 2005, Date de livraison : décembre 2008, Surface : 1 998 m<sup>2</sup> SHON + 200 m<sup>2</sup> parvis, Budget : 4 900 000 € HT

Situé dans le campus de la Nive à Bayonne, la bibliothèque construite par Jean De Giacinto Architecture Composite est un exemple dans l'architecture contemporaine alliant la conservation du patrimoine. L'agence a été opposée lors du concours aux cabinets : Prunet, l'atelier Daniel Rubin et M. Stinco, elle a été lauréate en septembre 2005. Les aménagements ont été achevés en décembre 2009.

C'est sur un site investi par la nature et particulièrement les arbres que les architectes ont été conviés de construire la bibliothèque universitaire Florence Delay. Proche du Château Neuf et des bâtiments militaires subsistants, la construction de cette bibliothèque

incluait la conservation de plusieurs éléments du site qui sont le cavalier Vauban (le talus), le tunnel en pierre traversant le talus, et le mur pareboulet.

Durant la phase chantier, la masse de terre a été déplacée. Elle a été remise en place afin que le talus retrouve sa volumétrie initiale, il est intégralement recouvert de terre végétalisée du côté du cavalier. Les matériaux employés proviennent de la région comme le grès ou la pierre de Bidache dans le tunnel.

Le bâtiment se démarque par sa façade inclinée à 43% en verre, un filtre composite en béton vient la couvrir. De par sa volumétrie, elle reprend le profil du talus initial. Avec les nombreux arbres vivant sur le talus, celui-ci était donc enraciné, si aujourd'hui les arbres ont disparu, les racines se sont figées à travers les pare-soleils en béton. Certains des chênes ont été transformés en mobilier par Christophe Doucet.

Avec une surface de 2 000 m<sup>2</sup>, la bibliothèque abrite 45 000 volumes avec une capacité de 130 étudiants. La bibliothèque s'intègre dans le plan visant à ouvrir les bibliothèques à la fois aux étudiants et à la fois au public. C'est également l'occasion de restituer le patrimoine à ces habitants. Le tunnel a été restauré et intégré à la construction pour offrir un lieu de lecture sans gêne.

L'espace s'organise selon trois bandes longitudinales, la première correspond à l'espace de travail accolé à la verrière, la seconde est l'espace consacré aux postes informatiques, la dernière est le rayonnage des livres. La bibliothèque se développe sur deux niveaux. L'intérieur est traité avec la teinte claire du béton, elle est accompagnée avec la couleur blanche du mobilier.

Du point de vue énergétique, le bâtiment bénéficie d'une importante inertie due à sa qualité semi-enterrée. La bibliothèque est équipée d'une ventilation double flux avec des puits canadiens, ce dernier permet d'économiser près de cinq degrés dans le préchauffage et le rafraîchissement naturel. La verrière est quant à elle constituée de vitrage avec isolation renforcée (Uw 1.12 W/m<sup>2</sup>C, Ug 1.6Wm<sup>2</sup>C). Il conviendra que l'entretien d'un tel talus n'est pas aisé, du fait de sa forte pente, la ville a choisi un moyen de tonte 100% naturel et donc en adéquation avec les performances énergétiques : la chèvre en liberté !

(<http://www.actu-architecture.com>)

## **Jean-Louis Godivier, Paris – France**

<http://www.jeanlouisgodivier.com>

D'Architecture 1993

<http://www.godivier.free.fr>

### **Libraries :**

#### **Médiathèque Megève (Dep. Haute Savoie, Reg. Rhône-Alpes) – France 2004**

Maître d'ouvrage : VILLE DE MEGEVE, Architecte : GODIVIER Jean-Louis, Construction d'une médiathèque sur le site du palais des sports et des congrès. Surface totale : 2 764 m<sup>2</sup>, Montant des travaux (hors taxes) : 5 155 171 euros

#### **Médiathèque Pontarlier (Dep. Doubs, Reg. Franche Comté) – France 2002**

#### **Médiathèque Marceline Desbords de Vaise à Lyon – France 2001**

La médiathèque de Vaise est située place Valmy, en plein cœur du quartier de Vaise. Bâtiment de 3600 m<sup>2</sup> construit sur 4 niveaux (2500 m<sup>2</sup> ouverts au public), la médiathèque offre, depuis son ouverture en novembre 2000, trois espaces de bibliothèques, chargées de l'accueil du jeune public, des adultes et des personnes intéressées par le théâtre et les arts du spectacle. Des espaces de travail et de consultation Internet sont à la disposition du public.

#### **Médiathèque de Chataudun (Dep. Eure-et-Loire, Reg. Centre) – France 2000**

#### **Médiathèque et Bibliothèque Universitaire de Roanne, Roanne (Dep. Loire, Reg. Rhône-Alpes) – France 1997**

La Médiathèque de Roanne a ouvert ses portes en 1997. C'est une réalisation de l'architecte Jean-Louis Godivier qui offre sur plus de 4 000 m<sup>2</sup> des services dédiés à la lecture et la découverte culturelle. Elle met à disposition du public plus de 140 000 documents imprimés, sonores, audiovisuels et multimédia à emprunter et à consulter et propose une programmation culturelle tout au long de l'année centrée sur le livre. Elle intègre une bibliothèque universitaire, service délocalisé du SCD de l'Université Jean Monnet de Saint-Etienne. Les collections patrimoniales sont le fruit des confiscations révolutionnaires et de legs et dons successifs faits surtout au 19<sup>ème</sup> siècle. Le legs fait en 1898 par Auguste Boullier (1832-1898) constitue aujourd'hui l'une des richesses des fonds anciens de la Médiathèque. Cette collection de premier ordre sur Venise et la Vénétie rassemblant des manuscrits, des ouvrages imprimés et des estampes du 15<sup>ème</sup> au 19<sup>ème</sup> siècle est le témoin de la quête d'un érudit italo-phile qui a su construire un ensemble d'environ 7 000 volumes autour de certains thèmes qui lui étaient chers (historiographie vénitienne, œuvres de L'Arétin et Dolce, Interdit de 1606). Les archives historiques de la Ville, ainsi qu'une documentation variée sur le Roannais et son histoire industrielle font également partie de ce volet patrimonial. (<http://www.adbgv.asso.fr>)

#### **Centre Culturel – Médiathèque – du Parc à Drancy (Dep. Seine-Saint Denis, Reg. Île-de-France) – France 1993**

#### **Médiathèque, Salle de Spectacles, Auditorium (Complex Culturel) Équinoxe, Châteauroux (Dep. Indre, Reg. Centre) – France 1994**

Le Centre culturel Équinoxe à Châteauroux fut terminé en 1994. Le programme est important pour une ville de cinquante mille habitants : quatorze mille mètres carrés, plus de cent quatre-vingts millions de francs. Il y eut un concours national d'architecture. L'architecte parisien Godivier fut lauréat. On comprend que le projet, son image, aient séduit le jury. La liberté des formes peut être interprétée comme une composante de l'expression contemporaine ; l'image convenait pour emporter la décision d'un jury. Godivier avait auparavant été l'architecte des centres culturels de Thiers et Drancy.

Mais l'ouvrage doit intégrer toutes les contraintes de situation, de terrain, de programme, de dialogue avec l'existant, il doit prendre en compte des considérations multiples qui ne peuvent être qu'effleurées lors de l'esquisse. La forte parole des militaires : " la carte n'est pas le territoire " aide à faire réfléchir à la distance qui existe entre l'image proposée lors d'un concours et la réalisation, entre une idée séduisante pour le jury et la réalité : un terrain trop étroit pour un programme trop vaste, un volume très libre par rapport au voisinage, des formes qui sans doute sont voulues pour personnaliser l'ouvrage, et qui par leur développement, leur caractère provocant, par leur échelle surtout, affirment l'édifice, mais aussi, heurtent les perspectives.

Pour caractériser Équinoxe, est-ce le terme " architecture " qui convient, ou plutôt " design gestuel " ?

" Design " : concept plus habituellement lié à l'objet ménager ou industriel à durée de vie limitée – bouilloire, meuble, automobile. Équinoxe a transformé l'échelle du design. Une question : toutes les formes ont-elles vocation à s'adapter à toutes les échelles, dans l'espace... et dans le temps ? " Gestuel " parce que les lignes, les angles, les volumes définis par le trait, expriment la spontanéité, l'autonomie du geste.

La revue Techniques et Architecture (3-92), qui présentait Équinoxe, évoquait " un assemblage de formes guidé par un plaisir du dessin, dont les espaces intérieurs sont lotis par la suite, selon les besoins ".

Laissons le jugement sur les aspects fonctionnels, mais l'assemblage de formes guidé par un plaisir du dessin correspond bien à l'esprit du concours, puis ensuite au développement de l'esquisse. Dans l'approfondissement du projet, les espaces de liberté sont réduits, l'architecte est prisonnier de l'image d'origine. On l'a remarqué dans de nombreuses réalisations, pour la Bibliothèque Nationale de France en particulier. Le concours entraîne dans son enfermement l'architecte qui s'est engagé, le maire et le jury qui ont décidé, les utilisateurs qui ont des difficultés à faire passer leurs propres messages, leurs besoins programmatiques et fonctionnels. N C GUILLOT Architecte mandataire, JB CUBAUD ET RANDY assistants

1.990 m<sup>2</sup>, € 5.100.000 HT

Vallée et montagne caractérisent Saint Jean de Maurienne dans un échange continu dominé-dominant : le projet se pose comme un acte circonstancié de cette situation. La rigueur d'un parallépipède organise les accès, la douceur de la courbe accompagne l'œil dans les méandres urbains depuis le centre ville jusqu'aux sommets qui dominent de toutes parts les constructions. Des lames de verre verticales, semi opaques et orientées créent un voile de lumière diffuse autour et dans tout le bâtiment. Le verre, unifie et inscrit le projet dans le paysage des roches de quartz et des neiges éternelles, lieux et matériaux de mémoires enfouies, comme pour mieux en révéler la substance. La première approche intérieure de la médiathèque offre en lecture verticale, directement la vue sur les différents espaces, en contre plongée dans une « faille » qui intègre les escaliers. Cette verticale, est aussi lieu d'expositions le long du parcours . Des plateaux « libres » offrent une grande flexibilité aux espaces de consultation. La transversalité libre favorise le passage d'un thème à un autre, la découverte d'autres sujets. L'étagement des secteurs reproduit le degré d'animation du programme : Les plus jeunes en rez, les adultes et adolescents à l'étage, les archives au sommet. (Guillot)

Vallée et montagne caractérisent Saint-Jean-de-Maurienne dans un échange continu dominé-dominant: le projet se pose comme un acte circonstancié de cette situation. [Extension Lycée Louis Blériot, Bibliothèque, Marignane, Marseille – France 2004 - 2010](#)

[Extension Lycée Alphonse Daudet, Bibliothèque, Tarascon \(Arles\) – France 2009](#)

PACA (Provence-Alpes-Côte d'Azur), 3.200 m<sup>2</sup>, € 7.200.000

The double extension of the Alphonse Daudet Lycée in Tarascon raises the question of responsibility when building on a remarkable site

- Lycée built in 1933 by Gaston Castel (Grand Prix de Rome), listed as a historical monument;
- Kilmaine barracks, site listed as a historical monument, built in 1718, by the architect Desfour.

The building operation considers the memory of the site and territorial identity as narrative elements, as an extension of its morphology. In a site steeped in history, within a team whose role is to pass on our secular and republican values, there is no room for arrogance and pompous architectural features. Spatial order is achieved by incorporating programmatic and contextual constraints, within a unique process of shape generation. The facades comply with the laws of barrack composition: podium, buttress, minerality, succession of sober openings, following a repetitive cutting module, in a subtle allegory of the loophole. Pitted, coloured concrete, deployed over the entire construction, betrays the vanity of the artifices of architectural design and pays homage to traditional military constructions, massive, robust, sober and efficient. No plastic feats or material preciousness. The buildings, armed with abstraction, turn towards the only permanent elements of the site. Only tactics, specific devices, no feigned mannerisms.

Two considerations have given rise to the building's design:

- one involves the status of image and its symbolic efficiency in space mastering and in crystallising intentions;
- the other concerns the secular tectonic tradition and semantic use of construction as a vector of cohesion and readability of the constructed object.

All is played out in the ambivalent perception of the buildings. Spelled out in a singular, monolithic and mineral shape. Their billhook fashioned geometry fulfils their silent forms, proclaiming them as a system, in perfect symbiosis with the site. How to make a building credible in an era flooded with icons, counterfeits, as in the Ventimille market? Not in the art of cloning erected as a communications strategy. Not by using and abusing architectural processes where conventional architectural writing is enough to belong, the implication and recognition of an egocentric cultural system void of meaning. The architectural project is like a beautiful woman, invention keeps the flame alive. It is commonplace to say that the building is LEB. Nowadays, there are OCDs (obsessive compulsive disorders) in our profession, if you throw LEB at an engineering office, they will generally answer "external insulation, cladding and wood boiler". [Médiathèque Four Banal, La Turbie – France 2010](#)

100 sqf.

In the old village of La Turbie, close to the Trophy of August, we were asked to transform an old abandoned oven in a mediathèque. The realization of such a program, in this particular place, only composed of village houses, is atypical. The plot is surrounded by four existing buildings, and so, the majority of the elevations are blind. The surface of the plot is 100 m<sup>2</sup> and half of this surface is occupied by two old ovens. In this project, we propose to play with the contrast between subjects, textures and feelings felt in the streets of the village and those that we would find in a mediathèque. While respecting the history of this place that is so important for the inhabitants, this project is as atypical as the program and its geographical situation. The old ovens are completely demolished to create a maximum of surface. Their memory is preserved by the projection of their footprint on the ground. In this small place, we designed mobile and ludic systems to answer to the complicated program and its different functions. Along the peripheral walls are nested linear racks, illuminated by tubes of light embedded in the wall, in a high position. These shelves can receive books and also small colored seats and caster boxes. A large piece of furniture divides the space, playing with the different perspectives. It offers a desk and two computers. Sliding partitions with magnetized surface can be used for posting, creating animation on the wall. A partition on casters nestled in the wall of the toilets can be opened, doubling the surface of posting. This partition can also act as a projection screen. A large glass roof illuminates the reading areas with natural light. Artificial lights in a shape of drops water materialize the ludic space that is at the place of the old ovens. The pieces of furniture are all in white enameled wood. This colour was chosen to increase the feeling of space and to contrast with the colours of the architecture of the village. Three colours were chosen for the furniture which punctuates the space. A glassy wall is printed of quotations of famous authors who wrote about La Turbie. This glassy wall comes in superposition of the existing stone facade, writing a new page in the history of the village, without disclaiming the past. (<http://www.archdaily.com>)

[Médiathèque Ulysse, Saint-Denis – France 2011](#)

....La médiathèque est implantée au cœur du quartier Franc Moisin, à proximité du lycée Suger. Cet équipement affiche sa façade principale sur la placette créée à l'angle de l'avenue Le-Roy-des-Barres et du cours du ru de Montfort. Le site choisi offre la

possibilité de mettre en scène ce bâtiment symbolique de l'action culturelle et de la volonté de mixité urbaine (logements – équipements – activités), dans un quartier en devenir.

Un bâtiment lisible à livre ouvert

A l'image d'un livre ouvert, les dispositifs utilisés par l'architecture permettent de comprendre l'organisation interne des lieux depuis l'extérieur, invitant ainsi la population à fréquenter l'établissement : transparence, jeux des volumes et façade communicante. La médiathèque (liée à la salle de quartier) est un bâtiment lisible depuis l'espace public.

- La transparence en rez-de-chaussée donne à voir la grande salle hypostyle qui intègre les différents secteurs publics de la médiathèque. Cette transparence est maîtrisée : la façade n'est pas vitrée en allège, et les baies sont protégées par des lames brise soleil. Celles-ci assurent différentes fonctions :

- Filtrer la lumière et les regards indiscrets pour le confort et la sérénité des usagers,

- Permettre la protection anti-effraction en évitant les barreaudages disgracieux.

- Le jeu des volumes de l'étage, posés sur « le plan de référence » du toit terrasse identifie les fonctions salle de quartier, espace d'animation de la médiathèque, et circulations verticales. Ces volumes architecturaux (cylindres et parallélépipèdes) émergent librement dans l'espace en équerre (le dièdre), constitué par le plan horizontal du toit terrasse et le plan de la façade qui s'élève sur l'esplanade. Ce dispositif de « mise en relief » est comparable à celui des livres pour enfants qui développent des images – maquettes – pliage « en trois dimensions ». Ces volumes sont bardés de couleur jaune, orange et ocre rouge.

- La façade communicante, espace de « représentation » de l'établissement, donne sur la placette évoquant de manière monumentale une couverture de livre ou de C.

D. La façade est revêtue d'un écran en verre imprimée du mot Médiathèque traduit en 17 langues du monde illustrant la diversité du quartier, s'adressant à l'ensemble de sa population. Un totem avec le nom de la médiathèque Ulysse est érigé en signal. L'équipement est un repère important et notamment dans ce quartier en reconstruction.

Un bâtiment symbolique, évocateur : une construction fonctionnelle et pérenne

La médiathèque du quartier Franc Moisin est un bâtiment très symbolique, à l'écriture évocatrice, populaire et identifiable. La poésie de l'espace est le gage d'une dimension pédagogique facilitant l'intérêt et le désir des usagers.

Les matériaux, les matières et les couleurs créeront de bonnes conditions de confort pour les utilisateurs, et pour la pérennité des ouvrages.

Prestations extérieures principales

- Les façades du rez-de-chaussée sont en aluminium à rupture de pont thermique prélaqué (menuiseries, volets roulants et lames brise soleil de protection). Le soubassement est opacifié sur 1 mètre de hauteur, en périphérie. Certaines parties des services internes sont traitées en façade menuisée opaque. Les bandeaux sont en béton, coffrage soigné .

- Les volumes de l'étage sont en béton coulé en place et revêtu de vêtements en aluminium Reynobond prélaqué (ocre rouge, orangé jaune et noir). Fixations invisibles. Les menuiseries de l'étage sont également en aluminium à rupture de pont thermique.

- La façade principale à l'étage est réalisée en panneaux en VEA sérigraphié et fixés par pattes papillons SADEV en inox sur le voile béton. Celui-ci transparaît en toile de fond, animé par les ombres des mots sérigraphiés (le mot médiathèque en 17 langues) variant selon l'éclairage du soleil. Le voile béton intègre deux baies aux proportions singulières.

- La toiture terrasse constitue une terrasse refuge en cas d'incendie pour issue accessoire de l'étage. Cette terrasse, la 5e façade, est traitée à l'image d'un jardin avec une partie traitée en dalles sur plots et une partie végétalisée.

## **Hubert et Roy Architects, Paris – France**

<http://www.hubert-roy-architectes.fr>

**Libraries :**

**Ecole Maternelle et Élémentaire du Le Bourget – France 2011**

€ 4.800.000 HT

12 salles de classes: 5 classes maternelles à rez-de-chaussée et 7 classes élémentaires au premier étage. Deux salles plurivalentes. Deux bibliothèques, deux salles informatiques et un réfectoire commun. Un pôle administratif et un local gardien.

Parti Architectural

L'école du Bourget est à l'image du quartier en devenir, un quartier tourné vers le paysage du grand Paris, relié à la ville par des « corridors » verts, un quartier que la gare voisine met à proximité de Paris. Telle un organisme vertébré se glissant dans le parcellaire morcelé, l'école est conçue à partir d'une structure entièrement réalisée en bois, numérisée, optimisée et découpée en usine, montée en quelques mois par deux artisans. Cette structure, dont les portiques obéissent à un pas de 1,50m, est couverte d'une toiture végétalisée pour la rétention d'eau et l'inertie thermique/acoustique. Les élévations de la structure sont fermées par des panneaux vitrés calés sur la trame de 1,50m, ou par des feuilles d'aluminium de 4mm d'épaisseur, l'isolation prenant place dans l'épaisseur de la structure.

L'ensemble des salles de Maternelle est située au rez-de-chaussée avec des classes accessibles depuis la cour. A l'étage sont les classes Élémentaires. Le large oriel permet de profiter d'un apport de chaleur l'hiver et d'un regard depuis l'intérieur de l'école vers le lointain. ([http://architopik.lemoniteur.fr/index/php/realisation-architecture/ecole\\_maternelle\\_et\\_elementaire\\_du\\_bourget/4340](http://architopik.lemoniteur.fr/index/php/realisation-architecture/ecole_maternelle_et_elementaire_du_bourget/4340))

**Lycée Gustave Eiffel, Rueil-Malmaison – France 1998**

Réalisé par phases, en milieu occupé et dans un tissu d'habitat pavillonnaire, le lycée de Rueil-Malmaison réunit des unités d'enseignement différentes : carrières sanitaires et sociales, tertiaires et enseignement général. Considérant le dénivelé nord/sud, les classes se distribuent à partir d'une galerie de plain-pied avec le parvis, situé au niveau haut, tandis que le niveau bas est celui de la cour et de l'ensemble des équipements communs. Ces équipements - bibliothèque, permanence, salles des professeurs et conseillers, salle à manger, etc. - communiquent avec la galerie par des lieux de détente aux vues traversantes. La configuration ouverte du lycée le met en résonance avec l'environnement pavillonnaire en lui donnant le caractère de vie sociale demandé par le programme. Face aux pavillons qui entourent l'établissement le projet met en oeuvre des "jardins verticaux" en pignon des classe, ainsi qu'un lieu de récréation ouvert sur la ville.

## **Bruno Huerre Architecte, Paris – France**

<http://www.bruno-huerre.com>

### **Libraries:**

#### **Médiathèque Centrale Jacques Duclos, Pierrefitte-sur-Seine – France 2013**

Médiathèque centrale de Pierrefitte sur Seine. Agora, Secteur adultes, jeunesse, multimédia, Salle polyvalente, Administration, Parking paysager. Maîtrise d'ouvrage : SEM Plaine Commune, Maîtrise d'œuvre : Bruno Huerre architecte, BET : Beaulieu ingénierie: BET tout corps d'état, Surface : utile: 1674 m<sup>2</sup>/ SHON : 2118 m<sup>2</sup> / Montant HT travaux : 5 M€ / Etudes : Concours Lauréat Mars 2011, APS fin juillet 2011

Le site de la bibliothèque centrale de Pierrefitte est en mutation, tant dans le réaménagement de l'actuelle nationale 1 et la venue du tramway, que par une opération de grande envergure sur l'arrière du site en opération groupée de logements et d'aménagement paysager.

La particularité de ce programme repose sur la présence d'une surface d'échange, l'Agora, située directement après l'entrée et qui sert d'interface entre les espaces et fonctions multiples de l'équipement.

Un jardin patio au centre du plan permet d'apporter lumière, ventilation naturelle et transparences entre les secteurs. Sa forme en triangle tronqué crée un parcours dynamique et incite l'utilisateur à aller de l'avant.

Une partie du programme est installée dans un volume plutôt plein et fait écran au bruit de la nationale. Soulevé du sol, il produit une perméabilité depuis l'espace urbain.

Les façades sont traitées en isolation par l'extérieur et revêtues de panneaux de grandes dimensions en béton de fibre.

Une forte transparence est aménagée en façade sud donnant sur un parvis. (Huerre)

#### **Médiathèque Cosne Cours sur Loire ( Dep.: Nièvre – Burgund) – France 2004 – 2009**

1.250 m<sup>2</sup>, € 2.800.000

Sur un site remarquable en bord de Loire et du Nohain, terrain des anciennes forges royales du 17 au 19<sup>ème</sup> siècle, la communauté de communes Loire et Nohain décide de construire un équipement médiathèque et salle de conférence. L'intégration des éléments constitutifs du site dans la volumétrie, l'implantation et la constitution interne du bâtiment fut un enjeu architectural essentiel :

- en se posant sur les murs de soutènement du jardin des forges, • en mettant en scène l'église saint-Agnan du 11<sup>ème</sup> siècle
- en dialoguant avec le pavillon d'entrée des anciennes forges royales • en ouvrant des vues sur le cours d'eau le Nohain
- en s'inscrivant parallèlement à la Loire pour offrir un front bâti depuis la rive opposée

Le parcours :

Le parvis en situation de balcon sur le jardin et sur la Loire, se prolonge dans le hall de la médiathèque et permet de découvrir la section des adultes disposée en contrebas. La vue vers la Loire est conservée, mais filtrée par un dispositif de brises soleil verticaux.

Une ouverture en toiture sous la forme d'un shed parallèle à la Loire, irrigue de lumière le bâtiment dans toute sa longueur.

La banque principale en situation centrale a une visibilité optimale sur les espaces publics, adultes, salle de lecture, section jeunesse et multimédia. Sur la gauche du hall, l'accès à la section des adultes par un large escalier, nous fait entrer dans un espace presque entièrement en double hauteur et largement vitré sur le jardin. Des lames verticales en béton blanc filtrent la lumière et le regard. Ils ancrent également l'édifice dans le jardin. La salle de lecture située en face de la banque principale bénéficie d'une situation en avancée et centrale dans le site. La vue vers la Loire et vers la salle de la Chaussade, n'en sera que plus belle. La section des enfants est en accès immédiat légèrement en surplomb de l'entrée principale. Elle occupe la partie nord du bâtiment. La salle de consultation s'oriente vers la Loire, thème récurrent entre les secteurs. La section multimédia, est placée contre l'impasse, dans un environnement plus à l'écart et moins lumineux. Un atelier est contigu à l'espace des supports multimédias.

#### **Ville de Viroflay, Bibliothèque (Dep.: Yvelines – Île-de-France) – France 2006 – 2007**

1.850 m<sup>2</sup>, € 6.500.000

La parcelle nouvelle dégagée occupe une position stratégique à l'entrée du centre ville de Viroflay. Une esplanade relie le nouveau bâtiment au centre culturel existant, l'Écu de France, afin de constituer une entrée de ville identifiable et valorisante par la mise en valeur d'un véritable pôle culturel. Un élément déterminant du programme est l'auditorium de 200 places. Sa position est décisive dans le parti urbain et architectural. Nous avons choisi de le placer à l'angle sud-ouest du terrain, au premier étage, c'est à dire à l'endroit le plus en vue et bénéficiant de tous les reculs nécessaires. C'est un grand volume "plein" décollé du sol. Le programme de la bibliothèque occupe un volume de forme trapézoïdale en plan sur deux étages dont le hall central, est éclairé zénithalement et qui est couvert par une dalle en pente. Celle-ci est revêtue de cuivre, matière noble qui viendra jouer avec le béton blanc de l'auditorium. Véritable cinquième façade, cette grande surface de cuivre dont la couleur et la matière varient avec le temps sera vue des immeubles voisins surplombants, mais aussi de plus loin, depuis la rue montant sur le coteau d'en face. En contraste avec le volume opaque de l'auditorium, la façade de la médiathèque elle-même, notamment sur l'avenue du Général Leclerc est vitrée. Il s'agit de voir et de comprendre l'intérieur depuis le parvis, objectif renforcé par l'atrium central très éclairé par ses prises de lumière zénithale vers le nord. La silhouette de l'ensemble vers l'avenue avec ses longues horizontales vitrées venant entourer le volume de l'auditorium, qui semble en lévitation par rapport au sol, est suffisamment éloquente pour retenir l'attention des passants, piétons ou automobilistes et marquer de manière significative l'image de Viroflay. On associe ainsi la culture du livre, à celle de la parole ou du son pour créer un ensemble unitaire. La situation du foyer est très remarquable puisque du côté extérieur il surplombe le parvis d'entrée et offre une vue dégagée vers la ville, alors que du côté intérieur il est en balcon sur le vide central d'où on peut saisir tout le fonctionnement et l'activité de la bibliothèque. À gauche de l'atrium se trouve le secteur jeunesse qui "se glisse", sous l'auditorium, bénéficiant ainsi d'un plafond lisse, en pente et en courbes formé par la sous-face des gradins. Par quelques jeux de niveaux successifs, reliés par des marches ou par des rampes, le secteur jeunesse rejoint progressivement le niveau de l'esplanade en descendant. Les partitions engendrées par ces différences de niveaux sont propices aux différentes activités, tout petits, images, consultations, etc .. Le secteur adulte au premier étage s'installe en "L" autour du vide de l'atrium. Il bénéficie des quatre orientations permettant ainsi de hiérarchiser les différents sous-secteurs qui de ce fait, disposent tous d'un éclairage naturel maximal.

#### **Médiathèque d'Antibes Juan des Pins ( Dep.: Alpes Maritimes – Provence Alpes-Côte d'Azur) –**

**France 2000 – 2006**

3.200 m<sup>2</sup>, € 10.000.000

La médiathèque d'Antibes est implantée en bordure de la ville ancienne, dans un site dense. Les surfaces à construire se développent, en superstructure, sur trois niveaux principaux, un quatrième partiel et sur quatre niveaux en infrastructures dédiés aux services du livres et au parc de stationnement public dont le fonctionnement est séparé de la bibliothèque. Les élévations ainsi produites sont de nature à constituer un front bâti sur les deux boulevards principaux du terrain. Nous avons ménagé dans la façade principale une

large fenêtre urbaine dans la continuité visuelle de la rue Chaudon située à l'opposé. Elle constitue une invitation, un transfert de l'extérieur vers l'intérieur.

Organisation architecturale : un espace sans coupure

Tout le terrain disponible est occupé par notre projet pour assurer la présence de l'édifice dans son site, mais aussi, plus prosaïquement, par le fait que l'assiette foncière est relativement exigüe par rapport à la surface à construire. Il est plus aisé, en général, d'installer une bibliothèque sur de grands plateaux horizontaux, qui ne coupent pas la continuité intérieure des salles. L'espace de consultation doit être fluide de telle manière que les sous-espaces de lecture dédiés à chaque discipline s'interpénètrent, sans coupure. Cet objectif est plus difficile à atteindre dans le cas d'une organisation verticale où les départements sont situés les uns au-dessus des autres, donc séparés. Pour éviter l'effet "grand magasin" avec ses rayons spécialisés par étages, nous avons opté pour une organisation par demi-niveaux de part et d'autre du vide central. Ces plateaux décalés de la valeur d'un demi-étage (ce qui n'engendre pas de coupure) sont réunis entre eux par des volées d'escaliers ouvertes, au droit des postes d'information et de prêt et par des rampes sur le côté opposé, rampes qui permettent de changer de niveau sans changer d'espace dans le mouvement même de la marche. Ainsi pourra-t-on aller du haut en bas du bâtiment au cours d'une même promenade parcourant les divers secteurs, en ayant toujours une vue sur l'ensemble. Le grand atrium central joue un rôle prépondérant dans l'organisation intérieure mais aussi en tant que facteur d'unité pour toute la partie publique du bâtiment. Il est éclairé zénithalement et permet de saisir, dès l'entrée, l'ensemble des plateaux de lecture et facilite l'orientation tout comme il assure, à partir des postes d'information et de prêt, une vision panoramique.

**Jean Marc Ibos Myrto Vitart, Paris – France**

<http://www.ibosvitart.com>

**Libraries:**

**[Médiathèque André Malraux, Strasbourg – France 2008](#)**

Conversion and extension of existing grain warehouses into a public library. Reception, temporary exhibition room, 124-seat auditorium, cafeteria, reading rooms, document treatment studios, archives, administrative and service areas.

Client : Communauté Urbaine de Strasbourg, Competition : 2003, Realisation : 2006-2008, Construction cost : 37 M€ excl. taxes  
Surface : 18 000 sqm GFA, Architects : Jean-Marc Ibos Myrto Vitart, Project leaders : Claudia Trovati (building), Stéphane Bara (façades),

The river landscape is best approached horizontally. Everything here submits to the logic of the waterway: the linearity of the docks, the way the jetty stretches out and the trees are aligned. But also the warehouses, running from one end of the site to the other in a perfectly **continuous** line parallel to the docks, punctuated vertically by their silos, which rise up like prows. This harmony is what makes the place so beautiful. The small stretch of land has miraculously retained its initial coherence, in the sense that it is this specific industry, requiring maximum efficiency in the interaction between buildings, docks, crane tracks and roads, that has determined the rigorous and rhythmic succession of volumes. The project to convert the Seegmuller warehouse into a multimedia library, involving a doubling of the existing surface area, is in line with the main design principles governing the location. The silo is left untouched, as a vertical sign within the landscape. The depot that backs onto it is partly preserved, namely its fine concrete structure. The extension strictly expands vertically and horizontally from it. Libraries, contrary to warehouses, call for natural light. A new glass skin, replacing the brick cladding on the existing depot, acts as a continuation of the extension's exterior and unifies the development. Light emphasises the beauty of the pyramid-shaped capitals. The floors are an extension of the existing structures. Initially designed for storage, the distance between floor and ceiling is small. To provide a sense of space, there are voids around the edges that vertically expand the volumes. Taking an industrial approach, still relevant here given the low ceilings, the technical fittings are left exposed. The HVAC and utilities design falls within the generic linearity. A long, red ribbon, traced directly onto the building, links the floors of the library. Graffiti-like signage guides visitors to the upper floors. The floors are left sparse. Light bounces off the floors and is thus channelled into the building. Floors dissect the landscape horizontally, linking both branches of the canal. Mirrors capture the glimmer of the waterway. C'est à l'horizontale que s'appréhende le paysage fluvial. Ici, tout se plie à la logique du cours d'eau ; la linéarité des quais, l'étirement du môle, l'alignement des arbres. Jusqu'aux entrepôts qui se profilent d'un bout à l'autre du site, parfaitement réglés dans leur continuité sur une parallèle aux quais et dont les silos, tels des prows, ponctuent verticalement les extrémités. La beauté du lieu tient en cette harmonie. Petit bout de territoire miraculeusement préservé dans sa cohérence initiale où l'exploitation industrielle qui exigeait une efficacité optimum dans la relation des bâtiments aux quais, au chemin de grue et à la voirie a déterminé la rigoureuse succession rythmique des volumes. Le projet de transformation de l'entrepôt Seegmuller en médiathèque, avec à l'appui un doublement des surfaces existantes, s'inscrit dans les grands principes de composition du lieu. Le silo est conservé, signe vertical dans le paysage. De la halle qui s'y adosse, le projet conserve aussi la magnifique structure en béton. L'extension en constituera le strict prolongement vertical et horizontal. Une bibliothèque, contrairement à un entrepôt, appelle la lumière naturelle. Une peau de verre remplace le parement en briques de la halle existante. Calée dans la continuité de l'extension, elle réalise l'unité du lieu. La lumière souligne les chapiteaux pyramidaux. Les planchers prolongent ceux de l'existant. Initialement destinés au stockage, les plateaux sont bas sous plafond. Pour donner une sensation d'espace, des vides, en rive, dilatent verticalement les volumes. Dans une logique industrielle qui reste pertinente du fait de l'exiguïté des hauteurs, les équipements techniques sont laissés apparents. Le tracé des fluides s'inscrit dans la linéarité générique. Un long ruban rouge, à même le bâtiment, relie les niveaux de la médiathèque. La signalétique, appliquée à la manière de tags, guide le visiteur. Les plateaux sont laissés libres. La lumière s'y propage par réflexion sur le sol. Les planchers découpent le paysage à l'horizontale, reliant l'un à l'autre les deux bras du canal. (Ibos)

### **Libraries :**

#### **Cité scolaire internationale, Bibliothèque, Lyon – France 1992**

avec: Gilles Perraudin

maître d'ouvrage: Région Rhône-Alpes, école primaire, collège, lycée, salle polyvalente, bibliothèque, gymnases, terrains de sport, restaurants, administration, logements, parking, surface: 28 000m<sup>2</sup>, coût des travaux: 19 360 000 € (valeur 1989), calendrier: concours 1989, études 1989-1990, chantier 1991-1992

Face au confluent du Rhône et de la Saône, le bâtiment des salles de classes se déroule sur les berges du Rhône, accompagnant l'entrée du parc de Gerland. Il décline progressivement de 7 à 3 niveaux vers le Sud, délimitant dans ses courbes les cours extérieures destinées aux élèves. La façade Ouest totalement vitrée sur le fleuve délimite un atrium de 7m de large sur 300m de long dans lequel sont disposés les escaliers, coursives, mezzanines, blocs techniques et jardins intérieurs. Cet espace tempéré est totalement ouvert l'été grâce à un système de lamelles de verre motorisé. A l'Est, le bâtiment s'enroule autour du Centre de Vie qui regroupe l'ensemble des espaces communs aux trois écoles (primaire, collège, lycée), en un "village" couvert d'une nappe métallique suspendue et plantée. (Jourda)

#### **Akademie Mont Cenis, Fortbildungsakademie des Innenministeriums des Landes NRW, Bibliothek, Herne-Sodingen - Germany 1999**

collaboration with : agence d'architecture Perraudin architectes, Lyon (<http://www.perraudinarchitectes.com>) and hhs Architekten AG (Hesser-Hesser-Schleif), Kassel (<http://www.hhs.ag>)

maître d'ouvrage: EMC Mont-Cenis, surface: 7 100 m<sup>2</sup> utile; bâtiment intérieur 11 700 m<sup>2</sup>; 13 000 m<sup>2</sup> serre, coût des travaux: 51 130 000€ (valeur 1999), calendrier: concours 1992, études 1996, chantier 1997-août 1999

La proposition mise en place pour ce bâtiment est fondée sur le concept original d'architecture bioclimatique. Il s'agit du principe d'une "enveloppe micro-climatique" consistant à exploiter l'idée des espaces tampons à l'échelle du bâtiment tout entier et, dans le cas de ce projet, à l'échelle d'un ensemble de bâtiments. L'intégration au bâtiment d'un "champ solaire" de 10000 m de cellules photovoltaïques est destiné à protéger la serre de l'ensoleillement et à éviter des effets de contre jour. Cette idée originale fait du bâtiment une centrale solaire qui produira 1 mégawatt en pointe. C'est à ce jour la plus grande centrale solaire au monde. Le bâtiment est situé dans le parc se trouvant au centre de la commune de Herne-Sodingen, aménagé sur l'ancien carreau de la mine autour duquel s'était développée la ville depuis le début du siècle. Aujourd'hui, alors que les puits sont fermés et les bâtiments de la mine démolis, il faut redonner au secteur sa fonction de centre ville, de lieu de rencontre. La mise en œuvre du concept bioclimatique apporte une réponse aux préoccupations de protection de l'environnement, telles que réduction de la consommation énergétique, utilisation de matériaux dits "écologiques", récupération des eaux de pluie, décontamination du sol... Le bâtiment a été conçu en fonction d'objectifs de protection de l'environnement. Les matériaux et les composants de construction ont été choisis selon ces mêmes critères, induisant une variété limitée de matériaux: bois, verre et béton. Pour des raisons écologiques les matériaux naturels dominent. La structure arborescente de la serre est mixte bois/métal: les poutres et les poteaux de sections circulaires et rectangulaires sont en bois, les tirants et les éléments d'assemblage et d'articulation sont en acier. Leur architecture dialogue avec le paysage intérieure de la serre et le parc environnant. Les éléments de structure en bois proviennent de forêts proches du site. Ainsi les poteaux de structure de la serre sont des troncs d'arbres de 130 ans qui ont été coupés plus d'un an avant leur mise en œuvre sur le chantier, dans une forêt située à 100 km du site. (Perraudin architectes)

Une médiathèque est un lieu populaire destiné à l'émancipation et à la diffusion culturelle. Elle s'adresse à un vaste public dont la sensibilité est largement influencée par l'industrie du divertissement. Une médiathèque n'a donc pas la rigueur d'une simple bibliothèque. Son apparence est plus ouverte et peut exprimer une image plus spectaculaire. En d'autres termes, ce bâtiment peut et doit donner envie. Il doit stimuler le désir de découvrir, de partir à la connaissance d'autres, d'ailleurs ou tout simplement de soi, aussi efficacement qu'une Fnac ou qu'un Virgin sont capables de pousser à "consommer" de la culture.

Il possède néanmoins, comme tout édifice public de cette importance, un devoir de solennité. Toute la subtilité est donc de trouver cet équilibre, de trouver cette architecture qui sonne juste à la fois dans son contexte et dans son rôle.

L'édifice vient cadrer la place publique avec deux ailes aux formes pures et claires. Ses façades s'infléchissent légèrement vers le ciel pour alléger l'ouvrage et donner plus d'ampleur à l'espace public. Son rez-de-chaussée, totalement transparent, s'offre à l'urbanité mais plus on lève les yeux, plus l'édifice ce fait monolithique.

Le bâtiment est habillé de lanières fines et verticales. Leur densité et leur degré d'ouverture s'adaptent aux vues et aux usages. Elles se densifient à chaque niveau gravi. Tantôt pleines, tantôt perforées d'un motif baroque, ces lanières construisent une progression vers la densité et l'intimité.

Laquée d'un vermillon situé entre le rouge Ferrari et le orange signalétique, cet appareillage habille l'édifice d'une couleur particulièrement repérable et mémorisable.

La médiathèque scelle ainsi son identité par une présence et des ambitions affirmées dans la ville. (K Architectures)

### Libraries:

#### Médiathèque Podensac (Dep. Gironde, Reg. Aquitaine) – France 2012

surface : 1 233 m<sup>2</sup>, coût ttc : 2 040 000 €, calendrier : livrée en août 2012

#### Médiathèque Grand M, Toulouse – France – 2012

1.200 m<sup>2</sup>, € 6.000.000

### Awards :

Prix d'architecture Agora 2012

Ce projet d'un coût global de 6,185 m€, dont nous révélions l'image, en avant-première, dans notre page des Jeudis de l'architecture (notre édition du 17 septembre) devrait « donner accès à la lecture pour le plus grand nombre et aux nouvelles technologies de communication », selon Claude Touchefeu, adjointe au maire (PS) chargée de la solidarité et de la politique de la ville.

«Avec une surface de 1 400 m<sup>2</sup>, cet équipement constituera la plus grande bibliothèque du réseau de lecture publique de la ville », a ajouté l'élue. « Les espaces intérieurs seront aménagés de telle manière que les publics peu ou pas accoutumés à la fréquentation d'établissements culturels ne se sentent ni intimidés ni mal à l'aise, offrant dès l'entrée un espace d'exposition et des espaces de lecture, des collections de CD et de DVD ainsi que de très nombreux postes multimédias », a précisé l'adjointe. L'étage abritera un auditorium de 50 places permettant d'accueillir de petites formations musicales, d'assurer des projections, d'organiser conférences et débats. Ce projet « innovant à plus d'un titre », selon Claude Touchefeu, salué aussi à droite par Roger Atsarias (Toulouse pour tous), a été conçu par l'atelier d'architecture King Kong, lauréat d'un concours, en prenant en compte le développement durable. Le parvis « se veut un lieu de convivialité et de rencontre », avec promenade, bancs, fontaine et « jardin de contemplation », ouvert sur les quartiers de Reynerie et Bellefontaine. La Ville a sollicité hier une aide de plus de 3 m€ de l'Union européenne (au titre du Feder), soit la moitié du coût global, et d'un demi-million de la région. L'état, au travers de l'Anru (agence nationale de la rénovation urbaine) devrait participer à hauteur de 961 603€. Ce projet fait partie des 14 actions du projet urbain intégré éligible au Feder.

(<http://www.ladepeche.fr>) 26.09.2009

Dans le cadre du Grand Projet de Ville (GPV) et de son Agenda 21, la Ville de Toulouse souhaite construire une bibliothèque dans le quartier du Mirail. Cet équipement public s'inscrit dans le renforcement de l'offre culturelle dédiée aux habitants et constituera un point fort de l'amélioration du cadre de vie. (<http://www.oppidea.fr>)

## Lacaton & Vassal Architectes, Paris – France

<http://www.lacatonvassal.com>

Grand Prix National d'Architecture 2008, France

### Libraries:

#### School of Architecture (Library), Nantes – France 2009

27.580 m<sup>2</sup>, € 17.750.000

In building a structure of great capacity, the project design comes up with a scheme capable of creating a set of rich and diverse situations of interest to the School of architecture, the city and the landscape. Three decks at nine, sixteen and twenty-two meters above the natural ground level, served by a gentle sloping external ramp, progressively put the ground surface of the city in touch with the sky overhead. A lightweight steel structure redivides the height of these main levels. It enables the spaces devoted to the program to be generously installed and creates a system adapted to their extension and their future evolution. Linked to the spaces of the program are ample, double-height volumes with non-attributed functions, the transparent facades of which harness the sun's rays and vouchsafe the indoor climate. On the initiative of the students, teachers or visitors, these spaces become the locus of possible appropriations, events and programming. At any one moment the adaptation of the school to new interventions and its reconversion are possible. Like a pedagogical tool, the project questions the program and the practices of the school as much as the norms, technologies and its own process of elaboration. Anne Lacaton & Jean-Philippe Vassal, architects with Florian De Pous, Frédéric Hérard, and Julien Callot, Lisa Schmidt-Colinet, Isidora Meier, architects collaborators. (Lacaton)

#### Universitaire de Sciences de Gestion, Médiathèque, Université Montesquieu, Bordeaux – France 2006

€ 3.110.000

The PUSG (short for Pole Universitaire de Sciences de Gestion, Université Montesquieu) is situated in an old industrial area, a new neighbourhood called La Bastide, on the eastern side of the Garonne River. The faculty consists out of 4 different departments, and each department is housed in a separate part of the building. This is one of Lacaton-Vassal's first larger projects, and just like their smaller commissions (private houses, social housing, and a small office ) this design is characterized by a 'less is more' method. With a minimum use of materials and budget, they create a maximum of space and quality. They have proven that its perfectly possible to apply this critical way of looking at architecture to large scale public buildings. (<http://www.mimoo.eu>)

#### Université Pierre Mendès France Grenoble, Arts & humains sciences, Library, Grenoble – France 1995 - 2001

5.062 m<sup>2</sup>, € 3.078.000

The project is positioned in an alignment of new buildings that densify the eastern axis of the university. Set 13 meters apart, the two buildings are linked by three aerial footbridges and by the continuity of the conservatories on the main south and north facades, thereby giving the appearance of a single volume. The building, intended for teaching activities, is transparent and opens onto the campus and the chain of high mountains that encircles Grenoble. The main facades, consisting of small transparent conservatories, creates a plant filter : bougainvillias to the south, bamboo to the north. The conservatories are conceived according to the same principles as those of professional horticulturists and are administered by the same automatic systems : ventilation, watering, heating. They make for a surprising, changing and poetic image, in keeping with the artistic dimension of the university's teaching activities. The exoticism of the plant varieties invites one to look beyond the mountains. Research into cost-effectiveness has been a constant preoccupation during the conceiving of the project, in order to attain, within the same budget, the objectives of a larger building, warranted by the ascertaining of needs and the frequentation of university buildings. With no restriction as to the quality of the facilities, materials and products used, it has enabled us to create additional lecture rooms, a larger assembly hall, corridors that become genuine meeting places, a much bigger library occupying the whole of one floor. The sobriety, efficacy and rigor of the building are set alongside an unexpected event in the project, which creates its image and its poetry : the conservatory with their

flowers. Anne Lacaton & Jean Philippe Vassal, architects with Sylvain Menaud, Emmanuelle Delage, Mathieu Laporte, Pierre Yves Portier, collaborating architects. (Lacaton)

## **LAN (Local Architecture Network), Paris – France**

LAN has received several awards: the Nouveaux Albums de la Jeune Architecture (NAJA) prize awarded by the French Ministry of Culture and Communication (2004); the International Architecture Award from the Chicago Athenaeum and the European Urban Centre for Architecture, Art, Design and Urban Studies, the Archi-Bau Award, the Special Prize at the 12th World Triennale of Architecture, Sofia (2009); the AR Mipim Future Projects Award and the Europe 40 Under 40 Award (2010).

### **Libraries:**

#### **EDF Archive Centre, Bure-Saudron – France 2011**

CLIENT: EDF, LOCATION: Bure-Saudron / France, BUDGET: € 10,1M excl. VAT, SITE AREA: 3.30 hectares, BUILT UP AREA: 6800 m<sup>2</sup>, COMPETITION: 2008, COMPLETION: 2011, TEAM: LAN Architecture (lead architect), Franck Boutté (HEQ consultant), Batiserf Ingénierie (structure), Michel Forgue (surveyor), Base (landscape architects), LBE (utilities) PROJECT MANAGER: Christophe Leblond

Within the framework of the Meuse and Haute Marne economic support programme, EDF has decided to centralise all its intermediary Engineering Production Management archives in Bure.

Until now, these paper copy archives had been stored in nuclear, hydraulic and thermal production units, as well as in engineering units and associated services. As well as being spread over several sites, they were also handled in different ways. It had therefore become necessary to group them to rationalise and optimise the archiving functions: sorting, indexing, management and access. Over and above the functional aspect needed to manage the archives, this was also a strategic project providing a positive social and environmental impact on the region....

The objective is to obtain an energy-efficient building through the use of an intelligent morphology, a high performance skin, choice of adapted systems and the production of renewable energy. Wastewater management will reduce the ecological footprint and contribute to a symbiosis between the building and its environment.

The principles underlying the architects approach were to compress and minimise impacts. Consequently, the architects directed their research towards a five level, 19 m high building with an archives area covering approximately 1,400 m<sup>2</sup> and a total surface of approximately 7,000 m<sup>2</sup>. This approach results in:

- 1) considerable saving in terms of the building's envelope,
  - 2) improved functionality translated by a reduced number of kilometres covered per year,
  - 3) a marginal impact on the landscape (with view points at a considerable distance from the building),
  - 4) the possibility of a maximum use of the excavated land around the building's footprint to control water recuperation and treatment on the site,
  - 5) an energetically and environmentally extremely high performance building,
  - 6) the creation of a symbol representative of the approach taken by the Meuse and Haute Marne economic support programme.
- An archives storage building needs to have a considerable inertia and is thus "heavy". The need for fast and simple site management and optimum storage efficiency led us to develop a simple and rational layout complying with the logic of a project that is both bunker-like and, in itself, an industrial process. The question was how to integrate lightness into a massive object? How to avoid interrupting the continuity of the natural landscape?
- Firstly, by paying particular attention to the building's envelope.

To give the impression of a lightweight building in movement, the architects proposed incorporating stainless steel studs into the earth-coloured concrete cladding. This solution had the effect of blurring the building's limits and reflecting the surrounding colours and changing seasons.

<http://www.morfae.com/008-edf-lan>

#### **Toy Library, Bonneuil-sur-Marne – France 2005 – 2008**

Client: Bonneuil-sur-Marne Local Authority, 380 m<sup>2</sup>

The Bonneuil-sur-Marne children's toy library is a public building as well as a play space for children. The project creates an opposition between monumentality and the need for a warm, friendly environment within the same building. It is located in an area where 1960s social housing has had a strong physical and social impact. The exterior and interior spaces are designed to respect the dual nature of the building. The monolithic shell-like elevations are closely linked to the surrounding urban context. LAN Architecture wanted to create a strong urban symbol able to stand out from its environment, whose shell would protect its core and participate in the regeneration of Bonneuil-sur-Marne's social structures....

The design of the Bonneuil-sur-Marne children's toy library resulted from an approach that aimed to simultaneously resolve a number of problems and develop new ideas:

- New use for an existing building
- Design of a children's play area
- Creation of a small-scale public facility in a socially unstable area occupied by large housing complexes
- The difficulties of a very restricted budget (initially, the programme simply called for a new interior layout)

LAN Architecture decided to design a building that had no sense of scale and which would appear timeless, a dense solid mass, an urban symbol standing out from its environment, a shell able to protect its contents....

LAN Architecture's strategy was inspired by a medical logic of intervention. The creation of an additional freestanding skin allowed them to control the interfaces between exterior spaces, building and interior spaces, as well as meet the need to provide generous volumes.

The new elevations covering the existing building are adapted to the building's changed use and provide for the incorporation of a new main entrance, an open courtyard on ground floor level and additional surface areas for administrative functions. This solution maintained the existing in-situ cast green-tinted concrete shell.

The decision was taken to create a hermetic separation between the exterior and the open and colourful interior spaces. Children play in a sort of cocoon, rich in light variations, that rises up over the two levels; a simple, functional and comfortable scale and volume fully adapted to the needs of its users.

fiche technique

Programme Espace de lecture pour étudiants de premier et deuxième cycle, salle d'enseignement général, espace de culture générale. Espace de troisième cycle et de recherche, salles spécialisées. Espace de consultation informatique. Salle polyvalente pouvant être transformée en salle de projection, conférence ou exposition. Création d'un mobilier adaptable aux différentes configurations  
Maîtrise d'ouvrage Ministère de l'Enseignement Supérieur et de la Recherche Maîtrise d'ouvrage déléguée Rectorat d'Orléans - Tours et DDE du Loiret Mission Mission de base Maîtrise d'œuvre intégral Lipsky + Rollet architectes mandataire, Katja Rapold (chef de projet), SFICA (structure, fluides et réseaux), Bureau Michel Forgue (économie) Montant des travaux 3 190 000 euros HT Surface 3 328 m2 SHON Nombre de place assises 350, Livraison janvier 2005

La Bibliothèque Universitaire des Sciences d'Orléans est située dans le paysage verdoyant du campus de la Source, créée dans les années 70, pour une communauté de 5000 étudiants. Longtemps isolé, le campus est maintenant relié au centre urbain par une ligne de tramway qui rejoint, du Nord au Sud, le centre historique aux quartiers avoisinants et jusqu'aux nouvelles zones de développement. Le bâtiment s'intègre dans un panorama composé de grands arbres à proximité d'un lac, le long de la ligne de tramway, face à une des quatre stations desservant le campus. Un grand porche surmonté d'une colonnade en béton et d'une canopée en polycarbonate protège l'entrée et cadre la montée vers le lac. À l'entrée, une petite boîte en verre crée un sas, passage entre le dehors et le dedans; le visiteur est ainsi doucement conditionné à pénétrer dans l'espace silencieux des salles de lecture. Construire une bibliothèque pose la question de la connaissance : livres, journaux, images et archives numériques regroupés en un lieu unique représentent une masse d'informations qui réclame d'être compactée plutôt que partagée en une série de pièces.

Le projet a pour objectif de mettre l'emphase sur l'archétype spatial intégral Lipsky + Rollet architectes

Ni plus, ni moins, mais aussi simple que possible, la bibliothèque est organisée autour d'un atrium central avec des tables de lecture au 1<sup>er</sup> et au 2<sup>ème</sup> étage. Un meuble principal recouvert de panneaux en «fincof» (contreplaqué à effet cuir marron recouvert d'un film phénolique originellement utilisé pour les lanches de béton) contient toutes les étagères de livres. Au centre, la cage d'escalier conduit aux espaces de recherche qui s'ouvrent sur l'atrium. Une fenêtre horizontale est incorporée dans le grand meuble. Quatre autres boîtes de bois, de formes variables, s'articulent autour de l'atrium et renferment des espaces de travail en groupe ainsi qu'une salle multimédia. L'architecture est un support de vie ; et le ton uniforme gris du béton crée une atmosphère sobre, rehaussée seulement par les couleurs des ouvrages et les tenues vestimentaires des lecteurs. L'idée est de penser ce lieu comme un «milieu» plutôt qu'un espace dramatique ou monumental, afin que les activités humaines s'effectuent dans des conditions optimales. ce principe acquis, le projet se focalise sur la création d'une peau, tant efficace qu'économique, qui offre une bonne isolation et un contrôle de la lumière depuis l'intérieur. L'enveloppe extérieure est composée d'une double peau en polycarbonate teinté vert, de grandes ouvertures disposées aléatoirement comme un patchwork cadrent le paysage verdoyant. La structure de béton périphérique est donc enveloppée, entre deux peaux de polycarbonate qui la font presque disparaître. Pour le lecteur, la façade devient filtre entre l'intérieur et l'extérieur. La qualité de l'air s'obtient uniquement par ventilation naturelle : l'air frais est soufflé vers les étages inférieurs, il s'élève en période chaude et s'évacue à travers une série de skydoms. En hiver, un système de chauffage au sol régule la température. Les façades Sud et Est, équipées de brise-soleil verticaux mobiles à orientation variable, en polycarbonate métallisé, deviennent «façades-mosaïque» selon l'angle du soleil et la qualité de lumière désirée par les lecteurs. Le résultat de cette composition offre un endroit calme pour étudier. Après le passage du contrôle à l'entrée, plus d'éclat de voix, seulement des chuchotements... (Lipsky)

**Literature :**

“Rehabilitación de la Biblioteca Nacional y Universitaria de Estrasburgo, Francia”. En: TC Cuadernos, n. 74 (2006), p. 240-247

La bibliothèque nationale universitaire de Strasbourg située en coer de ville est un bâtiment prestigieux datant de la période allemande (1889 – 1895, Skjold Neckelmann \* 1854 Hamburg - + 1903 Neckargemünd, August Hartel \* 1844 Köln - + 1890

Strasbourg). L'attitude adoptée pour sa réhabilitation, consiste à respecter scrupuleusement l'architecture monumentale. Ainsi, le project valorise les modénatures caractéristiques de la façade et magnifie le dôme en le rendant visible depuis tous les niveaux intérieurs. Les nouveaux espaces principaux – accueil, circulation, lecture – sont traités avec une plasticité marquée qui dialogue avec l'architecture monumentale. L'intervention repose d'une part sur la suppression d'éléments parasites qui gênent la lecture de la qualité des volumes d'origine, et d'autre part, sur la construction de dispositifs de circulations verticales et la création de nouveaux plateaux fonctionelles. L'objectif des soustractions est de rendre accessible et visible au public même non lecteur, le volume sous le dôme. Ce volume exceptionnel incarne l'identité de la bibliothèque. Afin d'offrir un espace dégagé avec une qualité d'ambiance qui favorise la lecture, le travail et la convivialité, quatre plateaux sont créés sur le pourtour d u grand atrium. Ce dispositif qui remplace les cinq plateaux actuels, libère des hauteurs sous plafonds confortables pour les espaces accessibles aux lecteurs. Des noyaux de circulations verticales sont placés aux quatre angles des plateaux créés. Ces angles correspondant aux quatre anciennes cours deviennent des points névralgiques du fonctionnement de la nouvelle bibliothèque. Ils libèrent ainsi des contingences techniques et de sécurité, les volumes majeurs destinés au public. Cette disposition permet d'assurer un confort d'usage pour le personnel, et un confort visuel pour les grands plateaux publics. (a/nm/a)

La part més significativa de la proposta de rehabilitació és, sens dubte, la cúpula. Aquesta s'ha buidat d'elements innecessaris, netejant així tot el seu volum, omplint tot l'espai de llum, abarçant totes les plantes de l'edifici i fent-la plenament visible i accessible tant per a usuaris com per a lectors. En aquest volum de la cúpula s'ha insertat una gran escala, enorme, de cargol, que comunica les plantes de la Biblioteca; com a barana s'ha optat per una espiral que discorre per l'interior del cargol que forma l'escala, i que arriba fins al capdamunt de la cúpula. Tot plegat configura, sense cap mena de dubte, el signe d'identitat inequívoc de la Biblioteca, el seu cor. Així, aquest espai interior de la Biblioteca, més il·luminat, acull les sales de lectura i consulta generals, mentre que en els 4 laterals de l'edifici hi trobem (segons les plantes) els diferents serveis, com ara les zones de treball; o els dipòsits amb els fons. Finalment, a les 4 cantonades de l'espai central és on es troben les comunicacions verticals, imprescindibles en un edifici de 5 plantes. El valor total de la rehabilitació és d'uns 25 milions d'euros, i la superfície total del projecte és de 25.800 m<sup>2</sup>. (<http://www.bauenblog.info>)

## **Pôle culturel, théâtre & médiathèque, Deauville – France 2015/2016**

Maitre d'ouvrage/Client Ville de Deauville, Date 2010, Surface 5 500 m<sup>2</sup> SHON. Montants travaux 10 200 000 € H.T.

À l'entrée de Deauville, le pôle culturel, tourné résolument vers la mer et le centre ville, se signale par ses façades contemporaines inspirées des éléments de l'architecture de villégiature.

La longue façade le long de la route et des voies ferrées se déploie en séquences successives: talus planté, mur de briques, claustras bois et enfin grand vitrage structuré par des menuiseries bois marquant l'entrée du hall côté ville. La toiture accompagne cette organisation. Elle est composée d'une série de pentes en ardoise alternées, dotées de chiens assis qui baignent de lumière zénithale les salles du dernier étage.

Le pôle culturel associe dans un même bâtiment la salle de spectacle et la médiathèque. L'une est placée dans la base en brique, l'autre au-dessus, dans un volume léger et ouvert. Ce contraste donne de la force à l'édifice et exprime les programmes qui s'entrelacent. Pour donner une échelle raisonnable au bâtiment, une annexe constitue une liaison volumétrique avec les petites maisons du boulevard.

Entre ces deux volumes est créée une voie piétonne qui mène vers le parking arrière. Traité en verger, il est enclos de murs de brique qui prolongent les façades du bâtiment. L'accès au pôle culturel depuis le centre se fait par une promenade piétonne qui se glisse sous les arbres le long du stade. Cette promenade agrémentée

de bancs, de luminaires, de plantations, mène à l'entrée du pôle culturel de plain pied avec le parvis qui structure également le carrefour. Depuis le hall largement vitré vers la ville, on accède directement à la salle de spectacle, et par un large escalier à la médiathèque située au dessus. Celle-ci est organisée sur un seul niveau regroupant les sections jeunes et adultes. Ce grand plateau qui offre une vue «en balcon» sur la mer et le centre ville, est très lumineux grâce aux vitrages en périphérie et à la lumière zénithale. Le foyer bar de la salle de spectacle et la salle d'exposition sont également aménagés sur ce plateau. Cet assemblage de fonctions permet de créer un lieu d'animation et de convivialité.

Les autres fonctions techniques de la médiathèque sont rassemblées dans l'annexe reliée par une passerelle. Au rez-de-chaussée se trouve l'auditorium avec son petit hall qui peut fonctionner de manière autonome.

Ce bâtiment flexible, contextuel et contemporain, est ouvert aux pratiques innovantes du multimédia et à l'événementiel. (Michelin)

## **Îlot Armanac, Logements, Médiathèque et Gymnase, Bordeaux – France 2012**

Olivier Calvarese, Fanny Rozé (concours et études), Etienne Challet-Hayard (Directeur de Réalisation), Matthieu Miquel (Architecte Chantier), Maitre d'ouvrage/Client ING Real Estate, Site Bordeaux, Date 2012, Surface 18 000 m<sup>2</sup> SHON, Montants travaux 25 464 000 € T.T.C

L'îlot Armagnac forme une transition entre les typologies d'échoppes bordelaises et la nouvelle densité créée dans ce quartier. Cet îlot en proue amorce le développement urbain du quartier Belcier. Il apporte une forme d'urbanité à la place Armagnac, à l'échelle de l'existant et amène progressivement aux échelles plus hautes de la ville à venir. Il est composé à partir d'alignements stricts sur les rues et dispose d'une ouverture visuelle vers la place publique au sud. L'îlot est mixte avec logements et équipements publics - gymnase et médiathèque. Le cœur d'îlot est traité en jardin. Sa mise en scène gradinée vers le sud le rend bien visible depuis la place. Le cœur de l'îlot est vert, c'est un espace planté partagé par tous les logements. Ceux-ci sont tous différents et ouverts pour la plupart, sur le jardin central accessible à tous. Le parking n'est pas enterré, mais ses 4 niveaux sont intégrés à l'îlot de manière non visible, il est éclairé naturellement au nord. L'îlot est traversé par un cheminement piéton qui distribue chaque entrée d'immeuble, et renforce la convivialité.

Le jardin central est composé en terrasses successives qui s'élèvent depuis la place publique jusqu'au niveau 6, tout en haut de l'îlot. Cet effet de « jardins suspendus », orientés plein sud, est accentué par la diversité des plantations et les terrasses privatives qui donnent aussi sur le jardin.

La conception des immeubles répond aux principes de l'architecture bioclimatique. L'ensemble des façades est isolé par l'extérieur. Les toits orientés principalement au sud, sont équipés de panneaux photovoltaïques et de capteurs thermiques. Certains logements sont dotés de vérandas/serres, espaces inter climatiques qui prolongent le séjour et assurent une récupération de chaleur l'hiver et une ventilation l'été.

Les logements possèdent des qualités de lumière et d'habitabilité : ils sont traversants pour la plupart, ou bénéficient d'une double ou triple orientation. De grands duplex croisés, avec des doubles hauteurs généreuses sont implantées sur l'espace vert public. Les logements orientés sur le cœur d'îlot possèdent tous des prolongements extérieurs : balcon, loggia, jardin ou terrasse en toiture. Les parties communes sont éclairées naturellement. (a/nm/a)

## **La Fonderie Mulhouse, Bibliothèque, Centre d'Art, Cafeteria, Archives – Mulhouse – France 2003 – 2007**

La Kunsthalle / Présentation / La Fonderie

La Kunsthalle occupe 700 m<sup>2</sup> dans l'ancienne fonderie mécanique de la SACM (Société Alsacienne de Construction Mécanique). Un bâtiment achevé en 1924 qui signale la persistance d'une aventure industrielle qui a fortement marqué l'histoire mulhousienne et qui puise ses origines dans la première partie du XIXe siècle.

Aujourd'hui, la Fonderie amorce une nouvelle vie et regroupe plusieurs entités : la Faculté des sciences économiques, sociales et juridiques (FSSESJ), la Bibliothèque de l'Université et de la Société Industrielle (BUSIM), la section économique et sociale du Service Commun de Documentation de l'Université de Haute-Alsace, un restaurant universitaire, le Centre de Recherche sur les Economies, les Sociétés, les Arts et les Techniques (CREAT), les Archives municipales et de l'Agglomération mulhousienne et la Kunsthalle Mulhouse, centre d'art contemporain et ses ateliers pédagogiques d'initiation artistique.

La « Fonderie » (d'Giesserei, en dialecte mulhousien), est à la fois l'entreprise dans sa désignation globale et un bâtiment industriel servant de fonderie, dans son aspect fonctionnel.

Telle qu'elle se présente aujourd'hui, la Fonderie s'affirme comme la résultante d'une histoire industrielle, sociale, politique, humaine qui a débuté en 1826, lorsque André Koechlin crée sur ce site la première usine « André Koechlin et Cie » qui deviendra Société alsacienne de Constructions mécaniques en 1872.

A la fin du XXe siècle l'histoire de Mulhouse a été marquée par l'effondrement de son industrie, y compris de ce « symbole » que constituait la SACM.

A présent, la SACM est entrée dans l'Histoire et comme le note Marie-Claire Vitoux dans le livre SACM : quelle belle histoire : « L'entreprise s'est inscrite dans un territoire à plusieurs échelles. Se créant sur elle-même, elle n'a cessé de bâtir, rebâtir, surbâtir son espace usinier(...). Cette mémoire ne surgit que lorsque l'histoire est finie, le devoir de mémoire ne s'impose que lorsque la fin a eu

lieu, surtout quand elle fut vécue douloureusement. Rien ne sert de minimiser ou de relativiser la tristesse et l'angoisse nées de la destruction quasi complète du site industriel et des logements ouvriers ».

La grande nef qui mesure 100 mètres de long, 42 mètres de large et 15 mètres de haut a été conçue par l'architecte Paul Marozeau en 1922, marquant à cette époque la volonté de la SACM de relancer fortement ses activités au sortir de la Grande Guerre (1914-1918) et voulant s'inscrire avec cette nouvelle fonderie mécanisée dans le concept d' « usine moderne ». Ce caractère novateur et ambitieux justifie en partie l'impérieuse nécessité qu'il y a eu à sauvegarder cet élément de patrimoine.

Utilisée en tant que telle jusqu'en 1961 le bâtiment a heureusement échappé à la destruction qui lui était promise au seuil des années 1990....

Continuité et dualité

A proximité du château, dans le plan de sauvegarde de la ville, la médiathèque contemporaine cherche à (re)nouer le dialogue. En secteur patrimonial, et dans l'exiguïté du terrain, la marge de manoeuvre était étroite, mais laissait toutefois le champ ouvert à une intervention sans compromis. S'inscrivant dans la typologie du bâti environnant, un tissu d'hôtels particuliers et de maisons de ville, la médiathèque tire ses qualités du parcellaire existant. Se refusant à tout monolithisme, le bâtiment joue sur la dualité de deux entités dissymétriques, séparées par une faille taillée dans le verre. Comme deux pavillons dans un jardin, elle incarne la sérénité, tout en laissant filer le regard, par le jeu des transparences. Conçu à l'image d'une boîte à thé, le bâtiment réinterprète le thème de la toiture sous forme de ventelles d'ardoises. Ces longues lignes en couronnement du bâtiment assurent non seulement le filtrage de la lumière, mais l'unité entre les deux éléments de la médiathèque, dont l'une intègre une ancienne façade XVIIIème, sans « façadisme » aucun. A l'intérieur, le plan ne sacrifie en rien à la simplicité. De grands plateaux libres assurent la flexibilité nécessaire à ce genre d'équipement. (<http://www.archicontemporaine.org>)

"Se cultiver en s'amusant"

Notre volonté première était de supprimer le côté solennel que peut présenter une bibliothèque traditionnelle. Notre démarche a été de globaliser la demande du client en liant architecture, architecture intérieure et design, nous permettant d'assumer l'entière responsabilité fonctionnelle et esthétique de l'oeuvre.

1) La médiathèque

La triple peau de la façade sud permet de filtrer et de tamiser la lumière. Trois éléments distincts la composent: une cotte de maille, des cerfs-volants (toiles tendues colorées) et un mur-rideau. L'apposition de ces trois corps autorise une filtration douce et colorée à l'intérieur tout en conservant une luminosité optimale.

La nuit, l'épaisseur de ce mur virtuel (80 cm) et le jeu des ombres au travers des cerfs-volants amènent une lecture différente de celle de la journée.

2) La salle de spectacle

C'était la partie existante et disgracieuse de l'ancien bâtiment. Nous l'avons enfermée dans une "boîte en inox" et proposé de lui adjoindre une salle d'exposition.

Les grands murs inclinés reflètent l'environnement naturel tout en le déformant.

Derrière ce parallélépipède de métal, des coursives distribuent la scène et les loges.

La proue du bâtiment est destinée aux loges des comédiens avec une vue directe sur le Loing.

3) Evolutivité, mobilité

Connaissant l'évolution à venir d'un tel bâtiment (modification des supports...

Pascal Brunel Orain

PBO ARCHITECTURE is an architecture agency “OPQIBI” qualified and serving member, since 2010, of WGBC (World Green Building Council) for LEED® (Leadership in Energy and Environmental Design) projects elaboration. PBO ARCHITECTURE has been created in 1999 by Pascal BRUNEL-ORAIN, architect DPLG graduated of the Paris-Malaquais architecture school. Since its creation, PBO ARCHITECTURE is animated by the ambition to create a modern architecture of sustainable design at the forefront of technology, while favoring a citizen-based and eco-responsible approach.

The healthy and sustainable relationship with the different public and private customers is an absolute priority. PBO ARCHITECTURE team becomes attached to respect a professional and behavioral ethics where everyone works with the sole aim of designing and realizing quality architecture for the principal, conform to the demand. The respect of the customer promise is an aim embedded in PBO ARCHITECTURE culture.

#### **École, Médiathèque et Logements, Clamart – France 2006**

Architects Anne-Françoise Jumeau + Emmanuelle Marin + David Trottin/ PERIPHERIQUES ARCHITECTES + Louis Paillard, project manager(s) S. Razafindralambo, BET Structure: Ingerco, BET Fluides: Bethac, BET Economie: Talbot & Ass., Images de synthèse: Périphériques Architectes, client : The town of Clamart, program : A nursery school, a media library and 8 social housings, area 4 200 m<sup>2</sup> SHON (net floor area), location ZAC Bourgogne, Clamart (92140), cost 6 M € not including VAT (value of 2006), calendar Competition: 2003 Hand over: 2006

The multi-programmed project is between a large garden city and a detached house tissue. The idea is to condense the characteristics of the borough, mixing housing with social equipments, in order to redynamise the highly dense neighbourhood.

The whole being organised in layers, it allows the independent functioning of the primary school, the media library and the housing. The strange form has been designed in order to grasp the looks, in consideration of the banal surroundings. The green-golden concrete is going to complete this odd image.

On the ground floor, the reticulated disposition of the classrooms organizes an exchange surface : it creates a dialog with the frame around. At the same time this succession of interior / exterior niches produces the effect of a juxtaposition of closed / opened cocoons.

The display effect of the media library composed by its huge picture window and its big sculptural letters shouts out to the stroller. The double stair entry guides him to the first floor. Then he takes advantage of the highness (4.90) and the generosity of the space, observing the streets across the large windows.

The housing "tower" concentrates the vertical dynamic of the project. Its central access stairs puts the flats at the periphery, giving them a double orientation. The doors' bays with double openings offer an optimal connection to the environment.

Le projet au programme multiple naît à la croisée d'une vaste cité jardins et d'un tissu pavillonnaire. Il se veut dans la continuité de l'esprit de la ZAC caractérisant le lieu, mêlant habitations et équipement sociaux, afin de redynamiser un quartier très habité. L'ensemble s'organise en strates, permettant un fonctionnement indépendant de l'école, de la médiathèque et des logements. La forme inédite, étrange, a été dessinée pour retenir l'œil dans un entourage banal. Un béton teinté vert-doré rajoutera à cette bizarrerie.

La disposition réticulée des différentes salles de l'école occupant le rez de chaussée en fait une surface d'échange : le dialogue instauré avec le les alentours participe de plein pied à la vie de quartier. En même temps cette typologie ambivalente de niches intérieures / extérieures qui se succèdent fonctionnent comme une juxtaposition de cocons fermés / ouverts.

L'effet de vitrine de la médiathèque avec ses énormes baies vitrées et ses grandes lettres sculpturales interpelle le promeneur. La double hauteur de l'entrée l'emmène à l'étage. Fort de ses 4,90m, le généreux espace truffé de baies laisse contempler les alentours. La « tour » compacte de logements concentre la dynamique verticale du projet. Son escalier d'accès central dispose les appartements en périphérie, permettant la double orientation de chacun. Les baies à double ouvrant d'une hauteur de porte offrent un rapport à l'environnement optimal. (Périphériques)

### **Bibliothèque Kandinsky (Centre Georges Pompidou), Paris – France 2002**

Architects Emmanuelle Marin + David Trotin/ PERIPHERIQUES ARCHITECTES, Client Georges Pompidou Center, Program Reorganisation of the documentation and graphic art studio of Georges Pompidou Center, Area 2880 m<sup>2</sup> SHON (net floor area), Location Georges Pompidou Center, Paris (75004), France, Cost 1,67 M € including VAT, Calendar Completion: 2002

Au troisième étage du Centre Georges Pompidou à Paris se trouve le Cabinet d'arts graphiques et les bureaux du Musée National d'Arts Modernes, des salles de lecture et des magasins. Bien que l'espace du plateau soit occupé par de grands volumes, le verre, qui est le matériau du projet, éclipe cette densité. Transparent, opaque, brillant ou réfléchissant, le verre met en valeur le bâtiment de R. Rogers et R. Piano et amène de la lumière jusqu'au centre de l'étage.

Les meubles et le personnel sont protégés par des panneaux de verre, réfléchissants jusqu'à un mètre quarante au-dessus du sol. Cette composition transforme l'espace en une sorte de jeu où les gens apparaissent et disparaissent au grès des transparences et des réflexions, laissant imaginer leur activité sans jamais la révéler complètement.

At the third plant of Georges Pompidou's center in Paris, take place the graphic art's studio and offices and the National Museum of Modern Art's documentation offices, reading room and Warehouse.

Eventhought the reading room, public space of the floor, spreads in a central position, the glass, material of the project, eclipses the dense occupation of the place.

Transparent, opaque, bright or mirror, it values R. Rogers and R.Piano's building and let light reaching the center of the floor. Furnitures and working people are hidden by transparent glass panels made of mirror till one meter and forty. This composition turn the space in a kind of game place where people appears and disappears shown by transparent glass or hidden by mirrors, letting imaging place activity but never revealing it. (Périphériques)

Le principe architectural est très simple. Pour mettre en valeur la salle de spectacle dans ce site en plein coeur de ville, celle-ci est posée sur un socle, un présentoir minéral : comme un joyau urbain. Animé la nuit par un jeu de lumière en relation avec les spectacles, il brille de tous ses feux pour former un repère urbain important. Le socle contient les autres équipements sur l'emprise totale de la parcelle : les bureaux, salles de cours, bibliothèque, salle de danse, salle multifonction, etc. La grande salle émerge donc dans sa peau de métal, libre et majestueuse comme les massifs montagneux qui dominent la région grenobloise. Above and below the land previously occupied by Ewha Square and the athletic field the new 'Campus Valley' provides both, Client Ewha Campus Center Project T/F, 328 Jin-Seon-Mi Hall,

Ewha Womans University whaians and prospective female leaders with much-needed space for continuing education and student services. The campus centre is designed to offer a new sense of direction for higher education in the 21st century. It establishes organic relations between the enter and surrounding areas of campus as well as between above ground and underground spaces; and will serve to redefi ne access to the campus from the main road Jung Mun. Flying is the best way to reach the shores of Seoul Ewha University's new building (founded in 1886, Ewha welcomes 22,000 female students and is ranked as one of the best universities in the world), thought and realised by Dominique Perrault, as a result of an international architecture competition organised in 2003, and inaugurated on April 29th 2008.

A landscape then, more than an architecture work, located in the midst of Seoul's university area. A campus valley where nature, sport grounds, event locations and educational buildings mix, intermingle and follow one another. A long asphalted strip, delineated at one end by a race track, and, completely surrounded by nature. Arranged nature where pear trees and topiary reign. Black asphalt, red race track, green nature and finally the white brightness of a valley appears. A valley, which is bravely drawn in the ground, slides down along a gentle slope. At the other end, the slope becomes a huge stairway which can be used as an open air amphitheatre if necessary.

At the very heart of the valley, a dreamlike immersion takes place. Opposed to the outdoor world, a subtle and serene universe appears suddenly. Classrooms and libraries, amphitheatres and auditoriums, shops and movement... Everything follows up with a constant natural light.

Perrault is prone to buried, excavated, nestled places (the French National Library in Paris, the Velodrome and Olympic swimming pool in Berlin, both built, or the studies for the Kansai Library in Japan and the Cultural Centre in Santiago de Compostela, Spain...) Perrault has the desire, physically speaking, to appropriate the territory, to mingle the constructed material with the ground, the desire to exploit to its paroxysm the idea that "concept and matter have to grapple one with another".

At Ewha University, Perrault puts one more time in action: words (idea, concept, abstraction, geometry, strategy, tension, fusion, freedom, simplicity, evidence...), principles (physics, mechanics, dimension...) and commitments (urban concerns, creation of a location and not only of a building, refusal of formalism, and disappearance of architecture...) which best qualify his architecture.

With the forthcoming inauguration of Seoul Ewha Womans University, Dominique Perrault attests his intense international activity (Habitat Hotel in Barcelona, achievement in May 2008, NH Hotels in Milan, November 2008, the European Court of Justice in Luxembourg, December 2008, the Tennis Stadium in Madrid, May 2009, Donau-City Towers in Vienna, 2010, Theatre Mariinsky II in Saint-Petersburg, 2010...)

Dominique Perrault blends built and natural environments in a new campus center for the growing student body of Seoul's Ewha Womans University.

By Robert Ivy, FAIA

Blurring the line between construction and topography, French architect Dominique Perrault's campus center for Ewha Womans University in Seoul, South Korea's trendy Sinchon district is seamlessly integrated into the sloping hillside it intersects. At the crux of the prestigious campus, this multitiered, multifunctional hive of activity anchors the site and creates a landscape of its own.

The unique site is particularly fitting for the school, which was founded by American Methodist missionary Mary F. Scranton in 1886 and named Ewha (pear blossom in Sino-Korean) by the emperor in 1887 for the abundance of delicate flora at its original location in the city's central Chong-dong area. Beyond poetic metaphor, however, necessity was the mother of this striking structural invention.

Primarily, the existing gated campus of traditional Collegiate Gothic structures, designed in the 1930s by W.M. Vories, the eponymous, Japan-based architectural design firm of Kansas-born William Merrell Vories, was becoming increasingly inadequate. Ewha had risen in prominence and size to more than 20,000 students—reputedly the world's largest private women's university. Yet, while its international student body continued to grow, most domestic students were living at home, many with 2-hour commutes, and the campus lacked sufficient study space or places to gather for long days at school. For those who did remain on campus, weekends proved disconcertingly lonely and detached. Moreover, the addition of a notable building would communicate the university's growing global connection.

Working with a task force, former university president Shin In-ryung established structural and logistical guidelines for the proposed facility. It would be embedded into the landscape, include bi-level parking and a commercial area on lower levels, and redefine access to the campus. It was also determined that the project would require a design by an established international architect. So in February 2004, invitations to compete for the project were sent to a select group of firms from

which three finalists were chosen: Zaha Hadid, Foreign Office Architects (FOA), and Perrault.

Ultimately, the commission was awarded to Perrault for his scheme's sensitivity to landscape. According to the architect, his brief was "to expand urban activities into the campus." His solution was to rebuild the site's original topography, a hill with a slope; introduce the new building into the "constructed" hillside; then cover the building with a park. The result is both heroic and naturalistic, depending on the viewer's perspective.

Remarkably, little changed from Perrault's original program. Crucial to his realization was the decision to bifurcate the concrete-framed structure, dividing it into seemingly cloned halves by an immense rift, or "valley"—a strong assertion of contemporary intervention into the landscape. Ramped from its intersection with the street, this passage, lined with granite pavers, descends into the sliced reconstructed hillside, allowing access to the buildings along its route. It then terminates at a grand stairway that not only climbs up into the campus at the opposite end but serves as an informal seating area or, as Perrault envisioned, an open-air amphitheater. Intended to be a link to the community and social space for students and visitors, this walkway maintains a controlled progression of height to width that points downward to the interior activities, and upward to the older buildings on the hills above.

Insulated glazed walls, supported by a polished, stainless-steel-clad aluminum framing system notable for its perpendicular vertical fins, provide light to the lowest interior levels and animate both indoor and outdoor spaces with human activity. Intermittent doorways, signified by bold graphic numerals, provide the simplest of alterations to the otherwise continuous curtain wall.

Surmounting the binary structure, a green roof partially conceals the large building footprints. At the outset, Perrault intended to plant trees in this overhead park, but the shallow depth of the soil would only permit grass and shrubs.

Nonetheless, the constructed roofscape produces a natural effect with a stone path that meanders among plantings, artfully introduced mechanical elements (read chimneys), and stairs. It is difficult to understand if the park existed on the hillside, or if the hillside is entirely new. Indeed, the passageway can disappear from view, depending on where one stands on either side of the building, leaving only greenery merged with the campus landscape.

Perrault, a proponent of below-grade structures—with built projects like the French National Library in Paris and Velodrome and Olympic swimming pool in Berlin under his belt—feels there should be more research on the use of the earth, or landscape, as a viable building material like concrete or steel. "Usually nature is around the architecture," he says, adding that he and fellow architects should be "thinking about another kind of relationship with nature and soil."

Within this trompe l'oeil-like setting, one will find a battery of much-needed spaces—enough to constitute "a small city," notes Yoonhie Lee, associate professor of the university's department of architecture, and a member of the original competition committee instrumental in the center's interior programming. No single programmatic element dominates, though the building tends to aggregate the noisier, more social activities on the lowest level, four levels beneath the roof. Like a commercial district, this level, B-4, contains a twinned-screen art cinema, coffee houses, a gymnasium, restaurant, theater, art exhibition space, commercial banks, and retail outlets.

The higher you ascend, the quieter it gets, because, explains Lee, while classes are held here, one of the center's most important functions is to provide places for study. Formal, monitored librarylike spaces, with reserved carrels and desks, alternate with informal couches interspersed throughout, where students talk in small groups, review lessons, or simply socialize. A large, open staircase links upper and lower levels adjacent to the glazed curtain wall and seems to attract more student traffic on inclement days than the "valley" outside, which can seem daunting. While gravity-based drainage removes heavy monsoon rain, snowfall on the outer passage must be cleared by hand.

Of course, one benefit of building into a hillside is energy conservation. According to university sources, the thermal mass of the green roof and side walls sheltered by existing topography has resulted in a passive protection system that saves up to 25 percent of total energy costs as compared to conventional construction. Perrault also used a concrete core activation system, (aka in-floor HVAC made of piped heating and cooling under floor slabs) along with a "thermal labyrinth" system that optimizes air flow in the interstices between retaining walls and other structural elements to cool ambient air. And while the building's interior could have been dark and dingy, Perrault and his collaborators inserted light wells down through to the lowest inhabited levels, a strategy augmented by the glazing.

In terms of budget, the simple system and material choices, such as exposed-concrete columns, helped to deliver the building on time and within the financial strictures of the university. Even fireproofing, often prohibitive in such large open spaces, doubled as decorative elements in the otherwise muted interiors.

Clearly, Ewha Womans University took a bold step specifying a scheme that goes not up, but down. No less dramatic or memorable than the towers dotting the Asian landscape, the campus center makes a strong statement of the institution's commitment to the future, to its heritage, to its place in the environment, and to its students.

### **Libraries :**

**[Bibliothèque municipale, Résidence Lucien Rose, Rennes – France 2004 – 2009](#)**

900 m<sup>2</sup>, 1.300.000 €

Quant à la bibliothèque Lucien Rose, avec sa façade sud-ouest se déployant en escaliers, elle mime le dénivelé du terrain (dix mètres) qui sépare l'entrée du quartier de la grille d'accès au Parc du Thabor, pour une pente moyenne de 4%. "Le site a été entièrement remodelé", précise d'ailleurs Stéphane Pertusier. Cet écho qu'offre le bâtiment à la topographie du site n'est pas uniquement formel : La bibliothèque Lucien Rose "s'enfasse progressivement dans le sol", précise Philippe Croisier. Semblant prolonger le sol et ses sursauts - l'équipement offre un écho aux murs de soutènement parcourant le site - la bibliothèque Lucien Rose se fond dans son paysage. Pour autant, tout sobre et intégré qu'il soit au jardin botanique du Thabor, le quartier Lucien Rose ne reste-t-il pas, en vertu même de sa position d'appendice du parc, une enclave ? En tout cas, s'il est un témoin de la mixité sociale clamée par les acteurs du projet, c'est la bibliothèque : "Nous ressentons la mixité au quotidien", affirme à cet égard la responsable de l'équipement. Point de départ du projet, la bibliothèque Lucien Rose serait promise à en devenir, aussi, le point d'orgue. L'organisation intérieure de l'équipement traduit cette volonté. Eclairée par cinq failles zénithales qui confèrent à l'espace enterré une clarté inattendue, la bibliothèque se déploie sur deux niveaux. Rayonnages, espace de consultation, alcôve consacrée à la petite enfance et bureau du personnel animent le deuxième niveau du bâtiment alors que le premier niveau est consacré à des projections. Fruit d'une suggestion des architectes, cet espace de rencontre inédit fait d'ores et déjà l'objet d'une programmation originale : le premier événement organisé au sein de la bibliothèque Lucien Rose est un concert dessiné. ### Les Champs Libres, Rennes – France 1993 - 2006

In Rennes in der Bretagne wurde am 28. März 2006 der von Christian de Portzamparc (Paris) entworfene Kulturkomplex „Les Champs libres“ eröffnet. Das Kulturzentrum beherbergt drei Einrichtungen, die von außen klar zu unterscheiden sind: Das „Musée de Bretagne“ bildet einen fast fensterlosen Quader über einem verglasten Erdgeschoss, das „Espace de sciences“ ragt als Kuppel aus diesem Quader heraus, und die „Bibliothèque de Rennes“ durchstößt als umgedrehte, fünfeckige Pyramide den Sockel. Rund 35.000 Quadratmeter Nutzfläche wurden für die drei Bereiche geschaffen. Mit verschiedenen Fassadenmaterialien und Formen will Portzamparc Bezüge zu Stadt und Umgebung herstellen: Die rosarote Betonverkleidung soll an den Granit der bretonischen Felsküste erinnern, die Zinkschindeln des Wissenschaftszentrums verweisen auf die Schieferdächer der Stadt und dessen Kuppelform auf die Dolmen, für die dieser Landstrich berühmt ist. Der Luftraum des Foyers im Erdgeschoss wird mit Treppenläufen und Stegen durchkreuzt, die die verschiedenen Einrichtungen miteinander verbinden.

Ein Centre Pompidou für die Bretagne von Marc Zitzmann

Ehrgeiz oder Größenwahn? Mit 212 500 Einwohnern ist Rennes nicht nur eine der kleinsten Städte der Welt mit einer Metro, dem 2002 in Betrieb genommenen VAL. Die Hauptstadt der Bretagne nimmt mit dem letzten Dienstag eröffneten Kulturkomplex Les Champs libres auch explizit Bezug auf zwei der spektakulärsten Kulturbauten des späten 20. Jahrhunderts: das Pariser Centre Pompidou und das Guggenheim- Museum Bilbao. Der Vergleich mit der baskischen Hafenstadt hinkt freilich. Rennes mag seine Probleme haben: Wegen des starken Bevölkerungswachstums wird der Raum knapp und verstärkt sich die soziale Segregation, der Alkoholkonsum vieler bretonischer Jugendlicher ist besorgniserregend . . . Aber mit einer Arbeitslosenrate von bloss 8 Prozent, weit unter dem Landesschnitt, läuft der Wirtschaftsmotor auch ohne katalysierenden Bilbao-Effekt auf Hochtouren.

Drei Institutionen unter einem Dach

Triftiger ist der Vergleich mit dem Centre Pompidou. Wie in diesem wohnen auch in den Champs libres mehrere Institutionen unter einem Dach. Anders jedoch als Renzo Piano und Richard Rogers in ihrer 1977 fertiggestellten Architektur- Ikone erhebt Christian de Portzamparc diese Koexistenz zum wichtigsten Gestaltungsprinzip seines Kulturkomplexes. So sind die drei neuen Nachbarn schon von aussen klar zu unterscheiden: Das Musée de Bretagne bildet einen rechteckigen, fast fensterlosen Sockel über dem verglasten Erdgeschoss, welchen der von einem Dom überragte Konus des Espace des sciences und die fünfeckige umgekehrte Pyramide der Bibliothèque de Rennes durchstossen. Gemahnt das Museum von aussen an die Steinplatte eines Dolmens, dessen rosagraue Betonverkleidung den Granit der Felsküste evoziert, so verweisen die 16 000 Zinkschuppen des Wissenschaftszentrums auf die Schieferdächer der Stadt, während sich die auf drei Seiten verglaste Bibliothek mit ihrer weiss lackierten Aluminiumhaut ganz zeitgenössisch gibt. Auch in der Empfangshalle stossen heutig- kühle Grautöne und das Altrot des regionaltypischen Schiefersteins aufeinander. Charakteristisch für Portzamparc, den Architekten der Pariser Cité de la musique, ist die Gestaltung der weitläufigen Halle als ein Stadtviertel en miniature. Durch einen der drei Eingänge kommend, spaziert der Besucher an den Gebäuden der Bibliothek und des Wissenschaftszentrums vorbei zu einer bunt-fröhlichen kleinen Bibliothek und zum verzauberten «Laboratoire de Merlin» für Kinder oder zu einem Medienraum mit Internetzugang, Fernsehern und 220 Periodika. Auch dank der Arbeit des Grafikers Ruedi Baur, des Leiters des Instituts für Designforschung der Hochschule für Gestaltung und Kunst Zürich, vermag man sich auf Antrieb zu orientieren. Die Logos und Informationstafeln bringen überdies den dringend nötigen Schuss Farbe und Verspieltheit in den sonst etwas strengen Bau. Die Champs libres warten mit modernster Technik auf. So bietet das Wissenschaftszentrum neben einem der Geologie gewidmeten Saal, dessen Erdbebensimulator Kinder von 7 bis 77 Jahren begeistern dürfte, ein digitales Planetarium mit einem halbkugelförmigen Bildschirm von 14 Metern Durchmesser. In der Bibliothek ist der Verleih der 190 000 frei zugänglichen Bände voll automatisiert: Der Benutzer nimmt ein Buch aus dem Regal, führt es unter ein Gerät, das den Titel registriert, und legt es nach der Lektüre einfach in eine Box im Erdgeschoss zurück - ab Oktober wird sogar ein Roboter die Rückgaben sortieren. Die Bibliothekare können sich so auf Information und Beratung konzentrieren. Die sechs Stockwerke, auf denen je eine Abteilung untergebracht ist, sind alle gleich strukturiert: am Eingang der Empfangsschalter und das Gerät für die Identifikation der Bücher; dahinter die grauen Regale, deren geringe Höhe auf Klaustraphobiker beruhigend wirken dürfte; zur Fensterfront hin die Lesetische mit Blick auf die Esplanade Charles-de-Gaulle. Im Rahmen der Umgestaltung des Bahnhofsviertels wird der vordem oberirdische Parkplatz bis 2008 unter den Platz verlegt, an welchen der renovierte Saal für Massenspektakel «Le Liberté», ein neuer Multiplex mit 13 Sälen von Portzamparc sowie zwei öffentliche Gebäude angrenzen werden.

Wahrzeichen der bretonischen Identität

Den ersten Stock der Champs libres bildet ein Gefüge von Plattformen und Stegen, das um die Bibliothek und das Wissenschaftszentrum mäandert. Hier breitet sich über 1900 Quadratmeter die Dauerausstellung des Museums aus. «Bretagne est Univers» entwirft mit Hilfe von 2300 Exponaten einen detaillierten Abriss der Geschichte der Region vom Paläolithikum bis zur Jetztzeit. Gezeigt werden neben kunsthandwerklichen Arbeiten wie der berühmten «Brigitte», einer gallo-römischen Statue, auch Alltagsgegenstände wie Mobiliar, Geschirr und Kleider. Der folkloristische Aspekt tritt klar zurück zugunsten der Didaktik und - dank Elizabeth de Portzamparcs eleganter Szenographie - auch der Ästhetik. Das Musée de Bretagne ist alles andere als ein Kuriositätenkabinett von bloss lokalem Interesse - es beleuchtet, so sein Chefkonservator, Jean-Paul Le Maguet, im Gespräch, «das Werden einer Region aus einer europäischen Perspektive». Das Thema der bretonischen Identität wird in den Champs libres auf vielfältige, auch für auswärtige Besucher ansprechende Art und Weise aufgeklärt. Das Wissenschaftszentrum zeigt die Formung der Landschaft, insbesondere des armorikanischen Gebirges. Die Bibliothek konserviert das erste lateinisch-bretonisch-französische Wörterbuch aus dem Jahr 1499. Und das Museum zeigt in zwei grossen Sälen Wechselausstellungen zu im weitesten Sinne regionalen Themen - so Ende April ein Panorama der florierenden bretonischen Comicszene. Derweil im 450 Plätze fassenden Konferenzsaal der Historiker Maurice Olender über Rassismus und der Drei-Sterne- Koch Olivier Roellinger über Gastronomie sprechen werden. Für den Beitrag verantwortlich: Neue Zürcher Zeitung, 31.03.2006 (<http://www.nextroom.at>)

## Atelier Michel Rémon Architecte, Paris – France

<http://www.remon.fr>

### Informédiathèque de l'INSA ( École Nationale Supérieure des Arts et Métiers ), Lyon – France 2009

En coupe, l'espace intérieur est structuré en trois strates verticales successives : les bureaux au Sud, les services et les circulations verticales au centre, les salles de lecture au Nord. Dans son site, l'apparence, de l'infomédiathèque apparaît comme sa réaction à l'espace qui l'entoure. Ce monolithe d'une extrême simplicité se déforme successivement pour répondre à chaque espace qui lui fait face. Au Sud, il ferme la perspective du boulevard d'entrée à l'université. À l'Est il ferme une place urbaine ; à l'Ouest il bord un jardin. Au Nord il fait face à la grande façade blanche de l'atelier de thermodynamique qui réfléchit la lumière vers les salles de lecture. Conçu selon une démarche HQE, chaque plan de façade répond au moment de la course du soleil qui le concerne. (Rémon)

### École Nationale des Greffes a Dijon – France 2008

Nous avons recomposé l'unité architecturale de l'école en recomposant l'unité de sa coupe en long au travers de l'ancien et du nouveau bâtiment. Le déplacement de l'entrée crée un nouveau centre à l'édifice. Le site est stratifié dans la profondeur de la parcelle. L'école se développe le long du boulevard. Un patio intérieur, miroir du patio existant, compose les relations avec la partie résidentielle du site en fond de parcelle. La profondeur de façade sur rue manifeste ces deux axes de compositions perpendiculaires par sa double figure croisée. Les registres architecturaux utilisés expriment la stratification horizontale du programme (rez-de-chaussée pour l'accueil, piano mobile pour l'enseignement, étage de la salle du conseil tournée vers le paysage lointain au-delà de l'espace de la rue. (Rémon)

### UFR ( Unité de Formation et de Recherche ) de Droit, Bibliothèque et Restaurant, Paris 12<sup>e</sup>, Créteil, Dep. Val-de-Marne, Île de France (Paris) – France 2000 – 2005

L'UFR de droit de Créteil est composée comme un îlot, une enceinte clairement identifiable à l'échelle du site. Cette figure de 130mx70m de côté affirme la présence de l'université depuis la voie rapide. Depuis l'avenue du Général de Gaulle, l'îlot universitaire entrouvre sa cour intérieure et exprime la spécificité de sa fonction. L'entrée de l'université est marquée par ses éléments les plus signifiants : - À gauche, le cube soulevé de la bibliothèque universitaire affiche sa grande façade vitrée sur le boulevard. À droite, la forme triangulaire opaque des deux grands amphithéâtres s'ancre puissamment au sol. - La cour intérieure distribue toutes les fonctions de l'UFR. Elle est conçue comme un grand hall à ciel ouvert. (Rémon)

### Université Les Chênes, Cergy-Pontoise, Dep. Val-de-Oise, Île-de-France – France 1991 – 2001

Tout commence par le site. Qualifier le site. L'échelle de l'Université est d'abord définie par le tracé de son espace extérieur le " CHAMP " ouvert au Sud sur la ville. Le champ fédère l'ensemble universitaire des Chênes pour en constituer le repère spatial. Tout l'espace est organisé à partir de l'œil (l'origine du regard) situé à l'entrée du campus au Sud du terrain. Au fond de la perspective la bibliothèque est soulevée de terre. Elle ne ferme pas l'espace mais le stabilise, la lumière l'enveloppe. À droite, le bâtiment principal ouvre la figure par sa ligne en mouvement. La tête du bâtiment porte en elle cette dynamique. Sa figure emblématique est devenue une porte de la ville. La coupe en long du bâtiment stratifie les fonctions principales de l'université. À rez-de-chaussée les grands amphithéâtres, au 1<sup>er</sup> et 2<sup>e</sup> étages, la Rue de la Recherche, centre nerveux du bâtiment qui associe la bibliothèque et les centres de recherche. Dans les étages, les salles d'enseignement, les bureaux d'enseignants et l'administration. Les façades expriment cet assemblage d'échelles particulières. (Rémon)

Ce bâtiment universitaire est la plus importante réalisation de Michel Rémon. Situé en face du centre commercial, le grand vaisseau blanc longe le boulevard de l'Oise pour dresser sa proue sur le boulevard du Port. Une passerelle enjambe ce dernier pour aboutir à un vaste parvis. L'entrée se situe dans un bâtiment bas entouré par une tour cylindrique et le corps principal abritant amphithéâtres, et salles diverses. La pureté des lignes et la diversité des ouvertures et baies vitrées font toute la force du bâtiment. This university building is the most significant realization of Michel Rémon. Located opposite the shopping centre, the large white vessel skirts the boulevard of Oise to draw up its prow on the boulevard of the Port. A footbridge spans this last to lead to a vast square. The entry is located in a low building surrounded by a cylindrical tower and the principal body sheltering amphitheatres, and various rooms. The purity of the lines and the diversity of the openings and windows make all the force of the building.

#### **Libraries :**

#### Médiathèque d'Antibes – France 2000 – 2006

La médiathèque d'Antibes-Juan-les-pins, créée par l'architecte Pierre Riboulet, a ouvert ses portes en décembre 2006. Le projet s'est inscrit dans le cadre du développement culturel d'Antibes et de la Communauté d'Agglomération Sophia Antipolis (CASA). La nouvelle médiathèque constitue le pôle central d'un réseau qui comprend également une desserte par deux bibliobus et une médiathèque dans le quartier des Semboules à Antibes, renforcé par la Médiathèque de Valbonne (ouverte en mai 2007). Elle marque un saut quantitatif et qualitatif de la lecture publique à Antibes et dans son agglomération. La médiathèque s'inscrit dans cette nouvelle génération d'équipements qui ont pour volonté la mise en œuvre de la démocratisation de la culture et se veulent à la fois vitrine et carrefour social, tant par la diversification de leurs fonctions que par l'élargissement de leurs publics. La séparation habituelle entre section adultes et section enfants fait l'objet d'une répartition plus nuancée, basée sur une utilisation plus « pédagogique » de la documentation et un décloisonnement des publics. Elle est agencée autour de trois axes prioritaires : un grand service d'information et d'actualité au rez-de-chaussée, un secteur musical développé, regroupant tous les médias et supports sur les musiques, en lien avec la forte implication musicale d'Antibes, un secteur documentation commune enfants-adultes. Les collections sont multimédias, multisupports, avec des accès Internet et de la vidéo en consultation et en prêt dans tous les secteurs. Un laboratoire de langues permettant la formation et l'autoformation est en cours de mise en place. L'ensemble des services est complété par un portail développé et sur lequel se trouve une information complète sur les services et actions culturelles proposées dans le réseau ainsi que des échanges en ligne, fanzines, concours et blog, très conviviaux. L'inscription est gratuite pour les habitants de la CASA et hors CASA. Le programme d'activités culturelles riche et varié, est accessible sur le portail de la Médiathèque : [www.mediathèque-casa.fr](http://www.mediathèque-casa.fr) (<http://www.adbg.asso.fr>)

Bruno Huerre a conçu avec Pierre Riboulet, avant son décès en 2003, la nouvelle bibliothèque d'Antibes en optant pour une organisation par demi-niveaux de part et d'autre d'un vide central, l'atrium. Organisés autour de ce grand atrium central, les espaces sont très diversifiés tout en gardant une continuité par le parcours et les vues traversantes. Découverte.

#### **Le projet**

La nouvelle bibliothèque est implantée en centre ville, en bordure de la ville ancienne. Le site très dense est entouré de hauts et imposants bâtiments de logements qui bordent les rues. L'assiette de la surface à construire est relativement petite en regard du programme à bâtir.

Le bâtiment est implanté sur la totalité de l'emprise admissible. Les surfaces à construire en superstructure se développent sur trois niveaux principaux, un quatrième partiel. Quatre niveaux en infrastructures sont dédiés aux services du livre et au parc de stationnement public dont le fonctionnement est séparé de la bibliothèque.

Les quatre niveaux de superstructure constituent un front bâti sur les deux boulevards principaux du terrain. Une large fenêtre a été ménagée dans la façade principale urbaine dans la continuité visuelle de la rue Chaudon située à l'opposé. Elle constitue une invitation, un transfert de l'extérieur vers l'intérieur. Elle apporte également lumière et transparence au cœur du bâtiment. Organisation architecturale : un espace sans coupure

Pour éviter l'effet "grand magasin" avec ses rayons spécialisés par étages, une organisation par demi-niveaux de part et d'autre d'un vide central, l'atrium, a été adoptée. Ces plateaux décalés sont réunis entre eux par des volées d'escaliers installés au droit des postes d'information et de prêt et par des rampes sur le côté opposé qui permettent de changer de niveau sans changer d'espace dans le mouvement même de la marche. Il en résulte des transparences sur la longueur totale du bâtiment (50 m) et très différentes selon les niveaux, et qui ont le même but d'unifier les parties en un tout.

Ainsi, il est possible d'aller du haut en bas du bâtiment, au cours d'une même promenade, en parcourant les différents secteurs et en ayant toujours une vue sur l'ensemble. Le grand atrium central joue un rôle prépondérant dans l'organisation intérieure mais aussi en tant que facteur d'unité pour toute la partie publique du bâtiment. Il est éclairé zénithalement et par la grande fenêtre urbaine. Il permet de saisir, dès l'entrée, l'organisation de l'ensemble des plateaux de lectures dédiés à chaque discipline qui s'additionnent sans coupure.

ce grand lieu de culture en chantier depuis 5 ans comptait déjà 1000 inscrits recensés quelques jours seulement après l'ouverture le 11 décembre dernier. Organisée autour de ce grand atrium central, les espaces sont très diversifiés tout en gardant une continuité par le parcours et les vues traversantes. Ainsi, chacun trouve sa place, soit entouré de livres dans un lieu confiné, soit en bordure du vide central à la vue de tous ; en rapport avec la rue pour lire les actualités près des baies vitrées, ou en rapport avec le ciel et le paysage au dernier étage pour consulter un dvd.

Plus qu'une médiathèque, le bâtiment est un lieu d'échange et de culture. Et c'est bien ce qu'a souligné Renaud Donnedieu de Vabres, ministre de la Culture d'alors, dans son discours en saluant le caractère ouvert de l'architecture. "Je remarque avec plaisir combien sont atténuées ici les éventuelles séparations entre les sections et les supports. Pas d'espace strictement clos (...). Chacun ici doit se sentir accueilli et accueillir c'est donner l'esprit de découverte", dit-il. (<http://architecturedz.bloguez.com>)

### **Bibliothèque universitaire Le Mirail, Toulouse – France 1997 – 2003**

La bibliothèque universitaire centrale de l'université du Mirail a ouvert ses portes en 2004, soit 7 ans 1/2 après que l'architecte Pierre Riboulet ait remporté le concours. Elle vient s'établir entre la Maison de la Recherche et l'Arche dans la nouvelle configuration de la "façade de l'Université constituée de "plots".

Construite sur un emplacement particulièrement complexe en terme de contrainte spatiale et morphologique, elle jouit de toute la science des volumes et de l'articulation des fonctions dont a su faire preuve Riboulet tout au long de sa carrière jusqu'à sa mort en 2003. On y retrouve ainsi son goût pour les vues indirectes, les doubles hauteurs, les patios cachés, les galeries suspendues...

Le RDC (140 m NGF) reste comme auparavant dévolu aux stationnements du campus, tandis que les magasins s'organisent 2,60 m au-dessus. Le RDC public (148 m NGF) est situé 2 m au-dessus du niveau du sol de l'Université au droit de l'Arche et 1,85 m au-dessous du 2° étage du bâtiment de la recherche. De longues rampes de faible pente relient ces trois niveaux en conservant la logique du reste du Master Plan de Candilis, organisé autour de vastes circulations couvertes, mais à l'air libre. 2 étages encore surplombent le RDC public. (<http://www.pps-archi.eu>)

### **Bibliothèque francophone multimédia, Limoges – France 1993 – 1998**

Le contexte

La ville de Limoges, le commanditaire, a fait construire cette bibliothèque multimédia en centre-ville. La bibliothèque a une vocation régionale et s'étend sur 14 800 m<sup>2</sup> sur le site de l'ancien hôpital. La structure est ouverte au public le 12 septembre 1998. Le nouvel équipement a coûté 22 millions d'euros (40% de l'équipement financés par la ville de Limoges) et a bénéficié du concours financier de l'Etat pour la même somme (6 millions d'euros hors subvention mobilier et informatique), du conseil général de la Haute-Vienne pour 10% (2,1 millions d'euros) et du conseil régional du Limousin pour 10% (2,2 millions d'euros). Cet établissement a été aussitôt reconnu en tant que Bibliothèque Municipale à Vocation Régionale (B.M.V.R.) et en tant que Pôle d'excellence associé à la Bibliothèque nationale de France dans les domaines du théâtre, de la poésie et de la critique francophones. La B.f.m. constitue dans la réalité un vaste réseau : six bibliothèques municipales reliées entre elles par un réseau de fibres optiques leur permettant de proposer les mêmes services à tous.

Le projet, situé au cœur de la ville historique, a permis d'aménager l'ancien hôpital, tombant en ruine car abandonné au profit du C.H.U., ainsi qu'une vaste friche située aux alentours. La bibliothèque a été le premier édifice de ce vaste projet d'aménagement urbain. Sa construction a précédé l'édification de bâtiments universitaires, de logements et de différents équipements publics. Cet aménagement s'effectue en outre sur les fondations du quartier du forum romain : des axes romains ont pu être dégagés lors des fouilles préliminaires. Une mosaïque du début de l'ère chrétienne, datant d'Augustoritum, a été mise au jour.

L'édifice

Cet édifice résolument moderne intègre des vestiges de l'histoire locale : la bibliothèque reprend l'orientation des voies romaines et de ce fait n'est pas disposée parallèlement à l'hôpital. Le plan est totalement centré sur la grande mosaïque, des parties de l'ancien hôpital à architecture classique subsistent encore en façade latérale. L'édifice est à ce titre un continuum. La façade principale sur l'avenue Baudin est formée tel un volume distinct qui s'avance. Elle est intégrée à la Bibliothèque francophone multimédia lément vitrée sur ses trois faces, chapeauté d'une corniche-auvent, et invite le passant à entrer. Une fois franchi le hall, la bibliothèque est organisée autour d'un grand plateau central, salle unique de 15 000 m<sup>2</sup> où les livres sont disposés en accès libre, dédoublé par une ceinture en hauteur d'un étage mezzanine. Afin de privilégier la lecture et la réflexion, trois verrières circulaires dispensent un éclairage zénithal et peu de vues sur l'extérieur existent. Ces verrières, prolongées de volumes coniques, forment des cônes de lumière et sont équipées de stores vénitiens pour dispenser une lumière toujours maîtrisée. L'architecte parle de « lieu plein éclairé de l'intérieur ». La façade de cette salle sur la rue François-Mitterrand est en granit, référence à la pierre du pays et à la sérénité solide du livre, et

en vitrage avec deux longs bandeaux vitrés formant mouvement vers l'infini (la première en bas et la deuxième sous la corniche-auvent), et permettent à la salle d'être à la fois lieu intime et lieu d'ouverture. Un escalier à ressauts supporté par des haubans, eux-mêmes fixés à la corniche en béton et métal adoptant la forme d'un portique, rompt la façade monobloc de granit et crée l'illusion d'un mouvement vers le ciel. L'architecture est alors formée d'emboîtements successifs largement en débord du cadre strict de l'édifice. Un jardin d'hiver très moderne (trois parois de verre trempé-collé, glaces suspendues par des ventouses aux poutrelles métalliques, deck posé à terre) met

en relation les murs subsistants de l'ancien hôpital, bordant le jardin par un mur portique de granit enduit, et le bâtiment neuf très vertical en granit et longues bandes vitrées. Actualité Le bâtiment assure toujours sa vocation initiale. Il est labellisé Patrimoine du XXe siècle par arrêté du 25 mars 2002. (<http://www.banque.pdf.fr>)

#### Université Paris VII Réutilisation des Grand Moulins, Paris – France 2008

L'implantation de l'université dans le quartier Masséna s'entend dans le respect des bâtiments, mémoire de son passé industriel. Le parti pris du projet entend conserver aux bâtiments leur volumétrie d'origine et traiter la totalité du programme dans les volumes existants, sans adjonction d'extensions visibles.

Le traitement de l'enveloppe est minimaliste. La façade des Moulins sur le quai est conservée totalement. La façade sur l'esplanade conserve pour l'essentiel son système porteur ; les remplissages sont remplacés par de grandes baies vitrées uniquement recoupées par les nez de planchers. Le pignon des Moulins, jusqu'alors aveugle, est largement percé, trouvant là un nouveau statut de façade. Cet ensemble devient la vitrine des Grands Moulins en donnant à voir ses nouveaux usages. La façade se dématérialise en se vitrant, exposant les nouvelles fonctions du programme renforçant l'image « grand magasin » sous jacente de l'architecture de Georges Wybo.

La façade vers la Halle aux farines ainsi que la toiture du bâtiment nettoyage-silos, endommagée par un incendie, se perce de baies ponctuelles éclairant ainsi les volumes sous combles.

Les Grands Moulins accueilleront principalement la bibliothèque centrale (1.800 places de lecture), des unités de formation et de recherche (lettres, sciences humaines, formation continue, etc.), des services d'accueil aux étudiants, des services administratifs et un espace de restauration. #### Médiathèque Garenne-Colombes (Dep. Hauts-de-Seine, Reg. Îles-de-France) – France 2012

surface : 2500 m<sup>2</sup>, Cout travaux : 5 800 000 € HT, date études : 2008 travaux : 2009/2011, Maître d'ouvrage : Ville de la Garenne Colombes 92 France

La Garenne-Colombes Le projet de la médiathèque de La Garenne-Colombes devait s'insérer dans un tissu urbain de pavillons et de petits immeubles collectifs, prendre en compte la géométrie de la place de la Liberté, tout en s'imposant comme un équipement public contemporain. Implanté au centre de la parcelle qu'il occupe presque en totalité, le bâtiment qui ne fait que 13,50 m dans sa plus grande hauteur, est visible de tous côtés. A demi-protégée par les arbres, la façade vitrée au sud, arrondie sur la place et rectiligne sur la rue, est habillée de brise-soleils de différentes longueurs et largeurs, qui l'estompent par un jeu de reflets, d'ombres et de lumière. Les autres façades, sur le côté et arrière, donnent une vision architectonique totalement différente: murs de béton sur plusieurs hauteurs, fenêtres en bande, volumes cubiques, jardins intérieurs apportant une respiration aux immeubles d'habitation riverains. Long de 35 m, le hall en double hauteur laisse voir le bâtiment dans toute sa profondeur. Son accès légèrement décentré détermine une circulation fluide. A droite, en vitrine sur la place, les espaces communs, avec à l'arrière une salle d'animations séparée; au fond, éclairée par une lumière zénithale naturelle, une salle d'exposition ouvrant sur un jardin ; à gauche, l'auditorium, avec dissimulé par une façade légèrement courbe de bois qui le fait apparaître comme une sculpture répondant à la courbure de la façade. A l'entresol, les salles multimédia et de travail ont un accès séparé qui les rend indépendantes des horaires de la médiathèque. Ouvrant sur les espaces du rez-de-chaussée et sur des jardins intérieurs, le premier niveau, réservé à la lecture, est en balcon sur la place de la République. La lumière du sud est tamisée par les pare-soleil et un plafond incliné lui donne une acoustique parfaite. L'espace des enfants, lecture et atelier, est à l'écart du passage. Au deuxième étage se trouvent les bureaux des bibliothécaires avec une terrasse, des ouvertures vers la rue et des vues intérieures sur les salles de lecture. (Richard)

#### Médiathèque Gentilly (Dep. Val-de-Marne, Reg. Île-de-France) – France 2010

1.800 m<sup>2</sup>, € 3.850.000

La médiathèque-pont – Hqe et urbanité : Dans ce lieu où la maison Doisneau consacrée à la photographie et le bâtiment des services culturels de la ville forment avec la médiathèque un pôle culturel, des événements informels prennent place, qui permettent de tisser un lien social entre les générations. Un accès unique à la médiathèque lui donne sa lisibilité. La façade en sous face, avec son double mur de verre qui permet d'exposer des photos ou des livres, laisse passer des lumières différentes à travers l'espace transparent qui cadre la Bièvre par un balcon et reste souvent ouvert tardivement. Ce hall d'entrée au rez-de-chaussée abrite l'accueil, la presse et une salle de réunions ou de spectacles. Traitée comme un petit auditorium avec une régie, elle apporte un éclairage nocturne vibrant au passage.

La médiathèque de Gentilly s'ouvre tel un livre sur la ville. La géométrie circulaire à l'échelle de la ville du rez-de-chaussée, qui se poursuit par des murs extérieurs et des gradins, fonde cet espace public et génère une qualité contemporaine dans le parcours urbain. Le passage abrité par sa sous face, axe piétonnier qui mène au RER, est un lieu privilégié où les habitants prennent plaisir à s'attarder sous cette enveloppe structurale d'acier et de verre. Une façade a été dessinée sur la rivière Bièvre, aujourd'hui couverte, pour des cheminements futurs

Dans ce lieu où la maison Doisneau consacrée à la photographie et le bâtiment des services culturels de la ville forment avec la médiathèque un pôle culturel, des événements informels prennent place, qui permettent de tisser un lien social entre les générations. Un accès unique à la médiathèque lui donne sa lisibilité. La façade en sous face, avec son double mur de verre qui permet d'exposer des photos ou des livres, laisse passer des lumières différentes à travers l'espace transparent qui cadre la Bièvre par un balcon et reste souvent ouvert tardivement. Ce hall d'entrée au rez-de-chaussée abrite l'accueil, la presse et une salle de réunions ou de spectacles. Traitée comme un petit auditorium avec une régie, elle apporte un éclairage nocturne vibrant au passage

Au premier niveau, largement éclairée mais protégée du soleil et de la chaleur, les salles de lecture adultes sont divisées en deux espaces parallèles vitrés. L'une surplombe la vallée de la Bièvre, l'autre est aménagé pour la consultation des ouvrages et l'étude dans le calme de la lumière du Nord. Des ouvertures dans le plancher laissent percevoir le passage des piétons. Deux escaliers desservent au second niveau l'espace des livres d'art et les salles de lecture enfants, où les plus jeunes viennent une fois par semaine entendre un conteur. Séparée par un mur de livres, la section art s'inscrit dans un volume saillant arrondi en bois ajouré de verre. Sa forme d'appel visible d'en bas, l'oblique des panneaux de bois rouge à l'intérieur du bâtiment transparent incitent à gravir les marches rectilignes qui mènent à ce volume intrigant et clos. (Richard)

#### **PUG de Grenneville – France 2009**

Maîtrise d'ouvrage : Département des Hauts de Seine, Surfaces : 13 000 m<sup>2</sup>, Montant des travaux : 23 M.€HT

Salles d'enseignement et de recherche, salles informatique, laboratoires de langues, amphithéâtre 250 places, administration, bibliothèque, restaurant 700 repas, cuisine centrale. (Ripault)

#### **Centre culturel de Villepinte, École de musique et de danse, salle de spectacles, médiathèque, Villepinte (Dep. Seine-Saint Denis, Reg. Île-de-France) – France 2007**

Maître d'Ouvrage : Ville de Villepinte, Surfaces : 5968 m<sup>2</sup>, Montant des travaux : 8,1 M.€

Le projet rassemble une médiathèque, un conservatoire de musique et une salle de musique. Le plan en trident est articulé autour d'un hall central. La médiathèque en façade, constitue un bloc vitré à l'Est et au sud protégé par une galerie extérieure avec des protections solaires, lames verticales en bois.

Au centre des espaces, un escalier central constitue une brèche inclinée rehaussée d'un volume de lumière zénithal.

Le conservatoire, longe le parking avec des salles de géométrie aléatoire et des volumes équarris, « taillés dans le vif » pour les grandes salles d'instruments, détachées les unes des autres par des alcôves de lumière le long des circulations. Les salles de danses à l'angle constituent deux grandes baies comme des écrans avec ouvertures variables, protections solaires permettant également de montrer ou de cacher les danseurs sur le parvis.

La salle de spectacles sera réalisée ultérieurement, volume ovoïde, placé à l'angle opposé, partiellement incrusté dans le hall. Ecole de Musique et de Danse – salle de spectacles de 300 places – médiathèque (Ripault)

#### **Bibliothèque universitaire de Saint Quentin en Yvelines (Dep. Yvelines, Reg. Île-de-France) – France 2004**

Salle en libre accès – accueil – administration, MO : Conseil Régional d'Ile de France, Surfaces : 8435 m<sup>2</sup>. Montant des travaux : 11,6 M.€, Livré en 2004

La Bibliothèque Universitaire de Saint-Quentin-en-Yvelines, boulevard Vauban sur le Parc des Sources de la Bièvres s'inscrit dans la succession de bâtiments qui occupent une profondeur bâtie entre le boulevard et le parc. Cette profondeur constitue la façade urbaine du parc par des bâtiments épais qui apportent une densité là où la ville devient parc.

La progression des salles de lectures représentent 3 étages dont la grande hauteur du rez de chaussée qui ouvre un espace panoramique sur le parc, et les deux étages supérieurs qui alternent des doubles hauteurs permettant une fluidité dans les trois dimensions et des percées visuelles.

Les 3 avancées en proue: Philosophie, Sciences Sociales, Histoire et Géographie élançées sur le parc prennent racine et référence dans le corps principal des lettres qui longe le boulevard Vauban. La bibliothèque de Saint-Quentin-en-Yvelines est une épaisseur morcelée, évidée, découpée selon les disciplines représentées et favorisant des accès de lumière zénithales.

Le béton blanc coulé en place, teinte sable, contrasté par les encadrements des baies en acier laqué gris métal et les volumes de couleur (laques ou stuccos bleu et rouge) qui accompagnent le visiteur au cœur des espaces.

Dans cette situation extraordinaire entre ville et parc, le projet par sa structure cartésienne offre une lisibilité et une identité de toutes ses parties. (Ripault)

#### **Centre Universitaire René Cassin, Paris 13e – France 1990**

2 amphithéâtres – Bibliothèque, Maître d'Ouvrage : Ministère de 'Education Nationale, Surfaces : 2 564 M<sup>2</sup>, Montant des travaux : 3,05 M.€

Le projet conçu en coupe superpose deux grands amphithéâtres pour des formations juridiques. Dessinés comme des conques acoustiques, ce sont des instruments acoustiques et visuels, la superposition des deux salles galbées constituent le hall et la bibliothèque.

Un escalier serpente entre les salles et le mur de briques de verre, mitoyen avec la cour voisine, capteur de lumière qui accompagne la nef ascensionnelle qui remonte vers les parties hautes des amphithéâtres.

Les salles sont opaques en béton émaillé d'émaux de Briare, éclairées par des rampes d'ouvertures, l'espace du hall en compression et celui de la bibliothèque, entre les amphithéâtres sont largement vitrés et surplombent la rue.

C'est un bâtiment aérien, de grands volumes soulevés, en compression et décompression reliés par des circulations généreuses et lumineuses.

A l'angle de deux rues Parisiennes, ce bâtiment atypique et audacieux s'inscrit dans le gabarit tout en magnifiant ses sous faces et la gravité de ses masses. (Ripault)

**Prix L'Équerre d'Argent**

The first, unlucky life of the building began in the early 1960s, when the progressive communist mayor of Pantin, Jean Lolive, commissioned architect Jacques Kalisz to design a new administration center for the town. The gifted young architect conceived an expressive, sculptural building dominated by exposed concrete. It seemed at the time to be a statement against the coming trend in curtain-wall architecture. After it was built, however, it was considered — by both the administration and the local population — to be oversized for its context. Ambivalence led to negligence and to the building's eventual degradation. The steel inside the facade's prefabricated concrete elements, some of which are only 2.8 inches (7 centimeters) thick, suffered from water infiltration and rusted. Some of the facade elements began to break off. Several floors of the building were abandoned, and in 1996, civic officials decided to close the whole building. Situated in front of the town hall and along the canal Ourq in the center of Pantin, the concrete monument, an example of the brutalist movement, continued its slow and steady degradation. It became an eyesore for the town, and yet its total demolition, less than 30 years after its inauguration, did not seem appropriate. Finally, in the late 1990s, a solution arrived when the Ministry of Culture and the mayor of Pantin agreed to marry the old administration building with the homeless National Dance Center and to begin a renovation. In December 2000, the French architects Claire Guieysse and Antoinette Robain won the competition for the building's renovation. Today, Guieysse still expresses surprise at how easy it was to fit the new program into the existing structure. She recalls that during the planning phase, it seemed as if the building had been designed from the beginning for a more diverse program than that of an administration center. Rejuvenation and Rebirth The National Dance Center required 11 dance studios, three of which would be open to the public. The program also called for a library, classrooms, exhibition and conference rooms, a cinema, a cafeteria, and offices. These spaces are distributed over 97,000 square feet (9000 square meters), on four floors of the six-story building. Two floors have not been renovated but have been kept in their previous state for a possible future extension of the program, if and when needed. The architects renovated the entire exterior and tried to restore the building's initial appearance. The fragile reinforced concrete elements were repaired and protected through new chemical treatments. But most of the design work was on the interior. The architects tried to adapt the existing structure to the new program while keeping as much concrete exposed as possible. They centralized the program around the large, 85-foot- (26-meter-) long entry hall, which stretches up to the sixth floor. This impressive space is dominated by a massive concrete stair and ramp leading gradually to top. While the original building was completely oriented to the street and closed to the nearby canal on the opposite side, the renovation architects opened the entry hall at several places to the canal and developed a greater transparency. Today, the cafeteria and parts of the reception area are situated behind large glass facades with a view to the water. The architects designed a red wall for the entry hall, behind the stair and the ramp, which extends to the hall's full six-floor height. Otherwise, unpigmented, exposed concrete dominates the interior. Aztec-like patterns, which Kalisz cut into the concrete surfaces during the original construction, give a certain aura of mystery. Because the building had not been originally constructed as a dance center, special attention needed to be given to acoustic insulation. The existing concrete structure promoted sound transmission throughout the building. To remedy this, each of the 11 dance studios was given a special treatment depending on its situation, configuration, and use. Two of them were conceived as a "box within a box" and completely insulated from the surrounding walls, ceiling, and floor. To reduce the cost of the renovation, the other studios were insulated through their floor structure and, when necessary, also on the ceiling and the walls. ( <http://www.architectureweek.com> )

J. Bléhaut associé

maître d'ouvrage VILLE DE REIMS

RESTRUCTURATION ET RÉHABILITATION

4 000 m2, 5,99M€ valeur 2006

Grand témoin de la reconstruction de la ville de Reims après la grande guerre, la Bibliothèque Carnegie (du nom du donateur américain), symbolise parfaitement la qualité architecturale de l'époque art déco dans cette ville. « Carnegie » n'est pas simplement un monument repaire dans la ville, c'est aussi un édifice dans lequel tous les arts concourent à la réussite de l'œuvre (l'art du vitrail y est particulièrement bien présent). La rénovation-restauration a consisté à retrouver la fonctionnalité perdue originelle du lieu en l'adaptant aux contraintes contemporaines, tout en mettant en valeur « les arts décoratifs ». Deux volumes reliés sous terre et dans le ciel se posent de part et d'autre de l'axe, transgressant la symétrie de la porte classique avec deux piles de largeur différentes. Les deux piles sont posées sur un socle vitré, accueillant l'espace jeunesse et les commerces. Pour une identification optimale, les niveaux publics de la médiathèque occupent l'aile Sud ; les commerces et les locaux de TLT, irrigués par la lumière du jardin, sont situés aux deux premiers niveaux de la pile Nord, en liaison avec la sortie du métro. Au-dessus, les locaux de l'INA se déploient sur deux niveaux. / Au bout des allées Jean-Jaurès, le bâtiment émerge d'un jardin en contrebas sur lequel il s'ouvre : l'axe traverse le jardin en passerelle pour se transformer en parvis, point de convergence, espace de distribution, lien entre la place carrée et les allées Jean-Jaurès. Ils sont couronnés par un toit belvédère qui offre une vue privilégiée sur la ville, dont les espaces de réception éclairés la nuit lancent un signal visible de loin.

La terre cuite domine le traitement des façades, en écho à la forte identité de la cité. La façade principale est protégée par des pare-soleil, modules verticaux de hauteur variable, en éléments de terre cuite assemblés sur une ossature métallique. Réparties sur l'ensemble des trois façades principales, les immenses persiennes tamisent la lumière du jour, cadrent les vues sur la ville, elles magnifient l'assemblage inédit de la brique et du verre, tout en offrant aux visiteurs le spectacle de la vie urbaine. La "porte Marengo" est un monument, son architecture s'attache à exprimer l'institution. De loin, la médiathèque est un bâtiment énigmatique ; de près son fonctionnement intérieur se lit clairement : elle est en osmose avec le quartier Marengo, elle le fédère et en est le point de mire. (SCP)

### [Serero Architecture Research Group, Paris - France](#)

#### **Libraries:**

#### [University of Amiens. Auditorium and Library, Amiens – France on design](#)

Paris-based firm serero architects has won the design competition for the university of amiens' new library and auditorium. located at the heart of the campus, the new building will serve as a central place for social exchange. The design takes advantage of the conditions of the site: the auditorium floor is integrated into the natural slope of the landscape while long steps of stone are utilized to connect the lower level of the garden with the reception area. The library and the auditorium are two clear volumes in both form and facade treatment. The former is clad with a 'smart skin' of vertical wooden louvres that open and close according to the level of humidity in the air, much like the scales of a pine cone. the angles of the sun-shading correspond with the orientation of the interior spaces to provide a gradual transition from protected zones to open and transparent. other means of daylighting include sheds on the green roof of the library which allow for light to filter through and a strip of curtain glass window that runs along the upper wall of the auditorium that provide a clerestory effect.

(<http://www.designboom.com>)

Projet lauréat concours restreint Site : IUT d'Amiens, Territoire communal de Salouel (80), France Maître d'ouvrage : Rectorat de l'Académie d'Amiens Surface : 1 420 m<sup>2</sup> Cout prévisionnel: 1 900 000€ H.T. Conception : SERERO Architectes Urbanistes : David

Serero, Yoichi Ozawa, Ran She, Fabrice Zaini Bureaux d'études techniques: BETOM Ingénierie, HQE: CAPTERRE, Acousticien : Pierre Pasquini UNE EXTENSION DE LA TOPOGRAPHIE Situé au cœur de l'IUT d'Amiens, la nouvelle bibliothèque et l'auditorium constituent un pôle central de l'IUT pour l'enseignement et les rencontres autour des technologies et le catalyseur de la vie étudiante du campus. Notre projet est constitué de deux plateaux situés au même niveau que le du jardin central de l'IUT, la bibliothèque au Sud, et l'amphithéâtre au Nord dont les gradins suivent la pente naturelle du terrain. Entre ces deux volumes se glisse le hall d'accueil et donne accès à ces deux espaces. Un escalier dans une faille entre ces deux bâtiments, lie directement le hall au niveau bas. La bibliothèque est pour nous un lieu où la lumière naturelle a un rôle primordial. Nous l'avons placée au cœur des espaces grâce à des sheds sur toute la longueur de la toiture orientés au Nord. Eclairé en lumière zénithale, elle participe à créer un lieu d'échange, un lieu où la connaissance est multiple et non limitée, ouverte sur d'autres disciplines et cultures. L'amphithéâtre, quant à lui, est constitué de murs en béton clair éclairé par des fenêtres hautes sur toute la longueur du bâtiment. Elles sont occultables par des stores à rouleaux intégrés dans le plafond. La bibliothèque est conçue sur un plateau libre avec une retombée intermédiaire de poteaux seulement (porté de 10,80m). Tous les espaces sont conçus sur une trame régulière de 1,80m et 7,20m qui organise toutes les réseaux de la bibliothèque, système éclairage, de ventilation, répartition du mobilier et calepinage des façades, etc... offrant une très grande clarté et lisibilité des espaces intérieurs. L'effet intérieur est celui d'une grande transparence et d'une grande simplicité dans l'accès aux ouvrages. Le bâtiment fait ainsi la transition entre l'espace d'accueil de grand volume et des zones plus silencieuses propice à la concentration et au travail individuel. UNE FAÇADE EN ECAILLES L'enveloppe de ce bâtiment est conçue comme une peau intelligente de grande performance, qui contrôle les ambiances et les vues à l'intérieur du bâtiment. Le système de façade est inspiré par les écailles de la pomme de pin qui s'ouvrent et se ferment en fonction de l'humidité pour laisser s'échapper les graines. Les vitrages sont ainsi protégés par des brise-soleil en bois dont l'angle varie sur la longueur de la façade en fonction de l'orientation des espaces. Ce dispositif permet une transition graduelle de zones plus protégées à des zones plus ouvertes et transparentes. Ces brise-soleil sont orientés verticalement pour mieux répondre à l'orientation principale du bâtiment plein Ouest (soleil bas mieux filtré que par des brises soleil horizontaux). #### **Médiathèque Hélène Oudoux (extension), Massy – France 2010**

1.952 m<sup>2</sup>, 3.470.000 €

Les questions posées par cette extension-restructuration sont : - la lisibilité du bâtiment et de son entrée dans le bâtiment créé, - la fluidité et repérage des lecteurs dans un bâtiment attractif, - la différenciation des flux lecteurs et des services internes, - le décloisonnement des espaces tout en conservant leur intimité, - respecter la fonctionnalité et adéquation financière programme/esquisse. Pour atteindre ces objectifs nous avons : - pour l'extension - développé un projet à base carrée, évidé d'un quart sur deux niveaux. Ce parti compact permet l'inscription d'un vaste parvis et d'un glacis éclairant la salle de conférence, en R-1. C'est aussi une réponse urbaine, en contrepoint à la barre de logements qui l'encadre comme un rideau de scène. Son ancrage est réalisé par son extension en proue (à l'Ouest), et en débord (côté Nord) du bâtiment existant. Cette disposition (et la qualité des matériaux choisis) renchérisse son identité et installe sa dimension publique au centre du quartier. A l'intérieur, la structure libère le plan, répondant à la demande de flexibilité et d'implantation d'accès différenciés. Il autorise la présence d'un escalier non encloué, particulièrement convivial, entre RDC et R+1. Le vide créé relie les niveaux en garantissant leur lisibilité : ainsi en R-1, la salle de conférence, en R.D.C le hall et salle d'expression corporelle, en R+1, l'espace en R+2, l'espace Adultes et Adolescents. Les baies toute hauteur (Nord et Ouest) illustrent l'ouverture et l'animation de la bibliothèque pour les quartiers alentours. La volumétrie proposée apporte repérage et luminosité souhaitées. (<http://www.larchitecture.com>)

#### **Médiathèque Maurice Genevoix, Orléans-La-Source – France 2009**

1.721 m<sup>2</sup>, 2.460.000 €

L'originalité de ce programme est d'envisager une Médiathèque de plain-pied (avec l'accès du public depuis un parvis commun avec le gymnase et indépendamment pour les services). Cette demande s'inscrit dans un concept de médiathèque globale, favorisant l'accès comme la perméabilité, à l'ensemble du fond documentaire. Dès lors, le lecteur a un sentiment d'un tout unitaire et indivisible. Les dispositifs architecturaux, mis en place, illustrent cette volonté par une partition claire des secteurs, renforcée par une hiérarchie des espaces entre simple et double hauteur, éclairés latéralement. Chaque regroupement thématique des collections - fiction, documentaire, son et image - s'implante naturellement sous chaque toiture différenciée. Dès lors, s'établit un rapport harmonieux entre l'accueil du public et l'intimité du lieu, grâce à cette lisibilité d'ensemble, tant en fonctionnalité (dont gradation de hauteur de présentation des documents), qu'en éclairage naturel. En outre, la structure libère le plan, répondant à la demande de flexibilité. La fluidité des espaces favorise la découverte aisée des documents, comme la cohabitation conviviale de publics variés. Le principe de partition des rayonnages facilite les passages intersecteurs, comme d'inciter les lecteurs «aux chemins de traverse». Ce parti permet aussi de mêler zones de présentation et de consultation, afin de rendre attractif les ouvrages, comme d'en présenter de nouveaux. Ces principes, où les activités s'imbriquent naturellement dans un chuchotement confortable, concourent à l'attraction du lieu et par conséquent à sa fréquentation. (<http://www.larchitecture.com>)

#### **Médiathèque (ancien centre commercial), Poissy – France 2006**

2.550 m<sup>2</sup>, 4.980.000 €

La Médiathèque de Poissy est un projet singulier, puisqu'elle est implantée dans un ancien centre commercial désaffecté. Les contraintes du projet sont sa hauteur uniforme sous dalle et le peu de lumière naturelle en façade. Ce bâtiment de plain-pied possède néanmoins une implantation stratégique en centre ville (contiguë à la gare), tout en bénéficiant d'un vaste parking en sous-sol. L'enjeu de cette réalisation tient dans la qualification des espaces intérieurs notamment dans la zone centrale décloisonnée de 1200 m<sup>2</sup>. La décoration et la qualité de l'éclairage furent déterminantes. Notre parti s'illustre par le souci d'identification des espaces de lecture notamment par un traitement elliptique du faux plafond staff surbaissé par rapport au faux-plafond bois perforé. Dès lors il entre en résonance avec le parquet bois implanté dans la zone publique de la Médiathèque. La clarté d'aménagement depuis la banque centrale est déterminante grâce à une circulation centrale privilégiée. Ainsi, de part et d'autre, l'espace Actualités légèrement surélevé marque son autonomie; l'implantation elliptique de la zone Adultes en permet une identification immédiate. Les espaces Jeunesse et Travail sont implantés, côté façade. Cet agencement permet - outre une grande flexibilité - une surveillance aisée, tout en valorisant l'intégration des nouvelles technologies. Ce parti favorise la cohésion de l'ensemble, la perméabilité du public d'une zone à l'autre, tout en autorisant l'autonomie de chacun. (<http://www.larchitecture.com>)

#### **La Alhóndiga (Mediateka/Biblioteca), Bilbao – Spain 2005 - 2010**

The French designer Philippe Starck has been entrusted with refurbishing the old municipal grain market of Bilbao, an industrial building designed in 1905 by the architect Ricardo Bastida that has now been turned into a multidisciplinary space dedicated to leisure, culture and wellbeing. Inaugurated since early May 2010, Alhóndiga Bilbao seeks to establish itself as a centre that is open to the citizens, oriented to the integral growth of the person and to the development of human relations. That is why the facility covers an area of forty-three thousand metres square distributed over the Central Square and another three cubic buildings that define the main axes of this project: the Media Library, the Physical Activity Zones and Leisure. The Media Library has been understood as a social space in which, besides reading, consulting and studying, one can watch a film or listen to music. A gym, several rooms for physical exercise and personal growth, a wet area and a sun terrace integrate the building dedicated to Physical Activity. Lastly, the Leisure zone has an auditorium for four hundred people, an exhibition room several cinema halls and a restaurant space, as well as the Sala Bastida whose name pays tribute to the architect who designed the grain market and which will have polyvalent uses. For this project, Starck has applied construction criteria based on efficiency and sustainability, he has chosen materials such as concrete, exposed brick and glass and has introduced thermal solar panels. He has thus managed to humanise the building while always maintaining its architectural singularity, and has transformed it into a new landmark for Bilbao's quotidian life. #### **Bibliothèque Saint Barbe, Rénovation, Paris – France 2008**

1881-1884

Restructuration et rénovation du collège par Ernest Lheureux, élève de Théodore Labrousse. Il construit les deux ailes du bâtiment qui existent encore aujourd'hui le long de la rue Valette et de l'impasse Chartière.

1936-1939

Construction, par les architectes Daniel Lionel et Raoul Brandon, du bâtiment qui longe encore actuellement l'impasse d'Ecosse. 2005-2007

Travaux de réhabilitation du collège Sainte-Barbe par l'architecte Antoine Stinco.

Les bâtiments de 1881 et de 1936 ont été réhabilités dans le souci de leur caractère patrimonial. Dans le réfectoire, les tables en marbre et les mosaïques de fleurs et d'oiseau conçues par Gian Domenico Facchina (1826-1903) ont été restaurées, tout comme la salle de dessin dotée d'une verrière centrale et ornée de bas-reliefs exécutés par Charles Gauthier (1831-1891). Le mobilier et les peintures de l'amphithéâtre de physique-chimie ont été rénovés à l'identique. Les façades du bâtiment ont été entièrement nettoyées et leurs mosaïques remises à neuf.

#### **Médiathèque de la Madeleine – France 2013**

Surface Shon 2.200 m<sup>2</sup>, Budget HT € 4.200.000

La restructuration et l'extension d'un ancien commissariat à l'enveloppe très présente à l'échelle de la place des Fusillés et des Déportés mais déconnecté de son environnement urbain. L'accessibilité de l'équipement est modifiée. L'espace devient alors prolongement de la place et se parcourt de plain-pied. La médiathèque se divise en deux entités programmatiques : le pavillon d'accueil et la salle de lecture dont les horaires peuvent différer. Dans la salle de lecture, la qualification de sous espaces, d'ambiances lumineuses et acoustiques est traité par une toiture : la nappe active. L'ambiance intérieure fait référence à la fois à l'intérieur chaleureux des salons de lecture des maisons bourgeoises et aux qualités des grands espaces de manufactures baignés d'une lumière zénithale diffuse. La médiathèque s'ouvre sur un jardin traversant qui participe à la mise en relation des quartiers populaires avec le centre ville.

#### **Médiathèque Proville, Proville – France 2008**

Equipe : Mathieu Berteloot, Olivier Camus et Lydéric Veauvy, Maître d'ouvrage : Mairie de Proville, Surface de terrain : 531 m<sup>2</sup>  
Surface de construction : 610 m<sup>2</sup> (Terrasse : 90 m<sup>2</sup>), Budget : 823 282 €

The new mediathèque of Proville has to open onto the village and become a place of exchange and culture, a public library and a surprising and enthusiastic place inviting everyone to the pleasure of reading. Create a contemporary architecture dealing with the environment and the existing elements. The new spaces created are offering changing atmospheres and lighting effects due to large surfaces of glass and different partitions, patios and nice places where to take time to read, views on the church tower and the trees around. Over roofs and terraces have been thought in wood which turns grey with the years. The balance between town and nature's reached with an environmental approach: large picture windows to take advantage of the natural supplies of heat, and respiring partitions with systematic outside thermic insulation. (archdaily)  
Site area: 531 sqm, Constructed area: 610 sqm + 90 sqm of terrace

### **Libraries:**

#### **Bibliothèque Louise Michel, Paris – France 2011**

programme Construction d'une bibliothèque et d'un local DASCO, maîtrise d'ouvrage Ville de Paris, DAC, DASCO, SLA20 maîtrise d'oeuvre TERRENEUVE architectes, mandataire; responsable de projet Tina Sickert / C&E, b.e.t. structures / DJ AMO, économiste / Cap Ingelec, b.e.t. fluids, Mission de base de maîtrise d'oeuvre, Surface 850 m<sup>2</sup> SHON, Montant de travaux 1,6 M€ HT de travaux, Calendrier études 2002-04; chantier 2009-10, livré en mars 2011

Située en bordure de la ZAC Réunion, dans un quartier en pleine mutation qui voit petit à petit disparaître les traces de son tissu urbain caractérisé par ses parcelles en « lanières » et ses impasses, - pour laisser place à des terrains plus « carrés », à des bâtiments de logements collectifs, et à des équipements publics. De fait, ce qui caractérise aujourd'hui ce quartier « Réunion », c'est bien une forte déstructuration et une grande disparité des constructions : hauteurs très variables, de R+1 à R+9 ; absence d'alignement, immeubles de grande hauteur en retrait... ; mais aussi de nombreux espaces vides ; jardins privés en coeur d'îlot, places, terrain de sport municipal, terrains en friche... Pour éviter la sensation d'écrasement de ce petit équipement - d'une hauteur limitée à R+1-, le projet conserve le vide existant en mitoyenneté avec les bains douches, et de l'autre côté, propose à l'étage un retrait par rapport aux nouveaux logements. Cet effet de détachement permet de bien identifier et de signaler la bibliothèque, notamment depuis la rue de Buzenval. Afin d'éviter l'effet d'horizontalité issu du gabarit du bâtiment, l'architecture de la bibliothèque propose un fractionnement du volume sur la rue des Haies. Ce dispositif a plusieurs objectifs : - il permet de retrouver une référence à l'échelle du bâti caractéristique de cette rue et du parcellaire en lanière : à l'accès des deux équipements correspondent deux volumes implantés à l'alignement, qui suggèrent chacun l'échelle d'un bâtiment indépendant, et une certaine verticalité. Le volume de liaison laisse entrevoir à l'étage une transparence qui donne à lire la profondeur de la parcelle, - l'autonomie formelle du bâtiment, nécessaire de par son statut d'équipement, ne s'opère pas au détriment de l'échelle de la rue. Si l'écriture se veut contemporaine, elle s'inscrit dans une démarche d'intégration basée sur la lecture approfondie du contexte dans lequel s'implante la bibliothèque. - il permet l'expression d'une cinquième façade où chaque entité programmatique est lisible. Si le matériau de couverture n'est pas visible en tant que tel depuis la rue, les pentes des toitures permettent de comprendre la volumétrie du bâtiment à l'intérieur de l'îlot. (Terreneuve)

### **Médiathèque Don Quichotte de la Plaine, Saint-Denis – France 2002 - 2007**

Construction de la médiathèque de la Plaine à Saint-Denis, maîtrise d'ouvrage Plaine Commune / Ville de Saint-Denis maîtrise d'oeuvre TERRENEUVE architectes, mandataire / Satoba, b.e.t. structures / DJ AMO, économiste / Cap Ingelec, b.e.t. fluids / Peutz, acousticien. Mission de base de maîtrise d'oeuvre surfaces : 1000 m<sup>2</sup> SHON, Montant de travaux 1,9 M€ HT de travaux + 0,15 M€ HT de mobilier. Calendrier Concours 2002; études 2002-2004; chantier 2006-2007, livraison 2007

Premier équipement public culturel réalisé sur le territoire de la Plaine Saint-Denis, la médiathèque Don Quichotte exhibe une carapace métallique, emblématique de l'histoire industrielle métallurgique encore récente de ce site en pleine reconversion. La médiathèque se développe autour d'une salle de lecture traversante, enjambant l'ancien chemin de fer du site industriel de la Plaine. Elle en reprend les deux principaux archétypes, sheds et façades métalliques, pour composer une architecture lumineuse, articulant les échelles de la ville et du quartier en pleine mutation. Afin d'obtenir une grande inertie thermique, la structure -murs, planchers, toiture, sheds - a été intégralement réalisée en béton avec une isolation extérieure rapportée, protégée par le bardage métallique. Le confort thermique d'été est assuré sans climatisation, grâce à une limitation des surfaces vitrées exposée au sud et à l'ouest, et à l'installation de brises soleil extérieurs en tôle d'acier perforée.

#### **PROJET**

Une coque incandescente entourée, à distance respectueuse, d'entités autonomes établissant en plan une sorte d'éclatement contenu, alors qu'en élévation une forme compacte paraît prendre appui sur de fines ondulations de verre : éloigner et fédérer, tenir à distance et agréger. Le paradoxe n'est qu'apparent. Il tient aux impératifs du programme. Eux-mêmes liés aux activités des différentes entités (plateformes) jusque là indépendantes et réunies ici pour de meilleures conditions de travail, d'accueil, de transmission de savoirs et une présence accrue dans le vaste territoire d'une agglomération suburbaine.

Une forme centrale donc. Voire même, à y regarder de plus près, deux : une coque refermée sur elle-même et, décentrée, un patio ouvert sur le ciel. Musique, Danse, Théâtre dans la première. Expositions sur la seconde. Deux aboutissements de pratiques, deux finalités rêvées ou enviées de toutes les pratiques artistiques développées ici.

Une coque indépendante ceinte par une rue intérieure. Une rue qui, comme le béton constituant les voûtes de la salle, isole du bruit, protège des nuisances des plateformes voisines, en fait toutes les autres plateformes. L'isolement comme isolation phonique. Une sorte de quarantaine spatiale qui ne prive pas l'auditorium d'une connexion directe avec le hall, la billetterie, le bar ouvert les soirs de représentation artistique, la rue intérieure elle-même reliée aux entrées secondaires, à la réserve d'instruments, à la salle de percussion et à la salle de répétition de l'Ecole de musique. Sous le contrôle visuel du régisseur. A deux pas des quais de livraison des matériels et instruments.

Une conque rouge comme un cœur battant. Avec autour, autant d'entités physiques que de plateformes. Sur un ou deux niveaux, selon les surfaces qui leur sont nécessaires car la volonté de contenir le programme dans un volume relativement limité pour générer des économies et préserver les surfaces boisées du terrain, conduit à s'établir sur un socle et un niveau supérieur. (TETRARC)

### **Médiathèque BDIV (Bibliothèque Départementale d'Ille et Vilaine) Fougères – France 2008**

## PROJET

Créer un équipement culturel de ce type, dans un site en mutation, est un sujet qui se doit d'être traité à la hauteur de l'enjeu qu'il représente. A la fois lieu de travail et de recherches, espace de rencontres, instrument pédagogique, centre d'informations, la médiathèque invente un nouvel espace collectif d'échanges. C'est pourquoi, ce projet présente une réponse architecturale à forte identité, revendicative d'une figure affirmant son statut de bâtiment public unique, inscrit dans une culture urbaine en voie d'achèvement. Le projet s'articule sur des principes simples en occupant le terrain sans concession, on peut être une, celle de créer un jardin au cœur du bâtiment afin d'y garantir un espace serein. Les deux entités du programme ont leur propre autonomie de fonctionnement et sont clairement identifiées dans le projet suivant leurs accès et leurs façades respectives.

L'ensemble de l'équipement est construit sur deux niveaux. Suivant les contraintes et exigences du programme, l'antenne BDIV et le secteur logistique s'implantent obligatoirement au rez-de-chaussée, la médiathèque se répartit dans une suite logique de fonctionnement entre les deux niveaux, complétée à l'étage du service de coordination. Il suffit d'un regard pour comprendre l'organisation des lieux. Les formes architecturales sont caractérisées par un jeu malin de pleins et de vides maîtrisant une matière qui devient ici un composant architectural de qualité grâce à un matériau irremplaçable qu'est le béton. Le beau béton, car les parois extérieures sont traitées en panneaux matricés se déclinant en claustras sous forme d'énigmes indéchiffrables devant les parois vitrées extérieures et signe, d'une façon sans ambiguïté, l'identité du nouvel équipement. En conclusion, le projet présente des qualités essentielles, d'où que l'on vienne, le bâtiment se remarquera, paré de sa texture architecturale exclusive, symbolique et signifiante, pour le rendre emblématique d'une vocation culturelle universelle. (TETRARC)

## **TOA architectes, Strasbourg, Paris – France**

<http://www.toa-archi.com>

### **Libraries:**

#### **Espace Culturel Django Reinhardt, Strasbourg-Neuhof - France 2010**

maître d'ouvrage Communauté urbaine de Strasbourg, programme Médiathèque, superficie 1 250 m<sup>2</sup> shon, coût 2 160 000 €HT

Le programme justifie une occupation quasi-totale de la parcelle pour développer le plain-pied des espaces de la médiathèque ouverts au public. A charge pour les façades de répondre à un juste équilibre entre d'une part l'ouverture de la médiathèque sur le quartier et d'autre part l'intimité nécessaire à la tranquillité des lecteurs et utilisateurs. D'une échelle volontairement modeste, presque domestique, l'équipement appuie son identité sur le thème d'une "façade paysage" dans laquelle apparaissent des portraits d'auteurs, d'artistes, comme symbole d'ouverture du lieu vers les arts et la culture. (TOA)

#### **Bibliothèque et UIT du Grillenbreit, Colmar – France 2000 – 2005**

maître d'ouvrage Ville de Colmar, programme Biblio, amphî, salles de cours, superficie 4 710 m<sup>2</sup> shon + 2 900 m<sup>2</sup> shon, coût 4 192 000 €HT+3 158 000 €HT

onstruite autour de l'ancienne cheminée de brique, mémoire du site industriel, la bibliothèque est le signal inattendu qui manifeste la présence du site universitaire. La salle de lecture implantée au nord coté rue structure l'articulation entre les espaces de la ville et du campus.

Coté sud, face à la bibliothèque, le soubassement en pierre hérité de l'ancienne usine structure l'édification des bâtiments de l'IUT en préservant la mémoire urbaine de l'activité industrielle passée. Les jardins et "chemins de traverses" constituent un maillage qui favorise une fluidité de déambulation et les échanges entre les différents départements universitaire. (TOA)

#### **Centre culturel et sportif de Huttenheim – France 2002**

maître d'ouvrage Com. de communes de Benfeld, programme Gymnase 250 places, bibliothèque, superficie 2 150 m<sup>2</sup> shon coût 1 738 000 €HT

La salle polyvalente d'Huttenheim est un équipement public associé à l'idée festive, au spectacle sportif et culturel, au loisir et à la détente. En renforçant l'identité du lieu dans ces pratiques, elle devient également la "vitrine" sud de la commune. Issue d'une réflexion sur le caractère souvent qualitatif du patrimoine rural d'Alsace, le bâtiment est inspiré par les séchoirs à tabacs omniprésents dans les paysages locaux.

Le long de la route du Ried, la façade principale devient un filtre qui protège le hall et le bar, étirés entre le paysage de l'III et le spectacle de la salle. Le jour, les vanelles protègent de la lumière et de l'échauffement du soleil de l'ouest ; la nuit, elles laissent entrevoir la profondeur de la grande salle et les activités qui s'y déroulent. (TOA)

#### **Bibliothèque universitaire de l'INSA, Extension (Institut National des Sciences Appliquées) , Strasbourg – France 1995 - 1997**

maître d'ouvrage Académie de Strasbourg, programme Bibliothèque, parking vélos 300pl., superficie 450 m<sup>2</sup> shon, coût 419 000 €HT

Cette bibliothèque en extension de l'INSA de Strasbourg est la quatrième greffe du genre sur un boulevard urbain en cours d'aménagement pour le nouveau tramway. Ce "petit bâtiment" est une opportunité pour une requalification des espaces publics et des façades du boulevard. Au cœur de la réflexion sur les modes de déplacement, le programme initial est revisité pour organiser également le stationnement de 250 vélos.

A l'ombre du bâtiment existant réalisé par les architectes Demaret et Herrenschmidt, le toit accueille les deux roues et offre une nouvelle image emblématique pour représenter l'institution. (TOA)

## **Valode & Pistre Architects, Paris – France**

<http://www.v-p.com>

### **Libraries:**

#### **The CAP Gemini Ernst & Joung University (Library), Gouvieux – France 2002**

Cap Gemini - 23 000 m<sup>2</sup>

L'université Cap Gemini Ernst & Young est le lieu d'identité et d'enracinement d'une cohésion d'entreprise. Près de Chantilly, le site est constitué d'un immense parc du XVIIIème siècle et d'un château construit par la famille Rothschild. Le parc retrouve son tracé initial, le château est restauré dans son architecture d'origine. Bâtiments de briques et de pierres, disques de cuivre concentriques, le nouveau campus décrit un hémicycle, centré sur l'axe principal du château. La forme fédère, les matériaux se répondent. Campus et château entrent en résonance. La figure principale emprunte à l'orangerie autant qu'au cloître. Espace semi-

circulaire, refermé par la façade du château, elle recrée un monde serein, dégagé des contingences extérieures, lieu de concentration et d'effervescence intellectuelle. Du château éclectique au campus résolument contemporain, qualité et pérennité de l'architecture font écho à la qualité et la pérennité souhaitée de l'entreprise. (Valode)

### **The Leonardo da Vinci University Centre (Library), Courbevoie – France 1994**

Conseil Général des Hauts de Seine - 55 000m<sup>2</sup>

Dans le contexte de la Défense, le pôle universitaire Léonard de Vinci affirme sa singularité, intellectuelle et culturelle : devant un long bâtiment rectiligne gris sont installés trois édifices élégants et libres, sculptures devant leur cimaise, formes archétypales jouant avec le fond. Les couleurs et les matières accentuent l'effet sculptural : les deux prismes enchâssés l'un dans l'autre sont en granit brun, le cube évidé est recouvert de granit marbré vert et la proue, cône inversé, est de marbre blanc. Au jeu formel répond une organisation fonctionnelle claire : dans le bâtiment-cimaise, les plateaux d'enseignement, flexibles et évolutifs et dans les trois édifices, laboratoires, administration et bibliothèque. Entre les deux se glisse une rue intérieure, dense, animée, lumineuse. Bordée de lieux de vie, restaurant, cafétéria, salles de sport, elle offre de multiples occasions de rencontre entre étudiants et professeurs. (Valode)

### **Bibliothèque de Yingkou, China 2014**

La ville côtière de Yingkou, dans le nord-est de la Chine, développe un nouveau quartier dédié à la culture ayant pour ambition de donner à la ville un rayonnement régional. La bibliothèque, élément emblématique de l'ensemble du projet, en sera la première réalisation. Le programme complexe, regroupant les archives et la bibliothèque, ainsi que les archives gouvernementales, est unifié dans un bâtiment aux formes légères et dynamiques. L'idée contemporaine du « cloud » sert de base conceptuelle au projet. L'utilisation de la ventilation naturelle, de brise-soleils, de puits de lumière pour l'éclairage naturel, en font également un projet en très respectueux de l'environnement. Avec une surface totale de 60 000 m<sup>2</sup>, la bibliothèque sera le premier bâtiment phare de la ville et donne le coup d'envoi du développement architectural des espaces publics environnants. La bibliothèque sera ouverte au public en 2014. (Valode)

French architecture firm completes four-winged library in Yingkou, Liaoning Province

In 2012 Valode & Pistre Architectes (VP ARCHITECTES) won the international competition of YINGKOU LIBRARY in Yingkou, Liaoning Province. It is a referential public building in an urban area stressing its functional use and full incorporation into the surrounding landscape.

VP Architectes is one of the leading International French Architecture design groups with many branches around the world. Its design work has spread into 16 countries, focussing on large public buildings, business centres and residences. The group has been actively working in China for more than seven years with operative offices in Beijing and Shanghai. This particular project is located in Yingkou, Liaoning Province. The local government expects to forge a brand new district by constructing the cultural building, thereby setting a benchmark for urban taste and appeal.

Archives to be held within the building will record the history of city evolution and development while the library is the beneficiary of a long history and a profound cultural heritage, upholding its great mission to pass on and promote Chinese culture. The whole building is compared by VP Architectes to a cloud flying above the sharing platform repository of history. Its architecture blends a light facade with a graceful solemnity but is distinctively different from the surrounding conservative architecture with its stylish characteristics.

The simple concaving volume embraces aerial greening and rest space which is protected by a diverse number of functional facades highlighting various visual effects. The central lobby and double-height reading space combine to achieve an elegant coherence and perfect harmony between building and surrounding environment.

VP incorporated the concept of 'cloud computing' into design to extend the function, service channels and service radius of the archives and library as well as transforming a traditional building into a popular multimedia complex. The project is composed of a 24m-high main building and urban sharing platform on the 2nd floor with an elevation of 6m. Auxiliary public service facilities are located on the ground floor and level one including a lecture hall, multimedia hall, parking, etc. Urban public sharing space on the 2nd floor provides citizens with a rest place permeated with profound cultural significance and richness. The library, archive, urban construction archive and real estate archive are to be located from 3rd to 5th floors operating separately without impact on the public-orientated nature of sharing platforms.

Furthermore, sun-breaking louvers enriching the building appearance are incorporated into the façade to optimise sun control efficiently with advanced design and operating options. VP Architectes has combined greening gardens and rest spaces into the overall design to build up a much more pleasant internal circumstance simultaneously while fulfilling its functional use. ### **Médiathèque La Riche, Tours – France 2000**

Une bibliothèque municipale destinée à la jeunesse ouvre ses portes en 1987, rue de la Mairie. Son succès amène rapidement la municipalité à étendre ses activités et à acquérir un fonds pour adultes. Cependant, la surface de 80m<sup>2</sup> devient vite insuffisante pour accueillir un public toujours plus nombreux dans de bonnes conditions. La vie culturelle étant au cœur du quotidien des Larichois, l'équipe municipale décide de la réalisation d'un équipement adapté aux nouveaux besoins et à l'émergence des nouvelles technologies. Le projet de la médiathèque est ainsi voté en 1994 par le conseil municipal. Un véritable travail de coordination et de dialogue s'engage alors entre les différents acteurs du projet : définition des enjeux et besoins, prises de contacts, constitution d'un groupe de pilotage, visites de bibliothèques et médiathèques, lancement du concours pour le bâtiment. La première pierre est posée le 18 novembre 1998 et s'élève bientôt, derrière la mairie et l'église, à côté du centre social Equinoxe, un bâtiment à l'architecture forte, moderne mais aussi fonctionnelle, oeuvre de l'architecte Patrice Vallée. L'équipe de bibliothécaires est constituée, le mobilier est installé, les collections déménagent, s'étoffent... et la médiathèque ouvre ses portes au public le 29 janvier 2000.

#### **Médiathèque Jean Falala Cathedral Reims – France 2003**

The new Médiathèque stands opposite the 800 years old Reims Cathedral, a gothic masterwork, on a site formerly occupied by the Police Station (Jean Walter architect 1920) and other small buildings. The façade of the Police Station was kept to form part of the new building. The harmony of this building and its integration within the surrounding buildings are achieved with the classical proportion of a square base and the alignment of the roof lines with the surroundings : the high gable roof of the Police Station has disappeared and now lines up with the roof of the new building, allowing a modernisation of its image while keeping its familiar appearance dear to the inhabitants of Reims. The new building therefore appears like a natural prolongation of the existing volumes. The large clear glass facades open of the existing volumes. The large clear glass facades open the architecture onto the city. The immense glass windows of the facade are made possible thanks to a steel post and beam structure always traced on the same geometrical base which maintains the floors in suspension. This frame rests on a base made out of the original 'Courville Stone' allowing the continuity of traditional materials. Thus, the urban block is reconstituted with a certain classic force facing the gothic cathedral. This reconstitution follows the idea that the arrival of modern architecture on the cathedral square must not provoke a break out of the architecture but, on the contrary, a soft transformation. From inside of the Médiathèque, the glazed edge of the Médiathèque's roofline enables readers to see the full height of the cathedral's west front, an unforgettable experience. Reflexions on the glass front of the Médiathèque also create the fleeting illusion of fusion between the Médiathèque and the cathedral, between different ages, in shadow and light. (Viguier)

Face à la cathédrale et d'une superficie de 6.500m<sup>2</sup>, la médiathèque s'inscrit sur un terrain jusque-là occupé par l'Hôtel de Police. Conserver la façade de l'Hôtel de Police s'est imposé, non pas par crainte d'avoir à la reconstruire mais par respect pour Reims, meurtrie, détruite : un attachement réel pour ce qui subsiste s'est transformé au cours de l'étude en nécessité. L'arrivée de la modernité sur ce site tellement beau du parvis de la cathédrale ne doit pas entraîner un éclatement de l'architecture, une autonomie de rupture dans la forme urbaine ; mais au contraire une transformation douce, et un réglage fin qui fassent que le bâtiment résiste à la co-visibilité avec la cathédrale dans le silence. L'harmonie de cette co-visibilité sera assurée par la proportion classique obtenue à partir d'une base carrée et déclinée selon les principes de l'Art de la Construction.

Cette référence géométrique fera disparaître la haute toiture à deux pentes de l'Hôtel de Police pour en régler la hauteur sur celle du nouveau bâtiment (15 mètres) et en même temps permettre une modernisation de son image tout en lui conservant son apparence familière aux Rémois.

Le bâtiment neuf apparaît ainsi comme un prolongement naturel du volume dont les façades en verre clair ouvrent l'Architecture sur la ville ; ces baies sont possibles grâce à une structure nervurée, faite de poutre et de colonnes métalliques, toujours tracées sur la même base géométrique. Cette ossature métallique repose sur un socle constitué en pierres de Courville, fondateur du bâtiment, et qui pour le piéton assure une continuité absolue des matières traditionnelles. Ainsi, l'îlot urbain est reconstitué dans l'idée d'une certaine force classique, uniquement lisible par les lignes de métal noir.

Depuis l'intérieur de la médiathèque, le vitrage de la rive horizontale de la toiture permet de voir la façade de la cathédrale sur toute sa hauteur et de créer un moment inoubliable pour le lecteur.

#### **Médiathèque Amplepuis – France 2006 – 2007**

C'est un parallélépipède de 400 m<sup>2</sup> dont toute la façade nord est vitrée, absorbant la lumière naturelle et la vie de cette place de l'Europe : Mairie, Poste, Musée, Perception... la médiathèque prolongée de son parvis en constitue désormais un élément fort. On lit ici en open space. Une mezzanine réunit la salle polyvalente, les bureaux, des tables de lecture cosy en surplomb de la place. Gris clair sur les murs, résine teintée sombre au sol, quelques touches de couleur –bleu pour le coin accueil, orange pour l'espace d'écoute des CD- le cadre est sobre, pur et lumineux. La médiathèque communique par des passerelles et escaliers métalliques avec un immeuble de logements construit en contrebas. Une étroite faille aménagée en jardin sépare ces deux réalisations qui constituent l'îlot Place de l'Europe. L'ensemble donne un nouveau visage à ce centre d'Amplepuis.

[Cinémas MK2 Bibliothèque, Paris – France 2003](#)

Le MK2 Bibliothèque a été inauguré le 19 février 2003. Il est à ce titre l'un des derniers cinémas construits à Paris. Il est situé dans le 13e arrondissement, sur un terrain triangulaire tout en longueur (plus de 300 m de long sur 30 m de large) entre la bibliothèque François-Mitterrand (qui a donné son nom au site) et les rails de la gare de Paris-Austerlitz.

Comme quasiment tous les cinémas parisiens récents, il s'agit d'un multiplexe ; avec 14 salles, il s'agit du plus grand cinéma du groupe MK2. Conçu par les architectes Jean-Michel Wilmotte, Véronique Kirchner et Serge Barbet, le MK2 Bibliothèque s'articule autour d'une rue centrale proposant des services annexes (restaurant, boutiques, expositions temporaires).

Deux nouvelles salles de 120 places chacune ont été rajoutées en 2011, et ont ouvert le 9 novembre de la même année, portant le nombre total de salles du multiplexe à 16.

Les deux plus grandes salles, ainsi que les deux plus récentes, sont situées en hauteur (A, B, C, D), les autres en sous-sol (1 à 12).

Intérieur d'une salle avec ses banquettes à deux places

Ses salles ont également la caractéristique d'offrir des banquettes de deux places lorsque les accoudoirs correspondants sont relevés, dessinées par le designer Martin Szekely.

Le MK2 Bibliothèque a été un des éléments importants de l'aménagement et de la revitalisation de la ZAC Paris Rive Gauche. Il est en effet le seul commerce attirant un public, le soir et durant le week-end, dans cette zone essentiellement constituée de bureaux. En revanche, l'ouverture de ce multiplexe a été suivie par la fermeture de deux cinémas du 13e arrondissement, le Gaumont Gobelins Rodin sur l'avenue des Gobelins et le Gaumont Grand Écran Italie à la place d'Italie. ### **Institutsgebäude am Hegelplatz, Fachbereichbibliothek Germanistik / Skandinavistik, Humboldt-Universität, Berlin – Germany 2005 – 2006**

Neubau – Sanierung – Ausbau 20.000 m<sup>2</sup> BGF, 10.000 m<sup>2</sup> NF, € 18.000.000

Das zur Verfügung stehende Grundstück liegt an einem sehr prominenten Ort im Stadtraum. Das neue Ensemble der Humboldt-Universität - bestehend aus Neubauten sowie Altbauten unterschiedlicher Generation - hat die Aufgabe, den Hegelplatz eindeutig fassen zu können. Es soll einerseits den Platz klar besetzen; andererseits ist zu berücksichtigen, daß entlang der vorhandenen Straßen evtl. zu einem späteren Zeitpunkt eine weitere Randbebauung erfolgen könnte. Die Antwort auf diese differenzierte stadträumliche Aufgabenstellung ist die Entwicklung einer „gefalteten Fassadenhaut“, die - je nach Perforationsgrad - diesen unterschiedlichen Anforderungen gerecht wird. Im Grundriss folgt diese neue Haut klaren stadträumlichen Linien, die sich den 2 verschiedenen Seiten des vorhandenen Reuterhauses auch verschieden annähert. Auf der einen Seite wird direkt angeschlossen, auf der anderen verbleibt eine kleine Fuge, die einen Hofdurchblick ermöglicht. Auf diese Weise wird das Reuterhaus angemessen freigestellt bzw. von den ergänzenden Bauten gerahmt.

#### **GEFALTETE FASSADENHAUT**

Die Fassadenhaut erfährt bei Haus 1 auf der zum Platz ausgerichteten Seite eine 2-geschossige Reliefform, eine Art modernes Ornament, welches die Vertikalbetonung der Reuterhausfassade aufnimmt. Weiter Richtung Reuterhaus wird die Haut dann perforiert und löst sich in eine Art „Stützenschirm“ auf. Der Gebäude-Klimaabschluß befindet sich in einer dahinter liegenden Ebene. So entsteht eine lebendige Fassadenschichtung. In modifizierter, einfacherer Form wird dieses Element bei Haus 3 aufgenommen und weitergeführt. Schließlich legt sich die Haut „wärmend“ in modifizierter Form um das bestehende Seminargebäude (Haus 4). Auf diese Weise entsteht ein Ensemble, welches einerseits die heterogene Herkunft noch erkennen läßt, gleichzeitig aber als ein zusammengehöriges Ganzes lesbar wird.

#### **INNERE ORGANISATION**

Die stadträumlichen Vorgaben werden im Gebäudeinneren aufgenommen. An den „Anbauseiten“ werden überwiegend die großen Räume organisiert, die ihre Belichtung über die angrenzenden Fassaden realisieren, so daß im Falle einer möglichen weiterführenden Straßenrandbebauung keine notwendigen Öffnungen verschlossen werden. Bei Gebäude 1 sind hier insbesondere der große über 2 Geschosse gehende Hörsaal zu erwähnen sowie die Bibliotheksflächen. Die Bibliothek selbst ist im wesentlichen als ruhiger Studien-Ort introvertiert organisiert. Sie öffnet sich dann zum Innenhof (Lesehof) hin im EG sowie teilweise im UG. Die höhenversetzten Ebenen innerhalb der Bibliothek erhöhen das räumliche Erlebnis und die Verknüpfung der Einzelbereiche miteinander. „Gefaltete Decken“ lassen Licht ins Untergeschoß und ermöglichen vielfältige Blickbeziehungen. Der Haupteingang der gesamten Anlage liegt im Reuterhaus. Nach Betreten des Einganges befindet man sich auf einer Art „rotem Teppich“ (tatsächlich ein dunkler Schieferboden). Dieser Teppich bietet Orientierung und führt zu den jeweiligen Haupteingangspunkten der Einzelgebäude. Im Gebäude 1 wird der Teppich im Info-Bereich der Bibliothek weitergeführt. Die Buchsicherungsanlage der Bibliothek ist erst auf Höhe der Info-Theke notwendig, so daß hier der vordere Informations-Bereich (OPAC + MF) ohne Kontrollen jederzeit öffentlich zugänglich ist. Des weiteren befinden sich im Gebäude 1 Seminarräume unterschiedlicher Größe und mehrere PC-Pools. Im Haus 2 sind im wesentlichen Sonderfunktionen, wie 1 Orchesterprobenraum, 1 Konzertsaal und Musikübungsräume, untergebracht. Das neue, großzügige und lichtdurchflutete Foyer des Reuterhauses kann sowohl als Pausenfläche für Musikveranstaltungen wie auch als eigene Veranstaltungsfläche fungieren. Im letzteren Fall dient das direkt anschließende Café im EG des Hauses 3 als zugehöriger Service. Das Café hat einen direkten Außenbezug und eignet sich durch seine Lage und Ausformulierung besonders für öffentliche oder halböffentliche Veranstaltungen. Foyer, Café und Eingangspodest bilden dann eine funktionierende Einheit. Haus 3 dient gemeinsam mit dem ehemaligen Plattenbau (Haus 4) im wesentlichen der Unterbringung der Institutsverwaltung. Neben kleinen Seminarräumen im EG und 1. OG finden hier Büro- und Besprechungsräume, Sekretariate und einige Sondernutzungen Platz. Eine räumliche Besonderheit des ehemaligen Plattenbaus liegt in der sehr großen und eigentlich für Büroräume wenig geeigneten Raumtiefe. Hier wurde eine „Nischenlösung“ entwickelt: Die Flure werden mehrfach räumlich durch Nischen aufgeweitet, an denen dann mehrere Büroeingänge sowie jeweils 1 Serviceraum angegliedert sind. Hierdurch konnte die vorhandene Tragstruktur weitgehend erhalten bleiben, und es entstehen gleichzeitig angenehme Raumaufweitungen, die auch als Warteflächen für die Studierenden dienen. (Ablemann)

### **Institut für Sozialwissenschaften Berlin-Mitte, Humboldt Universität, Berlin – Germany 1998 – 2004**

7.000 m<sup>2</sup>, 3.924 m<sup>2</sup> NF, € 18.500.000, Umnutzung – Sanierung – Ausbau

Nutzungen: Hörsaal, Seminarräume, Fachbereichsbibliothek, Büros, Verwaltung, Studentische Arbeitsräume

Das Gebäude ist ein ehemaliges Geschäftsgebäude, erbaut 1905 von Baumeister Otto Richter, eingetragen in die Denkmalliste Berlin. Ziel der Baumaßnahme ist es, den gesamten Gebäudekomplex für die Belange einer modernen Universität zu ertüchtigen. Die denkmalwerte Bausubstanz, insbesondere Fassade und Haupttreppenhaus wurde sorgfältig saniert, die Innenaufteilung aller Geschosse vollständig den neuen Nutzungsanforderungen entsprechend erneuert. Offenheit und Transparenz bestimmen das Bild des neuen Hochschulgebäudes. Im Rahmen der organisatorischen und räumlichen Umstrukturierung der Humboldt-Universität wird ab 1993 das gesamte Institut für Sozialwissenschaften einschließlich der Institutsbibliothek in diesem Gebäude konzentriert. In 10-jähriger Bauzeit, während permanent laufender Nutzung, wird das Gebäude innen vollkommen umstrukturiert; es entstehen großzügige Foyer- und Flurbereiche, Bibliotheks-, Seminar- und Arbeitsräume. Wichtige denkmalpflegerische Aspekte bei der Sanierung sind die Wiederherstellung der erdgeschossigen Scheinarkaden und der Originaldachform sowie die Restaurierung des Treppenhauses als die maßgeblich gestaltgebenden bauzeitlichen Elemente des Gebäudes. Die Umgestaltung ist vom Leitbild getragen, das Neue aus dem Alten zu entwickeln und dabei den spezifischen Charakter des Gebäudes herauszuarbeiten. Der Eingangsbereich im EG ist großzügig gestaltet; die dabei entstehenden Verkehrsflächen können sinnvoll mit den Warteflächen vor den Seminarräumen und den Schrank- und Garderobeflächen der Bibliothek gekoppelt werden. 3 neue Wandscheiben durchteilen den Großraum des Erdgeschosses und bilden das Foyer. Sie sind mit leuchtenden, bedruckten Glasscheiben beplankt, die Raritäten der Humboldt-Bibliothek seriell abbilden. Verschiedenfarbige Hintergründe geben den Glasflächen unterschiedliche Tiefen und ziehen den Blick des Betrachters ins Gebäudeinnere. Der Lichthof ist in die in die Foyerfläche durch Austausch erdgeschossiger

Fenster gegen Gastürelemente einbezogen. Die beiden großen Höfe sind durch Türen zugänglich und können als weitere Warteflächen (bei entsprechender Witterung) und als zweiter Eingangsbereich mitgenutzt werden. Die Fachbereichsbibliothek der Sozialwissenschaften hat eine (Freihand-) Größe von ca. 70.000 Bänden sowie ein angestrebtes Leseplatzangebot von 70 Plätzen. Diesem entspricht eine Flächengröße von ca. 1.000 qm. Die Bibliothek ist im hinteren Teil des EGs sowie in der nördlichen Hälfte des 1.OGs plziert; die vorhandenen Raumböhen (ca. 4,50 m) ermöglichen den Einbau einer Galerie im EG, die die dritte Station an der vertikalen Wegachse (interne Bibliothekstreppe) bildet und außerdem zur Vermehrung der Regalaufstellfläche dient. Diese Galerie ist an die hinteren Treppenhäuser direkt angeschlossen. Im Untergeschoß befindet sich das Freihandmagazin mit weiteren Nutzerarbeitsbereichen. Zwei große Oberlichter stellen die Blickverbindung zum Außenraum her. Insgesamt wird den Besuchern ein differenziertes Angebot geboten: Anleseplätze, DV-Informationsplätze, Stehleseplätze, Großraumplätze, Gruppenarbeitsräume und Carrels. Gestalterisch ist die Bibliothek durch die Transparenz zum Foyer und zum Außenraum gezeichnet; der umgebende Stadtraum mit den hier geballten Verkehrsmitteln (Straßenbahn, S-Bahn, Fernbahn, Individualverkehr) ist bis in die gesamte Tiefe der Bibliothek sichtbar. Auf der Galerieebene stehend blickt man durch Foyer und Seminarraum hindurch auf die Passanten entlang der Fassade. Dem Maßstab der Großräume angemessen, wird die Bibliothek von neuen, großen Elementen akzentuiert: der V-förmigen Stahlterpette und der Galerie, der ovalen Verbuchungstheke und den gefalteten Informationsplätzen im Erdgeschoß sowie dem Carrelblock im OG. Die Möbel (Theke, Infoplätze, Carrels) sind Sonderanfertigungen nach Entwurf der Architekten. Im EG liegen 3 Seminarräume der Sozialwissenschaften; davon sind die beiden größeren durch eine schalldämpfende Schiebewand zusammenlegbar (für größere Veranstaltungen auf Institutsebene). Ihnen zugeordnet ist eine zum Foyer gehörige Wartefläche. Über die großen, zweiseitigen Scheinarkadenfenster liegt der große Seminarraum bildlich inmitten der Stadt. Hier befinden sich Lehrende und Lernende quasi im öffentlichen Straßenraum. Wegen des Schallschutzes sind die Räume mit einer Lüftungsanlage ausgestattet. Die innen vorgeblendete zweite Fassade enthält die Verdunkelungsanlage, die Entrauchung und die Beheizungsebene. Diese innere Schicht folgt ihrer eigenen Geometrie und wird mit der historischen Außenfassade verschränkt. Das 2. und 3. OG wurden komplett bis zur tragenden Struktur entkernt; im 2. OG wurden weitere Seminarräume eingebaut und dazu eine gemeinsame Foyerfläche geschaffen. Separiert davon liegen die Institutsräume an den ruhigeren Fluren. Das Dachgeschoß wurde in der ursprünglichen Kubatur wiederhergestellt (Dachhöhe über Traufe: ca. 8,30 m). Gemeinsam mit dem gegenüberliegenden Mitropa-Haus bildet das Gebäude dadurch aus nördlicher Richtung gesehen wieder eine Art Tor zur Universitätsstraße. Der Mittelflügel des Dachgeschosses erhielt ein gänzlich neues Dachtragwerk aus V-förmigen Stahlstützen; die neuen Räume werden „frei“ in den Dachraum hineingestellt. In den Flur- und Foyerbereichen ist die gesamte Dachhöhe erlebbar, hoch aufgesetzte Lichtkuben belichten und akzentuieren die Flure. Die neuen Institutsräume im DG bieten mit ihren großräumigen Gauben und den großen Raumböhen imposante Ausblicke in die Stadtlanschaft. Die Treppenhäuser wurden wiederhergestellt, das Haupttreppenhaus mit bauzeitlicher Ausmalung restauriert. Der vorhandene Aufzug wurde aus dem Haupttreppenhaus entfernt; dies bekommt dadurch mehr Raum und Licht. Die Strassenfassaden des Gebäudes wurden restauriert. Die Fenster, außer im EG, blieben erhalten. Der ursprünglich vorhandene Traufschmuck mit Blechfries, Blechfächchen und Fahnenstangen sowie Blechfußrosetten ist gänzlich verschwunden und nur aus alten Fotos bekannt. Beispielhaft wurden kurze Traufabschnitte mit abstrahierteren Ornamenten ausgestattet. Eine volle Rekonstruktion des unzweifelhaft gestaltgebenden Details wurde nicht angestrebt. Die vermauerten Scheinarkaden wurden geöffnet und mit neuen Fensterelementen versehen. Die mit seitlichen, asymmetrisch angeordneten Blechfeldern versehenen Elemente tragen stählerne, profilierte Kämpfer und tragen die Aussöhnung von alt und neu in sich. Sie greifen nicht in das Repertoire von Schaufenster zurück, sondern bezeugen die Anforderungen der neuen Nutzung. Die Blechfelder folgen der Geometrie der inneren Fassadenschicht. Sie zeigen die Verschränkung der inneren und äußeren Fassadenebene miteinander. Im vorderen, offenen Hof wurde ein Lichtkubus zur Belichtung der darunterliegenden Leseplätze (Freihandmagazin) errichtet. Er dient gleichzeitig als „Leuchtzeichen“ im Hof. (Abelmann)

### Hauptbibliothek Mitte Brunnenhof, Berlin-Mitte – Germany 1997

8.000 m² NF, € 8.000.000, Neubau - Sanierung

Die Hauptbibliothek Mitte befindet sich seit 1928 ununterbrochen im Gebäude Brunnenstrasse 181. Nach der Wende 1989 verfügte sie im Vorderhaus, 1. OG, noch über 220 qm Fläche in baulich und technisch schlechtem Zustand. Nachdem ein Standortgutachten im Auftrag des Kultursenats den räumlichen Verbund der Hauptbibliothek mit der Kinderbibliothek des Bezirks angeraten hatte, verlegte der Bezirk zunächst interimshaft seine Kinderbibliothek in eine Teilfläche des Gewerbehofs. Als dauerhafter Ort wurde von uns das Untergeschoß unter der geplanten Bibliothek vorgeschlagen; dieses läßt sich über den neuen Eingangsbau miterschließen und über die Hofflächen beleuchten. Der vorgeschlagene und inzwischen realisierte Standort mit Eingang im 3.Hof wurde gewählt, weil er kompakte und räumlich und funktional gut organisierte Bibliotheksflächen ermöglicht. Die 4 Höfe haben jeweils eigene Themen und führen damit durch die Gesamtanlage: Die Durchfahrt von der Brunnenstrasse in den ersten Hof wurde in einem 1.Bauabschnitt 1991 geöffnet und verbreitert, um die Höfe optisch mit der Strasse und dem gegenüberliegenden Park zu verbinden; an der Durchfahrt präsentiert sich die Bibliothek in Form einer großen Vitrine. Der 1. Hof gibt den Blick auf die Bibliothek frei (Trendbereich). Für den 2. Hof vor dem Spänebunker hat die Berliner Künstlerin Ulrike Hogrebe 3 Plastiken aus Stahl entworfen. Die Finanzierung der Plastiken hat der Bauherr als Beitrag für Kunst am Bau übernommen. Der 3. Hof bildet ein Forum vor der Bibliothek; und ist von deren Eingangsbau beherrscht; von hier aus sind alle Flächen einsehbar. Im hintersten, 4. Hof erhebt sich der neue Oberlichtkubus der Kinderbibliothek.; dieser Hof wird nicht betreten, sondern nur eingesehen. Der Neubau im 3. Hof dient als Erschließungsbau für die gesamte Bibliothek. Im EG liegt die zentrale Verbuchungstheke; von hier aus führt die Treppe hölzern / betonen in das UG und steinern / stählern ins OG. Die Deckeneinschnitte ermöglichen vertikale Durchblicke. Die Galerie im OG bleibt leer und wird als Veranstaltungsfäche genutzt (Bühne für Musikgruppen, Laufsteg bei Modenschau). Das Dach ist leicht zwischen die Rückwand und die Fassaden gehängt; der umlaufende Verglasungsstreifen setzt den Neubau vom Altbau ab. Der Neubaubereich ist mit einer Sprinkleranlage versehen zur Bildung eines Brandabschnittes zwischen den Quergebäuden. Das Untergeschoß bietet der Kinderbibliothek etwa 500 qm Fläche; die vorhandene Raumstruktur, gekennzeichnet durch den Wechsel von Hofflächen und Gebädeflächen, wurde erhalten und durch Einbauten akzentuiert: unter den Gebäuden sind jeweils kleine Räume, "Höhlen", "Kabinette" eingerichtet, die mit differenzierten Licht- und Raumverhältnissen den Kindern verschiedenen Milieus bieten. Unter den Höfen sind jeweils große Räume angelegt, die von oben belichtet werden. Als zentrale Skulptur steht der Treppenkubus im UG. Unter dem Lichtkubus im 4. Hof ist eine Senke geschaffen worden, die, mit einem "unmöblierbaren" Flußkiesboden, einen Ruhe- und Versammlungsort bietet. Im 2. Hof wurde der ehemalige Spänebunker (Möbelfabrik) zu einem WC-Turm umgenutzt; in diesem liegt gleichzeitig die zweite Treppenverbindung von UG und EG. Seitlich des Spänebunkers wurden Übergänge geschaffen zur Anbindung des 1.Quergebäudes. Dieses wird nach Auszug der Interimskinderbibliothek zum Trendbereich umgebaut. Die Nutzung dieses Bereichs ist separat möglich. Die Möblierung der Bibliothek besteht aus Standardbibliotheksregalen und angefertigten Spezialmöbeln, die von uns entworfen und konstruiert wurden. Grundprinzip der meisten Möbel ist die Addition von tragenden Stahlprofilen und ausfachenden, aufliegenden Holzflächen. Beherrschendes Thema bei Entwurf und Realisation war die Dualität von Alt- und Neubau. Ziel war dabei, den Altbau weitestgehend in Substanz und auch Milieu zu erhalten. Die Grenze zwischen notwendiger Renovierung (gleich Erneuerung) und möglicher Akzeptierung von

"Alterungsspuren" musste dazu ständig überprüft werden. Den Altbaumaterialien Putz + Klinker wird Stahl + Beton als neue Materialien gegenübergestellt. Im Altbau-Untergeschoss legten wir größten Wert auf die Erhaltung eines "Kellermilieus". (Abelmann)

### Universitätsbibliothek der Humboldt-Universität zu Berlin, Berlin – Germany 1997

Umbau - Sanierung - Ausbau mit Sonderelementen, Projektstand 1. BA Fertigstellung März 1997, 2. BA in Planung  
Portfolio Kosten | Größe EUR 2.600.000, 2.000 qm HNF

Vestibül Universitätsbibliothek der Humboldt-Universität Berlin, Sicherung der Kuppelraumschale und Ausbau als Medienzentrum (temporäre Nutzung)

Die Kuppel wurde von dem Beratenden Ingenieur für Bauwesen Prof. M. Manleitner auf ihre Tragfähigkeit und Sanierungsfähigkeit hin begutachtet. Im Rahmen der Sanierung wurden daraufhin die durchhängenden Spanndrähte der Rabbizkonstruktion nachgespannt bzw. fehlende ergänzt. Die Kuppelschale war raumseitig mit Ei-Tempera bemalt als Natursteinimitation. Eindringene Feuchtigkeit führte zu Pilzbefall und Verfärbung der Malschicht. Durch Setzungen und Erschütterung waren Teilflächen der Gipschale vom Untergrund gelöst. Die gelösten Teilflächen wurden rückgesichert, Risse / Löcher verfüllt. Die Oberfläche wurde mechanisch gereinigt und anschließend verfestigt. Die Wände sind mit Kunststeinplatten bekleidet, der abgesehen von einigen Einschublöchern in hervorragendem Zustand waren und lediglich mechanisch gereinigt wurden. Der Bodenbelag aus 3 verschiedenen Kalksteinmaterialien in rot, weiß und schwarz, die eine Rosette in Raummitte bilden, ist erheblich, besonders in Raummitte, beschädigt (gebrochene, lose Platten; mechanische Beschädigungen). In den beschädigten Bereichen ist der Boden durch die Bedeckung mit einem Hohlrumboden vor weiteren Verlusten gesichert; alle Durchbrüche für Medien (Heizleitungen, Strom, DV) wurden an bereits bestehende Fehlstellen gelegt. Wandleuchten, Steinbänke und Mahagonitüren wurden gereinigt, restauriert und wieder montiert. Die neuen Anforderungen wurden durch 5 Elemente in die denkmalgeschützte Raumhülle hineingeschrieben:

1. Die runde Bodenplatte ist als Hohlrumboden konstruiert, konserviert den darunter verbliebenen, kriegsbeschädigten Marmorboden, beheizt (Fußbodenheizung) den Raum, nimmt die Elektro- und Datenleitungen in den Hohlräumen auf, dämmt den Raum gegenüber dem Keller (eingelassene Zellulose in den Hohlräumen), verbessert die Raumakustik (Nachhallzeit)
2. Zwei kreisbogenförmigen PC-Tische nehmen jeweils 2 x 8 PCs auf. Die äußeren Infoplätze sind Sitzplätze, die inneren Stehplätze; die Bildschirme stehen übereinander.
3. Die kreisausschnittförmige Info-Theke bietet 3 Personal-Arbeitsplätze. In den rückwärtigen Schränken sind neben der erforderlichen Regalfläche auch der Heizkreisverteilungskasten integriert.
4. Die Galerie mit Spindeltreppe bietet 10 Computer- bzw. Mikrofiche-Arbeitsplätze für längere Recherchen. Die Galerie ist in eine der beiden Raumnischen eingeschrieben und läßt den runden Hauptraum frei. Als Motiv nimmt sie die Raumloggien des ehemaligen Lesesaales wieder auf. Die Galerie ist komplett selbsttragend konstruiert und mit den Kuppelwänden nicht verbunden.
5. Der "Kronleuchter" ersetzt einen durch Kriegseinwirkung verlorenen Kronleuchter. (Abelmann)

### Ackermann + Raff Architekten, Tübingen – Germany

### Mensa und Mediothek in Balingen, Balingen – Germany 2008

Bauherr: Stadt Balingen, Planungsbeginn: 06.2004, Ausführung: 09.2006 - 07.2008, Bruttogrundfläche: 2.463m<sup>2</sup>  
Bruttorauminhalt: 11.373 m<sup>3</sup>, Baukosten KG 300+400: 4.0 Mio €

Im Zuge des Ausbaus zur Ganztageschule werden im Schulzentrum Längenfeld eine Schulmensa für maximal 1000 Essen, eine Mediothek, verschiedene Seminarräume und Übungsräume für die Jugendmusikschule errichtet. Der Standort ist eine Restfläche, die sich neben der von unserem Büro geplanten Gymnasiumserweiterung befindet. Damit das Schulgelände offen und durchlässig bleibt, wird die multifunktional zu nutzende Mensa als langer liegender Baukörper in die Hangtopographie eingefügt. Die zweigeschossige Mediothek darüber - bildhaft ein großer Wissenspeicher - schafft einen markanten Hochpunkt des Schulzentrums und einen baukörperlichen Kontrast zur ins Gelände integrierten Mensa. Die Mensa und die Mediothek besitzen getrennte Eingänge, die an den Ecken in den Baukörper eingeschnitten sind. Beide Bereiche sind durch ein gemeinsames Treppenhaus miteinander verbunden. Um die große Masse des Gebäudes zu reduzieren, werden die Fassadenflächen erdfarben verputzt. Im Kontrast zum äußeren Erscheinungsbild werden im Innenbereich die Boden- und Wandflächen farbig gestaltet. (Ackermann)

### AEP Architekten Eggert Partner, Stuttgart u.a.O – Germany

<http://www.ae-p.de>

### ZMB Zentralmedizinische Bibliothek, Philipp-Universität Marburg - Germany 2000 – 2004

5,1 Mio, Nutzfläche 1.830 m<sup>2</sup>, Bruttogeschossfläche 2.320 m<sup>2</sup>,

Das Universitätsklinikum Marburg, eine der großen Fakultäten im Bereich der Gesamtanlage der Universität, liegt an exponierter Stelle in den Lahnbergen. Zusammen mit der Mensa und dem Hörsaalgebäude bildet die neue zentrale medizinische Bibliothek (ZMB) das Kommunikationszentrum der studentischen Aktivitäten. Einerseits als Solitär freistehend, andererseits in die topographische Platzgestaltung des Mensavorplatzes integriert, überwindet der Bibliotheksneubau den vorhandenen Höhensprung mittels einer öffentlichen Durchwegung. Diese Passage ist Teil der Verbindung zwischen Klinikum im Norden und den universitären Lehr- und Forschungsgebäuden im Süden. Das schräg gestellte Stahl-Glas-Tragwerk im Bereich des überdachten öffentlichen Fußwegs markiert im städtebaulichen Kontext den beidseitigen Zugang zur Bibliothek. Die Schrägstellung des Bauteils folgt dem topographischen Höhensprung zwischen dem angrenzenden Hörsaal und dem Mensavorplatz. Die Konzeption der Fassade beruht auf einer Synthese des Sonnenschutzes und der Tageslichtnutzung. Um die Räume im Inneren des Gebäudes ausreichend gegen sommerliche Überhitzung zu schützen, sind der wärmedämmenden Pfosten-/Riegelfassade bedruckte Glaslamellen vorgeschaltet, die zu jeder Tages- und Jahreszeit automatisch der Sonne nachgeführt werden. Die Glaslamellen sind zu ca. 80 % lichtundurchlässig bedruckt. Für eine optimale Ausgestaltung der studentischen Arbeitsplätze ist jedem Lesetisch individuell ein Blendschutzelement zugeordnet. Durch die gleichmäßige, punktförmige Rasterung der Bedruckung dringt ein Maximum an Tageslicht ins Innere. Der Lesesaal wird dadurch diffus ausgeleuchtet, der Energieverbrauch für Beleuchtung minimiert. Bei bedecktem Himmel ist ein Sonnenschutz nicht notwendig, die Glaslamellen werden dann senkrecht zur Fassade gefahren, der Lichteinfall somit nicht behindert.

Glas

Die Last der großzügigen Verglasungen wird über Punkthalter abgefangen. Die einzelnen Punkthalter im Raster von 1,10 m halten die Scheiben 1,20 x 3,30 m an sechs Punkten. Die schräg aufgestellte Stahlkonstruktion, bestehend aus einer doppelten U 140-

Grundkonstruktion, nimmt die Lasten der Verglasung über schräg liegende Flachstahlprofile 100 x 20mm auf. Diese sind einerseits an der Grundkonstruktion, andererseits an der Dachkonstruktion, bestehend aus HEA 80 abgehängt. Die Verglasungen bestehen aus VSG-Scheiben (2 x 8 mm ESG) mit absturzsichernder Funktion und im Bereich der Überkopfverglasung aus VSG-Scheiben (2 x 8 mm TVG). Die drehbar gelagerten Vertikallamellen aus VSG-Scheiben (2 x 10 mm TVG) sind punktförmig an Stahlguss-Spidern befestigt. Die Drehbarkeit wurde mittels Alu-Rundrohren realisiert, die über Schubstangen im Linearbetrieb beweglich an der Stahlkonstruktion befestigt sind.

**Ergänzungsneubau Universität (ENUS), Bielefeld – Germany 2011 - 2013/2014**

Nutzfläche 39.000 m<sup>2</sup>, BGF 74.400 m<sup>2</sup>, BLB NRW Bielefeld

Mit dem Ergänzungsneubau Universitätsstraße (ENUS) in Bielefeld planen agn Niederberghaus & Partner ein weiteres Großprojekt im Bereich Hochschulbau. Agn konnte das Ausschreibungsverfahren für das 110 Millionen € Projekt für sich entscheiden und wurde mit der Generalplanung beauftragt. Das Hauptgebäude der Universität Bielefeld weist einen erheblichen anbieterungsbedarf auf. (see: **Döll Steliet voor bouwkunst – <http://www.dollab.nl>**) Um Platz für die notwendigen Maßnahmen zu schaffen, wird ein Teil der universitären Nutzungen in den Ersatzneubau verlagert, der auf ca. 40.000 m<sup>2</sup> Nutzfläche Raum für Zentralmensa, Bibliothek, Hörsäle, Seminarräume und Institute bietet. Das Volumen des Neubaus gliedert sich in einen zweigeschossigen Sockel mit den öffentlichen Nutzungen Mensa, Bibliothek, Hörsäle sowie den Fakultäten, die in vier Ringen entlang einer Magistrale organisiert werden. Seriell gefertigte Bauelemente, nachhaltige Materialien und eine integrale, innovative Technik stehen für einen Ressourcen schonenden, energieeffizienten und wirtschaftlichen Ansatz. So soll der Neubau mit einer Kombination aus Nahwärme- / Nahkältenetz, Betonaktivierung sowie Präsenzmeldern und Luftqualitätsfühlern für die nutzungsunabhängige Klimasteuerung ausgerüstet werden. Hohe Flächenwirtschaftlichkeit, einfache Konstruktion und integrale Haustechnik zeichnen den neuen Baustein des Hochschulstandortes Bielefeld aus und lassen einen angemessenen Rahmen für die universitäre Ausbildung entstehen. (agn)

**Geowissenschaften (Bibliothek) Westfälische Wilhelms-Universität, Münster – Germany 2011 - 2013**

BGF: 12.4645 m<sup>2</sup>, BRI: 47.481 m<sup>2</sup>, HNF: 6.071 m<sup>2</sup> Bauherr: Bau- und Liegenschaftsbetrieb NRW, Niederlassung Münster  
Wettbewerb 1. Preis (2008). Green-Building nach Eu-Standard / aktuell: Vorzertifizierung (Silber) nach DGNB

Im Generalplaner-Wettbewerb um den Institutsneubau der Geografie der Westfälischen Wilhelms-Universität Münster erzielte agn 1. Preis. Ein zweiter Preis wurde nicht vergeben. In Ausschreibung und Beurteilung war besonderer Wert auf die Themen Realisierbarkeit sowie Nachhaltigkeit, Umweltverträglichkeit und ökologische Standards im Sinne eines „Green Building“ gelegt worden.

Aus dem Juryprotokoll: „Die Entwurfskonzeption besticht durch einen prägnanten Solitär und fügt sich gut an den bestehenden Viefach-Riegel des Technologiehofes an. Die Zuwegung aus Südost-Richtung ist mit großzügigem Vorplatz optimal gestaltet. Das Gebäude ist sehr kompakt konzipiert. Die Baumasse erscheint von außen allerdings trotzdem aufgelockert. Die Lichthöfe sind gut platziert. Der zweite Bauabschnitt ist gut angeordnet und lässt sich gestalterisch gut einbinden. Das Gebäude passt maßstäblich zu den bereits bestehenden Gebäuden. Es nimmt die bestehende Viererreihe auf und führt sie zu einem Ende. Die Fassade ist zeitgemäß geprägt, nimmt jedoch auf die bestehenden Gebäude Rücksicht“. Neben hoher Wirtschaftlichkeit, einfacher Konstruktion und integraler Haustechnik bietet das neue Institutsgebäude für Geographie ein hohes Identifikationspotential. (agn)

**Landschaftsbibliothek Aurich – Germany 1995 – 2002**

BGF 1.950 m<sup>2</sup>, BRI 9.630 m<sup>2</sup>, € 3.500.000

Bauherr: 'Ostfriesische Landschaft', Aurich, Realisierungswettbewerb 1. Preis

Die Ostfriesische Landschaft ist die Nachfolgerin der Landesstände Ostfrieslands und heute ein regionaler Kulturverbund, der als eine seiner Aufgaben die Unterhaltung einer allgemein zugänglichen wissenschaftlichen Bibliothek ansieht. Das hierfür 1965 bezogene Bibliotheksgebäude erreichte in den 1980er Jahren die Grenzen seiner Kapazität und war in seiner Ausrichtung auf eine reine Magazinaufstellung nicht mehr zeitgemäß. So wurde 1992 ein Architekturwettbewerb ausgelobt, den wir mit unserem Entwurf gewannen. Ziel war die Schaffung eines Freihand- und Lesebereiches in Ergänzung der vorhandenen Magazinflächen, aber auch der Erhalt von Erweiterungsfläche für das Magazin und die Verwaltung. Die neu zu schaffende Magazinfläche konnte wegen des hohen Grundwasserstandes nicht in Untergeschossen untergebracht werden. Damit ergab sich aus dem Programm ein für den Standort relativ großvolumiger oberirdischer Baukörper. (AHM)

**Awards:**

2006 Saarländischer Bauherrenpreis für Bereichsbibliothek Uni Saarbrücken

2008 Landes- und BDA-Preis: Anerkennung für Bereichsbibliothek Universität Saarbrücken

Bauherr: Saarland, Wettbewerb: Sept. 2000, EU-offen, 1. Preis, Planung: Okt. 2001 - Okt. 2002, Bauzeit: Apr. 2003 - Febr. 2005

BGF: 2.900 qm, BRI: 11.500 cbm, Baukosten: 6,5 Mio Euro

Das Gebäude versteht sich als Ergänzung des kubischen Ensembles um die Fachbereiche Physik und Chemie mit seinen "schnittmengenartig" angeordneten Baukörpern. Gewissermaßen als "Aufheiterung" des tristen Ensembles setzt sich der neue Baukörper skulptural aus fast orangefarbenen, massiven Klinkerflächen und glänzendem, tektonisch aufgelösten Aluminiumflächen zusammen. Die neue Anlage wird durchkreuzt vom inneren Wegenetz des Campus und bildet dabei einen Durchgangsort mit eigener Ausstrahlung. Die Innenräume mit ihren Sichtbetonflächen und Eicheregalen gruppieren sich um ein viergeschossiges Lichtatrium herum, an dem sich auch die Leseplätze befinden. (<http://www.baunetz.de>)

Eigenbrodt, Olaf, Hamm leistet sich ein neues Zentrum. Die Zentralbibliothek im Heinrich –von-Kleist-Forum steht für einen gelingenden Strukturwandel, in: BuB Forum Bibliothek und Information, Jg. 62, 2010, 11/12, pp. 790 - 794

Pirsich, Volker, Die Zentralbibliothek der Stadtbüchereien Hamm in neuem Glanz, in: B.I.T. online. Zeitschrift für Bibliothek, Information und Technologie, Jg. 13, 2010, 3, pp. 307 – 314

Am 26.2.2010 wurde mit viel Landesprominenz (der ehemalige Ministerpräsident Rüttgers allen voran) das Hammer Heinrich-von-Kleist-Forum mit der neuen Zentralbibliothek eröffnet. Das Heinrich-von-Kleist-Forum am Bahnhofsvorplatz mit seinen drei Partnern Zentralbibliothek, VHS und privater Fachhochschule SRH [Stiftung Rehabilitation Heidelberg] (+ ein gemeinsamer Veranstaltungsraum + ein bewirtschaftetes Bistro) ist die neue Kultur- und Bildungsstandort in der westlichen Innenstadt. Nach 20 Monaten Planungszeit, 23 Monaten Bauzeit und bei 23,5 Millionen Baukosten wurde der Bau punktgenau eröffnet - und gut 15.000 Besucher strömten an den beiden Eröffnungstagen in das Gebäude. Die Zentralbibliothek als größter Partner weist 4.400 m<sup>2</sup> Fläche auf insgesamt sechs Stockwerken auf (davon vier Publikumsgeschosse, ein Untergeschoss mit Magazin, Technik und Lager sowie ein Verwaltungsgeschoss im 4. Obergeschoss). Die Bibliothek selbst ist heute zumindest eine der modernsten Öffentlichen Bibliotheken Deutschlands; Ihr neues Herz ist eine Sortier- und Förderanlage (Gilgen Logistics), die - bis auf das Verwaltungsgeschoss - alle Stockwerke erreicht; Selbstverbucher für Ausleihe und Rückgabe (incl. Außenrückgabe; Bibliotheca RFID) und Kassenautomaten (Crown) sind für das Haus aufgrund der Vielgeschossigkeit neuer notwendiger Standard. Insgesamt warten 14 Internet-PCs (+ 2 Spiele-PCs) und 16 OPACs auf die Kunden, die darüber hinaus ein WLAN-Angebot im gesamten Publikumsbereich vorfinden. Das neue Haus verbindet Funktionalität und Ästhetik einerseits sowie bibliothekarische Funktionen im engeren Sinne und Aufenthaltsqualität andererseits. Kühle ausstrahlende Materialien und Farben des architektonischen Konzepts (Sichtbeton, Natursteinboden, Naturholz) gehen eine harmonische Verbindung ein mit den Materialien und Farben, die bibliothekarischerseits in das Projekt eingebracht wurden. ### **Literature:**

Robert Klaus Jopp, Der Neubau für die Deutsche Bibliothek in Frankfurt am Main, in: ABI-Techni, 17, 2, pp. 117-128

Das Preisgericht vergab 1982 den 1. Preis an das Büro Färber / Hochstetter. Nach Diskussionen einigte sich aber der Verwaltungsrat 1983 auf den 4. Preisträger das Büro Behnisch & Partner. Nach wiederum lebhaften Debatten wurde 1983 / 1984 ein zweiter Wettbewerb unter den 5 Preisträgern von 1982 anberaumt. Am Ende gewann der Entwurf (2. Preisträger von 1982) von Arat, Kaiser, Kaiser.

Schon 1981/82 war ein Architektenwettbewerb ausgeschrieben worden, um den in Frankfurt dringend benötigten Neubau zu konzipieren. In der zweiten Stufe des Architektenwettbewerbs hatten die Stuttgarter Architekten Arat/Kaiser/Kaiser den Siegerentwurf geschaffen. Als Bauplatz ist ein ca. 19.000 qm großes Grundstück am Rande eines parkartigen Villenviertels an der Westseite und einer vier- bis sechsgeschossigen Blockrandbebauung an der Ostseite, an der Kreuzung zweier vielbefahrener Magistralen, der Adickesallee und der Eckenheimer Landstraße, gewählt worden. Das Grundkonzept der Architekten orientierte sich demzufolge an städtebaulichen Gegebenheiten und Zwängen. Der Kerngedanke lag in der baulichen Schließung der Straßenkanten. Der Bibliotheksbau setzt sich aus mehreren Komplexen zusammen: ein Verwaltungstrakt mit den Arbeitsräumen der Mitarbeiterinnen und Mitarbeiter an der Eckenheimer Landstraße; in spitzwinkliger Form auf der anderen Seite des Grundstückes an der Schlosserstraße das Areal des Lesesaals; davor in Richtung Adickesallee der Kubus des Konferenztraktes. Lesesaal und Verwaltungstrakt ist auf der straßenabgewandten Seite der Bibliotheksgarten vorgelagert. Am Schnittpunkt der genannten Gebäudeteile liegt ein Vorplatz, eine "Piazza". Von hier aus erschließt sich dem Besucher das zentrale Eingangsfoyer als Rotunde mit einer flachen, kuppelartigen Glasüberdachung. Die Architekten waren von Anfang an bemüht, ihre architektonische Sprache aus dem funktionalen Inhalt des Gebäudes zu entwickeln. Das gesamte Gebäude der Bibliothek soll nach dem Willen seiner Schöpfer dem Nützlichen und Zweckmäßigen verpflichtet sein. Quintessenz ist die Verbindung von Verwaltungsgebäude mit Lesesaallandschaft sowie Konferenzzentrum und Ausstellungsareal. Die Funktionen dieser unterschiedlichen Gebäudeteile bestimmen jene Formensprache, die Prof. Kaiser in seiner Rede anlässlich des Richtfestes am 13. September 1994 mit einem "Nebeneinander von hoch und niedrig, von Geschlossenheit zu den Straßen und Offenheit zum Garten . . ." als "durchgängiges Kompositionsprinzip" definierte. Daß sich das Gebäude trotz oder gerade deswegen relativ bescheiden

ausnimmt, liegt nicht zuletzt daran, daß einer der Kernbestandteile der Bibliothek unter die Erde "verbannt" wurde. Die geringe Grundstücksgröße und konservatorische Überlegungen führten dazu, daß man den mit Abstand größten Teil des Gebäudevolumens unterirdisch anlegte. Die 30.000 qm des Magazins sind auf drei Untergeschosse verteilt. Ausgestattet mit einer Kompaktregalanlage, bietet es Raum für 18 Millionen Bände. Erst wenn man diesen nicht sichtbaren Teil des Gebäudes in die Betrachtung des Gesamtbauwerkes mit einbezieht, erschließen sich die wahren Dimensionen des Baus. Maßgebend für die äußere Gestalt des Gebäudeteils entlang der Eckenheimer Landstraße ist eine geschickte Anordnung der Bauteile zum Bibliotheksgarten hin, sowie die Abkehr der meisten Mitarbeiteräume und anderer funktionaler Bereiche von der lauten Straße hin zum ruhigen Garten. So ist dieser Gebäudetrakt zur Straße hin weitgehend geschlossen und zum Garten hin großzügig verglast, was für die Versorgung der Büroräume mit Tageslicht optimal ist. Großraumbüros wurden vermieden; die Mehrzahl der Räume sind als Zweierzimmer dimensioniert. Schnittpunkt aller Wege für die Benutzerinnen und Benutzer ist die Eingangshalle, die durch eine Glaswand den Blick in den Lesesaal ermöglicht. Geradeaus kommt man an der Buchsicherungsanlage vorbei in den Benutzungsbereich. Von hier aus links geht es zu den Online-Katalogen und der Bücherausgabe, rechts zum Informationszentrum und in den Lesesaalbereich. Der Lesesaaltrakt besteht aus drei Bereichen, dem im Sockelgeschoß gelegenen Multimedialesesaal, dem zentralen Lesesaalbereich (Hauptlesesaal) im Erdgeschoß und dem Zeitschriftenlesesaal, als eine Art über dem Hauptlesesaal schwebenden Galeriesystem. Zum Garten hin ist auch dieser Gebäudeteil über die gesamte Front verglast. Außerdem ist das Dach mit Oberlichtern versehen, die die Versorgung mit Tageslicht noch optimieren. Die zur Straßenseite ausgerichtete Lesesaalwand ist geschlossen und bietet Platz für einen Teil der Bücherregale der Freihandbibliothek, die insgesamt auf 80.000 - 100.000 Bände ausgelegt ist. Der Magazintrakt ist in drei großen Ebenen unterhalb des gesamten Areals angeordnet. In der Mitte jeder Magazinetape befindet sich ein sogenannter Stützpunkt, der an die zentrale Förderanlage angeschlossen ist. Sie verbindet sämtliche Abteilungen des Hauses sowie die Lesesäle und die Bücherausgabe. Diese Transportanlage ist eine Spezialanfertigung, eine Kombination von Telearbeitsystem mit Paternosterförderern. Auf den Magazinetafen wird der Transport der Bücher in kleinen Elektrowagen erfolgen. Durch dieses Transportkonzept sollen die Bücher in einer angemessenen Zeit bereitgestellt und auch größere Buchtransporte innerhalb der Magazinbereiche realisiert werden. Die relativ geschlossenen Außenfronten des Bibliotheksgebäudes sind nur in den Erdgeschoßzonen auch zu den Straßen hin geöffnet. Dem Passanten offenbaren sich der Ausstellungssaal mit seiner Galerie, das Restaurant und die Eingangshalle, durch die man nicht nur in den Lesesaalbereich sondern auch durch ihn hindurch in den Bibliotheksgarten blicken kann. Alles in allem ist das neue Gebäude der Deutschen Bibliothek Frankfurt am Main kein Bau, der durch spektakulären oder gar übertrieben repräsentativen Charakter besticht. Seine Vorzüge liegen eindeutig in der Zweckmäßigkeit. Somit entzieht sich dieser Bau meiner Meinung nach den immer wieder angestellten Vergleichen mit anderen Nationalbibliotheken, wie im übrigen auch Die Deutsche Bibliothek nur schwer mit anderen Nationalbibliotheken verglichen werden kann. Im neuen Gebäude der Deutschen Bibliothek Frankfurt am Main werden neueste Computertechnik und ein elektronisches Hochgeschwindigkeitsnetz, an das fast alle PCs der Mitarbeiterinnen und Mitarbeiter des Hauses angekoppelt sind, dafür sorgen, daß die Bibliothek den Herausforderungen des interaktiven Informationszeitalters gewachsen ist. Diesem Ziel dient auch ein speziell auf die Nutzung der neuen elektronischen Medien ausgelegter Multimedialesaal. In allen Gebäudeteilen wurde größter Wert auf Flexibilität und Vernetzbarkeit gelegt. Das Einbringen von großzügig dimensionierten Kabelkanälen, Hohlraum- bzw. Sandwichböden und Kabelschächten ist die bauliche Voraussetzung dafür. Der gesamte Lesesaalbereich beispielsweise kann - neben den bereits ohnehin in der ersten Ausbaustufe vorgesehenen PC-Anschlüssen - bei steigendem Bedarf gänzlich verkabelt werden. Auch von Seiten der Hardware wurden alle Vorkehrungen getroffen, um flexibel auf steigende Anforderungen in der Zukunft reagieren zu können und innerhalb der Bibliothek den Zugriff auf interne und externe Datenspeicher und -netze zu ermöglichen. Das neue Gebäude der Deutschen Bibliothek in Frankfurt wird Platz für eine bessere Umsetzung traditioneller bibliothekarischer Arbeitsprozesse bieten. Darüber hinaus wird es alle Möglichkeiten einräumen, um mit Hilfe neuester Informationstechnologien, unter Nutzung technischer Innovationen möglichst viele Informationen, in welcher Form auch immer, an den Nutzer zu bringen. aus: Kolasa, I.: Dem Nützlichen und Zweckmäßigen verpflichtet. - In: Dialog mit Bibliotheken (1994) Sondernummer Der Neubau der Deutschen Bibliothek Frankfurt am Main, S. 9-11 (<http://www.deposit.d-nb.de>)

## **ARC architekturkonzept GmbH, Halberstadt Magdeburg – Germany**

### **Libraries:**

#### **Hochschulbibliothek – Umbau Haus 1, FH Magdeburg, Stendal – Germany 2011**

Entwurf 05/2009, Fertigstellung 04/ 2011, Standort Fachhochschule Magdeburg -Stendal, Standort Stendal, Hochschulcampus Haus 1, Bauherr Landesbetrieb Bau, NL Nord,Stendal, Kosten 3,347 Mio Euro, ARC architekturkonzept | Bearbeiter: S. Lauterbach, F. Schaper | LPH 1 - 5 (HOAI), ARC projektmanagement | Bearbeiter: M. Lerche, S. Flügel | LPH 6 - 9 (HOAI)

Das Projekt war der Umbau einer ehemaligen Taunentziesenkaserne (1936-1938) in Stendal zur Hochschulbibliothek mit Testothek, Mediathek sowie Büro- und Archivräumen.

Es integriert den Gesamtbedarf der Bibliothek des Standortes der Hochschule Magdeburg -Stendal in Stendal.

Die Bibliothek befindet sich im gesamten Erdgeschoss und teilweise im Obergeschoss in Verbindung mit der Testothek. Weitere Flächen im Obergeschoss sind für die Lehre hergerichtet. Die für die Bibliothek benötigte Archivfläche sowie Verwaltungsarchiv ist im Dachgeschoss untergebracht.

In der Bibliothek ist ein großer zentraler Raum mit Ausleihetheke und Freihandbereich angeordnet, von wo aus sich alle Bereiche erschließen. Links und rechts neben dem zentralen Bereich befinden sich die Lesebereiche, wobei der Lesebereich II auch als Gruppenarbeitsraum genutzt werden kann. Die Bibliothek ist im Obergeschoss an einen weiteren Freihandbereich angeschlossen, welcher in Verbindung mit der Testothek steht. Im Obergeschoss wurden für Lehrzwecke ein großer Mehrzweckraum, ein Projektarbeitsraum und weitere Büros integriert.

Gestalterisch wurden an der Außenfassade keine Veränderungen vorgenommen. Ziel bei der Planung war, die Fassade entsprechend dem historischen Bild mit seinen Tür- und Fenstereinfassungen sowie Putzfassade mit Klinkersockel wieder herzustellen.

Aufgrunddessen wurde auch der Turmaufsatz mit Uhr wiedererrichtet um das prägnante Erscheinungsbild des Gebäudes auf Campusgeländes zu erhalten. (<http://www.competitionline.com/de/projekte/50624>)

#### **T(echnische) U(niversität) Braunschweig, Campus Nord, Zentrum Geistes-, Sozial- und Erziehungswissenschaften, Zentralbibliothek, Braunschweig – Germany on design**

Doch der Neubau einer zweiten Uni-Bibliothek verzögert sich. TU-Vizepräsident Professor Norbert Dichtl, für Strukturfragen der Hochschule zuständig, über den möglichen Baubeginn: „2010, 2012 oder später.“ Oder gar nicht? Dichtl: „Die Bibliothek wird gebaut, aber sie steht erst auf Platz acht unserer Prioritätenliste.“ Auf Platz eins rangieren Sanierungs- und Brandschutzmaßnahmen. Vor Tagen noch hatte Professor Dietmar Brandes, Leiter der Universitätsbibliothek, an einen Baubeginn seiner Dependence im nächsten Jahr gedacht. Die zweite Bibliothek – sie wird etwa so groß wie die Uni-Bibliothek Hildesheim – sieht aus wie ein flotter Vergnügungsdampfer – erster Platz eines Wettbewerbs, der schon vor einigen Jahren entschieden wurde. Entwurfsverfasser sind die Stuttgarter Architekten Rutschmann und Partner, heute Rutschmann, Goldbach und Laszcz. Die Jury sprach von einem „scheinbar schwebenden Baukörper“ und lobte die „Leichtigkeit der Gesamterscheinung“. Ursprünglich wurden die Gesamtkosten der Bibliothek nach Prof. Brandes auf 15 bis 16 Millionen Euro geschätzt. Doch die prompte Realisierung scheiterte. Der Bund hätte ohne Weiteres seinen Anteil von 50 Prozent aufgebracht, aber das Land Niedersachsen konnte die andere Hälfte nicht bezahlen. Inzwischen hat sich das Finanzierungsmodell bei öffentlichen Bauten geändert, mit der Folge, dass das Land wohl mehr als 50 Prozent der Kosten aufbringen müsste. Im Moment ist die geisteswissenschaftliche Bibliothek auf dem Campus Nord provisorisch in einem Kasernenbau untergebracht. Der Neubau wird die momentan noch erstreuten Buchbestände der Institute bündeln: Bücher für Geisteswissenschaftler, Erziehungswissenschaftler und Sozialwissenschaftler. Die neue Bibliothek, dieser Luxusliner des Lesens, wird der Mittelpunkt von Campus Nord, dessen Kreislauf nach Meinung aller noch mehr in Schwung kommen könnte. (<http://www.bison/mitteilungen/2008/MBL08-1.pdf>)

In Braunschweig wurde am 4. November 2001 ein begrenzt offener Realisierungswettbewerb für den Neubau einer Hochschulbibliothek in Braunschweig auf dem sogenannten "Campus Nord" entschieden. Auf dem Grundstück der ehemaligen Bundesgrenzschutzkaserne im Norden Braunschweigs soll das Zentrum der Geistes-, Sozial- und Erziehungswissenschaften der TU Braunschweig entstehen. Die geplante Zentralbibliothek für diesen Fachbereich soll die Buchbestände der einzelnen Institute und der zentralen Universitätsbibliothek aufnehmen. Das Preisgericht unter Vorsitz von Hartmut Rüdiger (Braunschweig) vergab die folgenden Preise:

1. Preis (46.000 Mark): Architekten Rutschmann und Partner (Stuttgart);
2. Preis (37.000 Mark): Werkgemeinschaft hsv (Braunschweig);
3. Preis (28.000 Mark): Schulitz + Partner (Braunschweig);
4. Preis (22.000 Mark): Henn Architekten Ingenieure (München);
5. Preis (14.000 Mark): Dohle + Lohse (Braunschweig).

Außerdem wurden die Arbeiten der folgenden Büros zum Ankauf (9.000 Mark) empfohlen: Tenbohlen-Welp (Berlin), Gehlen + Schreiber (Stuttgart), Birger Schmidt & Uwe Schüler (Rendsburg) sowie Dörr Ludolf Wimmer (Berlin). Der erstplatzierte Entwurf schlägt eine zentrale Anordnung des dreigeschossigen Gebäudes in der Campusachse vor. Dies bilde einen Schwerpunkt in der Gesamtanlage und führe zu-dem zu einer überzeugenden Platzbildung mit hohen räumlichen Qualitäten, lobte die Jury. Außerdem seien der Zugang, das Foyer und die Eingangssituation sehr gut gelöst; Orientierung und Erlebbarkeit einer geisteswissenschaftlichen Bibliothek würden hier vorbildlich aufgezeigt, heißt es weiter. Bilder vom Siegermodell sind unter <http://www.biblio.tu-bs.de/ausstellung/ubii/bilder.htm> zu sehen.

Sieger ist der Entwurf des Stuttgarter Büros Rutschmann und Partner, deren Konzept durch besondere Übersichtlichkeit und Transparenz besticht. Der Neubau auf dem Gelände der ehemaligen Bundesgrenzschutzkaserne am Bienroder Weg ist als Zentralgebäude und Mittelpunkt des gerade entstehenden geisteswissenschaftlichen Zentrums gedacht. In ihm werden die bisher bestehenden 23 Teilbibliotheken der Geistes-, Sozial- und Erziehungswissenschaften zusammengefasst. 550 000 Bücher werden einmal in den Regalen stehen, auf bis zu 650 000 Werke wird das Gebäude ausgelegt sein. Dr. Beate Nagel, stellvertretende Direktorin der Bibliothek und zugleich Fachreferentin für Architektur, hat hohe Erwartungen an den geplanten Neubau: "Wir erwarten vor allem Synergieeffekte. Die Zusammenlegung aller Institutsbibliotheken der sogenannten reinen Buchwissenschaften erleichtert die Zusammenarbeit der Institute. Für die Studierenden entfallen die langen Wege. Allein schon die einheitlichen Öffnungszeiten sind ein bedeutender Fortschritt." Städtebaulich hebt der Siegerentwurf die triste Kasernenarchitektur des Geländes auf und setzt einen Kontrapunkt zu den bereits bestehenden Gebäuden. Eine Glasfassade öffnet das Haus besonders zum geplanten Campus und der dazugehörigen Straße hin. Die hohe Lichtdurchlässigkeit soll den Innenräumen eine freundliche Atmosphäre verschaffen, damit den Studierenden das Schmöckern leichter fällt. Der Blick nach draußen ist immer gegeben, der Besucher fühlt sich nicht hermetisch eingesperrt oder gar abgeriegelt. Der Wissenschaftsrat der Bundesrepublik Deutschland, zuständig für die Aufnahme derartiger Bauvorhaben in den Haushaltsrahmenplan, hat dem Vorhaben bereits zugestimmt: Der Kostenrahmen liegt bei 26 Millionen Mark. Baubeginn könnte aller Voraussicht nach Ende kommenden Jahres sein. Der Einzug dürfte dann im Laufe des Jahres 2004 erfolgen.'

#### **Dubai Central Library, Dubai – Emirat of Dubai 2009**

Competition: 2005 – 1st prize, Client: Dubai Municipality, Gross floor area: 43,700 m<sup>2</sup>, Gross volume: 220,000 m<sup>3</sup>

Client: Dubai Municipality, Competition: 2005 – 1st prize, Gross floor area: 43,700 m<sup>2</sup>, Gross volume: 220,000 m<sup>3</sup>  
The client, Dubai Municipality, strives to develop a central library of international format with a significance that reaches beyond the borders of the Emirate of Dubai. The new library's holdings will include about 1,700,000 volumes. 300,000 to 400,000 volumes will be available in the library's open-access section. Book handling and information systems will reflect the latest technological developments. Planning is progressing rapidly ever since Dubai Municipality revealed the winning design in January 2006. The planning consortium of 'asp' Architekten Stuttgart, Obermeyer Planen+Beraten Munich and ACG Architecture Consulting Group developed the Preliminary Design in record time, addressing the clients various needs and issues for such an ambitious project. In the meantime options are discussed of relocating the building site from the initially proposed location at Lake Al-Mamzar to the prestigious Business Bay in downtown Dubai which indeed would be a suitable location for a cultural institution of this scale. The base of the building contains public areas such as a conference center, exhibition spaces, the audio-visual library, a bookstore, a children's library and administrative offices. Above it the grand space of the central library area rises in a sweeping gesture. Library garden: The library garden in the western part of the building plot, connected to the meditation rooms and children's library, is planned to stimulate all the senses. An orthogonal network of paths with pergola structures as sun shade is the basis of the design in the garden. The garden has the character of a promenade garden, a baroque pleasure garden or a traditional monastery garden, i.e. it is closed and offers the

opportunity to contemplate and communicate while walking. (ASP)

## **AS&P Albert Speer & Partner, Frankfurt a.M – Germany**

<http://www.as-p.de>

### **Europäische Schule, Frankfurt a.M. (Bibliothek) – Germany 2000 – 2003**

Lernen auf europäisch Die Auswahl Frankfurts als Sitz der Europäischen Zentralbank machte die Errichtung einer Europäischen Schule notwendig. Der erste Bauabschnitt mit dem Hauptgebäude, einer Dreifeld-Sporthalle und einem Kindergarten wurde im Jahr 2001/2002 in kürzester Zeit und unter hohem Kostendruck geplant und gebaut. Der zweite Bauabschnitt, der die Grundschule und eine Erweiterung der Kantine umfasst, wurde im November 2005 fertiggestellt. Das besondere pädagogische Konzept der Europäischen Schulen mit vier Schulsprachen, speziellem Förderunterricht und Unterricht in allen Landessprachen der Europäischen Union, machte eine besonders kleinteilige Struktur erforderlich. Das Hauptgebäude reagiert auf seine Lage in einem Grünzug zwischen Nordweststadt und westlichem Stadtrand. Zwei riegelartige Gebäudekörper nehmen die Grünzone als Pausenhof in Ihre Mitte und sind nur durch eine gläserne Eingangshalle und die sogenannte Kreativbox verbunden. Während in den flankierenden Riegeln die Klassenzimmer und Kleingruppenräume untergebracht sind, beherbergt die Kreativbox Sonderräume für die musischen Fächer und die Bibliothek. Der zweite Bauabschnitt wiederholt die Grundstruktur des ersten in kleinerem Maßstab. Über einen Steg werden beide Bauabschnitte zu einer logischen, homogenen Einheit verbunden. (AS&P)

### **Zweigbibliothek der Theologischen Fakultät, Humboldt-Universität, Berlin – Germany 2007**

Bauvolumen: 13.000.000 €, Beginn und Ende der Maßnahme: Aug. 2004 – Apr. 2007

Die Institutsgebäude in der Burgstraße 26 und der Anna–Louisa–Karsch - Straße 1 wurden für die Theologische Fakultät von Grund auf saniert und durch einen Neubauteil erweitert. Damit konnte die bisher auf drei Standorte verteilte Fakultät an einem Standort konzentriert werden. Die Planung beruht auf dem in einem Architektenwettbewerb mit dem ersten Preis ausgezeichneten Entwurf der Berliner Architekten Assmann & Salomon. Das 1912 erbaute und als Einzelbaudenkmal eingetragene Gebäude Burgstraße 26 wurde umfassend saniert, wobei die Fassaden weitgehend ihr historisches Aussehen zurückerhielten. Es beherbergt alle Büro- und Seminarräume als auch die Hörsäle. Das angrenzende Gebäude an der Anna–Louisa–Karsch-Straße 1 ist zusammen mit einem hofseitigen Neubau heute Sitz der Zweigbibliothek der Theologischen Fakultät.

### **Veterinärmedizinische Bereichsbibliothek, Humboldt-Universität und Freier Universität, Bibliothek**

#### **Düppel, Berlin Zehlendorf – Germany**

Umbau einer Reithalle zur veterinärmedizinischen Fertigstellung 1997, € 3.000.000

Mit Beginn des Sommersemesters wurde die veterinärmedizinische Bereichsbibliothek in Düppel in Betrieb genommen. Damit konnten die auf mehrere Standorte in Dahlem und Düppel verstreuten Literaturbestände an einem Platz zusammengeführt werden. Mit dem Beschluß über die Fusion der veterinärmedizinischen Fachbereiche von Humboldt-Universität und Freier Universität Anfang der neunziger Jahre fiel zugleich die Entscheidung, Düppel zum veterinärmedizinischen Campus auszubauen, mit Kliniken, Instituten und Einrichtungen in unmittelbarer Fußnähe. Bei der Suche nach einem Standort für die Bibliothek fiel die Wahl auf die damalige Reithalle am Königsweg, die wegen ihrer Größe und ihrer zentralen Lage für ihre neue Funktion als Bibliothek prädestiniert erschien. Die Technische Abteilung führte 1993 ein konkurrierendes Angebotsverfahren unter drei Berliner Architektenbüros durch, das die Architekten Assmann, Salomon und Scheidt für sich entscheiden konnten. Nach ihrem Entwurf wurden drei neue Ebenen in dem stützenfreien Hallenraum geschaffen: Ein gegenüber dem Außengelände leicht angehobenes Erdgeschoß, ein etwas verkleinertes Untergeschoß, das von den alten Hallenfundamenten den notwendigen Abstand wahrt und eine auf einer Stahlkonstruktion ruhende Obergeschoßplattform. Alle drei Ebenen sind durch ein großzügiges Atrium miteinander verbunden und bewahren innen und außen die alte Gebäudehülle in weitgehend originaler Form. Dies kam dem denkmalgeschützten Bauensemble des alten Gutshofs Düppel zugute und half zugleich, Kosten zu sparen. Das neue Haus bietet auf 1600 qm Hauptnutzfläche Platz für 160.000 Buchbände und damit genügend Platz für Zuwächse, auch wenn künftig die Literatur aus Berlin-Mitte hinzukommen wird. Im Erdgeschoß sind die Bibliothekarischen Dienste, der Katalogsaal, die Zeitschriftenauslage und die Lehrbuchsammlung untergebracht. Lesesaal und Monographien-Freihandmagazin befinden sich im Obergeschoß, das Zeitschriften-Freihandmagazin im Untergeschoß. 80 Leseplätze stehen den Besuchern zur Verfügung, davon rund die Hälfte in Gruppenarbeitsräumen, die akustisch vom Lesesaal getrennt sind. Außerdem gibt es einen Medienraum, einen PC-Raum und Arbeitsplätze für Doktoranden. Die gesamte Bibliothek ist behindertengerecht gestaltet. Mit Baukosten von 6,05 Millionen Mark war der Umbau der Reithalle um rund ein Drittel billiger als ein Neubau gleicher Größe es gewesen wäre.

### **Hochschul- u. Landesbibliothek Fulda – Germany 2013**

Der Neubau ist Auftakt einer perspektivischen Weiterentwicklung der Hochschule Fulda. Bausteine des Projekts sind die Hochschul- und Landesbibliothek (HLB) mit ca. 4.000 Quadratmetern Nutzfläche sowie die Mensa mit Cafeteria und Außengastronomie, das StudentServiceCenter und weitere zentrale Flächen auf insgesamt ca. 2.600 Quadratmetern Fläche sowie die zugeordneten Freianlagen. Der Neubau soll sich architektonisch und städtebaulich in die vorhandene, teilweise denkmalgeschützte Bausubstanz aus ehemaligen Kasernengebäuden unterschiedlicher Epochen einfügen und zum neuen Mittelpunkt entwickeln. Aus der Jurybewertung zum 1. Preis: „Die Maßstäblichkeit und Arrangierung der Gebäudevolumen, gegliedert entsprechend der drei geforderten Hauptnutzungen, passen sich erfolgreich in das bestehende stadträumliche Geflecht ein. Durch die Platzierung des dreigeschossigen Bibliotheksbaus zentriert entlang der Achse des ehemaligen Exerzierplatzes wird eine eindeutige Hierarchisierung der Freiflächen geschaffen, die die unterschiedlichen Nutzungsanforderungen einer angemessenen räumlicher Zuordnung gewährt. Die stadträumliche Platzierung der drei Funktionen ist sinnfällige. Eine prägende und überragende Qualität des Entwurfes ist die Verflechtung von seinen Außen-Innenraum-Sequenzen im neuen Campuszentrum. Vom ‚Campusplatz‘ betrachtet, lädt jedes der

neuen Gebäude sein Publikum ein. Hier heraus entwickelt sich eine sehr klare Orientierungsleitlinie, die dem Nutzer das funktionelle Angebot jedes einzelnen Gebäudes verdeutlicht. Der architektonische Ausdruck der Gebäude weist eine bestechend ruhige Eigenständigkeit auf, die sich ebenfalls in den bestehenden baulichen Kontext eingliedert.“ (baunetz)

#### **Fachhochschule – University of Applied Sciences – Bibliothek, Bielefeld – Germany 2013**

Client BLB Bau- und Liegenschaftsbetrieb NRW NL Bielefeld, GFA I Volume 92.100 m<sup>2</sup> I 382.300 m<sup>3</sup>, Total costs 154 Mio. Euro KG 200-700 brutto

In creating the northern university campus (Hochschulcampus Nord) the federal state of North Rhine-Westphalia has provided an exposed development area situated in immediate relation to the University of Bielefeld. The new university of applied sciences takes its place in the southern part of the northern university campus which has a very sensitive landscape with the valley of a stream, the Gellershagener Bachtal. Toward the new campus, which is yet to be built, a clear spatial edge is set while the landscape is shaped in a more differentiated and open manner. The new building of the university is “prelude” and reception for the new development area. The idea of a spatial succession of “hot spots” is continued in the concept of access to and within the building. Coming from the central campus square one enters a multistorey lobby which makes a generous entrée and from which the main campus axis is continued, generating a central access corridor for the building. (Auer)

#### **Universitätsbibliothek Magdeburg - Germany 2003**

Client: Landesbetrieb Bau, Niederlassung Mitte, GFA I Volume 15.000 m<sup>2</sup> I 70.000 m<sup>3</sup>, Total costs 30,7 Mio. Euro, (KG 200-700 gross)

The new university library, in contrast to the existing student cafeteria, forms a link between university and city. Following the principal of a folded band, a spatial continuum has been created over long diagonals, symbolically standing for the contents of the building as a “reading-landscape”. Subject area work zones ascend from the borrowing, periodicals and user area at entry level. As the spatial centre, the atrium enables clear orientation and links to library areas. (Auer)

Der Entwurf des Gebäudes folgt dem Prinzip der Faltung einer bandartigen Fläche. Der Gesamtgrundriss der Bibliothek verläuft über eine Länge von ca. 100 m trapezförmig von einer Breite von ca. 100 m auf eine Breite von ca. 50 m zusammen. Auf Grund des Faltungsprinzips erstrecken sich die einzelnen Geschossdecken nicht über die gesamte Grundrissfläche. Das Gebäude ist teilunterkellert und hat im ersten Bauabschnitt neben dem Untergeschoss und Erdgeschoss drei Obergeschosse. Das Gebäude insgesamt befindet sich im Niedrigenergiehaus-Bereich und ist hinsichtlich sommerlichem und winterlichem Wärmeschutz optimiert. Im Innenbereich schaffen zielgerichtete funktionsgebundene Leuchten, wie individuelle Arbeitsplatzleuchten an den Lesetischen und in die Regalsysteme integrierte, abgestimmte Langfeldleuchten eine konzentrierte Arbeitsatmosphäre.

#### **Bibliothèque Université Lille 1, Villeneuve d'Ascq (Lille) - France 2015**

Un learning center sur l'innovation à Lille 1

Le 29 décembre 2010 par Marion Sabourdy

En arrivant sur le campus de l'Université des sciences et technologie Lille 1, on ne peut pas louper la Bibliothèque universitaire (BU), avec sa forme ronde et sa façade aux motifs tourmentés. « La BU est un peu l'emblème du campus, nous indique Laurent Matejko, chef de projet Learning center et responsable du service public ; c'est le tout premier bâtiment du campus, construit dans les années 1960 (1965) selon les plans de l'architecte Noël Le Maresquier (\* 06.08.1903 Paris – + 20.10.1982 Paris) ».

Original, le plan du campus se veut être une sorte de cellule dont la BU représente le noyau et les autres secteurs les organites. Visiblement passionné par le sujet, Laurent Matejko poursuit : « le bâtiment a une conception singulière, panoptique, ce qui signifie qu'on a une vue à 360° à l'intérieur et sans mur porteur. Seuls des pylônes de sécurité soutiennent l'ensemble ».

Mais si le projet architectural est intéressant, il masque mal ses lacunes. « D'une part, le bâtiment n'est plus aux normes techniques et d'autre part, cette bibliothèque n'a absolument pas été conçue pour les besoins pédagogiques des étudiants d'aujourd'hui, déplore Laurent, par exemple, nous n'avons pas assez de prises électriques pour que chacun puisse brancher son ordinateur et le travail en équipe n'est pas facilité ». ....

Un learning center est une « place to explore and to stay », un lieu de rencontre entre plusieurs pratiques, entre des étudiants, le « grand public » et les professionnels de la documentation et de l'apprentissage. « On y reste pendant des heures pour travailler seul ou en groupe ou boire un coup avec un professeur ». Suivant cette définition et avec une ambition non dissimulée, Laurent Matejko et ses collègues ont « travaillé avec pôles de compétitivité et développé une stratégie de diffusion de la Culture de l'Innovation dans un campus qui a 40 ans d'histoire scientifique. C'est le fil d'Ariane entre les différentes fonctions que nous souhaitons développer ». ....

Avec une enveloppe de 35 millions pour réhabiliter ce bâtiment, transformer ses fonctions, et éventuellement l'étendre, « nous sommes la plus grosse opération du plan campus Lille, le troisième projet français le plus cher de la dernière décennie en termes de bibliothèques. Au niveau européen, nous nous situons dans la fourchette classique de coût des learning centers, qui se situe entre 25 et 50 millions d'euros ».....

En clair, le learning center sera un « lieu de test vis-à-vis du public » avec le recours à la technologie RFID pour le prêt des livres ou l'insertion de flash codes sur les lieux d'exposition pour développer l'autonomie des usagers et étendre l'usage des smartphones.

Et l'offre se prolongera également sur le web. « Dans le cadre du réseau des learning center régionaux, nous sommes invités à mettre en place un learning center virtuel, annonce Laurent Matejko, son aspect et ses contenus étant encore à définir ».

En attendant, la BU va bientôt lancer un futur blog d'information sur les travaux, proposer des renseignements en ligne, étendre ses ressources virtuelles comme sa base d'annales de sujets d'examens (consultée plus de 300 000 fois par an) et celles à destination de La Recherche. « Le changement n'est pas révolutionnaire mais le saut sera néanmoins important culturellement parlant ».....

(<http://www.knowtex.com/blog>)

Die bisherige Bibliothek der Université Lille 1 in Villeneuve d'Ascq, ein emblematischer, kreisrunder Bau, war Mitte der sechziger Jahre von dem Le-Corbusier-Schüler Noel Le Maresquier als Zentrum des damals neuen Uni-Campus errichtet

worden. Die in die Jahre gekommene Bibliothek soll mit ihrer Zeichenhaftigkeit erhalten, räumlich und städtebaulich aber neu interpretiert und durch weitere Inhalte ergänzt werden. Unter dem Titel „Innovation“ soll das Gebäude zum neuen „Learning Center“ werden – ein Begriff, der erstmals mit dem Rolex Learning Center in Lausanne breitere Kreise zog. Den dafür ausgelobten Wettbewerb hat das Büro Auer+Weber+Assoziierte (München) jetzt gewonnen. Die Architekten stellen das bestehende Gebäude auf einen neuen „Landschaftssockel“. Er bildet nach Westen die klare Kante einer urbanen Platzsituation, die zur Schnittstelle zwischen Learning Center und dem benachbarten Kulturzentrum wird. Als Ort der Kommunikation bietet der Platz neuen Raum für das studentische Leben auf dem Campus.

Die Organisation des Zuganges und der neuen Funktionseinheiten unterhalb des Plateaus macht „Neu“ und „Alt“ ablesbar: Eine konzentrische Lichtfuge setzt den Landschaftssockel vom bestehenden zylindrischen Baukörper ab und überhöht durch ihr Streiflicht die Koexistenz zwischen dem alten und neuen Bauteil. Eine großzügige Halle vom Eingangsniveau bis ins oberste Geschoss verbindet beide miteinander. Dabei wird die bestehende Fassade nicht durchbrochen.

Die Grundform des Bestandes – die Geometrie des Kreises – dient als Gestaltungsprinzip im Zusammenspiel von Alt- und Neubau. Die Kreisform wird vervielfältigt, addiert, skaliert und gegeneinander versetzt. Dabei entstehen Zwischenräume mit verschiedenen Funktionen, architektonischen Ausprägungen, unterschiedlichen Tiefen und Lichtstimmungen.

„Unser Entwurf skizziert eine Wissenslandschaft, die sich um eine zentrale Halle als kommunikativer Ort organisiert“, erläutern die Architekten. „Verschiedenste Lernsituationen gehen fließend ineinander über und schaffen Zwischenräume, die multifunktional genutzt werden können und die sich der Besucher auf verschiedene Weise aneignen kann.“

Die Fertigstellung des neuen Learning Center mit seinen 7.300 Quadratmetern Nutzfläche wird für September 2015 erwartet. (<http://www.baunetz.de>)

#### **Chinesisches Kulturzentrum (Bibliothek), Berlin – Germany 2007**

Bauherr: Grundstücksgesellschaft Köbis Dreieck, Nutzer: Volksrepublik China, vertreten durch die Botschaft der VRC in Berlin  
Ausstellungs- und Veranstaltungsräume, Lehrküche, Bibliothek, Sprachlabore, Seminar- und Schulungsräume, Büros, Realisierung 2005-2007/BGF 2.511qm

Der chinesische Staatspräsident Hu Jintao und Bundeskanzler Gerhard Schröder haben am 11. November 2005 in Berlin den Grundstein für das erste chinesische Kulturinstitut in Deutschland gelegt. Das 8 Millionen Euro teure Projekt wird von dem Berliner Architekturbüro Augustin und Frank realisiert. Der Bau entsteht im Köbis-Dreieck in der Klingelhöferstraße zwischen den Hoffjäger-Palais und der Zentrale von KPMG (BauNetz-Meldungen 12. 4. 2005 und 18. 2. 2005). Die Einrichtung dient der Vermittlung der chinesischen Kultur in Deutschland. Augustin und Frank sehen hierfür einen fünfgeschossigen Bau vor, dessen Fassade mit einer Natursteinverkleidung und Fensterbändern gestaltet werden soll. Im ersten Obergeschoss, in dem sich eine Bibliothek befinden soll, wird die Natursteinfassade jedoch nur von dünnen Fensterlisenen geschlitzt. Im Erdgeschoss werden öffentliche Funktionen wie ein Ausstellungsfoyer, ein Mehrzweckraum und ein Buchladen untergebracht. Das dritte und vierte Stockwerk soll Schulungsräume beherbergen. In das Dachgeschoss wird die Verwaltung einziehen. Im Frühjahr 2007 soll der Bau fertig gestellt sein. (Augustin)

## **AV 1 Architekten (Butz Dumjovic Schannè Urig), Kaiserslautern – Germany**

<http://www.av1architekten.de>

### **Schillerbibliothek Berlin – Germany on design**

#### **1. Preis und Beauftragung**

Die Schiller-Bibliothek in der Nähe des denkmalgeschützten Rathauses ensembles von Fritz Bornemann (\*1912-+2007- Amerika-Gedenkbibliothek 1951-1955, Universitätsbibliothek Bonn 1961) soll erweitert werden. Das Ergebnis des dazu ausgeschriebenen Wettbewerbs wurde am Montag bekannt gegeben. Unter Vorsitz der Dresdner Architektin Canan Rohde-Can entschied sich die Jury unter 20 eingereichten Entwurfsvorschlägen für folgende Preisträger:

1. Preis: AV1 Architekten Butz Dumjovic Schannè Urig (Kaiserslautern)

2. Preis: Klaus Block Architekten (Berlin)

3. Preis: Peter W. Schmidt Architekten (Berlin)

Anerkennung: gmp Generalplanungsgesellschaft, Meinhard von Gerkan, Stephan Schütz zusammen mit Rehwaldt Landschaftsarchitekten (Dresden)

Anerkennung: Eckert Negwer Suselbeck Architekten (Berlin)

Anerkennung: e2a Wim & Piet Eckert (Zürich)

Der Siegerentwurf von AV1 Architekten Butz Dumjovic Schannè Urig schlägt einen abgestuften Gebäuderiegel vor, der sich über die gesamte Grundstückstiefe erstreckt. Zwischen diesem Neubau und dem bestehenden Kubus formt sich ein schmaler Grünstreifen zur Naherholung, durch den sich ein kleiner Weg schlängelt. Dahinter liegt das zwölfgeschossige Rathausgebäude aus der Nachkriegszeit. Auf die klaren, horizontalen Linien des Rathauses und die Transparenz des ehemaligen Sitzungssaals, der zu drei Seiten vollständig verglast ist, reagiert die Fassade des Neubaus mit einer großzügig verglasten Fassade, die durch in der Tiefe verspringende Fensterelemente für eine verspielte Transparenz sorgen sollen. Für den Neubau mit knapp 1.800 Quadratmetern Hauptnutzfläche ist ein Budget von über vier Millionen Euro vorgesehen. Die Bauarbeiten sollen 2012 beginnen. Die später vorgesehene Erweiterung zu einer Bezirkszentralbibliothek ist mit einer Nutzfläche von insgesamt 6.000 Quadratmetern ausgeschrieben. (<http://www.baunetz.de>)

### **Zentrum für Bioinformatik, Universität des Saarlandes Campus, Bibliothek, Saarbrücken - Germany 2009**

Bauherr: Saarland, vertr. durch Landesamt für Zentrale Dienste – Amt für Bau und Liegenschaften, Saarbrücken

Das Zentrum für Bioinformatik mit den Funktionen Institutsgebäude, Hörsaal und Bibliothek fügt sich mit seinen drei Einzelbaukörpern locker in den Campus ein, indem es das vorhandene Wegenetz aufgreift und den vorhandenen Bestand mit den Neubauten ergänzt. Gebäude, Freiräume, Höfe, Atrien in oder von Baukörpern gefasst, schaffen Orte der Begegnung aber auch der Konzentration. Die drei Hauptfunktionen bleiben eigenständig erlebbar und sind doch homogen. Das klare funktionale Konzept

erleichtert die innere Orientierung und wird durch wechselnde Ein- und Ausblicke gestärkt. Öffentliche und teilöffentliche Flächen sind von den gestapelten und zonierten Bereichen der Wissenschaftler getrennt, ohne an Kommunikationsfähigkeit zu verlieren. (<http://www.aksaarland.de>)

Nachdem das Büro AVI Architekten aus Kaiserslautern den Realisierungswettbewerb für das neue Forschungsinstitut für Bioinformatik an der Universität Saarbrücken gewonnen hat, erfolgte im November 2006 der Spatenstich. Die Bauarbeiten an den Hochschulgebäuden verzögerten sich jedoch durch die Insolvenz einer Baufirma. Am 11. September 2008 war nun das Richtfest für den Baukomplex, der drei verschiedene Funktionsbereiche beherbergen wird: das Institutsgebäude für Informatik und Bioinformatik, einen Hörsaal sowie eine Bibliothek. Die einzelnen Baukörper sollen locker in den Campus eingefügt werden, indem das vorhandene Wegenetz aufgegriffen und der vorhandene Bestand mit den Neubauten ergänzt wird. Die Architekten beschreiben ihren Entwurf so: „Gebäude, Freiräume, Höfe, Atrien in oder von Baukörpern gefasst, schaffen Orte der Begegnung, aber auch der Besinnlichkeit. Die drei Hauptfunktionen Bibliothek, Hörsaal und Institut bleiben eigenständig erlebbar und sind doch homogen. Das klare funktionale Konzept erleichtert die innere Orientierung, die durch die wechselnden Ein- und Ausblicke noch verstärkt wird. Öffentliche und teilöffentliche Flächen sind von den gestapelten und zonierten Bereichen der Wissenschaftler getrennt, ohne an Kommunikationsfähigkeit zu verlieren.“ Das Ensemble aus drei Baukörpern umfasst etwa 7.400 m<sup>2</sup>. ### **Libraries:**

#### **Stadtbibliothek Anna Seghers, Stendal - Germany 2012**

Innenraumgestaltung: Katrin Köstler, Leipzig

Bauherr : Hansestadt Stendal, Fertigstellung: 2012

Per Stadtratsbeschluss wurde dem alten Franziskanerklostergebäude ein Neubau nebenangestellt. Dieser war im Erdgeschoss für Vorträge, Konzerte und Ausstellungen konzipiert, im Obergeschoss konnte die beengte Fläche der Bibliothek erweitert werden. Dieser Backsteinneubau wurde am 9. Januar 2012 eröffnet.

Die Umgestaltung der bestehenden Stadtbibliothek wurde möglich mit Mitteln aus dem Konjunkturpaket. Es galt, zwei Bibliotheken der Hansestadt an einen gemeinsamen Standort zu verlegen. Ziel war, an das historisch wertvolle Ensemble des Refektoriums einen Erweiterungsbau anzufügen und dort neue Räumlichkeiten zu gewinnen. Die hierzu gelungene Lösung des Architekturbüros Bach/Schwarzbrunn/Zabries aus Stendal durften wir innenarchitektonisch mit Farben und Materialien und denkmalgerecht begleiten. (<http://www.bdia.org/el182/e300/projects3054>)

### **Literature:**

Schwäbisches Tagblatt, 19.02.2011

db Deutsche Bauzeitung, Vol. 145, 2011, 5, pp. 19 - 24

Michael B. Frank hat Mut. Einen 50 Meter langen Spalt ließ er in die Decke des Erdgeschosses brechen und eine himbeerrote Rampe bauen. Vom Parterre steigt sie in die erste Etage. Freitragend, mit nur einer V-Stütze. Eine Brücke von der Düsternis ins Licht, von der Gruft zum Himmel. Klare, schnörkellose Linien: wie kunstvoll gefaltetes Papier wirkt die Brüstung des westlichen Treppenhauses. Die niedrige Halle, sagt der Architekt, hatte etwas „Gruftiges“. 30 Meter breit, aber kein Lichtstrahl drang in ihre Mitte. Niemals hätte das Erdgeschoss zeitgemäß genutzt werden können! Jetzt flutet das Tageslicht aus den Oberlichtern und Fensterreihen der ersten Etage durch den Deckenschlitz, erleuchtet das weiträumige Foyer und öffnet zugleich den Blick hinauf zu den verglasten Arkaden und zum Tonnendach. Viel Licht strömt von oben ins Parterre. Entlang der Arkaden wurde der Boden des ersten Geschosses geöffnet und die Rampe mit roter Brüstung eingebaut. Es war ein gewaltiger, der größte Eingriff in die Substanz, den Frank keck mit Rot unterstrich. Aber die geöffnete Decke brachte dem Erdgeschoss „einen neuen Lebensschub“, betont der Architekt. „Und nicht ein einziges Mal sagte der Statiker: Geht nicht!“. Ein funktionalistischer Ansatz, so wie er sich seit jeher in der Tonnenhalle ausdrückt. Ein gestreckter Industriebau, in dem ehemals nicht weniger als elf Drucktische, jeweils 65 Meter lang, nebeneinanderstanden. Der Architekt Manfred Lehbruck (1913 Paris – 1992 Stuttgart), Sohn des berühmten Bildhauers Wilhelm Lehbruck, schuf 1950/51 die Tonnenhalle als Druckerei samt Farbküche und Ateliers für die Textilfabrik Pausa. Dieser klaren, geometrischen Formensprache, die sich aus der Funktion ergab, folgte Michael B. Frank bei der Sanierung des Gebäudes. Die Büros der Diakonie Sozialstation an der Nordseite und des Regionalverbands südwärts umschließen das Foyer wie eine Schale. Nur mit Glaswänden sind sie davon getrennt. Da die Fenstersimse der Büros zu hoch sind, um sitzend hinauszuschauen, wurden die Räume um 45 Zentimeter erhöht. Im Foyer bildete sich dadurch ein Podest, das als Bank genutzt werden kann, genauso als „Spielwiese“ für Aktionen oder Ausstellungen. Licht strömt nicht nur die Rampe hinunter. An der westlichen Schmalseite der Halle ist eine Wand aus mattiertem Profilglas konstruiert, die von innen beleuchtet wird. Im Raum stehen zwei große Glasblöcke, die genauso funktionieren. „In der großen Kiste ist aber noch eine kleine Kiste“, erklärt der Architekt. Die Leuchtkörper verbergen in ihrem Inneren Toiletten. Und die Sockel sind mit Gitter verkleidet. Im Brandfall öffnen sich wärme gedämmte Lamellen. So gelangt nachströmende Luft ins Foyer, durch einen großen Tunnel, der unter dem Gebäude gegraben wurde, an der Jakobstraße auftaucht und mit Sitzbänken überbaut wurde. Im Erdgeschoss der Tonnenhalle hat auch ein Vortragsraum für 80 Personen seinen Platz, der angemietet werden kann. In weißen Schränken sind Teeküche und Garderobe versteckt. Gegenüber hat die ehemalige Farbküche die Sanierung überdauert – mit den Waagen für die Farbmischungen und den Zuleitungen für die Druckfarben. Mit Glaswänden ist sie umschlossen wie eine überdimensionierte Vitrine. „Die Farbküche hat den Charakter, als ob die Spätschicht gerade vorbei wäre“, findet der Architekt. Die Spuren der Produktionsgeschichte sollten nicht verloren gehen. Im Erdgeschoss hängen einige alte Rohre, mit Gipsverband umwickelt, Armaturen und Uhren aus den 1950er Jahren. Und einzelne historische Heizkörper, die tatsächlich warm sind. Nicht nur die Rampe, auch die abgetretenen Werkstreppen führen ins Obergeschoss. Weil die Geländer zu niedrig waren, ließ Frank zusätzlich weiße Blechtafeln aufsetzen. Am westlichen Treppenhaus scheint die Brüstung gefaltet wie Papier – wie kunstvolles Origami. Einer strengen Harmonie folgt der Architekt. Deshalb bleibt die Technik unsichtbar. Nirgendwo stören Kabelpritschen oder abgehängte Decken die imposante Raumwirkung. Nichts soll von den klaren Linien, der rhythmischen Gliederung, vom puren Raum ablenken. Im Boden verschwindet die Technik und in Möbeln. Die Kabel der Deckenleuchten führen

sogar aus dem Haus hinaus aufs Dach und wieder hinein. Die Oberfläche der Tonnen hatte „absolute Priorität“, sagt Michael B. Frank. Die raue Maserung, die sich durch die Schalbretter auf den Beton übertragen hatte, sollte unbedingt erhalten bleiben. „Das ist eine Handwerkstechnik, die fast nicht mehr gemacht wird.“ Auch die historischen Fenster wurden nicht ausgetauscht, aber aufgerüstet, mit Isolierglas und Sonnenschutz versehen. Im ersten Geschoss gestaltet das Licht den Raum. Fensterbänder in den Fassaden, Oberlichter in den Tonnenschalen öffnen den Baukörper, machen ihn transparent und schwerelos. In diesem späten Abkömmling der klassischen Moderne vereinen sich Glas, Beton und Stahl. Arkaden trennen die riesenhafte Halle längs in zwei Hälften und erinnern an einen historischen Bahnhof. Für die südliche Hallenhälfte sucht die Stadt noch einen Mieter. Im Norden breitet sich die Stadtbücherei aus. Vor ihren Pforten endet die Rampe in einer dynamischen Rundung und zieht sich als Brüstung entlang des Luftraumes. Die Sichtachsen durchmessen fast die gesamte Hallenlänge. Überall Durchblicke, Ein- und Ausblicke – zum Innenhof, zu den Hügeln der Alb, über die Dächer der Stadt. Medienbearbeitungsraum, Büro der Büchereileiterin und Lesesalon sind deshalb ausschließlich an den Hallenenden platziert. So wie auch die historische Toilette, vier Meter hoch, Klos mit schwarzem Ring und Kette am Spülkasten. Bücherregale und Leseinseln gliedern die Halle, ohne sie zu verbauen: eine mächtige Rundbank für Kinder, eine Sitzecke für Erwachsene, gemütliche Lümmelkissen für Jugendliche. Orte, um sich zurückzuziehen, um ungestört in Geschichten einzutauchen. Ausleihtheke und Schränke in Weiß wirken wie gestrandete Eisblöcke. Auf einem Betongitter mit Glasbausteinen, die Licht ins Erdgeschoss lenken, thront das Lesecafé mit Stühlen des Bauhaus-Designers Charles Eames. Wie überhaupt das Mobiliar – Schalensitze und Elefantenhocker – die 1950er Jahre aufscheinen lassen. Die Sitzmöbel der Bücherei tragen kräftige Farben, vorwiegend Rot und Orange. Ansonsten sind die Töne dezent gesetzt. Silber, Weiß, Schwarz. „Wir haben übernommen, was aus dem Haus kam“, sagt Frank. Konsequenz folgte er der klaren Handschrift des Architekten Manfred Lehbruck, um den Charakter der Tonnenhalle zu erhalten. „Es ist eine wertvolle Fläche“, sagt Michael B. Frank über das Pausa-Areal. Das vollendete Werk mache alle glücklich, selbst die Handwerker. „Es ist ein tolles Gefühl.“ Und doch verspürt er Wehmut. „Ich werde die Pausa vermissen.“ (<http://www.tagblatt.de>)

### **Baum Kappler Architekten Gesamtplaner GmbH, Nürnberg – Germany**

Unser Architekturbüro besteht seit über 100 Jahren. Im Jahr 1907 von Robert L. Kappler in Hersbruck gegründet, wurde unser Büro von Eduard Kappler zunächst in Lauf/Pegnitz und dann im Zuge des Wiederaufbaus 1946 am Standort Nürnberg weiter ausgebaut. Seit dem Eintritt von Dietrich Kappler 1976 haben wir unsere Kompetenz kontinuierlich fortentwickelt. Mit Andreas Baum als Partner gestalten wir seit 2008 gemeinsam mit unseren engagierten Mitarbeiterinnen und Mitarbeitern die baulichen Herausforderungen in der Metropolregion Nürnberg mit, seit 2011 als baum-kappler architekten gmbh.

Das Raumkonzept der ältesten städtischen Bibliothek im deutschen Sprachraum wurde zuletzt 1978 auf Grund denkmalpflegerischer Auflagen an den vorgegebenen Räumen ausgerichtet, sodass nicht immer bibliothekarische Ideallösungen möglich waren. Aufgrund mittlerweile überalterter Ausstattung und Haustechnik ist eine Generalsanierung der denkmalgeschützten Bestandsgebäude vorgesehen. Zudem wird eine räumliche Erweiterung durch einen Neubau realisiert. (Kappler)

### **Becher Rottkamp, Berlin – Germany**

<http://www.becher-rottkamp.de>

**Libraries:**

**Zentralgebäude Fachhochschule Potsdam, Bibliothek, Potsdam – Germany 2009**

Bauherr: Land Brandenburg, Projektdaten: BGF 9838 m<sup>2</sup>

Das Zentralgebäude der FH Potsdam bildet das Herzstück des Campusgeländes. Das multifunktionale Gebäude beinhaltet eine Mensa mit Großküche, eine Cafeteria, zwei Hörsäle, die Bibliothek der Fachhochschule, die zentralen Dienste, Theaterwerkstätten und einen Konferenzbereich. Alle Nutzungen gruppieren sich um ein zentrales Foyer, welches gleichzeitig als Ausstellungs-, Repräsentations- und Kommunikationsbereich dient. (Becher)

Schon etliche Monate früher als geplant haben die Potsdamer FH-Studenten ab morgen mehr Lebens- bzw. Studierqualität auf ihrem Campus in der Pappelallee: Das neue Hauptgebäude, entworfen vom Berliner Architekturbüro Becher und Rottkamp (siehe BauNetz-Meldung zum Richtfest vom 16. März 2007) bietet auf drei Ebenen zwei zusätzliche Hörsäle mit 250 bzw. 120 Plätzen und eine neue Bibliothek. Ebenfalls sind im Neubau mit 5.000 Quadratmetern Nutzfläche Theaterwerkstatt sowie Mensa und eine Cafeteria untergebracht. Damit hat die FH eine neue Repräsentanz. Der alte FH-Sitz weicht der Neustrukturierung der Potsdamer Stadtmitte am Alten Markt im Zusammenhang mit dem Wiederaufbau des im Krieg zerstörten und danach abgerissenen Stadtschlösses. Alle Nutzungen gruppieren sich um ein zentrales Foyer, welches gleichzeitig als Ausstellungs-, Repräsentations- und Kommunikationsbereich dient. Die öffentlich zugängliche Mensa verfügt über 235 Plätze. Die Cafeteria, die auch samstags und bis in die Abendstunden geöffnet sein wird, bietet zusätzlich 105 Plätze. Auf 2.600 Quadratmetern befindet sich nun eine neu sortierte Bibliothek mit modernen Schulungs- und Computerräumen, deren lichte Architektur zum Arbeiten mit vielfältigen Medien einlädt. Eine Besonderheit ist der Mitarbeitertrakt in der Mitte der Bibliothek, der die Kommunikation zwischen Nutzern und Bibliotheksverantwortlichen erleichtert. (<http://www.baunetz.de>)

### **Auszeichnung Guter Bauten BDA BaWü 2005**

Durch die Aufteilung in 2 Gebäude können lebhaft und ruhige Zonen voneinander getrennt werden. Im Nordbau (wegen seiner geschwungenen Fassade auch "Banane" genannt) befindet sich der kommunikative Bereich: EG mit Verbuchungstheke, Lesecafé mit Zeitschriften. 1. OG: Internet-Bereich mit AV-Medien. Über einen Glassteig kommt man in den Südbau ("Bücherkiste"). Hier befindet sich der ruhige Kernbereich (Bücher, CDs; Filme, Sachmedien). Der hohe Anspruch der Architektur spiegelt sich in beiden Gebäudeteilen auch in der Einrichtung wieder. Sorgfältig ausgewählte oder speziell angefertigte Möbel vermitteln ein stimmiges Gesamtbild. Für die Kinderabteilung wurde das Spielmöbel "Wiesenland" von der FH für Innenarchitektur in Stuttgart gefertigt. (<http://www.bibliotheksportal.de>)

### **Neukonzeption Gottfried-Wilhelm-Leibniz-Bibliothek, Hannover – Germany 2011 - 2013**

Bauherr: Staatliches Baumanagement Hannover, 7 Mio. €, 1. Preis Wettbewerb, VOF-Verfahren

Das Bibliotheksgebäude wurde 1976 als freistehende Stahlbetonkonstruktion, bestehend aus den vier Gebäudeteilen Katalogsaal- und Lesesaalgebäude sowie Magazin und Verwaltung an der Kreuzung Schützenstrasse / Waterloostrasse erbaut. Es ist in seiner äußeren und inneren Gestalt ein deutliches Zeugnis zeitgenössischer Architektursprache mit strukturgebenden Brettschalung des Sichtbetons und dem dunkel eloxierten Aluminium.

Die Unterbringung des Raumbedarfs wird nahezu ausschließlich durch den Umbau des Bestands gewährleistet. Eine Ausnahme stellt die Erweiterung des vorhandenen Foyers dar. Diese ist geplant, um die problematische Außenwirkung der vorhandenen Eingangssituation zu verbessern und gleichzeitig die energetischen Schwachpunkte zu beseitigen. Das EG mit seiner Flächenerweiterung unterteilt sich in den gesicherten Bibliotheksbereich und die öffentlich zugängliche Zone mit Garderobe und der Akademie für Leseförderung. Das 1.OG des Katalogsaalgebäudes wird so hergerichtet, dass die Präsentation der Bestände und Exponate in raumbildenden Elementen erfolgt. Neben der Ausstellung wird ein Vortragsaal und eine Cafeteria eingerichtet.

### **Herzog August Bibliothek Wolfenbüttel – Germany 2013**

Wettbewerb, 1. Preis, Bauherr: Staatliches Baumanagement Braunschweig, € 8 Mio

Der Neubau des Magazinegebäudes und das Servicegebäude bilden im Zusammenspiel mit der Bibliothek und dem Direktorenhaus eine Hofsituation, die sich durch ihre Proportion und Abstände auszeichnet. Der Verbindungsgang zwischen Bibliothek, Servicegebäude und Magazin bildet eine schützende Klammer um das Direktorenhaus und hält einen respektvollen Abstand. Basierend auf der Idee der berühmten alten, 1890 abgerissenen Bibliothek, die unter Leibniz 1705 entstand, sollten die Bücher wieder architektonisch zur Geltung gebracht werden. Heller, stehender Klinker, dunkel verfugt, symbolisiert die pergamentgebundene Büchersammlung des Herzog- August. Die Klinker werden in der Fassade in unterschiedlich große Felder gegliedert analog der Gliederung des Buchbestandes in 20 verschiedene Sachgruppen. (Becker)

### **KulTourKate Schöneiche, Gemeinde Schöneiche bei Berlin – Germany 2012**

Bauherr: Gemeinde Schöneiche bei Berlin, € 1,4 Mio

Die Gemeinde Schöneiche bei Berlin errichtet ein Kulturzentrum, welches u.a. die Gemeindebibliothek, das Archiv der Ortschronisten sowie das Kultur- und Tourismusmanagement beherbergt. Im Rahmen der Neugestaltung des Eingangs zur Dorfau bildet der Neubau der KulTourKate das vermittelnde Gelenk zwischen zeitgenössischer Architektur des Rathausesneubaus und der vorhandenen Bausubstanz an der historischen Dorfau. Hierbei werden Gliederung und Struktur der bestehenden Gebäude aufgenommen und in moderne Architektur übersetzt. Die klare Gliederung des Gebäudes ist am Baukörper sowie in der Grundrissgestaltung abzulesen. Nach Betreten befindet sich der Besucher in einem Raum in dem die einzelnen Funktionsbereiche nicht räumlich getrennt sind, sodass ein offener Gesamteindruck entsteht. Das Projekt ist als Niedrigenergiehaus geplant. Brandschutz wurde so geplant, daß bei geringem Aufwand das Großraumkonzept realisiert werden kann. (Becker)

Zunächst hatte die Gemeinde lediglich geplant, eine neue Bibliothek zu bauen. Da es für eine solche keine Fördermittel gegeben hätte, wohl aber für ein Gebäude mit kultureller und touristischer Nutzung, wurde das Konzept im Herbst 2009 geändert. Das Rathaus, das direkt neben der KulTourKate geplant ist, muss aus Eigenmitteln gezahlt werden. (<http://www.moz.de>)

### **Bauhaus Bibliothek Dessau, Dessau – Germany 2008 - 2011**

Bauherr: Landesbetrieb Bau Land Sachsen-Anhalt, Niederlassung OST, € 3,2 Mio

Die Stiftung Bauhaus Dessau erhält gemeinsam mit der Hochschule Anhalt eine Bibliothek in unmittelbarer Nachbarschaft des Bauhauses. Die neue Bibliothek findet ihren Platz in einem 1963 errichteten ehemaligen Tanzcafé und wird zum Bauhausgebäude durch einen Neubau ergänzt. Das Tanzcafé ist ein nur noch seltenes Zeugnis zeitgenössischer Architektur der ehemaligen DDR und fand in Gestalt und städtebaulicher Einfügung die Zustimmung durch Walter Gropius. Die 1969 einsetzenden Erweiterungen und Umbauten zerstörten die sensible Einordnung in den Kontext. In Absprache mit Stadtplanung und Denkmalpflege wurde der Rückbau der Erweiterung der Planung zugrunde gelegt. Der zum Bauhaus hingewandte Neubau, mit seiner von geglättetem Putz und opakem Glas bestimmten zurückhaltenden Erscheinung, wirkt als städtebauliches Gelenk zwischen Werkstattbau des Bauhauses und dem Bestandsgebäude. Im Rahmen der Energieoptimierung wird die Hülle des Bestandes in Abstimmung mit dem Landesamt für Denkmalpflege hocheffizient gedämmt und die Dachfläche des Werkstatt- und Lesebereichs unter Berücksichtigung der Sicht aus dem UNESCO-Weltkulturerbe mit micromorphen Solarzellen der jüngsten Generation ausgestattet. Diese Maßnahmen sind Bausteine der Energetischen Sanierung der Gebäude der Stiftung Bauhaus Dessau. (Becker)

Dessau-Roßlau erhält eine neue Bibliothek. Um die Bestände der Stiftung Bauhaus Dessau und der Hochschule Anhalt (FH) aufzunehmen, wird eine ehemalige Kaufhalle aus DDR-Tagen umgebaut. Sie entstand 1961/62 in unmittelbarer Nachbarschaft zum Bauhausgebäude und beherbergte auch ein Tanzcafé. Nach der Wende gerieten die architektonischen Qualitäten des Gebäudes

durch Umbauten und Leerstand in Vergessenheit. Architekt **Hermann Rey** griff bei der Gestaltung der Hauptansichten nicht nur gekonnt auf zentrale Elemente der Bauhausarchitektur von Walter Gropius zurück, sondern erwieh auch den internationalen Strömungen der damaligen Architektur seine Referenz. Rey dynamisierte und aktualisierte die vormalig streng kubische Sachlichkeit der Bauhaus-Moderne. Mit dieser Mischung aus Zitaten der klassischen Moderne und aktuellen Tendenzen spiegelt die Dessauer Bauhaus-Kaufhalle mustergültig den Zeitgeist der frühen 1960er Jahre. Darüber hinaus war und ist das Gebäude gerade durch die Nachbarschaft zum Bauhausgebäude – dem Sinnbild einer universellen Moderne schlechthin – auch ein einmaliges Dokument der Hoffnungen und Sehnsüchte, aber auch der Widersprüche und Ambivalenzen im geteilten Nachkriegsdeutschland.  
(<http://www.dbz.de>)

### **Stadt- und Landesbibliothek Volkshochschule Potsdam – Germany 2009 – 2010**

Wettbewerb, 1. Preis, Bauherr: Kommunaler Immobilien Service KIS, Landeshauptstadt Potsdam, € 12,5 Mio

Der Wissenspeicher der Landeshauptstadt ist ein Zusammenspiel zweier wichtiger Institutionen – Bibliothek und Volkshochschule. Das Gebäude aus dem Jahr 1974 war eine der modernsten Bibliotheken der ehemaligen DDR. Nach Rückbau bis auf die Grundstruktur erhält das Gebäude einen den Anforderungen entsprechenden hochtechnisierten Ausbau. Die Fassade, welche die Assoziationen an ein Bücherregal erweckt, entspricht engergetisch höchsten Standards. Funktionseinheiten der Bibliothek wie Ausleihe, Vortragssaal oder Freitreppe werden in ihrer radialen Formensprache in die vorhandenen Strukturen gestellt. Es entsteht ein umfassendes Raumerlebnis, welches sich durch seine Offenheit auszeichnet und somit dem Geist eines öffentlichen Raumes entspricht. (Becker)

### **Bibliothek Fachhochschule Brandenburg, Brandenburg an der Havel – Germany 1996**

Bauherr: Brandenburgischer Landesbetrieb für Liegenschaften und Bauen Niederlassung Potsdam, 3,1 Mio. €

Die Ästhetik der denkmalgeschützten ehemaligen Remise ist geprägt durch eine Tragstruktur aus gusseisernen Stützen, Sandsteinkapiteln und Kreuzgewölben. Durch Freistellen und sensibles Ergänzen dieser Struktur wurde die Grundlage des Entwurfes geschaffen. Die Fassade hingegen, die durch Aufstockung des Gebäudes in den dreißiger Jahren des letzten Jahrhunderts ihre Proportion verloren hatte, wurde deutlich verändert. Die kleinen Fenster im Erdgeschoss wurden durch größere Elemente ersetzt, so dass ein Sockelgeschoss ablesbar wurde, das die Fassade eindeutig gliedert. Das Winkelgebäude wurde klar gegliedert: ein Haupt- und ein Nebenflügel. Der Hauptflügel wurde durch völligen Verzicht auf Einbauten und Trennwände flächig betont. Hier kommt die bemerkenswerte Ästhetik der Tragstruktur deutlich zur Geltung. Es entstanden der großzügige Foyerbereich, die darauf folgende Freihandzone und der im Obergeschoss liegende Lesesaal mit einem großen Oberlichtband. Im Westflügel wurden sämtliche Funktionen untergebracht, die nur geringen Raumbedarf benötigen. Das Ergebnis ist ein sensibel saniertes Gebäude, in dem die neue Nutzung mit der vorhandenen Struktur eine Symbiose eingeht. (Becker)

### **Hörsaalgebäude mit Campus Bibliothek, Universität Leipzig – Germany 2003 - 2009**

120.041 m<sup>2</sup> (BRI), 25.816 m<sup>3</sup> (BGF), € 34.000.000

#### **Literature:**

Bauer Charlotte, Ute Stephan, Tag und Nacht in der Bibliothek. Wie aus einer Bibliothek der 1970iger Jahre an der Universität Leipzig ein moderner Lernort wurde, in: B.I.T. online. Zeitschrift für Bibliothek, Information und Technologie, Jg. 13,2010,3,pp. 317-319

03.11.2009, Books around the Clock, Unibibliothek in Leipzig fertig

Am vergangenen Freitag, 23. Oktober 2009, wurde unter dem Motto „Books around the clock“ die Bibliothek der Universität Leipzig am Campus Augustusplatz feierlich eröffnet. Die Planungen für den Neu- und Umbau der Bibliothek stammen von dem Münsteraner Büro Behet Bonzio Lin Architekten, das den gesamten Um- und Neubau des Leipziger Uni-Campus mit Ausnahme des „Paulinum“ plant. Das „Paulinum“ an der Stelle der abgerissenen Universitätskirche aus der Feder von Erick van Eggeraat soll erst Ende nächsten Jahres fertig werden. Eine Übersicht über die fünf Bauabschnitte der Uni bietet die [BauNetz-Meldung](#) vom 8. Juni 2009 zur Fertigstellung des fünften Bauabschnitts. Der zweite Bauabschnitt beherbergt neben den Hörsälen die jetzt eröffnete zentrale Campusbibliothek in einem Bestandsgebäude. Die Bibliothek wurde durch einen zentralen Lichthof an das Foyer angeschlossen und in die Untergeschosse erweitert. Sie hat durch helle Wandflächen mit Holzeinbauten eine ruhige und konzentrierte Atmosphäre erhalten. (<http://www.baunetz.de>)

Das Hörsaalgebäude ist ein Bestandsgebäude des 1970iger Campus. Die neue Mensa umgreift es und verbindet sich mit diesem zu einem, durch große Lichthöfe gegliederten Hybriden. Das Hörsaalgebäude rückt somit städtebaulich ins zweite Glied. Nach Außen zeigt es sich als Gebäude lediglich zum Innenhof und prägt die Dachlandschaft. In seinem Inneren war es geprägt durch die Backstein verkleideten Foyerwände, sowie den skandinavischen Charme innerhalb der Bibliothek. (Behet)

### **Town Hall, Bad Aibling – Germany 2012**

Client Stadt Bad Aibling, Architect Behnisch Architekten, München, Gross 4.300 m<sup>2</sup> / 46,285 sq.ft, Volume 15.000m<sup>3</sup> / 529,625 cu.ft

In the center of Bad Aibling lies Marienplatz, a historic plaza flanked by public, retail and hotel buildings. It is here that the two main streets of the town intersect and where the existing Town Hall from the 1970s stood. Bad Aibling has decided to construct a new Town Hall as a means by which to further invigorate the center.

The old town hall has been demolished down to the cellar level. The new building has been erected on this floor, respecting the existing load-bearing capacity of the cellar and foundations as well as the existing supply network.

The new hall accommodates primarily public functions. It is designed as a multi-functional venue that will house a variety of programs – including space for citizens' services, administrative offices, meeting rooms, as well as a public library and a registry for weddings – all under one roof. The ground floor level will be further vitalized through the presence of shops and a café transforming this public space into an environment that is lively and engaging after business hours as well.

The entrance of the town hall from Marienplatz leads into an atrium rising over all storeys. From here, visitors can walk through the building and experience it as a public space, a flowing communicative thoroughfare for chance and planned encounters. (Behnisch)

### **City Hall Kolbermoor with Library and Education Center, Kolbermoor –Germany 2010 - 2012**

Client: Stadt Kolbermoor, Gross: 4.465 m<sup>2</sup> / 48,061 sq.ft, Volume: 17.665 m<sup>3</sup> / 623,834 cu.ft

The city of Kolbermoor outside of Munich, plans a new multifunctional City Hall, with citizen's services, a public library, continuing education services, administration, meeting rooms, exhibition spaces, and a special ceremonial room for weddings, all under one roof. The new city hall is designed to be a strong public icon and to create a lively public environment throughout the day and during hours when city administration offices are closed. The building is situated near the historical city center, in an active urban district. This area will act as a link between the heavily trafficked road on the one side and the newly redesigned civic park on the other. The proposed design will house the public areas in a curved two-storey building weaving elegantly into the surrounding landscape. With its inviting, delicate and transparent architecture the building will reach out and connect the Rathausplatz (city commons) with the park, while administration is located above. The Rathausplatz is distinguished by its generous natural stone surfaces and a canopy of overhanging trees offering plenty of shade. Here, residents and business people mingle, festivals are held and a variety of events staged. The Rathausplatz is both, a place to linger and a gateway into the building, the park, and the adjacent canal. The park benefits from its stands of old trees, which structure it spatially and imbue it with character, while its expansive lawns and large trees provide further attractions. Therefore the redesign of the park is restrained to establishing pathways, adding new park furniture, and playground opportunities. (behnisch)

### **Handelskammer Hamburg – Haus im Haus – (Wirtschaftsbibliothek), Hamburg – Germany 2004 - 2007**

Client: Handelskammer Hamburg, Gross: 1,000 m<sup>2</sup> / 10.760 sq.ft.

#### **Awards:**

2008 Building of the year, award presented by the Architekten- und Ingenieurverein Hamburg e.V. (Association of architects and engineers)

2008 Chicago Athenaeum International Architecture Award

2008 Merit Award for Interior Architecture presented by the AIA California Council (AIACC)

2008 BDA Hamburg Architekturpreis – third prize

2008 IIDA's Best of Competition

2008 Winner of the 35th Annual Interior Design Competition organized by the IIDA - International Interior Design Association (1 of 5 winners)

2007 Architectural Lighting Award, Commendable Achievement, Interior Lighting Category

Hamburg's Chamber of Commerce required a more intensive use of their existing neo-classical building on Adolphsplatz. The brief for the 2003 design competition anticipated the introduction of several additional floor levels within the existing Börsenhalle and a structure which respects the fabric of the historic building. The design proposal adds a total of five new levels which occupy a relatively small proportion of the hall in order to preserve its generous spatial character. A business start-up center, consultation, exhibition, club and meeting room facilities for members, guests and visitors are arranged in a sculptural manner. The uppermost level affords access to generous roof terraces and beautiful views out over the roofs of Hamburg through a band of arched clerestory windows. The new structure is composed of layers and planes, where lightness, immateriality and reflection contrast the solid, elaborate walls of the existing building. A variety of fascinating spatial solutions emerge within both the new structure and in relation to the existing building. The light, free-floating character of the new extension is complemented and accentuated by an LED lighting system that was jointly developed by the architects and Nimbus Design. Although not part of the original architectural competition entry, the lighting system was later seen to offer extraordinary potential for special lighting effects. The "House in a House" is the first structure in the world that is completely lit by LED lamps. (Behnisch)

### **Engineering School, Ulm – Germany Renovation and Modernization (Library) – Germany 2000 – 2006**

Client: Staatliches Vermögens- und Hochbauamt Ulm, Gross: 19.500 m<sup>2</sup>

The original design for the "Fachhochschule für Technik" (Ulm Engineering School) in Ulm was completed in 1960-63 by Behnisch & Partner. The project, awarded to the firm based on the 1958 first prize competition entry, was highly innovative in its use of modern prefabricated concrete systems. A construction grid of 3 x 3 m was imposed, but the architects strove to alleviate the rigidity of the system by varying the building elements as much as possible. Good use was also made of the site, an old fortification right outside of Ulm which offered spectacular views and level changes. The subtle interplay of space relieves the rigidity of the system, whose austerity reflects the attitudes of the period. Prefabricated building systems have rarely been deployed in such a highly imaginative manner. In 2004, after 41 years of continuous occupancy, section E, B, as well as the Auditorium of the campus buildings were completely renovated to meet the University's changing needs and to generally bring the buildings' systems up-to-date and in-line with current technology. The 'pre-cast' concrete and glass façade elements were refurbished so as to satisfy the current thermal requirements of the German National Building Code. In order to preserve the original appearance, the pre-cast concrete elements were cleaned, the glazing was replaced, and the exterior shading devices were anodised. In addition, the metal roof and drainage system were renovated. Interior improvements included technical modernisation, asbestos abatement, new partition walls, ceilings, balustrades and finishes with increased insulation values, new flooring based on the original design, a completely new lighting system, and code complying restrooms. Furthermore, the renovation ensures handicapped accessibility. The students' request for more informal meeting spaces was finally satisfied with this renovation. A Cafeteria was integrated in the garden level by relocating the Library on two levels with a new spiral stair case as a connection element. Smaller social areas were added next to the Library, following the original 1960's layout. The Auditorium space was carefully refurbished, preserving the original design while meeting today's demand for audiovisual techniques. (Behnisch)

### **Akademie der Künste in Berlin, Bibliothek – Berlin 2005**

Bauherr: Land Berlin für die Akademie der Künste vertreten durch: Senatsverwaltung für kulturelle Angelegenheiten und Senatsverwaltung für Stadtentwicklung, Architekten: Behnisch & Partner, Stuttgart mit Werner Durth, Darmstadt.

„Ich bin gar nicht erst auf den Gedanken gekommen, da eine Steinfassade zu machen. (...) Und wir wollten schon gar keine Assoziationen an die Großkotzigkeit der Hitler-Architektur und der wilhelminischen Architektur wecken. Wir haben gegen Rücksichtslosigkeit angebaut.“ (Günter Behnisch im Spiegel 20-2005). Der mit allen Spuren seiner wechselvollen Geschichte erhaltene Altbau der Ausstellungshallen sollte wieder seinem früheren Zweck entsprechend hergestellt und durch ein Ensemble von Neubauten umgeben werden. Der Entwurf von 1994 gliedert sich in vier Bereiche: Den Pariser Platz begrenzt – ganz im Sinne der damals von der Senatsverwaltung empfohlenen 'Kritischen Rekonstruktion' – der neue „Kopfbau“ anstelle des zerstörten Palais von Arnim; an ihn schließt nach Süden entlang der Brandwand des westlichen Nachbargebäudes (DZ-Bank/Frank O. Gehry) die „Spange“ mit Räumen für die Abteilungs-Direktoren und Referenten an, die sich im Süden mit dem Archivbau an der Behrenstraße verbindet. Dieses Gebäude wendet sich über einem öffentlichen Durchgang und einem Lesesaal mit einer eher geschlossenen Fassade als „Gedächtnis der Akademie“ dem Denkmal für die ermordeten Juden Europas zu. Das Holocaust-Denkmal und der Pariser Platz sind durch eine als „gläserne Fuge“ gestaltete Wandelhalle zwischen der alten Saalfolge und dem Hotel Adlon miteinander

verbunden, um so mit einer öffentlichen Passage neue stadträumliche Bezüge zu erschließen. Im Zentrum des Ensembles liegen die 1906-1907 gebauten Ausstellungshallen, die als „Fundstücke“ belassen und unter Berücksichtigung denkmalpflegerischer Belange sorgsam restauriert werden sollten: Das Alte wird von Neuem umgeben und bleibt doch als historischer Ort erkennbar. Im Kopfbau zum Pariser Platz liegen über dem Foyer die eher repräsentativen Bereiche wie Plenarsaal und Präsidialebene, in den Untergeschossen eine Experimentierbühne mit großem Zuschauerraum als „black box“. Im Foyer erhebt sich die große Haupttreppe aus dem Erdgeschoss. Eine zentrale Halle mit freien Treppenläufen zwischen Alt- und Neubau verbindet die unterschiedlichen Nutzungsebenen. Ein Bistro leitet über zum Wintergarten, der als Wandelhalle eine Verbindung zur Behrenstraße herstellt. Die Fassade zum Pariser Platz war zu Beginn sehr umstritten, da sie nicht den Vorstellungen der Senatsverwaltung hinsichtlich der 'Kritischen Rekonstruktion' an diesem Ort entsprach. Heute, da sich die Fassade des Hotels Adlon in der Fassade der Akademie spiegelt, und dies wiederum Kritik hervorrief, sagt Behnisch: "Aber das habt ihr doch immer gewollt....". Eine Aufsatzkonstruktion auf einer Pfosten-Riegel-Konstruktion aus geschweißten Stahlprofilen trägt die großen absturzsichernden Verbundglasscheiben. Zur Nordseite des Gebäudes war kein Sonnenschutz erforderlich. An den übrigen Fassaden befinden sich zum Teil außen liegende bzw. innen liegende Sonnen- und Blendschutzvorrichtungen um das gläserne Gebäude vor zu großer Überhitzung zu schützen. Die Problematik der Überhitzung ist derzeit in der Fachwelt umstritten. Die Fassade zur Behrenstraße ist als Putzfassade mit einem mineralischen Anstrich und Lochfenstern ausgeführt worden.

Glas

Als Abschluss des Gebäudes über der Dachterrasse haben sich die Architekten für ein farbig bedrucktes Glasdach entschieden, das mit einem Blattmotiv an die einst auf diesem Grundstück gepflanzten Bäume erinnert und in den Farben den Bezug zu den Fassaden der Nachbargebäude herstellt. Gleichzeitig nimmt dieses farbiges Glasdach über den Schiffstrepfen und Himmelleitern des Lichthofs unter dem Himmel Berlins jene Tradition des Expressionismus in der Architektur auf, die im Freundeskreis der »Gläsernen Kette« 1919 begründet worden war (Werner Durth). Das Glasdach über dem Clubraum (35 m x 20 m) wird von Glasträgern aus VSG 3 x 12 mm TVG mit einer Länge von 5,25 m unterstützt. Die Isolierglasscheiben haben die Abmessungen 5,25 m x 1,60 m. Auf die Glasträger ist ein Edelstahl-Flachprofil zur Aufnahme des Verglasungsprofils aufgeklebt. Das zu Reinigungszwecken betretbare Dreifach-Isolierglas ist eine Sonderanfertigung mit folgendem Aufbau: außen: 10 mm ESG mit keramischen Siebrück und Sonnenschutzbeschichtung, SZR: 12 mm Kryptonfüllung, Mitte: VSG 2 x 8 mm ESG mit 1,52 mm PVB-Folie und eingelegter Motivfolie innen: VSG 10 mm TVG + 6 mm TVG mit 1,52 mm PVB-Folie, low-e Beschichtung auf der Innenseite, TVG aus 6mm k-Glas dient als Wärmespiegel zur Innenseite. (<http://www.baunetzwissen.de>)

### **St. Benno Gymnasium, Dresden – Germany 1994 – 1996**

In the early 1990's the Bishopric of Dresden-Meissen succeeded in obtaining a site in the centre of Dresden free of the considerable problems of clear ownership status. The long and narrow site is located on the heavily trafficked inner city ring road, close to the terraced banks of the Elbe River. This conflict between aggression and tranquillity provided the basis for the design, informing both the organisation of the building and its architectural expression. The distinctive long, blue, outer wall gives the school a clear identity. Facing onto the ring road the largely opaque facade provides a calming buffer against the hostility of automobile traffic, screening a series of educational spaces arranged over four floors. In contrast the clusters of classrooms are turned away to the west, opening out over terraced gardens towards a residential district. Here the use of colour is equally lavish, but again, in support of the geometry, much more differentiated. Inside, various situations define the building; a chapel, [a library](#), a communal hall, a sports hall and a roof top laboratory. Each have their own character and quality moods, traits which we believe should be encouraged in the education of our children, in their own individual development. (Behnisch)

### **Amherst College Science Center, Science Library, Amherst, MA – USA 2012 - 2016**

The Trustees of Amherst College have determined that the existing Merrill Science Center at Amherst is in need of replacement. As a result, they have retained the services of Behnisch Architekten together with Payette Associates to examine and recommend solutions for the siting & development of a New Science Center. The New Science Center is to be constructed on the Amherst College campus and will serve to house new laboratories, classrooms, offices, animal facilities, and a [science library](#), and a science shop, for the departments of Astronomy, Biology, Chemistry, Physics and Psychology. The project consists of the development of new teaching and research facilities with a net program of 120,000 square feet, which will result in a gross building size of approximately 220,000 square feet. As active academic and research endeavors, it is critical that any interruption in the work of these departments is minimized. The site for the building is generally in the vicinity of the existing Merrill Science Center. The question of utilizing any portion of the Merrill site is complicated by the presence of the McGuire building, a true addition to the west of the original Merrill Science Center housing the Biology Department, their attendant green house, and a modest animal facility. The organic geometry of the new building and its orientation around a unifying central space suggests a fresh identity for the Sciences at Amherst College, one where distinct scientific departments co-exist in a shared architectural community. This community is further invigorated through an intimate connection with campus circulation occurring within a dynamic, spatial experience. The New Science Center nestles itself into the hill, preserving valuable visual connections to the surrounding Connecticut River Valley, and opening up long lost physical connections between the Quad and the lower parts of the Amherst campus. To the extent possible, the building preserves opportunities for Amherst College to build upon highly desirable sites to the north and east, as well as indicating opportunities for future expansion that do not compromise these sites for a significant period of time. The internal building configuration provides a robust and flexible framework for a variety of programmatic approaches, all of which support the notion of a highly interactive, communicative, and inspiring environment for the pursuit of scientific education, advancement and research. The Center will be built in two phases, partially on the site of the existing Merrill building. Phase one will allow the relocation of the key scientific initiatives from Merrill and the building's subsequent demolition, and phase two will accommodate remaining initiatives from adjacent facilities and the implementation of the major landscaping of the remaining Merrill site. This new terraced landscape opens the southeast corner of the campus to the greater surroundings, both visually and physically, while keeping the Science Center in close proximity to the center of the college campus.

(Behnisch)

New Science Center at Amherst College

Project Timeframe:

The planning and design process for the new science center is expected to last roughly two years, with groundbreaking in 2012. Ultimately, the astronomy, biology, chemistry, physics and psychology departments and the neuroscience program will be housed in the new center. It's expected that construction will occur in two phases to minimize disruption to the sciences. In the first phase, about 75 percent of the new center will be constructed to the east and north of Merrill over a roughly two-year period. Merrill will then be dismantled and an additional, smaller portion of the new facility will be built on part of the former Merrill site, completing the new science center in 2016.

The Amherst College Board of Trustees have engaged Behnisch Architekten and Payette Associates to design a new science center to replace the Merrill Science Center, which is nearing the end of its useful life. In collaboration with a committee composed of the science department chairs, trustees, alumni and administrators, Behnisch and Payette have developed a preliminary conceptual plan for the center. A conceptual plan is not a building design, but rather a way of determining how

space can best be organized in the context of a building, and how a building can best be sited in a wider landscape. Campus Meetings. On Tuesday, Nov. 9 (2010), Stefan Behnisch of Behnisch Architekten, along with colleagues from Behnisch and the firms Payette and Stephen Stimson Associates, presented conceptual plans for the proposed new science center, discussed the process that led to those plans, and described the next phase of the collaborative planning and design process.

#### Project Concept:

The new science center will be a model of sustainability and interdisciplinary collaboration, a visionary testament to the power and importance of science education and research in a liberal arts college setting. While the new science center will provide students and faculty with state-of-the-art teaching and research capabilities in the life and physical sciences, its design and programming is also intended to stimulate interaction among all students, faculty and staff, not just those associated with the sciences. A soaring atrium located at the heart of the building will serve as its main orientating element. Study spaces, computing lounges, conference rooms and meeting areas will occupy the atrium's various levels and benefit from its natural light and sweeping views. Directly off the atrium and spanning two levels, the science library and its reading spaces will be an integral part of the new center, as will the modern classroom and lecture spaces that will be adjacent to faculty offices and research laboratories. The building's carefully considered location, with much of its mass built into a hillside, will ensure that its scale is appropriate relative to other buildings in the center of campus, and will open up stunning views of the Holyoke range. The planning, design and phased construction process that is now underway will ensure that the sciences will remain at the heart of the Amherst College campus, and that disruption to teaching and research programs will be minimized. The building and its surrounding landscape will suggest an architectural vision that is respectful of the historic beauty of the existing campus while being distinct and forward-looking in its expression. Why a New Science Center? Merrill Science Center, built in 1968 as a home for the astronomy, chemistry and physics departments, has served decades of students and faculty well. The five-story, 164,000-square-foot brick-clad building on the southeast corner of the campus is now approaching the end of its useful life. It is becoming increasingly costly to maintain the complex to meet today's highest research and instruction standards. Detailed studies of Merrill's structure and systems show that renovating it would cost about as much as, if not more, than constructing a new facility. Additionally, the limitations of Merrill's architecture would constrain the college's ability to reconfigure its layout in ways that will allow us to provide the best science education to our students and adequate research facilities for Amherst's science faculty. Merrill's looming presence at the corner of the upper campus also fails to integrate or resolve important campus use patterns, and it blocks important view corridors within the campus as well as southward toward the Holyoke Range. As well, Merrill consumes nearly one-third of the energy demand of the entire campus, at a cost of approximately \$1.3 million per year. The new science center will be a sustainable building, and will adopt a number of progressive design strategies with a view to reducing demands on energy resources; annual energy costs are estimated to be about \$300,000 per year.

#### Planning Oversight:

The president and the board of trustees will continue to make decisions related to the financing, scope and final design of the new science center, influenced by input from faculty, staff, students, alumni advisors, participating firms and other members of the college community. This consultative process has been under way for two years. (<http://www.amherst.edu>)

#### [University of Baltimore, John and Frances Angelos Law Center \(Library\), Baltimore, MD – USA 2009 – 2013](#)

Client: University of Baltimore, Architect: Behnisch Architekten, Boston with Ayers/Saint/Gross, Baltimore, Competition 2008, 1st prize, Planning and construction 2009-2012, Gross 17,650 m<sup>2</sup> / 190,000 sq.ft.

The University of Baltimore called for a new law school building that would offer a contemporary and functional solution as well as establish the school as an integral partner in enhancing the culture, commerce, and future of Baltimore and the region. The prominent location of the site, opposite Penn Station, demands a significant building that serves as a gateway into the city and engages the surrounding neighbourhood. The building should not only provide classrooms, a library, faculty and administrative offices, but also offer inviting spaces for study and student-faculty interaction. The winning design is a composition of three volumes, each of which holds one of the three main program points: classrooms, library, and faculty / administration. The administrative volume also includes the separate accessible clinics, where students, faculty, and local attorneys provide legal services to the community. An atrium connects the three volumes, providing space for a lobby, coffee bars, and lounges. The Appellate Moot Court for mock sessions extends down from the main lobby to a lower garden level; court hearings, lectures and events are held within its assembly space. (Behnisch)

#### [Deutsches Rundfunkarchiv Bibliothek, Babelsberg \(Potsdam\) – Germany 2000](#)

Am 6. Dezember 2000 wurde auf dem Gelände des Ostdeutschen Rundfunks Brandenburg (ORB) in Potsdam-Babelsberg das von den Architekten Busmann + Haberer (Köln / Berlin) gebaute Deutsche Rundfunkarchiv (DRA) eröffnet. 1998 hatten die Architekten einen Wettbewerb für den Neubau gewonnen, der neben dem DRA auch das Archiv des Deutschen Rundfunkmuseums und einen Teil des ORB-Archivs aufnimmt. Das Gebäude besetzt die südwestliche Ecke des ORB-Geländes in der Medienstadt, wo es sich als schlüssige Ergänzung des eher kleinteiligen Altbaubestands bewähren sollte. Der orthogonale Baukörper ruht auf einer verglasten Sockelzone, die zur Haupteingangsseite im Osten einen starken Rücksprung ausbildet. Die darüber liegenden drei Geschosse bilden das in zwei Funktionsbereiche geteilte Innere des Hauses nach außen ab: Während der Archivbereich, verkleidet mit einer vorgehängten Ziegelschale, trotz langer Fensterbänder eher schwer und geschlossen wirkt, öffnet sich der angeschlossene Arbeits-, Kommunikations- und Erschließungsraum mit großzügigen Glasfassaden zur Umgebung. In diesem Bereich sind Zonen mit öffentlichem Charakter, also Information, Leseplätze und der Freihandbestand untergebracht. Einläufige Treppen durchqueren den über ein Glasdach von oben belichteten Luftraum in nahezu skulpturaler Weise und verbinden die Geschossebenen miteinander. Im Erdgeschoss bestimmt zusätzlich ein geschwungener Raumteiler das Bild, der sowohl als Theke wie auch als Unterbringungsraum für Karteikästen genutzt werden kann. Insgesamt stehen in dem 21 Millionen Mark teuren Neubau nun fast 9.000 Quadratmeter Bruttogeschossfläche zur Bewahrung, Dokumentation und Erforschung der deutschen Rundfunkgeschichte zur Verfügung. Bauherr: Deutsches Institut für Normung e.V., Berlin, DM 28.000.000, BGF 9.500 m<sup>2</sup>

Beim Neubau des Deutsches Institut für Normung e.V. DIN in der Budapester Straße in Berlin-Tiergarten wurde am 21. Oktober 1998 Richtfest gefeiert. Das zehngeschossige Bürogebäude wird nach dem Entwurf der Architekten Johannes Heinrich, Jan C. Bassenge, Kai Puhan-Schulz und Walter Schreiber realisiert. Es wird mit dem Stammhaus in der Burggrafenstraße durch eine Passage verbunden. Das neue Gebäude mit einer Gesamtfläche von knapp 10.000 Quadratmetern soll nur zum Teil vom Deutschen Institut für Normung genutzt werden, darüberhinaus sollen Flächen zwischen 140 und 980 Quadratmetern vermietet werden. Im Erdgeschoß befindet sich ein Mietbares Konferenz-Center neben Laden- und Archivflächen. Darüber hinaus wird auch andere Infrastruktur geboten: ein Datennetz, die Cafeteria mit Bistro, 14 Sitzungsräume mit einer Kapazität zwischen 15 und 120 Personen (einschließlich Sitzungslogistik), eine technisch-wissenschaftliche Bibliothek, die Hausdruckerei und in der Tiefgarage 250 Stellplätze. Der Neubau wird den Namen Alexander-von-Humboldt-Haus bekommen - am Eingang soll ein 2,70 Meter hohes Denkmal Humboldts aufgestellt werden. Das 60 Millionen Mark teure Gebäude wird im Herbst 1999 fertiggestellt sein. (<http://www.baunetz.de>)

Die Oberösterreichische Landesbibliothek soll an ihrem traditionellen Standort in der Linzer Innenstadt erweitert und in eine Freihandbibliothek umgewandelt werden. Dazu wird der denkmalgeschützte Altbau aus den 1930er Jahren saniert (1934, Julius Smolik 1879 Neutitschen – Mähren – 1948 Wien) und an der Rückseite als Passstück ein 6geschossiger Neubau errichtet, der sich in Naturstein materialisiert. Der bisherige Hof wird zum großzügigen, lichtdurchfluteten Herz der neuen Bibliothek. Ein Großteil der Magazinbestände wird künftig in den Untergeschossen des Neubaus Platz finden, die Verwaltung erhält Räume in dessen Turmlaterne (Bez Kock).

#### **Bibliothek Neufahrn (Freising) - Germany 1996 - 2000**

Bibliotheksgebäude mit Gaststätte und Wohnungen, Bauherr: Gemeinde Neufahrn bei Freising, Bausumme: EUR 3 Mio.

Das Bibliotheksgebäude bildet den städtebaulichen Abschluss des neuen Ortszentrums, dessen Gestaltung auf unserem Wettbewerbsentwurf von 1996 (1.Preis) basiert. Das winkelförmige Bauwerk enthält die Gemeindebücherei, eine Gaststätte und vier Maisonette-Wohnungen, die über einen Laubengang im 1. OG erschlossen sind. Der Baukörper der Bücherei setzt in seiner strengen, introvertierten Architektursprache einen markanten Akzent und nimmt gleichzeitig Beziehung auf mit der gegenüber liegenden evangelischen Kirche (Gulbransson). Der Innenraum ist durch historische Vorbilder (z.B. barocke Klosterbibliotheken) inspiriert. Er erstreckt sich über drei Ebenen, deren Zentrum durch einen schiffsförmigen, von einem Oberlicht überwölbten Luftraum gebildet wird. Auf diese Weise entsteht eine lichtdurchflutete und dennoch ruhige, meditative Atmosphäre. Auch die Ausstattung – als Idee eines raumgreifenden, den Besucher umschließenden und bergenden Bücherregals – ist präzise auf die besondere Bauaufgabe abgestimmt. Zum Platz hin öffnet sich die Bücherei (Internet-Café) und das Lokal über eine Arkadenzone, die als „Leitmotiv“ das gesamte Ortszentrum zusammenbindet. (BKLS)

#### **Hasso-Plattner-Bibliothek, Universitätsbibliothek Mannheim – Germany 2006**

4.732 m<sup>2</sup> HNF, € 17.900.000

Der Mittelbau des Mannheimer Barockschlosses bekam zum 400-jährigen Stadtjubiläum im Jahre 2007 seine historische Außenansicht zurück. Die historische Bausubstanz wurde erhalten, die Mansarddächer wurden rekonstruiert. Die Bibliotheksflächen befinden sich über die ganze Front des Mittelbaus hinweg, einschließlich der beiden äußeren Türme, auf der 2. bis 5. Etage. Im Inneren entstand eine neue Bibliothek. Die moderne Stahl-Tragkonstruktion ist sichtbar. Für die Statik wurden die massiven Außenwände des Schlosses zur Lastabtragung genutzt. So konnten über dem 2. OG starke Stahlverbundträger (90 m hoch und 18 m lang) eingebracht werden, die das Dachgeschoss mitsamt der eingestellten Galerieebene tragen. Im östlichen Teil tragen diese sogar noch die Regale des darunterliegenden 2. OG, die an der Decke aufgehängt wurden (wegen Erhalt der Bestandsdecken der darunter liegenden historischen Räume). Vom Dach des Mittelturmes wurden 2 Galerieebenen komplett abgehängt, die über der Decke des Rittersaals schweben. Dies ist durch den großzügig bemessenen, über alle 3 Ebenen reichenden Luftraum über der Leselounge gut sichtbar. Die Erschließung der Bibliothek musste wegen der zentralen Lage des barocken Treppenhauses über die beiden Treppenhäuser an den Flanken des Mittelbaus erfolgen. Im Inneren des Bibliotheksbereichs liegen in Nähe der Eingangszonen im westlichen und östlichen Bereich jeweils eine Treppe und ein Aufzug. Sie verbinden alle 3 Bibliotheksebenen

miteinander. Mittels Rampen sind trotz versetzter Geschosshöhe im Mittelraum alle Bibliotheksflächen barrierefrei zu erreichen. Darüber hinaus haben die 3 Ebenen des Mittelraums Treppenhäuser sowie einen Aufzug. Als Bodenbelag dominiert ein roter Teppichboden, kombiniert mit schwarzem Naturstein-Belag in den Eingangs- und Verkehrszonen. Die anteilig großen Teppichflächen waren vor allem aus raumakustischen Gründen notwendig. Insgesamt verfügt die Bibliothek über ca. 500 Arbeitsplätze. Davon sind ca. 400 als Standardarbeitsplätze mit Ausstattung für multimediales Arbeiten ausgerüstet. Die übrigen ca. 100 Arbeitsplätze verteilen sich auf Katalogrecherche in den Eingangszonen, den Schulungsraum, Gruppenarbeitsräumen sowie 6 komfortabel ausgestatteten Carrells. ### **Awards:**

**2006 - BDA Preis Bremen**

Der Bau des Campus Centers auf dem Gelände der JUB bildet sowohl funktional als auch architektonisch den vorläufigen Höhepunkt der Transformation des ehemaligen Kasernengeländes zu einem attraktiven universitären Campus. Das Campus Center vereint unter einem Dach **Information Ressource Center (IRC)**, Konferenzbereich, Gastronomie und Shops. Das Gebäude schafft damit im deutschen Hochschulbau einen völlig neuen Bautypus. Im Masterplan ist das Campus Center als kommunikativer und inspirierender Mittelpunkt der IUB vorgesehen, der ihr architektonisches Bild nach innen und außen prägen wird. Der Bau setzt die bisherige architektonische Strategie fort, durch moderne Neubauten und unter Einbeziehung der vorhandenen Qualitäten der Altbauten, dem Campus eine neue, eigenständige Charakteristik zu geben. In der Achse des Campus und des Altbaues erhebt sich im Hintergrund der Neubau als 4-geschossige Scheibe aus grünem Glas. Der Neubau überragt und durchdringt zugleich das große rote Ziegeldach des Altbaus und bildet mit ihm eine neue Skulptur, die die Bedeutung des Campus Centers in der Gesamtanlage der IUB unterstreicht. (Boege)

6.600 m<sup>2</sup>, € 12.700.000

### **Literature:**

**Bibliothek. Forschung und Praxis 27, 2003, pp. 56 - 58**

Der Baukörper besteht aus einer Glashülle in Form einer Pyramide, die auf sich bis zum 2. OG vergrößernden Quadraten aufgesetzt ist. Die Hülle ist ab dem 3. OG als Doppelfassade konstruiert. Auf den einzelnen Geschossen befinden sich mit Ausnahme der Verwaltungsebene so gut wie keine Wände. Die äußere Erschließung erfolgt an 3 Stellen: der Haupteingang öffnet sich zum Marktplatz nach Osten, ein Nebeneingang befindet sich an der Westseite, ein Notausgang liegt im Norden. Die innere Erschließung erfolgt über ein zentrales Treppenhaus, das 2 Fahrstühle umschließt. Dieses "Auge" mit einem Durchmesser von ca. 8 m stellt den Kern des Gebäudes dar. Das Gebäude gliedert sich vertikal in 9 Stockwerke. Farbkonzept im Inneren: grau: alle Metallteile; korallrot: Haupttreppe; grün: alle Holzteile. (<http://www.bibliotheksportal.de>)

Am 1. Februar 2004 war die neue Zentralbibliothek in Ulm erstmals öffentlich zugänglich. Sie wurde nach Entwürfen des Kölner Architekten Gottfried Böhm realisiert. Böhm hatte den Auftrag erst nach einer Überarbeitung bekommen, denn im Wettbewerb hatte er nur den 4. Platz belegt (BauNetz-Meldung vom 15. 7. 1999).

Die neue Bibliothek hat eine Grundfläche von 29 x 29 Metern, kragt in den beiden Obergeschossen aus und geht oberhalb des 2.OG in eine steile Pyramide über. Sie verfügt über eine Nutzfläche von über 4.600 Quadratmetern und wird in der Mitte über eine offene Stahltreppe und einen Doppelaufzug erschlossen. Der 36 Meter hohe Bau bildet einen Platz, der sich zur Bibliothek in Form eines Amphitheaters öffnet. Das Gebäude gliedert sich über neun Geschosse: Im Untergeschoss liegen Buchbinderei, Veranstaltungssaal und Garderobe. Im Erdgeschoss befinden sich Ausleihe, Nah- und Informationsbereich, vom 1. bis 3. Geschoss eine Kinderbibliothek und die verschiedenen Literatur-Abteilungen. In der 4. Etage liegt die Verwaltung und im Stockwerk darüber ein Lesecafé mit Galerie. Alle Bildschirmarbeitsplätze gruppieren sich um das zentrale Treppenhaus und an der Fassade liegen die Arbeitsplätze mit Blick auf die Stadt und die Alpen. Gesteigert wird dieser Eindruck noch durch ein Deckengemälde des Architekten, das die Verlängerung der roten Treppe im obersten Stockwerk in die „Unendlichkeit“ darstellt. Offiziell eröffnet wird das Haus am 20. April 2004. (<http://www.baunetz.de>)

#### **Philosophische Seminar, Bibliothek, Westfälische Wilhelms-Universität, Münster – Germany 1. Preis 2011**

Das Philosophische Seminar der Westfälischen Wilhelms-Universität in Münster braucht neue Räume. Dafür soll ein Bestandsgebäude am mittelalterlichen Domplatz in der Münsteraner Altstadt, das Institutsgebäude für Kunstgeschichte und Philosophie am Domplatz 23, umfassend modernisiert und erweitert werden. In dem 2010 ausgeschriebenen Wettbewerb waren „Lösungen für eine maximal mögliche Flächenenerweiterung durch Neuorganisation im Bestandsgebäude sowie die Erweiterung im Außenbereich“ gefragt. Schließlich soll damit ein Gebäudekomplex mit 5.850 Quadratmetern Nutzfläche entstehen.

1. Preis: Peter Böhm Architekten, Köln

ein 3. Preis: Bolles + Wilson, Münster

ein 3. Preis: MM Architekten, Hannover

4. Preis: Birk und Heilmeyer, Stuttgart

Das Büro eisfeld engel Architekten (Hamburg) erhielt eine Anerkennung.

Von den 15 Teilnehmern waren sechs Büros vom Auslober gesetzt worden, die weiteren neun wurden „unter Berücksichtigung der Kategorien ‚junges‘ bzw. ‚erfahrenes‘ Büro“ ausgelost. Von den gesetzten findet sich nun nur Bolles + Wilson unter den

Preisträgern. Da das Juryprotokoll noch nicht freigegeben wurde, zitieren wir hier die Selbstbeschreibung der Erstplatzierten: „Durch die Um- und Neugestaltung des Philosophikums entsteht ein schönes Platzgefüge: Der ruhig proportionierte Platz, flankiert durch den neuen Bibliotheksanbau, geleitet zum Eingang. Er mündet in einem quer liegenden Platz über dessen Endpunkt, geziert durch eine Skulptur, der Fußgänger nun die Aa erreichen kann. Neu- und Altbau sind durch eine gläserne Halle zu einer Einheit verbunden. Ihre Zusammengehörigkeit drückt sich auch in der gleichartigen Materialität der hell-geschlammten Ziegelfassaden aus. Die innere Struktur der Nutzung und Erschließung ist übersichtlich und klar gegliedert.“ Obwohl sich die Jury mit einem Preis und zwei dritten Preisen recht eindeutig äußerte, sollen nun alle vier Preisträger zu einem VOF-Verfahren eingeladen werden. Vorher werden noch alle eingereichten Arbeiten in einer Ausstellung der Öffentlichkeit gezeigt. (<http://www.baunetz.de>)

**Max Planck Institut für internationales und ausländisches Privatrecht (Bibliothek), Hamburg – Germany 2005 – 2006**

3.490 m<sup>2</sup>

Das Max-Planck-Institut für ausländisches und internationales Privatrecht liegt seit seinem Umzug von Berlin nach Hamburg im Jahre 1956 – in zentrales zwischen dem westlichen Ufer der Alster im Osten, der Universität im Westen und dem Messegelände mit dem davor legenden Dammtor-Bahnhof im Süden. Die Herausforderung bei der Planung der dritten Erweiterung an diesem Standort bestand vor allem darin, ca. 3.600 m<sup>2</sup> Bruttogeschossfläche (davon ca. 2.000 m<sup>2</sup> oberirdisch) auf dem bereits dicht bebauten Grundstück unterzubringen. Der Neubau fügt sich fast selbstverständlich in den bereits bestehenden Kreis um den Innenhof ein, den bis dahin das aus den 50er Jahren stammende 3-geschossige Gebäude zum Mittelweg mit südlichem Flachbau und der Turm im Norden mit östlichem Flachbau aus den 70er Jahren gebildet hatten. Der Abriss des südlichen Flachbaus des Altbaus schafften den erforderlichen Platz für den 4-geschosigen Neubau welcher das Ensemble nach Süden hin arrondiert. Der kompakte neue Baukörper greift in Teilen die Umrisse des bisherigen 1-geschossigen Bestandes auf. Die daraus resultierende – sich zum Mittelweg wie auch zum rückwertigen Bereich verjüngende Baumasse - verleiht der Erweiterung ihre unverwechselbare spannungsreiche Figur. Durch einen Querschnitt im Bereich des neuen Vorplatzes erhält der Baukörper zusätzlich eine gewisse Leichtigkeit. Durch eine einheitliche Grundkonzeption und die verwandten Materialien verbinden sich die unterschiedlichen Gebäudeteile und bleiben trotzdem different und eigenständig. Der Erweiterungsbau mit neuem Haupteingang, Foyer, Haupttreppenhaus, Bibliothek und Seminarraum setzt neue Akzente, erschließt den Bestand beiseitig, ohne diesen zu dominieren. Gleichzeitig wird das Ensemble des Instituts im architektonisch-städtebaulichen Raum durch den Neubau prägender dargestellt. (bof)

## **Boge Johannsen Architekten, Hamburg – Germany**

Florian Boge, Gerd Johannsen

<http://www.bojo.de>

### **Libraries:**

**Forum Berlin-Neukölln, Hauptbibliothek Helene Nathan, Berlin – Germany 2000**

Nach einer langen Planungsphase wurde 1997 der Bau des Forums Neukölln konkret. Die Bibliothek wurde in das Einkaufszentrum integriert. Eine vielfältige Mischung aus Shopping, gastronomischer Kultur und Unterhaltung entstand. Über zwei Etagen stehen die Medien großzügig auf 4.000 qm für die Benutzer in übersichtlichen, hellen Räumen bereit. (<http://www.bibliotheksportal.de>)

Im Berliner Bezirk Neukölln eröffnet am 2. September 2000 nach rund zweijähriger Bauzeit das neue Einkaufs- und Urban Entertainment Center „Forum Neukölln“. Die Hamburger Architekten Florian Boge und Gerd Johannsen haben an der Einkaufsmagistrale Karl-Marx-Straße für ca. 250 Millionen Mark einen Gebäudekomplex geschaffen, der auf sieben Geschossen insgesamt 40.000 Quadratmeter Nutzfläche bietet. Bedingt durch die Höhendifferenz im Gelände verfügt das Zentrum über drei ebenerdige Zugänge auf verschiedenen Ebenen: Während die Eingänge an der Karl-Marx-Straße direkt in das Erdgeschoss führen, gelangen die Kunden von der Flughafenstraße aus direkt ins erste Obergeschoss. Den Mittelpunkt des Komplexes bildet ein ellipsenförmiges offenes Atrium, das sich nach oben hin verjüngt und den Blick auf eine abschließende, rund 40 Meter hohe Glaskuppel frei gibt. Von dieser zentralen Halle aus, die sich über alle sieben Geschosse des Centers erstreckt, sind alle Bereiche zu erreichen: Auf den ersten vier Geschossen finden sich auf 29.000 Quadratmetern rund 65 Einzelhandelsgeschäfte und 17 Restaurants und Cafés, außerdem soll hier auch auf 2.000 Quadratmetern ein Fitnessstudio einziehen. In den darüber liegenden Geschossen befinden sich die kulturellen Bereiche des Forums: ein rund 6.000 Quadratmeter großes Multiplexkino sowie auf zwei weiteren Etagen die neuen Räume der Stadtbibliothek Neukölln. Das Bauvorhaben ist umstritten: Von der ortsansässigen Geschäftswelt wird eine Verlagerung der Umsatzströme zu ihren Lasten befürchtet. Dem wird von Befürwortern entgegen, das Projekt diene der Aufwertung der inzwischen mit Problemen kämpfenden Einkaufsstandorts inmitten des dichtbesiedelten Arbeiterbezirks: Eine weitere Abwanderung von Kunden zu Shopping-Centern auf der grünen Wiese sei nur durch Steigerung der Attraktivität in innerstädtischen Lagen zu begegnen. Unmut kam auch darüber auf, dass für das Center ein erst kurz vorher mit Millionenaufwand saniertes Gründerzeitwohnhaus in der markanten Ecklage zur Flughafenstraße zerstört wurde. Der Abriss eines fünfziger-Jahre-Bibliotheksgeländes konnte durch die Eingliederung der Bücherei in den Neubau abgefangen werden. Dennoch brauchte das Neubauprojekt nach einem Architekten- und Investorenwechsel rund zehn Jahre von den ersten Planungen bis zur Eröffnung. (<http://www.baunetz.de>)

#### **Stadtbibliothek Münster, Münster – Germany 1987 – 1993**

##### **Awards:**

**Mies van der Rohe Award 1995 Nomination**

**German Architecture Award 1995 Commendation**

Der Entwurf von Bolles-Wilson schuf zwischen dem historischen Crameramtshaus und dem Kiffepavillon aus den 50er Jahren eine neuartige Architekturinszenierung.

Die Stadtbücherei besteht aus zwei Gebäudeteilen, deren Zwischenraum eine auf die Lambertikirche zulaufende Gasse bildet.

Ein Element der Bücherei ist eine Scheibe, die mit der vorhandenen Bebauung den Blockrand formt. Das andere Element ist ein schiffsartiger Solitär-Bau. Verbunden werden beide Bauwerke durch eine Brücke im ersten Obergeschoss, aber auch durch ein gemeinsames Untergeschoss, in dem sich der Medienbereich und die Kinderbücherei befinden.

Die Fassaden der Gebäudeteile sind durch zwei mächtige Kupferschürzen abgedeckt, unter denen sich innerhalb der Gebäude die zentralen Treppen befinden. (<http://www.baukunst-nrw.de>)

#### **BEIC (Biblioteca europea di informazione e cultura) – Milan Library, Milan – Italy in progress**

The main aims of this library are meeting the increasing and diversified cultural demand of Milan and Lombardy, establishing new ways to coordinate the various existing libraries, promoting and managing the computerization process of services and the digitalisation of documents. The name of this library itself clearly defines its mission: an international body that promotes the European vocation of Milan and Italy; not only a container where documents are stored, but primarily a workshop and a centre for the production and spreading of information, as well as a public infrastructure for knowledge and culture. The BEIC will be a large open-shelf library with a close interconnection between the books and the computer modules: it will contain both hard copies and digitalized books, with original texts and translations, with global works and collections, important monographs and many periodicals. The public will have direct access to the works in the open-shelf sections, while the remaining documents will be kept in a vast closed archive. The BEIC will be organized according to the strongly user-oriented "threelevel" library model. There will be a Near Zone (with the entrance, reception and information desk, exhibition areas, browsing area, children's library, media forum, educational centre, conference centre, news section, newspaper library, travel and leisure section, community information) with some shops and catering facilities; a Middle Zone, with openshelves (reference, theme sections with open-shelf archive, reading and consulting areas); and a Far Zone, with department storerooms and a closed deposit in the basement. The project provides the creation of a large building about 36 m high and lying on a 5-m base that slopes down to the east and west with two wide green ramps. This building is intended as a true cornerstone in the city, as an "ark" of culture and information linked to the urban and regional framework - as an urban symbol. The extraordinary expressivity of its architecture aims at transmitting the exceptional public function it hosts. It will be an urban icon: the public space par excellence that invites to discover and explore.

#### **Bibliothèque Nationale de Luxembourg – Luxembourg in progress**

Zu klein, nicht mehr modernisierungsfähig, schlechte Verwahrungsbedingungen, untragbare Besuchs- und Arbeitsbedingungen - so lauten die Vorwürfe gegenüber der aktuellen BNL. Nach langen Jahren Ungewissheit zeichnet sich nun eine definitive Lösung ab. Der Ministerrat hat am 20. Mai 2011 dem Bauprogramm für die neue BNL zugestimmt. Gebaut wie auf Bricherhaff auf Kirchberg – ein Standort, der seit längerem in der Diskussion ist, nachdem der Umbau des Betonklotzes gegenüber dem Konferenzzentrum auf Kirchberg sich als zu umständlich und womöglich als zu teuer erwiesen hat. Baubeginn soll 2014 sein, falls der dazu notwendige Gesetzentwurf die parlamentarische Hürde rechtzeitig schafft. Das neue Gebäude soll eine Nutzfläche von 24.260 Quadratmetern haben (Stationierungsraum für PKW nicht unbegriffen). Die Dienste des "Bicherbus", die derzeit in Diekirch stationiert sind, werden in das neue Projekt integriert. Mit der Ausarbeitung der neuen Baupläne wurde vor wenigen Tagen das Architektenbüro Bolles et Wilson beauftragt, dasselbe Büro, das den Wettbewerb für den Bau auf der place de l'Europe gewonnen hatte. Ein Teil des Geländes ist späteren Erweiterungen vorbehalten. Mehr als zehn Jahre wird am Projekt einer neuen BNL gewerkelt. Zuerst sollte die Bibliothek lediglich eine Annexe bekommen, dann sollte sie in die Räumlichkeiten des Robert-Schuman-Gebäudes auf Kirchberg kommen, das heute noch etliche Dienste des EU-Parlaments beherbergt. Verzögerungen beim Umzug der EU-Institution aus dem klobigen Bau ließen die Euphorie für diese Lösung weiter abkühlen. 2010 nannte Premierminister Jean-Claude Juncker in der Erklärung zur Lage des Landes Bricherhaff als möglichen neuen Standort für die BNL. Eine anschließend eingesetzte Arbeitsgruppe soll sich nochmals mit dem Neubau beschäftigen und kostensparende Vorschläge unterbreiten. Als positiv bewertet der LSAP-Abgeordnete und fervente Sprecher eines zeitgemäßen Neubaus für die BNL, Ben Fayot, am Montag die Nachricht über die Regierungsentscheidung bezüglich des Bauprogramms für die BNL. Er hoffe, dass es beim Baubeginn 2014 bleibe, sagte er Tageblatt.lu. (<http://www.tageblatt.lu>) (27.Juin 2011)

#### **City Library Helmond – The Netherlands 2010**

Like most Dutch cities Helmond is busy reinventing itself. The new City Library, which officially opens in October 2010, is the first component of a comprehensive new inner city shopping zone (master plan: Prof. Joan Busquets). Directly adjacent to the new library are the 1970's Tree Houses and Theatre (1977) by Piet Blom (1934-1999). Here the new library facade is moulded and sloped in dialogue with its dramatic neighbour. A between space, a block internal café terrace, a comfortable and dramatic extension of the existing enclosed Theatre Square is the result of this spatial symbiosis. The outer, street-facing facade is the representative face and entrance of the new library. Upper level projections mark the extremities, brackets (ears) carrying large-format 'Bibliotheek' letters. A horizontal facade articulation differentiates ground level shops from glazed and setback first floor (Children's Library) and the brick surface of the upper office level. A careful detailing and material choice for external surfaces provides a 'tactility' fitting to the historic Helmond city centre. Rough dark brown and unusually horizontal bricks (Hilversum format 50 x 290 mm) on upper levels have open vertical joints and a beige horizontal mortar joint, stressing the layered grain of the brickwork. In contrast the base is in a flat beige brick (in 3 different heights – 50, 100, 140 mm). These are not laid in mortar, but glued together - resulting in a stone-like solidity and homogeneity. The internal spaces of the library are developed as an unfolding spatial sequence. Much of the ground floor is given over to retail. Entry is from both sides – via a generous double height entrance hall to the street side and via the more intimate café and event corner facing the Theatre Court. The upward sequence is announced by a grand stair, which arrives at a first floor exhibition deck and the 'piano nobile' of the library. Here information stations, bookshelves and children / teenager zones are arranged around a central media Hot Spot: precisely circular, a Chinese-red sandwich. The Hot Spot offers the digital latest. The route continues upward concluding in the light-filled upper level with a long working bench integrated in the long 'tree house-facing' window. elements, the choreographing of atmosphere and character. Lanterns in the foyer, a newspaper

reading table, a striped and upholstered café bench seat with Scandinavian lighting, information counters and a group study room with fragments of a 1950's mural mounted on the wall, are among the long list of localised detail. The philosophy is one of multiplicity, a user-friendly comfort already much appreciated by librarians and reading Helmonders.

**International Prize DEDALO MINOSSE 2003**

Ein kultivierter Eklektiker ist Stephan Braunfels, versiert in der Geschichte der Architektur, Verehrer großer architektonischer Gesten als auch des Materials Sichtbeton. Drei Leidenschaften, die er mit Axel Schultes teilt, der mit seinem städtebaulichen Masterplan für ein "Band des Bundes" und dem Bundeskanzleramt der deutschen Politik in Berlin neue monumentale Räume konzipierte.  
Raumprogramm

Eigentlich sollte nur ein Gebäude entstehen, so zumindest sah es die Ausschreibung des Realisierungswettbewerbs des Jahres 1994 vor. Doch ausufernde Nutzerwünsche wusste danach Stephan Braunfels für eine Zerteilung des Raumprogramms zu nutzen, für einen baulichen Brückenschlag über die Spree in die Berliner Innenstadt hinein, ganz so wie ihn Axel Schultes vorgesehen hatte. Eine 200 bzw. 157m lange und acht Geschosse hohe Kammstruktur setzte Braunfels als Paul-Löbe-Haus nördlich des alten Reichstags auf den Spreebogen, das die Abgeordnetenbüros und Ausschussräume aufnahm. Seine Fortsetzung und zugleich auch Widerpart findet nun das Paul-Löbe-Haus mit dem erst kürzlich fertig gestellten Elisabeth-Lüders-Haus auf dem östlichen Spreeufer, eine 107 bzw. 144m lange und bei gleicher Gebäudehöhe, aber neun Geschosse hohe Komposition aus Kämme und mehreren großgeometrischer Baukörper. So unterschiedliche Nutzungen wie die Parlamentsbibliothek, der große Anhörungssaal, Ausstellungs- und Festsäle sowie die Büros finden sich nun dort. Die unterschiedlichen Längen der Nord- und Südfassaden beider Häuser erklärten sich aus dem gewundenen Lauf der Spree, den Braunfels in seine Konzeption einbezog. Als einen Raum, als eine Piazza mit der Spree in ihrem Zentrum konzipierte der Architekt die Bebauung der beiden Ufer, die über zwei neue 62m lange Brücken – eine städtische und eine interne – miteinander verknüpft werden. Dazu bemühen sich vielerlei weit in den Spreerraum hinein ausragende Bauelemente, kaum unterfangene Flugdächer oder der überdimensionale Betonbügel über der monumentalen Freitreppe des Elisabeth-Lüders-Hauses um bauliche Korrespondenzen über den Fluss hinweg. Dies luzide Spiel mit geometrischen Regeln und Störungen belebt die überaus großen Baumassen nachhaltig. Dabei antwortet der strengen, kaum gebrochenen Linearität der Kammstruktur des Paul-Löbe-Hauses mit seinen Höfen und den mit monumentalen Sichtbeton-Wandscheiben abgeschlossenen Stirnseiten der Kämme das neue Haus zur Spree hin mit einer komplexeren Komposition von Körpern und Räumen, die Variationen und Kombinationen von Kreis und Quadrat darstellen, die Beton- und Glasflächen in unterschiedliche Beziehungen zueinander treten lassen. Dazu konzentrierte Braunfels alle repräsentativen Sonderräume des Elisabeth-Lüders-Hauses zur Wasserseite. Den gläsernen Kubus der beiden dreigeschossigen Räume des Anhörungs- und Festsaaes setzte er in zwei Kreise: einmal in einen monumentalen Betonrahmen à la Louis Kahn – in zwei kreisförmig ausgeschnittene Betonquadrate zur Stadt und Spree – wie auch zum Binnenraum des Hauses in einen Halbkreis von Erschließungsräumen. Dies anders kombinierte Braunfels Kreis und Quadrat bei der großen viergeschossigen Bibliothek über dem parlamentarischen Gedenkraum zur Deutschen Teilung. In einen gläsernen Kubus mit horizontalen Glaslamellen-Verschattern implantierte er den Bibliotheksraum als eine Rotunde zweier Schalen aus Sichtbeton, deren Zwischenraum nun der Erschließung dient. Von Geschoss zu Geschoss zwischen kreisförmigen Galerien und halbkreisförmige Leseebenen wechselnd, gelang ihm hier ein Raum mit faszinierenden Ausblicken auf den Reichstag und die Spree. Allein das Personal fühlt sich angesichts der beträchtlichen Höhenunterschiede noch etwas unwohl. Der Bibliothek zur Seite gab Braunfels die große, nach unten sich sehr dynamisch verjüngende Freitreppe für eine Stadtöffentlichkeit, die sich nach seinem wie auch Wolfgang Thierses Wunsch hier einmal ungezwungen neben der großen Politik entfalten soll. Der Idee der Begegnung dienen auch die vielen Galerien, Treppen und nicht zuletzt das Herz des Gebäudes, das große Atrium. Dessen Ebene befindet sich im Gegensatz zum Paul-Löbe-Haus nicht auf der Höhe der Spreeufer, sondern 6,40 Meter höher, um darunter in fünf Geschossen u.a. das Bibliotheksdepot aufzunehmen. Axial auf die Rotunde hin orientiert und flankiert von den Seitentrakten der Kämme, die hier wie eigenständige Häuser anmuten, wirkt dieses Atrium nicht ungewollt wie eine moderne Transformation der Piazza der Città Ideale-Perspektive aus dem Herzogpalast von Urbino.  
Konstruktion

Doch Braunfels ist nicht weniger ein versierter Eklektiker als Konstrukteur. So erstreckt sich über dem Atrium ein weites wie tiefes und völlig stützenfreies Betonkassettenfeld, dessen 3,56 m Raster dem konstruktiven Raster beider Gebäude entspricht. Beeindruckend sind seine Spannweiten, faszinierend seine Wechsel von Beton- zu Stahl- oder Glaskonstruktionen. Nirgends finden sich bei ihm abgehängte Decken, damit die Betonmasse zur natürlichen Temperierung des Hauses genutzt werden kann. Fugenlos mit Rissverteilungsbewehrung sind seine großen Betonscheiben ausgeführt, deren Schalkantenstöße und Ankerlöcher elegant zur Gliederung der Flächen eingesetzt wurden. Allein einmal mehr entsprach hier die Ausführungsqualität deutscher Betonbauer nicht den Architektenwünschen. Doch auch dafür fand Braunfels schweren Herzens eine Lösung, die neue Betonlasur "faecal colour" der Firma PSS Interservice, die eine erhebliche Nachbesserung des Sichtbetons ermöglichte.

#### **Fakultät für Mathematik und Informatik der Technischen Universität, Bibliothek, München – Germany 2002**

Hauptnutzfläche: 23.500 m<sup>2</sup>, Bruttogrundrissfläche: 48.000 m<sup>2</sup>, Bruttorauminhalt: 225.900 m<sup>3</sup>, Gesamtbaukosten: 70 Mio. EURO

Für ca. 2.200 Studenten und das entsprechende Lehrpersonal werden Arbeits- und Seminarräume, zentrale Einrichtungen, wie Hörsäle und Bibliothek sowie Räume für Verwaltung und Gebäudebetrieb geschaffen. Der Haupteingang der Anlage ist nach Nordosten zur künftigen U-Bahn und dem zentralen Hochschulplatz orientiert. Im Erdgeschoss sind der Halle weitere Hörsäle, die Fachschaft, der Dekanatsbereich, die Einrichtungen zum Gebäudebetrieb und stark publikumsfrequentierte Einrichtungen angegliedert. Im Westen bildet die Bibliothek den Abschluss des Komplexes. In den drei Obergeschossen sind entlang den Galerien die studentischen Seminarräume angeordnet. Die Arbeitsräume der Institute befinden sich in den Fingern der beiden Kammstrukturen in ruhiger Lage. Die zentrale Erschließungshalle ist als überdachter Außenraum und Kommunikationsbereich konzipiert. Freie Treppen führen über Brücken zwischen den Kämmen bis zur obersten Galerieebene. Daneben werden mit den jeweils 2 Treppenhaukernen eines Gebäudefingers die dort erforderlichen vertikalen Verbindungen geschaffen. (Brechensbauer)

### **Awards:**

**Bauwerk des Jahres 2009, AIV Architekten- und Ingenieurverein Hamburg e.V.**

Visionen verbinden. Zuweilen auch Partner, die auf den ersten Blick nicht zusammenzupassen scheinen. Denn wer hätte geahnt, daß eines der angesagtesten Hamburger Architektenbüros sich für eine Integrierte Gesamtschule engagiert? Kai Richter, Mitinhaber von Bothe Richter Teherani (BRT), und die Architektin Heike Hillebrand haben jetzt für die Bergedorfer Gesamtschule einen Bibliotheks-Pavillon entworfen - ohne Auftrag, ohne Wettbewerb, einfach aus Begeisterung für die Sache. Möglich wurde dies durch den Enthusiasmus zweier Pädagogen. Nicht zuletzt als Reaktion auf Pisa hatten Direktor Dirk Hagener und Deutschlehrer Michael Magunna die kühne Idee, eine zentrale Schulbibliothek einzurichten und so auszustatten, daß Jugendliche sich darin wohlfühlen. Mit Hilfe von Bibliothekswissenschaftlern der Universität Hamburg sowie Unterstützung von Eltern und Sponsoren wurde vor anderthalb Jahren tatsächlich eine großzügige "Leselandschaft" in der Gesamtschule eingerichtet, um gerade die jüngeren Schüler zur Lektüre zu animieren. Dies war jedoch nur der erste Schritt, denn Hagener und Magunna wollten von Anfang an mehr: nämlich auch einen Anbau als Studienbibliothek für die Oberstufe, der das Ganze zum Modell für eine Schulbibliothek der Zukunft macht und allein schon durch seine Gestaltung eine andere Kultur des Lesens signalisiert. "Eine bewundernswerte Initiative, nicht nur für einen leidenschaftlichen Architekten, auch für den Vater von fünf Kindern", sagt Kai Richter. Der Clou an dem von BRT geplanten Neubau im Eingangsbereich des Campusgeländes ist, daß der zweigeschossige gläserne Pavillon die 70er-Jahre-Schule mit dem Wohnquartier verbinden und für Anwohner öffnen würde. Die Bibliothek soll mit Kulturcafe und einem Angebot an Printmedien im Erdgeschoß zum Treffpunkt werden. Als Herzstück des Pavillons haben BRT einen Bücherturm geplant, der als begehbare Regal in die obere Etage führt. Der lichte Raum dort ist als Studienbereich konzipiert, in dem möglichst wenig von der Konzentration auf Bücher ablenkt. "Hier könnte ein idealer Ort für individuelles Lernen entstehen", sagt Hagener. Lutz Wendler: Hamburger Abendblatt, 23.11.2005 (<http://www.abendblatt.de>)

#### **Universitätsbibliothek Erlangen, Neugestaltung, Erlangen – Germany 2011/2012**

Der zu Beginn der 70er Jahre errichtete „Neubau“ der Universitätsbibliothek an der Universitätsstraße ist baulich in die Jahre gekommen und genügt zudem nicht der heute gültigen Energieeinsparverordnung. Unter der Federführung des Staatlichen Bauamts Erlangen-Nürnberg erfolgen daher dringliche Sanierungsmaßnahmen und im Zug des Sonderprogramms „Energetische Sanierung staatlicher Gebäude“ eine grundlegende Sanierung von Dach, Fassade und der Beleuchtung. Nach Abschluss der Maßnahme sind Einsparungen von ca. 352.000 kg CO<sub>2</sub> bzw. 1.100.000 kWh pro Jahr prognostiziert. In Verbindung mit der dazu notwendigen, massiven Verstärkung der Wärmedämmung wird auch die Fassade grundlegend verändert. Nach einem Entwurf von „Brückner & Brückner Architekten“ aus Tirschenreuth wird die bisher geschlossene und monolithische Sichtbetonfassade aufgelöst werden. Die Fassaden des Sockelbaus und des Bücherturms werden optisch über durchlaufende vertikale Bänder aus Natursteinelementen miteinander verzahnt. Der bisher rote Bücherturm wird nicht mehr betont, sondern seine Masse durch eine zum Himmel hin heller werdende Oberflächengestaltung aus Glas und Metall aufgelöst. Zusammen mit einigen schrägen Elementen sollen Assoziationen an Bücherrücken in Regalen hergestellt werden.

Der Sockelbau wird durch Verwendung von Naturstein und Putzfassaden in gedeckten Farben aus Beige-/Brauntönen die Bezüge aus der Nachbarbebauung aufnehmen. Die geplante Gestaltung der Fassade fand daher die Zustimmung der Stadt Erlangen und der zuständigen Denkmalschutzbehörde. Der Beginn der Baumaßnahme ist für den 21.03.2011 vorgesehen. Der Bibliotheksbetrieb wird aufrecht erhalten. Auf ihrer Homepage wird die Bibliothek die Nutzer über unvermeidbare Einschränkungen laufend informieren. Die Fertigstellung der wesentlichen Bauteile ist zum Ende des Jahres geplant. Die Baukosten liegen bei ca. 4 Mio. €.

#### **Kulturspeicher Würzburg, Bibliothek – Germany 2002**

Umbau eines Lagergebäudes zu einem Museum und Kulturgebäude. Der Kulturspeicher ist ein ehemaliger Getreidespeicher am Alten Hafen der Stadt Würzburg. Das 128 m lange Gebäude wurde 1904 für die bayerischen Staatshäfen errichtet. € 21.000.000

### **Awards:**

**2002 Balthasar-Neumann-Preis**

Der Ort am Fluß – ein Hafen – der Kran vor dem Haus – die Farbe des Steins: mächtige, geradezu archetypische Bilder bannen uns. Dann dämmert Erinnerung. Ein Haus erzählt seine Geschichte: Geschäftige Bewegung, hektischer Lärm, Eisen auf Eisen, das Quietschen haltender Waggonen, tuckernde Schlepper, das Schwenken, Heben und Senken der Kräne ... Stille. Schließlich greift die Zukunft Raum: ein Lagerhaus ist zum Kulturspeicher geworden. Räume sind entstanden. Räume, die es begreifbar machen: die Verbindung des Alten mit dem Neuen – Einblicke, Ausblicke, Durchblicke – Eingänge, Übergänge, Durchlässe – Material und Oberflächen Die Räume machen neugierig, stiften Beziehungen und erzeugen Gefühle. Unser leidenschaftlichstes Bild: Hinter uns

der Fluß, der sich in der Abenddämmerung sanft an der Kaimauer bricht und kühl an uns heraufkriecht. Vor uns die alte Fassade mit dem gerarbttem Kalkstein und dem angewittertem Sandstein – daneben die Kalk- und Sandsteinplatten der neuen Fassade, die ihre Lage zur Seite und nach oben hin langsam, aber stetig verändern. Wahre Dinge, die für sich selber stehen, die einfach da sind. Das Licht, das aus den Fassadenöffnungen tritt, schafft Spannung, die zur Neugier wird. Das Innen läßt sich erahnen: respektvoll in und neben das Alte eingestellte Körper, unaufdringlicher, selbstverständlicher Raum, Raum für Leben, Raum für Kunst. Raum für „Konkrete Kunst“, die nicht verweisen, sondern sich selbst genug sein will. Ein Zufall? Und hinter dem Haus der Wein, der seine langen Wurzeln in den Berg bohrt. Eine schöne Fügung, Bauchkitzeln, ein Wohlgefühl. Ein Lagerhaus wurde zum Kulturspeicher. Der Kulturspeicher ist zu einem Ort geworden. Zu einem Ort, der offen ist für Neues, der aufnimmt und gibt. Auch zu einem Ort, der seine Geschichte nicht vergißt, sondern weitererzählt. (Brückner) (<http://www.german-architects.com>) (<http://www.baunetz.de>)

Am 23. und 24. Februar 2002 wird in Würzburg der „Kulturspeicher“ im Sanierungsgebiet Alter Hafen eröffnet. Das Museumsquartier in einem umgebauten Lagerhaus aus dem Jahr 1904 wurde von dem Architekturbüro Brückner & Brückner (Tirschenreuth) geplant, die 1997 einen internationalen Wettbewerb gewonnen hatten. Neben der Sammlung der Städtischen Galerie wird die der Stadt Würzburg überlassene Privatsammlung für Konkrete Kunst des Berliner Sammlers Peter C. Ruppert in die neuen Räume einziehen. Zudem sind Flächen für Wechselaustellungen, Apartments für Gäste der Stadt, Werkstätten, eine Bibliothek sowie ein Café entstanden. Vollständig erhalten ist von dem alten Speichergebäude nurmehr der Mittelteil: Hier betreten die Besucher ein mehrgeschossiges Foyer mit Oberlichtern, in dem die alte Holzkonstruktion freigelegt und in Szene gesetzt wurde. Brückner & Brückner entkernten die beiden seitlichen Teile des Altbaus, implantierten „respektvoll“ ein neues Gehäuse und ergänzten die steinernen Originalfassaden durch gläserne Vorbauten am Hafenbecken. In ihnen sind Verwaltung, ein Raum für Veranstaltungen sowie das Café mit großer Freiterrasse untergebracht. Über durchlaufende Treppen und Stege entlang der Wasserseite gelangt man zu den getrennten Sammlungen. In neuen Anbauten an den Stirnseiten des Speichers, die mit Lamellen aus Naturstein verkleidet sind, sind zusätzlich 3.400 Quadratmeter für Wechselaustellungen untergebracht. Erklärtes Ziel der Architekten war es, ein Museum „jenseits der klassischen musealen Anmutung“ zu bauen. Vielmehr ließen sie sich von „mächtigen, geradezu archetypischen Bildern“ (der Hafen, der Kran vor dem Haus) in den Bann ziehen, die die Geschichte des Ortes erzählen. (<http://www.baunetz.de>)

## **Bruno Fioretti Marquez Architekten, Berlin – Germany**

<http://www.bfm-architekten.de>

### **Libraries:**

#### **Mittelpunktbibliothek Berlin-Köpenick – Germany 2005 – 2008**

##### **Standort:**

Das Wettbewerbsgrundstück ist aufgrund seiner Position im Stadtgrundriss gleichzeitig vom urbanen Charakter der Altstadt von Köpenick und der großzügigen Wasserlandschaft geprägt. Der Ort bildet eine spannende Schnittstelle zwischen Stadt und Landschaftsraum. Ausgangspunkte unseres Entwurfs sind die Bestimmtheit des Altstadtgrundrisses mit seiner geschlossenen Blockrandbebauung, die räumliche Qualität der historischen Gestalt des Platzes sowie die Nähe und die Blickbeziehung zum Wasser. Weiterer Ausgangspunkt ist die Vielfältigkeit der Dachlandschaft und die industrielle Prägung des Uferareals durch die schlichten Fabrikgebäude.

##### **Zielsetzung:**

Die Bebauung soll eine klare Definition des Straßenraums, eine präzise Artikulation des historischen Altmarktplatzes in den ursprünglichen zwei Bereichen sowie eine deutliche Hierarchie zwischen Platz und Bibliotheksaußenbereich schaffen. Zielsetzung dieser Arbeit ist es den Neubau im Einklang mit den unterschiedlichen Charakteren und Facetten des Grundstücks zu bringen und ihn mit der bestehenden Schule und dem „Hexenhaus“ zu einem neuen Ganzen zusammenfassen.

##### **Außenräume:**

Der Neubau übernimmt in seiner Dimension den Maßstab der vorhandenen Bebauung. Die Anordnung des Baukörpers schafft Außenräume, die einen spezifischen Charakter erhalten und unterschiedliche städtebauliche Aufgaben übernehmen. Auf der nördlichen Seite wird der Straßenraum wieder gefasst und gleichzeitig wird die Blickbeziehung zum Wasser definiert. Auf der westlichen Seite wird der historische Grundriss des Altmarktplatzes wiederhergestellt, indem das neue Volumen an Stelle des ursprünglichen eingeschossigen Gebäudes plaziert wird. Der Eingang zur Bibliothek und das Lesecafé werden den neuen Platz beleben und ihm eine neue Bedeutung geben. Auf der südlichen Seite öffnet sich das Gebäude zu einem bepflanzten grünen Hof, der in Zukunft durch den geplanten neuen Baukörper definiert wird. Die subtile Differenzierung der bestehenden Strassen- und Platzsteinbeläge (kleinere und größere Kopfsteinbeläge mit schmalerer und breiterer Rasenfuge) wird thematisiert und die unterschiedlichen Atmosphären der Außenräume werden durch Variationen der Dichte zwischen Rasen und Steinen unterstrichen.

##### **Architektur:**

Der Neubau beherbergt den Lesebereich und die öffentlichen Räume der Bibliothek, im Altbau ist die Verwaltung untergebracht. Alt- und Neubau sind durch ein gläsernes Element, in dem die Ausleihe befindet verbunden. Diese gläserne Fuge bildet die Schnittstelle zwischen Verwaltung und dem öffentlichen Bereich der Bibliothek sowie zwischen Bestand und Neu.

##### **Altbau:**

Um den Reiz der alten Bausubstanz zu erhalten werden im Altbau die Eingriffe in den Bestand auf ein Minimum reduziert. In einem zentralen Kern befindet sich die neue Sanitäreanlage sowie ein Auzug. Eine Rampe zwischen Alt- und Neubau bringt den Bestand auf die neuen Standards des barrierefreien Bauens.

##### **Neubau:**

Ein kompakter Baukörper aus Ziegelstein ergänzt das bestehende Ensemble. Das bewegte Profil des Daches fügt das Volumen fügt das Volumen der Bibliothek in den kleineren Maßstab der Umgebung ein und thematisiert die Vielfältigkeit der bestehenden Dachlandschaft. Im EG befinden sich die Räume der Bibliothek (Café, Veranstaltungs-, Gruppenarbeitsraum) die auch außerhalb der Öffnungszeiten der Bibliothek benutzbar sind. Sie sind durch ein großzügiges Foyer erschlossen. Das Foyer öffnet sich zum Bibliotheksgarten und kann während der warmen Jahreszeiten in eine Loggia umgewandelt werden. Durch einen zwei- bis dreigeschossigen Raum betritt man den eigentlichen Lesebereich, ein großes Fenster öffnet den Blick zum Spreuerfer. Der Bereich für Erwachsene-, Jugend- und Kinderbereich sind auf zwei Geschosse verteilt. Die Bücheregale werden entlang der Wände und in den eingeschossigen Bereichen untergebracht, während die Leseplätze in den zweigeschossigen Räumen plaziert sind. Das Dach überspannt den Lesebereich der Bibliothek und bewirkt eine einheitliche räumliche Wirkung (Einraum-Bibliothek).

##### **Materialien:**

Das Gebäude besteht aus vier Elementen, die jeweils aus einem eigenen Material gebaut werden. Außenwände (Mauerwerk), Dachkonstruktion (Holz), Innenstruktur (Beton), Mobilierung (MDF und Bücher). Der Neubau der Bibliothek wird in massiv tragender Ziegelbauweise ausgeführt. Das außen sichtbare Mauerwerk erzählt wie beim Altbau von dem tatsächlichen, tragenden Wandaufbau. Um den heutigen ökologischen Anforderungen gerecht zu werden, ist das Mauerwerk außergewöhnlich tief (64 cm). Der Innenraum wird mit einer durchgehenden plastischen Betonstruktur gebildet, die gleichzeitig die Ziegelwände aussteift. Um die

Massivität der Mauer sichtbar zu machen, sind die Fenster innen liegend. Es werden drei verschieden große Öffnungen über die Fassaden angeordnet. Die mehrgeschossigen Lufträume die den Lesebereich prägen, zeichnen sich an der Fassade ab. Die breiten Fensterrahmen liegen innen auf der Wand. Die Ausschnittweise zeigte außergewöhnlich schöne Umgebung von Spreuer und Altstadt wird zum gerahmten Bild. Das bewegte Profil des Daches, eines der wichtigsten Merkmale des Gebäudes wird als versetztes Falwerk in weiß gestrichenem Brettschichtholz ausgeführt. Natürliches Licht aus den Oberlichtern wird durch schmale Querrippen tief in den Lesesaal geführt. Ziegel, Beton und Holzkonstruktion sind mit dem gleichen warweißen Farbton nicht deckend lasiert und werden dadurch zusammengebunden. Dabei bleiben alle Materialien erkennbar. Alles was trägt, sieht man auch. Jedes Bauteil spricht in der Sprache des Materials aus dem es besteht. (Bruno)

### Stadtbücherei Erbracher Hof, Schweinfurt – Germany, 2004

#### **Literature:**

Käpplinger, Claus: Berlin: Massiver fünfköpfiger Ziegelbau, in: DBZ 2, 2009-05-09

Kleefisch-Jobst, Ursula: Stadtbücherei im Erbracher Hof, in: Jahrbuch Deutsches Architektur Museum 2008

Brinkmann, Ulrich: Mit Sorgfalt erweitert. Stadtbibliothek im Erbracher Hof, Bauwelt, 2008, 13

#### **Situation:**

Das denkmalgeschützte Ensemble Erbracher Hof ist zur Stadtbibliothek umgebaut worden. Der historische Ort liegt am südlichen Rand der Altstadt in der Nähe vom Main und bildet zusammen mit dem gegenüberliegenden Museum Schäfer den Stadteingang. Das ursprüngliche Ensemble besteht aus drei Gebäuden. Das Vorderhaus an der Rittergasse, dem Verbindungstrakt und der Zehntscheuer, eines der ältesten Gebäude Schweinfurts.

#### **Gebäude:**

Um die prägnante städtebauliche Stellung der Zehntscheune zu erhalten, wird die notwendige Erweiterung in einem Sockelgeschoß untergebracht. In dem Vorderhaus an der Rittergasse ist ein Hotel vorgesehen. Das neue Hautzollamt schließt den Vorplatz der Bibliothek ab. Drei neue Bauteile gruppieren sich um die Zehntscheune: Ein Basisgeschoß unter dem Vorplatz, eine Glaslaterne und ein Sicherheitstreppehaus. Jedes Element übernimmt verschiedene Aufgaben. Das Basisgeschoß vervollständigt das Raumprogramm der Bibliothek. Die Fundamente des historischen Gebäudes werden freigestellt und sichtbar gemacht. Die bestehenden Eichenstützen der Zehntscheune werden mit der Tragstruktur des neuen Bauteils thematisiert: Massive Holzstützen tragen die Sichtbetondecken. Ein bewußter Kontrast besteht zwischen der rauen Materialität des Fundaments der Zehntscheune und der Präzision des neuen Baukörpers. Ein lang gezogener Glaskörper, die so genannte Laterne, lenkt das Tageslicht in den versenkten Leseraum. Dieses transparente Volumen begrenzt und bildet den Vorplatz und schützt ihn vor dem Straßenlärm. In der Nacht markiert die leuchtende Laterne die Präsenz der unterirdischen Bibliothek im Straßenraum. Die gläsernen Querschwerter dienen zur Aussteifung und leiten gleichzeitig das Licht tief in den unteren Raum. Die externe Sicherheitstreppe bringt das Gebäude auf die neuen Sicherheitsstandards, ohne den Innenraum des bestehenden Gebäudes zu berühren. Das Treppehaus abstrahiert das Profil des Nachbargebäudes in einem Guss aus Beton.

#### **Wegführung:**

Der Hauptzugang der Stadtbücherei erfolgt über den Vorplatz. Über eine ringförmige Wegführung sind Altbau und Neubau miteinander verbunden. Mittelpunkt des Rings ist die Zehntscheune. Vom Eingangsbereich im Erdgeschoß führt eine Treppe zum Basisgeschoß. Eine Rampe entlang der Bücherwand leitet den Besucher um das freigelegte Mauerwerk der Fundamente herum. Der anfänglich horizontale Raum entwickelt sich mit der Drehung und Senkung der Rampe in die Vertikale und führt über einen ansteigenden Garten wieder in die Höhe. Die Sitzstufen im Garten bieten Leseplätze im Freien und schaffen die Verbindung mit dem Lesegarten im Erdgeschoß.

#### **Möbiliar:**

Die Möbel aus Eiche übernehmen verschiedene Aufgaben: bewirken die Schallabsorption, beinhalten die technische Anlage (Zu- und Abluft), schaffen jeweils ihre spezifischen und erforderliche Beleuchtung. Boden, Wände und Decke der Gebäude bleiben frei von jeweiligen technischen Einrichtungen. (Bruno)

### **bsp.architekten ( Bernhard Schmidt Partner ), Berlin – Germany**

<http://www.bsp-schmidt.de>

#### **Libraries:**

**Universitätsbibliothek Ernst-Moritz-Arndt, Universität Greifswald – Germany 2001 -**

HNF 8.750 m<sup>2</sup>, BGF 15.500 m<sup>2</sup>, 23.000.000 €

In Greifswald wurde am 28. November 2001 eine neue Hochschulbibliothek eingeweiht. Das Berliner Büro BSP.architekten war 1996 als Sieger aus einem europaweiten Auswahlverfahren hervorgegangen und mit der Realisierung des Projekts beauftragt worden. Bis zuletzt hatte ein 1882 von Martin Gropius errichteter Klinkerbau als Zentralbibliothek gedient. Bauliche und bibliothekarische Missstände machten allerdings einen Neubau der wissenschaftlichen Bibliothek für die Fachbereiche Naturwissenschaft und Medizin nötig. Der Bibliotheksneubau befindet sich am zukünftigen Campusplatz im Osten des Altstadtkerns. Die „räumliche Verbindung eines natürlichen, blühenden Grünraumes im Norden“ und eines architektonischen und städtischen Platzraumes im Süden bildete nach Angaben der Architekten den „selbstverständlichen Genius Loci“ des Entwurfs. Der Arbeitsraum „Bibliothek“ sollte sich demgemäß „in einem Spannungsfeld der Antipoden Natur / Kultur sowie Garten / Platz“ entwickeln. Der Bau setzt sich aus drei architektonischen Grundbausteinen zusammen: Ein „Haus der Verwaltung“ und ein „Haus der Bücher“ werden durch eine dazwischen liegende große Erschließungs- und Lesehalle miteinander verbunden. Gleichzeitig vermittelt die „große Halle“ zwischen den Außenräumen des natürlichen Arboretums im Norden und dem städtebaulichen Forum im Süden. Das „Haus der Bücher“ kontrastiert mit seiner Lochfassade aus grün patiniertem Kupfer mit dem „Haus der Verwaltung“, das durch eine Bandfassade aus gelbem Klinker geprägt wird. Dazwischen spannen sich die Ganzglasfassaden der großen Halle. Ein signifikant auskragendes Flachdach über der Halle und dem Freihandbereich („Haus der Bücher“) soll die Bedeutung des Gebäudes im Gesamtensemble der zukünftigen Institutsbauten betonen. Der Bibliotheksbau entstand auf der Basis eines 1995 durchgeführten städtebaulichen Wettbewerbes, aus dem das dänische Büro Dall + Lindhardtsen als Sieger hervorgegangen. Neben dem Bibliotheksgebäude sind eine modernisierte und erweiterte Universitätsklinik, eine Mensa sowie ein Hörsaalgebäude und Rechenzentrum geplant. Die Fertigstellung aller Bauten ist bis 2015 vorgesehen. (<http://www.baunetz.de>)

### **BSS Architekten (Bär-Stadelmann-Stöcker), Nürnberg – Germany**

<http://www.bss-architekten.de>

#### **Libraries:**

**Universitäts- und Landesbibliothek Darmstadt – Germany 2005 - 2013**

Bauherr: TU Darmstadt € 74.000.000 BFG 30.619m<sup>2</sup>

Der Entwurf wird geprägt vom Gedanken der Raumbildung, der Vernetzung und Identifikation sowie dem Respekt vor dem heterogenen Umfeld der Universität. Die ULB bildet durch einen mäandrierenden Baukörper zwei unterschiedliche Freiräume aus, nach Norden zum Hauptgebäude den tiefer gelegenen Lesehof, nach Süden zur Otto-Berndt-Halle den Campusplatz. Beide Außenbereiche sind über den aufgeständerten Gebäudeflügel und eine großzügige Freitreppe miteinander verbunden. Vom Campusplatz aus erfolgt die Haupteinschließung der Bibliothek über ein zweigeschossiges, öffentliches Foyer und die zentrale Halle. Dieses Atrium als kommunikativer Mittelpunkt der Einrichtung, als Orientierungs- und Merkpunkt beherbergt die übergeordnete vertikale Erschließung und schafft eine gute Belichtung auch im Herzen der Bibliothek. Nach oben folgen der Allg. Lesesaal und die übrigen Fachlesesäle, die sich in Schichten zunehmender Kontemplation vom Atrium zur Fassade aufbauen: Haupteinschließung - Freihandbestand - Arbeitsplätze. (BSS)

## **Georg Bumiller, Gesellschaft von Architekten mbH, Berlin – Germany**

<http://www.bumillerarchitekten.de>

**Libraries:**

**Land- und Amtsgericht Frankfurt a.d. Oder, Bibliothek – Germany 2005**

Bauherr: Landesbauamt Frankfurt/Oder, BGF/HNF 12.000/6.600, 18.0 Mio €

Um die dritte Staatsgewalt von der Exekutive zu unterscheiden und ein in den Stadt- und Landschaftsraum wirkendes Zeichen zu errichten, wurde das Raumprogramm in einem in alle Richtungen strahlenden Solitär zusammengefaßt. Dieser wurde in das vorhandene Raumgefüge des Behördenzentrums verankert, wobei er Raumbeziehungen zur Peripherie des Geländes und der zentralen Fußgängererschließung unter den alten Alleebäumen etabliert. Durch einen knappen Innenhof erreicht man das vor dem gestapelten Saalbereich liegende mehrgeschossige Foyer. Im Kontrast zu den bestehenden Ziegelgebäuden wird der Neubau in monolithischem, einschaligem Leichtbeton gegossen. Die monolithische Leichtbetonkonstruktion verleiht dem Haus eine prägnante und typische Erscheinung. Das Volumen wird so geschnitten, sodass der Körper erhalten bleibt. Die Struktur ist klar zu lesen und die Raumfolge - im Sinne der Annäherung - genau geplant. Das Foyer wird zur Halle. Sie ist das Bindeglied des Hauses, der öffentliche Raum im Haus, über den die Gerichtssäle erschlossen werden. Eine Fuge im Gebäude, trennt den dreieckigen Körper mit den öffentlichen Funktionen des Hauses von den Verwaltungsbereichen. Über diese Fugen dringt von allen Seiten Licht in die Halle und schafft eine räumliche Verbindung zwischen Innen und Außen.

Über eine Große Treppe, geht man dem Licht entgegen und gelangt so zu den Gerichtssälen. Neben den Sälen, gliedern sich eine Cafeteria und Seminar- und Waerteräume an die Halle an, so dass diese aus vielen Perspektiven erlebt werden kann. Das Raumkontinuum findet seinen vertikalen Abschluß in der juristischen Fachbibliothek. Die Wartebereiche vor den Sälen orientieren sich zur Halle. Licht dringt von vielen Richtungen in den Raum und stellt den Bezug nach Außen und in die anderen Bereiche des Hauses her. Der Raum wird vielschichtig kodiert - der Beginn einer räumlichen Transparenz. Die harten Materialien der öffentlichen Bereiche werden kontrastiert durch warme und weichere in den intimen Räumen wie der Bibliothek. (Bumiller)

## **Chestnutt Niess, Berlin – Germany**

<http://www.chestnutt-niess.de>

**Libraries :**

**IKMZ Informations – Kommunikationszentrum mit Mensa der TFH Wildau – Germany 2002 – 2007**

Die vorhandene Gebäudegeometrie der historischen Halle wird durch einen zeitgenössischen Ergänzungsbau, der seiner Nutzung Ausdruck verleiht, fortgesetzt und somit ihre städtebauliche Positionierung zwischen der TFH und der restlichen denkmalgeschützten Industrieanlage als Tor an der Querachse zur ehem. Arbeitersiedlung unterstrichen. Erstmals erhält die Flucht der langen Giebelfront der Gesamtanlage ihren südlichen Anschluß als städtebauliche Kante. Die Umnutzung der bestehenden Halle zum IKMZ mit ihrem ungewöhnlich hohen Innenraum wurde durch den sensiblen Einbau sämtlicher Geschoßdecken ermöglicht, ohne die vorhandene Gebäudehöhe zu überschreiten und unter Beibehaltung des historisch beabsichtigten Gesamtvolumens. Somit beschränkt sich die Verwendung des Bestandes auf seinen Erhalt bzw. die Ertüchtigung der Außenhülle, ohne die räumliche Eigenschaft des Bauwerkes als Halle zu vernichten. (<http://www.german-architects.com>)

**Bibliothek am Luisenbad, Berlin-Wedding – Germany 1988 – 1995**

Das Werk von Chestnutt\_Niess erhält die Geschichte des Luisenbads: Einst ein prächtiger Amüsierbetrieb mit Quelle, Garten, Theater und Restaurant wurde die Badeanstalt fast völlig von den Bomben des Krieges zerstört. Die übriggebliebene Mauer soll als Erinnerung an die Geschichte und Versprechen für gegenwärtige Kunst dienen. Vor der Abrisswut rettete eine Bürgerinitiative nur Teile der historischen Gebäude. Das Eingangsgebäude, „Vestibül“ genannt, welches ehemals zum großen Saal führte, und das kleinere freistehende „Comptoir“ waren die ruinösen Überreste der vergessenen Idylle des Luisenbades, die miteinander verbunden und erweitert wurden, um eine öffentliche Stadtteil-Bibliothek entstehen zu lassen. Die neuen Anbauten verstehen sich als moderne Fortführung des vorgefundenen Collagenprinzips. Die teils ruinös gelassenen Materialien aus den unterschiedlichen Entstehungszeiten der Altbauten wurden ergänzt durch großflächig angelegte, selbstbewusste Elemente des Neubaus. **Neubau Laborkomplex Department Chemie und Didaktik Naturwissenschaften (Bibliothek), Universität zu Köln – Germany on design**

1. Preis Realisierungswettbewerb 2012. Auslober Universität zu Köln, Aufgabe Neubau/Umbau/Sanierung, Größe HNF ca. 29.500 qm, Wettbewerbsart beschränkter Realisierungswettbewerb

Die Universität zu Köln hat heute die Preisträger/innen im Architekturwettbewerb für den Neubau eines Laborkomplexes auf dem naturwissenschaftlichen Campus präsentiert. Der erste Preis, mit einer Prämie von 90.000,00 Euro, geht an das Architekturbüro Code Unique Architekten aus Dresden. Zweitplatzierte ist das Büro Lepel & Lepel aus Köln mit einer Prämie von 60.000,00 Euro. Zwei dritte Preise mit jeweils 40.000,00 Euro vergab die 13-köpfige Jury an die Büros Nickl & Partner Architekten AG aus München und Thomas Müller Ivan Reimann Gesellschaft von Architekten mbH aus Berlin. Außerdem wurden drei weitere Arbeiten mit Anerkennungen.

Aus ursprünglich 110 Bewerbungen hatten sich 25 Architekturbüros aus ganz Deutschland, aber auch aus Großbritannien, den Niederlanden, Österreich und Spanien für die Finalrunde in einem Losverfahren qualifiziert. 22 Büros haben dann ihre Arbeiten eingereicht. Ziel ist es, ein modernes Laborgebäude für die Lehre und Forschung an der Universität nach neuesten Erkenntnissen zu errichten.

Der rund 170 Millionen teure Neubau südwestlich des bestehenden Chemie-Hörsaalgebäudes am Grüngürtel soll künftig die zentrale Anlaufstelle für viele Studierende der Universität zu Köln werden. Eine Öffnung zur nördlich gelegenen Universität war somit neben der Funktionalität zentraler Wunsch der Nutzer, eine städtebauliche hochwertige Schließung der Baulücke an der Universitätsstraße ausdrücklicher Wunsch der Stadt. Die Preisträger schaffen es, in unterschiedlicher Weise, beide Aspekte miteinander zu vereinen. Das Votum ist der Jury nicht leicht gefallen“, betont der Kanzler der Universität, Dr. Johannes Neyses, „sowohl die vielen verschiedenen Lösungsansätze als auch die Qualität der Wettbewerbsarbeiten haben dem Preisgericht die Qual der Wahl beschert.“

Die Planung und Ausführung soll Anfang 2013 beginnen. Das erste Bauteil soll Ende 2017 und der zweite Bauteil Ende 2019 fertiggestellt werden. Im Preisgericht waren u.a. Bernd Streitberger, Beigeordneter der Stadt Köln, der Rektor der Universität, Prof. Dr. Axel Freimuth sowie Vertreter/innen des Departments für Chemie und des universitären Baudezernats vertreten.

(<http://www.portal.uni-koeln.de>)

Das Wettbewerbsgebiet schließt an den nördlichen Bestandsbau der Universität an und wird süd-westlich durch die Luxemburger- sowie die Universitätsstraße begrenzt. Der fünf geschossige Neubau gliedert sich formal in drei Baukörper, die zusammen ein Ganzes ergeben, aber dennoch auf Grund ihrer differenzierten Anordnung verschiedene räumliche Situationen generieren. Entlang der angrenzenden Straßen werden die städtebaulichen Kanten gestärkt. Auf dem Grundstück selbst entstehen unterschiedliche Freibereiche und Platzstrukturen. Ein angenehmer städtebaulicher Maßstab entsteht durch den Dreiklang der Baukörper. Der mittlere Baukörper nimmt dabei eine besondere Stellung als Zentralbaustein ein. Ihm schließen sich auf beiden Seiten die Institutsbereiche an. Da die fußläufige Hauptschließung im Wesentlichen von Norden zu erwarten ist, wird die Situierung des Neubaus so gewählt, dass ein einladendes Entree zwischen Altbau und dem neuen Institutsgebäude entsteht. Über eine großzügige Freitreppe wird der Publikumsverkehr auf den internen Campusplatz geleitet. Ebenerdig gelangt man sowohl in den Altbau als auch über den Haupteingang in das zentrale Foyer des Neubaus. Dieser Gebäudeteil bildet auch im Inneren die funktionale Mitte. Auf Grund der Anhebung des Platzniveaus ist es nun auch möglich einen direkten Außenzugang der studentischen Arbeitsplätze zu realisieren. Alle stark frequentierten Bereiche mit vorwiegend öffentlichem Charakter gruppieren sich um den mittig gelegenen Campusplatz. Eine Achse mit allen notwendigen infrastrukturellen Bereichen erstreckt sich über die gesamte Gebäudelänge und verbindet alle Baukörper miteinander. Entlang dieser belebten Achse befinden sich Praktikumsräume und aufgeweitete Flurbereiche mit kommunikativer und studentischer Arbeitsatmosphäre. Dieser Achse schließen sich auf beiden Seiten die ruhiger gelegenen Institute mit den verschiedenen Professuren an. Das Untergeschoss schließt im Bereich des Campusplatzes direkt an den überdachten Lieferbereich an. Von hier aus werden alle Werkstattbereiche, die Zentrale Analytik, das Chemikalienmanagement sowie die Bibliothek beliefert. (<http://www.codeunique.de>)

### **Neubau HafenCity Universität Hamburg, Hamburg – Germany, on construction (Richtfest 2012)**

1.Rang Realisierungswettbewerb 2007, Bauherr Freie und Hansestadt Hamburg, Umfang BGF 27.000 m<sup>2</sup>

Kosten 62.000.000 €, Leistung Lph. 1 - 8

Auf dem Areal am Magdeburger Hafen / Baakenhafen wird der Neubau der zum 1. Januar 2006 gegründeten Hafen City Universität als Hochschule für Baukunst und Raumentwicklung realisiert. Mit dem Neubau sollen die bislang räumlich getrennten Disziplinen Architektur, Bauingenieurwesen, Geomatik und Stadtplanung unter einem Dach vereint werden. Insgesamt gehören ca. 1.500 Studierende und ca. 180 Beschäftigte der neuen Hochschule an. Das Gebäude der HCU gliedert sich in zwei Gebäudeteile, die durch einen transparenten mehrgeschossigen Binnenraum vertikal und horizontal eng vernetzt sind. Die öffentlichen Nutzungen mit hohem Publikumsverkehr im Erdgeschoss gewähren durch beide Gebäudeteile höchstmögliche Transparenz von der Überseeallee bis zum Kai des Baakenhafens. Während im südlichen Gebäudeteil mit Blick zum Kai vorrangig gastronomische Einrichtungen angeordnet werden, befinden sich im Bauteil Nord die Zugänge zur zwei- bis dreigeschossigen Bibliothek und zur Ausstellungsfläche. Die mehrgeschossige Bibliothek mit ihren vielfältigen Blickbeziehungen zum Innen- und Außenraum ist gut ablesbar zum Straßenraum orientiert und akzentuiert den Eingangsbereich der Hafencity-Universität. Der Anspruch der HCU Interdisziplinarität und Kommunikation zu fördern wird durch ein Konzept umgesetzt, öffentlich wirksame und nutzbare Funktionen wie Medienzentrum mit Bibliothek, Galerie als Ausstellungsfläche, die sowohl intern als auch extern nutzbar ist, in der Erdgeschosszone so zu organisieren, dass eine Nutzbarkeit sowohl durch die Studierenden, als auch durch die Öffentlichkeit möglich wird. Unterstützt wird dies durch die Anordnung der Cafeteria und der Mensa, die auch außerhalb der klassischen Nutzungszeiten geöffnet und als flexible Arbeitsbereiche, Internet-Lounge und Treffpunkt genutzt werden können. Die oben beschriebenen Gebäudeteile erhalten jeweils eigenständige Fassaden, die auf die unterschiedlichen Situationen reagieren. Gegenüber den strenger ausgebildeten Fassaden des zur Stadt orientierten Bauteils Nord mit in der Ebene homogenen Flächen differenziert sich der elbseitige Bauteil Süd mit bewegten Zuschnitten der auskragenden Brüstungselemente, die eine starke Tiefenwirkung in der Fassade erzeugen. (Code)

Das Wissensquartier wird von 2010 bis 2013 eine Hauptbaustelle der Hafen-City sein. Neben der HUC entstehen hier der Neubau der Logistics University, die Greenpeace-Zentrale, das designport hamburg und Gebäude für weitere Nutzer aus der Kreativbranche. Durch eine Vielzahl von Gebäuden mit hohen ökologischen Standards geprägt, soll sich das Wissensquartier außerdem zu Hamburgs erstem nachhaltigen Vorzeigequartier entwickeln. (<http://www.baunetz.de>)

### **Hochschule für Bildende Künste (Bibliothek) Dresden, – Germany 2009**

Fertigstellung 2. BA 02. Juni 2009 (I. Preis VOF - Verfahren 2004), Bauherr Staatsbetrieb SIB, NL Dresden II

Aufgabe Sanierung/Umbau, Umfang BGF 24.100 m<sup>2</sup>, Kosten 17.800.000 €, Projektphase 09 / 2004 – 05 / 2009

Der Gebäudekomplex der Hochschule für Bildende Künste in der Güntzstraße in Dresden wurde von 1902 bis 1907 erbaut und als Kunstgewerbeschule und Kunstgewerbemuseum genutzt. Im 2. Weltkrieg wurde das Gebäude stark zerstört, worauf in den 50er Jahren mehrere teilweise provisorische Sicherungs- und Umbaumaßnahmen erfolgten. Dieser Zustand blieb bis zum Beginn der Gesamtanierung im Juni 2006 erhalten. Der Gebäudekomplex wird nach der Sanierung weiterhin von der Hochschule für Bildende Künste Dresden genutzt werden.

Konkrete Zielstellung der Gesamtanierung war die Verbesserung der Nutzungsstrukturen für die Lehre unter Berücksichtigung der vorhandenen räumlichen Gegebenheiten sowie die Grundinstandsetzung der Gebäudesubstanz. Weitere Wesentliche Maßnahmen waren die Erweiterung der Bibliothek, der Umbau der Aula zum zentralen Hörsaal, die Errichtung eines Lastenaufzuges, die bauliche und technische Ertüchtigung des Restaurierungsbereiches sowie der Einbau eines analytischen Labors. Grundlegende gestalterische Herangehensweisen an die Planung waren der Rückbau und Freilegung der Gebäude-Ursprungsstruktur, die Neuordnung von Zugängen und die Schaffung klarer Grundrisse. Die Bekleidung der Raumflächen und Einbauten erfolgte unter Verwendung weniger und zurückhaltender Materialien in dezenter und sachlicher Gestaltung.

#### **Stadtgeschichtliches Museum Leipzig, Bibliothek – Germany 2004**

Bauherr Stadt Leipzig, Bauzeit 2002 – 2004, BGF 4.375 m<sup>2</sup>

Am 7. März 2004 wurde das Stadtgeschichtliche Museum auf dem Sachsenplatz in Leipzig eröffnet. Es ist der erste realisierte von vier L-förmigen sogenannten „Winkelbauten“ rings um das Museum der bildenden Künste, das sich noch im Bau befindet. Für die Planung des Stadtgeschichtlichen Museums zeichnet das Architekturbüro Ulrich Coersmeier (Leipzig/Köln/Berlin) verantwortlich. Die städtebauliche Grundform des gesamten Ensembles geht auf den Entwurf des Berliner Büros Hufnagel Pütz Rafaelian zurück: Es war seinerzeit mit einem ersten Preis für das Konzept eines halbtransparenten Quaders für das Bildermuseum, der von vier L-förmigen Winkelbauten flankiert wird, ausgezeichnet worden (BauNetz-Meldung zum Richtfest am 30. 4. 2001). Der jetzt fertig gestellte Bauabschnitt des ersten „L“ an der südöstlichen Ecke Reichsstraße/Böttcherstraße stellt allerdings nur einen Teil des zukünftigen Baus dar: An der derzeitigen Brandwand soll demnächst ein Wohn- und Geschäftshaus anschließen, das die Situation vervollständigt. Das Stadtgeschichtliche Museum war bisher in den Räumen des Alten Rathauses untergebracht. Hier soll in Zukunft nur die Dauerausstellung präsentiert werden. Wechselausstellungen, Depots, Magazin, Werkstatt, Bibliothek und Verwaltung werden im Neubau angesiedelt. Die Lagerräume, Depots und Werkstätten nehmen mit 2.100 Quadratmetern rund zwei Drittel der gesamten Museumsfläche ein; „Werkstattcharakter“ war daher auch das Leitmotiv bei der Gestaltung des Hauses. Wechselseitige Ein- und Ausblicke in und durch die unterschiedlichen Bereiche des Gebäudes hindurch bis hin zu einem „Museums-Schaukasten“ für die Passanten war Teil des Konzepts. Idee war die Platzierung eines „nach außen geschlossenen Kubus“, in den gezielt Öffnungen eingeschnitten“ wurden. Als dominierendes Fassadenmaterial wählten die Architekten daher den Naturstein „Rochlitzer Porphyr“, zum Innenbereich öffnet sich eine Glasfassade. (<http://www.baunetz.de>)

Bausumme 1.400.000 Euro, Auftraggeber: Sächsisches Immobilien- und Baumanagement

### **Awards:**

**Anerkennung zum George Bähr Preis 2008**

Der Ersatzneubau der Bibliothek ist als Pavillon in die bestehende Streuobstwiese eingestellt. Er nimmt in Ausrichtung und Grundrissform Bezug zu den bestehenden Bauten. An der Südostecke des Gebäudes liegen hinter einem tiefen Gebäudeeinschnitt Windfang, Garderobe und der Foyerbereich. Auf der Südseite und der Ostseite sind die Funktionsbereiche (Sanitärräume, Verwaltungsräume, Archivraum) angelagert. Im Zentrum des Gebäudes liegt der Freihandbereich der Bibliothek. Auf der Nordseite, mit Ausblick auf die Streuobstwiese und auf der Ostseite befinden sich die Leseplätze. Diese werden über großflächige Fensterbänder natürlich belichtet. (dd1)

Bauherr: Bundesrepublik Deutschland, Staatliches Hochbauamt Baden-Baden. Wettbewerb 1999, 1. Preis, Realisierung 1999 – 2003, HNF 7.767 m<sup>2</sup>, BGF 12.640 m<sup>2</sup>, BRI 52.300 m<sup>3</sup>, Gesamtkosten € 25.000.000

Mitten im historischen Fächergrundriss Karlsruhes arrondiert die mäanderförmige Großform des Erweiterungsbaus den trapezförmigen Baublock. Der Blockrand ist im Norden ist mit einem dreigeschossigen Winkel geschlossen, die Fortsetzung des Mäanders wandelt sich dann zur Bibliothek, die mit der Breite des Kopfbaus einen Dialog mit dem gegenüberliegenden Palais aufnimmt. Das Gebäude zeigt seine Identität als skulpturale Erscheinung, deren strikte Seiten an städtebaulich markanten Stellen mit plastischen Ausformungen versehen sind. Eine homogene Fassadenstruktur aus Naturstein mit teilweise flächenbündiger Sicherheitsverglasung überzieht die Oberfläche. (Dohle)

#### **Hochschule für Wirtschaft und Recht (Bibliothek), Berlin – Germany 2008 - 2010**

Bauherr: Hochschule für Wirtschaft und Recht, Senatsverwaltung für Stadtentwicklung, Baukosten: 8,9 Mio Euro, Bauvolumen: 9.600 qm BGF

Die Hochschule für Wirtschaft und Recht ist mit rd. 8500 Studierenden und über 50 Studiengängen im privaten und öffentlichen Wirtschafts-, Verwaltungs- und Rechtsmanagement sowie in den Ingenieurwissenschaften eine der größten Fachhochschulen in Berlin. Um der stetigen Expansion der Hochschule gerecht zu werden, wird ein weiteres Gebäude am Campus Berlin Schöneberg entwickelt. Es handelt sich um ein Verwaltungs- und Kontorgebäude aus dem Jahr 1938, das aufgrund seines qualitativen Niveaus im Fassaden- und Innenbereich als Baudenkmal eingestuft ist. Die gesamte Baumaßnahme gliedert sich in drei wesentliche Bereiche:

Die umfassende Gebäude-, Fassaden- und Fenstersanierung unter Berücksichtigung energetischer und denkmalpflegerischer Aspekte, den Umbau der Innenbereiche zum Zwecke der Umnutzung zur Hochschule mit Seminar- und Verwaltungsräumen sowie die Entfernung von zwei Geschossen zum Einbau der zentralen Hochschulbibliothek und einer Cafeteria auf rd. 2500 qm Fläche. Sämtliche Massnahmen werden unter Berücksichtigung des Denkmalstatus durchgeführt. Teile der Baumaßnahme werden im Rahmen des Konjunkturpakets II finanziert und durchgeführt.

#### **Umbau und Modernisierung Mediathek, Neckargemünd – Germany 2010**

**Bauherr:** SRH Holding, Die SRH Holding (SdBR) (ursprünglich Stiftung Rehabilitation Heidelberg) ist eine private Stiftung bürgerlichen Rechts mit Sitz in Heidelberg. Die Stiftung fungiert als Dachgesellschaft für diverse Tochterunternehmen, die auf den Gebieten des Gesundheits-, Bildungs- sowie Sozialwesens tätig sind. Dazu zählt der Betrieb von privaten Hochschulen, Berufsfach- und allgemeinbildende Schulen, Bildungszentren für Weiterbildung und berufliche Rehabilitation sowie Krankenhäuser und eine Rehabilitationsklinik. Die SRH Holding ist Mitglied des Diakonischen Werks der Evangelischen Landeskirche in Baden e. V. Die Gründung der SRH geht zurück auf eine Initiative im Evangelischen Arbeiterwerk in Heidelberg, aus dem heraus am 5. September 1955 die Gründung des Vereins Stoeckerwerk e. V. erfolgte. Ziel dieses Vereins war zunächst die Umschulung von Kriegsversehrten, später dann die Rehabilitation von Behinderten. Außerdem wurden Wohnheime für Arbeiter und Werkstudenten betrieben. Die Vereinsziele wurden spezifiziert mit der Gründung der Stiftung Berufsförderungswerk Heidelberg am 4. Februar 1966. Das Stiftungsziel war, Einrichtungen zur umfassenden Rehabilitation körperbehinderter Menschen zu betreiben. Am 1. Januar 1971 wurde der Name der Stiftung in Stiftung Rehabilitation Heidelberg geändert; deren Initialen SRH blieben auch nach mehrfacher Umstrukturierung des Unternehmens in den folgenden Jahrzehnten als Namenskürzel erhalten. Das Einheitsunternehmen Stiftung Rehabilitation wurde durch eine Satzungsänderung vom 1. November 1995 in einen Konzern mit rechtlich selbständigen Tochterunternehmen und diversen Unternehmensbeteiligungen umgewandelt, der Stiftungszweck auf die „Erbringung von Dienstleistungen des Gesundheits-, Bildungs- und Sozialwesens“ erweitert. Dies spiegelte sich auch in der am 15. April 1999 erfolgten neuerlichen Namensänderung in SRH Holding, verbunden mit der Umbenennung des Stiftungsrats in Aufsichtsrat, wider. (<http://www.srh.de>)

**Bauzeit:** Juni 2010 - Oktober 2010, 830.000 € brutto ohne Baunebenkosten, 1,04 Mio € brutto mit Baunebenkosten

Die bestehende Mediathek des Berufsbildungswerkes Neckargemünd GmbH, sowie ein bestehender Lehrerbereich und die Lehr- und Lernmittelverwaltung der SRH Schulen GmbH wurde umgebaut und modernisiert. Die tragenden Bauteile (Stahlbetonstützen, Wände, Decken), sowie die bestehende Fensterfront und der Estrich blieben erhalten. Nichttragende Wände, Boden- und Deckenverkleidungen und sonstige Einbauteile wurden abgebrochen und bis auf den Rohbau zurückgebaut um eine neue Grundrissaufteilung zu ermöglichen. Die Elektro-, Fernmelde- und IT-Installationen wurden ebenso wie die Lüftungs- und Sanitärinstallationen komplett erneuert, sowie eine neue flächendeckende Brandmeldeanlage installiert. Die neu gestalteten Bereiche werden komplett mechanisch be- und entlüftet, die neue Beleuchtungsanlage ist tageslichtgesteuert. Der Ausbau erfolgte in Trockenbauweise. Die großzügig verglasten Raumtrennwände sorgen für maximale Tageslichtausbeute und bieten Schallschutz von Raum zu Raum. Die neu abgehängte Decke ist raumakustisch wirksam, sowie größtenteils reversibel ausgeführt. Der neue Bodenbelag aus Kugelgarn ist strapazierfähig und wirkt ebenfalls geräuschabsorbierend. Die neu gestaltete Mediathek ist auf ca. 315 m<sup>2</sup> in 3 verschiedene Bereiche eingeteilt: den Sachbuch-, den Kinder- und den Teenie-Bereich. Hier stehen Bücher, DVDs, Musik-CDs, Hörbücher und Zeitschriften zum Verleih bereit. Ca. 29.000 Medien lassen sich auf rund 575 Laufmetern Regal, in Büchertürmen und anderen Präsentationsmöbeln unterbringen. Auf gemütlichen Sitzmöbeln kann gelesen und an Leseplätzen mit EDV-Anschluss recherchiert und gearbeitet werden. An der signifikanten Empfangstheke, gestaltet aus grünem Corian, befinden sich zwei, im Backoffice 10 Computer-Arbeitsplätze. Ausserdem gibt es für die Besucher einen weiteren, abgetrennten Arbeitsraum mit 6 Plätzen für intensive und introvertierte Arbeit. Der angeschlossene Lehrerbereich ist gegliedert in einen locker möblierten Aufenthalts- und Meetingbereich mit Kaffeetheke und Mitarbeiterschliessfächern, abgeschlossene Vorbereitungs-, Besprechungs- und Arbeitsräume und den bestehenden Verwaltungsbereich. Ein helles Farbkonzept, dominiert von weiß und akzentuiert durch Orange- und Grüntöne schafft eine frische und lichte Atmosphäre in der sich gut lesen, lernen und arbeiten lässt. (Donnig)

#### **SRH Fachschule Heidelberg, Bibliothek, Heidelberg – Germany 2004**

**Bauherr:** SRH Holding Heidelberg, **Bauzeit:** 2002 – 2004, **Bausumme:** € 30.000.000, **Bruttogrundfläche:** 14.200 m<sup>2</sup>

Am 3. Juli 2002 wurde in Heidelberg-Wieblingen der erste Spatenstich für den Neubau der privaten Fachhochschule Heidelberg gefeiert. Die seit 1969 existierende Einrichtung verfügte bisher über kein eigenes Gebäude. Die Pläne für den Neubau stammen von den Architektinnen Marion Donnig und Ellen Unterstab aus Rastatt. Das Hauptmerkmal des dreigliedrigen Gebäudes ist ein weithin in der Rheinebene sichtbarer 50 Meter hoher gläserner Turm, der so genannte „scientific tower“. Die transparente und geschwungene Form des Neubaus stehe für Dynamik und Aufschwung, die Stahl-Glas-Konstruktion für Transparenz der Fachhochschule Heidelberg, die kein akademischer Elfenbeinturm, sondern ein praxisorientierter bürgernahe Bildungspartner der Studierenden und ein fortschrittlicher Forschungs- und Entwicklungspartner der Wirtschaft sein will - so die Architektinnen in ihrem Erläuterungsbericht. Das Gebäude ermögliche durch eine konsequente Umsetzung des Prinzips der Multifunktionalität eine ständige Anpassung an sich verändernde Nutzeranforderungen. Die neue Fachhochschule besteht aus einer Komposition von drei Gebäudeteilen, die auf einer großzügigen Plaza angeordnet sind. Jeder Gebäudeteil hat seine eigene funktionale Bestimmung und Identität:

Der „scientific tower“ (Hörsaal, Seminar-, Unterrichts- und Übungsräume) bestimmt die Gesamtkomposition des Gebäudekomplexes und soll den wichtigsten Stadtzugang Heidelbergs aufwerten. Der vierzehngeschossige Turm wird als Stahlbetonskelett-Konstruktion mit vorgehängter Glas-Doppelfassade ausgeführt.

Das „scientific forum“ (Empfang, Kommunikation, Audimax, Cafeteria, Ausstellung) bildet die horizontale Verbindung zwischen „scientific tower“ und „scientific arc“ und durchdringt beide Bauteile. Die leicht geschwungene Fassade nimmt die runde Schwingung des Turms auf und führt die Besucher mit einer einladenden Geste zum Haupteingang. Die offene Halle stellt das Herzstück der Gesamtkomposition dar, von dem alle Gebäudeteile aus übersichtlich und mit kurzen Wegen erschlossen werden. Das zweigeschossige Forum wird freispannend als Stahlkonstruktion über die gesamte Gebäudetiefe ausgeführt. Die Transparenz zur scientific plaza wird durch eine großzügige Stahl-Glasfassade erreicht.

Der „scientific arc“ (Anwendungsbezogene Forschung & Entwicklung, PC-Studios, Bibliothek, Medien, Administration) bildet das architektonische Rückgrat für die Plaza. Der weiche Schwung der Fassade lenkt den Besucher auf den Haupteingang. Dieser Gebäudeteil ist so angelegt, dass eine eventuelle Erweiterung der Hochschule einfach möglich ist, ohne die Gestaltungsabsicht des

ursprünglichen Gebäudes zu beeinträchtigen. Der viergeschossige „scientific arc“ ist als eine Stahlbetonskelett-Konstruktion mit einer Bandrafterfassade konzipiert.

Die „scientific plaza“ (Außenbereich, offenes Auditorium, Campus) schließlich verbindet den Gedanken der modernen Campus-Universität mit dem traditionellen urbanen Element der italienischen Piazza. Hier entsteht ein offenes Auditorium und ein Treffpunkt, der in das Gebäude überleitet.

Der Neubau wird 6.400 Quadratmeter Hauptnutzfläche haben, wird bis zu 1.200 Studenten aufnehmen und soll im Herbst 2004 bezugsfertig sein. (<http://www.baunetz.de>)

Die dynamische Botschaft der neuen Heidelberger Fachhochschule ist auch architektonisches Programm. In der ältesten Universitätsstadt Deutschlands wurde im Juli 2002 mit dem Neubau der 1969 gegründeten Fachhochschule begonnen. Seit ihrer Fertigstellung im September 2004 besitzen Stadt und Region eine neue, selbstbewusste und zukunftsorientierte Wissenschafts- und Forschungseinrichtung. Das bauliche Konzept der neuen Lehranstalt setzt auf ein inspirierendes Spannungsfeld durch Gegensätze wie Strenge und Sinnlichkeit, Ordnung und Freiheit. Als öffentlicher Raum soll die Hochschule zugleich motivieren und provozieren und damit den geistigen Austausch zwischen Studierenden und Lehrkörper nachhaltig fördern. Das Gebäude gibt der Hochschule ein Erscheinungsbild, das sich deutlich von dem anderer Hochschulen abhebt und für den Aufbruch in die Wissenschaft des 21. Jahrhunderts steht. So tritt die dreigliedrige Komposition mit ihrer unverwechselbaren, dynamischen Formen- und Farbensprache bewusst dem nüchternen, orthogonalen Stil vieler pädagogischer Zweckbauten entgegen und sorgt damit auf formaler wie inhaltlicher Ebene für Transparenz, Offenheit und Identität. Zentrales Gestaltungselement des Ensembles ist der 13-geschossige, in der Rheinebene weithin sichtbare „Science Tower“. Mit einer Nutzfläche von 2700 qm hat der 54 Meter hohe und als Stahlbetonskelett-Konstruktion mit vorgehängter Glas-Doppelfassade angelegte amorphe Baukörper im wahrsten Sinne des Wortes eine herausragende Funktion. In seinem Inneren sorgen leichte, offene Strukturen für lehrstuhlübergreifende Synergieeffekte. Seine geschwungene Form bietet von jedem Standort neue Perspektiven und prägt entscheidend den Stadteingang der Wissenschaftsstadt Heidelberg. Der schlanke Turmbau durchstößt mit seiner Breitseite das Herzstück der Gesamtanlage: das geschwungene „Science Forum“. Die offene Halle, von der aus alle Gebäudeteile übersichtlich erschlossen werden, verbindet Tower und „Science Arc“. Sie ist lebendiges Zentrum für Begegnungen und Veranstaltungen aller Art. Mit zwei Geschossen und einer Nutzfläche von 690qm ist die freispannende Stahlkonstruktion über die gesamte Gebäudetiefe ausgeführt. Der „Science Arc“ ist die dritte eigenständige Bauform. Leicht gekrümmt, bildet die viergeschossige Stahlbetonskelett-Konstruktion mit Lochfassade das Rückgrat für die „Science Plaza“. Mit leichtem Schwung lenkt der 3600 qm Nutzfläche bietende Baukörper auf den Haupteingang. Am Platzeingang befindet sich als Symbol interdisziplinären Arbeitens die verglaste „Himmeltreppe“. Einer Schere gleich öffnet sich die Komposition auf die großzügig ausgelegte „Science Plaza“. Als offenes, in das Gebäude überleitendes Auditorium lädt sie zum Verweilen inmitten von Natur, Wasser und Kunst ein. Mit dem Neubau der Fachhochschule werden gleich mehrere Ziele definiert und erreicht. So können durch den Einsatz umweltfreundlicher Baumaterialien sowie der Möglichkeit, räumliche Bedingungen selbst zu regulieren, Umwelt und Energieressourcen nachhaltig geschont werden. Ein auf die Architektur abgestimmtes Farbkonzept unterstreicht die Ausdruckskraft des Baus, weckt Emotionen und spricht die Sinne an. Das signalhafte Leistsystem im Inneren der drei Hochschulhäuser erleichtert die Orientierung. In puncto Nachhaltigkeit erlaubt die räumliche, technische und konstruktive Planung eine außerordentliche Variabilität der Räume und des Mobiliars. Auf sich ständig ändernde Nutzerbedingungen kann damit schnell und flexibel reagiert und zugleich eine hohe Investitionssicherheit für den Bauherrn gewährleistet werden. (Donnig)

## **Max Dudler Architekt, Berlin – Germany**

<http://maxdudler.de>

### **Libraries:**

#### **[Bibliothek, Deutsche Hochschule für Verwaltungswissenschaften, Speyer – Germany in design \(2014\)](#)**

Voraussichtlich bis Ende 2014 soll in Speyer ein Bibliotheksneubau an der Deutschen Hochschule für Verwaltungswissenschaften errichtet werden. Das teilte Finanzstaatssekretär Salvatore Barbaro anlässlich eines Besuches bei der Niederlassung Landau des Landesbetriebs Liegenschafts- und Baubetreuung (LBB) mit. „Der großen Bedeutung der Hochschule entsprechend konnten wir den international renommierten Architekten Max Dudler für die Planung gewinnen.“ (<http://www.fm.rlp.de>)

#### **[Pädagogische Hochschule Zürich – Bibliothek – Switzerland 2012](#)**

Bauherr:SBB Schweizerische Bundesbahnen, Baudirektion Kanton Zürich (Baufeld A), Bauzeit2009-2012, Bauvolumen  
Baufeld A20 - Pädagogische Hochschule BGF: 54.300m<sup>2</sup> BRI: 216.400m<sup>3</sup>, Baufeld A30 - Büro- und Geschäftshaus BGF: 15.300m<sup>2</sup> (Mietfl.) BRI: 68.000m, Baufeld C (mit Chipperfield+Gigon/Guyer) BGF: 56.700m<sup>2</sup> BRI: 213.000m<sup>3</sup>

Neubau eines Stadtquartiers an der Zürcher Europaallee im Anschluss an das elegante Gebäude der alten Sihlpost (1929). Die Gebäude für Baufeld A und C des Entwicklungsgebietes, die u.a. die Pädagogische Hochschule Zürich beherbergen, schreiben die lebendige Kontinuität der Zürcher Architekturtradition in der Sprache unserer Zeit fort. Die Straßen, Gassen, Plätze und Passagen des städtebaulichen Plans entfalten das gesamte Repertoire der europäischen Stadtbaukultur. Vielfältige urbane Nutzungen sind im Quartier auf engstem Raum vereinigt. Details wie Wasserspiele, Stadtlichter und Bänke vervollständigen ein Stück Stadt von zeitloser, europäischer Identität. (Dudler)

Der Campus PH Zürich wurde von Max Dudler entworfen. Seine sehr individuelle Ästhetik arbeitet oftmals mit den Farben Grau, Schwarz und Weiss, die auch in der Bibliothek PH Zürich den Ton angeben. Zudem spielt in seiner Ausstattung der Räume Kirschholz eine bedeutende Rolle. Max Dudler gewann im März 2006 den vom Kanton ausgeschriebenen Wettbewerb für die Gestaltung eines Teils der Europaallee, und diese Entscheidung wurde mittels einer Volksabstimmung im September 2006 bestätigt. (<http://bibliothek.phzh.ch>)

#### **[Folkwang Bibliothek, Essen – Germany \(Competition 2006\) 2012](#)**

Bauherr: Bauliegenschaftsbetrieb NRW BGF: 1.870 m<sup>2</sup>, BRI 7.300 m<sup>3</sup>

Auf dem Werdener Campus wird ein exklusiver Bibliotheksneubau errichtet, mit dem die Folkwang Universität der Künste ab 2010 über "die musikwissenschaftliche Bibliothek des Ruhrgebiets" verfügt. Vereinigt sind hier neben den Folkwang Beständen die ehemalige Musikwissenschaftliche Bibliothek der RUB und die früheren Bestände der Musikpädagogik der Universität Duisburg Essen. Voraussichtliche Fertigstellung des Gebäudes: März 2012. Für die Realisierung des Neubaus steht insgesamt ein Budget von 6 Millionen Euro zur Verfügung, von denen die Alfried Krupp von Bohlen und Halbach-Stiftung 2,5 Millionen Euro großzügig zugesagt hat. Das Land NRW (Bau- und Liegenschaftsbetrieb NRW) finanziert den anderen Teil. Aus dem vom Bau- und Liegenschaftsbetrieb NRW (Niederlassung Duisburg) ausgelobten Wettbewerb ging als Sieger der Entwurf des Architektenbüros Max Dudler, Berlin, hervor, das nach Ansicht der Jury das überzeugendste Konzept zur Entwicklung der neuen Bibliothek im Rahmen des denkmalgeschützten Ensembles der Alten Abtei vorschlug. Die Fassade ist konzipiert aus transparentem Stein. (<http://www.folkwang-uni.de>)

## Jacob und Wilhelm Grimm-Zentrum, Bibliothek der Humboldt-Universität Berlin – Germany 2006 – 2009

Bauherr: Humboldt-Universität zu Berlin, Techn.Abt. BGF 37.500 m<sup>2</sup>, BRI 138.570 m<sup>3</sup>

### **Awards:**

2011 „Deutscher Natursteinpreis“, Deutscher Naturwerkstein-Verband e.V. (DNV) in Zusammenarbeit mit dem BDA

2010 „Grosse Nike 2010“, „Nike für die beste städtebauliche Interpretation, Architekturpreis des BDA, Jacob-und-Wilhelm-Grimm-Zentrum, Berlin

2009 „Architekturpreis Berlin 2009“, Auszeichnung, Architekturpreis e.V., Jacob-und-Wilhelm-Grimm-Zentrum, Berlin

2009 – „BDA Preis Berlin“, Bund Deutscher Architekten LV Berlin, Jacob-und-Wilhelm-Grimm-Zentrum, Berlin

The Jacob-und-Wilhelm-Grimm-Zentrum is the new central library of Humboldt University, located on the famous old boulevard Unter den Linden, near Museum Island and Brandenburg Gate. It's the biggest freehand library in Germany and contains 2 million books, all of them public accessible and not in closed depots. Berlin-based Swiss architect Max Dudler won the competition, in which 277 architects participated, with a typical 'Berlin style' rationalist building. Behind a strictly orthogonal façade, the visitor encounters the big reading hall, which refers to the terraces of the Hanging Gardens of Semiramis. The space is illuminated by natural roof light and contains green desks and lamps with stone covers for 250 people, all designed by the architect. The atmosphere of the hall breathes a similar spirit as the big library hall by Labrouste in Paris. Most of the 1250 workstations are located directly at the façade with tremendous views over the city. contributed by TicketB (<http://www.mimoa.eu>)

Mit der Errichtung des Jacob-und-Wilhelm-Grimm-Zentrums hat die Zentralbibliothek der Universitätsbibliothek nun erstmals in ihrer fast 180-jährigen Geschichte ein eigenes Gebäude erhalten. 12 verschiedene Zweig- und Teilbibliotheken mit insgesamt 2.500.000 Medieneinheiten finden hier ein neues Zuhause. Hierbei handelt es sich um ein deutschlandweit einmaliges Angebot mit 2.000.000 Medien im Freihandbestand. Der Leiter der Bibliothek Milan Bulaty gerät ins Schwärmen, wenn er von seinem neuen Haus erzählt. Schön sollte es sein, funktional und zeitlos. Einen zentralen Lesesaal mit Tischen und Lampen sollte es geben und Loungebereiche, die als Treffpunkte dienen. All diese Wünsche der Bibliotheksleitung spiegelte der Entwurf des Schweizer Architekten Max Dudler wieder, der im Jahr 2004 als Wettbewerbssieger aus 277 Entwürfen hervorging. Nur wenige Entwürfe der anderen Teilnehmer sind über die Traufhöhe hinausgegangen. Dudler hat bewusst das Volumen von der S-Bahn her zurückgenommen und damit einen sehr schön proportionierten Stadtplatz geschaffen, der gleichzeitig eine wichtige Wegeverbindung zwischen der Museumsinsel und der Friedrichstadt herstellt. Nordseitig wurde das Gebäude höhengleich an die vorhandene Brandwand angebaut; der an den neuen Platz angrenzende höhere Baukörper bildet parallel zum S-Bahnviadukt ein städtebaulich repräsentatives Merkzeichen heraus. Im Inneren setzt sich der Stadtplatz als langgestreckte, zweigeschossige Eingangshalle fort, die die Cafeteria und einige weitere öffentliche Funktionen aufnimmt und in der rege Betriebsamkeit herrscht. Nachdem man sich durch einen dunklen schmalen Gang ins Untergeschoss begeben hat, um sich seiner Garderobe zu entledigen, gelangt man zurück durch das Foyer über eine breite einläufige Treppe zum Herzstück des Gebäudes: Einem zentralen Lesesaal mit 252 Arbeitsplätzen. Die Atmosphäre im Lesesaal ist geprägt von dem warmen Kirschholzfurnier, dem dunklen Grün der Tischplatten und den individuell steuerbaren Tischlampen. Zunächst wirkt der Saal eher introvertiert, auf den zweiten Blick gibt jedoch er den Blick frei in die Stadt und die angrenzenden Buchbestände, über die Oberlichter gelangt Tageslicht hinein. Hervorragend gelöst ist die Einbettung des Saales in die Freihandbereiche. Terrassenförmig erstrecken sich die Arbeitsplätze über 5 Etagen – Max Dudler assoziiert hier „die hängende Gärten“ von Babylon. Von allen Arbeitsplätzen führen kurze Wege zu den Buchbeständen. Nicht nur der Lesesaal, das gesamte Gebäude ist geprägt durch eine klare, sachliche Formensprache, den reduzierten Einsatz von Materialien und Farben, durch eine symmetrische Ordnung und vor allem aber durch die Stringenz, mit der sich das Grundraster von 60cm als Skelett durch das gesamte Gebäude zieht. Abgeleitet aus der kleinste Einheit – dem Buch – leitet sich eine Regaltiefe von 60 cm ab, die im Wechsel mit der Flurbreite von 90cm ein Rastermaß von 1.50 m bildet. Nicht nur die innen liegenden Stützen nehmen dieses Rastermaß in Abständen von 3 Metern bis zu 12 Metern auf, es zeichnet sich auch im Vertikalschnitt und in den Fassaden ab. Gestapelte Stützen aus Kalkstein mit einer Breite von 60 cm und bodentiefe Fenster aus Glas ohne Rahmen und Fensterbänke bilden die sehr abstrakt gehaltene Fassade. Die Fensterbreiten variieren in drei verschiedenen Grundmaßen je nach Nutzung im Inneren. Hinter den schmalen Fensterschlitz befinden sich die Archivbereiche, die breiteren Fenster versorgen die außerhalb des zentralen Lesesaales gelegenen Arbeitsbereiche. Dass hier trotz knapper Mittel ein Haus von so großer Eleganz entstehen konnte (der Kostenrahmen von 75 Mio. € wurde eingehalten und nicht überschritten), ist nach Milan Bulatys Worten auf die außergewöhnlich gute Zusammenarbeit zwischen Bibliotheksleitung und Architekten zurückzuführen. Gemeinsam ist man gereist, um verschiedene Bibliotheken zu besichtigen und zu studieren, viele Themen wurden disziplinenübergreifend diskutiert und in Frage gestellt. Beispielsweise hat man zwar ein vertikales Buch-Transportsystem eingebaut, aber auf ein durchaus übliches horizontales Fördersystem verzichtet. Allein dadurch konnten 6-9 Mio. € eingespart werden, die Betriebskosten verringern sich ebenfalls. Dieses Geld konnte stattdessen in 7.000 m<sup>2</sup> amerikanischen Kirschholzfurnier aus nur einer Marge – des einheitlichen Furnierbildes wegen – investiert werden. Wurde Milan Bulaty von seinen Fach-Kollegen auch kritisiert wegen des zentralen Lesesaales, den im heutigen digitalen Zeitalter doch niemand mehr benötige, so sprechen die Besucherzahlen für sich. Ca. 5.000 Besucher sind es am Tag, die die Bibliothek nutzen und sich bereits gegenseitig die begehrten Leseplätze streitig machen. Zur Zeit ist die Bibliotheksleitung aufgrund des großen Andranges damit beschäftigt, ein sinnvolles System zu finden, um den Studierenden der Humboldt Universität ausreichenden Zugang zu freien Lese- und Arbeitsplätzen zu gewährleisten. ## Diözesanbibliothek Münster – Germany 2002 – 2005

Bauherr: Bischöfliches Generalvikariat. BGF 14.300 m<sup>2</sup>, BRI 50.900 m<sup>3</sup>

### **Awards:**

2010 „Auszeichnung vorbildlicher Bauten in Nordrhein-Westfalen 2010“, MWEB-WV NRW, Architektenkammer NRW, Diözesanbibliothek und Verwaltungsbauten Bischöfliches Generalvikariat, Münster

2007 „Architekturpreis Nordrhein-Westfalen 2007“, Bund Deutscher Architekten Diözesanbibliothek, Priesterseminar und Verwaltungsbauten BGV, Münster

2007 „Deutscher Natursteinpreis 2007“, Besondere Anerkennung, Deutscher Naturwerkstein Verband e.V. DNV

Diözesanbibliothek, Priesterseminar und Verwaltungsbauten BGV, Münster

### **Literature:**

Max Dudler: Diözesanbibliothek. Dicocean Library Münster. Niggli Verlag, 2008

Der realisierte Entwurf für die theologische Spezialbibliothek reagiert auf die städtebauliche Situation der „Diözesaninsel“ im Kuhviertel an der Überwasserkirche. Dudler stärkt vorhandene städtebauliche Figuren und setzt Neubauten und Bestand in eine streng orthogonale Ordnung, die im Kontrast zum Gewirr der umliegenden Altstadtgassen liegt. Hier sieht der Architekt eine Parallele zum romanischen Dombezirk in Pisa. Dudlers Entwurf besteht aus zwei Verwaltungskuben und einem 70 Meter langen Riegel für die Bibliothek. Alle drei Neubauten sind mit „transluzidem“ (Dudler) Naturstein verkleidet und mit einem völlig

gleichmäßigen Raster aus hochformatigen Lochfenstern überzogen, was den Bauten eine Anmutung der Ruhe, aber womöglich auch der Langeweile verschafft. Im Bibliotheksriegel liegen unten der Katalogbereich und eine „Santini-Sammlung“ alter Kirchenmusik mit Ausstellungsraum und Lesesaal. In den Obergeschossen ist ein dreigeschossiger Lesesaal mit 40 Arbeitsplätzen eingerichtet worden. Die Bibliothek bietet insgesamt Platz für eine Million Bücher. (<http://www.baunetz.de>)

### **The Forum at the Eckenberg Academy (Eckenberg-Gymnasium), Adelsheim – Germany 2013**

Construction : begun Autumn, 2010, Area: 1,000 m<sup>2</sup>, Use: assembly hall, library, cafeteria, Construction costs: 3.5 M. EUR  
Client: State of Baden-Württemberg

The extensive campus of the Eckenberg Academy is located on a scenic hillside overlooking the town Adelsheim. This boarding school is owned and operated by the state of Baden-Wuerttemberg. The entire campus consists of 11 individual buildings from the 1960s and 70s. The solitary 2 and 3-story buildings line the slope in a regular fashion - but this regularity lacks a visible hierarchy and there is no perceivable campus center.

With the new forum a campus center is both physically and functionally established. The new building will provide - within an area of 26 x 26 meters - an auditorium, a library, a cafe, classrooms and multi-functional meeting space. Supported by three mammoth columns, the distinctive honeycomb roof slab reduces the weight of the supporting structure, while bringing natural illumination into the deepest corners of the building. (Ecker)

.....Aus dem früher mit Stützmauern durchzogenen Gelände ist mit dem 26 Meter langen, 26 Meter breiten und fast neun Meter hohen Neubau ein baulicher Mittelpunkt entstanden. Dieser 1.000 Quadratmeter großer Bau bildet zusammen mit der Mensa das neue Zentrum des gesamten Areals. Er beinhaltet neben einer vielfältig nutzbaren Auditoriumsfläche eine Bibliothek, ein Café und drei Klassenräume. Die vorgefundene Terrassierung der Außenanlagen wurde für den Innenraum uminterpretiert – so gelangen die Schüler von jeder der vier angrenzenden Ebenen niveaugleich in das Gebäude. Diese Ebenen ragen unterschiedlich weit in die hohe Aula hinein und erlauben vielfältige Blickbeziehungen....(<http://www.baunetz.de>) 21.02.2013

### **IIT Kent College of Law (Library), Chicago – USA 1993**

Interior Design 10/92, Interiors 06/91, Robert Piotrowski in the Office Powell/Kleinschmidt, Project: University Classroom Building and Library, Faculty of Law, Construction: 1991-93, Area: 25,500 m<sup>2</sup>, Client: Illinois Institute of Technology, Kent College of Law

The law school of Illinois Institute of Technology is located in the center of downtown Chicago. Lecture halls, classrooms, a courtroom for television broadcasts and an advanced law library are housed in this 11-story building.

The library is located in the upper five floors of the building - at the top of the structure is a large reading room. This space is spanned by a vaulted roof with a lamellar structure of connecting steel tubes. The chosen formal language is a modern reinterpretation of the traditional reading room found in many American university libraries. The glazed north facade offers fantastic views of the skyline of the city. (Ecker)

### **Hörsäle, Bibliothek, Mensa, Ernst-Moritz-Arndt-Universität, Campus Loefflerstraße, Greifswald – Germany 2013 – 2016**

Bauherr: Betrieb für Bau- und Liegenschaften Mecklenburg-Vorpommern, GF Bereich Rostock

The Ernst-Moritz-Arndt University (EMAU) in the Hanseatic City of Greifswald (Mecklenburg-Vorpommern) located on the site Loefflerstraße campus humanities departments at his, after the medical and surgical hospitals, the historic building have left here. Is necessary for the new use of the stock a "new combined" with library area for the three humanities, with three classrooms and a canteen with a cafeteria issue. A well-run high for this purpose planning competition has now been decided. From 163 agencies that had applied, were invited to 21st The jury, chaired by Eckhard Gerber (Dortmund) named on 7 April from 20 submissions this award winners: 1. Price: Eßmann gardener Nieper GbR Architekten, Darmstadt / Leipzig. (<http://www.baunetz.de>)

Etwas schmaler und ein Geschoss weniger: Abstrichen zum Trotz soll der geplante Bibliotheks-Kubus auf dem Steintor-Campus nicht nennenswert an Qualität einbüßen, meinen die Architekten Thomas Gärtner und Jens Wilgeroth, die im Leipziger Büro der Partnerschaft Eßmann, Gärtner, Nieper an den Entwürfen arbeiten. Darin stecke ausreichend Luft, sagen sie, als gestalterisches Element, aber auch als Puffer: Die Zahl der Leseplätze werde gemäß der Vorgabe bei 150 liegen, trotz des eingesparten Geschosses. Der Funktionsaufbau der Bibliothek besteht aus zwei "Regaltürmen" mit Treppenhaus in der Mitte und "Leseebenen" frei aufgehängt im Luftraum an den Seiten. Das Prinzip ähnelt - wie auch manches Detail - dem ungleich größeren Neubau der Grimm-Bibliothek der Berliner Humboldt-Universität. Aber in diesem Entwurf des Schweizer Architekten Max Dudler nimmt ein Lesesaal den Kern des Gebäudes in voller Höhe ein. Im hallechen Gegenstück sind die Arbeitsplätze in Boxen ("Carrels") an der Ost-, und auf Terrassen an der Westseite zu finden. Und dort war noch etwas an Fläche zu gewinnen. Eigentlich aber, sagen die Architekten, "braucht es die Lufträume als Kontrast", zu den eng gestellten Regalen auf den recht niedrigen Geschossen. Betrachtet man auf dem Entwurf den Kubus von außen, fällt auf, wie wenig Fenster die Klinkerfassade gliedern. Licht wird vom Glasdach über den Leerräumen einfallen. Führt das im Sommer zu Hitze-problemen? Nein, sagen die Architekten und verweisen auf den Sonnenschutz mit außen liegenden, nach Süden schräg stehenden und kippbaren Lamellen und die Öffnungen in der Dachzone. Die sollen im Querluftstrom den Wärmestau abführen, "und das ohne Zugluft in den unteren Geschossen." Die Klinkerfassade lässt mit abwechselnd quer und längs verlegten Backsteinen eine reliefartige Oberfläche entstehen. Das Baumaterial war mit Blick auf das Ambiente gewählt worden, was zum Erfolg der Architekten im "wettbewerblichen Verfahren" beitrug. Doch das war noch vor der Entscheidung, viele der historischen Ziegelbauten der Agrarfakultät abzureißen.

Aber der Bibliothekskubus wird die Rolle ausfüllen, die ihm schon in den städtebaulichen Vorplanungen zgedacht war: als Wahrzeichen und Wegmarke unmittelbar am künftigen Haupteingang zum Campus. Er wird ein bildprägender Apuliter sein. Im Entwurfsprozess kam den Architekten sogar Castel del Monte in den Sinn, die konzentrische Staufferburg in Apulien. Er ist aber das zeitgenössisch schnörkellose Pendant zum Ziegelquader der Unibibliothek. Wie passend, dass die Architekten nun auch beim

geplanten Geisteswissenschaftlichen Zentrum der Uni Greifswald eine Bibliothek bauen, die dort ebenfalls ein historische Parallele hat. Das Gebäude wurde 1880 errichtet, in Gestalt eng angelehnt an sein ein Jahr zuvor eröffnetes Vorbild in Halle. Würfel als Wahrzeichen. Mitteldeutsche Zeitung 08.03.12 (<http://www.mz-web.de>)

### Neubau Zweigbibliothek – GSZ (Geistes- und Sozialwissenschaftliches Zentrum) Martin-Luther Universität Halle-Wittenberg, Halle/Saale – Germany 2014

„Der Rückbau ist der Anfang des Aufbaus – und auf den freuen wir uns“, sagt Rektor Prof. Dr. Udo Sträter. „Es ist und bleibt ein tolles Projekt.“ Im Juli fiel der Startschuss, 2014 soll alles fertig sein: An der Emil-Abderhalden-Straße entsteht für 52 Millionen Euro das GSZ in der Regie des Landesbaubetriebs. Die Bibliothek wird wegen des Kostendeckels zwar kleiner ausfallen als ursprünglich gedacht, aber bereits in den Architekturentwürfen wird der Reiz des futuristischen „Bibliotheks-Kubus“ deutlich. „Und die Bibliothek wird 2014 funktionieren, es sind ausreichend Expansionsflächen vorhanden“, beschreibt Uni-Kanzler Dr. Martin Hecht das Projekt. Der 17,5 Meter hohe Bibliotheksneubau im Kubus wird einen besonderen Blickfang des GSZ darstellen und als Wahrzeichen den Charakter des Campus bestimmen. Gelbliche Ziegel, die an das Hauptgebäude der Universitäts- und Landesbibliothek (ULB) erinnern, stellen weithin sichtbare Gestaltungselemente dar. Entwurf zur Innenansicht des Bibliotheks-Neubaus – „Bücher als tragende Pfeiler des Gebäudes“ (Entwurf: EBmann/Gärtner/Nieper Architekten GbR)

Eine weitere Besonderheit ist das Glasdach bzw. die großen Oberlichter im Dach. Bis in die unteren Ebenen sorgen sie für Helligkeit und erwecken für den Leser den Eindruck, unter „freiem Himmel“ zu arbeiten. Die Position scheinbar sparsam gesetzter Fenster erschließt sich im Innern des Hauses – hier ergeben sich aus den Lesebereichen und Büros ansprechende Ausblicke in den kleinen Park und auf den Campus. „Die Bücher sollen bildhaft als tragende Pfeiler des Gebäudes gesehen werden“, so das Konzept der Architekten des Büros EBmann/Gärtner/Nieper.

Für die Nutzer stehen zwei lichtdurchflutete Lesebereiche zur Verfügung: ein großzügiger Raum auf der Westseite und Inseln sowie Lesebalkone auf der Ostseite. „Offene Orte“ für die Leser an den Stegen und Treppen des mittleren Raums sollen darüber hinaus geschaffen werden. Ein großzügiges Foyer, in der Mittelzone ein Infotresen und ein Zeitschriftenbereich dürfen natürlich nicht fehlen. (<http://www.uni-halle.de/gsz>)

#### Fachhochschule Hof (Bibliothek) – Germany 2003

Am 30. April 2001 feierte die Fachhochschule Hof den Spatenstich ihres 2. Bauabschnitts, des neuen „Technikum“. Der Entwurf für den knapp 44 Millionen Mark teuren Hochschulbau stammt von dem Münchener Architekturbüro Eicher, Hitzig, Schindhelm, die den 1995 dafür ausgelobten Wettbewerb gewonnen hatten. Der Erweiterungsbau der erst vor sieben Jahren gegründeten Fachhochschule wird die technischen Studiengänge Wirtschaftsingenieurwesen, Technische Informatik sowie Werkstoff- und Oberflächentechnik beherbergen. Auf ca. 5.400 Quadratmetern sollen ein Audimax, Lehrsäle, Labore und eine Maschinenhalle untergebracht werden. Der Neubau ist einer von drei Riegeln, die strahlenartig von einem gedachten Mittelpunkt aus wegführen. Ebenso radial sind auch die Außenanlagen zwischen den Riegeln gestaltet. Die langen dreigeschossigen Bauten werden durch kleine Übergänge miteinander verbunden - die so entstehende gekrümmte Achse endet in der Rotunde der Cafeteria. Die erweiterte Anlage erinnert damit formal an einen Zirkel, was man als Symbol für die Bauaufgabe verstehen kann. Zusammen mit der technischen Ausstattung sollen 50 Millionen Mark investiert werden. Im Herbst 2003 soll das Technikum übergeben und für die Studenten geöffnet werden. (<http://www.baunetz.de>)

#### Fachhochschule Würzburg-Schweinfurt-Aschaffenburg, Abteilungsbibliothek Schweinfurt – Germany 1994

Die Abteilungsbibliothek Schweinfurt der Fachhochschule Würzburg-Schweinfurt-Aschaffenburg ist gemeinsam mit dem Rechenzentrum und den Studentischen Einrichtungen im dem 1993 fertiggestellten Gebäudekomplex "Zentrale Einrichtungen" untergebracht. Er verbindet das Hauptgebäude mit der bereits 1989 fertiggestellten Mensa. Die Nord-, Ost- und Südseite sind in Anlehnung an die bestehenden Gebäude mit Sichtmauerwerk aus rotem Ziegel verkleidet. Für die Westfront und die gegenüberliegende Seite des Innenhofs, die die Längsseiten des Lesesaals bilden, wurde eine Holz-Glas-Konstruktion gewählt. Die Bibliotheksräume liegen mit Ausnahme des Magazins im Erdgeschoß und sind in funktionaler Beziehung um den Lesesaal als Zentrum der Bibliothek gruppiert. Der hohe, rechteckige Raum, über dem sich ein Tonnendach wölbt, bietet mit seinen hellen Farben und dem freien Ausblick auf eine weite Grünanlage eine von den Benutzern sehr geschätzte, ruhige und angenehme Atmosphäre. (DBI – Beratungsdienst Bau und Einrichtung)

#### Bundesministerium der Justiz, Bibliothek, Berlin – Germany 1996 - 2001

internationaler Wettbewerb 1996, 1. Preis, BGF 58.000 m<sup>2</sup>

Das neue Bundesjustizministerium verbindet die bruchstückhaften Teile des Quartiers zu einem homogenen Ensemble. So wurden die bestehenden fünf Innenhöfe erhalten und innerhalb des Gebäudekomplexes miteinander in Beziehung gesetzt. Ihre historische Substanz wurde bewahrt und behutsam ergänzt und jedem der Höfe eine spezifische Nutzung zugeordnet. Die baugeschichtliche Entwicklung zwischen den für den Komplex relevanten Stadträumen „Hausvogteiplatz“ und „Gendarmenmarkt“ blieb erkennbar. Die dem „Prausenhof“ vorgelagerte Mohrenkolonade an der Mohrenstraße erschließt den Gebäudekomplex. Durch den repräsentativen Haupteingang und das angrenzende Foyer gelangen Gäste und Besucher in den ersten Innenhof des Gesamtkomplexes, den "Repräsentationshof". Er stellt einen „Ort der Mitte“ im Ministerium dar. Die im Erdgeschossbereich transparent gestalteten Wände dieses Hofes schaffen eine direkte Sichtbeziehung zum neuen, kreisförmigen Konferenzsaal und zum

„Casinohof“. Die Hoffassaden oberhalb der Erdgeschosse bleiben mit ihren glasierten Fliesen und den großen Fensterflächen als typisches Merkmal des ehemaligen Konfektionsgebäudes erhalten. Nachträglich in die Stahlskelettkonstruktion der weiträumigen Fabrikationsetagen eingefügte Einbauten wurden entfernt. Um den Eindruck der Transparenz zu bewahren, erhielten die Wände der neu entstandenen Arbeitsräume verglaste, frei vor der Fassade angebrachte Aufzüge. In Höhe des sechsten Obergeschosses überdachen Stahl-Glasdächer, auf denen Photovoltaikmodule installiert sind, die denkmalgeschützten Höfe. Unter dieser Überdachung entsteht eine klimatische Pufferzone, die eine erweiterte, ganzjährige Nutzung der Hofbereiche erlaubt und in der Grünpflanzen gedeihen. Weitere Höfe wurden zu Gärten aufgewertet. Der Dienstsitz des Bundesjustizministeriums ist eine Gruppe unterschiedlicher Bauwerke im ehemaligen Berliner Konfektionsviertel, das als historisch wertvollsten Teil die "Mohrenkolonnaden" einschließt. Diese Kolonnaden stellen das älteste erhaltene Beispiel des Frühklassizismus in Berlin dar. Sie wurden 1787 nach Plänen des bedeutenden Architekten Carl Gotthard Langhans errichtet und waren einst Teil einer Brücke, die über den später zugeschütteten Festungsgraben führte. Nach dessen Zuschüttung wurden auf dem gewonnenen Terrain zu Beginn des 20. Jahrhunderts ein Teil der heute denkmalgeschützten Gebäude des Ministeriumsareals errichtet. Der "Prausenhof" (1912-1914) mit dem angrenzenden "Haus Nagel" (1897) und dem "Haus Stern" (1901) sowie dem "Haus Muthesius" (1914) stellen inmitten des Quartiers zwischen Mohrenstraße und Kronenstraße ein typisches Beispiel der Berliner Gewerbearchitektur dar. Wie das gesamte ehemalige jüdische Konfektionsviertel erlitten die Gebäude im Krieg schwere Schäden. Das "Haus Nagel" beherbergte gemeinsam mit dem "Prausenhof" zu DDR-Zeiten das Amt für Erfindungs- und Patentwesen. Als Erweiterungsbau für diese Behörde hatte die DDR bereits mit der Errichtung eines Neubaus an der Jerusalemer Straße begonnen. Der Bund übernahm 1990 den Rohbau und 1994 zog hier die Berliner Dienststelle des Bundesjustizministeriums ein. Das "Haus Stern" wurde 1973 bis 1977 für die Nutzung durch das Presseamt der DDR umgebaut. Zum Standort des Justizministeriums gehörte auch der Plattenbau an der Jerusalemer Straße, der 1994 fertig gestellt wurde. Das zum Presseamt der DDR umgebaute „Haus Stern“ wurde zurück gebaut. Die von 1901 datierende Jugendstilfront des Hauses zur Mohrenstraße blieb jedoch erhalten und wurde von späteren Überformungen befreit. Die zur Kronenstraße weisende Rückseite des Neubaus stellt durch eine Glasfassade mit strengem Quadratraster einen bewussten Kontrast zur historischen Vorderfassade her. Ein im Innenbereich des Plattenbaus Jerusalemer Straße schon existierender Rohbau wurde durch einen dreigeschossigen, aufgeständerten Glaskubus komplettiert. Hier befinden sich die Bibliothek des Ministeriums sowie Teile der Justizhistorischen Sammlung. Die außen liegenden Stahl-Dachtragwerke überspannen die Höfe und nehmen die abgehängte Isolierverglasung auf, die die Höfe räumlich abschließt. Die Dachtragwerke tragen die aufgeständerte Sonnenschutzkonstruktionen und Photovoltaikmodule aus beweglichen, elektromotorisch verstellbaren Shadowwings. Die Sonnenschutzkonstruktion über den beiden Innenhöfen bestehen aus Glaslamellensystemen, die teilweise mit Photovoltaikmodulen zur Erzeugung von elektrischem Strom belegt sind. Neben der Erzeugung von elektrischem Strom soll das Lamellensystem der Verschattung, insbesondere der Wärmereflektion dienen, um die verglaste Fläche vor Wärmeeintritt zu schützen. In den Atrien bleiben Tageslichttransparenz und Bezug zur Außenwelt weitestgehend erhalten, so dass die wechselnden Himmelszustände wahrgenommen werden können. (Eller)

Am 30. Mai 2002 wurde in Berlin das Bundesministerium der Justiz eingeweiht. Der neue Dienstsitz des Ministeriums liegt in einem Gebäudeensemble mitten im alten Berliner Konfektionsviertel am Gendarmenmarkt. Der Block, begrenzt durch Mohren-, Jerusalemer- und Kronenstraße, besteht aus Bauten unterschiedlicher Epochen, die nach den Plänen des Düsseldorfer Architekturbüros Eller + Eller durch Neubauten ergänzt und zusammengefasst wurden. Neben den barocken Mohrenkolonnaden von Carl Gotthart Langhans von 1787 finden sich auf dem Areal vier um die Jahrhundertwende erbaute Konfektionshäuser - Haus Nagel, der Prausenhof, Haus Muthesius, Haus Stern -, die bis zur Enteignung durch die Nazis in jüdischem Besitz standen, sowie mehrere Plattenbauten, unter anderem der unvollendete Sitz des Patentamts der DDR. Der Haupteingang führt durch die restaurierten Mohrenkolonnaden vor dem Prausenhof, durch die man das Zentrum der Anlage betritt, den mit einem Glasdach überspannten Repräsentationshof. Hier erinnert eine Installation von Ulrich Schröder "Die Verkündung der Reisefreiheit" an die historische Pressekonferenz am 9. November 1989, auf der Günther Schabowski beiläufig die Reisefreiheit für alle DDR-Bürger bekanntgab. Das Pressamt war im 1973 bis 1977 umgebauten Haus Stern untergebracht, das von Carl Bauer um die Jahrhundertwende entworfen wurde. Von dem Traditionsbau blieb nur die Jugendstilfassade an der Mohrenstraße erhalten, dahinter setzten Eller + Eller einen Glasriegel mit strenger Fassade zur Kronenstraße. Vom Repräsentationshof aus gelangt man in den zweiten von fünf Innenhöfen, dem Kasinohof, auf dem ein unter Rasenniveau gelegter runder Neubau steht, der Gustav-Heinemann-Konferenzsaal. Daran schließt sich der begrünte Gartenhof an. Einen vierten Hof, auf dem der Fuhrpark der Behörde steht, erreicht man durch den Plattenbau an der Jerusalemer Straße, über dem ein aufgeständertes Kubus schwebt. Hier sind die 300.000 Bände fassende Bibliothek mit großem Lesesaal und Teile der justizhistorischen Sammlung untergebracht. Der fünfte Hof schließlich ist der kleine intime Innenhof des Hauses Nagel. Auf den Glasdächern der Innenhöfe wurde eine Photovoltaikanlage installiert, die bei ausreichendem Sonnenschein 100 der insgesamt 650 Arbeitsplätze mit Strom versorgt. Die Gesamtkosten für das Projekt belaufen sich auf 142 Millionen Mark. (<http://www.baunetz.de>)

<http://www.f29architekten.de>

**Mediathek, Burg Giebichenstein Kunsthochschule Halle, 1.Preis 2011**

Auszug aus dem Protokoll der Preisgerichtssitzung

Der Entwurf zeigt ein lineares, schlankes Gebäude, das sich der angrenzenden Villenarchitektur eindeutig unterordnet. Es orientiert sich mit der straßenseitigen Flucht an der Villa Neuwerk 7, ohne sich in den Vordergrund zu drängen oder dominierend zu wirken. Damit fügt es sich wohlthuend ein, ist zurückhaltend, dennoch in seinem Erscheinungsbild klar, eigenständig und dem Standort angemessen. Durch seine Länge wird ein baulicher Abschluss nach Süden geschaffen, dessen Wirkung sich nach innen, zum Campus hin entfaltet. Es entsteht eine wirkliche Campusmitte, als Herzstück des Geländes. (f29)

**Modellbibliotheken für junge Kunden**

Eine Bibliothek für junge Kunden zu planen bedeutet - entgegen dem traditionellen Verständnis - Kunden und nicht Medien in den Mittelpunkt aller Überlegungen zu stellen. Die Vorgabe, in bestehenden Gebäuden Bibliotheken mit gleichberechtigten Angeboten herkömmlicher und neuer Medien zu entwerfen, bietet dabei eine optimale Voraussetzung für eine zeitgemäße Interpretation. Die Konzeptionen für vier neue Bibliotheken in Polen, Spanien und Deutschland zielen darauf ab, das Spannungsverhältnis von traditioneller und digitaler Wissensvermittlung gestalterisch und atmosphärisch umzusetzen und dabei sowohl dem Buch als Kulturgut als auch dem digitalen Zeitalter gleichermaßen gerecht zu werden. Durch eine besondere Innenraumgestaltung mit einer innovativen Möblierung werden übersichtliche Räume geschaffen, in denen die Besucher das Medienangebot individuell oder

gemeinschaftlich nutzen können. Nicht Bücherregale dominieren die Entwürfe - stattdessen bilden sie den Rahmen für themenbezogene Bereiche und lassen großzügige Räume entstehen, die flexible Nutzungen ermöglichen.

### Biblioteca para Jóvens Cubit, Zaragoza – Spain 2007

Cubit becomes the first library for young people in Spain and sets the trend for future libraries. One of the futuristic rooms

Cubit Library Cubit Library of Zaragoza is the first library of Spain conceived and designed specifically for youth.

Prompted by the Bertelsmann Foundation and the City Caja Inmaculada in Zaragoza, is a model library in which are combined in a novel architecture, the selection of media and cultural program. The name of the library comes from a combination of their particular form of a cube and the importance of digital media content: as design element, the hub establishes the relationship with lumps of sugar (the building housing the library was an old sugar), while the proposed contents of the center is linked to the digital bits of the Internet age. Cubit's cube. The mission that was born Cubit is to create a space where youth can find all necessary information resources in their daily life, useful for student activities, professional or recreational, as well as personal development. Is a library which attempts to activate the target group of young people between 13 and 25 who identify strongly encouraging the new location and that they perceive the library as a space tailored to their own codes and languages. To achieve this end, Cubit offers an innovative model of access to information that combines traditional educational resources, such as books, audiovisual media and with the intensive use of Internet and multimedia technologies in a space that promotes communication and interaction between visitors through architectural discourse itself. In addition, the supply of media focus on those cultural phenomena that are most relevant for young people, such as Internet and information technology, comics, video games and music. The initial collection of the library has 15,000 titles in all media. The new library is located within the grounds of Zaragoza Active, developed by the City of Zaragoza, which in turn has reclaimed the site where once stood an old sugar factory, in the neighborhood of Rabal. Cubit is an ambitious project launched by the Bertelsmann Foundation, which conducted a national call for the construction of a model library for youth, which was won by the City of Zaragoza and Caja Inmaculada in 2004. Cubit opens with a cycle that brings us to the libraries of the future. A magnet for young people in the city: The library model applied in Zaragoza Cubit targets an audience between 13 and 25 years and thus provides a fully accessible design, cozy and atypical, isolated from traditional libraries. More than two decades of work by the Bertelsmann Foundation in Europe in the field of public libraries have allowed this entity to be pioneering a concept library that seeks to increase the response to user needs, defining them as genuine "customers" of these centers, customers whose expectations must always be the guide that determines the evolution of the library, acquiring content, cultural programming and, ultimately, the entire joint offer. With this philosophy, the Bertelsmann Foundation has led the first European youth libraries in Germany (Dresden) and Poland (Wroclaw and Olstzyn). The will of the new library of Zaragoza is becoming a magnet for young people in the city, a space that could attract those young people who until now believed that a library has no interest in them. With this objective, the Library Cubit will be a center which will offer young people another way to meet, learn and have fun. For a library should be young, and a reading area, a place for knowledge transfer, communication and entertainment. That is why among the resources available to users of Cubit will be a growing presence of media and technology, with the horizon of medium term representing 50% of all available means (the other 50% will be books). The catalog also responds to concerns information that may have youth in the areas that most interest them, such as career guidance, personal development, culture and the arts or entertainment. The original architecture Cubit: The appearance of the building is unmistakably that of a futuristic cube, which in turn is composed of many cubes. The walls and ceilings of these cubes are made entirely in colored glass, and floors are partially. At the top and bottom together all the spaces, which are transparent and open with what the user moves in a free and clear, where everything is interconnected. Thus, the interior design creates resonances with cyberspace and its many links (links).

The entire structure is characterized by transparency and manages to create the impression that the library is not lifted within the Antigua Sugar, but float in it. The architect responsible for the project is the German Christian Schmitz. Street level houses hub services to the public, lending the funds on youth, film, music and books on these two issues. The first floor houses the game and made publicly accessible Internet. The second floor is for digital newspaper archive, Comiecteca and has an area for projections. The third and last floor of the cube is a space for consultation to be shared with carrying out different activities. On July 2 opens with a creative writing workshop with designer Alberto Gamon, students who attend IES 'The Sugar'. The hub is connected to a tower, called "Tower of Books" by bridges and stairs. The books are surrounded by an empty space on three floors in height and are distributed through the more demanding issues that youth-employment, language, green space, health, sports, hobbies, novels .... Through the transparent shelves are the means which open and close the empty space to the outside light. If you have borrowed many books, the lobby is flooded with light. If the shelves are full, the light only passes through the voids between the books. A greater use of the media, more light. A visual metaphor is both a measure of the very success of the offer contained in the library. On the Bertelsmann Foundation: Bertelsmann Foundation ( [www.fundacionbertelsmann.org/](http://www.fundacionbertelsmann.org/) ) was founded in 1995 by Reinhard Mohn, representing the fifth generation of families Bertelsmann / Mohn, owners of media group Bertelsmann, and bases its work on the belief that competition and civic engagement are the essential foundation for social progress. Its mission is to promote and enhance the shift towards a society oriented and able to build the future, calling that particular through the identification of challenges and social problems to develop and implement exemplary models of solution. In the field of public libraries, the Bertelsmann Foundation has made an important task of disseminating new concepts of management and has participated in the development of model libraries, including the Library of Alcudia (Mallorca), Can Torró, which in 2010 have turned twenty years since its commissioning. Bertelsmann Foundation works in four major projects: Diversity Management, Foundations, Youth Social Entrepreneurship and New Business Culture. In addition, each year organizes Dialogue and Action Congress, in its 2009 edition was inaugurated by King D. Juan Carlos. (<http://www.fundacionbertelsmann.org>)

#### **Goethe-Institut Santiago de Chile – Chile 2011**

In February 2010, the building that has historically housed the Goethe-Institute was damaged by earthquake. While FAR continues work on the historic structure, an interim solution was needed, but one with a complete character and integrity of its own. The temporary Cultural Institute is to be installed on an unfinished floor in an office high-rise. The space is characterized by a large depth of 16m between core and façade, but with only limited space for class-rooms, library, office, event- and exhibition space. A language was created through a vocabulary of existing furniture and a new metal shelving system, configured to subdivide the large open floor. This strategy minimizes the resources while creating a coherent landscape. The furniture divisions are arranged radially around the core, allowing views out from any given point and drawing sunlight into the full depth of the floor. The radial arrangement of the services, exposed and coloured, emphasise the centrifugal force of the layout. (FAR)

#### **Interkulturelle Familienbibliothek, Berlin-Kreuzberg - Germany 2010**

Bausumme: € 1.080.000

Die Wilhelm-Liebknecht-Bibliothek liegt unmittelbar am Kottbuser Tor, das sich zum sozialen Brennpunkt mit einem hohen Gewaltpotential entwickelt hat. Die Bibliothek als eine öffentliche Nutzung hat an diesem urbanen Standort eine wichtige, stabilisierende Funktion. Mit Fördermitteln aus dem KP11 und dem BIST-Programm (Bibliothek im Stadtteil) wurde die Fassade und das Innenleben des Gebäudes von 1964 grundlegend saniert: auf der Straßenseite wurde eine durchgängige Profilglasfassade vorgestellt, die mit ihrer grünlich-weißen Farbigekeit hell und einladend wirkt. Eine großzügige Verglasung im Erdgeschoss schafft Transparenz zum öffentlichen Raum der Stadt. Glastrennwände und Wanddurchbrüche schaffen im Innenleben der Bibliothek neue Strukturen. Ein durchgängiges Farbkonzept verleiht dem Gebäude und seiner heterogenen Ausstattung ein neues Gewand. (ff)

#### **Universität Mainz, Max Planck Institute for Chemistry (Bibliothek) – Germany 2011**

Competition 1. Prize 2007, Design Period 2007 – 2010, Costs: € 46.000.000, Net 7.882 m<sup>2</sup>, Gross 20.382 m<sup>2</sup>, Vol. 24.986 m<sup>3</sup>

The distinct shape of the institute's new building is intended to make a mark in the heterogeneous constructional environment, at the junction of the new area of the technical college of higher education and the science-related commercial buildings. The tower-like structure is a landmark on the new campus route signifying conclusion as well as transition. The piazza style entrance situation eclipses this university axis and integrates the existing Institute of Polymer Research in the campus idea. The location of the structure is oriented to the centre on one hand, while facing away from the sound emissions of the motorway on the other. The structure of the building allows straightforward extension to the west and north. The entrance room with open 'communication decks' positioned in front connects the institute premises with the public area. (Fritsch)

#### **Neubau Rathaus und Bürgerhaus Markt Heroldsberg, Bibliothek, Markt Herolsberg – Germany 2006**

Neubau eines Rathauses und Bürgerhauses mit Tiefgarage | Bauherr Markt Heroldsberg, Wettbewerb 2001: 1 Preis, Baugeginn: Rathaus 2003, Bürgerhaus 2004, Fertigstellung: 2006, Nutzfläche ges.: 2.100m<sup>2</sup>, BGF: Rathaus 3.230m<sup>2</sup>, Bürgerhaus 1.690m<sup>2</sup>, umbauter Raum: Rathaus 11.090m<sup>2</sup> Bürgerhaus 7.350m<sup>2</sup>, Baukosten ges.: € 9.500.000

Das neue Bürgerzentrum besteht aus zwei versetzten Baukörpern, dem 4-geschossigen Kubus für das Rathaus und einem langgestreckten 2-geschossigen Flachbau mit Gemeindesaal und Bibliothek. Eine großzügige Treppe verbindet nicht nur zwei gleichwertige Plätze sondern auch die Hauptstraße mit dem Bahnhof. Die Gebäude werden im Niedrigenergiestandard ausgeführt. Der Energieaufwand wurde durch ein Klimakonzept mit Bauteilkühlung, Erdkanal und Nachtauskühlung, sowie einer Bus-Steuerung der wesentlichen Komponenten nochmals optimiert. (Gaiser)

#### **Bibliothekserweiterung (Altbau: Bücherturm 1960 – 1966, Denkmalschutz von Otto und Peter Haupt)**

#### **Universitätsbibliothek Karlsruhe – Germany 2006**

Bauherr: Land Baden-Württemberg, vertreten durch den Landesbetrieb Vermögen und Bau Baden-Württemberg, Amt Karlsruhe  
Projektleitung: Vermögen und Bau Baden-Württemberg, Amt Karlsruhe, Planung: Prof. Heinz Mohl, Karlsruhe \* 1931,  
Baudurchführung: Architekten Gaiser und Partner, Karlsruhe. Gesamtbaukosten: € 13.300.000, Bauzeit: 03/2003–01/2006  
Das Gesamtkonzept zur Neuordnung des Forumbereiches wird durch den Baustein der Bibliothekserweiterung vervollständigt. Der langgestreckte Gebäuderiegel verbindet sich mit dem bestehenden Bibliotheksturm zu einer neuen Einheit und ordnet in Verbindung mit einem angrenzenden Neubau die bislang undefinierte Eingangssituation zum Campus.  
Als Zentrum für Information, Ausbildung und Kultur mit Zugang zu 300.000 Bänden in Freihandaufstellung und 300 neuen Leseplätzen bietet die Bibliothek ihre Leistungen künftig in einem 24-Stunden Betrieb an. (<http://www.vba-karlsruhe.de>)

Als letzter Baustein aus dem Ideen- und Realisierungswettbewerb von 1984 (Heinz Mohl) ist jetzt mit der Erweiterung der Bibliothek zu einem Informations- und Kommunikationszentrum begonnen worden. Die Nutzung der vorhandenen Einrichtungen müssen während der Bauzeit uneingeschränkt in Betrieb bleiben. So wird südlich der vorhandenen Magazinbibliothek ein längsgestreckter Baukörper angeordnet der die neuen Nutzflächen aufnimmt. An die Lage und Ausformung des Baukörpers waren nicht nur die Forderungen an eine neue funktionierende Organisation sondern auch städtebauliche Verträglichkeit an Gebäudehöhen und an die Aussenbereiche geknüpft. Mit der Erweiterung und dem Ausbau erfolgt der Umbau der Magazinbibliothek (Bücherturm) zu einer 24-Stunden Freihandbibliothek mit modernster Multi-Media Ausstattung. (Gaiser)

### **NS-Dokumentationszentrum, München – Germany 2014**

Bauherr: Landeshauptstadt München, Kulturreferat / Baureferat, 3.200 m<sup>2</sup>,

Mit dem NS-Dokumentationszentrum auf dem Grundstück der ehemaligen Parteizentrale der NSDAP wird fragmenthaft an die frühere städtebauliche Situation zwischen Königsplatz und Carolinenplatz angeknüpft, ohne jedoch die einst symmetrische Gewichtung von Baukörpern beiderseits der Briener Straße wieder aufleben zu lassen. Im Gegenteil: die Wiederbebauung des Grundstücks des „braunen Hauses“ wird einen asymmetrischen Akzent innerhalb der axialen Platzkonfiguration setzen und somit ihr Ziel erreichen, sich von der bestehenden Topographie abzulösen, die immer noch vom Stempel geprägt ist, den die Nationalsozialisten diesem Ort durch ihre Umbauten aufdrückten. Das NS-Dokumentationszentrum kann somit gleichsam zu einem neuen öffentlichen Standort für eine distanzierte Betrachtung des belasteten Umfeldes werden, der die auf eine axiale Perspektive angelegte Platzkomposition bewusst aus einem anderen Blickwinkel vorführt. Mit unserem Entwurf versuchen wir dieser Zielsetzung so weit wie möglich Nachdruck zu verleihen. Der komprimierte, ungerichtete Kubus, den wir vorschlagen, besetzt zwar den Bauort und markiert somit den geschichtlich unheilvollen Ort der Täter, er wird jedoch durch seine Autonomie gleichzeitig als frei in den Umland gesetztes Objekt erlebt. Typologische Elemente der historischen Villenbebauung wie längs gerichtete Straßenfassade, Eingang zur Straße, Frontalität etc. werden mit dem Neubau nicht wieder belebt. Er steht frei in dem sich hier über die Nachkriegsjahre etablierten Grünraum, von dem er auch betreten wird. Über den Grünraum setzt sich das Dokumentationszentrum mit dem weiteren Kontext der Umgebung in Beziehung. (Georg)

### **Kernsanierung IC Komplex Ruhr-Universität Bochum – Germany on construction**

Die Sanierung eines ersten Teils des Hochhaus-Komplexes der Ruhr-Universität Bochum kann beginnen. Die HOCHTIEF Solutions AG konnte sich gemeinsam mit Gerber Architekten (Dortmund) in einem vom Bau- und Liegenschaftsbetrieb NRW Dortmund durchgeführten Wettbewerbsverfahren durchsetzen.

Ziel der Campussanierung ist es, den Studierenden und Wissenschaftlern in Bochum auch in räumlicher Hinsicht exzellente Studien- und Forschungsbedingungen bieten zu können. Die energetische und ökologische Sanierung

Die Sanierung eines ersten Teils des Hochhaus-Komplexes der Ruhr-Universität Bochum kann beginnen. Die HOCHTIEF Solutions AG konnte sich gemeinsam mit Gerber Architekten (Dortmund) in einem vom Bau- und Liegenschaftsbetrieb NRW Dortmund durchgeführten Wettbewerbsverfahren durchsetzen.

Ziel der Campussanierung ist es, den Studierenden und Wissenschaftlern in Bochum auch in räumlicher Hinsicht exzellente Studien- und Forschungsbedingungen bieten zu können. Die energetische und ökologische Sanierung wird zu einem nachhaltigen Projekt entwickelt, das eine zeitgemäße intensive Kommunikation zwischen Forschung und Lehre realisiert. Es ist ein Rückbau bis in den Rohbauzustand vorgesehen.

Der IC Komplex besteht aus einem neugeschossigen Hochhausriegel, umschlossen von dreigeschossigen Flachbauten (ICFW, ICFO). In die östlichen Flachbauten werden die Fakultäten Maschinenbau und in den westlichen Teil sowie in drei Hochhausebenen die Bau- und Umweltingenieurwissenschaften einziehen. Neue Büros, Werkstätten, Hörsäle und Labore entstehen. Die grundsätzliche Aufgabe bestand darin, einerseits die prägende Silhouette der Gebäude aus den 60er Jahren von Helmut Hentrich und die architektonische Charakteristik der Gesamtanlage zu erhalten und auf der anderen Seite eine grundsätzlich verbesserte Orientierung zu erreichen. Gerber Architekten lösten diese Aufgabe durch das Anlegen von zwei Erschließungsachsen. In Verbindung mit neuen offenen Treppenräumen ist über die Ost-West-Magistrale eine ebenenübergreifende Erschließung und Anbindung der weiteren Gebäudekomplexe möglich. Die geplante Nord-Süd Achse verbindet den neuen Haupteingang im Norden mit dem bestehenden im Süden. Klare lineare Wegführungen, Sichtbeziehungen zu den gestalteten Innenhöfen und kommunikative Verbindungen über die Geschosse bewirken eine hohe Raumqualität und eine intuitive Orientierung in und außerhalb der Gebäude. Fakultätsübergreifende und stark frequentierte Bereiche wie die Bibliothek, Computerpools, Fachschafts- und Verwaltungsräume liegen im Kernbereich der Flachbauten und unterhalb des Hochhauses an der Nord-Süd Magistrale.

### **Central Building of the Goethe University on the Riedberg Campus, Library, Frankfurt/Main – Germany 2012**

Competition: 2006 - 1st Prize, Client: Land Hessen vertr. durch das Hessische Baumanagement RNL Rhein-Main, Gross area: 11.404 m<sup>2</sup>, Volume: 65.268 m<sup>3</sup>

The two-storey foyer forms the backbone of the slender and long building, which accommodates seminar rooms, the library and the cafeteria. Despite the difference in level of 3.50 m the foyer's two storeys allow for an access at ground level from both of the flanking streets. Six lecture halls are shifted as a base beneath the accessible square clearly reducing the visible building mass. The underground lecture halls receive daylight from the sides via patios, cut into the square. (Gerber)

### **Cologne University of Applied Sciences, Library, Campus Gummersbach - Germany 2005 - 2007**

Competition: 2004 - 1st Prize, Construction period: 2005 – 2007, Client: BLB NRW Köln Planung für Bilfinger Berger AG Köln (GU), Gross area: 27.716 m<sup>2</sup>, Volume: 97.057 m<sup>3</sup>

The buildings of the new campus run in line with the existing structure in a north-south direction and define the approach to the city in a new way. The different functions of the university are to be found in an H-shaped seminar and institute building and a square central building with lecture halls, cafeteria and library, which can also be used for external events. (Gerber)

**Recklinghausen Campus of the Gelsenkirchen University of Applied Sciences, Department of Material Science and Business Engineering, Library, Recklinghausen - Germany - 1999 – 2001**

Client: Land Nordrhein Westfalen vertr. durch das Staatliche Bauamt Recklinghausen competition: 1995 - 1st Prize, Construction period: 1999 – 2001 Gross area: 19.480 m<sup>2</sup>, Volume: 83.853 m<sup>3</sup>

The three cubic buildings of the university of applied sciences, plastered in white, form a group along an ascending, narrow forum at the transition point between the city and the open countryside. The central forum is characterised by the stairs, which follow the topography and can be used as seats, and by the timber-clad lecture halls, which protrude out from the row of buildings. The cubic central building housing the library and the cafeteria gives way to an elongated ascending forum. The library comprises the ground floor and the gallery level and is connected to the main building of the campus by a glazed steel footbridge. Window panes over two floors and a skylight ensure adequate daylight. (Gerber)

**Fachhochschule Lüneburg, Fachbereich Automatisierungstechnik, Lüneburg University of Applied Sciences, Department of Automation Technology, Lüneburg – Germany 1996 – 1997**

Competition: 1993 - 1st Prize, Client: Land Niedersachsen vertr. durch das Staatshochbauamt Lüneburg, Gross area: 10.930 m<sup>2</sup> Volume: 52.800 m<sup>3</sup>

The elongated new building unites all functions of the university in one slender, three-storey structure, which opens up to a forecourt in the east and virtually projects into the slope in the west. The existing topography is picked up inside the building in the form of a wide staircase, which becomes a striking feature of the design. (Gerber)

**Göttingen State and University Library, Niedersächsische Staats- u. Universitätsbibliothek, Göttingen – Germany 1991 - 1993**

Client: Land Niedersachsen vertr. durch das Staatshochbauamt Göttingen, Competition: 1985 – 1st Prize, Construction period: 1991 – 1993, Gross area: 47.059 m<sup>2</sup>, Volume: 189.730 m<sup>3</sup>

**Awards:**

1994 BDA-Preis Niedersachsen 1994; Niedersächsische Staats- und Universitätsbibliothek Göttingen

The state and university library is one of the five biggest libraries in Germany and has a valuable stock of books. Its structure resembling the “back of a hand with five fingers” is partially due to the urban surrounding and partially derives from the internal pattern of utilization. The most frequented areas are situated directly along the lofty entrance hall. Inside the “fin-gers” the visitor finds bright working and reading areas. (Gerber)

**Library of the Institute for Art History (Kunsthistorisches Institut), Florence - Italy 2004 - 2013**

2004 - 1st Prize, Client: Max Planck Gesellschaft München, 4.000 m<sup>2</sup>, € 6.145.000

The reading room, the heart of every library, defines the library’s atmosphere and working conditions. Here it is designed underground enclosing a large oak tree. A circular skylight provides daylight for the work areas on two levels. Open access shelves and repositories, not accessible for the public, are found on three sides in the back of the reading room. (Gerber)

**King Fahad National Library Riyadh, Saudi Arabia - 2010**

Client: Königreich Saudi-Arabien vertr. durch die Arriyadh Development Authority Competition: 2002 - 1st Prize; Construction period: 2007 – 2010; Gross area: 68.500 m<sup>2</sup>; Volume: 452.000 m<sup>3</sup>

The square new building encases the old library, which holds the archives like a treasure chest. The old roof will be a reading room, whereas its newly designed dome remains visible above the flat roof of the new building. A three-dimensional steel wire construction serves as an external sun protection. Its white membrane interprets Arabic traditions technologically and culturally in a modern way. (Gerber)

The square building with its vibrant, geometric order of the libraries in the 1970s and stands out clearly from the heterogeneous urban landscape from. In the midst of an urban park, the new library will be open and transparent and, despite its size on delicate nature intertwined with the urban space. It forms a cubic “ring” around the preserved according to criteria listed old building, which forms an architectural whole with the new building. Thus, the flat roof of the old building serves as a reading room, while inside it - are the books magazines - such as in a treasure chest. Reached the bridges over the visitors from the reading room open access area on the third floor of the new building. The existing dome is being redesigned as a steel and glass construction and towers over the new roof that covers the inner courtyards and the reading room. A tense beneath the roof membrane filters the white elongated by skylights and daylight urgent supplies all rooms evenly with glare-free light. Take over at night lights above the membrane serving as a light blanket that function. On the ground floor are located around the old building except the main entrance hall primarily exhibit space, a restaurant and a bookshop. Of the other occupations separated and accessible, the Library of the women in the first floor of the new southwest wing is housed. Clamped white membrane surfaces, which are held by a three-dimensional steel rope threads under construction to serve, before the floor facades as a sunscreen and interpret the Arabic tradition of tent structures on technologically advanced manner. Also here is the cultural understanding of Arabs enshrined principle of covering the entrance into the architecture. The addition of old and new provides a unified and representative architectural appearance with a characteristic shape is formed. At night the facade glows in alternating colors and becomes a cultural beacon in the city. (<http://www.baunetz.de>)

#### **Bürgerpalais Stuttenheim, Städtische Galerie, Bücherei, Erlangen – Germany 2010**

Die wechselvolle Geschichte des Palais mit den einbezogenen - ebenfalls denkmalgeschützten - Gebäuden der ehemaligen Post und Polizei zeigt sich bereits im Innenhof. Mit seiner transparenten Überdachung bildet er den zentralen Mittelpunkt des gesamten Komplexes. Lesebrücken ermöglichen den barrierefreien Zugang in alle Richtungen. Die in Stahl und Glas ausgeführten Lesebalkone erlauben nicht nur einen interessanten Blickwinkel auf die historische Innenfassade, sondern auch den Blick in die Vergangenheit: Eine transparente Montage gemahnt daran, dass in diesem Innenhof auch die Erlanger Juden vor ihrem Abtransport in die Konzentrationslager zusammengetrieben wurden.

Über eine Wendeltreppe erreicht man die Gewölberäume des Untergeschosses, die das Kunstpalais, die ehemalige Städtische Galerie, nutzt. Dieser neue Ort für internationale zeitgenössische Kunst in Erlangen bietet mit dem Innenhof die Chance, Literatur und Kunst mit einander zu verbinden. Im Alltagsgeschehen vorrangig aber ist die Nutzung als Bibliothekscfé mit Tageszeitungen und Zeitschriften.

#### **Deutsche Nationalbibliothek Leipzig – Germany – 2010**

Brutto: 23.000 m<sup>2</sup>, Nutzfläche: 14.000 m<sup>2</sup>

Nach knapp vier Jahren Bauzeit ist vergangenen Samstag der jüngste Erweiterungsbau der Deutschen Nationalbibliothek in Leipzig eröffnet worden. Es ist der vierte Erweiterungsbau für die 1912 gegründete Institution, bei der alle deutschsprachigen Verlage Belegexemplare ihrer Veröffentlichungen abgeben müssen. Da diese Bücher hier kumulativ eingelagert werden und jährlich etwa 300.000 Veröffentlichungen hinzukommen, ist bislang alle 30 Jahre eine Gebäude-Erweiterung nötig gewesen. Mit dem zweiten Standort in Frankfurt am Main zusammen bewahrt die Deutsche Nationalbibliothek insgesamt 26 Millionen Bücher, Zeitschriften, Zeitungen, Noten sowie Audio- und Videodateien auf. Die jetzt eröffnete Erweiterung wurde von Gabriele Glöckler (Stuttgart) entworfen und in Arbeitsgemeinschaft mit dem Büro ZSP Architekten geplant und realisiert. Auf 14.000 Quadratmetern kommen nun das Deutsche Buch- und Schriftmuseum unter sowie das zuvor in Berlin ansässige Deutsche Musikarchiv. Die Fläche verteilt der Neubau geschickt über neun Geschosse, von denen jedoch drei unterirdisch errichtet wurden. Über der Erde zeigt sich der Erweiterungsbau als relativ transparent. Die vier Hauptgeschosse über dem gläsernen Foyer werden von einer frei geformten Metallhülle umfasst, die vage Assoziationen an ein liegendes Buch formuliert – zum Glück aber, ohne damit allzu aufdringlich zu werben. Die Architekten: „Das Konzept ‚Umschlag – Hülle – Inhalt‘ übersetzt die Funktion des Gebäudes in seine Architektur. Der Inhalt wird durch eine kompakte Hülle um die Magazinbereiche geschützt. Ein leichter Umschlag formt die Außenhaut und bindet die Einzelbereiche zusammen.“ Durch die freiere Form würde sich der fünfgeschossige Baukörper „von der symmetrisch-axialen Ausformung des Deutschen Platzes und den vorgegebenen Linien und Fluchten des Hauptgebäudes“ emanzipieren. Im Erdgeschoss sind, hinter dem „gläsernen Vorhang“ der offenen Fassade, die öffentlichen Bereiche wie etwa die Flächen für Dauer- und Sonderausstellungen untergebracht. Seinen Bedarf an Kühl- und Heizenergie deckt das Gebäude durch eine bis zu 6.000 Meter in die Tiefe reichende Geothermie-Anlage. Nördlich des Gebäudes haben die Architekten einen Freibereich angelegt, der den alten und neuen Gebäuden des Ensembles einen Ankerpunkt bieten soll. Vor allem bietet der Neubau jetzt eine direkte Verbindung zwischen dem Hauptgebäude von 1912 und dem Bücherturm von 1982. Die Kosten des Projekts werden mit insgesamt 59 Millionen Euro angegeben. (<http://www.baunetz.de>)

Kritik und Politik sind sich einig: Das Haus ist ein Glücksfall. Schön, schwungvoll, ausdrucksstark, eigenwillig und doch gefällig präsentiert sich der Erweiterungsbau der Deutschen Nationalbibliothek in Leipzig. Auf imponierende Weise stellt das von der Stuttgarter Architektin Gabriele Glöckler entworfene Gebäude gemässigte Traditionalisten und Modernisten gleichermaßen zufrieden. Das ist kein Wunder. Die starken Gesten dieses Neubaus kommen aus einem Geist der Behutsamkeit. Hier war eine Architektin am Werk, die weiss, wie leicht Architektur zum Sündenfall werden kann. Jedes Bauwerk frisst Land, versperrt die Aussicht ins Weite, belastet seine Umgebung. Schlechte Kunstwerke kann man ignorieren. Missratene oder auch nur triviale Gebäude aber demonstrieren ihr Dasein penetrant im öffentlichen Raum, wenn sie ihn denn einmal erobert haben. Künstler dürfen verantwortungslos sein, Architekten dürfen es nicht. Die Deutsche Nationalbibliothek ist gefräßig. Von jeder im Inland erscheinenden Publikation, gleichgültig, welcher Sprache, fordert sie den Verlagen zwei Exemplare ab. Mittlerweile erfasst ihr gesetzlicher Sammelauftrag neben Druckwerken und Tonträgern auch digitale Veröffentlichungen. Zudem sammelt sie möglichst alle im Ausland auf Deutsch herauskommenden oder Deutschland betreffenden Werke. Diese Belegexemplare werden auf die beiden Standorte in Leipzig und Frankfurt am Main verteilt. Vollständigkeit ist das Ziel. Allein in Leipzig treffen täglich rund tausend Editionen ein und wollen archiviert sein. Alle zwanzig, dreissig Jahre platzt der Vielfrass aus den Nähten und braucht neue Magazine. Gabriele Glöcklers Schöpfung ist bereits Leipzigs vierter Erweiterungsbau. Die ersten beiden fanden noch hinter den Fassaden der 1912 gegründeten Deutschen Bücherei Platz. Dann stellte die DDR in 40 Meter Abstand zum schmucken historisierenden Bau des Architekten **Oskar Pusch (\* 1877 Dresden - + 1970 Dresden, Deutsche Bücherei 1914 – 1916)** ein Bücher-Silo hin: ein Magazin aus fünf Türmen, fensterlos und bis 51 Meter hoch, rigider Funktionalismus. Form follows function? «Funktion kriert Form», heisst der Wahlspruch Glöcklers. Die Differenz zwischen beiden Leitsätzen scheint nicht gross, doch wohin sie führt, zeigt der Bibliotheksanbau, der nun Oskar Puschs klassizistischen, durch einen Schuss Wiener Jugendstil aufgelockerten Riegel mit den 1982 fertiggestellten Büchertürmen zu einem Ensemble verbindet. Sachlich und sinnlich schliessen sich bei Glöckler nicht aus. Der Funktionalismus versteht unter dem Sachgerechten das Nüchterne. Das neue Haus an Leipzigs Deutschem Platz, einem länglichen Oval mit einer Rasenke, von Bäumen lauschig umstanden, ist indessen alles andere als nüchtern. Es genüge nicht, «dass ein Bauwerk seine Funktion gut und wirtschaftlich erfüllt, es muss diese Funktion auch ausdrücken», meinte der US-Architekt James M. Fitch einmal über Louis H. Sullivan, den «Vater der Wolkenkratzer». Getreu dieser Forderung hat die schwäbische Architektin ein sprechendes Bauwerk geschaffen. Die auf Strassenniveau befindliche Ausstellungshalle des Buch- und Schriftmuseums, das vom Alt- in den Neubau übersiedelt, ist verglast und signalisiert: Komm

herein, dieser Bereich ist öffentlich! Die darüberliegenden vier Geschosse aber sind in eine Aluminiumhaut eingeschlagen, und zwar gerade so, wie ein Umschlag ein Buch umfängt. Bibliotheksdirektor Michael Fernau und seine Mitarbeiter zeigen sich von der bildlichen Suggestion entzückt: ein Bibliotheksbau in Buchform, ein hingebreiteter Foliant, wie passend. Frau Glöckler demotiviert nicht den visuellen Effekt, möchte ihn aber als Planungsergebnis, nicht als Vorgabe verstanden wissen. «Ich bin in der Zeit der Postmoderne aufgewachsen und weiss, dass man sich beim Bauen vor konkreten Bildern hüten muss», sagte sie uns. Von Robert Venturi hat sie gelernt, dass Architektur ihre städtebauliche Geste auf die Geschwindigkeit der Passanten abstimmen muss: Schnelles Vorbeieilen erfordert grosse, kompakte Gesten; dem langsam Näherkommenden hingegen kann man Filigranes zumuten. So verhält es sich nun auch an Leipzigs Deutschem Platz. Wer dort bloss vorübersaust, dem wendet der silbrig glänzende Foliant abweisend den grossen runden Rücken zu. Unschwer zu erraten, dass diese geschlossene Wölbung konservatorischen Forderungen gehorcht. Was dahinter- liegt, braucht Schutz. Magazine besetzen immerhin mehr als 80 Prozent der frisch hinzugewonnenen Flächen. Filigraner, poetischer, transparenter zeigt sich der Erweiterungsbau allen, die den Weg bis vor seinen Eingang gefunden haben. Hier tritt einem Glöcklers Werk in Gestalt zweier gegenläufiger, ineinander verschränkter Baukörper gegenüber, und hier erblickt man gleichsam den Schnitt des über dem Erdgeschoss ruhenden Folianten. Zartfarbene Glasplatten, deren verschiedene Rottöne Johann Sebastian Bachs vierter Goldberg-Variation «nachkomponiert» sein sollen, gliedern die Fassade. Dass auch das Deutsche Musikarchiv, zuvor in einer Villa in der Randlage Berlins ansässig, nach Leipzig gezogen ist, stand noch nicht zur Debatte, als Gabriele Glöcklers 2002 den offenen Wettbewerb um den Erweiterungsbau gewann. Aber die aufs Entwerfen spezialisierte, nur ein kleines Büro bzw. Atelier betreibende Architektin hat auch diese Aufgabe elegant gelöst. Statt eines unterirdischen Geschosses hat der Neubau nun deren drei, und im rückseitig gelegenen Innenhof des Altbaus ist, futuristisch anmutend wie ein Ufo, ein Lesesaal mit Audio-Arbeitsplätzen entstanden. Ein Bereich für Schaukästen mit historischen Abspielgeräten, für Tonstudios und für eine absolut schalldichte Abhörkabine (in der Stille dort haben Töne, zumal die leisen, eine unglaubliche Transparenz) fanden in der Übergangszone zwischen Alt- und Neubau Platz. Die Maxime der Eingangsfassade, das neue Haus als gebaute Einladung zu gestalten, setzt sich innen fort: Schöne Hölzer, geschwungene Formen, fließende Linien, glänzende Oberflächen, Rundungen statt rechter Winkel frönen der Lust am organischen Design, Glaswände entgrenzen die öffentlichen Zonen. Im neuen Lesesaal des Buch- und Schriftmuseums liegt ein hellgrauer Teppich mit langem Flor, wie er in Hotelfoyers erprobt ist. Ein Ort mehr zum Wohnen denn zum Arbeiten, so scheint es. Überraschen muss, wie gut das Miteinander dreier Baustile funktioniert. Oskar Puschs Hauptgebäude bleibt die in sich ruhende Bastion der alten, Einkehr und Dämmerlicht suchenden Lesekultur. Die Büchertürme verströmen dank einer neuen weissen Aussenhaut beinahe so etwas wie skulpturales Raffinement. Energischer als zuvor betonten sie die Korrespondenz mit den Hochhäusern aus DDR-Tagen, welche die Strasse des 18. Oktober Richtung Stadtzentrum säumen. Dazu nun Gabriele Glöcklers Bau. Er verkörpert den Geist der neuen Zeit, da Bibliotheksbesucher nicht mehr die natürlichen Feinde der ihre Schätze hortenden, um den Erhalt der Bücher besorgten Archivare sind, sondern Exponenten des gern beschworenen «offenen Zugriffs auf Wissen». Dass Erdwärmeheizung, Tageslichtsteuerung, Klimatisierung und dergleichen Techniken in diesem Haus vom Feinsten sind, effizient und nachhaltig, versteht sich. Der Deutsche Platz endlich, der auf der Blickachse zwischen dem Völkerschladtenkmal und dem Turm des neuen Rathauses liegt, der schon vor hundert Jahren ein repräsentativer Ort werden sollte und doch immer ab vom Schuss blieb, ist gefühlte zwei Kilometer näher ans Zentrum gerückt. Leipzig, die ärmste und vielleicht schönste von Deutschlands Grossstädten, äfft beim Bauen oft falsche westliche Vorbilder nach. Beim Schwäbinnen-Import am Deutschen Platz aber hat man für einmal alles richtig gemacht. Joachim Güntner in: Neue Zürcher Zeitung, 13.05.2011 (<http://www.nzz.ch>)

**Kulturpalast Dresden (Zentralbibliothek) – Germany 1st Prize 2009 on design (2015)**

### **Literature:**

**Dieter Schölzel, Kulturpalast Dresden. Baugeschichte und Umbauvorschläge zur Dresdner Philharmonie. Überarbeitetes Manuskript zum Vortrag am 29.10.2003 in der sächsischen Akademie der Künste.**

([http://www.kulturpalast-dresden-erhalten/content\\_de/dieterschoelzel.html](http://www.kulturpalast-dresden-erhalten/content_de/dieterschoelzel.html))

The result of the international architectural competition for the reconstruction of the Kulturpalast in Dresden was announced on Thursday, 18<sup>th</sup> June 2009. Architects Meinhard von Gerkan, Stephan Schütz and Nicolas Pomränke from architectural firm von Gerkan, Marg and Partners won the first prize of the competition, in which over 25 firms took part. With the new design for the hall and the **integration of the Central Library**, the intention is for the Kulturpalast to revert to its original key role as acultural meeting point – a kind of urban “open house”. The unique central location between the Altmarkt, the Schloss area and Neumarkt necessitates a building oriented in every direction so as to meet the requirement for geographical and conceptual openness as a civic meeting place. The design takes this objective into account in that all the cultural installations can be accessed from all three entrance sides of the building. The large southern lobby on the ground floor acts as a main entrance to all functional areas, but also as a social meeting point and a local urban fulcrum. The Central Library can be reached from all entrances, but particularly from the Altmarkt side. This central arrangement reinforces the Library as a key facility alongside the concert hall. All the same time, the clear symmetrical arrangement of all cultural facilities reinforces the historical design concept. The Library is wrapped in a ring round the concert hall like a slipcase. Placing the library vestibule beneath the concert hall allows central access, and provides spacious areas for ancillary functions grouped around the entrance. Behind the entrance area, the library is divided into two “towers”, which are connected internally at gallery level to make a complete circle. The events areas of the library are found in the airy rooms along Schloss Strasse, and are likewise also accessible from the main vestibule in accordance with the concept of a multifunctional, open building. (gmp)

Symbol für selbstbestimmtes Lernen

Die öffentliche Bibliothek ist in jeder Stadt Symbol und Werkzeug für freies und selbstbestimmtes Lernen. Der Umbau des Kulturpalastes bietet die Chance, die Haupt- und Musikbibliothek und die Jugendabteilung „medien@age“ der Städtischen Bibliotheken so weiterzuentwickeln, dass sie den hohen Erwartungen der Dresdner auch in Zukunft entsprechen können - schließlich repräsentiert eine Bibliothek die Stadt und den Geist ihrer Bürger. Die Fusion der Haupt-, Musik und Jugendbibliothek zur neuen Zentralbibliothek im Kulturpalast bringt klare Vorteile. Der Service für die Besucher verbessert sich durch kürzere Wege, längere Öffnungszeiten und hervorragende Anbindung. Eine Zentralbibliothek genau zwischen Altmarkt und Neumarkt wird wie früher gesellschaftlicher Mittelpunkt und öffentlicher Raum, Ort des Informationsaustauschs und der Kommunikation. Die neue Bibliothek bietet 6.000 Quadratmeter öffentliche Fläche. Mit täglich 3.000 bis 4.000 Besuchern stellt sie das Kommunikationszentrum im neuen Kulturpalast dar. Die großen Glasflächen schaffen eine Verbindung zwischen Innen und Außen. Die Besucher haben einen wunderbaren Blick auf die Stadt, zugleich kann die Bibliothek von außen eingesehen werden. Neben den Medienbeständen im

Freihandbereich wird es Leseabteilungen, Auskunft- und Abspielplätze sowie Ausstellungsflächen und Spielbereiche für Kinder geben. Eine 24-Stunden-Rücknahme verbindet sich mit dem repräsentativen Eingang im Hauptfoyer. Schulungs- und Veranstaltungsräume bieten hervorragende Möglichkeiten, alle Arten von Lesungen, Seminaren und Konferenzen durchzuführen. Vor allem jüngerer Publikum, das heute schon zu den größten Besuchergruppen zählt, dürfte die Vorzüge zu schätzen wissen. (<http://www.dresden.de>) 14.03.12

#### Kulturpalast in Dresden wird komplett umgebaut

Der mehr als 80 Millionen Euro teure Umbau des Dresdner Kulturpalastes zu einer modernen Konzerthalle ist beschlossene Sache. Der Stadtrat sprach sich am Mittwochabend mit großer Mehrheit für den kompletten Umbau aus - trotz gestrichener Fördermittel von rund 35 Millionen Euro. Für die Finanzierung soll auch das Kapital von zwei städtischen Stiftungen herangezogen werden, von der Kreuzchor- und der Sozialstiftung. Dabei geht es um insgesamt 27,2 Millionen Euro. [www.mdr.de](http://www.mdr.de) vom 05.04.2012  
Das Landgericht Leipzig hat im Streit um den Umbau des Dresdner Kulturpalastes die Klage des Architekten Wolfgang Hänsch (\*11.01.1929 Königsbrück) abgewiesen. Nach Ansicht der zuständigen 5. Zivilkammer verletzt das Vorhaben seine Urheberrechte an dem Bauwerk nicht. Hänsch wollte verhindern, dass der Mehrzwecksaal des Gebäudes abgerissen und durch einen neuen Kongressaal ersetzt wird. [www.mdr.de](http://www.mdr.de) vom 25.04.2012 (<http://www.neumarkt-dresden.de>)

Architekt: Wolfgang Hänsch, Herbert Löschau, Heinz Zimmermann, Dieter Schölzel (u.a.), Basisentwurf: Leopold Wiel \_ Kunst: u.a. Gerhard Bondzin & Kollektiv (Wandbild), Freiflächengestaltung: Günther Krätzschmar (Brunnen, Hochbeete, Rückseite mit Leuchten auf dem Plateau) (zerstört 2009-2011), Bauzeit: 1966- 69 (diverse Wettbewerbe seit 1953)

Adresse: Altmarkt, Schloßstraße, Galeriestraße, Umbau: voraussichtlich ab September 2012, Abriss des alten Mehrzwecksaals, Einbau eines komplett neuen Konzertsaaus (GMP),

1962 begann der Bau des dominanten Dresdner "Palastes" für Kultur, ein in der Baugeschichte der DDR in dieser Funktion einzigartiges Gebäude (mit Räumen für künstlerische Betätigung als Volkshaus). Im Hintergrund rußgeschwärtzer Ruinen von Schloss und Frauenkirche war dies ein kulturpolitischer Akt, der mitten in einem neuen "sozialistischen Stadtzentrum" an die langen kulturellen Traditionen Dresdens anzuknüpfen suchte. Städtebaulich wie architektonisch bedeutete der Glas-Beton-Kasten mit anthroposophisch anmutendem Kupferdach einen rigorosen Bruch mit dem historisch überlieferten Stadtgrundriss und der vormodernen Architektur. Ursprünglich sollte das Haus jedoch in den 50er Jahren-Planungen mehr als 100 Meter hoch werden und im verzierten-dekorativen Stil der "Nationalen Tradition" errichtet werden. Der rhomboide Innenraum erinnert u.a. an den Kongressaal im Moskauer Kremlgelände, 1959-1961 im Auftrag von Nikita Chruschtschow für 6000 Zuschauer der KPDSU-Parteitage errichtet. Vorbildhaft wirkte aber auch u.a. das neue Konzerthaus De Doelen von Rotterdam von 1962-66.

Architekturführer der DDR, Bezirk Dresden 1978:

"Kulturpalast: flacher Baukörper 102,80 m x 71,80 m mal 19,35 m bildet städtebaulichen Abschluss des Altmarktes nach Norden. Monolith. Stahlbetonskelettbauweise (Raster 6 m x 9 m), Sockelgeschoss Naturstein, Obergeschoss Aluminium-Glas-Elemente, teilw. Betonstrukturwände, Saalbau profiliertes Kupferdach; Mehrzwecksaal mit Kipparkett 2740 Plätze, Studiotheater 192 Pl., Restaurant: 205 Pl., Klubräume 584 Pl.; ..."

Architekturführer Dresden 1997:

"Der kompakte, flache Baukörper ist äußerlich durch Material- und Farbkontraste geprägt: Während die Sockelzone aus poliertem roten Granit besteht, setzt sich der Hauptkörper aus großen, in Aluminiumrahmen gefaßten Glasflächen zusammen; er wird von weißen Betonsimsen eingerahmt. Die Rückseite sowie die Außenwände der Funktionsräume sind durch Betonfertigfenster untergliedert. Ein gefaltetes Kupferdach bildet den Abschluss. Dabei erhebt sich der zentral gelegene sechseckige Festsaal äußerlich als Dachaufbau. In Höhe des 1. OG umschließt ein Balkon den Kulturpalast. An der Fassade zur Schlossstraße befindet sich das Wandbild "Weg der roten Fahne" vom Kollektiv Gerhard Bondzin, ein typisches Werk des sozialistischen Realismus. Der Eingang enthält fünf Bronzetüren von Gerd Jaeger, die Motive aus der Dresdner Geschichte darstellen."

Festsaal

32 m breite, 10 m tiefe Bühne, fahrbare Jehmlich-Orgel, Hauptbühnenfläche 320 m<sup>2</sup>; Portalhöhe 11,5 m, mittels Kipparkett auch als Ball- oder Kongreßsaal nutzbar. 2 Seitenbühnen mit je 160 m<sup>2</sup>, 1 Hinterbühne mit 79 m<sup>2</sup>.

(<http://www.das-neue-dresden.de/kulturpalast-dresden.html>)

#### Abbe-Zentrum am Wissenschaftscampus Jena Beutenberg, Bibliothek, Jena – Germany 2005

Bauherr Ernst-Abbe-Stiftung, Wettbewerb 2003 – 1. Preis, Entwurf Volkwin Marg und Hubert Nienhoff mit Stephan Rewolle BGF 4.020 m<sup>2</sup>, Bauzeit 2004-2005

.....  
Mit der Eröffnung des Abbe-Zentrums am 23.01.2006 hat der Wissenschaftscampus am Jenaer Beutenberg eine neue Mitte bekommen. Dieses Gebäude ist das Kommunikationszentrum des Campus. Es wird von allen Campusanrainern gemeinsam genutzt und beherbergt das Casino, einen Hörsaal mit Foyer und die Campusbibliothek. Es wird von uns, der BMBG (Beutenberg Management Betriebsgesellschaft mbH), betrieben.

Der repräsentative Bau mit 22 m Höhe dominiert in seiner zentralen Lage den Campus. Die konkav gewölbten Seitenfronten zitieren das Logo des Bauherren, der Ernst-Abbe-Stiftung, und damit auch die Jenaer Domäne „Optischer Gerätebau“.

Mit der Errichtung des Zentralgebäudes entsteht ein neues Zeichen für den Wissenschaftsstandort Jena. Der Campus Jena-Beutenberg stellt in nationaler wie internationaler Hinsicht einen wichtigen Standort deutscher und thüringischer Forschungstätigkeit dar. Die gekrümmte Fläche als raumbildendes Element des Entwurfes weist auf die Forschungstätigkeit Ernst Abbes und Carl Zeiss' hin, deren Entwicklungen auf Grundlage der Lichtbeugung durch gekrümmte Flächen das Fundament für den Ruf Jenas als Forschungsstadt gelegt haben. Zwei geschwungene, scheibenförmige Baukörper öffnen sich in Nord-Südrichtung. Durch einen leichten Versatz der Seitenflügel wendet sich das Gebäude dem ankommenden Besucher am nördlichen Haupteingang entgegen. Analog dazu weist das Gebäude durch den Versatz auf der Gartenseite in den attraktiven, unbebauten Landschaftsraum im Südwesten. Die Stahlbetonkonstruktion mit einer Fassade aus Metallpaneelen mit grünlichen Glasflächen verleiht dem Gebäude eine der Nutzungsart entsprechende Modernität und Transparenz sowie eine zeichenhafte Abstraktion. (gmp)

#### Changzhou Culture Center (Library), Changzhou - China on design

Die Architekten von Gerkan, Marg und Partner (gmp) haben in einem internationalen Wettbewerb mit KSP – Jürgen Engel Architekten, Atelier Zhanglei, Arata Isozaki und weiteren führenden Architekturbüros laut Jury den ersten Preis für ein Kulturzentrum in der neu geschaffenen Stadtmitte Changzhous gewonnen. Mit insgesamt 365.000 Quadratmetern vereint der Neubaukomplex verschiedene Museen, wie z.B. das Kunst-, ein Wissenschafts- und Technikmuseum sowie eine Bibliothek zusammen mit Serviceeinrichtungen zum kulturellen Stadtteilzentrum im Xinbei Bezirk der drei Millionen Einwohner Stadt zwischen Wuxi und Nanjing.

Wettbewerb 2012 – 1. Preis, Entwurf Meinhard von Gerkan und Nikolaus Goetze mit Magdalene Weiss, Partner China Wei Wu. Mitarbeiter Wettbewerb Martin Friedrich, Sebastian Schmidt, Kong Buhong, Jiang Lanlan, Yao Yao, Zhang Zhen,

Gao Shusan, Dominika Gnatowicz, Sa Xiaodong. Tragwerksplanung schlaich bergemann und partner. Freiraumplanung WES & Partner. Bauherr Changzhou Jinling Investment and Construction Co., Ltd  
BGF insgesamt 365.000 m<sup>2</sup>  
BGF Bücherei 32.800 m<sup>2</sup>  
BGF Kunsthalle 20.600 m<sup>2</sup>

BGF Wissenschafts- und Technikmuseum 18.300 m<sup>2</sup>  
BGF Serviceeinrichtungen 37.300 m<sup>2</sup>  
BGF unterirdisch auf 2 Ebenen 256.000 m<sup>2</sup>

Der Entwurf orientiert sich an der lokalen Kultur, indem er Bezug auf Changzhou als südchinesische Wasserstadt nimmt. Die in einem großen Bogen brückenartig auskragenden Gebäudemodule bestehen aus sechs 45 Meter hohen Pavillons, die im Innern durch ihre unterschiedlichen Funktionen architektonisch stark variieren, in ihrem Äußeren jedoch optisch eine Einheit bilden. So entsteht das Kulturforum unter einem gemeinsamen Dach. Die Kunstgalerie im Osten und das Wissenschafts- und Technikmuseum im Westen bilden gemeinsam die öffentliche Plaza im Zentrum von Changzhou. Mit Wasserspielen und großzügigen Landschaftsmotiven bietet sie eine hohe Aufenthaltsqualität und dient als Treffpunkt im Bezirk. Unterirdisch befinden sich 256.000 Quadratmeter, die sich auf eine Tiefgarage sowie vielfältige Laden- und Verkaufsflächen aufteilen, durch Tiefhöfe belichtet sind und mit den Kultureinrichtungen in direkter Verbindung stehen. Ein diagonal durch das 17 Hektar große Grundstück führender Wasserlauf verbindet oberirdisch alle Funktionen miteinander und belichtet zudem die im Souterrain befindlichen Restaurantflächen. Die Fassade nimmt in Material und Farbe Bezug auf die regionale Bautradition: grauer Schiefer schafft einen massiven äußeren Eindruck, während helle Oberflächen im Inneren der Gebäude mit weißen Elementen und transparente Glasfassaden einen starken Kontrast erzeugen. Das Kulturzentrum wird die neue Stadtmittle und ihre Entwicklung mitprägen und spiegelt Changzhous Kombination aus traditionellem Stadtkern und moderner Metropole wider. Das große Dach verbindet die sechs Kulturpavillons und definiert somit den öffentlichen Raum für die Bürger von Changzhou. (gmp)

## **Gössler Kinz Kreienbaum Architekten, Hamburg – Germany**

<http://www.gk-arch.de>

**Librares:**

**Erwin-Schrödinger Zentrum. Zentralbibliothek Naturwissenschaften. Computer- und Medienservice der Humboldt Universität zu Berlin, Berlin-Adlershof – Germany 2000 – 2003**

gross floor area 16.500 sqm

Located between the Brandenburg Gate and the Berlin-Brandenburg International Airport, one of Europe's most ambitious projects is being created on a 420-hectare site: Berlin Adlershof – the City of Science and Technology. Up to 20,000 people will soon live and work here. The Humboldt University's natural sciences institutes, diverse research and development institutions, innovative industries, and media companies are relocating to the site. The information and communication center with its multimedia library and computer center is the main public building and provides services for the entire area. It is built on the site of a former institute for aerodynamic research and several of the hangers from the 1930s have been reused and are now an integral part of the building. The information and communication center consists of a computer center, a library, central auditoriums, a television studio, and a privately funded and run conference center. The project is an example of successful cooperation and synergy between the academic community, private research, and urban development. (Gössler)

Der Siemens-Architekt Hans Hertlein (1881\* - 1963+) hat in der Nazizeit in Berlin auch mehrere andere große Anlagen der Rüstungsindustrie erbaut, die in einem sachlich-modernen Stil gehalten sind und nur in Details (wie „Führerbalkons“) an die Blut- und Boden-Ära erinnern. Eine dieser Anlagen steht im Ortsteil Lichterfelde am Platz des 4. Juli. Die ehemalige Telefunken-Fabrik von 1937-1940 wurde jahrzehntlang von den Amerikanern als McNair Barracks genutzt. Nach Abzug der Amerikaner steht ein Großteil des Komplexes leer. Die Einrichtung von Loftwohnungen kommt nur schwer in Gang. Nun soll ein Teil der Anlage schulischen Zwecken dienen. Der dafür durchgeführte begrenzte offene, einstufige Realisierungswettbewerb mit vorgeschaltetem Bewerbungsverfahren ist nun entschieden worden. Ziel des Wettbewerbs war die Zusammenführung der Kopernikus-Oberschule an diesem Standort. Dazu sollte der nordwestliche Teilbereich der ehemaligen Telefunkenwerke zu einem Schulgebäude umgeplant werden. Die Einpassung der Schulnutzung sollte unter Berücksichtigung der denkmalpflegerischen Anforderungen erfolgen. Neu errichtet werden soll eine Dreifachsporthalle mit den erforderlichen Sportfreiflächen. Die Jury, an der unter anderem die Architekten Bettina Götz, Julia Tophof, Stephan Höhne und Hermann Scheidt teilnahmen, vergaben folgende Preise:

1. Preis

Gössler Kinz Kreienbaum Architekten BDA, Hamburg

2. Preis

Anderhalten Architekten, Berlin

3. Preis

Eller + Eller Architekten, Düsseldorf

Ankauf

Georg Bumiller Ges. v. Architekten, Berlin

Ankauf

Numrich Albrecht Klumpp Planungsbüro GmbH, Berlin

Die Jury beurteilt den ersten Preis so: „Durch Abriss des vorhandenen Dreiflügelbaus und Errichten eines großzügigen Stahl-Glas-Daches entsteht eine weitläufige Eingangssituation. Das denkmalgeschützte Gebäude erhält eine räumliche Öffnung zum Osteweg und wird auf selbstverständliche Art und Weise inszeniert. Der Hauptzugang ins Gebäude erfolgt axial in der Gebäudeecke. Der Schulhof wird gleichzeitig zum Eingangshof. Die Lage des Eingangs ermöglicht kurze Wegelängen in die beiden Gebäudeflügel. Die Sporthalle und das Vordach erzeugen eine stadträumlich angemessene Eingangssituation der Billy-Wilder-Promenade in das Quartier. Im Gebäude des Nordkasinos werden direkt in Eingangsnähe die öffentlichen Nutzungen wie Essen, Mehrzweckraum, Bibliothek, Schülercafé und Freizeitbereich untergebracht. Das Kasinogebäude wird weitestgehend freigestellt. Die Arbeit besticht durch ihren zurückhaltenden Umgang mit dem Baudenkmal und ihre stadträumlichen Bezüge.“ (<http://www.baunetz.de>)

## **Architekturbüro Werner Grannemann, Bremerhaven – Germany**

Nach dem Ausscheiden (Ruhestand) von Rolf Mielke wurde das Architekturbüro Grannemann + Mielke im Juli 2009 in Architekturbüro Werner Grannemann umbenannt.

### **Libraries:**

#### **Stadtteilbibliothek Bremerhaven-Leherheide – Germany 2011**

Client: Seestadt-Immobilien (Wirtschaftsbetrieb der Stadt Bremerhaven), 3.100 m<sup>2</sup>, 505 m<sup>2</sup>, € 1.000.000

Neubau der Stadtteilbibliothek Leherheide als eingeschossiger Bibliotheksbau auf einer Fläche von ca. 500 m<sup>2</sup>. Das wie ein Buch gestaltete Gebäude bietet Kindern, Jugendlichen und Erwachsenen gleichermaßen ein breites Spektrum an Informationsquellen. Hier können neben Büchern auch DVDs und Computerspiele ausgeliehen werden. Es ist ein Bilderbuchkino für die Kleinsten geplant, ein loungeartiger Tresen für Jugendliche sowie Arbeitsplätze zur Internetrecherche für die Großen. Neben einem sowohl Bibliotheksgästen als auch Wochenmarktbesuchern zugänglich, behindertengerecht WC werden die sanitären Anlagen der Bibliothek jeweils ein WC auf Kinderhöhe für Jungen und für Mädchen anbieten. Des Weiteren bietet eine Informationsstation Hintergrundwissen über den Stadtteil, die Bibliothek und Weiteres. (Grannemann)

In einem Problembezirk Bremerhavens wurde das Stadtteilzentrum neu gegliedert. Die einstige Attraktivität dieses Zentrums sollte wieder hergestellt werden. Aus dem Grundstücksverkauf der alten Stadtteilbibliothek musste der Neubau und das neu angelegte Wochenmarktgelände realisiert werden. Die Aufgabe war es, durch die direkte Lage an einer Hauptstraße, einen markanten und raumbildenden Neubau in eine vorhandene Grünfläche zu bauen. Die äußere Form des 5,80 m hohen Bibliotheksgebäudes ist als liegendes Buch gestaltet, die Attika aus HPL-Platten wurde als oberer Buchdeckel, die Fassade zur Straße als gerundeter Buchrücken und der rot verkleidete Sockel als unterer Buchdeckel gestaltet. Drei Fassaden, als Pfosten-Riegel-Fassaden mit Sonnenschutzgläsern ausgebildet, öffnen sich in Richtung Grünanlagen und symbolisieren mit den erhabenen Deckschalen die Buchseiten. Im barrierefreien Eingangsbereich wurde das Vordach aus HPL-Platten, wie ein Lesezeichen gestaltet. Die mit HPL-Platten verkleidete und komplett geschlossene Stahlbetonwand auf der Straßenseite schottet das Innere gegen Straßenlärm und Beobachtung ab. Im Inneren wurde ein flexibler Bibliotheksbereich geplant, der in Kleinkinder-, Jugend- und Erwachsenenbereiche zониert ist. Dieser lässt sich bei Veranstaltungen wie Autorenlesungen, Bilderbuchkino oder Schulklassentage, an die jeweilige Situation leicht anpassen. Das Raumprogramm wird durch Büro-, Technik- und Sanitäräume - mit dem ersten öffentlichen Behinderten-WC Bremerhavens - ergänzt. (<http://www.heinze.de>)

## **Planungsbüro Gerhard Guckes & Kollegen, Idstein – Germany**

<http://www.guckes-partner.de>

### **Libraries:**

#### **Erweiterungsbau Hochschule Frsenius mit Bibliothek, Hörsälen, Verwaltungsräumen, Idstein – Germany 2008**

Nach langer Vorbereitung wird der dringend notwendige Neubau an der privaten FH nun realisiert. Sechzig Räume sind geplant, darunter eine große Bibliothek mit modernen Computerarbeitsplätzen sowie Hörsäle, Praxis- und Seminarräume und Büros. Die EFF sei zuversichtlich, so der Präsident, dass die neuen Räumlichkeiten bereits im Wintersemester 2008/2009 zum Lernen, Forschen und Arbeiten genutzt werden können. Für die Architektur des Neubaus mit einem Investitionsvolumen von 4,6 Millionen Euro zeichnet Gerhard Guckes verantwortlich. Das neue Gebäude, das funktional und behindertengerecht ausgebaut wird, soll sich architektonisch nicht an das Hauptgebäude anpassen, sondern wird einen modernen Kontrast dazu bilden. Damit will die EFF, ihrem Leitgedanken folgend, Tradition mit Innovation auch optisch verbinden. (<http://www.idw-online.de>)

#### **Hochschule Ruhr – West Standort Bottrop – Germany 2013**

Presseinfo vom 15.03.2011

Geplanter Neubau der Hochschule Ruhr West in Bottrop erhält ein Gesicht

Siegerentwurf im Wettbewerb um den Neubau der Hochschule am Standort Bottrop steht fest.

Bottrop – Der Siegerentwurf für den Neubau der Hochschule Ruhr West in Bottrop steht fest. Er stammt von der Arbeitsgemeinschaft „h4a Gessert + Randecker + Legner Architekten (Stuttgart) und Vögele Architekten (Stuttgart) mit Käufer + Passer (Tuttlingen) und Planergruppe Oberhausen (Oberhausen)“. Nach dem derzeitigen Planungsstand wird die Hochschule den Neubau in Bottrop ab Herbst 2013 beziehen können. Für die Baukosten sind 22 Millionen Euro veranschlagt. Der Siegerentwurf setzte sich in einem Auswahlverfahren durch, das die Niederlassung Münster des Bau- und Liegenschaftsbetriebes NRW (BLB NRW) durchgeführt hat, damit die drei im November 2010 durch eine fachkundige Jury gekürten Preisträger des Wettbewerbs zum Neubau der Hochschule Ruhr West in Bottrop ihre Entwürfe nachbessern. Die Jury hatte den Preisträgern dazu kritische Hinweise an die Hand gegeben. Das nun abgeschlossene Auswahlverfahren stellt sicher, dass der unter funktionalen, wirtschaftlichen, energetischen und städtebaulichen Aspekten beste Entwurf zur Ausführung kommt. Das Preisgericht lobte an dem jetzt gekürten Siegerentwurf bereits im November, dass der Zuschnitt der Räume flexible Nutzungen ermöglicht, und dass die wichtigen Funktionsbereiche wie etwa die Bibliothek sinnvoll im Gebäudekomplex angeordnet sind. Architektonisch reagiert der Bau durch die Gliederung in einzelne schmale Finger besonders gut auf die umliegende kleinteilige Bebauung. Mit durchgehend drei Geschossen fügt er sich außerdem in der Höhe harmonisch in die Umgebung ein. Kritisiert hatte das Preisgericht offensichtliche Mängel in der Einhaltung der Abstandsflächen und der Anordnung der Parkflächen auf dem Grundstück. „Die Verfasser haben die konstruktive Kritik angenommen, die Probleme gelöst und sich insgesamt hervorragend präsentiert“, lobt Markus Vieth, Leiter der Niederlassung Münster des BLB NRW, und ergänzt: „Wir freuen uns, diesen nach der Überarbeitung in jeder Hinsicht besten Entwurf im Wettbewerb für den Standort Bottrop realisieren zu können!“ „Es ist eine besondere Herausforderung, einen in sich geschlossenen Hochschulkörper für 500 Studienplätze zu planen. Dem Entwurf der Arbeitsgemeinschaft „h4a Gessert + Randecker + Legner Architekten und Vögele Architekten mit Käufer + Passer sowie der Planergruppe Oberhausen“ ist das besonders gut gelungen, denn er verbindet alle wichtigen Funktionalitäten offen miteinander“, findet auch Prof. Dr. Eberhard Menzel, Präsident der Hochschule Ruhr West. „Darüber hinaus setzen wir auf eine

energetische Ausrichtung des Hochschulgebäudes, so dass eine Zertifizierung als Zero Emission Campus erfolgen soll“, so Menzel weiter.

„Das neue Gebäude für die Hochschule Ruhr West wird das Areal rund um die Hans-Sachs-Straße städtebaulich aufwerten“, sagt Bottrops Technischer Beigeordneter Norbert Höving. „Wir freuen uns, in Bottrop einen Baukörper mit anspruchsvoller Architektur zu bekommen, der zukünftig Standort der Hochschule Ruhr West sein wird. Damit wird der Schritt zu einem attraktiven Hochschulstandort vollendet. Das nachhaltige Energiekonzept ist beispielhaft für das Projekt InnovationCity, bei dem wir ein Zielgebiet zur Niedrigenergiestadt umbauen wollen.“

Der zweistufige Wettbewerb zum Neubau der Hochschule Ruhr West an den beiden Standorten Mülheim und Bottrop hatte am 25./26. November 2010 mit den Sitzungen des Preisgerichts geendet. Für Bottrop hatte die Jury drei erste Plätze und einen dritten Platz – diesen an den jetzt gekürten Sieger – vergeben. (<http://www.blb.nrw.de>)

## **Hammeskrause Architekten, Stuttgart – Germany**

### **Libraries:**

#### **Fraunhofer Institut, Biomedizinische Technik, Bibliothek, Potsdam – Germany 2007**

Am 9. Mai 2007 wurde in Potsdam der Neubau für das Fraunhofer Institut für Biomedizinische Technik (IBMT) feierlich eröffnet. Der Neubau im Wissenschaftspark Golm wurde von dem Stuttgarter Büro Hammeskrause (hervorgegangen aus Brenner & Partner) geplant. Auf einer Nutzfläche von 4.100 Quadratmetern ist ein multidisziplinär arbeitendes Institut mit Laboren und Büros entstanden. Die Baukosten betragen 16 Millionen Euro ohne Ausstattung. Die Architekten erläutern ihren Entwurf wie folgt: „Der Institutsneubau steht in engem räumlichem Zusammenhang mit dem bestehenden Fraunhofer-Institut IAP. Es wird ein gemeinsamer Park um den bestehenden Teich entstehen, an dem sich die Haupteingänge der Institute befinden. Die Auseinandersetzung mit den Inhalten des Instituts ließen ein Gebäudekonzept entstehen, das die Offenheit, Innovation und Dynamik einer Forschungseinrichtung zum Ausdruck bringen soll und gleichzeitig die gewünschte Ruhe und Gelassenheit ausstrahlt. Der tendenziell einfache Baukörper ist stärker in der Fläche der Fassade bearbeitet, hier entwickelt er Plastizität, Gliederung und materielle Differenzierung. Der lebendige Eindruck wird unter Einhaltung einer strikten formalen und konstruktiven Ordnung erzeugt, die in der mäandrierenden Struktur zum Ausdruck kommt. Auch Assoziationen zu zellulären Systemen sind für ein Institut der Lebenswissenschaften beabsichtigt und angemessen. Innerhalb des kompakt verdichteten, dreibündigen Grundrisses wird über einfallendes Zenitlicht ein Rhythmus verschiedener Orte (Foyer, Bibliothek, Lichthof, Patio, Technikum) entstehen, der das Gebäude über Tageslicht zwischen den hochkomplexen Laborclustern gliedert.“ (<http://www.baunetz.de>)

#### **Delphinium-Stockholms stadsbibliotek (Asplund Bibliotek), Stockholm – Sweden on design**

This proposal highlights the new library as a new, visible public building with great merit. A functional new public building is added to the site, the north side of the ridge is developed and emphasised and the Asplund building is given a new, dignified context. In the townscape, the new building provides a clear backdrop to the Asplund building in the classic view from Odengatan. It creates a distance to the Asplund building that enables two distinguished buildings to be in symbiosis on the site with clear space and respectful distance to each other. The low podium building with its elegant circular garden space creates a transition and a connection between the two buildings. Restoration of the hill and its extension down into the new garden also creates an enclosed landscape space of unusual quality in the townscape. The silent, “secret”, garden together with the restored slope of the ridge forms a new public space in the city, well separated from noisy Odengatan. This outdoor space is experienced through the whole sequence of indoor areas that run through the library. As a result, visitors will be able to easily find their way around and obtain an overview using the outer townscape and the Asplund building for orientation. The high-rise component restores and highlights the hill’s profile in the meeting between building and ground on the way up from Odengatan to the top of the hill. The semi-transparent facade can literally reflect the hill and the landscape space. Delphinium bases its unique quality on a number of very well detailed starting-points in the townscape which are clearly defined in their form, both as separate design elements and as parts of a harmonious whole. Delphinium is a cleverly designed proposal, sensitive, clear and with the quality of a new icon. It will be very beautiful addition to Stockholm’s architecture. In its self-evident position and simplicity, it stands out as a good response to how a new distinguished building can be created in our time. The project has a theme that alludes to Asplund’s architecture without imitating it. Its idiom is clearly related to Asplund’s own language of design in the form of clear and simple geometric shapes and subtle details. The solemn, dark reserve of the Asplund building is contrasted by a light openness, but with the same attention to detail and with playful references to the rotunda’s form in the courtyard and the rounded interiors. By locating the extension along Gyldegatan, the proposal utilises the least valuable part of the hill face next to the garage entrance. The uppermost part of the building is, however, outside the border of the competition site. The jury has seen this as important for the proportions of the building and for the design concept that reflects the profile of the hill. The fact that a component of the upper high-rise slab has broken out from the large volume is important for the proportional meeting with the Observatory. Delphinium is the proposal that best corresponds to the vision of a light, open and communicative library. The project has considerable potential to be developed into a well-functioning library in accordance with the vision in the brief. The large communal open area at street level divides the visiting public up into either the subject sections in the high-rise component or to the Asplund building. The library will be inviting to the passer-by since the low-rise component with the main entrance is located along Odengatan. This alludes to Asplund’s proposal for market hall buildings in this location from 1926, even if it is now a question of a “knowledge market hall”. The main entrance offers a moment to read today’s paper, drink a cup of coffee, and take a short-cut through the library to Sveavägen away from the weather or a convenient route up to the Observatory park. You get a feeling for the hill and the protected courtyard through the low-rise building. The subject sections are lifted up into the high-rise component in which you are never far away from the light and the view over Observatorielunden, the peaceful courtyard or the city. The subject sections with their many different functions can be found in the high-rise component, where curved, bright staircases with transparent walls facilitate orientation. The building’s width and proportions provide considerable scope for creating a very functional library. The library is present in the townscape and visitors to it maintain constant contact with the surroundings and the other parts of the library. The project also has considerable development potential with respect to the City Railway and Läkarhuset projects. The facade of the high-rise component is both the secret

and the solution in the project. In the presentations, the project gives the impression of a solid white building - but it is actually a semi-transparent modelled glass building that displays the ongoing activities in the building at all times of the day and night. The facade can be given different properties and it can both hide and display what is going on inside. When darkness descends over Vasastan, the building will light up and invite to discussion or to just a quiet moment to oneself among other people. It will be especially interesting to develop the variable expression given by the facade during the day, during the long dusk of the dark winter months and during the night. And likewise when it reflects the hill's thick green foliage or stripped branches. There is scope to allow the glazed facade to be more open or closed depending on requirements. In the continued process and in the building's future life, it can be changed and adapted to suit varying requirements. When fully realised, the transparent impression should be reinforced, bringing the building even more to life. The integration of the decorative pattern is particularly important to develop. Delphinium is a very unobtrusively presented proposal that has required closer study to shed light on its qualities, but it has the potential to be very strong. The presentation has a lightly suggestive and sketchy feel to it. When the proposal is to be concretised into a real building, it is important to pay considerable attention to preserving and developing its ethereal lightness and the precise details required by the project in all technical designs. When examining the development potential of the different solutions, the jury has found that the project has a robust, basic structure that can easily be developed. In conclusion, Delphinium's holistic solution brings new qualities to an extent that can balance the cultural and historical losses caused by the disappearance of the three annexe buildings. A new functional public building is added to the site, the north side of the ridge is developed and emphasised and the Asplund building is given a new, dignified context. (<http://www.arkitekt.se>)

September 2009

Summary:

In 2007, the winning design of an architectural competition for an extension to the Gunnar Asplund designed Stockholm City Library was announced. The heritage significance of the library building and its annexes are theoretically protected by a range of Swedish laws, but it is considered that the winning design would have serious adverse impacts on the heritage of the Asplund Library complex.

The proposed size of the new buildings would overwhelm the library and the original monumental main entrance would lose its function, thereby diminishing the power of Asplund's original design. The proposed demolition of the three annexes would destroy the overall experience of the site as originally planned and designed by Asplund.

The heritage values of this site, and the international importance of the work of Gunnar Asplund requires careful and comprehensive reconsideration of the proposal to avoid such impacts.

The presidents of ICOMOS, the International Union of Architects, DOCOMOMO International and the ICOMOS ISC20C have jointly requested that the Mayor of the City of Stockholm urgently reconsider the project to avoid any adverse heritage impacts, and to resolve a more acceptable design solution in heritage terms.

### **Fachhochschule Bibliothek Neu-Ulm – Germany 2006 – 2008**

Bauherr: Freistaat Bayern, 6.500 m<sup>2</sup>, € 23.000.000

163 Meter Länge, 25 Meter Breite und 19 Meter Höhe misst der rund 27 Millionen teure Bau, der von Volker Kurrle aus dem Stuttgarter Architekturbüro Harris + Kurrle entworfen wurde. Der zweistöckige aluminiumverkleidete Riegel verbindet Design mit Funktionalität und ist in gepflegte Grünflächen mit einem See eingebettet. Diese grenzen direkt an das Gelände der Landesgartenschau an, deren Sportstätten die Hochschule künftig als Teil ihres Campus nutzen kann. Im Erdgeschoss sind alle zentralen Bereiche wie Bibliothek, Mensa und drei große Hörsäle mit 105, 120 und 180 Sitzplätzen, die durch ein großzügiges Foyer erreicht werden. In den beiden Obergeschossen befinden sich 29 Seminarräume, sieben EDV- bzw. Sprachlabore und die Büros der Mitarbeiter aus Lehre und Verwaltung. Im Vergleich zum alten Gebäude stehen der 2 Hochschule nun 16 zusätzliche Hörsäle bzw. Seminarräume zur Verfügung. Eine Besonderheit des Neubaus sind sechs von Innenhöfen belichtete Kommunikationszonen, so genannte Clubs, die speziell für die Zusammenarbeit zwischen Studierenden, Dozenten, Mitarbeitern und Kooperationspartnern der regionalen Wirtschaft konzipiert wurden. Die Bibliothek verfügt auf einer Fläche von über 800 Quadratmetern nun über einen Loungebereich, Lese- und Arbeitsplätze mit Blick ins Grüne sowie Einzel- und Gruppenarbeitsräume. Die Mensa bietet Platz für 200 Gäste und kann – zusammen mit dem Foyer – für Veranstaltungen genutzt werden.

### **Heisenberg-Gymnasium Bruchsal – Germany 2011**

Beschränkter Wettbewerb 2008 1. Preis, Neubau eines Gymnasiums mit Ganztageseinrichtung, Bauherr: Heisenberg-Gymnasium, NF: 3.600 m<sup>2</sup>, BGF: 5.200 m<sup>2</sup>

Das Gebäudekonzept für das Heisenberg-Gymnasium in Bruchsal trägt dem Schulkonzept der Privatschule Rechnung, das ein neues Verständnis von selbständigem Lernen und dementsprechend auch freiere Anforderungen an die Lernräume beinhaltet. Die Schule ist in enger Zusammenarbeit mit dem Kollegium des Heisenberg-Gymnasiums entwickelt worden, wobei der klassische raumbezogene Unterricht durch freiere Lernzonen erweitert wird, die flexibel zu den Klassenräumen zugeschaltet werden können. Dadurch entstehen Lernlandschaften, die ebenfalls auf das Konzept der Ganztagschule angepasst sind. Auf diese Weise konnten Ergebnisse aus der Forschungsarbeit „Das offene Klassenzimmer“ räumlich umgesetzt und in Zusammenarbeit mit den zukünftigen Nutzern weiter entwickelt werden. (Hausmann)

Die Schulgattung des Privatgymnasiums scheint schwer im Kommen zu sein. So auch in Bruchsal, wo Anfang Februar das zweizügige Heisenberg-Gymnasium eingeweiht wird. Der Neubau ist ein weiterer Standort der gleichnamigen Einrichtung in Karlsruhe; der Entwurf ging 2007 aus einem eingeladenen Wettbewerb hervor, den das Büro Hausmann Architekten (Aachen) für sich entscheiden konnte. Die Architekten haben ein U-förmiges Gebäude konzipiert, in dessen Mitte sich ein geschützter Schulhof

befindet. Während der eingeschossige Schenkel mit eigener Bibliothek der Oberstufe vorbehalten ist, befinden sich im zweigeschossigen Schenkel Fachräume und die Verwaltung sowie im Obergeschoss die Klassenräume für die Unter- und Mittelstufe. In der Mitte zwischen den beiden Gebäudeschenkeln, direkt am Haupteingang gelegen, wurde ein großer, flexibel nutzbarer Raum realisiert, der als Pausenhalle, Mensa und Veranstaltungsbereich genutzt wird. Vor allem im Obergeschoss konnte ein Raumprogramm realisiert werden, dass der angestrebten Idee eines klassenübergreifenden Lernens entspricht. Hier befinden sich sogenannte Lerncluster, die aus jeweils vier um eine gemeinsame Lerninsel gruppierte Klassenräume bestehen. Die Lerninseln, die in der Gebäudemitte liegen, werden über jeweils zwei Patios belichtet. Interne Treppen erschliessen alle drei Cluster, geflüchtet wird über einen außen liegenden Fluchtbalkon. So können auch die Erschließungszonen genutzt werden, die sich jeweils zwischen den Patios gruppieren und mit den eingebauten Sitzbänken viel Raum zum Lernen und Kommunizieren bieten. #### **Thüringer Universitäts- und Landesbibliothek Jena (ThULB) – Germany 2001**

Fläche: 13.311 qm (Hauptnutzfläche), Gesamtkosten: 96,9 Mio. DM, Baukosten: 86,1 Mio. DM, Einrichtungskosten: 10,8 Mio. DM

Baubeschreibung: Der Gebäudekomplex wird durch eine diagonal verlaufende, verglaste Eingangshalle erschlossen, die ein vom Haupteingang zum Gebäudekern hin ansteigendes Dach besitzt. Diese Halle trennt gleichzeitig den bibliotheksinternen Bereich vom Benutzungsbereich. An die Verkehrszonen im Gebäudekern schließen nach außen die Regalbereiche mit Freihandbeständen an. In den ruhig gelegenen Außenbereichen befinden sich entlang der Fensterfronten die Benutzerarbeitsplätze, größtenteils als Einzel- bzw. Doppelpunkte konzipiert. Durch Lichtgräben in den Freihandbereichen wird zusätzlich Tageslicht bis in die Erdgeschosszone geleitet und so eine helle, freundliche Atmosphäre geschaffen. (<http://www.bibliotheksportal.de>)

#### **Hörsaal und Medienzentrum, Technische Universität, Campus Lichtwiese – Germany 2013**

Bauherr: Technische Universität Darmstadt, Architekt: Ferdinand Heide, Frankfurt, Baukosten: 31,3 Mio. €, finanziert aus dem Sonderinvestitionsprogramm des Landes Hessen, Baubeginn: 2011, Hauptnutzfläche: 7.500 m<sup>2</sup> zuzüglich Neben- und Verkehrsflächen, Bruttogrundfläche: ca. 14.900 m<sup>2</sup>, Bruttorauminhalt: ca. 71.000 m<sup>3</sup>, Hörsaalzentrum: 4 Hörsäle für insgesamt 1.450 Personen, zum Teil zusammenschaltbar, 2 Multifunktionsräume, 20 Lern- und Seminarräume, div. Schulungs- und Rechneräume, Bibliothek: 2 Fachlesesäle mit Freihandbereichen, Platz für rund 460.000 Medien, Sonstiges: 1 Cafeteria mit Außenbereich

.....Ferdinand Heide hat das Hörsaal- und Medienzentrum als kompakten Solitär konzipiert, in dem verschiedene universitäre Nutzungen miteinander verzahnt werden. Auf rund 7.500 qm Nutzfläche entstehen vier große Hörsäle, in denen zukünftig insgesamt 1.450 Plätze zur Verfügung stehen werden. Durch mobile Trennwände können bei Bedarf jeweils zwei Hörsäle zusammengelegt werden, wodurch mit 900 Plätzen der größte Hörsaal der Universität entsteht. Der Hörsaalbereich wird durch zwei Multifunktionsräume und 20 Lern- und Seminarräume unterschiedlicher Größe ergänzt. In allen Räumen des Hörsaalbereichs werden die technischen Voraussetzungen geschaffen, um sowohl traditionelle Lehr- und Lernformen als auch das an der TU Darmstadt bereits erfolgreich erprobte E-Teaching und E-Learning anwenden zu können. Die Bibliothek führt alle bisher dezentral zugänglichen Medienbestände der Fachbibliotheken des Campus Lichtwiese zusammen. Der Grundriss sieht vor, die Arbeits- und Lesepunkte auf drei Ebenen kranzartig um den Buchbestand in Form eines kompakten zentralen Bücherblocks herum anzuordnen.... #### **Deutsches Krebsforschungszentrum Heidelberg (DKFZ), Neukonzeption, Neubau und Sanierung (Bibliothek), Heidelberg – Germany 2014**

Bauherr: Deutsches Krebsforschungszentrum Heidelberg, Stiftungsvorstand, Bruttogrundfläche: 46.540 qm

### **Awards:**

**Knauf Diamant Award 2008, Anerkennung, Kategorie Bauphysik**

Das DKFZ plant im Zuge größerer Umbaumaßnahmen die Neukonzeption und Sanierung des Deutschen Krebsforschungszentrums in Heidelberg. Das Gebäudeensemble wurde im Jahr 1972 erstellt. Der Gesamtkomplex entspricht nicht mehr den technischen und baurechtlichen Vorschriften. Um die zukünftige Forschungsarbeit des DKFZ zu gewährleisten, sollen die Bauteile Hochhaus, Radiologie und Dokumentation saniert werden. Hochhaus Die Regelgeschosse des Hochhauses werden komplett neu strukturiert, um bessere Arbeitsbedingungen für die Nutzer zu erreichen. Durch die Änderung der Grundrissorganisation von einer Dreibündigkeit zu einer Zweibündigkeit entstehen Raumtiefen von 15 m und 6 m. Durch die funktionale Gliederung der Großraumlaborzone sind die Auxiliärbereiche auf kürzestem Wege erreichbar. In der Mitte des Geschosses befindet sich die Kommunikationszone mit Besprechungsraum, Bereichsbibliothek und einer Teeküche. Die Bürobereiche schließen an die Kommunikationszone an. Radiologie Die Radiologie wird auf das bestehende Untergeschoss des Reaktors als 2- bzw. 3-geschossiger Stahlskelettbau mit Flachdecken neu erstellt. Die Gebäude sind als 2-bündige Anlage konzipiert. In der Radiologie befinden sich die

Patientenbereiche und der Forschungsbereich. Radiologie mit den Großgeräten, PET, CT, MRT und den Linaacs. Zusätzlich wird ein Verbindungssteg an das Hochhaus in den Ebenen 0 und 1 vorgesehen. Dokumentation Das Dokumentationsgebäude wird entsprechend der baurechtlichen Bestimmung saniert und um ein Geschoss erweitert. (Heinle)

### **Gesamtsanierung Kollegiengebäude II, Universität Stuttgart, Stuttgart – Germany 2009**

Bauherr: Land Baden-Württemberg vertreten durch die Oberfinanzdirektion Stuttgart vertreten durch Vermögen und Bau Baden-Württemberg Universitätsbauamt Stuttgart und Hohenheim, Bruttogrundfläche: 26.886 qm

Das Kollegiengebäude II - ein Hochschulgebäude aus dem Jahre 1965 - ist im wesentlichen genutzt durch die Institute der Fakultät 9 (**Philosophisch-Historische Fakultät**) und der Fakultät 10 (**Wirtschafts- und Sozialwissenschaften**) mit deren Bibliotheken, Hörsälen und Seminarräumen und einer Cafeteria. Das Hochhaus mit einer teilweise offenen Kernzone (Aufzüge, Technik- und Sanitärräume, Treppenhäuser) besitzt auf seiner Südseite 15 Geschosse mit Büronutzung, auf der Nordseite 10 Geschosse zur Unterbringung der **Bibliotheken** und Räume für die Lehre. Die Baumaßnahme umfasste die Erneuerung von Gebäudetechnik, Dach und Nordfassade, abgehängten Decken und Bodenbelägen, sowie umfangreiche Schadstoffsanierungen. Fakultätsbibliotheken, Hörsäle, Kernzonen, Institutsbereiche und die Cafeteria wurden entsprechend geänderter Nutzung umgeplant. Die wenigen Materialien des Bestandes in hochwertiger Sichtqualität (Beton, Mauerwerk, Holz) sind Ausdruck des architektonischen Denkens der neuen Stuttgarter Schule - sie wurden in ihrer bewussten Reduziertheit erhalten und ergänzt. (Heinle)

### **Fachhochschule Koblenz, Standort Remagen, Neubau auf dem Rhein Ahr Campus – Germany 2005**

Bauherr: Land Rheinland-Pfalz vertreten durch das Ministerium der Finanzen vertreten durch den Landesbetrieb Liegenschafts- und Baubetreuung, Niederlassung Koblenz/Staatsbauamt Koblenz, Bruttogrundfläche: 21.431 qm

#### **Struktur der Streuobstwiesen**

Die langen, schlanken Baukörper der Fachhochschule nehmen die Struktur der ehemaligen Streuobstwiesen wieder auf: zwei parallelen Zeilen mit je vier Gebäuden unterschiedlicher Höhe, entsprechend der Nutzung. Räumliche Mitte der Anlage ist das Forum, von dem aus alle Gebäude erschlossen werden. Es wird umgrenzt von den vier dreigeschossigen Laborbauten, dem Rechenzentrum/Multimedia-Zentrum und der Mensa/Aula. Eine Nord-Süd-Achse führt über das Forum.

Der Zugang von der Stadt Remagen führt nördlich auf das Forum zu, der Zugang von den Parkplätzen, der näheren Umgebung von Süden her. Der dunkle Plattenbelag und die zurückhaltende Begrünung unterstützen die formale Sprache der Gebäude.

Verbindungsgebäude dazwischen bilden die zweigeschossigen Bauten mit Rechenzentrum/Multimedia-Zentrum im Osten und mit Mensa/Aula im Westen. Die Bibliothek ist als ein Sonderelement zwischen den Gebäudezeilen in einem mehrgeschossigen, runden Bau zum Rhein hin orientiert. (Heinle)

### **Gesamtsanierung Kollegiengebäude I, Universität Stuttgart, Stuttgart – Germany 2002**

Bauherr: Land Baden-Württemberg vertreten durch die Oberfinanzdirektion Stuttgart vertreten durch das Universitätsbauamt Stuttgart und Hohenheim

Das Kollegiengebäude I der Universität Stuttgart wurde erbaut durch die Architekten und Hochschulprofessoren Gutbier, Siegel und Wilhelm für die Fakultät Architektur und Stadtplanung. (Die Landesregierung und die Stadt Stuttgart stimmten nach langer Überlegung dem Antrag der TH Stuttgart für den Bau eines Hochhauses - Kollegiengebäude I (K I) an der Keplerstraße 11 - zu. Mit der Planung dieses Gebäudes wurde die Architektur-Abteilung der Technischen Hochschule Stuttgart beauftragt; die Realplanung ging an die drei TH-Professoren – Rolf Gutbier 1902-1992, Günter Wilhelm 1908-2004 und Curt Siegel 1911-2004 –, die alle in gleicher Weise als Urheber dieses Werkes gelten. Bau: 1956-1960), die auch heute noch hier untergebracht ist. Im Rahmen der Sanierung wurde die gesamte Gebäudetechnik erneuert, **eine Fakultätsbibliothek geschaffen**, behindertengerechte Einrichtungen ergänzt, sowie verschiedene Institutsbereiche umgeplant. Im Innenausbau wurde auf Nachhaltigkeit Wert gelegt: So wurden Sichtbeton-, Sichtmauerwerks- und Holzoberflächen sorgfältig erhalten oder ergänzt, abgehängte Decken und Bodenbeläge nur wo notwendig ersetzt. In vielen Bereichen wurde großflächige Transparenz erhalten oder geschaffen. Die Studentischen Arbeitsbereiche wurden neu möbliert. Um die Aufzugskapazitäten des Hochhauses zu erhöhen (die Studentenzahlen waren von anfänglich 800 auf heute ca. 2.000 gestiegen) wurde eine Zielwahlsteuerung eingebaut, sowie einer der Aufzüge erstmalig mit einer "Twin-Nutzung" ausgestattet (Patent Thyssen), bei der unabhängig voneinander 2 Kabinen übereinander in einem Schacht fahren. (Heinle)

### **Friedrich-Schiller-Universität II, Jena, Institutsgebäude für Sprachwissenschaften mit Mensa, Jena – Germany 1999**

Bauherr: Jenoptik AG vertreten durch Jenoptik Bauentwicklung GmbH, Jena, Bruttogrundfläche: 9.800 qm

Im Zentrum von Jena wurde ab dem Jahre 1992 das ehemalige Carl-Zeiss-Hauptwerk revitalisiert. Mit dem "Institutsgebäude der Friedrich-Schiller-Universität mit Mensa" wurde 1999 die letzte Baulücke dieses zentralen Stadtquartiers geschlossen. Errichtet wurde der Neubau auf einer bereits existierenden, öffentlichen Tiefgarage mit 350 Plätzen. Institutsräume, Sprachlabore und Multimediazentrum der Sprach- und Medienwissenschaften bilden mit der Mensa des Studentenwerks Jena-Weimar mit 650 Sitzplätzen eine bauliche Einheit. Sichtmauerwerk und -beton sowie Aluminium und Glas bestimmen das Erscheinungsbild der Fassaden, die in bewusstem Kontrast zu den historischen Bauten der Umgebung stehen. In den Innenräumen wurden die Materialien in ihrer Oberflächenqualität, zum Teil mit intensiven Farbakzenten, belassen. Im Rahmen eines Kunstwettbewerbwerbes ausgewählte Arbeiten unterstützen die architektonische Struktur des Gebäudes. (Heinle)

#### **Multimediazentrum**

Bereits um 1900 errichtete die Dyckerhoff & Widmann AG die ersten Stahlbetonbauten auf dem Zeiss-Gelände in Jena. Heute befindet sich dort der Universitätscampus der Friedrich-Schiller-Universität. Das siebengeschossige Institutsgebäude für Sprach- und Medienwissenschaften schließt die letzte Baulücke auf dem Universitätscampus. Das Gebäude **beherbergt Multimediaräume, Sprachlabore** mit hohen akustischen Anforderungen, eine Betriebswerkstatt, Büro- und Besprechungsräume und die Mensa des Studentenwerks. Die Vorgabe, das Multimediazentrum einer breiteren Öffentlichkeit zugänglich zu machen, erfordert einen direkten Zugang vom Ernst-Abbe-Platz. Dadurch wird die herausgehobene Funktion des Zentrums, das sich auch durch die Ausstattung mit hochmoderner Kommunikationstechnik auszeichnet, besonders betont. Über ein kleines Foyer im Erdgeschoss ist ein Großgruppenraum, genannt „Black-Box“, mit ca. 50 Sitzplätzen erreichbar, der mit modernsten Kommunikationseinrichtungen für Videokonferenzen sowie mit einem Regieraum und Dolmetscherkabinen ausgestattet ist. Ein weiterer Bereich des Multimediazentrums wurde als interner Arbeits- und Studienbereich im 2. Obergeschoss sehr zurückhaltend angeordnet. Dieser beinhaltet drei auditive Sprachlabore mit jeweils 25 Plätzen, die sich aus der Fassade des Gebäudes auf das Dach des Speisesaals schieben. Außerdem wurden Sprachlabore für das Selbststudium mit 14, 20 und 24 Plätzen, Gruppenräume für Audio und Video sowie Aufnahme- und Projektionsräume auf einer 850 m<sup>2</sup> umfassenden Fläche integriert. (Heinle)

## Innovatives Bildungs- und Bibliothekszentrum der politechnischen Universität, „NEWTON“, Opole – Poland on design

Wettbewerb 1.Preis, Preisgerichtssitzung:07 / 2011, Bauherr: Politechnika Opolska, Verantwortliche/r Partner: Thomas Heinle, Bruttogrundfläche: 5.791 qm

Das Entwurfskonzept des neuen Bildungs- und Bibliothekszentrum hat sich aus einer ausführlichen Umgebungsanalyse heraus entwickelt. Die dynamische Komposition vier einzelner Bauteile bildet einen Kontrast zur strengen Anordnung der umgebenden Bebauung und etabliert einen vielseitigen öffentlichen Ort. Die Klarheit der Kubaturen und ihr einheitlicher architektonischer Ausdruck einerseits und deren freie Anordnung andererseits, verleihen dem Ensemble einen Ausdruck von Eleganz und Dynamik. Die äußere Erschließung - Freitreppe und umlaufende Galerien-verbindet die Baukörper untereinander und ermöglicht unterschiedliche Perspektiven des Ortes wahrzunehmen. Sie belebt den geschützten Platz, den die Kubaturen in ihrer Mitte bilden. Auch durch die Vermeidung des rechten Winkels entstehen im Äußeren abwechslungsreiche Raumfolgen. Im Inneren sind die Räume und deren Nutzung hingegen klar definiert: Die Gebäudeteile beherbergen die vier Bereiche Bibliothek, Aula, didaktisches Zentrum und Mensa. Verbunden sind sie durch ein gemeinsames Zentrum, das durch seine Einschnitte und Öffnungen in den freien Raum, mehr Teil der Landschaft als Gebäude ist. (Heinle)

## Bibliothek der Exakten und Technischen Wissenschaften, Technische Universität, Wroclaw – Poland – 2013

13.526 m<sup>2</sup>

Visitors enter the hall through the main entrance, so he looks at the loan and the staircase leading up into the open-access. Both parts are illuminated by a skylight. The main hall is connected by stairs and air spaces with the two main floors of the public open access library. From the stairs, the visitor first arrives in the firstUpstairs at the research sites and a general information area. This is followed by the area of standards and patents, its core is a two-story reading room. In another part of the first Upper level is a first part of the open stacks with a two-storeyed gallery reading. On the staircase, the path leads into the second Floor. Here is the climax of the sequence of rooms, the great reading room overlooking the campus. Through the windows of the upper region arising from this insight into the magazine room and warehouse management. The floors are connected at various points spatially. In addition to the reading rooms make two spiral staircases in the east and west of those connections.

Sustainability: - Sunscreen, - Ventilation and cooling, - Heat recovery

### **Libraries:**

#### City Archive & Library, Hofheim – Germany 1st Prize 2011 on design

Das Raumprogramm besteht aus der Stadtbücherei mit ca. 1 200 m<sup>2</sup> und dem Stadtarchiv mit ca. 380 m<sup>2</sup>. Die Bausumme beläuft sich auf ungefähr 4 800 000 EUR für die Kostengruppen 200–700.

Zusätzlich zum Realisierungsteil fordert der Auslober für das Umfeld der neuen Stadtbücherei einen städtebaulichen Ideenteil. Die bisherigen Räumlichkeiten von Stadtbücherei und Stadtarchiv erfüllen nicht mehr die räumlichen und funktionellen Anforderungen, die an eine moderne Stadtbücherei und ein Stadtarchiv in einer Stadt wie Hofheim am Taunus gestellt werden. Durch die neue städtebauliche Ausformung des Kellereiplatzes ergibt sich die Möglichkeit den gesamten Bereich neu zu ordnen. Im Zuge der Umstrukturierung sollen die Bücherei und das Stadtarchiv verlagert und städtebaulich sinnvoll an die nördliche Seite des neuen Platzes angeordnet werden. Die übrige Fläche des Wettbewerbsgrundstücks soll durch einen Ideenteil gestaltet werden. Dies beinhaltet die Ausformulierung der verbleibenden Fläche durch Ergänzungsbauten bzw. einer Flächengestaltung. Ziel des Wettbewerbes ist es einen Entwurf zu erarbeiten, der die vorgegebenen Ziele der Stadt Hofheim am Taunus optimal vereint. Die Stadt beabsichtigt die Ergebnisse des Wettbewerbs zeitnah umzusetzen. (<http://www.competitionsline.com>)

#### Institut für Halbleitertechnik, Bibliothek, Frankfurt a.d. Oder – Germany 1999

Am 20. Dezember 1999 wurde in Frankfurt/Oder der von Henn Architekten Ingenieure (München) geplante Neubau des Instituts für Halbleiterphysik (IHP) in Anwesenheit von Brandenburgs Ministerpräsident Manfred Stolpe feierlich eingeweiht. Der vierflügelige Gebäudekomplex besteht aus mehreren unabhängigen Bauten, die durch einen dreigeschossigen Verbindungsgang miteinander verbunden sind. Ein ca. 900 Quadratmeter großer sogenannter Reinst-Raum bildet das Kernstück der Anlage. Die technischen Versorgungseinrichtungen des Instituts sind in einem viergeschossigen Kopfbau untergebracht, Labors und Büros befinden sich in drei kammartig angeordneten, dreigeschossigen Gebäudeflügeln. Das Eingangsgebäude mit Bibliothek und Cafeteria sowie zwei „Kommunikationstürme“ komplettieren das Ensemble. In Nord-Süd-Richtung ergibt sich eine maximale Ausdehnung von 130 Metern, in west-östlicher Richtung erstreckt sich der Komplex über 116 Meter. Die Baukosten des Institutsneubaus belaufen sich auf ca. 128 Millionen Mark und wurden zu 75 Prozent von der EU getragen; Bund und Land steuerten je 12,5 Prozent dazu bei. (<http://www.baunetz.de>)

#### Faculté de Médecine, Bibliothèque, Site Necker, Paris – France 2010 - 2014

En collaboration avec Patriarche & Co., Paris <http://www.patriarche.fr>

BGF 23.000 m<sup>2</sup>, 2010 1<sup>st</sup> Prize

Der 1966 von André Wogenscky (\*1916 Remiremont/Vosges - + 2004 Saint-Rémy-des-Chevreuse/Yvelines Cité radiouse, Marseille 1945-1952 en collaboration avec Le Corbusier) einem Schüler Le Corbusiers erbaute zehngeschössige Turm mit zweigeschossigen Sockelbau darunter, erhält ein markantes Eingangsgebäude, das in das unterirdische Podiumsgeschoss – dem kommunikativen Zentrum des Ensembles führt, in dem sich neben den bestehenden Hörsälen und Seminarräumen nach der Umgestaltung auch das Restaurant und eine vergrößerte Bibliothek befinden werden. Der gläserne Eingangsbau greift das Motiv der Patios auf, die die Seminarräume im Untergeschoss belichten, indem es diese räumlich invertiert. Das

Wechselspiel von offenen und geschlossenen Patios wird auf dem Vorplatz mit weiteren Glaskuben fortgesetzt, auch die **Bibliothek** wird so von oben belichtet. Neu ist auch die Fassade aus Glaselementen unterschiedlicher Opazität. Unter Beibehaltung des Originalen Rasters umhüllt sie das Gebäude und öffnet sich an den Stirnseiten. (Henn)

### **Libraries:**

**Fachhochschule / Universitätsbibliothek Osnabrück, Zentralbibliothek Westerberg, Osnabrück –**

**Germany on design**

1. Prize 2010 Bruttogeschossfläche: 15.250 m<sup>2</sup>

Auf einem ehemaligen Kasernengelände in Osnabrück besteht die Möglichkeit, zwei eigenständige Bibliotheken der Fachhochschule und der Universität in einem gemeinsamen Gebäude unterzubringen. Der Neubau bietet die Möglichkeit der optimalen Nutzung der Synergieeffekte zwischen den zwei Bibliotheken und den Studenten. Zwei Bibliotheken in einem Haus, an einem Ort mit besonderer städtebaulicher Bedeutung. Das Gebäude wird zukünftig die Funktion des nördlichen Entrees zum Hochschul-Campus übernehmen. Der Campus soll zu einem belebten Stadtquartier werden. Studentisches Arbeiten in Arbeitsräumen und Bibliotheken mit langen Öffnungszeiten, Abendveranstaltungen für die Öffentlichkeit, die Lehre und Forschung mit Gastwissenschaftlern aus aller Welt werden dazu beitragen, dass ein lebendiger Campus entsteht. Der viergeschoßige Neubau wird als Schale aufgefaßt: er umschließt zwei Gartenhöfe. Alle Bibliotheksbereiche öffnen sich über hohe Glasflächen zu diesen innenliegenden, ruhigen Höfen. Die Gärten sind die gemeinsamen Räume in einem offenen und transparenten Neubau. (Herbst)

Leitidee des Entwurfes ist es mit einem präzisen Körper einen einprägsamen Ort für eine öffentliche Institution zu schaffen. Mit baulichen Mitteln soll die neue Bibliothek als „kulturelle und geistige Mitte“ der Hochschulen zum integrativen Bestandteil auf dem Campus ausformuliert werden. Diesem Ansatz folgend setzt die bauliche Konzeption die raumbildende Orthogonalität der vorgefundenen Strukturen auf dem Hochschulareal fort. Der Neubau formuliert die bauliche Kante zum Barbaraplatz, definiert dadurch eindeutig den öffentlichen Raum als Adresse und eröffnet Blick- und Wegebeziehungen zwischen Platz, Forum und Campus. Der Barbaraplatz wird die gemeinsame Adresse für die neue Bibliothek und den gesamten Hochschulcampus. Es soll ein Campus wie ein dichtes, zentrales Stadtquartier entstehen.

Raum.

Der Baukörper definiert und hierarchisiert Räume: den öffentlichen Straßenraum und Platz, die gedeckten Vorbereiche zum Eingangsbereich, die internen Gartenhöfe mit Leseterrassen, das öffentliche Forum.

Transparenz.

Die Verknüpfung dieser Räume durch den Neubau eröffnet Blickbeziehungen aus den Gebäuden in typologisch differenzierte Freiräume.

Eingang und Treffpunkt.

Das Bibliotheksfoyer bildet mit seinen Vorbereichen den zentralen Ort zwischen den öffentlichen und geschützten Bereichen und signalisiert Offenheit, Lebendigkeit und eigene Identität. Der Eingang in die neue Bibliothek erfolgt von drei Seiten über gedeckte Vorbereiche. Die öffentlichen Foyer-, Ausstellungs- und Gastronomiebereiche öffnen sich zum angrenzenden Barbaraplatz und zum Forum.

Es bildet mit ihnen als fließende Raumlanschaft ein kommunikatives Raumkontinuum und vernetzt dadurch den Hochschulcampus mit der städtischen Nachbarschaft.

Fachhochschule und Universität.

Die Ausformulierung von zwei Bibliotheksbereichen in einem Haus folgt dem Konzept einer räumlichen Zonierung in flexibel miteinander verknüpfte Gebäudebausteine. Über das gemeinsame Sockelgeschoss und zwei zentrale Treppenanlagen mit Aufzügen im Verbinder werden die Häuser formal und funktional zu einer Bibliothekseinheit verbunden. Das gewählte Gebäuderaster und Tragsystem ermöglicht flexible Nutzungsmöglichkeiten unter Ausnutzung gewünschter Synergieeffekte und eine Anpassung an geänderte Benutzungskonzepte für beide Bibliotheksstrukturen.

Bibliothek und Nutzungen.

Der viergeschoßige Neubau wird als Schale aufgefaßt: er umschließt zwei Gartenhöfe. Alle Bibliotheksbereiche öffnen sich über hohe Glasflächen zu diesen innenliegenden, ruhigen Höfen. Die Gärten sind die gemeinsamen Räume in einem offenen und transparenten Neubau. Die Organisation der Bibliothek ist von dieser Idee bestimmt. Die Hierarchisierung erfolgt entsprechend der zu erwartenden Nutzungsintensität von „offen nach intern“. Es entsteht für die Bibliothek ein offener Nutzerbereich, der konzentriertes und kommunikatives Arbeiten ermöglicht. Arbeits- und Leseplätze sind an den sonnengeschützten Gartenhöfen, aber auch am Fenster vorgesehen. Terrassenartig angeordnete Arbeitsgalerien öffnen sich über einen Luftraum zu den beiden Gartenhöfen. Treppenanlagen und Gartenhöfe verbinden alle Geschoße miteinander. Die Verwaltungsbereiche besitzen einen eigenen Zugang und wurden in räumlicher Nähe zur Anlieferung mit Poststelle organisiert. Im Gegensatz zu den Verwaltungsräumen der Universität, sind die der Fachhochschule direkt vom Benutzerbereich begehbar. Die Anlieferung erfolgt von der westlichen Erschließungsstraße.

Fassade und Materialität.

Unser Vorschlag für die Bibliothek folgt der Typologie des Bücherregals, der Bücher und der darin enthaltenen Textzeilen. Entsprechend ergibt sich eine Fassadengestaltung in der die großen, stehenden Öffnungen gefüllt werden – die Bücherregale zeichnen sich in der Fassade fast ab. Der Materialkanon aus den bestehenden Hochschulgebäuden soll aufgenommen und modifiziert werden. Entsprechend werden die tragenden Außenfassaden mit unterschiedlich hellen, lebhaft gemischten Ziegelsteinen (Wasserstrichklinker) bekleidet. Die Fassadenöffnungen werden durch senkrechte Klinkerfaschen mit zwei- bzw. dreifachen Rücksprünge strukturiert. In die Faschenleibungen werden Lüftungselemente integriert, über welche die Innenräume natürlich belüftet werden können. Die Fensterbänke sind im Farbkanon der Fassaden durchgefärbte Betonelemente. Entsprechend der Himmelsrichtung variieren die Fassadentiefen um an den sonnenzugewandten Fassaden eine bestmögliche Selbstverschattung der Fensteröffnungen zu erreichen. Die Fenster sind innenbündige, klar beschichtete Holzfenster. Jene Fensterelemente hinter denen Regale stehen, können durch Füllpaneele aus transluzentem Natursteinglasverbund geschlossen werden, um die Bücher angemessen zu schützen. Andere erhalten außenliegende Schiebeelemente oder werden sogar mit einer tieferliegenden Ziegelschicht ganz verschlossen. Auf diese Weise wird Sonnenschutz mit baulichen Mitteln ermöglicht. Die Fassaden zu den innenliegenden Gartenhöfen sollen, im Kontrast zu den tief strukturierten Außenfassaden, große Fensteröffnungen erhalten und dadurch viel natürliches Licht ins Gebäudeinnere bringen. Der das Äußere bestimmende Materialkanon soll auch im Inneren des Baukörpers fortgesetzt werden. Im Ausbau werden einfache Materialien wie Beton, Stein, Holz, Asphalt, Stahl, Textilien möglichst authentisch und unbehandelt verwendet. Die Betondecken und stützen bleiben unverputzt und dienen als passive Speichermassen. Abgehängte Decken sind, soweit raumakustisch vertretbar, nicht vorgesehen. Die hellen Innenwände stehen im Kontrast zu dem dunklen

Fußboden. Der Bodenbelag der öffentlichen Erschließung soll sich im Erdgeschoss fortsetzen um die optische Vernetzung von Innen- und Außenräumen zu unterstreichen.

Tragwerk und Konstruktion.

Das modulare Entwurfsprinzip erlaubt den Einsatz vorgefertigter Bauteile. Zur Gewährleistung einer kurzen Bauzeit und zur Kostenreduzierung können die Neubauten mit Fertigteilen errichtet werden. Für das Tragwerk des Bibliotheksgebäudes wird eine Stahlbetonskelettkonstruktion gewählt, sie bietet die größtmögliche Flexibilität im Innenausbau und bei späteren Umnutzungen oder Umgestaltungen der Innenräume. Hinzu kommt, dass der Baustoff Stahlbeton die Brandschutzanforderungen ohne zusätzliche Verkleidungen erfüllen kann. Die Horizontalaussteifung der Gebäude erfolgt über die Stahlbetondeckenscheiben. Vertikal werden die Gebäude über die Stahlbetontreppenhaus- und Aufzugskerne sowie weitere Stahlbetonwandscheiben ausgesteift. Die Abtragung der Vertikallasten erfolgt über die Stahlbetonlochfassaden bzw. über die geschlossenen Stahlbetonwände, die Stahlbetoninnenwände der Treppenhäuser und der Aufzugsschächte, sowie über Stahlbetonstützen. Alle sonstigen verbleibenden Wände können hinsichtlich einer größtmöglichen Flexibilität als nichttragende Wände ausgeführt werden. Wesentlich für die Wirtschaftlichkeit der Rohbaukonstruktion ist die Ausführung der Deckenebenen. Bei der Deckendimensionierung sind neben der Wirtschaftlichkeit das Verformungsverhalten und die Schwingungsanfälligkeit zu berücksichtigen. Um eine größtmögliche Flexibilität in der architektonischen Gestaltung und in der Trassenführung der Haustechnik zu ermöglichen, werden die Geschosdecken als punktgestützte Stahlbetonflachdecken ausgeführt. Die Deckendicke kann bei einem maximalen Stützenraster von ca. 6,0m in der Regel mit  $h = 30$  cm angegeben werden. Die Dachdecken werden wie die Geschosdecken als punktgestützte Stahlbetonflachdecken mit extensiver Begrünung geplant. Die Treppenläufe werden i.d.R. als Stahlbetonfertigteile ausgeführt und mit geeigneten, zugelassenen Einbauteilen schalltechnisch von den Podesten und Geschosdecken getrennt. Auf Grund der regelmäßigen Gebäudestruktur und des vorhandenen Rasters der Lastachsen ist eine Flachgründung mit Einzel- und Streifenfundamenten als kostengünstigste Gründungsvariante möglich. Die Fundamente werden frostfrei auf gewachsenen tragfähigen Baugrund gegründet.

Raumheizung – Winter.

Grundsätzlich sollen sich Bibliotheken als großflächige und offene Räume darstellen. Der architektonische Entwurf folgt diesem Grundsatz, so dass eine gleichmäßige und konstante Temperierung der Bereiche sichergestellt werden und Temperaturunterschiede bzw. Schwankungen vermieden werden müssen. Insofern erfolgt die Beheizung der Geschosse im Winter über eine Betonkerntemperierung. Die Trägheit des Systems erweist sich hierbei als Vorteil, da über den gesamten Tagesverlauf eine gleichmäßige Temperierung sichergestellt ist. Randzonen und Einzelarbeitsplätze werden unterstützend mit Heizkörpern beheizt.

Raumkühlung – Sommer.

Die Gestaltung der südlich orientierten Fassade mit schmalen Fenstern und tiefen Leibungen verhindert in Kombination mit dem außenliegenden Sonnenschutz einen Eintrag von äußeren Lasten. Durch die Innenhöfe ist eine Belichtung mit Tageslicht sichergestellt. Da nutzungsbedingt nicht auf eine künstliche Beleuchtung verzichtet werden kann, erfolgt durch die Beleuchtung und die zeitweise hohe Anzahl von Personen im Gebäude ein Wärmelasteintrag, der nicht in jedem Falle durch die natürliche Fensterlüftung abgeführt werden kann. In diesem Fall kommt die Betonkernaktivierung zum Einsatz, die zunächst über eine freie Kühlung in Kombination mit den Rückkühlwerken die inneren Wärmelasten abführt. In extremen Situationen wird die Betonkerntemperierung als aktive Kühlfläche in Kombination mit der Kälteerzeugung genutzt.

Kontrollierte Lüftung – Winter.

Zur Minimierung von Wärmeverlusten werden die Nutzungsbereiche mit einer raumlufttechnischen Anlage nach dem Prinzip einer kontrollierten Wohnraumlüftung mit hocheffizienter Wärmerückgewinnung ausgestattet. Dabei wird über die RLZ-Zentrale eine geringe Luftmenge zugeführt. Diese Luft durchströmt die Nutzungsbereiche und wird im Bereich der zentralen Steiger wieder erfasst. Diese Durchspülung sorgt neben der Sicherstellung des Mindestluftwechsels und der Reduzierung von Wärmeverlusten auch zur Abfuhr von bibliotheksspezifischen Gerüchen. Eine manuelle Fensterlüftung ist in Teilbereichen (z.B. Verwaltung) möglich.

Kontrollierte Lüftung – Sommer.

Das gesamte Gebäude soll im Sommer natürlich über Fenster gelüftet werden. Wird eine aktive Kühlung notwendig, schaltet die Lüftungsanlage (wie zuvor für den Winterfall beschrieben) zu. Elektro – Beleuchtung Die im Hinblick auf einen effizienten Energiehaushalt und eine maximale Tageslichtnutzung konzipierte Fassade wird durch eine Beleuchtung mit Präsenz – und Helligkeitssensoren ergänzt. (<http://europaconcorsi.com>)

### **Hochschulbibliothek der HTW (Hochschule für Technik und Wirtschaft) Dresden – Germany 2002 – 2006**

Auftraggeber: Staatsbetrieb Immobilien- und Baumanagement Dresden II, Wettbewerb: 1. Preis 2002, Planungs- und Bauzeit: 2003 – 2006, Bauvolumen: Bruttogeschossfläche 3.933 qm, Bruttorauminhalt 16.885 cbm, Gesamtbaukosten 8.100.000 Euro

Die neue Bibliothek verkörpert die „geistige Mitte“ des Campus. Sie setzt in direkter Beziehung zu den denkmalgeschützten Institutsgebäuden deren raumbildende Orthogonalität auf dem Hochschulstandort fort. Der viergeschossige Neubau umschließt ein nach oben offenes Atrium zu dem sich alle Bibliotheksbereiche über ihre Fensterflächen öffnen. Die Bibliotheksfassaden folgen der Typologie des Bücherregals und der darin enthaltenen Bücher. Entsprechend wurden stehende Öffnungen zu einem disziplinierten Spiel variiert. Tiefe Fensteröffnungen mit innenbündigen Eichenholzfenstern erzeugen eine umlaufend stark profilierte Außenfassaden mit großformatigen, grün-bräunlichen Betonelementen. In den Atriumfassaden dagegen sind die Fenster außenbündig in eine hell gestrichene, flächige Putzfassade eingefügt. Das Klimakonzept nutzt physikalische Prozesse zur Regulierung des Wärmehaushaltes. Die Kaminwirkung des zentralen Atriums unterstützt die Querlüftung auf allen Geschossen. Tief liegende Fenster mit transluzenten Naturstein-Glas-Verbundelementen schützen vor Sonnenlicht und Wärmeeinstrahlung. Eine zentral gesteuerte Fensterlüftung zur Kühlung des gesamten Baukörpers im Sommer ersetzt die Klimaanlage. (Herbst)

#### **Stadtbibliothek Pforzheim – Germany 1999 – 2002**

Gesamtkosten: 15,4 Mio EUR inkl. JMS und JKS sowie Tiefgarage, (in den Gesamtkosten sind 256.000 EUR Aufbaumittel für Medien enthalten), Einrichtungskosten: 1,3 Mio EUR

Außen: massive Steinfassade, von großflächigen Fenstern durchzogen. Gut viereinhalb Meter hoch ist die weiß getünchte Halle, die sich an den Eingangsbereich anschließt. Ein Oberlichtauge schwebt in elf Metern Höhe über dem Gast. Im Inneren des klassisch geschnittenen und klar gegliederten Baukörpers befinden sich Möbel, die sich in ihrem Design an Vorbilder des 19. Jahrhunderts anlehnen. Farbe: korallenrote Kastenregale vor rosafarbenen und weißen Wänden. Es soll Wärme und Geborgenheit ausstrahlen, aber auch ein Gefühl von Ruhe vermitteln. (<http://www.bibliotheksportal.de>)

Im Jahre 1988 gewannen wir einen städtebaulichen Wettbewerb im Zentrum Pforzheims, elf Jahre später erhielten wir den Auftrag zur Realisierung eines Gebäudes. Gemäß den städtebaulichen Vorgaben ist die Südfassade im Radius von 70 m gerundet. Das hauptsächlichliche Fassadenmaterial ist ein heller Sandstein. Er wird durch plastische, horizontal verlaufende Aluminiumprofile kontrastiert, die den oberen und unteren Abschluß der Fensterbänder bilden. Zentrales architektonisches Element im Inneren ist die geschwungene Treppe vom Foyer in den Bibliotheksraum. Die Möblierung ist in einem dunklen Rot gehalten, um die unruhige Farbigkeit der Bücherrücken zu fassen. Gleichzeitig strahlt es Ruhe und Würde aus. (Hilmer)

#### **Universitätsbibliothek Bremen Sanierung, Bremen – Germany 2000 – 2004**

Bauherr: Universität Bremen, Bausumme: ca. 15 Millionen EUR

Die 1971 gegründete Universität Bremen wird ständig größer. Gleichzeitig steigen die Energiepreise. Der insgesamt wachsende Energieverbrauch der Universität gab deshalb Anlass, über Einsparpotenziale nachzudenken. Da die Anfang der 70er Jahre errichtete Staats- und Universitätsbibliothek (SuUB) mit am meisten Energie auf dem Campus verbrauchte, wurde eine gesamtenergetische Sanierung dieses Gebäudes beschlossen.

Die Entscheidung zur energetischen Erneuerung war eng verknüpft mit Vorstellungen zur Verbesserung der Nutzbarkeit und Attraktivität für die Besucher. Als Bibliotheksgebäude naturgemäß mit viel Platz für Bücher, aber nur wenig hellen Fensterbereichen ausgestattet, war für die Räume ein neues Beleuchtungskonzept gefragt. Auch der Aufenthalt, ob zwischen Regalreihen oder im Lesebereich, sollte angenehmer werden – mit angemessener Beleuchtung, wohltemperiert und nicht mehr begleitet von Geräuschen aus Lüftungskanälen.

Bauwerk, Baukonstruktion und technische Ausstattung bieten ein repräsentatives Beispiel für Büro- und Verwaltungsgebäude der 60er bis 80er Jahre, deren Modernisierung in den nächsten Jahren verstärkt ansteht. Das Sanierungsprojekt SuUB kann damit als Vorbild dienen. Die Beteiligten erhoffen sich eine Art „Leitfaden“ für die energetische Sanierung von Gebäuden der 70er Jahre, auf den für weitere Sanierungsprojekte der Universität, aber auch für andere öffentliche und private Bauvorhaben, zurückgegriffen werden könnte. Insgesamt wurden über 15 Mio. Euro in die Sanierung investiert, davon 7,24 Mio. Euro für energetische Maßnahmen und deren wissenschaftliche Begleitung. Weiterhin wurden die Sanierung der technischen Infrastruktur, die Modernisierung und ein neues Raumnutzungskonzept finanziert.

Die energetische Sanierung wurde vom Bundesministerium für Wirtschaft und Arbeit (BMWA) im Rahmen des Förderkonzeptes „Energetische Verbesserung der Bausubstanz (EnSan)“ gefördert. Das Monitoring sicherte Kenntnisse über Energienutzung und Raumklima im Bestand als Planungsgrundlage und kontrolliert das Sanierungsergebnis über einen längeren Zeitraum. Die Bibliothek wurde 1975 eröffnet. Sie bietet neben den Präsenzbereichen auch Verwaltungsräume, Werkstätten und einen Vortragssaal sowie Nebenflächen für Technik. Der Grundriss ist nahezu quadratisch angelegt und entwickelt sich über 5 Ebenen. Die großzügige Präsenzfläche führt zwangsläufig zu großen und tiefen Räumen. Dadurch verfügt das sehr kompakte Gebäude aber auch über ein günstiges A/V-Verhältnis von 0,2 m<sup>-1</sup>.

Der Bau ist als Stahlbetonskelettbau mit Vorhangfassade ausgeführt. Die feinteilige vertikale Gliederung dieser Fassade wird von der Universität als markantes Gestaltungselement angesehen, weshalb für die Sanierung ihr Erhalt gefordert war. Typisch für die Bauzeit ist die Fassade mit Festverglasung. Entsprechend der damaligen Auffassung von Komfort und thermischer Behaglichkeit wurden sämtliche Gebäudeflächen maschinell klimatisiert.

Die hohen Energiekosten der Universität erforderten eine erhebliche Energieeinsparung. Eine Sanierung des Gebäudes der SuUB, mit 831 kWh/m<sup>2</sup>a ein sehr großer Verbraucher, lag deshalb nahe. Ziel war es, mehr als 50% des ursprünglichen Primärenergiebedarfs einzusparen. Daneben klagten Bibliotheksnutzer wiederholt über das Raumklima, unausgewogene Beleuchtung, nicht zu öffnende Fenster, schlechte Temperierung sowie einen permanenten Geräuschpegel. Eine Modernisierung sollte diese Probleme ebenfalls lösen.

Für den Verwaltungsbereich war es entscheidend, trotz Verzicht auf eine Klimatisierung zu jeder Zeit ein angenehmes Innenraumklima zu sichern. Neben der energetischen Sanierung sollte der Eingangsbereich umgestaltet und die Innenausstattung sowie die technische und rechentechnische Ausstattung der Arbeitsbereiche modernisiert werden. Alle Maßnahmen mussten bei laufender Nutzung durchgeführt werden.

#### **Innovative Finanzierung**

Die energetische Sanierung kostete 7,24 Mio. Euro. 50% wurden durch das Zukunftsinvestitionsprogramm (ZIP) sowie das Förderkonzept EnSan finanziert. Für den Eigenanteil der Universität waren zunächst im Haushalt keine Investitionsmittel vorhanden. Die Idee, die Gesamtfinanzierung über einen Performance-Contracting-Vertrag zu ermöglichen, verwarf der Bauherr aber nach eingehender Prüfung. Stattdessen wurde ein Kommunaldarlehen aufgenommen, dessen Tilgung über die zukünftige Haushaltsentlastung durch die Energiekostenreduzierungen erfolgt. Die Universität schlüpfte dabei selbst in die Rolle des Contractors – übernahm die Risiken, aber auch die wirtschaftlichen Chancen eines solchen Verfahrens („Intracting“). Die übertroffenen Einsparprognosen und die ständig steigenden Energiepreise sprechen für diese Entscheidung.

Die Fassade ist eine Pfosten-Riegel-Konstruktion aus einer Zweifachverglasung mit Aluminiumprofilen. Aufgepresste Innenprofile gewährleisten eine gewisse thermische Entkopplung. Auf Öffnungsflügel wurde beim Bau des Gebäudes verzichtet. Eine außen liegende Stahlrahmenkonstruktion trägt feste wie bewegliche Sonnenschutzglieder. Neben der feingliedrigen Glasfassade ist diese Konstruktion ein weiteres Gestaltungsmerkmal der SuUB. Die beweglichen Aluminiumjalousien werden fassadenweise über Motoren gesteuert.

Für eine Fassadensanierung sprachen sowohl energetische Gründe als auch die Verbesserung der thermischen Behaglichkeit und der individuellen Regelungsmöglichkeiten für die Nutzer. Insbesondere die Verwaltungsräume, die ca. 10% der HNF ausmachen, konnten durch den Einbau von Öffnungsflügeln an Behaglichkeit und Nutzerfreundlichkeit gewinnen. Das eingebaute neutrale Sonnenschutzglas ( $g=0,38$ ) in Kombination mit den vorhandenen Sonnenschutzelementen gewährleistet den sommerlichen Wärmeschutz.

Die Dachflächen wiesen im Bereich der Dachterrasse in der oberen Ebene zu geringe Dämmung auf und wurden auf Dämmstärken von 100 bzw. 140 mm ergänzt. Das Bibliotheksgebäude ist nicht unterkellert, die Bodenplatte ist ungedämmt. Etwa ein Drittel der spezifischen Transmissionswärmeverluste ergeben sich an den erdreichanliegenden Flächen. Eine Verbesserung dieser Situation war wirtschaftlich nicht vertretbar. (<http://www.bine.info>)

## Universitätsbibliothek Leipzig- Wiederaufbau.Modernisierung.Erweiterung, Leipzig – Germany 1991 – 2002

Bauherr: Staatshochbauamt Leipzig II, Bausumme: Ca. 65 Millionen EUR

Im Zweiten Weltkrieg wurde das Hauptgebäude in der Beethovenstraße durch Bombenangriffe zu zwei Dritteln zerstört. Die Kataloge und Bestände waren jedoch ausgelagert worden und blieben unversehrt. Nach dem Krieg wurde lediglich der unbeschädigte linke Gebäudeflügel genutzt. Zu einem Wiederaufbau des Hauptgebäudes fehlten jahrzehntelang die finanziellen Mittel. Erst nach der Wende begann 1994 die aufwendige Wiederherstellung und Erweiterung der Bibliothek einschließlich Rekonstruktion einzelner Gebäudeteile, die 2002 abgeschlossen wurde. Hierbei wurde die Ruine des rechten Flügels (Niveau Kellergeschoss) abgetragen, ein zweites Kellergeschoss ausgehoben, und die Fassade – trotz erheblicher Mehrkosten – originalgetreu wiederaufgebaut (siehe Bild oben, heute erinnert nur noch eine kleine Dehnungsfuge daran). (<http://www.wikipedia.org>)

## HMP Architekten Allnoch und Hütt GmbH, Köln – Germany

Gegründet wurde das Büro hmp 1957 in Köln und firmierte lange Zeit unter dem Namen Heier, Monse & Partner, von 1995 bis 2003 unter dem Namen HMP Bauplanung GmbH. Nach Ausscheiden der Gründungsväter werden die hmp ARCHITEKTEN nach kontinuierlicher Entwicklung des Büros heute geführt von den gleichberechtigten Geschäftsführern / Gesellschaftern Klaus Allnoch und Michael Hütt.

## Hochschul- und Kreisbibliothek Bonn-Rhein-Sieg, St. Augustin – Germany 1996 – 2001

Architektenwettbewerb 1.Platz 1996 Auslobung unter Beachtung energetisch günstiger und ökologisch verträglicher Bauweisen

Bauherr: Hochschule Bonn-Rhein-Sieg vertreten durch BLB NRW NL Bonn BRI / BGF / HNF: 127.000 m<sup>3</sup> / 30.100 m<sup>2</sup> / 26.500 m<sup>2</sup>  
Baukosten: 45,76 Mio. € (brutto inkl. NK)

Ein prägnanter Hochschulbogen

Die Neugründung der Fachhochschule Bonn-Rhein-Sieg in Sankt Augustin wurde nach dem Gewinn des 1.Preises eines Architektenwettbewerbes zur innovativen Bauaufgabe. Die Gebäudestruktur formuliert den Charakter einer „Fachhochschule in der Landschaft“, die durch ihren Viertelkreis den städtebaulichen Abschluss des Zentrums von Sankt Augustin bildet. Der Gesamtkomplex gliedert sich in drei Baukörper, die sich um einen internen Campus zur kommunikativen Nutzung gruppieren. Die fünf variabel nutzbaren Hörsäle des Hörsaalzentrums sowie die Mensa im Eingangsbereich laden zu Veranstaltungen auch außerhalb des Studienbetriebes ein. Der Haupteingang wird durch das Tonnendach markant in Szene gesetzt. Übersichtliche Gebäudeanordnung, Transparenz der Baukörper schaffen zusammen mit der farblichen Gestaltung eine helle, freundliche Atmosphäre. Die Zweite-Haut-Fassade der Bibliothek und Transparente Wärmedämmung der Maschinenhalle sind zwei markante ökologische Bausteine, die Fotovoltaik Elemente, Erdwärmenutzung und Nachtauskühlung ergänzen. In der Summe ein Gebäudekomplex, der Studieren in moderner, innovativer Umgebung realisiert. (HMP)

## Hochbauamt Nordhorn – Germany

## Stadthaus Archiv Euregio Bücherei, Nordhorn – Germany 2001

Gesamtkosten: 1.900.000 DM, Baukosten: 1.500.000 DM, Einrichtungskosten: 420.000 DM

Das aus zwei orthogonal angeordneten Flügeln bestehende neue Stadthaus bildet die Ost- und Südwestwand des Platzes, die Öffentliche Bibliothek die Nordkante. Dieses Gebäude, das an die Rückseite des alten Rathauses grenzt, stammt aus den 60er Jahren. Die Bibliothek ist ein dreigeschossiger, weißgeputzter Trakt. Im EG wird die Lochfassade mit ihren fast großflächigen Verglasungen aufgelöst. Die Bibliothek ist um einen zweigeschossigen Eingangsbereich mit Kasse, Ausleihe und Toiletten erweitert worden. Die Stahl-Glas-Fassade zum Platz fasst mit leicht geschwungenem Bogen Alt- und Neubau zusammen. (<http://www.bibliotheksportal.de>)

## ZHI Stuttgart, Hochschule der Medien, Bibliothek, Stuttgart – Germany 2013

BGF 8.288 m<sup>2</sup>, BRI 33.642 m<sup>3</sup>, Baukosten 19,5 Mio. €, Bauherr Land Baden-Württemberg

ZHI Fachhochschule Stuttgart, Hochschule der Medien Neubau für die zusammengeführte Hochschule. Neubau für Informationsdesign. Die Fusion der Stuttgarter Hochschule für Druck und Medien und der Hochschule für Bibliotheks- und Informationswesen zur Hochschule der Medien fordert eine Zusammenlegung der Standorte. Geplant ist ein Neubau auf dem Campus der Universität Stuttgart in Vaihingen. Er beinhaltet Büro- und Seminarräume, Hörsäle, TV- und Audiostudios, Rechnerpools, Audio/Video- Labor und eine zweigeschossigen Bibliothek mit ca. 1 200 m<sup>2</sup>. Der Entwurf sieht einen 2-3 geschossigen Baukörper mit Untergeschoss als freie Großform vor. Es handelt sich auch im Aufriss um eine frei schwingende Form. Der ca. 87 m lange und 43 m breite Solitär umschließt vier Innenhöfe. Diese liegen teilweise über der Decke EG und über der Decke OG 1. Im Erdgeschoss liegt der publikumsintensive Bereich wie Bibliothek und Hörsäle. Im 1. OG befinden sich überwiegend Seminarräume. Die Institute mit Büros und kleineren Gruppenräumen sind im 2. OG untergebracht. Das TV Studio befindet sich im Untergeschoss. Geplant ist eine Skelettkonstruktion mit punktgestützten Deckenplatten auf Stahlbetonfertigteilen in Fassadenebene und aussteifenden Erschließungskernen. Die Fassade wird als Pfostenriegelfassade mit abwechselnd transparenten und geschlossenen raumhohen Elementen ausgeführt. Über den bauteiltemperierten Decken befinden sich Hohlräume für die Installationsführung. Durch die Nutzung von Geothermie wird der Energiebedarf des Hauses optimiert. Für die Bereiche HLS, MRS, Elektrotechnik, Aufzug Medientechnik und Außenanlagen sind Fachingenieure eingeschaltet. (<http://www.competitionsline.com>)

## HHS Architekten AG (Hesser-hesser-Schleif), Kassel – Germany

Akademie Mont Cenis, Fortbildungsakademie des Innenministeriums des Landes NRW, Bibliothek, Herne-Sodingen - Germany 1999

see: Jourda Architectes, Paris - France

Die Fortbildungsakademie von Jourda & Perraudin in Herne Eine vom französischen Architekturbüro Jourda & Perraudin konzipierte Stadt unter Glas ist auf einer früheren Industriebrache in Herne entstanden. Das Ensemble der Bauten zeigt auf vorbildliche Weise, wie sich ökologische Konzepte und herausragende Architektur vereinen lassen. Vor wenigen Tagen konnte nun die Anlage eingeweiht werden. Ein Unternehmer aus Lyon und ein Bergbauingenieur aus Marseille taten sich 1871 zusammen und erwarben ein Stück Land nahe der westfälischen Ortschaft Herne. Nach dem seinerzeit als Wunderwerk gepriesenen Eisenbahntunnel in den französischen Alpen nannten sie ihre Zeche «Mont-Cenis», und der Name lässt wohl etwas von der Dynamik anklingen, welche der Entwicklung des Ruhrkohlebergbaus seinerzeit eignete. Mehr als ein Jahrhundert beherrschte die Zeche mit ihren Fördertürmen den Stadtteil Sodingen, dann kam mit der Krise der nordrhein-westfälischen Montanindustrie das Aus. 1978 fuhren die letzten Kumpel in den Schacht, zwei Jahre später gähnte an Stelle der einstigen Zechenanlagen eine 60 Hektar grosse Brache. Strukturwandel beschränkte sich hier wie anderenorts im Revier zunächst darauf, Strukturen der industriellen Ära auszulöschen. Die Arbeitslosenquote in Herne liegt heute bei nahezu 20 Prozent. «Wandel ohne Wachstum», so lautet einer der Slogans der 1988 beschlossenen, dezentral ausgerichteten IBA Emscher Park. Natürlich ist die ökonomische und ökologische Erneuerung der grössten Industrieregion Europas ein Ziel, zu dem das Instrument Bauausstellung nur Anstösse geben kann. Und eine Rundreise zu den einzelnen Projekten hinterlässt mancherorts zwiespältige Gefühle: Ob es gelingt, all die Businessparks, Innovationszentren und Zukunftsfabriken dauerhaft mit Betriebsamkeit zu erfüllen, ist ebenso fragwürdig wie die Akzeptanz mancher Kunst- und Kulturprojekte in einer nicht eben bildungsbürgerlich geprägten Region. Doch es gibt auch Projekte, die man als gelungen bezeichnen möchte: etwa die Revitalisierung des Duisburger Innenhafens und die Umnutzung des Mont-Cenis-Geländes in Herne. Die Entscheidung des Landes Nordrhein-Westfalen, auf dem Areal der Kohlengrube eine Fortbildungsakademie des Innenministeriums zu errichten, führte 1991/92 zu einem zweistufigen Wettbewerb, in dem sich das in Lyon gegründete Atelier Jourda & Perraudin mit einem zukunftsweisenden Konzept einer Stadt unter Glas durchsetzen konnte. Gemeinsam mit den Projektpartnern Hegger Hegger Schleiff aus Kassel und den Ingenieuren von Ove Arup wurde, unterstützt durch einen Forschungsauftrag der Europäischen Union, die Idee einer mikroklimatischen Hülle entwickelt. - Insgesamt 62 Fichtenstämme tragen die aus Holz bestehende Dachkonstruktion der ringsum verglasten Halle. Die Dimensionen sind beeindruckend: 176 Meter misst der Innenraum in der Länge, 72 Meter in der Breite und 15 Meter in der Höhe. In diesen gewaltigen, lichtdurchfluteten Freiraum stellte Projektarchitektin Françoise Hélène Jourda acht aus stereometrischen Primärformen entwickelte, zwei- bis dreigeschossige Baukörper. Neben die klaren Kuben treten die Halbtonne des Casinos sowie der markante Kegelstumpf der Bibliothek. In zwei Zeilen die zentrale Erschliessungssachse flankierend, bieten die Volumina nicht nur der Fortbildungsakademie Platz. Entgegen den ursprünglichen Plänen entschied man sich nämlich während der Projektierungsphase, auch kommunale und öffentliche Einrichtungen in die Gebäudehülle zu integrieren. Durch die Einbeziehung von Quartierbibliothek und Bürgeramt, Restaurant, Hotel und Versammlungssaal findet das in der Glashülle anklingende Thema der Transparenz und Offenheit auch funktional seine Entsprechung. Holzstege und Schotterflächen alternieren in den unbebauten Arealen und setzen sich auch ausserhalb der verglasten Stadt fort. Eine weitläufige Treppenanlage führt vom Zentrum Sodingens hinauf zur Akademie, die von einem grossen Pappeloval umgeben ist. «Oval Light» nennt der Künstler Mischa Kuball seine Installation, die Akademie und Park zukünftig ins Licht rücken wird. Mit ihrer Verkleidung aus weisslasierten Kiefernpaneelen wirken die einzelnen Volumina im Inneren der Halle angenehm leicht und freundlich; wo früher einmal Schwerstarbeit verrichtet wurde, weht nun ein fast mediterraner Hauch. „Mediterraner Hauch“ ist durchaus wörtlich zu verstehen: Die Glashülle, die sich, sofern es das Wetter zulässt, an verschiedensten Stellen öffnen lässt und auch im Winter durch Sonneneinwirkung und Wärmerückgewinnung angenehme Temperaturen ermöglicht, lässt ein Binnenklima entstehen, das dem von Nizza gleicht. Leben kann sich somit ganzjährig auch ausserhalb der eingestellten Gebäude abspielen, deren Räume daher vergleichsweise bescheiden dimensioniert werden konnten. Da eine Glashaut alles umhüllt, wurden Wetterschutz und Wärmedämmung für die Fassaden der einzelnen Gebäude zu irrelevanten Faktoren. Die gläserne Hülle übernimmt eine weitere Funktion: In das Dach und die Südwestfassade wurden mehr als 10 000 Quadratmeter Photovoltaik-Module integriert. Stolz spricht denn auch die «Entwicklungsgesellschaft Mont-Cenis» vom grössten Solarkraftwerk der Welt. Die glasintegrierten Siliziumzellen, die zusammen eine Spitzenleistung von einem Megawatt erbringen können, sind hier einmal nicht lästige Applikation, sondern dienen, gleichsam zu Wolken arrangiert, der gezielten Verschattung einiger Raumpartien im Inneren. Mit grossen Dächern und gläsernen Hüllen haben Jourda & Perraudin schon verschiedentlich experimentiert - so beim Internationalen Schulzentrum in Lyon (1989-92) und den Universitätsbauten für Marne-la-Vallée (1992-96). Wurde die Stringenz ihrer Projekte aber bisweilen durch manieriert-organische Ausbildungen in Frage gestellt, so beeindruckt das Meisterwerk in Herne gerade durch seine strukturelle Klarheit und formale Prägnanz. Zudem ist es ein Beleg dafür, dass ökologisches Bauen und grosse Architektur zu harmonieren vermögen. © Text: Hubertus Adam, Neue Zürcher Zeitung und [www.nextroom.at](http://www.nextroom.at), 20.10.1999. ([http://www.atrien.ch/uploads/c\\_23\\_5\\_1%20Doku%Herne.pdf](http://www.atrien.ch/uploads/c_23_5_1%20Doku%Herne.pdf))

## HPP Hentrich-Petschnigg & Partner GmbH + Co. KG, Düsseldorf - Germany

<http://www.hpp.com>

**Libraries:**

Hochschule Ruhr West – Bibliothek, Mülheim an der Ruhr – Germany 2014

Bauherr: BLB NRW, BGF: 62.500 m<sup>2</sup> / Fertigstellung: 2014, Architektur: ARGE HPP / ASTOC

Die Wettbewerbsaufgabe bestand in der Schaffung eines urbanen Hochschulcampus mit hoher Identität, Aufenthaltsqualität und Nutzungsflexibilität. Als städtebaulich integriertes Ensemble besteht die Campusanlage aus vier Institutsgebäuden, drei Sonderbauten (Bibliothek, Hörsaalzentrum und Mensa), einem Parkhaus sowie großflächigen Außenanlagen. Insgesamt werden 62.500 Quadratmeter Bruttogeschossfläche für moderne Lehre und Forschung und öffentliche Veranstaltungen realisiert. Das äussere Erscheinungsbild der 2- bis 6-geschossigen Baukörper ist von Ziegelfassaden und großflächigen Bandfenstern mit vertikalen Verschattungselementen geprägt. Im inneren erzeugen Sichtbetonwände und -böden den gewünschten Werkstattcharakter. Flexible Grundrisse bei den Institutsgebäuden erlauben die Nutzung durch unterschiedliche Lehrereinrichtungen. (hpp)

Mülheim an der Ruhr/Bottrop, 09. Juli 2012: Heute fällt der Startschuss für den Neubau der Hochschule Ruhr West. Der Bau- und Liegenschaftsbetrieb NRW (BLB NRW) errichtet für die Hochschule Ruhr West einen Campus in Mülheim an der Ruhr sowie den zweiten Standort in Bottrop. Nach derzeitigem Planungsstand werden die Arbeiten in Mülheim im Herbst 2014 und in Bottrop im Herbst 2013 abgeschlossen sein. Insgesamt investiert das Land Nordrhein-Westfalen 173 Millionen Euro in den Neubau der Hochschule Ruhr West an ihren beiden Standorten.

Auf den Baufeldern an der Duisburger Straße in Mülheim und an der Hans-Sachs-Straße in Bottrop werden die Baustellen eingerichtet. Der Baubeginn steht unmittelbar bevor. Hier wird die Hochschule Ruhr West, die derzeit übergangsweise in angemieteten Räumen untergebracht ist, Neubauten erhalten, die einen zeitgemäßen Hochschulbetrieb ermöglichen und ein adäquates Umfeld für Lehre und Forschung bieten: In Mülheim entsteht ein Campus mit vier Institutsgebäuden, einem Hörsaalgebäude, einer Bibliothek, einer Mensa und einem Parkhaus, mit einer Bruttogeschossfläche von insgesamt 62.500 m<sup>2</sup>. Der Neubaukomplex in Bottrop mit einer Bruttogeschossfläche von 11.400 m<sup>2</sup> wird neben Hörsälen, Mensa und Bibliothek auch das Institut Informatik und das Institut Energiesysteme und Energiewirtschaft beherbergen.

Der Entwurf für den Mülheimer Campus stammt von der Arbeitsgemeinschaft HPP Hentrich-Petschnigg & Partner (Düsseldorf) und ASTOC Architects & Planners (Köln). Der Bottroper Standort wurde von der Arbeitsgemeinschaft h4a Gessert + Randecker + Legner Architekten (Stuttgart) und Vögele Architekten (Stuttgart) entworfen. Beide Arbeitsgemeinschaften gingen aus einem zweistufigen Wettbewerb mit angeschlossenem Auswahlverfahren als Sieger hervor. Dieses Wettbewerbsverfahren hatte die zuständige Niederlassung Münster des BLB NRW initiiert und durchgeführt. So stellte sie sicher, dass die sowohl unter funktionalen und wirtschaftlichen als auch unter architektonischen und städtebaulichen Aspekten besten Lösungen zur Ausführung kommen. Im kommenden Herbst wird bereits an beiden Standorten der offizielle Grundstein für die Neubauten gelegt. In Mülheim wird die Hochschule den Campus nach derzeitigem

Planungsstand im Herbst 2014 beziehen können. Der Standort in Bottrop wird bereits im Herbst 2013 fertiggestellt sein. Insgesamt investiert das Land NRW 173 Millionen Euro in den Neubau der Hochschule Ruhr West. Davon entfallen 139 Millionen Euro auf Mülheim und 34 Millionen Euro auf Bottrop. (<http://www.hochschule-ruhr-west.de>)

### **“O.A.S.E.” (Ort des Austauschs des Studiums und der Entwicklung) Lern- und Kommunikationszentrum, Medizinische Fachbibliotheken, Heinrich-Heine Universität, Düsseldorf - Germany 2011**

Bauherr: Universitätsklinikum Düsseldorf A.d.ö.R., BGF: 5 055 m<sup>2</sup>

Auf dem Gelände der Heinrich-Heine-Universität Düsseldorf findet heute der Spatenstich zum Baubeginn der "O.A.S.E." statt. Die neue medizinische Fachbibliothek des Universitätsklinikums Düsseldorf soll unter dem Leitmotiv Erlebnisraum Bibliothek Studieren, Lesen und Lernen sowie Inspiration, soziale Begegnung und Austausch ermöglichen. Die äußere Erscheinung des 35 Meter hohen Neubaus ist von einem Kapillarsystem inspiriert. Diese Gestaltungsidee bildet sich wirkungsvoll in der glatten weißen Fassadenhaut ab. Organisch geformte Glasfelder ziehen sich netzartig über den schlanken Kubus und stellen attraktive Bezüge zwischen Innen- und Außenraum her. Es entsteht ein lebendiges Gebäude mit hoher Identifikation sowie großem Wiedererkennungswert. (HPP)

Die O.A.S.E. ist Raum für Austausch, Begegnung und ein Zentrum des Lernens an der Medizinischen Fakultät. Sie ist ein Ort, an dem Studierende eine attraktive zeit- und bedarfsgemäße Lern- und Arbeitsumgebung finden können. Hauptmerkmal der O.A.S.E. sind die Lernräume und Lernbereiche, in denen Studierende die Möglichkeit haben, alleine oder in Gruppen in ruhiger Atmosphäre zu lernen und zu arbeiten. Alle Räume sind mit Strom- und Netzwerkan schlüssen versehen, sodass die Möglichkeit besteht, Laptops unbeschränkt zu nutzen. Viele Räume verfügen über Interaktive Whiteboards oder Bildschirme, sodass auch Gruppen mit nur einem portablen PC gemeinsam lernen und arbeiten können. Der zweite Schwerpunkt der O.A.S.E. wird in der neuen Fachbibliothek Medizin in den oberen Etagen bestehen (Eröffnung voraussichtlich im September 2011), wodurch die Studierenden in den Lernräumen auch auf die dort vorhandene Literatur zurückgreifen können. Selbstverständlich gibt es auch in der Fachbibliothek viele Arbeitsplätze zum Lernen und Arbeiten. Das Angebot der O.A.S.E. wird durch eine Cafeteria (Eröffnung voraussichtlich im September 2011) im Erdgeschoss, die "Halle des Austauschs" und den "Raum für Entwicklung" abgerundet. In der vierten Etage wird es ab September außerdem einen E-Learning-Raum geben, der außerhalb von Lehrveranstaltungen von den Studierenden frei genutzt werden kann. Zusätzlich befinden sich in der O.A.S.E. die neuen Räumlichkeiten der Fachschaft Medizin sowie drei Beratungsräume des Medizinischen Studiendekanats. Die Selbstlernräume stehen allen Studierenden der Medizinischen Fakultät kostenlos zur Verfügung. (<http://www.medizinstudium.uni-duesseldorf.de>)

Am Donnerstag, 24.11.2011 haben Heinrich-Heine-Universität Düsseldorf, Medizinische Fakultät und Bauherr Universitätsklinikum Düsseldorf ein modernes Lern- und Kommunikationszentrum eingeweiht: die O.A.S.E. genannte neue medizinische Fachbibliothek. O.A.S.E. bedeutet Ort des Austauschs, des Studiums und der Entwicklung.

24. November 2011 - Der futuristisch anmutende Neubau wurde mit rd. 13 Millionen Euro Baupmitteln aus dem Konjunkturpaket II des Bundes finanziert. Mit der architektonischen und planerischen Umsetzung wurde das Architekturbüro Hentrich - Petschnigg & Partner GmbH (HPP) aus Düsseldorf beauftragt.

„Was auf dem Campus vor allem für die immerhin 900 Medizinstudierenden im klinischen Studienabschnitt fehlte“, erklärt Studiendekanin Prof. Dr. Stefanie Ritz-Timme anlässlich der Einweihung, „war eine adäquate Lernumgebung und Aufenthalts- und Kommunikationsräume. Die Idee war, diese zusammen mit der ohnehin zu ersetzenden alten Fachbibliothek zu schaffen. Idee und Konzept des Raumprogramms entstanden im Studiendekanat der Medizinischen Fakultät zusammen mit den Studierenden der Fachschaft Medizin.“

Das 35 Meter hohe Gebäude mit 3.400 qm Nutzfläche und acht Geschossen enthält hinter seiner prägnanten Fassade Lese- und Ausleihebereiche, Arbeits- und Lernräume, Räume der Studentenschaft und in der gesamten Erdgeschossenebene eine „social area“, wo Veranstaltungen stattfinden können und ein informeller Aufenthaltsbereich mit einer Cafeteria angeboten wird. Betreiber und Bauherr der O.A.S.E. ist das Universitätsklinikum Düsseldorf.

Die O.A.S.E. wird ein Gewinn für die Studierenden und auch für den Studienstandort Düsseldorf sein. Sie bietet optimale Lernbedingungen und ist ein Meilenstein auf dem Weg der Fakultät, die Lehr- und Lernkultur im Medizinstudium stetig zu verbessern. (<http://www.uni-duesseldorf.de>)

### **Mediothek Krefeld – Germany 2005 - 2008**

Bauherr: Stadt Krefeld / BGF: 7 500 m<sup>2</sup>, Wettbewerb: 1. Preis 2002, Architektur: HPP in Zusammenarbeit mit db Dieter Berten

Der geringe Anreiz zum Verweilen auf dem Theaterplatz in Krefeld veranlasste die Stadt, einen Wettbewerb zur städtebaulichen Neuordnung des Quartiers zwischen Ostwall, St. Anton-Straße und Königstraße auszuloben. Die neue Mediothek ist der erste realisierte Abschnitt der geplanten Neugestaltung dieses öffentlichen Raums, zu dem auch das Seidenweberhaus und das Stadttheater gehören. Auf rechteckigem Grundriss entstand ein klar gegliedertes, 3-geschossiges Gebäude, das sich mit seiner gläsernen Eingangsfassade zum Theaterplatz öffnet. Über das Foyer, in dem sich Information, Ausstellungs- und Verbuchungstheken befinden, gelangt der Besucher in das glasüberdachte Gebäudeatrium. Hier zeigt sich vollständig die außergewöhnliche Innenraumgestaltung, die auf der Idee des »kontinuierlichen Raums« aufbaut: Um das Foyer sowie den zentralen Ausstellungs- und Vortragsbereich ziehen sich Rampen in die Höhe, die die terrassenförmig ansteigenden Ausleiheebenen fließend und barrierefrei miteinander verbinden. Der Besucher durchwandert die Mediothek wie auf einer Promenade und erlebt dabei je nach Standort und Ebene immer wieder neue Raumeindrücke. (hpp)

An der Stelle, an der am 29. März 2008 die neue „Mediothek Krefeld“ feierlich eröffnet worden ist, stand bereits zuvor ein Bibliotheksgebäude – damals nannte man das noch „Stadtbücherei“. Das alte Gebäude war aber den Erfordernissen einer modernen

Bibliothek mit Computerarbeitsplätzen, Internetzugang und DVD-Ausleihe nicht mehr gewachsen und wurde im Sommer 2006 abgerissen. Der Architektenwettbewerb für den Neubau war bereits im Jahr 2002 entschieden worden. Die Realisierung des Neubaus nach Planungen von HPP Architekten, Düsseldorf, in Zusammenarbeit mit Dieter Berten, Krefeld, nahm nach dem Abriss des Altbaus gerade einmal 18 Monate und 8,8 Millionen Euro in Anspruch. Die Mediothek steht am Theaterplatz in direkter Nachbarschaft zum 50er-Jahre-Gebäude des Stadttheaters und dem 1976 errichteten Seidenweberhaus. Der dreigeschossige Neubau öffnet sich zum Platz hin mit einer Fensterfront und dem vorspringenden Dach. Von hier betritt man über das Foyer das Atrium in der Mitte des Gebäudes. Um dieses Foyer zieht sich eine kontinuierliche Rampe in die Höhe, die alle Ausleiheebenen der Mediothek fließend und barrierefrei miteinander verbindet. Die Architekten sprechen von einem „einzigartigen Raumkontinuum“, greifen damit offensichtlich auf Rem Koolhaas' Erschließung für die nicht realisierte Bibliothèque Jussieu in Paris (1992) zurück – in Krefeld allerdings räumlich weniger komplex, dafür auch mit einer deutlich besseren Orientierung für die Besucher. „Der Besucher“, erläutern uns die Architekten, „durchwandert den lückenlos zusammenhängenden Raum über Rampen wie auf einer Promenade und erlebt je nach Ebene und Standort immer wieder neue und überraschende Raumeindrücke. Dabei kann er nie die Orientierung verlieren, da das Gebäude und dessen Organisation von jedem Punkt aus vollständig überblickt werden kann.“ Die Gefahr, das sich die Krefelder in ihrer neuen Mediothek mit ihrem multimedialen Angebot verirren, besteht glücklicherweise also nicht. (<http://www.baunetz.de>)

#### **Petersbogen, Juridicum, Leipzig – Germany 2001**

Bauherr: KIG Immobiliengesellschaft mbH & Co. KG über EC Harris GmbH, Standort: Leipzig / BGF: 53 000 m<sup>2</sup>

Der Entwurf für den Petersbogen zwischen Petersstraße und Schlossgasse fasst drei Bausteine in einem Gebäude zusammen, die Einkaufspassage mit insgesamt 12 000 Quadratmetern Verkaufsfläche auf drei Ebenen, ein Verwaltungsbereich der Fakultät sowie der Bibliothek mit 150 000 Bänden und 500 modern ausgestatteten Leseplätzen. Das Volumen des Neubaus präsentiert sich entsprechend der hochfrequentierten städtischen Funktionen selbstbewusst. Von der belebten Petersstraße führt die Passage in einem weiten Bogen in Richtung Burgplatz und neues Rathaus. In Zusammenarbeit mit der Stadt Leipzig, der juristischen Fakultät der Universität Leipzig und privatwirtschaftlichen Unternehmen ist damit ein wichtiges Projekt zur Stärkung der Leipziger Innenstadt umgesetzt worden. (HPP)

#### **Libraries:**

#### **Hochschule Harz, Abteilung Halberstadt (Bibliothek) – Germany 2004**

Bauherr: NOSA GmbH (Holding der Stadt Halberstadt), Bruttogeschossfläche: 7300 m<sup>2</sup>

Neubau des Hochschulstandortes am Halberstädter Domplatz unter Einbeziehung von zwei historischen Gebäuden.

Der Neubau schiebt sich als Verbindungsbau zwischen die sog. Dompropstei und das ehemalige Domgymnasium. Hier wurden drei wesentliche Funktionen untergebracht: Die Hochschulbibliothek, die Mensa, und zwei größere Lehrsäle. Die beiden Säle, die durch eine mobile Wand getrennt sind, können auch gemeinsam genutzt werden. Die Altbauten werden für Seminarräume und für die Hochschulverwaltung genutzt. (Hülsdell)

#### **Stadtbibliothek Heinrich Heine, Halberstadt – Germany 2000**

Bauherr: Stadt Halberstadt, Bruttogeschossfläche: 2750m<sup>2</sup>

#### **Awards:**

**Auszeichnung beim Architekturpreis des Landes Sachsen-Anhalt 2001**

Umnutzung und Sanierung eines Teils des ehemaligen Halberstädter Bischofssitzes. Der Petershof sieht auf eine über 1000jährige Geschichte zurück. Die Erfüllung der Anforderungen an eine moderne Bibliothek wurden bei der Konzeptfindung der reinen Konservierung vorangestellt. So wurde z.B. die sakrale Intimität der Kapelle durch den Einbau einer Lesegalerie uminterpretiert. Blickbezüge mit der Umgebung schaffen hier die Offenheit, die das Erscheinungsbild prägt. Es wurde großer Wert darauf gelegt, alte Strukturen und entstandene Brüche erfahrbar zu machen. Die geradlinigen Ein- und Umbauten werden durch die historischen Strukturen kontrastiert. (Hülsdell)

#### **Stadtbibliothek Bernburg (Saale) – Germany 1999 – 2000**

Bauherr: Stadt Bernburg, Hochbauamt, Gesamtkosten: 4.350.000 DM, Baukosten: 3.700.000 DM, Einrichtungskosten: 650.000 DM

Mitten in der Stadt Bernburg, gegenüber des Lindenplatzes - an der Stelle des ehemaligen Schulgebäudes - entstand in kurzer Bauzeit der Neubau für die Stadtbibliothek. Im Erdgeschoss entstand sowohl ein Internetcafé als auch ein Lesecafé mit der Zeitschriftenabteilung. Im 2.OG befindet sich die Kinder- und Jugendliteratur, damit die Kinder im Haus integriert werden. Im DG steht die Belletristik. (<http://www.bibliotheksportal.de>)

#### **Evangelisches Augustinerkloster zu Erfurt - Wiederaufbau der Bibliothek & der Waidhäuser, Erfurt – Germany 2009**

#### **Awards:**

**Staatspreis für Architektur und Städtebau 2010**

Auftraggeber: Evangelisches Augustinerkloster Erfurt,

Wiederaufbau der historischen Bibliothek und der Waidhäuser sowie denkmalpflegerische Maßnahmen am Klosterkomplex, Leistungszeitraum: offener Realisierungswettbewerb nach GRW95, Planung: 2005-2006, Bau: 2006-2009, Herstellungskosten: 6,40 Mio. EUR, realisiert: 2010, Baudaten: HNF: 1.030m<sup>2</sup>, BGF: 2.975m<sup>2</sup>, BRI: 11.550m<sup>2</sup>

Die Bauaufgabe besteht aus der Errichtung von Neubauten auf dem historischen Gelände des Augustinerklosters zu Erfurt. Die neuen Gebäude sind Ersatz für die im 2. Weltkrieg zerstörten historischen Gebäude - der Bibliothek und der Waidhäuser. Die Neubauten folgen im Wesentlichen der ehemaligen Kubatur des historischen Bibliotheksgebäudes und beherbergen folgende Funktionen: - Bibliotheksbereich - Veranstaltungsbereich - Repräsentationsbereich. Im Bereich der ehemaligen Waidhäuser entsteht ein 3-geschossiges Apartmenthaus in deutlich reduzierter Kubatur im Vergleich zum Ursprungsgebäude. Der Wiederaufbau erfolgt auf den Grundmauern der mittelalterlichen Anlage mit den vorhandenen Kellergewölben von Bibliothek und Waidhäusern. Dies erfordert die statische Sicherung und denkmalpflegerische Sanierung der historischen Mauern. Die statische Sicherung erfolgt über eingebaute Mikropfähle entsprechend den statischen Erfordernissen für die geplanten Neubauten. Ein weiterer Bauabschnitt umfasst Maßnahmen zur konservatorischen und restauratorischen Sicherung der Natursteinfassaden des mittelalterlichen Klosterkomplexes und der Klosterkirche. (Junk)

#### **Fachhochschule und Campus Urstein, Puch b. Hallein, Salzburg – Austria 2005**

Bauherr: HÖ Heimat Österreich, Bauvolumen: BGF 17.000 m<sup>2</sup>, BRI 66.700 m<sup>3</sup>, Realisierung: 2003-2005, Wettbewerb: 2002 - 2. Preis, Überarbeitung 1. Preis

Das Gebäude der Fachhochschule ist ein inhaltliches Abbild der interdisziplinären Lehre der Hochschule. Situierung und räumliche Organisation des Neubaus stellen den Bezug zu den Bestandsbauten und der beeindruckenden landschaftlichen Umgebung her. Der Bau erschließt sich über das zentral liegende „Vertikale Foyer“, das eine gute Verknüpfung zwischen den geschossweise organisierten Fakultäten garantiert. Hörsäle, Audimax und Gastronomie sind im Erdgeschoss angeordnet. Die Bibliothek steht als intellektuelles Zentrum und frei geformter Körper im gläsernen Foyer. Der Campuspark wird den Studenten als Freizeit- und Erholungsraum zur Verfügung gestellt. Der Neubau der FH und dem benachbarten Studentenwohnheim ist Auftakt für die Entwicklung des Technologieparks Urstein. (kadawittfeld)

### **Libraries:**

#### **Universität Liechtenstein, Bibliothek, Vaduz – Fürstentum Liechtenstein 2000 – 2003, 2. BA 2005**

Bauherr: Gemeinde Vaduz, BGF: 10.525 m<sup>2</sup>, Kubatur: 54.400 m<sup>3</sup>

Das Fabrikensemble der ehemaligen Baumwollspinnerei Jenny, Spoerry & Cie wurde gegen Ende des 19. Jahrhunderts errichtet. Nach Stilllegung der Produktion beschlossen die Gemeinde Vaduz und das Land Liechtenstein gemeinsam, dort im Zuge einer Umnutzung eine Universität sowie Ausstellungs- und Konferenzräume unterzubringen. Da das Raumprogramm des Nutzers die Kapazität der ehemaligen Fabrikhallen vollständig erschöpfte, fand sich hier für die in einer Universität benötigten, offenen Räume kein Platz mehr. Dieses Dilemma lösten wir, indem wir einen Teil der neuen Nutzung in einen vorgelagerten Erweiterungsbau ausgelagerten, der durch mehrere Passarellen mit dem Bestandsgebäude verbunden ist. Zum einen wurde so die Baugeschichte des Ensembles, das seit seiner Entstehung ständig umgebaut und erweitert worden war, fortgeführt, zum anderen blieb so die innere Struktur der Bestandsgebäude erlebbar. Der Erweiterungsbau, eine aufgeständerte, transparente Stahlkonstruktion, die Bibliothek und Cafeteria beherbergt, bildet nun den räumlichen und kommunikativen Mittelpunkt der Universität. Die dominante Struktur der Sheddächer und Stützen aus Gusstahl prägt die Hallen der alten Fabrik. Zwischen- und Flurwände wurden, genauso wie Türen, Fenster und Einbauten, an diese vorgegebene Struktur angepasst. So entstand ein Raumgefüge mit Fluchten und Blickbeziehungen, das einerseits die neue Nutzung zeigt, andererseits aber auch die Klarheit der Architektursprache der ehemaligen Fabrik dokumentiert. Die im Bestandsgebäude untergebrachten Seminar- und Unterrichtsräume werden ausschließlich von oben beleuchtet. Dies verleiht ihnen ihren introvertierten Charakter und ist eine ideale Voraussetzung für konzentriertes Arbeiten. Zudem unterstreicht die überall spürbare Geschichte des Gebäudes mit ihren baulichen Narben und Glanzlichtern die eigenständige und einzigartige Identität der „neuen Spoerry-Fabrik“. (Karl)

#### **Freiluftbibliothek Magdeburg-Salbke – Germany 2009**

Was haben ein Bürgerverein, eine ausgemusterte Kaufhausfassade aus Hamm, 20.000 Bücher und ein Modellvorhaben des Bundes mit einer Brachfläche in Magdeburg zu tun? Das kann man am 20. Juni 2009 in Salbke, einem Stadtteil von Magdeburg, herausfinden. Auf der Freifläche der früheren Ortsbibliothek wird die von Karo Architekten (Magdeburg) geplante Freiluftbibliothek mit Bühne als Ort der Begegnung für Jung und Alt eröffnet. Zur Vorgeschichte: In dem Magdeburger Stadtteil Salbke, der unter einem extremen Schrumpfungsprozess leidet, wurde 2005 für zwei Tage eine temporäre Freiluftbibliothek errichtet. Die Bücher dieser Bibliothek stammten aus Spenden, die in der ganzen Stadt eingesammelt wurden. Obwohl das improvisierte Bibliotheksmöbel nur für ein Wochenende existierte, hat es eine dauerhafte Wirkung entfaltet. Der ständig wachsende Bestand an Büchern ist heute auf gut 20.000 Bücher angewachsen, für den nun mit einem Bibliotheksgebäude aus einer recycelten Fassade einer abgebrochenen Horten-Kaufhausfassade aus Hamm in Westfalen eine dauerhafte Bleibe realisiert wurde. ### **Awards:**

#### **2002 Anerkennung zum Thüringer Staatspreis für Architektur und Städtebau**

Der Campus mit einem aufgelassenen spontanbegrüntem Fabrikareal ist ein zentrumsnaher Campus entstanden: eine weitgespannte Schwerlinie ordnet ein System niedriger Baukörper und Platzfolgen, die sich über einen längsorientierten Raum verknüpfen. Mensa, Hörsaalgebäude und **Bibliothek** umgeben einen zentralen Campusplatz. Die weitläufige Distanz zwischen diesem und den am anderen Ende der Achse situierten Institutsgebäuden bieten Spielraum für nachfolgende, flankierende Bauabschnitte. Die Verflechtung von Architektur und Natur ist gestaltendes Prinzip: raumhohe Verglasungen führen den Blick in die grünen Freiräume, vertikale und horizontale Lichtführungen schaffen Offenheit, weit auskragende Dächer vermitteln Innen- und Außen. Hierzu im Kontrast stehen die strenge Raumwirkung der geschlossenen, introvertierten Hörsäle als Herz der Anlage. Die formale Einheit der Bebauung wird durch die prinzipielle Materialzuordnung unterstützt. Innerhalb eines einheitlichen Formen- und Detailrepertoires entwickelt sich eine lebendige Vielfalt, die inspirierende Studienbedingungen von hoher Qualität schafft. (KBK)

#### **Schulstadtbücherei Arnberg – Germany 2005**

Der Schulstadtbücherei nähert man sich über eine schmale Treppenanlage die geradewegs auf einen farbigen Buchrücken zielt. Die „Buchtür“ führt den Nutzer auf die ehemalige Schulbühne der Aula. Der Bereich stellt nun den Empfang dar, hinter diesem befinden sich die Büros für die Verwaltung. Von der Bühne aus erlebt man die Bücherei in ihrem ganzen Ausmaß, von hier aus kann man sich orientieren. Die Buchregale bilden das Zentrum und sind auf einem „roten Band“, welches sich konsequent durch den Raum zieht, linear und ansteigend, arrangiert. Rechts und links des Bandes befinden sich die Hauptlaufwege mit den notwendigen Funktionsbereichen (Leseplätze, Garderoben, Buchrückgaben, Kopierer, Neuerscheinungen, Sonderthemen). Die Decke nimmt das „rote Band“ gestalterisch auf. Vorhandene Sichtbeziehungen und Sichtachsen, ermögliche eine leichte Orientierung, die zudem durch eine abgestimmte Typographie und Grafik Unterstützung erfährt. Farbflächen definieren Raumübergänge und Wege. Das Selbstlernzentrum auf der Empore, ist räumlich wie ein Hörsaal aufgebaut. Es ist Bestandteil des Gesamtkonzeptes und unterscheidet sich gestalterisch nicht. Jeder einzelne Bereich des Gesamtkonzeptes „Schulstadtbücherei“, sei es der Empfang, die Büchereiebene, der variable Aufenthaltsbereich, die Cafeteria, der Lesehof oder auch das Selbstlernzentrum, repräsentiert vorrangig die Kommunikation zwischen Menschen jeden Alters. Die Grundidee der Innenarchitektur ist dabei eine übergeordnete Transparenz und Weite. (Keggenhoff)

The basic concept of interior design is a high degree of transparency. A sense of vastness, space and effortlessness is designed to make spending time in a library, in a self-access learning centre, an enjoyable experience. The use of intense colours creates an upbeat atmosphere. The Schulstadtbücherei is approached via a narrow set of stairs that lead straight to a colourful book spine. With its narrow, vertical opening, the 'book door' symbolises the so-called 'refilling of the shelves' when a book is returned by the reader. Users are guided to the 'stage'. The area that was once a stage is now the reception, behind which lie the administrative offices. The stage is a place where visitors experience the full magnitude of the library and where they can get their bearings. The feeling of being at eye level with the approximately 30,000 media units is designed to inspire and encourage users to rise to the challenge. The shelves constitute the central point and form a 'red band' that runs through the space in a consistent, linear, rising and arranged contour. To the right and left of the band are the main walkways, with the corresponding functional areas. These include: reading desks, cloakrooms, book return points, photocopiers, new releases, special topics, features and so on. These flanking functional areas are essential to guarantee a seamless flow of use. The ceiling creatively borrows the 'red band' and forms a 'room with a room'. Visual links and centre points help the user to find his bearings, aided by coordinated typography and graphic art. Panels of colour define the transitions between areas and routes. The self-access learning centre in the gallery is set out like an auditorium. It forms part of the overall concept and has the same creative feel. Each individual area of the 'Schulstadtbücherei' overall concept, whether it be the reception, the library section, the fluctuating public area, the cafeteria, the reading area or the self-access learning centre, primarily represents communication between people of all ages. One of the driving forces behind this interior design composition was to make this 'place of knowledge' a popular destination because of its atmosphere. Our aim with the space was to generate enthusiasm, motivation, surprise and inspiration. The key objectives for the design shown here were:

1. To maintain and increase competitiveness.
2. To create a uniform image.
3. To develop essential flexibility within a skeletal structure.
4. To produce an ambience that would motivate the staff.
5. To create a hotspot for students, citizens and friends of the town of Arnberg.

In short:

We have provided, on behalf of the town and the school, the spatial platform and spatial quality to ensure that future activities on this site are successful and can be focused on specific target groups. (<http://www.architonic.com>)

## **KGB Architekten (Kirchmeier, Graw, Brück), Weimar – Germany**

### **Libraries:**

#### **Nietzsche Dokumentationszentrum, Naumburg a.d. Saale – Germany 2008 – 2010**

Bauherr: Stadt Naumburg, € 3.000.000

Am 6. Oktober 2001 wurde in Naumburg (Sachsen-Anhalt) der Wettbewerb für den Neubau eines Nietzsche-Dokumentationszentrums entschieden. Die Jury unter Vorsitz des Leipziger Professors Ingo Andreas Wolf wählte folgende Preisträger aus:

1. Preis (24.000 Mark): Kirchmeier Graw Brück Architekten, Weimar
2. Preis (18.000 Mark): Becher + Rottkamp Architekten, Berlin
3. Preis (12.000 Mark): Prof. Fischer, Fischer, Fromm & Partner, Berlin

#### 4. Preis (6.000 Mark): Konermann Pawlik Siegmund Architekten, Hamburg

Der drei Millionen Mark teure Neubau wird die in den USA erworbene Bibliothek des Nietzsche-Gelehrten Richard F. Krummle beherbergen. Das Gebäude soll auf dem Nachbargrundstück des als Museum genutzten historischen Wohnhauses Friedrich Nietzsches in Naumburg errichtet werden. Der Siegerentwurf des jungen Weimarer Büros KGB Architekten (Mathias Kirchmeier, Karsten Graw, Sabine Brück) sieht einen klaren solitären Baukörper vor, der keine direkten Beziehungen zum Kontext knüpft. Entworfen als "reine Struktur", ist das dreigeschossige Gebäude im unteren Bereich geschlossen; unter dem Dach bietet eine zum Himmel, zu den Seiten und zu den anderen Geschossen geöffnete Vortrageebene den Blick über die Altstadt. Nach Aussage der Architekten ist dieser verglaste Raum „der Sprache gewidmet“. Ein abgetrennter Besprechungsräum auf gleicher Höhe richtet den Blick gen Nietzsches Balkon am Nachbarhaus. Die eigentliche Sammlung ist im "Kern" des Hauses untergebracht, einem introvertierten Haus-im Haus, in dem die Exponate gelagert und ausgestellt werden. (<http://www.baunetz.de>)

Am Rande der Altstadt von Naumburg in Sachsen-Anhalt steht ein zweigeschossiges hellgelbes Eckhaus mit dunkelgrünen Fensterläden und spätklassizistischer Fassade. Dort verbrachte der Philosoph Friedrich Nietzsche (1844-1900) zum Teil seine Kindheit und Jugend. Später, in den Jahren zwischen 1890 und 1897, pflegte seine Mutter Franziska den geistig Umnachteten in dem Haus. Auf dem un bebauten Grundstück nebenan wird dem Philosophen nun ein Neubau gewidmet. In der Glas-Holz-Konstruktion entsteht ein Nietzsche-Dokumentationszentrum. «Wir planen, dass wir das Gebäude im Frühjahr 2010 übergeben werden», sagt der Naumburger Oberbürgermeister Bernward Küper (CDU). Anfang Oktober sollen die Hochbauarbeiten beginnen. Die Kosten von rund drei Millionen Euro tragen die Kommune, das Land und zum überwiegenden Teil die Europäische Union. In einem Architekten-Wettbewerb gewann schon im Jahr 2001 der Entwurf des Weimarer Büros Kirchmeier Graw Brück. «Aber erst jetzt können wir den Bau realisieren, weil der Stadt damals nicht genügend Fördergelder zur Verfügung standen», sagt Küper. Im Keller des Nietzsche-Dokumentationszentrums sollen Magazinräume entstehen. Das Erdgeschoss wird einen Besucherbereich beherbergen und mit Platz für Ausstellungen und Lesungen. Arbeitsräume für Wissenschaftler, Studenten und andere Besucher sowie Büros entstehen in der ersten Etage. Die inhaltliche Arbeit des Zentrums wird die Friedrich-Nietzsche-Stiftung übernehmen, die diesen Sonntag gegründet werden soll. «Vom benötigten Kapitalstock von rund drei Millionen Euro sind 50 000 Euro beisammen, das ist für den Anfang ausreichend», sagt Ralf Eichberg, Vorsitzender der im Jahr 2004 gegründeten Stiftungsinitiative. Die Stiftung soll aus einem die geschäftsführenden Direktorium und einem gewählten Beirat als Kontrollgremium bestehen. Die Arbeit der Mitglieder, die aus Politik, Kultur und Wissenschaft stammen, ist ehrenamtlich. «Eine Aufgabe ist es, die Nietzsche-Stätten in Sachsen-Anhalt, zu denen auch Röcken als Geburtsort des Philosophen gehört, touristisch besser zu vermarkten», erläutert Eichberg. Daneben solle das Dokumentationszentrum ein Anziehungspunkt für Wissenschaftler und für die Öffentlichkeit sein. So seien Tagungen, Vorträge, Veranstaltungen für Schulklassen und Lehrer-Weiterbildungen geplant. Kernstück ist die von der Stadt Naumburg angekaufte Bibliothek des US-amerikanischen Germanisten Richard Frank Krummel. «Es ist die vermutlich größte private Sammlung zur Nietzsche-Rezeption im 20. Jahrhundert», sagt Eichberg. Seit 1946 habe Krummel rund 7000 Bände und unzählige Zeitungsartikel aus dem deutschsprachigen Raum zusammengetragen, die sich mit Leben und Werk des Philosophen auseinandersetzen. «Es ist vorgesehen, dies um Filme, Tonträger, Kunstwerke und neue Medien zu erweitern», sagt Eichberg. (<http://www.mz-web.de>)

### **Kister Scheithauer Gross ksg-architekten, Köln-Leipzig – Germany**

<http://www.ksg-architekten.de>

#### **Libraries:**

#### **Wirtschafts- und Sozialwissenschaftliche Fakultät, Erweiterungsbau (Bibliothek), Universität zu Köln – Germany 2016**

kister scheithauer gross architekten und stadtplaner (ksg) sind mit dem Erweiterungsbau der Wirtschafts- und Sozialwissenschaftlichen Fakultät der Universität zu Köln beauftragt.

Als innerstädtische Campusuniversität im Westen Kölns ist die Hochschule eingebettet in ein gewachsenes und dichtes städtebauliches Umfeld. Südlich des Planungsgebiets liegt das Hauptgebäude der Universität. Westlich wird das Grundstück von der stark befahrenen Universitätsstraße begrenzt. Auf der Ostseite befindet sich das eingeschossige, denkmalgeschützte Riphahn-Gebäude der WiSo-Fakultät. Im Norden grenzt das Hochhaus, ebenfalls von Wilhelm Riphahn, an, eines der ersten Erweiterungsbauten der Universität zwischen 1956 und 1960.

Ziel des VOF-Verfahrens war es, eine angemessene denkmalpflegerische Lösung für Fassade und Grundrisse zu erhalten, die auf umfangreichen Voruntersuchungen für Form und Lage des Gebäudes beruht.

Der Entwurf von ksg setzt dabei auf drei Schwerpunkte bei der Weiterentwicklung der Studie. Erstens: die architektonische Ausformung des Erdgeschosses und der Fuge zwischen Alt- und Neubau. Zweitens: die Ausbildung einer Silhouette bzw. Relieffierung der Kubatur. Drittens: die Materialisierung des Neubaus in Bezug auf den Riphahn-Bau.

Die Gestaltung der Fuge zwischen Alt- und Neubau ist von großer räumlicher Bedeutung. Nach den Plänen von ksg entsteht eine freie Durchblickzone entlang des Altbaus, nur unterbrochen von gläsernen Verbindungen. Im Zusammenspiel mit verglasten Loggien entstehen wettergeschützte Bereiche, die als Pausenflächen für die Seminarräume dienen.

In der Erdgeschosszone bleiben die Durchblicke auf den Altbau bestehen. Ein zweiter „Haupteingang“ nimmt aus der Richtung des Albertus-Magnus-Platzes den Publikumsstrom auf und ist dem bestehenden Haupteingang dialektisch entgegengesetzt. Die Rhythmisierung der Fassade nimmt Bezug auf den Altbau von Riphahn sowie dessen Typologie der Addition. Die Materialität ist zweigeteilt. Im Erdgeschoss eine Verkleidung aus Betonfertigteilen, die sowohl robust ist als auch die konstruktive Aufständigung materialmäßig begleitet und homogen erscheinen lässt. Die aufgehenden Geschosse werden als Referenz dem Riphahn-Gebäude gegenüber mit bräunlich-lehmfarbenen Ziegel verkleidet.

Prof. Johannes Kister erläutert: „Eine ruhige vertikale Struktur lässt das Gebäude so selbstverständlich wie möglich wirken, es steht in Bezug zu dem Riphahn-Bau und will durch Reduktion und Bescheidenheit den Bestand nicht übertrumpfen.“ (Kister)

#### **Stadtbibliothek Leipzig, Umbau – Germany 2012**

#### **Literature:**

Scholl, Heike, Birgit Spazier, Abenteuer Sanierung, in: BuB. Forum Bibliothek und Information, 2, 2013, pp. 140-142

Bauherr Stadt Leipzig Stadtbibliothek Leipzig, 7 100 m<sup>2</sup> Nutzfläche, 9 300 m<sup>2</sup> Nettofläche, € 14.000.000

Das so genannte Alte Grassmuseum in Leipzig, erbaut 1894-97 von Hugo Licht (\*21.02.1841 Niederzedlitz – 28.02.1923 Leipzig, Neues Rathaus Leipzig 1899 – 1905), ist schon seit 1927 kein Museum mehr. Seit 1990 dient es als Hauptstelle der Stadtbibliothek Leipzig. Soeben wurde es zwei Jahre lang durch die Leipziger Niederlassung des Büros kister scheithauer gross saniert und

umgebaut. „Diese Bibliothek hat Sichtbarkeit“, stellte die Festrednerin Rita Süßmuth während des Festaktes zur Einweihung Ende Oktober 2012 fest.

Im Rahmen der Umbauarbeiten wurden die Fassaden saniert, die Funktionen des Hauses neu geordnet sowie Eingangsbereich und Oberlichtsaal neu gestaltet. Bei den dafür durchgeführten Abrissarbeiten kamen unerwartet historische Strukturen zum Vorschein – konstruktive, aber auch dekorative wie die historische Ausmalung von Kappendecken. „Es galt, die Spuren des Architekten Hugo Licht zu berücksichtigen und die Innenräume des früheren Museums für Kunsthandwerk mit dem modernen Bibliotheksbetrieb zu vereinen“, so die Architekten.

Durch die Modernisierung entspricht das Gebäude den heutigen Anforderungen an eine Bibliothek: Selbstverbuchung, Benutzung auch während der Nachtzeiten sowie Print-on-Demand sind jetzt möglich. Die Bibliothek erwartet eine Million Besucher im Jahr. Die Umbaukosten lagen bei knapp 15 Millionen Euro. Baunetz 14.11.12 (<http://www.baunetz.de>)

#### Projekt

Sanierung und Modernisierung der Stadtbibliothek

Leipzig / Deutschland, 2012

#### Beschreibung

Leipzig, 13. November 2012 – Die Sanierung und Modernisierung der Stadtbibliothek Leipzig nach den Plänen von Kister Scheithauer, grossarchitekten und stadtplaner (ksg) ist abgeschlossen.

Das denkmalgeschützte Gebäude am Wilhelm-Leuschner-Platz in Leipzig wurde als Museum für Kunsthandwerk in den Jahren 1894 bis 1897 durch den Leipziger Stadtbaumeister Hugo Licht errichtet. Nach beträchtlichen Kriegsschäden wurde der Bau mit geringen Mitteln repariert und in den Jahren von 1950 bis 1990 als Bürogebäude genutzt. Darauf folgte die Nutzung als Hauptstelle der Städtischen Bibliotheken.

Mit dem nun abgeschlossenen Umbau und der Sanierung des Gebäudes gehen eine völlig neue funktionale Ordnung und eine angemessene Gestaltung des Eingangsbereiches sowie des Oberlichtsaales einher. Der behindertengerechte Zugang erfolgt fortan über den Haupteingang.

Steffen Kühn, Architekt und ksg-Geschäftsführer, erläutert das Konzept der Sanierung: „Ein Baudenkmal wie dieses zu sanieren und umzubauen, ist eine besondere Aufgabe. Überaus spannend im Abriss, als sich unerwartete historische Strukturen zeigen – konstruktive aber auch dekorative – wie die historische Ausmalung von Kappendecken. Es galt, die Spuren des Architekten und Stadtbaudirektors Hugo Lichts zu berücksichtigen und die Innenräume des früheren Museums für Kunsthandwerk mit dem modernen Bibliotheksbetrieb zu vereinen. Glücklicherweise dienen beide Nutzungen, sowohl die ehemalige als Museum wie auch die neue als Bibliothek, der Kommunikation von Menschen. Ein Aspekt, der die Transformation ungemein erleichtert und insbesondere im Eingang und der Treppenhalle gut erlebbar ist.“

Neben der Sanierung der historischen Fassaden, insbesondere der reich geschmückten Nordfassade, wurden die vorhandenen historischen Strukturen im Inneren freigelegt und saniert. Durch die Modernisierung entspricht das Gebäude den heutigen Anforderungen an eine Bibliothek: Selbstverbuchung, Benutzung auch während der Nachtzeiten, sowie Print-on-Demand sind jetzt möglich.

„Diese Bibliothek hat Sichtbarkeit“ lobt die Festrednerin Rita Süßmuth während des Festaktes zur Einweihung am 26.10.2012. „Sie haben für eine Farbe und ein Design gesorgt, die einladen“, so die ehemalige Bundestagspräsidentin.

Ein modernes Dienstleistungsgebäude und ein Ort der Wissensermittlung werden die ca. 1 Mio. Besucher pro Jahr in die Lage versetzen, im ehemaligen Grassmuseum den kompletten Service einer öffentlichen Bibliothek optimal zu nutzen.

#### Staatliche Studienakademie (Berufsakademie Sachsen) / Evangelische Hochschule für Soziale Arbeit, Dresden Germany 2011

Ein neuer Campus im Herzen von Dresden – prägnante öffentliche Gebäude prägen den Sachsenplatz vis-à-vis der Albertbrücke. In Fortsetzung der Kunstakademie ist das Gelände der historischen, 1861 gegründeten Städtischen Gewerbeschule, in den letzten 5 Jahren zu einem Areal für die Staatliche Studienakademie Sachsen und die Evangelische Hochschule für Soziale Arbeit umgestaltet worden. Der Entwurf für den Neubau reagiert auf die Stadtstruktur – ein markanter Solitär schafft den Abschluss des Campus, das Karree wird zur Gerokstraße geschlossen. Es entsteht ein ruhiger Innenhof – das Herz des neuen Campus. Der Neubau ist eine Schichtung aus drei unterschiedlichen Funktionen: Im Erdgeschoss befinden sich Werkstätten und Labore des Instituts für Holzverarbeitung, große Raumhöhen und komfortable Andienmöglichkeiten bestimmen den Charakter. Über das offene Treppenhaus erreicht man die Mensa und Cafeteria des Areals, eine nach Süden zum Hof ausgerichtete Terrasse schafft Möglichkeiten des informellen Campuslebens und profitiert von der geschützten Lage. Im 2. Obergeschoss befindet sich die Campusbibliothek – um einen zentralen Innenhof gruppieren sich die notwendigen Funktionen. Die Fassade des Gebäudes besteht aus einer freien Komposition von Öffnungen; Kontrast erhält die Struktur durch dunkle Betonwerksteine und helle Putzflächen. Die Bestandsbauten wurden behutsam saniert und brandschutztechnisch ertüchtigt. Dezentle Töne im Inneren arbeiten die Qualitäten der historischen Bausubstanz heraus. Besondere Bereiche wie die Kapelle für die Evangelische Hochschule für Soziale Arbeit und der große Hörsaal setzen besondere Akzente. Insgesamt sind ca. 2.500 m<sup>2</sup> Hauptnutzfläche im Neubau und ca. 6.600 m<sup>2</sup> Hauptnutzfläche im Altbau entstanden. Die hochwertigen Außenanlagen des Innenhofes mit ihren Sitzmöglichkeiten schaffen Verweilqualität. (<http://www.baunetz.de>)

#### Hochschule „an der Karlsburg“ Bremerhaven. 5. Bauabschnitt (Bibliothek) – Germany 2004 – 2005

Bauherr: Senator für Bildung und Wissenschaft, Bremen, BFG: 6.900 m<sup>2</sup>, € 12.000.000

Ein dreieckiges Grundstück beherbergt den Institutsneubau der Hochschule in Bremerhaven. Konsequenterweise im Norden an die Grundstücksgrenze gesetzt wandelt sich das Gebäude in Richtung Kennedybrücke zu einer bauplastischen Figur. Überraschend öffnet sich hier der winkelförmige Bau mit Rücksprüngen und Faltungen. Aus einer breiten Freitreppe entwickelt sich ein vielschichtiges skulpturales Gebäude, das der hervorgehobene Kopfbau krönt und für die Fernwirkung der Gebäudesilhouette sorgt. Ausgehend vom Eingangsbereich ist in Erd- und 1. Obergeschos die Bibliothek mit Selbstlernbereich, Sprachlabor, Ausstellungsebene, Lese- und Freihandzone angesiedelt. Zudem befinden sich im ersten Geschos Hörsäle sowie größere Seminarräume. Institutsräume nehmen die folgenden Ebenen ein, während Verwaltungsräume im obersten Geschos den Nutzungsabschluss bilden. Neben der reinen Form betont seine homogene Klinkerhaut die skulpturale Wirkung des Neubaus. Ein Torfbrandklinker braun-schwarz-roter Färbung umhüllt das gesamte Gebäude, bekleidet die geneigte Dachfläche des Hörsaals sowie seine Untersicht. Akzentuiert gesetzte Öffnungen unterstreichen den Charakter und gewähren Einblick in das Gebäudeinnere mit seinem lebhaften Farbenspiel. Das Zusammenwirken von städtebaulicher Gestalt und der massiven haptischen Materialität führt zu einem für diesen Ort unverwechselbaren Baukörper. Es entsteht eine langlebige und widerstandsfähige Ziegelskulptur, die sich ins Gedächtnis und die Stadtsilhouette einschreibt. (Kister)

#### MPI (Max Planck Institute) for ethnological research (Library), Halle-Wittenberg – Germany 2002

Direct commission, Client: Frankonia Eurobau AG & Co. KG, BFG: 4.000 m<sup>2</sup>, € 4.700.000

The former manufacturer's mansion with its extensions is set in a lavish park right in the middle of a residential Gründerzeit area. The listed building is a Solitaire and required a special approach for the new building. Consequentially, the new institute building is also defined as a mansion while integrated modestly into the existing urban structure. The cubic building opens itself with floor to ceiling windows towards the original mansion and park. Overhanging structural roof slabs made from black exposed concrete interfere the glass façade, which gives a much lighter impression. Another emphasis within the building is the transition between old and new. The new design uses modern materials in shades of grey while the existing mansion consists of wall panels applying earthy tones. That way, the floral patterns discreetly emerge out of the grey-black backgrounds. The connection between mansion, new library and office building is used as cafe and main entrance and as such forms the integral part of the overall institute. (Kister)

#### **House of Finance, Bibliothek, Goethe Universität Frankfurt am Main – Germany 2008**

„House of Finance“ heißt das fächerübergreifendes Prestigeprojekt der Johann-Wolfgang-von-Goethe-Universität Frankfurt/Main auf dem neuen Campus Westend, für das am 9. Juli 2007 Richtfest gefeiert wurde. Es entsteht nach den Plänen von Kleihues + Kleihues (Jan Kleihues und Norbert Hensel, Berlin), die im entsprechenden Wettbewerb den ersten Preis gewonnen hatten (BauNetz-Meldung zum Wettbewerbsergebnis im Dezember 2004).

Das rund 23 Millionen Euro teure Gebäude mit rund 7.000 Quadratmetern Hauptnutzfläche, fünf Hörsälen und sechs Seminarräumen soll im Frühjahr/Sommer 2008 fertig sein. Rund 130 weltweit vernetzte Wissenschaftler sollen darin über finanzbezogene Themen arbeiten.

Die Architekten erläutern ihren Entwurf: „Insbesondere die Tektonik des IG-Farben-Ensembles von Poelzig, die Ausprägung des Sockels zur Stadt, die geschlossenen Gebäudeecken und die plastische Herausarbeitung der Öffnungen aus dem monolithisch wirkenden Baukörper bilden im Zusammenhang mit der Risalitwirkung der Kammstruktur das Leitbild für die Entwurfsplanung zum House of Finance. Das House of Finance erhält zum tiefer liegenden Grüneburgpark einen ausgeprägten und durch seine größeren Steinformate betont hervorstechenden Sockel, der zum höher liegenden Plateau des zentralen Campusgeländes aufgrund des Geländeversprungs entfällt.

Das House of Finance folgt der zuvor beschriebenen Leitidee: Hierbei bilden die grundrisslichen Gebäudeknoten betonte Fassadenrisalite, welche durch die geschlossenen Gebäudeecken zusammen mit der überhöhten Attika die Fernwirkung des Poelzig-Baus aufgreifen. Diese Entwurfsphilosophie ist auch in Poelzigs Haus des Rundfunks in Berlin ablesbar.

Das neue Institutsgebäude wird als Lochfassade aufgefasst, wobei die Seitenrisalite mit schmalen zweiachsigen Fensterelementen vertikal betont sind. Die Rahmung des Volumens wird durch eine Schattenfuge hervorgehoben.

Die Materialität des Neubaus sollte sich in einer Bandbreite von Cannstatter Travertin des Poelzig-Baus bis zum Trosselfels darstellen. Besonderer Wert wird darauf gelegt, die Farbigkeit des Poelzig-Baus nicht zu übertreffen.“ Bauentz 12.07.2007

#### **Museum of Labor and Industry “Eugenio Battisti”, Library, Brescia – Italy 2008 – 2010**

Client Comune di Brescia, Italy, Competition 2004, 1st Prize, Architects Jan Kleihues and Klaus Schuwert, Conversion and extension of former steel works premises into a museum Planning 2004, Gross floor area 15.000 m<sup>2</sup>, Building costs € 25 Mio.

Das Thema des Entwurfs entwickelt sich aus der Gegenüberstellung des Ortes mit den Funktionen eines Museums: der auf Schnelligkeit und pure Nützlichkeit angelegten Produktionsanlage steht die dauerhafte und von einem reinen Funktionsanspruch losgelösten Institution des Museums gegenüber. An der südlichen Stirnseite des Komplexes ist die Eingangshalle geplant, ein Turm an der Südwestecke markiert den Haupteingang. Die Werkstätten sind innerhalb der ständigen Ausstellung in einer Art Glasvitrine untergebracht, durch die man die Instandhaltung und Restaurierung der Maschinen betrachten und die Räume im Sinne einer offenen Werkstatt auch betreten kann. Bibliothek und der Lesesaal des Museums sind so angeordnet, dass sie durch eine Glaswand getrennt sowohl unabhängig von einander, als auch mit einem einzigen Zugang gemeinsam betrieben werden können. Der Bestand wird restauriert und nur wo nötig durch geringfügige Maßnahmen verändert. Die Struktur des gegenüber liegenden Walzwerks soll in seinem jetzigen Zustand erhalten bleiben. Der Raum zwischen Museumsgebäude und Walzwerk ist als lange Piazza angelegt. (Kleihues)

#### **„Haus der Bildung“, Bonn – Germany 2008 - 2011**

competition 2009 1st prize, € 11.000.000, BGF 10.290

Aufgabe des Wettbewerbs war es, mit der Umnutzung des denkmalgeschützten “Alten Stadthaus” zum “Haus der Bildung” einen räumlichen Zusammenschluß für die Bonner Stadtbibliothek und VHS zu schaffen. Der Entwurf sieht dafür zwei größere Maßnahmen vor. Für die Außenwahrnehmung wird ein neues Entreegebäude geschaffen: das benachbarte Siemenshaus wird abgerissen und durch ein repräsentatives Eingangsgebäude ersetzt. Der verwahrloste Mühlheimer Platz wird aufgewertet und ein barrierefreier Zugang zum “Haus der Bildung” geschaffen. Für die Innenwahrnehmung entsteht ein großer geschossübergreifender

Les- und Lichthof, um den sich Stadtbibliothek und VHS gruppieren. Die ehemaligen Flure werden zu erlebbaren Galerien, die gegenseitige Ein- und Ausblicke zulassen und die Nutzungen in den Obergeschossen um den Lichthof miteinander verbinden. (Kleyer)

Auf sensible Art fügt sich die Bücherei in den verwinkelten Ortskern von Kemnat ein und behauptet doch ihre Autonomie. Sie greift Charakteristiken der Umgebung auf, um sie in einem nächsten Schritt selbständig weiterzuentwickeln. So reagiert sie zum Beispiel in ihrer Farbgebung auf die nah gelegene Kirche und in ihrer Verputzung auf die Fassaden anderer Gebäude. Großzügige Fensteröffnungen unterstreichen diesen Aspekt der kommunikativen Hinwendung. Gleichzeitig markieren die asymmetrische Setzung der Fenster, der nicht rechteckige Grundriss des Gebäudes sowie die ungewöhnliche Grobkörnigkeit seines Putzes eine signifikante Differenz zur Umgebung, wodurch die Eigenständigkeit seiner Formsprache unterstrichen wird. Im Innern erschließt sich eine leichte Räumlichkeit, die einerseits dem Zweck verbunden, andererseits originell ist. Die gelbliche Farbgebung reagiert erneut auf die Umgebung sowie auf die Fassade, das Außen- und Innenlicht spielen lebendig ineinander und die Raumgestaltung erzeugt vielschichtige Relationen zwischen großzügigen Leseräumen und Nischen des Rückzuges. Hier würde ich mich gerne niederlassen, in Ruhe lesen und gelegentlich das Auge schweifen lassen. (<http://www.bda-bund.de>)

Buck, A. und M.: Neubau Stadtbücherei in Gerlingen, in: Baumetall, Ausgabe 07/ 1998, TFV Stuttgart,

Die Doppelposten der viergeschossig verglasten Längsseiten mit ihren kupferverkleideten Lüftungsflügeln sind charakteristisch für das Gebäude. Die Assoziation an Bücherrücken könnte einen besonderen Hinweis auf den Inhalt des Gebäudes geben. Die Möglichkeit des individuellen Öffnens dieser Flügel führt zu ganz unterschiedlichen Fassadenbildern und macht zusammen mit dem Grün des Kupfers die Unverwechselbarkeit des Gebäudes aus. (<http://www.cooperconcept.org>)

An der Stadtbahn-Endhaltestelle setzt der Neubau der Stadtbücherei städtebauliche Akzente. Der markante Bau bestimmt den neu entstandenen Platz in der Mitte der Stadt. Die Stadtbücherei wurde am 24. April 1998 dem Publikum nach eineinhalb Jahren Bauzeit übergeben. Das Gebäude lebt von der Klarheit des Architektenentwurfs. Es unterscheidet sich - wie auch andere öffentliche Gebäude in Gerlingen - von den Profanbauten der Stadt und ist deutliches Zeichen seiner Entstehungszeit. Die großflächige Glasfassade schafft Transparenz nach innen und außen, so bieten sich von den oberen Stockwerken reizvolle Blicke auf die Stadt. Die Gestaltung der Außenfassade soll Buchrücken simulieren und damit einen Hinweis auf die Nutzung des Gebäudes geben. (<http://www.s.fachstelle.bib-bw.de>)

**Fakultät Bildungswissenschaften Bibliothek, Freie Universität Brixen, Brixen (Bressanone) – Austria 2004**

Der Neubau der Fakultät für Bildungswissenschaften der Universität Brixen besteht aus einem kompakten quadratischen Gebäudekomplex mit den Außenmaßen von 75 x 75 m mit einem dreigeschossigen aufgeständerten äußeren Ring. Vier große Baukörper im Gebäudezentrum bilden den Kernbereich des Gebäudes. In dem gläsernen Ring befinden sich die wesentlichen Seminar- und Verwaltungsräume sowie die Büroräume der Professoren befinden. Der viergeschossige Kernbereich mit den eingeschnittenen Lichthöfen beherbergt Labors, Bibliothek, Gymnastikraum, Aula Magna, Mensa und

Aufenthaltsräume. Der Neubau umfasst inklusive der Tiefgarage eine Bruttogeschossfläche von 23.000 m<sup>2</sup>. Die äußere Fassade besteht aus Sonder-Fensterprofilen mit einer Bautiefe von 90 mm. Innerhalb dieser Kombifassade mit angeordneten Vor- und Rücksprüngen im Versatz von 480 mm, wechseln sich die bündig in der Fassadenebene liegenden transluzenten Glastafeln mit den zurückgesetzten transparenten geschosshohen Glastafeln ab. Die Leibung ist nur als vertikales Verbundprofil in Form eines Parallel-Einstellflügels ohne Rahmen und Glas ausgeführt. Sämtliche Funktionsräume lassen sich natürlich über Fensterklappen be- und entlüften. Die in den seitlichen Rücksprüngen integrierten opaken Lüftungsklappen werden im Sommer zur Nachtkühlung genutzt.

Haustechnik

*Be- und Entlüftung*

Die Räume innerhalb der Kernbereiche werden natürlich über motorisch betriebene Oberlichter be- und entlüftet. Aufgrund der hohen inneren thermischen Lasten (Personenfrequenzierung, Beleuchtung, etc.) wurde eine zusätzliche mechanische Be- und Entlüftungsanlage mit integrierter Rekuperativ-Wärmerückgewinnung errichtet. Die Seminar- und Funktionsräume mit hohen Innenlasten werden mit einem 4-fachen Luftwechsel beaufschlagt. Bei sämtlichen anderen Räumen erfolgt die Lüftererneuerung mit einem 1-fachen Luftwechsel. In der Bibliothek erfolgt die Regelung der Luftmenge in Abhängigkeit von der Personenfrequenzierung geregelt. Für die Aula Magna wurde eine Klimaanlage mit integrierter Wärmerückgewinnung konzipiert, wobei zur Dimensionierung ein Luftwechsel von 25 m<sup>3</sup>/h und Person zugrunde gelegt wurde. Der über Luftqualitätssensoren (CO<sub>2</sub>-Sensor) bedarfsgeführte Luftvolumenstrom wird in Abhängigkeit von der Personenfrequenzierung geregelt. Die Außenluft wird im Winter- und Sommerbetrieb durch einen 200 m langen Luft-Erdwärmeübertrager (teilweise vom Grundwasser umschlossen), vorkonditioniert.

*Heizen und Kühlen*

Die Beheizung und Kühlung der Räume erfolgt über einzelraumgeregelte Fußbodenheizungen im Zusammenspiel mit der unregelmäßigen Bauteilaktivierung (TAD). Diese arbeitet im Heizbetrieb bei einer Außentemperatur unter - 5 °C. Die witterungsgeführte Regelung erfolgt bis zu einer max. Vorlauftemperatur von 27 °C. Bei einer Temperaturdifferenz zwischen dem Vor- und Rücklauf von unter 3 K wird die thermoaktive Decke abgeschaltet. Bei Außentemperaturen über 18 °C arbeitet die thermoaktive Decke mit einer konstanten Temperatur von 16 °C im Kühlbetrieb. Bei Rücklauftemperaturen unter 20 °C wird der Kühlbetrieb abgeschaltet. Zur Kälteenergieerzeugung wird das regenerative Nutzungspotenzial über das Grundwasser genutzt, das über einen Förderbrunnen und Wärmeübertrager an das Kaltwassernetz übergeben wird. Das Gebäude wird über die thermoaktiven Decken, die Fußbodenkühlung, die Luftkühlung der Lüftungsanlagen und über Umluftkühlgeräte für die Serverräume gekühlt. (Kohlmayer)
