

Dichloridobis(di-*tert*-butylmethylphosphine oxide- κ O)diphenyltin(IV)

Manuela Müller, Hans-Wolfram Lerner and Michael Bolte*

Institut für Anorganische Chemie, J. W. Goethe-Universität Frankfurt, Max-von-Laue-Strasse 7, 60438 Frankfurt/Main, Germany

Correspondence e-mail: bolte@chemie.uni-frankfurt.de

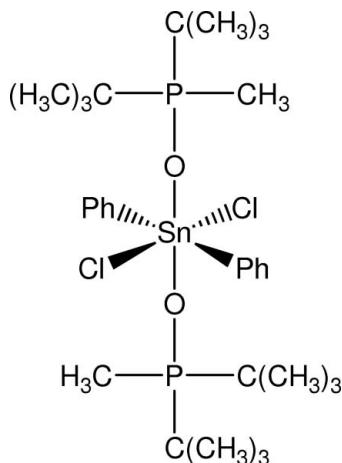

Received 8 May 2008; accepted 8 May 2008

Key indicators: single-crystal X-ray study; $T = 173$ K; mean $\sigma(\text{C}-\text{C}) = 0.012$ Å; R factor = 0.058; wR factor = 0.099; data-to-parameter ratio = 18.6.

The complete molecule of the title compound, $[\text{Sn}(\text{C}_6\text{H}_5)_2\text{Cl}_2(\text{C}_9\text{H}_{21}\text{OP})_2]$, is generated by crystallographic inversion symmetry, the Sn atom is located on a special position of site symmetry $\bar{1}$. The Sn atom adopts an all-*trans* $\text{SnC}_2\text{O}_2\text{Cl}_2$ octahedral geometry. As a consequence of the bulky substituents at the O atom, the P–O–Sn bond angle is 163.9 (3)°.

Dichloridobis(di-*tert*-butylmethylphosphine oxide- κO)diphenyltin(IV)

M. Müller, H.-W. Lerner and M. Bolte

Comment

We are interested in Lewis-acidic Sn(IV) compounds and their reactivity towards Lewis bases. Recently we have reported the synthesis and structure of $\{\text{Zn}[\text{Sn}(\text{CH}_2\text{SMe})_4]0.5\text{Cl}_2\}_n$ and $\text{Sn}(\text{CH}_2\text{PPh}_2)_4$ (Ruth *et al.*, 2007). In contrast to $[\text{SnCl}_4]\cdot[\text{CH}_3\text{SCH}_3]_2$ which forms an adduct in solid state with a six-coordinated Sn atom (Ruth *et al.*, 2005), the Sn(IV) centers in $\{\text{Zn}[\text{Sn}(\text{CH}_2\text{SMe})_4]0.5\text{Cl}_2\}_n$ and $\text{Sn}(\text{CH}_2\text{PPh}_2)_4$ are tetra-coordinated. However, Me_3SnCl forms an adduct with Me_3SnOH and H_2O in which the Sn atoms possess the coordination number five. It is interesting to note that this adduct represents an intermediate in Me_3SnCl hydrolysis (Lerner *et al.*, 2005). We report here the X-ray crystal structure analysis of the title adduct $[\text{Ph}_2\text{SnCl}_2]\cdot[\text{tBu}_2\text{MePO}]_2$, (I). The synthesis of (I) was achieved by treatment of Ph_2SnCl_2 with two equivalents of tBu_2MePO as indicated in the equation below.

Compound (I) has crystallographic inversion symmetry with just half a molecule in the asymmetric unit. The Sn atom is hexacoordinated by three pairs of different ligands in an octahedral fashion (Table 1). All ligand pairs of the same kind are mutually *trans* at the Sn atom (Fig. 1). As a consequence of the bulky substituents at the O atom the P—O—Sn angle is enlarged to 163.9 (3)°.

Experimental

tBu_2MePO (2.05 mmol) was added with stirring at ambient temperature to a solution of Ph_2SnCl_2 (0.58 mmol) in 25 ml THF. Colourless blocks of (I) were grown by storing this solution at room temperature for several weeks.

Refinement

The H atoms were geometrically positioned ($\text{C}—\text{H} = 0.95\text{--}0.98\text{\AA}$) and refined as riding with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ or $1.5U_{\text{eq}}(\text{methyl C})$.

Figures

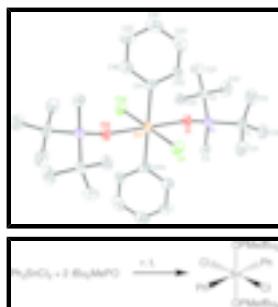

Fig. 1. Perspective view of (I) with displacement ellipsoids drawn at the 50% probability level; H atoms are omitted for clarity. Symmetry operator for generating equivalent atoms: (A) $1 - x, 1 - y, 1 - z$.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.058$	H-atom parameters constrained
$wR(F^2) = 0.098$	$w = 1/[\sigma^2(F_o^2) + (0.0102P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.88$	$(\Delta/\sigma)_{\text{max}} < 0.001$
3145 reflections	$\Delta\rho_{\text{max}} = 0.44 \text{ e \AA}^{-3}$
169 parameters	$\Delta\rho_{\text{min}} = -0.83 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
