Received 2 December 2008; accepted 6 December 2008

Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å;  $R$  factor = 0.045;  $wR$  factor = 0.125; data-to-parameter ratio = 16.8.

The asymmetric unit of the title compound,  $\text{C}_{14}\text{H}_8\text{Cl}_4\text{N}_2\text{OS}\cdot 0.5\text{H}_2\text{O}$ , contains two independent molecules with different conformations with respect to the aromatic ring planes, and one water molecule. The bond lengths and angles are typical of thiourea compounds of this class. The molecule exists in the solid state in its thione form with typical thiourea C—S and C—O bonds lengths, as well as shortened C—N bonds. The dihedral angles between the two aromatic planes are  $66.93$  (8) and  $60.44$  (9)° in the two independent molecules. An intramolecular N—H...O hydrogen bond stabilizes the molecular conformation and the crystal packing is characterized by N—H...O, O—H...S and O—H...Cl hydrogen bonds.

## 1-(4-Chlorobenzoyl)-3-(2,4,6-trichlorophenyl)thiourea hemihydrate

M. Khawar Rauf, M. Bolte and A. Badshah

### Comment

The background to this study has been set out in our previous work on the structural chemistry of *N,N'*-disubstituted thioureas (Khawar Rauf *et al.*, 2006*a*, 2006*b*, 2006*c*, 2006*d*). Herein, as a continuation of these studies, the structure of the title compound (I) is described. A depiction of the two independent molecules is given in Fig. 1. The water molecule links the molecules through  $O_W-H\cdots S$  and  $N-H\cdots O_W$  hydrogen bonds. Bond lengths and angles, can be regarded as typical for *N,N'*-disubstituted thiourea compounds as found in the Cambridge Structural Database v5.28 (Allen, 2002; Khawar Rauf *et al.*, 2006*b*). The molecule exists in the thione form with typical thiourea C—S and C—O bonds, as well as shortened C—N bond lengths. The thiocarbonyl and carbonyl groups are almost coplanar. An intramolecular N—H $\cdots$ O hydrogen bond is present, forming a six membered ring commonly observed in this class of compounds (Khawar Rauf *et al.*, 2006*a*). The crystal packing is stabilized by intermolecular N—H $\cdots$ O, O—H $\cdots$ S and O—H $\cdots$ Cl hydrogen bonds (Table 1).

### Experimental

Freshly prepared 4-chlorobenzoyl isothiocyanate (2.0 g, 10 mmol) was stirred in acetone (40 ml) for 15 minutes. Neat 3,5-dichloroaniline (1.62 g, 10 mmol) was then added and the resulting mixture was stirred for 1 h. The reaction mixture was then poured into acidified (pH 4) water and stirred well. The solid product was separated and washed with deionized water and purified by recrystallization from methanol/ 1,1-dichloromethane (1:10 v/v) to give fine crystals of (I), with an overall yield of 85%. Full spectroscopic and physical characterization will be reported elsewhere.

### Refinement

Hydrogen atoms bonded to C were included in calculated positions and refined as riding on their parent C atom with C—H = 0.95 Å  $U_{iso}(H) = 1.2U_{eq}(C)$ . The H atoms bonded to N were refined with the N—H distances restrained to 0.88 (1) Å. The water H atoms were refined with the O—H distances restrained to 0.83 (1) Å and the H $\cdots$ H distances restrained to 1.40 (5) Å and with  $U_{iso}(H) = 1.2U_{eq}(O)$ .

### Figures

Fig. 1. Molecular structure of (I) showing the atom numbering scheme. Intra- and inter-molecular hydrogen bonds are shown as dash lines. Displacement ellipsoids are drawn at the 50% probability level.

Fig. 2. Packing diagram of (I).

$$w = 1/[\sigma^2(F_o^2) + (0.0647P)^2 + 1.5427P]$$

where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\text{max}} = 0.001$

7172 reflections  $\Delta\rho_{\max} = 0.94 \text{ e } \text{\AA}^{-3}$   
 428 parameters  $\Delta\rho_{\min} = -0.60 \text{ e } \text{\AA}^{-3}$   
 7 restraints Extinction correction: none  
 Primary atom site location: structure-invariant direct methods

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
