

SUPPLEMENTAL MATERIAL

The apo-structure of the low-molecular-weight protein tyrosine phosphatase A (MptpA) from *Mycobacterium tuberculosis* allows for better target-specific drug development*

Tanja Stehle¹, Sridhar Sreeramulu¹, Frank Löhr², Christian Richter¹, Krishna Saxena¹, Hendrik R.A. Jonker^{1#}, Harald Schwalbe^{1#}

Figure S1. PtkA (Rv2232, M1-V291) amino acid sequence construct. Additional residues G(-7) - K(0) originate from **subcloning**.

Figure S2

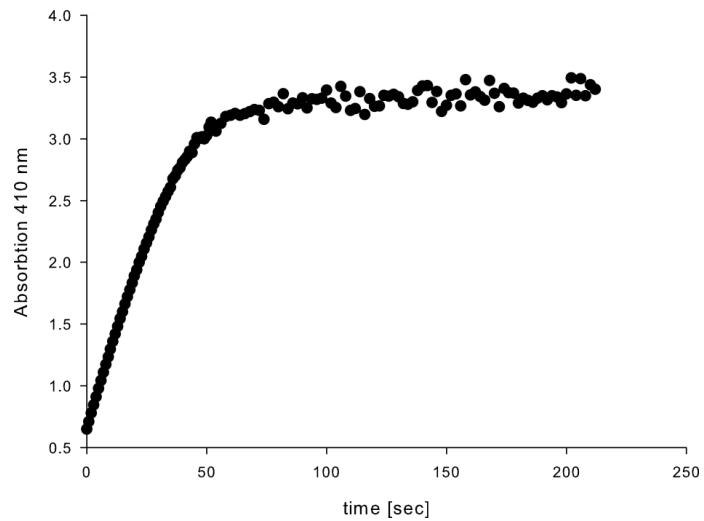

Figure S2. Dephosphorylation reaction of para-Nitrophenylphosphate (25 mM) catalyzed by wild type MptpA (20 μ M in 25 mM Tris-HCl (pH 7.0), 50 mM NaCl, 2 mM EDTA) monitored by the absorption of p-nitrophenol at 410 nm (Varian, Cary50Bio) at room temperature (25 °C).

Table S1. Order parameter S^2 , $(^1\text{H})-^{15}\text{N}$ heteronuclear NOE, $^{15}\text{N}-\text{T}_1$ and $^{15}\text{N}-\text{T}_2$ values for MptpA (1.0 mM in 150 mM NaCl, 50 mM HEPES (pH 7.0), 10 mM DTT) at T=298 K using a 600 MHz spectrometer with cryogenic probe. The T_1 longitudinal ^{15}N relaxation rates were determined from spectra with different delays of 10, 100, 400, 600, 800, 1000, 1200 and 1500 ms. T_2 transverse ^{15}N relaxation rates were determined using the following delays 35.2, 70.4, 105.6, 140.8, 176.0, 211.2, 246.4 and 281.6 ms. The $(^1\text{H})-^{15}\text{N}$ hetNOEs were obtained from the ratio of peak intensities ($I^{\text{NOE}}/I^{\text{no NOE}}$) with and without the saturation of amide protons.

Figure S3

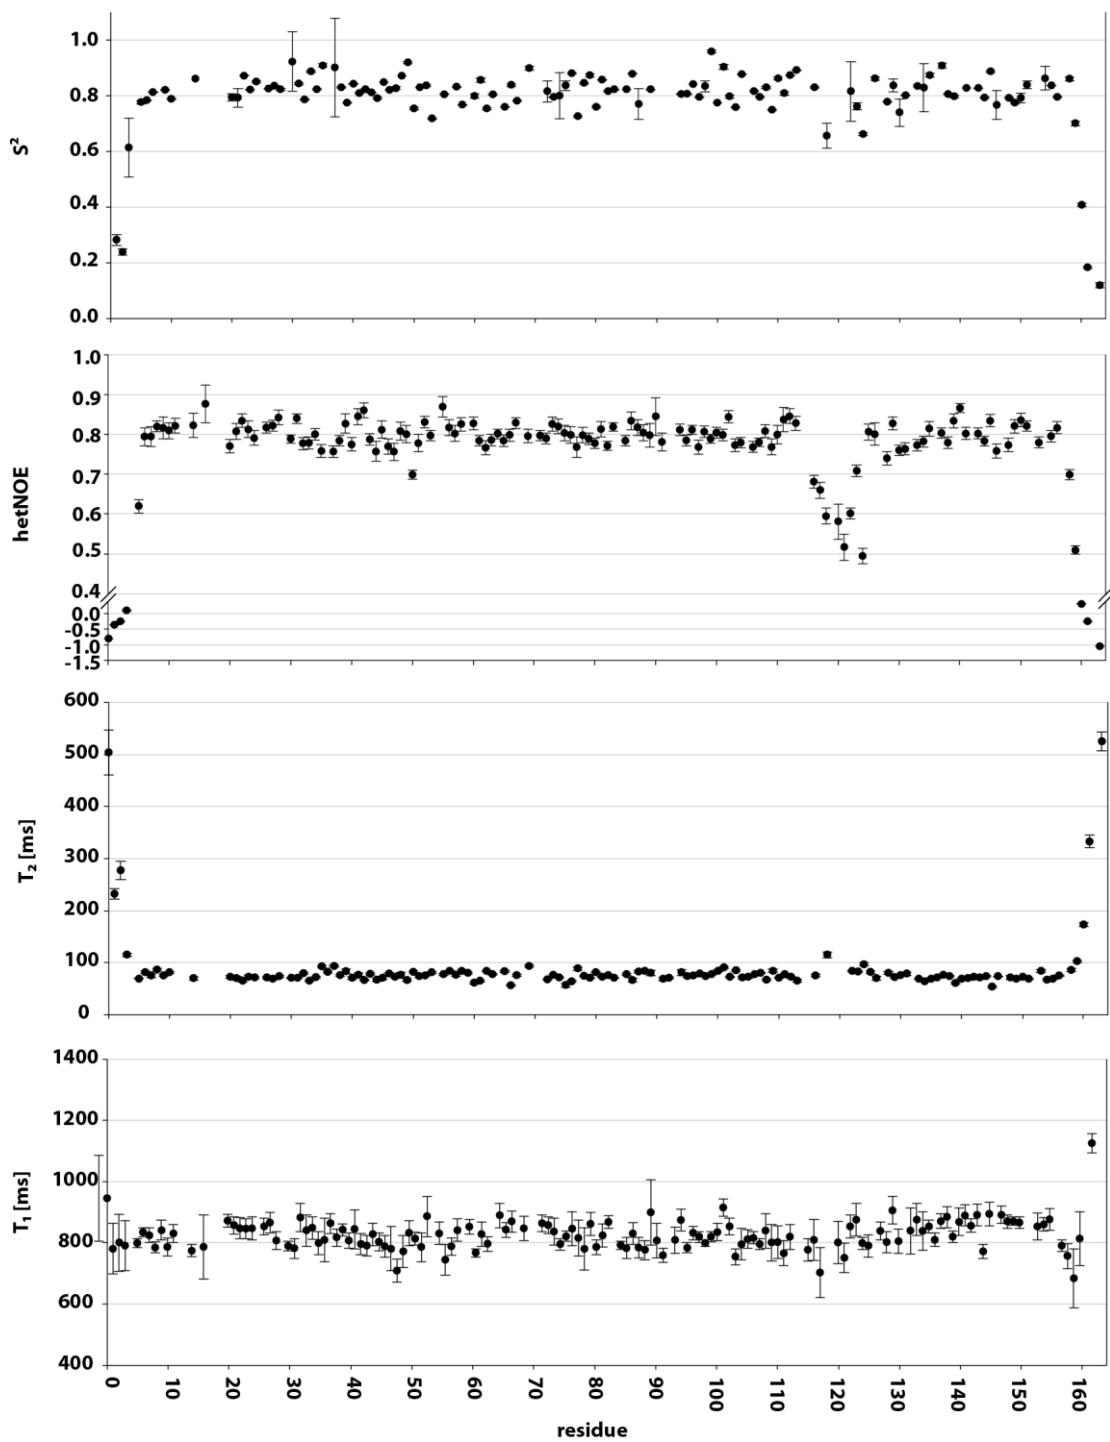

Figure S3. Heteronuclear relaxation data and S^2 order parameter of MptpA

Figure S4 and S5

In the phosphorylation assay for MptpA both enzymes (MptpA : PtkA, ratio 4:1) were incubated overnight at 4°C in the reaction buffer (300 mM NaCl, 50 mM Tris-HCl (pH 8.0), 10 mM β-Mercaptoethanol, 10 mM MgCl₂) containing 10 mM ATP. Phosphorylation was monitored by ³¹P NMR spectroscopy (Fig. S4) and MALDI-MS (Fig. S5). 1D ³¹P NMR spectra with ¹H inverse gated decoupling were recorded at a 300 MHz spectrometer. The spectrometer was locked on D₂O. Figure S4, A shows the expected lack of autophosphorylation activity of MptpA, while the autophosphorylation activity of PtkA can be verified due to ATP hydrolysis (ADP corresponding resonances at -5.78 ppm and -10.04 ppm) as well as with detection of a new peak resonating at -1.05 ppm (Fig. S4, B). The 1D ³¹P spectrum of the phosphorylation reaction mixture containing MptpA, PtkA and ATP (Figure S4, C) shows one additional peak at 3.92 ppm.

Figure S4

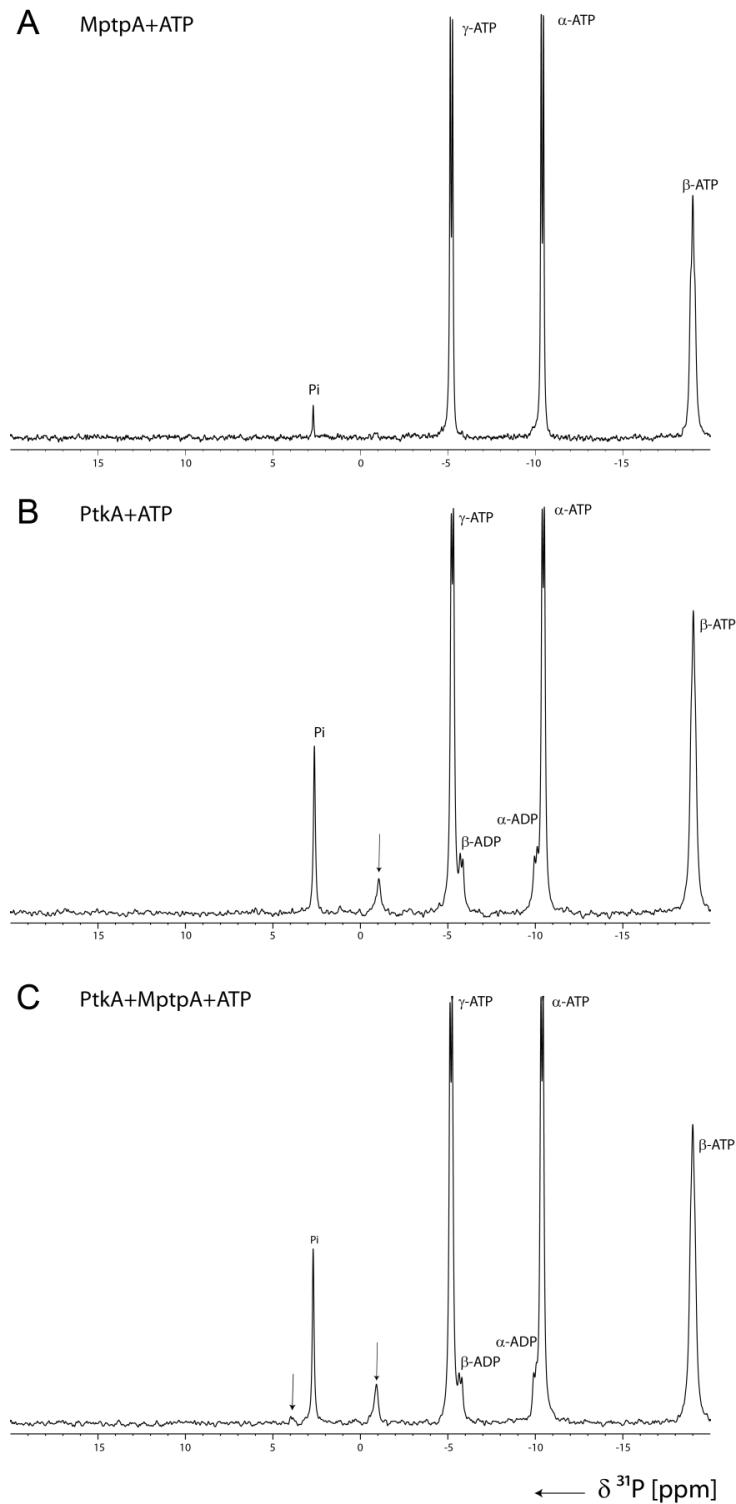

Figure S4. ^{31}P NMR spectroscopy of phosphorylation reaction. A. Autophosphorylation assay of MptpA (200 μM MptpA, 10 mM ATP) B. Autophosphorylation assay of PtkA (50 μM PtkA, 10 mM ATP) C. Incubation, showing phosphorylation of MptpA by PtkA (200 μM MptpA, 50 μM PtkA, 10 μM ATP). Resonances corresponding to phosphorylated tyrosine residues in PtkA and MptpA are indicated by arrows. All experiments were recorded with 3072 number of scans (TD = 4096, AQ = 0.24 s).

Figure S5

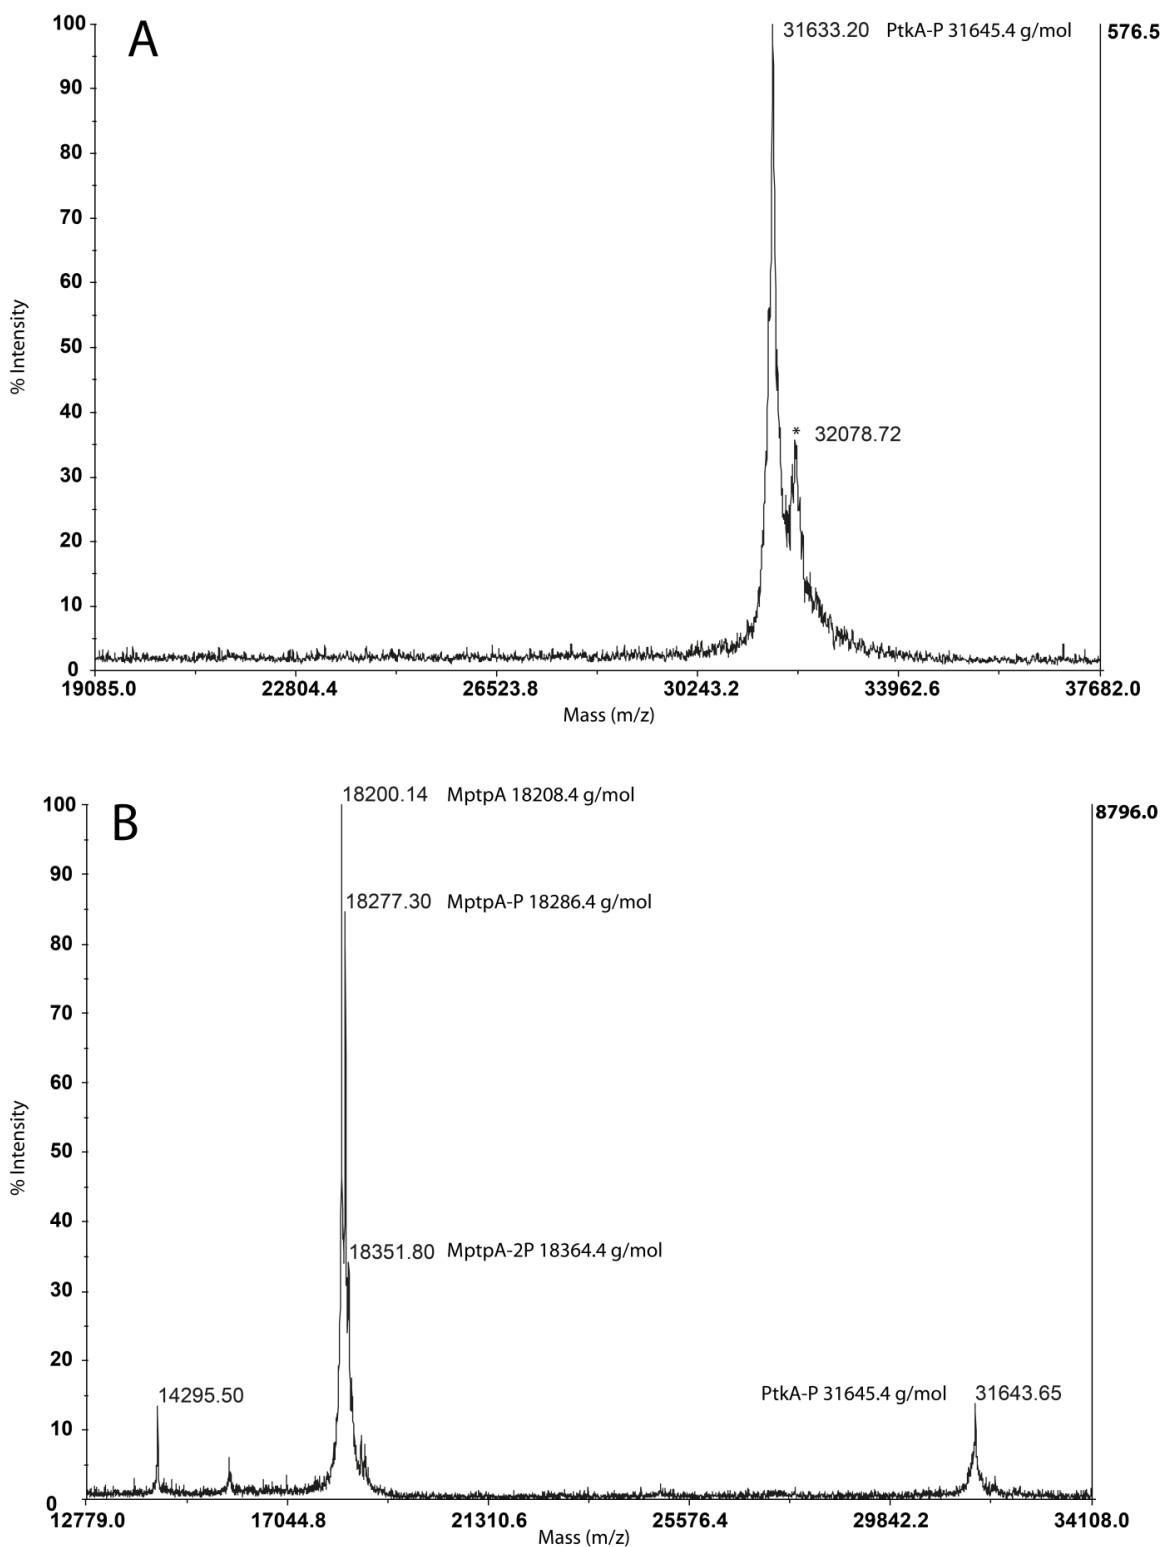

Figure S5. MALDI-MS annotated with experimental and theoretical molecular mass A. Autophosphorylation assay of PtkA (50 μ M) incubated with 10 mM ATP (* unassigned signal) B. Phosphorylation of MptpA (200 μ M) catalyzed by PtkA (50 μ M) in presence of 10 mM ATP.
