Received 22 August 2013; accepted 26 August 2013

Key indicators: single-crystal X-ray study; $T = 173\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.010\text{ \AA}$; disorder in main residue; R factor = 0.048; wR factor = 0.112; data-to-parameter ratio = 15.5.

The title compound, $[\text{FeZr}_2(\text{C}_5\text{H}_5)_4\text{Cl}_2(\text{C}_{13}\text{H}_{18}\text{B}_2)]$, is a heteronuclear complex that consists of a [3]ferrocenophane moiety substituted at each cyclopentadienyl (Cp) ring by a BH_3 group; the BH_3 group is bonded via two H atoms to the Zr atom of the zirconocene chloride moiety in a bidentate fashion. The two Cp rings of the [3]ferrocenophane moiety are aligned at a dihedral angle of $8.9(4)^\circ$ arising from the strain of the propane-1,3-diyl bridge linking the two Cp rings. [One methylene group is disordered over two positions with a site-occupation factor of 0.552 (18) for the major occupied site.] The dihedral angles between the Cp rings at the two Zr atoms are $50.0(3)$ and $51.7(3)^\circ$. The bonding $\text{Zr}\cdots\text{H}$ distances are in the range $1.89(7)$ – $2.14(7)\text{ \AA}$. As the two Cp rings of the ferrocene unit are connected by an *ansa* bridge, the two Zr atoms approach each other at $6.485(1)\text{ \AA}$. The crystal packing features $\text{C}-\text{H}\cdots\text{Cl}$ interactions.

[μ -3,3'-Bis(triethylboranyl)[3]ferrocenophane]bis(chloridozirconocene)

Adelina Reichert, Hans-Wolfram Lerner, Matthias Wagner and Michael Bolte

1. Comment

Recently we have reported on coordination behaviour of mono- and ditopic ferrocenylhydroborates $\text{Li}[\text{FcBH}_3]$ and $\text{Li}_2[\text{fc}(\text{BH}_3)_2]$ toward the $[\text{Cp}_2\text{ZrCl}]^-$ moiety (Fc = ferrocenyl, fc = 1,1'-ferrocenylene, Cp = cyclopentadienyl) (Reichert *et al.*, 2013a). Herein we describe the coordination behaviour of ditopic ferrocenylhydroborate derivative **2** that features an ansa bridge in its ferrocene backbone. The title compound **3** was prepared in a two-step one-pot procedure as shown in Fig. 1. The starting material **1** was synthesized according to a previously reported procedure (Reichert *et al.*, 2013b).

The title compound **3** (Fig. 2) features a heterotrinuclear complex. It contains a [3]ferrocenophane moiety substituted at the cyclopentadienyl rings with two BH_3 groups, which are each bonded *via* two H atoms to the Zr centres of the zirconocene chloride moieties. The $\text{Zr}\cdots\text{B}$ distances show that the two BH_3 residues coordinate in a bidentate fashion to the Zr centres (Edelstein, 1981).

The two cyclopentadienyl rings of the [3]ferrocenophane moiety are not exactly planar but enclose a dihedral angle of $8.9(4)^\circ$ due to the strain of the 1,3-propanediyl bridge linking the two cyclopentadienyl rings. The dihedral angles between the cyclopentadienyl rings at the two Zr centres show almost the same values: $50.0(3)^\circ$ and $51.7(3)^\circ$. The bonding $\text{Zr}\cdots\text{H}$ distances are in the range from $1.89(7)$ Å to $2.14(7)$ Å and the H atoms of the BH_3 groups not bonded to Zr show a $\text{H}\cdots\text{Zr}$ distance of $3.14(7)$ Å and $3.13(8)$ Å. Since the two cyclopentadienyl rings of the ferrocene unit are connected by an ansa bridge, the two Zr centres approach each other to a distance of $6.485(1)$ Å compared to $7.128(1)$ Å in the compound without an ansa bridge (Reichert *et al.*, 2013a). The crystal packing is stabilized by C—H \cdots Cl interactions.

2. Experimental

All reactions and manipulations were carried out under dry nitrogen or argon with carefully dried and degassed solvents, flame-dried glassware and Schlenk or glove-box techniques. Benzene and Et_2O were dried over Na/benzophenone and distilled prior to use.

A solution of $\text{Li}[\text{AlH}_4]$ in Et_2O (1 M , 0.86 ml , 0.86 mmol) was diluted with Et_2O (5 ml) and added dropwise with stirring at -78°C to a solution of **1** (0.242 g , 0.449 mmol) in Et_2O (15 ml). After 30 min , the mixture was allowed to warm to room temperature and stirred for another 1 h . The insolubles were removed by filtration (G4 frit) and washed with Et_2O ($2 \times 5\text{ ml}$). The solvent was removed from the filtrate under reduced pressure and the solid residue was further dried under dynamic vacuum overnight to obtain **2(Et₂O)** as a yellow compound; the amount of Et_2O present in the sample after drying was determined by ^1H NMR spectroscopy. Afterwards, in a glove box, neat solid **2(Et₂O)** (0.113 g , 0.333 mmol) and $[\text{Cp}_2\text{ZrCl}_2]$ (0.292 g , 0.999 mmol) were charged to a flask and suspended in Et_2O (30 ml). The suspension was stirred at room temperature overnight, the red insoluble material was isolated by filtration, washed with Et_2O ($3 \times 10\text{ ml}$) and treated with benzene. LiCl was removed by filtration and the filtrate was slowly evaporated to grow single crystals suitable for X-ray diffraction.

3. Refinement

One methylene group is disordered over two positions with a site occupation factor of 0.552 (18) for the major occupied site. The disordered atoms were isotropically refined. H atoms were located in a difference map, but those bonded to C were geometrically positioned and refined using a riding model with fixed individual displacement parameters [$U(H) = 1.2 U_{\text{eq}}(C)$] and with $C_{\text{aromatic}}-\text{H} = 0.95 \text{ \AA}$ and $C_{\text{methylene}}-\text{H} = 0.99 \text{ \AA}$. The H atoms bonded to B were freely refined.

Computing details

Data collection: *X-AREA* (Stoe & Cie, 2001); cell refinement: *X-AREA* (Stoe & Cie, 2001); data reduction: *X-AREA* (Stoe & Cie, 2001); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *XP* in *SHELXTL* (Sheldrick, 2008); software used to prepare material for publication: *SHELXL97* (Sheldrick, 2008) and *publCIF* (Westrip, 2010).

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
