Supporting Information contents:

Figure S1: Analysis of protein purity by SDS-PAGE and SEC – single module acceptors

Figure S2: Analysis of protein purity by SDS-PAGE and SEC – covalent fusion acceptors

Figure S3: Analysis of protein purity by SDS-PAGE and SEC – DEBS M1 and its derivatives

Figure S4: LC-MS analysis of products produced by bimodular chimeric PKSs newly generated in this study.

Table S1: Plasmids and primers used in this study

Table S2: Amino acid sequences of proteins used in this study

Table S3: Yields of proteins used in this study

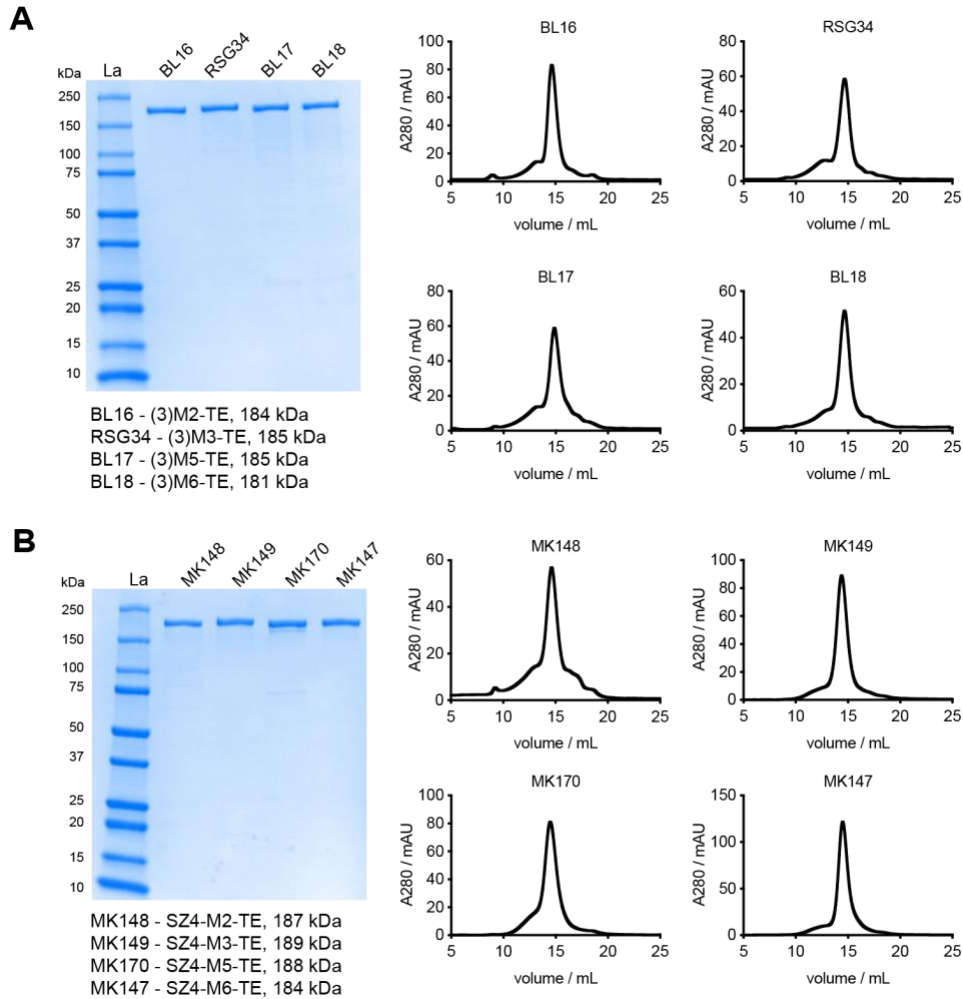

Figure S1. Analysis of protein purity by SDS-PAGE and SEC – single module acceptors. Acceptor proteins harboring a DEBS docking domain (A), and in comparison, a SZ domain (B). Protein abbreviations and their molecular weights (MW) are indicated. All proteins are pure and eluted in a predominately single peak from SEC.

Figure S2. Analysis of protein purity by SDS-PAGE and SEC – covalent fusion acceptors. Acceptor proteins in which a KR-ACP fragment was fused to the acceptor module. Protein abbreviations and their MW are indicated. All proteins are pure and eluted in a predominately single peak from SEC.

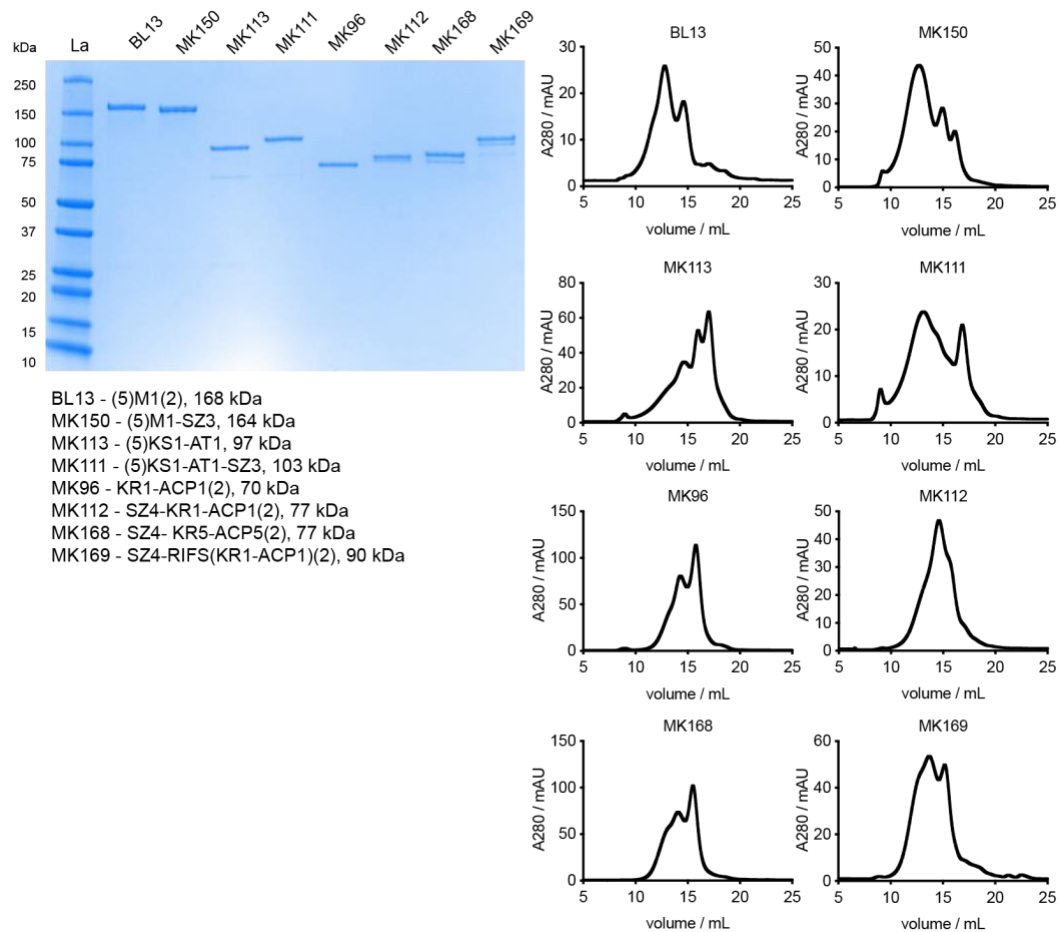

Figure S3. Analysis of protein purity by SDS-PAGE and SEC – DEBS M1 and its derivatives. DEBS M1 and its derivatives/fragments used in this study. If no indication is given the PKS domain/modules are derived from DEBS. Protein abbreviations and their MW are indicated. All proteins are pure, yet they appear as multiple oligomeric species based on SEC.

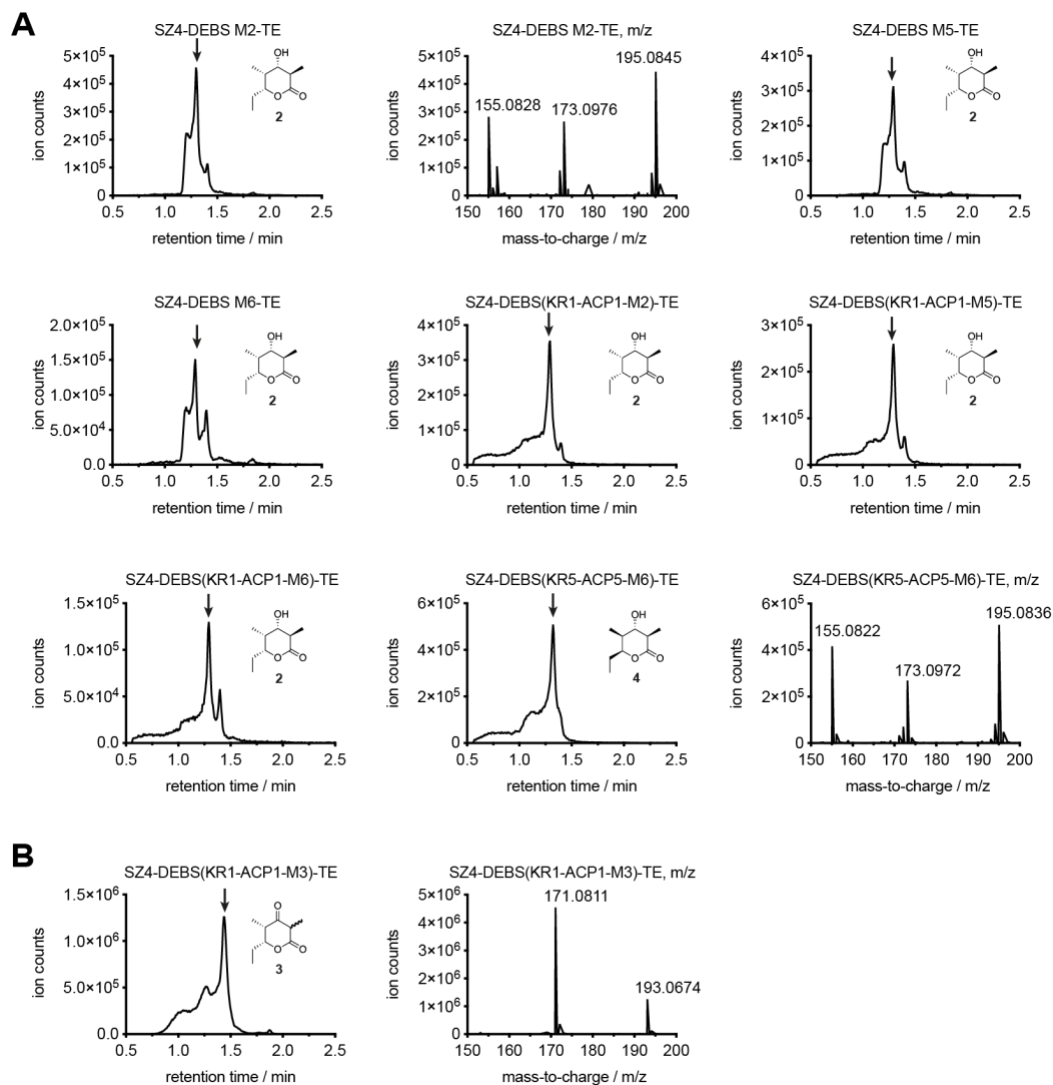

Figure S4. LC-MS analysis of products produced by bimodular chimeric PKSs newly generated in this study. A) Reduced triketide lactone products **2** and **4** ($C_9H_{16}O_3$, calculated MW 172.110) were detected in reaction mixtures containing SZ4-M2-TE, SZ4-M5-TE, SZ4-M6-TE, SZ4-KR1-ACP1-M2-TE, SZ4-KR1-ACP1-M5-TE, SZ4-KR1-ACP1-M5-TE, and SZ4-KR5-ACP5-M6-TE. B) Ketolactone **3** ($C_9H_{14}O_3$, calculated MW 170.090) was detected in reaction mixtures containing SZ4-KR1-ACP1-M3-TE. All PKS domain/modules are derived from DEBS. For all systems the extracted ion chromatograms were obtained by extraction of the $[M+Na]^+$ species and one chromatogram per compound is shown as an example. Labeled peaks from left to right correspond to $[M+H-H_2O]^+$, $[M+H]^+$, and $[M+Na]^+$ ions. The peak of interest is marked with an arrow based on its mass spectrum.

Table S1: Plasmids and primers used in this study. The cloning strategy is indicated for each construct. Some plasmids were only generated to function as intermediate constructs of the given cloning strategy and were not used for protein purification. If no indication is given the PKS domain/modules are derived from DEBS.

References for plasmids constructed elsewhere: pCK7¹; pBP130²; pAYC59³; pAJ20 and pAJ21⁴; pBL13, pBL16, pBL17, and pBL18⁵; pRSG34⁶; pFRSZ was a gift from Mislav Oreb, Goethe University Frankfurt. In addition pBL12 was used to produce LDD(4)⁵.

Table S2: Amino acid sequences of proteins used in this study. If no indication is given the PKS domain/modules are derived from DEBS. SZ domains are shown in red, docking domains in green, and linker regions in gray. L₁₂ is the ACP1-KS2 linker used to covalently fuse ACP1 to a heterologous acceptor module.
