

Supplemental Information

**Whole-genome analysis of giraffe
supports four distinct species**

Raphael T.F. Coimbra, Sven Winter, Vikas Kumar, Klaus-Peter Koepfli, Rebecca M. Gooley, Pavel Dobrynin, Julian Fennessy, and Axel Janke

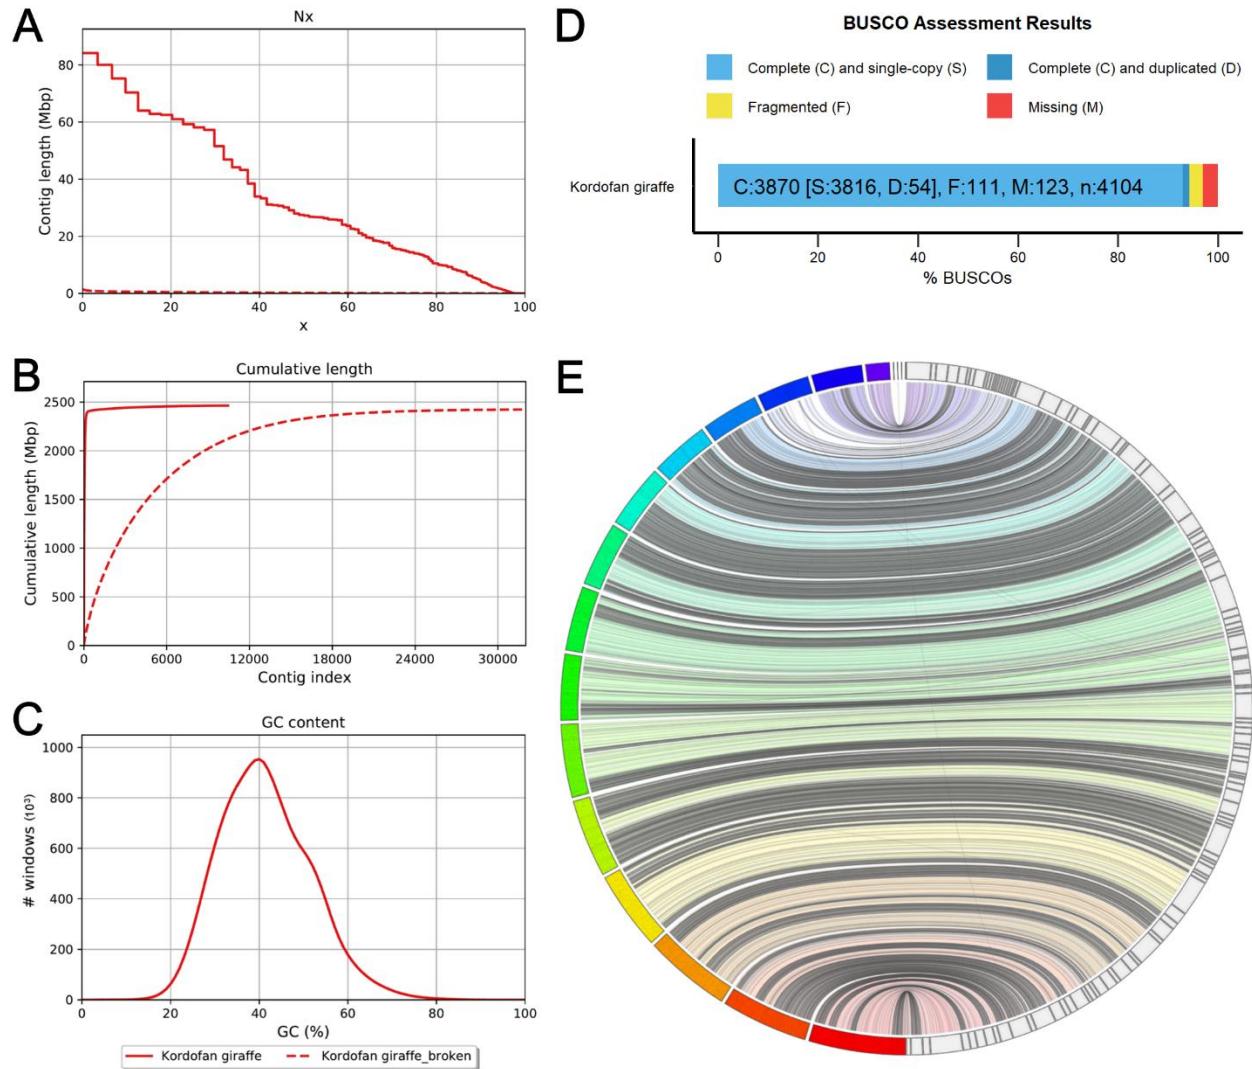

Figure S1. Quality assessment of the Kordofan giraffe genome assembly. Related to STAR Methods.

(A–C) Genome assembly continuity statistics measured as Nx (A) and cumulative length (B), and GC content (C). Plots include values calculated for contigs (dashed line) and scaffolds (solid line). (D) Assessment of genome completeness based on a total of 4,104 mammalian BUSCOs. (E) Genome consistency plot for the alignment of the Kordofan giraffe assembly against the nearly chromosome-length Masai giraffe *s. str.* assembly (<https://www.dnazon.org/>). The Masai giraffe *s. str.* scaffolds are on the left, in color, and the Kordofan giraffe scaffolds on the right, in grey. The assemblies are largely consistent showing only a few split alignments. Only the largest scaffolds that are equal to 95% of the Kordofan giraffe genome assembly length are shown.

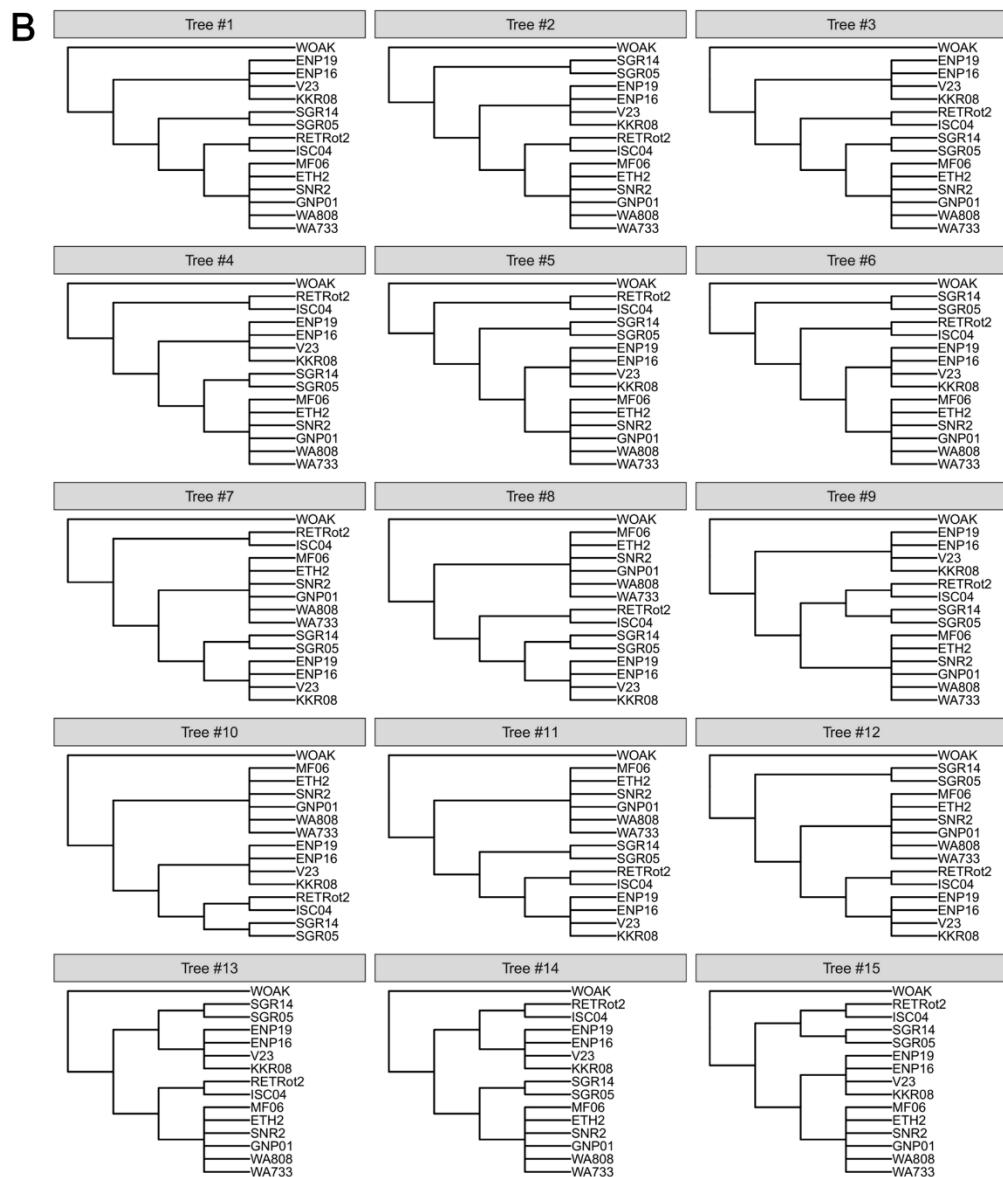

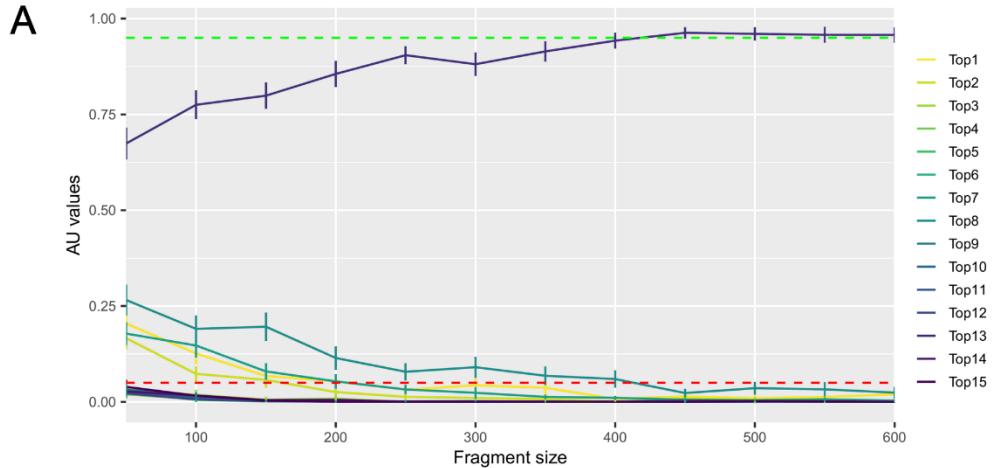

Figure S2. Aproximately unbiased (AU) tree topology test for increasing GF sizes. Related to Figure 2 and STAR Methods. (A) AU test performed for fragment sizes of up to 600 kbp in steps of 50 kbp, with 200 randomly sampled GFs per fragment size. The AU test evaluates if the data can statistically reject ($p_{AU} < 0.05$) alternative tree topologies. Dashed lines mark p_{AU} values of 0.05 (red) and 0.95 (green). Topology 13 was the only one that could not be rejected at fragment sizes ≥ 450 kb. (B) The 15 possible tree topologies for the relationship between the four species of giraffe that were evaluated by the AU test. Each tree includes two randomly sampled individuals per (sub)species. The okapi was used as an outgroup.

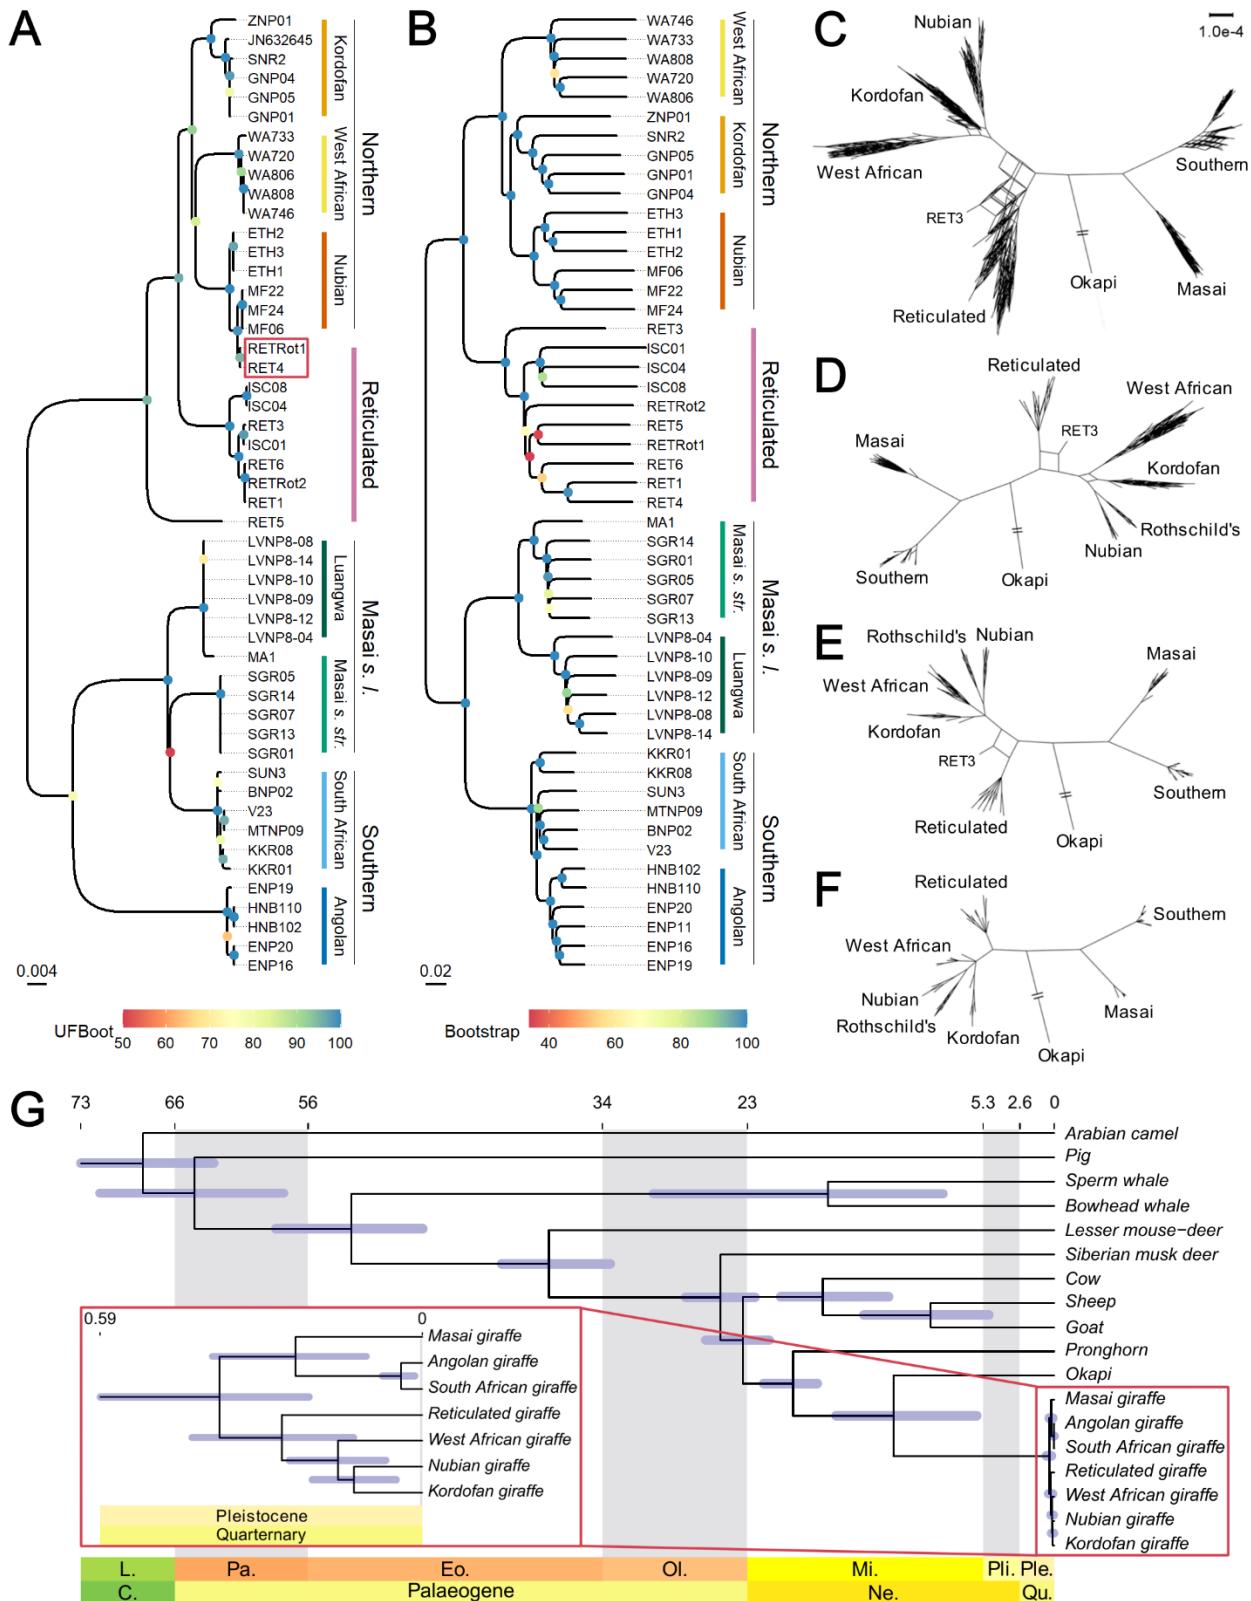

Figure S3. Mitochondrial and nuclear phylogenomics of giraffe and divergence times among Cetartiodactyla. Related to Figure 2. **(A)** Maximum likelihood phylogeny based on 13 mitochondrial protein-coding genes of 50 giraffe individuals. The okapi was used as an outgroup (not shown). Colored node circles indicate ultrafast bootstrap support. Individuals formed clades corresponding to their respective (sub)species with high support (> 99). Different from the nuclear tree is the grouping of South African and Masai giraffe *s. l.* and the placement of the West African giraffe as sister to the Nubian giraffe, although with low support (85). The red frame shows potential reticulated × Nubian giraffe hybrids. **(B)** Neighbor-joining tree based on genotype likelihoods of genome-wide SNPs. The okapi was used as an outgroup (not shown). Colored node circles indicate support values based on 1,000 bootstrapped genetic distance matrices with replacement blocks of 500 SNPs. **(C–F)** Consensus network from 1,068 maximum likelihood GF trees at 5% (C), 10% (D), 15% (E), and 20% (F) minimum thresholds for conflicting edges. The four species of giraffe are discriminated at all thresholds. Reticulations in the network increase at thresholds \leq 15% indicating phylogenetic discordance. The placement of individual RET3 in reticulations between the northern and the reticulated giraffe at thresholds \leq 15% suggests that it is a hybrid. **(G)** Divergence time tree of Cetartiodactyla estimated from 2,127 orthologous sequences (1,496,715 bp). Giraffe and okapi diverged ~12 Ma ago. Northern and reticulated giraffe split from southern and Masai giraffe ~370 ka ago. The divergence between southern and Masai giraffe occurred at ~260 ka ago followed by the split between northern and reticulated giraffe at ~230 ka ago. Node bars represent the 95% highest posterior density (HPD) intervals. A list of the 95% HPD intervals for node ages and the four calibration points used for dating the tree are shown in Table S4.

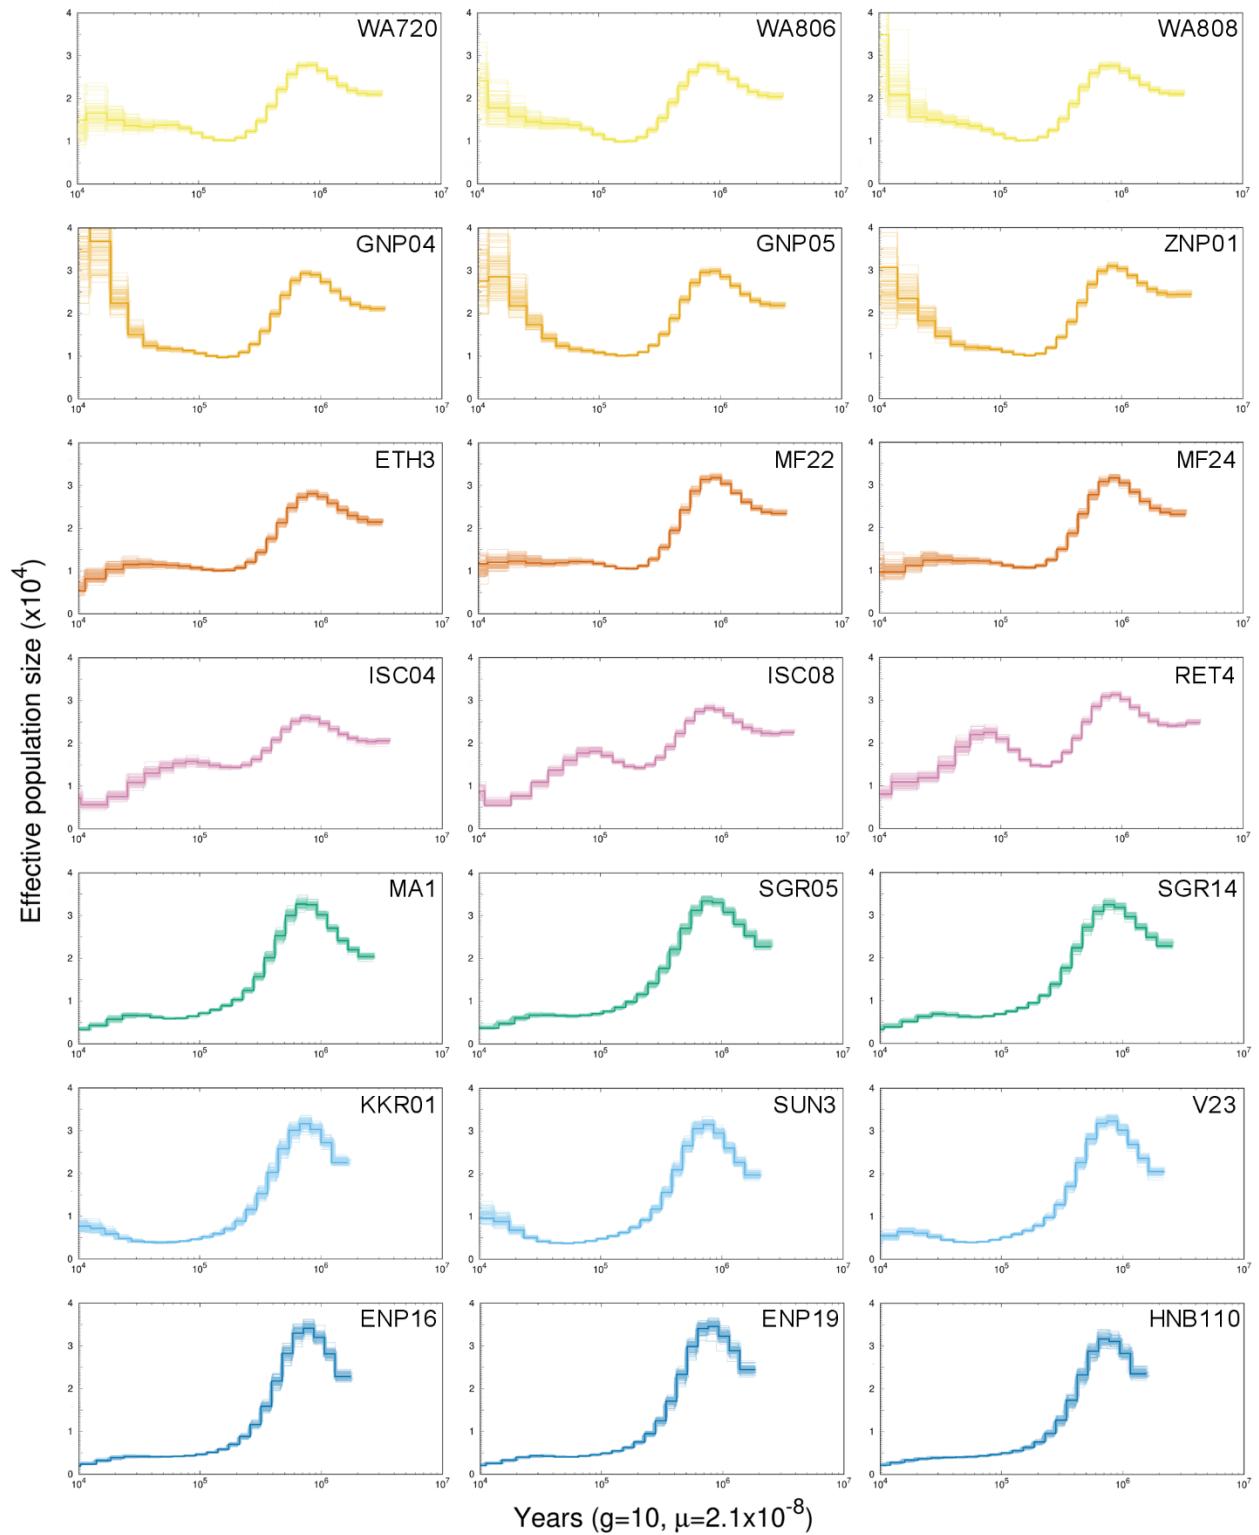

Figure S4. Demographic history of each giraffe individual with 100 bootstrap replicates. Related to **Figure 3.** Changes in N_e through time calculated by PSMC for the three individuals with the best sequencing

coverage per (sub)species. Sample names are given in each panel. Colors follow (sub)species affiliation as in Figure 3. Bootstrap replicates (light colored lines) show little variation in the data, except for West African and Kordofan giraffe individuals towards the more recent past indicating a potential artefact of the method. μ : mutation rate; g : generation time.

Family	Count	Length (bp)	Assembly length (%)
DNA	336,027	59,522,517	2.40
LINEs	1,257,542	633,147,039	25.69

Masai giraffe	<i>G. tippelskirchi</i>		This study; sample SGR05.
South African giraffe	<i>G. giraffa giraffa</i>		This study; sample V23.
Angolan giraffe	<i>G. g. angolensis</i>		This study; sample ENP16.

Table S3. List of Cetartiodactyla species used for orthology search and divergence time analysis.

Related to STAR Methods. Common names, scientific names, accession numbers, and source databases of downloaded sequences.

Tree node	Node ages (Ma)		Calibrated nodes	
	Mean	95% HPD	Age (Ma)	Refs.
Cetartiodactyla	68.39	63.08–73.05	63–73	[S3]
Pig + Cetruminantia	64.52	57.84–71.62		
Cetruminantia	52.76	47.39–58.44	47–58.75	[S4]
Cetacea	16.96	8.35–30.09		
Ruminantia	37.92	33.31–41.48	33–41.25	[S5]
Pecora	25.05	22.46–27.69		
Bovidae + Pronghorn/Giraffidae	23.37	21.38–26.17		
Bovidae	17.37	12.43–20.54		
Caprinae	9.28	4.89–14.29		
Pronghorn + Giraffidae	19.60	17.78–21.81	18–22.5	[S6]
Giraffidae	12.07	5.81–16.37		
<i>Giraffa</i>	0.37	0.21–0.59		
Northern giraffe + reticulated giraffe	0.26	0.12–0.42		
West African giraffe + Kordofan/Nubian giraffe	0.15	0.07–0.24		
Kordofan giraffe + Nubian giraffe	0.12	0.05–0.20		
Masai giraffe + southern giraffe	0.23	0.10–0.38		
South African giraffe + Angolan giraffe	0.04	0.01–0.07		

Table S4. List of the 95% highest posterior density (HPD) intervals obtained for splits within Cetartiodactyla and the four calibration points used for the divergence time analysis. Related to **Figure S3 and STAR Methods.** Node age estimates are in million years ago (Ma).
