

Supplement 2
Figure

S2 Fig. Whole Mount In Situ Hybridization (WISH) against *slc20a1a*, transversal sections

WISH was performed at 24 hpf. A shows zfl in lateral view, cranial to left. B-D show transversal sections, dorsal top (*), ventral bottom (**). Dotted line in A show area of section shown in close ups B-D. Compared to S1 WISH staining reaction was stopped much earlier to demonstrate strong expression of *slc20a1a* around cloacal region at this time point of development. In B we see restricted staining to both proximal pronephric ducts (arrows). C and D show expression further caudal.

Scale Bars: A: 250 μm; B: 150 μm; C+D: 100 μm
